

Sample End-to-end Configuration

This appendix describes an end-to-end provisioning example for a Routed Optical Networking topology.

- [Sample Configuration, on page 1](#)

Sample Configuration

This section details the step-by-step approach to build a new Routed Optical Networking based, 75 km fiber span to replace an existing legacy span in a two-node DCI topology.

- [Network Sizing Requirements, on page 1](#)
- [Planning and Design Phase, on page 4](#)
- [Implement Phase, on page 5](#)
- [Operate Phase, on page 59](#)
- [Optimization Phase, on page 71](#)

Network Sizing Requirements

This section details the sizing requirements for a network. For a small lab installation, three servers with 256 GB of RAM is enough to run the Crosswork, Crosswork Network Controller, Cisco Optical Network Controller, NSO, Crosswork Hierarchical Controller, and EPNM in a non-HA deployment. For a production setup, calculate the total resources required using information in the following tables.

Network Profiles

Network profiles are defined based on network size, services, and application features.

Network Entity/Feature	Lab (20%)	Production (100%)
Devices	2000	10000
Total number of interfaces	100000	650000
IGP interfaces	20000	100000

Network Entity/Feature	Lab (20%)	Production (100%)
VPN Services (L2, L3)	40000	200000
Endpoints per VPN service	2 to 10	50
Total LSPs (SR policies and RSVP tunnels)	12000	60000
Number of PCEP sessions	2000	10000

Note Each SR-PCE pair can only support 2000 PCEP sessions which means only 2000 headends for lab networks and 10000 headends for production networks. While counting headends, LCM nodes must be included.

Deployment Size per Network Profile

The following table is the recommended deployment sizing requirement for solution using Cisco Crosswork Network Controller.

Package	Contents	Crosswork Data Gateway Deployment	Recommended number of cluster VMs
Cisco Crosswork Network Controller Essentials	Cisco Crosswork Optimization Engine	On-Premise Standard (default): Collectors only.	When Essentials package is installed WITHOUT Element Management Functions: • 3 Hybrid nodes When Essentials package is installed WITH Element Management Functions: • 3 Hybrid nodes + 1 Worker node
	Cisco Crosswork Active Topology	On-Premise Standard (default): Collectors only.	
	Element Management Functions	On-Premise Standard (default): Collectors only.	
Cisco Crosswork Network Controller Advantage	Cisco Crosswork Service Health	On-Premise Extended: Collectors and offload services.	3 Hybrid nodes + 2 Worker nodes

Package	Contents	Crosswork Data Gateway Deployment	Recommended number of cluster VMs
Add-on Package	Cisco Crosswork Change Automation	On-Premise Extended: Collectors and offload services.	3 Hybrid nodes + 2 Worker nodes
	Cisco Crosswork Health Insights	On-Premise Extended: Collectors and offload services.	
	Cisco Crosswork Zero Touch Provisioning	On-Premise Standard (default): Collectors only.	

Note For non-production lab installations without HA, you can use 1 Hybrid node.

VM Resources

The following table provide the details on CPU, memory, and disk requirements needed for each Crosswork VM and the other VMs in the deployment.

Crosswork VM	Crosswork Data Gateway	NSO	SR-PCE	Crosswork Hierarchical Controller	EPNM
<ul style="list-style-type: none"> • CPU: 12 vCPU • RAM: 96 GB • DISK: 1 TB (SSD) 	<ul style="list-style-type: none"> • CPU: 20 vCPU • RAM: 112 GB • DISK: 0.5 TB 	<ul style="list-style-type: none"> • Small Network Profile <ul style="list-style-type: none"> • CPU: 8 vCPU • RAM: 64 GB • DISK: 250 GB • Large Network Profile <ul style="list-style-type: none"> • CPU: 24 vCPU • RAM: 132 GB • DISK: 1TB 	<ul style="list-style-type: none"> • CPU: 8 vCPU • RAM: 24 GB • DISK: 45 GB 	<ul style="list-style-type: none"> • CPU: 10 cores • RAM: 96 GB • DISK: 400G SSD (lab) , 3TB SSD (production) 	<ul style="list-style-type: none"> • Professional (Small) <ul style="list-style-type: none"> • CPU: 16 vCPU • RAM: 64 GB • DISK: 2.8 TB • Extended (Medium/Large) <ul style="list-style-type: none"> • CPU: 24 vCPU • RAM: 128 GB • DISK: 4 TB

Note In Routed Optical Networking 2.1, Cisco Optical Network Controller and Crosswork Network Controller require different Crosswork Infrastructure versions. The Crosswork Infrastructure Cluster for Cisco Optical Network Controller must have:

- 3 VM
- CPU: 12 vCPU
- RAM: 96 GB
- DISK: 1TB SSD

Cisco Optical Network Controller Scale Support

Cisco Optical Network Controller supports a maximum of 500 nodes and 600 services. Cisco Optical Network Controller can run on the same cluster. Cisco Optical Network Controller adds more resources incrementally at the maximum supported scale. It is captured in Crosswork VM resources in the table above.

Planning and Design Phase

The planning and design phase involves:

1. Network Planning and Design

Inputs needed: Packet layer traffic demands, optical fiber topology, resiliency criteria, and other network constraints.

- WAE can be used to determine a new network build or augmentations to an existing network.
- After the IP network circuits have been determined, Cisco ONP is used to determine the optical layer feasibility and components that are used to support the network.

Output for a sample configuration:

This topology uses two Cisco 8201 routers, two NCS 2006 terminal nodes with NCS1K-MD-64 add/drop multiplexers, and EDFA-35 bi-directional amplifiers. The span length is 75 kms. Longer spans may require additional ILA nodes for amplification.

2. Automation Software Resource Planning

Server requirements for the Routed Optical Networking software elements

Determine the servers required for the full solution. See [Network Sizing Requirements, on page 1](#) and [Installation Requirements for Routed Optical Networking Components, on page 4](#).

- For a lab or EFT setup, it is recommended to use three servers each with 384 G of RAM, 32 cores, and two TB SSD.
- The solution requires the use of VMware ESX 6.7 or higher.

Installation Requirements for Routed Optical Networking Components

The following list points to the installation requirements for different Routed Optical Networking components.

- [Cisco Optical Network Planner 5.1](#)

- [Cisco WAN Automation Engine 7.5.0](#)
- [Cisco NCS 2000 Shelf Virtualization Orchestrator 12.3.x](#)
- [Cisco Crosswork Cluster, Crosswork Data Gateway, and Crosswork Applications](#)
- [Cisco Optical Network Controller 2.1](#)
- [Cisco Evolved Programmable Network Manager 7.0.1](#)
- [Cisco Network Services Orchestrator 6.1](#)
 - [Cisco NSO Routed Optical Networking Core Function Pack 2.1](#)
 - [Cisco NSO Transport-SDN Function Pack Bundle 5.0](#)
 - [Cisco Network Services Orchestrator DLM Service Pack 5.0](#)
- [Cisco Crosswork Hierarchical Controller 7.0](#)
- [Cisco Crosswork Network Controller 5.0](#)

Implement Phase

The implement phase involves:

1. Installation of hardware components

- a. Hardware staging or installation and initial base configuration required for management connectivity.
- b. All onboard software updates must be completed to the required revision.
- c. All associated base wiring must be completed to support the network. This includes connections between the optical elements and connections between routers and optical add/drop end-points to support Routed Optical Networking circuits using ZR/ZR+ optics. See [Deployment Topologies](#).
- d. SVO 12.2 server or line card based installation to support NCS 2000 nodes. See [Install the External Server](#), and [Run the SVO Installation Tool](#).
- e. Create SVO instances for all NCS 2000 nodes. See [Create an SVO Instance](#).

2. Installation of the Automation Software Components

- a. Complete all server hardware installation and base configuration to support the solution, including VMWare ESX if not already installed.
- b. Install the following software components to support the Routed Optical Networking solution.
 - [Cisco Optical Network Planner 5.1](#) (for optical planning)
 - [Cisco WAN Automation Engine 7.5.0](#) (for IP planning)
 - [Cisco Crosswork Cluster, Crosswork Data Gateway, and Crosswork Applications](#) (for supporting Crosswork Network Controller)
 - [Cisco Optical Network Controller 2.1](#) (for supporting optical network)
 - [Cisco Evolved Programmable Network Manager 7.0.1](#) (for managing the physical router and the optical network nodes)

- [Cisco Network Services Orchestrator 6.1](#) (base installation to support RON FP)
 - [Cisco NSO Routed Optical Networking Core Function Pack 2.1](#) (for RON ML provisioning)
 - [Cisco NSO Transport-SDN Function Pack Bundle 5.0](#) (for Crosswork Network Controller SR and xVPN provisioning)
 - [Cisco Network Services Orchestrator DLM Service Pack 5.0](#) (for device synchronization between Crosswork Network Controller and NSO)
- [Cisco Crosswork Hierarchical Controller 7.0](#) (for provisioning the Routed Optical Networking ML service using the Crosswork Hierarchical Controller)

Note This is required only if the Routed Optical Networking ML service is provisioned via the Crosswork Hierarchical Controller GUI.

3. Onboarding of Devices

- a. Add devices to Cisco Optical Network Controller. See [Onboard Devices to Cisco Optical Network Controller](#).
- b. Add NSO, SR-PCE, and devices to Crosswork Network Controller. See [Add SR-PCE, NSO, and Routers to Crosswork Network Controller, on page 7](#).
- c. Add routers to NSO using the IOS-XR CLI NED. See Step 3 in [Provision ML Service Using NSO Routed Optical Networking CFP , on page 20](#).
- d. Add Cisco Optical Network Controller to NSO using the ONF TAPI NED.
- e. Add and configure the following Crosswork Hierarchical Controller adapters. See [Add Adapters to Crosswork Hierarchical Controller, on page 13](#).

Note This step is required only if the Routed Optical Networking ML service is provisioned via the Crosswork Hierarchical Controller GUI.

- Add and configure the Crosswork Network Controller adapter.
- Create or import sites in Crosswork Hierarchical Controller. See the sections, "Add Sites" and "Export and Import Sites" in the [Cisco Crosswork Hierarchical Controller Administration Guide 5.1](#).
- Add and configure the IOS-XR adapter. Create router devices in Crosswork Hierarchical Controller using the IOS-XR adapter type. After the routers are created, add the Crosswork Network Controller adapter to the router device.
- Add and configure the Cisco Optical Network Controller adapter.

4. Provisioning of Services

- a. Ensure all device interconnections are complete.

- b. To provision the Routed Optical Networking ML service, use either one of the procedures:
 1. **Using the NSO GUI:**
 - a. Utilize the Routed Optical Networking FP ML services to provision and end-to-end service. See [Provision ML Service Using NSO Routed Optical Networking CFP](#), on page 20.
 - b. Verify that the end-to-end service has been deployed by checking the NSO service deployment status using the check-sync status.
 - c. Verify the router optics controller state using the CLI or in EPNM. See [Troubleshoot Provisioning Issues](#).
 2. **Using the Crosswork Hierarchical Controller GUI:**
 - a. Utilize the Crosswork Hierarchical Controller GUI to provision and end-to-end Routed Optical Networking ML service. See [Provision Routed Optical Networking ML Service Using Crosswork Hierarchical Controller](#), on page 34.
 - b. Verify the router optics controller state using the Link Assurance tool in Crosswork Hierarchical Controller. See Step in [Provision Routed Optical Networking ML Service Using Crosswork Hierarchical Controller](#), on page 34.

Add SR-PCE, NSO, and Routers to Crosswork Network Controller

Perform these steps to add SR-PCE providers, NSO providers, and routers to Crosswork Network Controller.

Note When you add or import devices, or create providers, you need to specify the credential profile.

1. [Log in](#) to the Crosswork user interface.
2. To create a credential profile, choose **Device Management** > **Credential Profiles** from the main menu. See [Manage Credential Profiles](#).
 - a. For the NSO credential profile, the connectivity type must be set to NETCONF and HTTPS. Optionally, HTTP can also be defined if HTTPS is not used in NSO.

Edit Profile nso ×

Profile Name * nso

Add Credential Protocols

Connectivity Type	User Name *	Password *	Confirm Password *	
NETCONF	nso	🗑️
HTTPS	nso	🗑️

[+ Add Another](#)

[Save](#) [Cancel](#)

521905

- b. The SR-PCE credential profile requires HTTP credentials to communicate with the SR-PCE Northbound API.

Edit Profile SR-PCE ×

Profile Name * SR-PCE

Add Credential Protocols

Connectivity Type	User Name *	Password *	Confirm Password *	
HTTP	admin	🗑️

[+ Add Another](#)

[Save](#) [Cancel](#)

521906

- c. The router credential profile requires at a minimum, the SNMPv2 or SNMPv3 and SSH connectivity types. NETCONF is optional. GNMi is used when utilizing GNMi to configure streaming telemetry sensors on the node.

521907

3. Add the providers. See [About Adding Providers](#).
 - a. To add the SR-PCE or NSO provider, choose **Administration > Manage Provider Access** from the main menu. See [Manage Providers](#).
 - b. Add the NSO provider. See [Add Cisco NSO Providers](#).

Select the credential profile created for NSO. Select the family as NSO. The Device Key may be set to either the HOST_NAME or INVENTORY_ID depending on the specific deployment.

The following image demonstrates the connectivity to NSO's RESTCONF API over SSL using port 8888 and NETCONF using the default port of 2022. Since the Routed Optical Networking NSO CFP utilizes the XR CLI NED, the Cisco-IOS-XR model is not applicable and may be set to any version.

Cisco-IOS-XR	7.3.1	✕

521908

- c. Add the SR-PCE provider. See [Add Cisco SR-PCE Providers](#).

Select the credential profile created for SR-PCE. Select the family type as SR_PCE. The connectivity type for SR-PCE must be the HTTP. In the following image, the default API port of 8080 is specified. When the Property Key, "auto-onboard" is set to a Property value, "off", Crosswork Network Controller does not automatically add nodes that are discovered via the SR-PCE IGP topology to the device inventory. Devices must be added through the Crosswork Network Controller UI or inventory API.

521909

4. Validate communications with one or more providers. Check on the provider's reachability using the steps in [Get Provider Details](#).
5. Onboard devices. See [Add Devices Through the UI](#).
 - a. The Administration State, Reachability Check, and Credential Profile are mandatory elements. The Host Name must be used if the NSO provider device key is set to the Host Name value. If the NSO provider device key is set to Inventory ID that field must be populated. The Software Type, Software Version, UUID, Serial Number, MAC address, and Product Type are filled by device discovery. Optionally, tags can be applied to the device. The GNMI encoding type can be set to JSON or PROTO.

Add Adapters to Crosswork Hierarchical Controller

Prerequisite

When you work with Crosswork Hierarchical Controller adapters you are required to use credentials. These credentials are used for authentication when a device is assigned to an adapter. The same credentials may be shared by multiple adapters. The credentials are added under the **Services > Device Manager > Credentials**

tab in the Crosswork Hierarchical Controller GUI. The adapters needed for the Routed Optical Networking solution are:

Table 1: Routed Optical Networking Adapters

Adapter	Credential Type
Crosswork Network Controller	HTTP (username/password)
Crosswork Network Controller Crosswork Data Gateway	HTTP (username/password)
Cisco Optical Network Controller	HTTP (username/password)
IOS-XR	SSH - User and password

Note If Cisco Optical Network Controller and Crosswork Network Controller are on the same Crosswork cluster, they can use the same credential profile.

To add the adapters, perform the following steps:

1. In the applications bar in Crosswork Hierarchical Controller, select **Services > Device Manager > Adapters**.
2. Click **Add new adapter**.
3. Enter the adapter details:
 - **Adapter Type:** Select an adapter type from the list of available adapter types currently installed in Crosswork Hierarchical Controller.
 - **Adapter Name:** Unique user defined name of this adapter type instance (there can be several instances of the same adapter type).
4. To configure the adapter, select the adapter in the Adapters pane. Configure the parameters as displayed in the following images.
 - **Crosswork Network Controller Adapter:**

Note API version for Crosswork Network Controller must be V2.

Figure 1: Crosswork Network Controller Adapter Configuration - General Tab

The screenshot shows the 'General' tab of the configuration interface. It includes several sections:

- General Settings:** 'Enabled' is checked. 'Logging Level' is set to 'Info'. 'Affects Reachability' is checked.
- Discovery Cycle:** 'Full Data Fetch Interval [sec]*' is set to 76. 'Max run time for a single discovery cycle [sec]' is set to 60. 'Enable provisioning support*' is checked.
- SSH CONFIGURATION:** 'Host' is 10.195.165.76, 'Port' is 30603, 'Timeout [sec]' is 30, 'Api_version' is V2, and 'Credentials' is onc.

522152

Note The Full Data Fetch Interval must be set to 300s or higher in a production network.

The following parameters must be configured for Crosswork Network Controller notifications and collection.

Figure 2: Crosswork Network Controller Adapter Configuration - General Tab

The screenshot shows the 'NOTIFICATIONS CONFIGURATION' and 'COLLECTION PARAMETERS' sections:

- NOTIFICATIONS CONFIGURATION:** 'Enabled' is checked. 'Log_notifications' is checked. 'Log_level' is set to 'DEBUG'. Other events like 'Termination_point_event', 'L3_link_event', 'Sr_policy_change_event', and 'Sr_policy_oper_state_change_event' are also checked.
- FILE-BRINGERS CONFIGURATION:** 'Enabled' is unchecked. 'Remote address with file pattern' and 'Credentials' are present.
- COLLECTION PARAMETERS:** 'Enable Topology Collection', 'Enable L1 IGMP-IS Collection', 'Enable L2 IGMP-IS Collection', 'Enable Sr-Policy Collection', and 'Enable Rsvp-Te Collection' are all checked. 'IGMP-IS Priority' is set to 1.

522153

• **IOS-XR Adapter**

Figure 3: IOS-XR Adapter - General Tab

522154

Note The Polling Cycle should not be less than 300s in a production network. Concurrency can be increased. The Logging Level must be set to Info if everything is working correctly.

The following collection parameters must be configured. These parameters collect optical power values for the link assurance application.

Figure 4: IOS-XR Adapter - General Tab

522155

The status of the devices must be **ok** in the Devices tab after the addition and completion of a successful collection cycle.

• Crosswork Network Controller Crosswork Data Gateway Adapter

Crosswork Network Controller Crosswork Data Gateway adapter is used to collect telemetry data via gNMI to the router. In Crosswork Network Controller, the routers must be configured with the gNMI protocol with the encoding type set to “PROTO” and the GNMI capability enabled. In IOS XR, the routers must be configured for gRPC so that Crosswork Data Gateway can create gNMI telemetry subscriptions.

- The device name in Cisco Crosswork Hierarchical Controller must match the device name in Crosswork Network Controller for successful deployment. If successful, you will see Cisco Crosswork Hierarchical Controller as a new destination in Crosswork Network Controller. This is setup by Cisco Crosswork Hierarchical Controller and user interaction is not required. As Crosswork Data Gateway is enabled on devices, new collection jobs are populated. A single collection job is available for each router collecting multiple KPIs.

Provision ML Service Using NSO Routed Optical Networking CFP

Perform the following steps to provision the Routed Optical Networking ML service using the NSO Web UI.

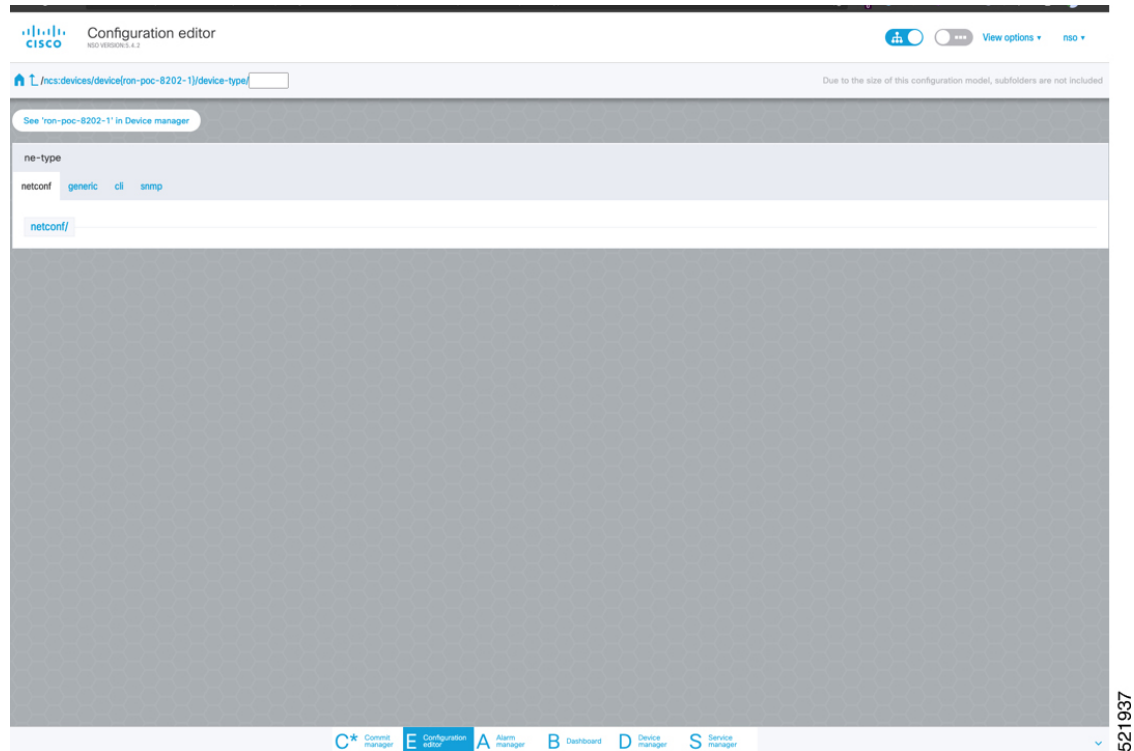

1. To add a new device, perform these steps:
 - a. In the Device manager, click the + to add a new device. Specify a name for the new device. Click **Confirm**.

- b. After creating the new device, click the device name to fill required and optional parameters. In this screen, the required parameters are the authgroup and IP address of the device.

- c. Scroll down in the device configuration screen. Click the “device-type” to bring up the device type selection screen. The device-type that is supported in the Routed Optical Networking ML FP is IOS-XR CLI NED.

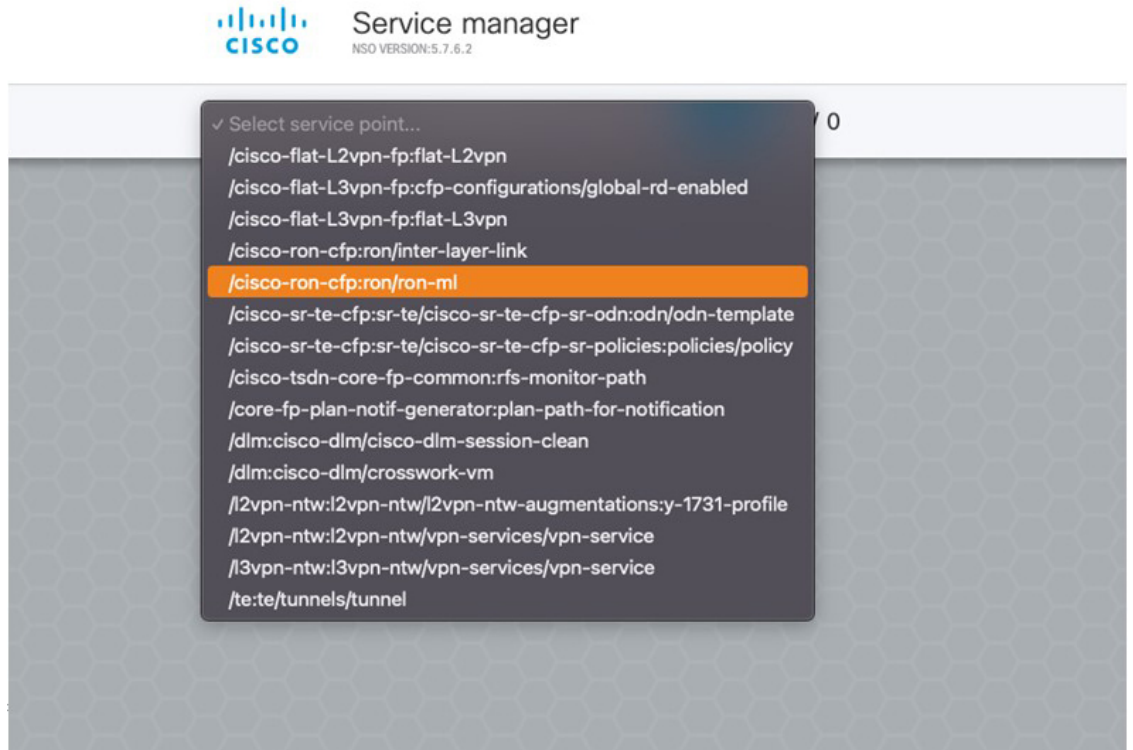

521937

- d. Click the blue NETCONF text to select the proper NED. The Routed Optical Networking ML FP requires the use of the **cisco-iosxr-nc-7.3** NED.

- e. Click the Commit manager to view the NSO CLI configuration being applied. Click **Commit** to save the device configuration to NSO.

Note Next we add the multilayer end-to-end service to configure and provision both the optical line system and routers. We recommend you to click **check-sync** in the Device manager to ensure that the device configuration is properly in sync with NSO before provisioning. If the device is out of sync, initial provisioning fails.

2. To create Routed Optical Networking ML service, perform these steps:
 - a. In the Service manager, select the Routed Optical Networking ML service point from the drop-down list. When we create the new Routed Optical Networking ML service, the required components are the service name, mode of the service (transponder or muxponder), and the bandwidth. The bandwidth corresponds to the line rate of the ZR/ZR+ optics. Click **Confirm**.

Create service

name

mode

bandwidth

- b. In the Configuration editor, click the newly created service name for editing the additional parameters that are required for the service. In this example, we set the circuit-id name in the global parameters. The frequency is set by the optical controller based on the specified optical add/drop port. The dac-rate

is set to the default value.

The screenshot shows the Cisco Configuration Editor interface for a circuit named 'poc_circuit_195200'. The configuration fields are as follows:

- name:** poc_circuit_195200
- circuit-id:** This is a demo circuit
- dac-rate:** (empty)
- mode*:** transponder
- grid-type:** (100mhz-grid)
- clear-rollback:** (empty)
- bandwidth*:** 400
- frequency:** (empty)

Below the configuration fields, there are sections for 'end-point' and 'custom-template', both of which are currently empty. The 'end-point' section has an 'Add list item' button. The 'custom-template' section also has an 'Add list item' button. The bottom navigation bar shows the following tabs: C* Control Manager, E Configuration editor (active), A Alarm Manager, B Dashboard, D Device Manager, and S Service Manager. The version number 521926 is visible in the bottom right corner.

Note

- User configuration global options are frequency and dac-rate
- Dac-rate controls the TX shaping parameters: 1x1.25 = enabled, 1x1 = disabled. Leaving it blank uses system default of enabled, and can be used in most circumstances
- Modulation of 16 QAM is available for 2x100G muxponder mode.

- c. After the ols-domain is added, you must add end-points to the circuit. Two end-points are always required. The end-points are the routers with ZR/ZR+ optics.

521927

d. Add the end-point-device to the service. Click **Confirm**.

521928

After the end-point is created, click the end-point to edit the end-point parameters. The line-port is a required parameter and refers to the optics port on the router. In this example, this is the same as the line-port specified in the inter-layer-link service for the end-point router.

The screenshot shows a dialog box titled "Add new list item". Inside the dialog, there is a text input field containing the text "end-point-device". Below this field is a dropdown menu with the text "ron-poc-8201-2" and a downward-pointing arrow. At the bottom of the dialog, there are two buttons: "cancel" and "confirm".

The transmit-power is an optional parameter for end-to-end provisioning. If it is omitted the optical controller (Cisco Optical Network Controller) will provide the transmit power. Transmit power sets the transmit power, the value is in 100*value in 0.1dBm increments. For example, -100 is -10dBm. If no value is specified the default of -10dBm is used for QDD-400G-ZR-S or QDD-400G-ZRP-S, or 0dBm for DP04QSDD-HE0 (Bright ZR+). The transceiver-capability field specifies the optic type and is only required if no packet layer configuration is being performed. In this example, you are performing packet layer provisioning so specifying the transceiver capability is not required.

Add the line-port of 0/0/0/20 to the Routed Optical Networking ML service.

- e. Click end-point to go back to the top-level endpoint configuration, click **terminal-device-packet** to configure Ethernet/IP parameters

Note

- Ethernet/IP configuration is optional.
- Bundle configuration adds an interface to an existing bundle or creates a new bundle and adds the newly created IP interface to it.

Interface configuration is used for configuring IP address parameters on newly created Ethernet interfaces.

In this example we add a new Bundle and assign an IP address to the Bundle.

- f. Click the plus sign next to bundle to add a bundle, in this case with an identifier of 500. This creates a bundle interface Bundle-Ether 500 on the endpoint router

The interface index for a bundle use case is always 0. In case of a non-bundle configuration in muxponder mode, the index can be 0–3 representing the number of interfaces created as part of the muxponder configuration.

- g. Click the bundle number and *ip-address* to configure an IP address on the bundle.

- h. Return to the top-level endpoint configuration, select the index 0 previously created and click **membership** to add the interface to the bundle

4. Verify status in NSO UI.

You can verify the status by inspecting the plan associated with the service. You can find the plan under the main ron-ml configuration which you can access by clicking the top portion of the service configuration. An example is highlighted in the following image.

The screenshot shows the Configuration editor interface for a service. The service name is 'poc_8201_1_to_poc_8201_2_20'. The configuration is as follows:

name poc_8201_1_to_poc_8201_2_20	bandwidth* 400	frequency 1952000
plan-location /cisco-ron-cfp:ron/cisco-ron-cfp:ron-ml-plan[cisco-ron-cfp:name='poc_8201_1_to_poc_8201_2_20']	circuit-id poc_circuit	dac-rate
mode* transponder	grid-type (100mhz-grid)	clear-rollback

a. Inspect the plan by clicking on the newly created service

The screenshot shows the 'ron-ml-plan' configuration page. The name field contains the following values:

```
682b3df2_30b2_4af2_9438_6dfb7738d0ef
6e2b4907_b08b_4338_8304_a4f2903b3311
f7a00076_d3db_4bd9_9d94_673d4cc462cb
poc_8201_1_to_poc_8201_2_20
```

If all steps are green and complete, the service has been properly deployed to the network

b. Inspect router configuration.

The **show configuration commit changes last 1** command shows the CLI config applied to the device during the NSO provisioning.

The **show optics controller 0/0/0/20** command verifies the operational status.

Provision Routed Optical Networking ML Service Using Crosswork Hierarchical Controller

1. If you are performing both router and optical line system provisioning, you must create NMC Cross Links between router optics port and optical line system add/drop port.

Crosswork Hierarchical Controller 7.0 in Routed Optical Networking 2.1 also supports “router only” provisioning which provisions optical parameters on router optics port and IP layer parameters but does not provision OLS.

- a. Select **Link Manager** application.

Figure 14: Crosswork Hierarchical Controller

You get the following initial view that shows the list of Cross Links.

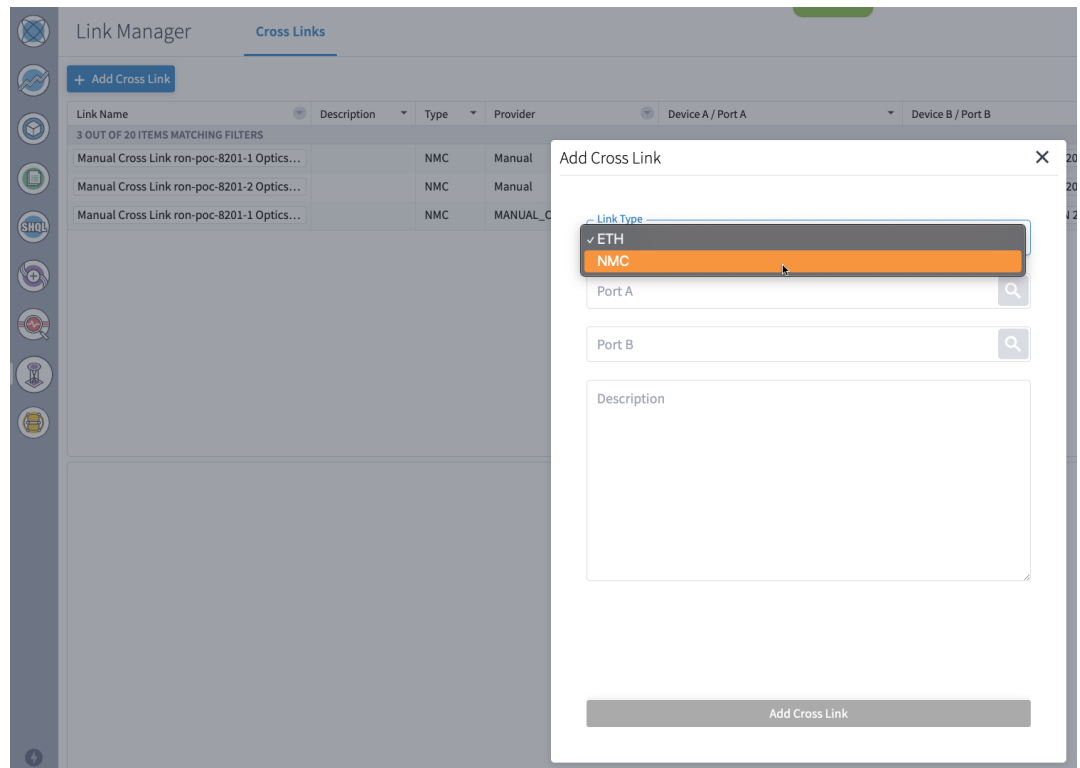

b. Click Add Cross Link.

Figure 15:

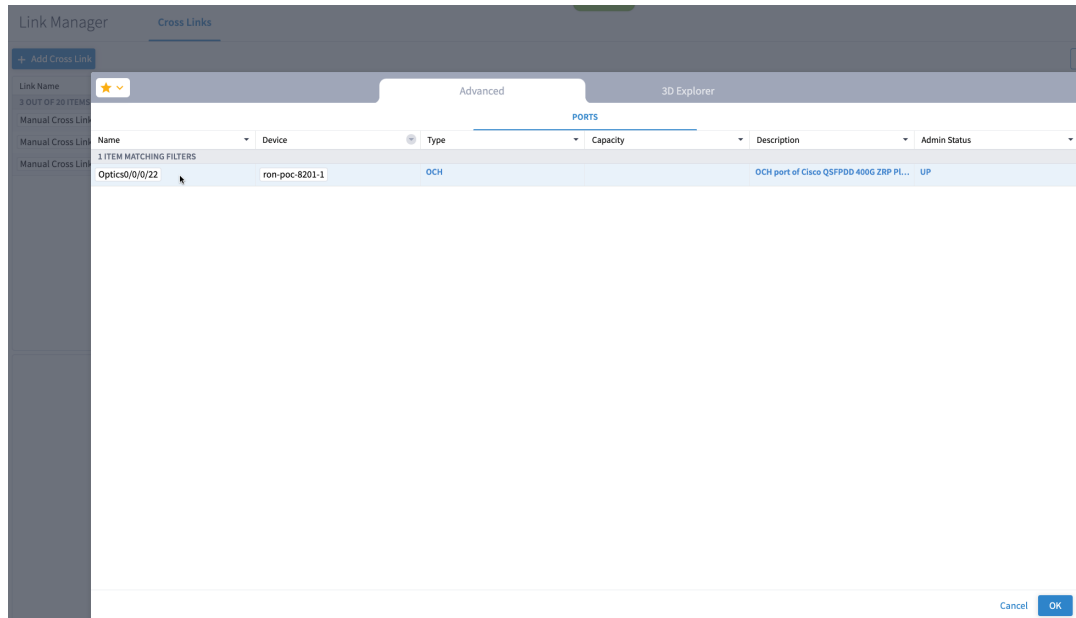

c. Select the NMC cross link type. Cross Link Manager supports ETH and NMC cross links.

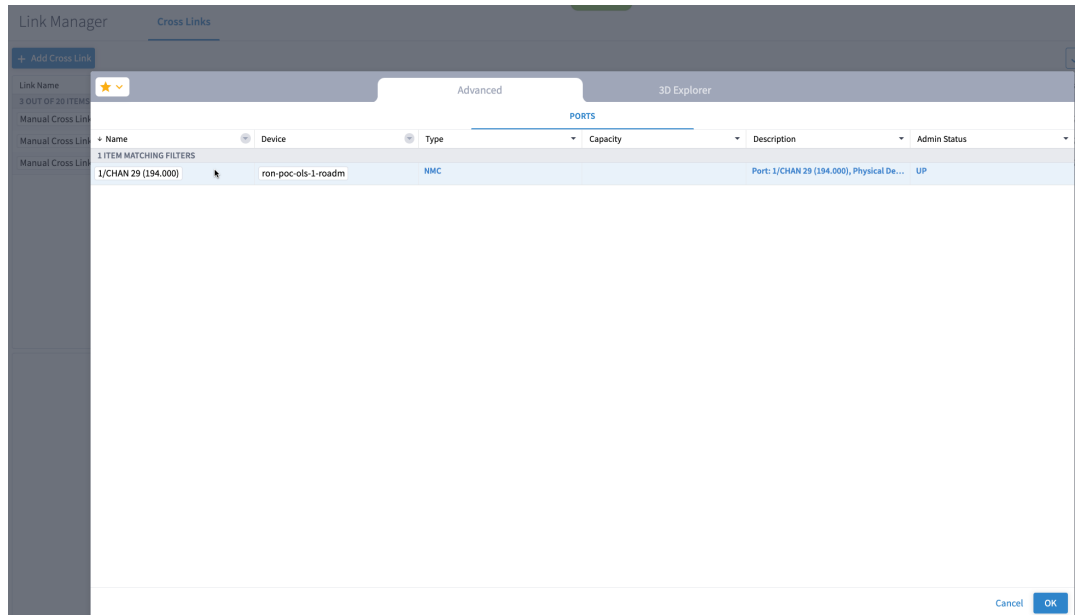

- d. The Link Manager application allows you to select either router DCO port or optical add/drop first. In the following image we filter the ports by the router device that we use for our NMC cross link.

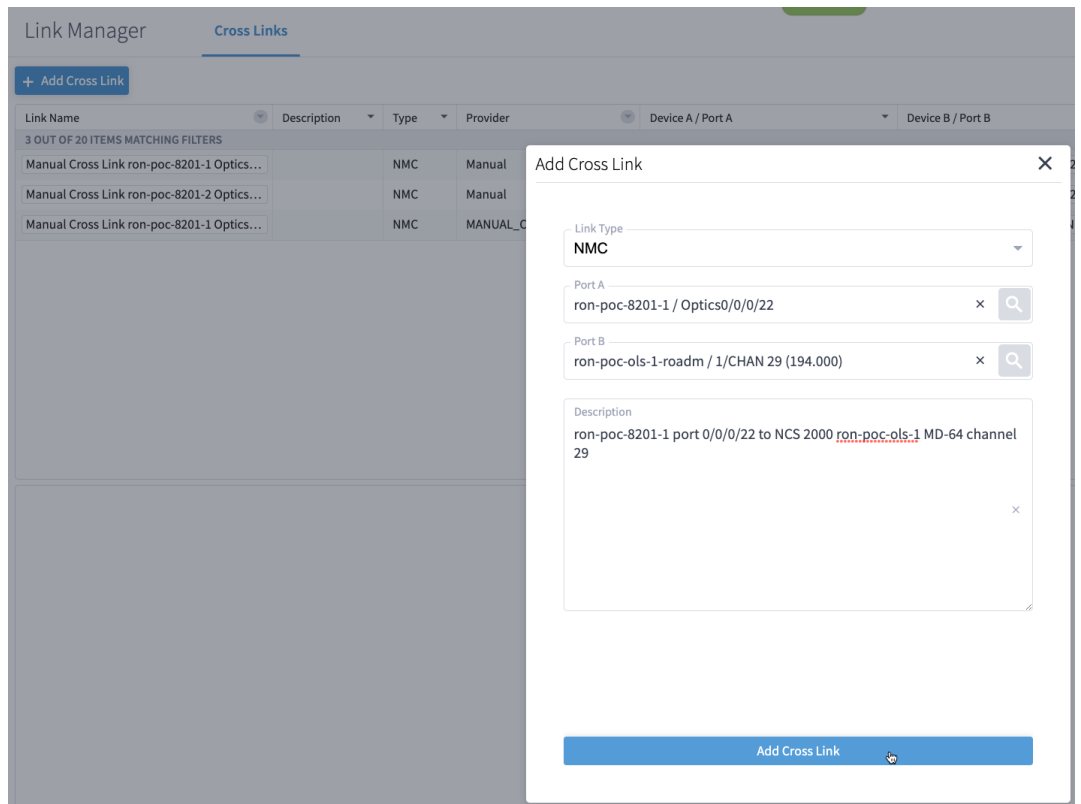

- e. The following image shows the filtered list. Our router, ron-poc-8201-1 has a single ZR+ optics port, select the port and click OK

- f. Like in the previous step, select the second port which is the optical add/drop port. Filter by device as *ron-poc-ols-1* and the Name as *194.000* to filter to the add/drop port

- g. Select the two ports (Ethernet and OCH) in your NMC Cross Link. Click **Add Cross Link**. (Optional) Add a description

- h. Click the added cross link to see its attributes.

The screenshot shows the Link Manager interface with the following data:

Link Name	Description	Type	Provider	Device A / Port A	Device B / Port B	Status	Method	Last Change
Optics0/0/0/22 / 1/CHAN 29 (194.000)	ron-poc-8201-...	NMC	Manual	ron-poc-8201-1 / Optics0/0/0/22	ron-poc-ols-1-roadm / 1/CHAN 29 (194.000)	Unknown	N/A	2023-04-24 10:23:34 EDT

2. (Optional) Cross-Link Connectivity Verification

- Cross-Link Connectivity Verification is supported on all router platforms and NCS 1010 with MD-32 and BRK-24 modules.
 - Connectivity Verification uses NSO CLI NED to modify router port state and TX power, is service affecting.
 - When validation starts, Hierarchical Controller continuously checks the RX power on the optical add/drop port. Connectivity Verification is performed in the background.
- a. Configure NMC Validation Settings. Settings are used to control validation, **Wait period to receive samples while on** must be set to 180 seconds, **Wait period to receive samples while off** must be set to 50.

- b. Select a link and click **Validate Link**. Alternatively, you can click **Validate All Manual Links** to perform connectivity verification for all links.

3. To provision the Routed Optical Networking IP link, perform these steps:

a. In the applications bar in the Crosswork Hierarchical Controller, click the **Services Manager** icon.

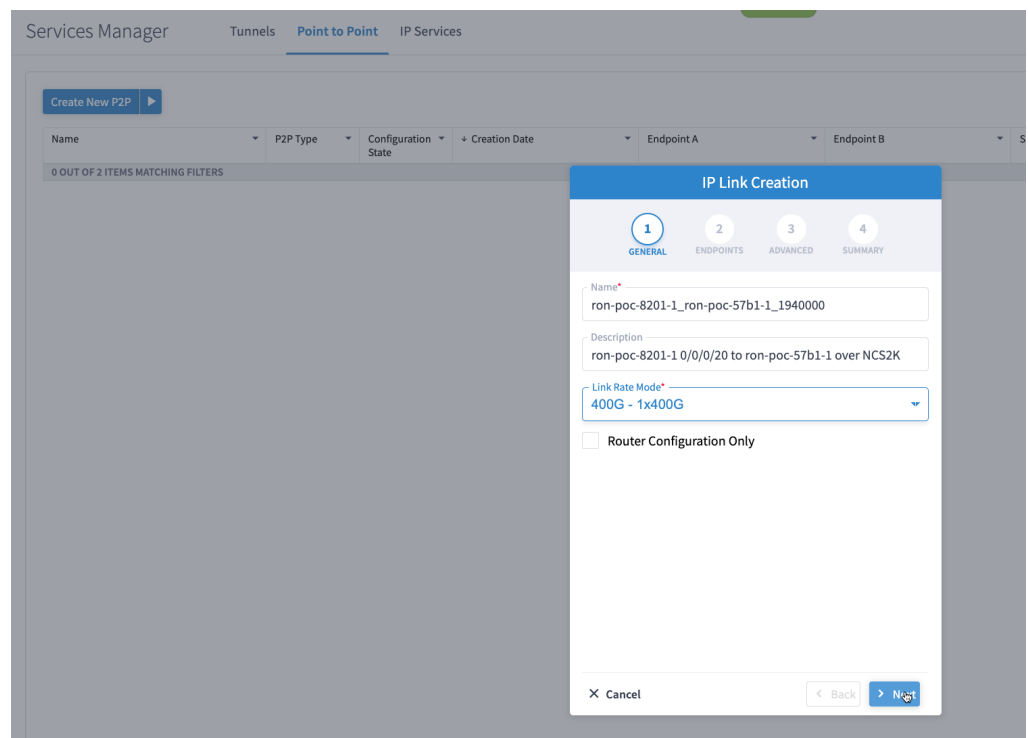

b. Select the **Point to Point** tab and click **IP Link** from the **Create New P2P** drop-down list to create end to end service between router DCO ports.

The **IP Link Creation** wizard appears.

- c. Enter the Cisco Crosswork Hierarchical Controller service name, description of the router optical controller, and the Link Rate Mode in the **General** tab.
 - Here, we are creating a 1x400G link. In 2x100G, 3x100G, and 4x100G modes, you can choose to create separate IP links or create a Bundle with each channel link added as a member.

Alternatively

- To create a 200G 16-QAM link, Select the 200G – 2x100G link rate mode.

200G 16-QAM allows the use of 200G signals on 50Ghz optical line systems. Default for 200G is QPSK at 60.1Ghz.

Router Configuration Only

✕ Cancel < Back > Next

(Optional) Check the **Router Configuration Only** check box to configure only the router optical controller and IP information and not the optical line system. This configuration is used when the OCHNC is created outside Cisco Crosswork Hierarchical Controller.

- d. Select the two router ports in the service. This is done by selecting the Site and Port. The transmit power for each endpoint is an optional parameter. The default TX power is used if no value is provided.

The screenshot shows the 'IP Link Creation' dialog box in the Services Manager. The dialog is currently on the 'ENDPOINTS' tab. It is divided into two sections: 'ENDPOINT A' and 'ENDPOINT B'. Each section contains three input fields: 'Site', 'Port A*' (with a magnifying glass icon), and 'Transmit Power [dBm]'. The 'ENDPOINT B' section also has a 'Port B*' field with a magnifying glass icon. At the bottom of the dialog, there are three buttons: 'Cancel', 'Back', and 'Next'.

- e. Click the magnifying glass icon to select the first router port.

The ports are displayed based on the following criteria:

- Is a ZR/ZR+ interface
- Has no existing optics configuration
- Has a proper NMC cross-connect configured

This page lists all available ZR/ZR+ ports currently unused on all devices. Select the *ron-poc-8201-1 Optics0/0/0/22* port.

- f. Similar to the previous step, choose *ron-poc-57b1-1 Optics 0/0/0/24* as the second router port.
- g. (Optional) Set the transmit power in dBm on each port. If OLS provisioning is being performed, the OLS controller returns the optical power. If the OLS controller does not return the optical power or **router only** provisioning is being used, the router default power is used.
- h. (Optional) Enter the IP address information for interfaces. If IP addresses are not entered, ZR/ZR+ router optical configuration happens; however, IP addresses are not configured.
- i. Click **Next** to move to **Advanced** configuration.

- p. Go to Services Manager to view provisioning progress.

Click the **Operations > Logs** tab to view the provisioning API calls used and responses. The logs show API calls and responses for both optical line system provisioning via Cisco Optical Network Controller and router provisioning via Crosswork Network Controller.

The screenshot shows the Services Manager interface with the 'Point to Point' tunnel selected. A table lists service links, with one entry in the 'IN PROGRESS' state. Below the table, the 'Operations' tab is active, showing a log entry for 'Discovery'.

Name	P2P Type	Configuration State	Creation Date	Endpoint A	Endpoint B	Speed	Operational State	Last 24h Operations	Last Operation
ron-poc-8201-1_ron-poc-57b1-1_1940000	IP Link	IN PROGRESS	24-04-2023 14:44:21 UTC	ron-poc-57b1-1 - Optics0/0/0/2...	ron-poc-8201-1 - Optics0/0/0/2...	400 GB		1	Create IP Link: Discovery

The 'Operations' tab shows a log entry for 'Discovery' with the following details:

- Normal Flow
- Adapter #1: onc-poc-90 ✓
- create service
- create service response

If the provisioning is successful, the **Configuration State** field changes to INSTALLED state and the **Operational State** field changes to UP state.

The screenshot shows the Services Manager interface with the 'Point to Point' tunnel selected. A table lists service links, with one entry in the 'INSTALLED' state and 'Up' operational state. Below the table, the 'Summary' tab is active, displaying details for the service link.

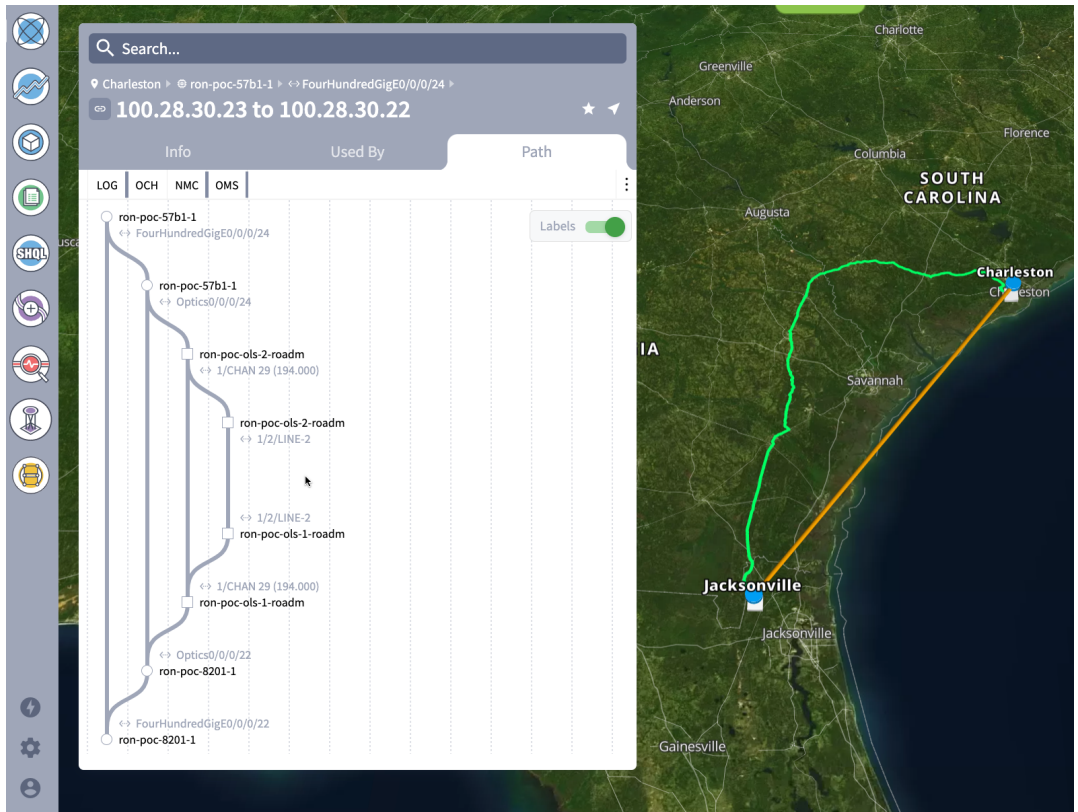

Name	P2P Type	Configuration State	Creation Date	Endpoint A	Endpoint B	Speed	Operational State	Last 24h Operations	Last Operation
ron-poc-8201-1_ron-poc-57b1-1_1940000	IP Link	INSTALLED	24-04-2023 14:44:21 UTC	ron-poc-57b1-1 - Optics0/0/0/2...	ron-poc-8201-1 - Optics0/0/0/2...	400 GB	Up	1	Create IP Link: ✓ Done

The 'Summary' tab shows the following details for the service link:

- GUID: 517d4cd5b6cc64eb7ad48a41269b2d45b
- Name: ron-poc-8201-1_ron-poc-57b1-1_1940000
- Creation Time: 24-04-2023 14:44:21 UTC
- Last Changed: 24-04-2023 14:44:21 UTC
- Template Name: default-template
- Service Links: 100.28.30.23 to 100.28.30.22
- IP Address Assignment Policy: User Allocated
- Is Bundled: No
- Channel Config: 1 x 400G
- Path Criteria: Latency

The **Summary** tab displays the new service link.

- q. Verify the end to end link across both IP and optical layers in the Explorer view.

- Use the Link Assurance application to verify the end to end path and relevant PM data. Select a link or port to see data on the ZRM, OCH, and OTS layers.

Link Assurance Inspect Links Settings

Operate Phase

To monitor the ZR/Z+ optics:

1. Use either CLI commands or EPNM to monitor router ZR/ZR+ optics for proper operation. See [Monitor ZR or ZR+ Optics Using EPNM](#), on page 59.
2. (Optional) Setup router ZR/ZR+ optics data collection in CW Health Insights. See [Monitor Performance of ZR/ZR+ Optics Using KPIs](#), on page 68.

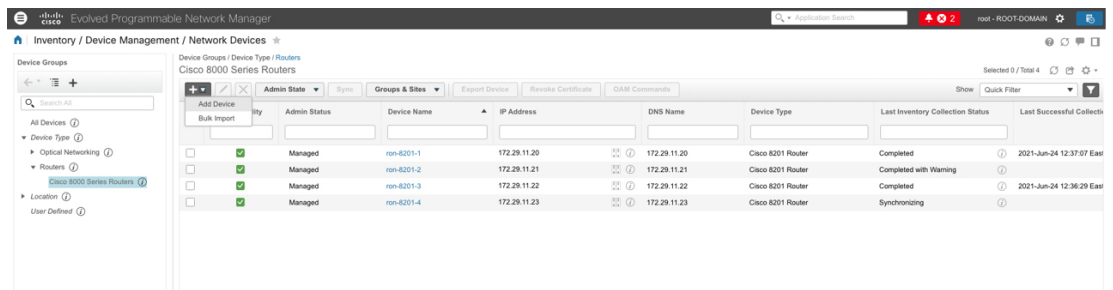

Monitor ZR or ZR+ Optics Using EPNM

This section adds the 8201 router to EPNM for monitoring the PM parameters on the ZR or ZR+ optics.

1. To add a new device to EPNM choose **Inventory > Device Management > Network Devices**. Click **Routers** or a subgroup if it is already defined in the left panel.

2. Click the **+** icon above the Network Devices table, then choose **Add Device**.

3. Configure the General, SNMP, and SSH parameters as seen in that following figures. Click **Verify Credentials** to validate that Cisco EPN Manager can reach the device. Click **Add** to add the device to EPNM.

4. To open the chassis view from the Network devices table, click the device name link. The following figure displays the chassis view of the 8201 router.

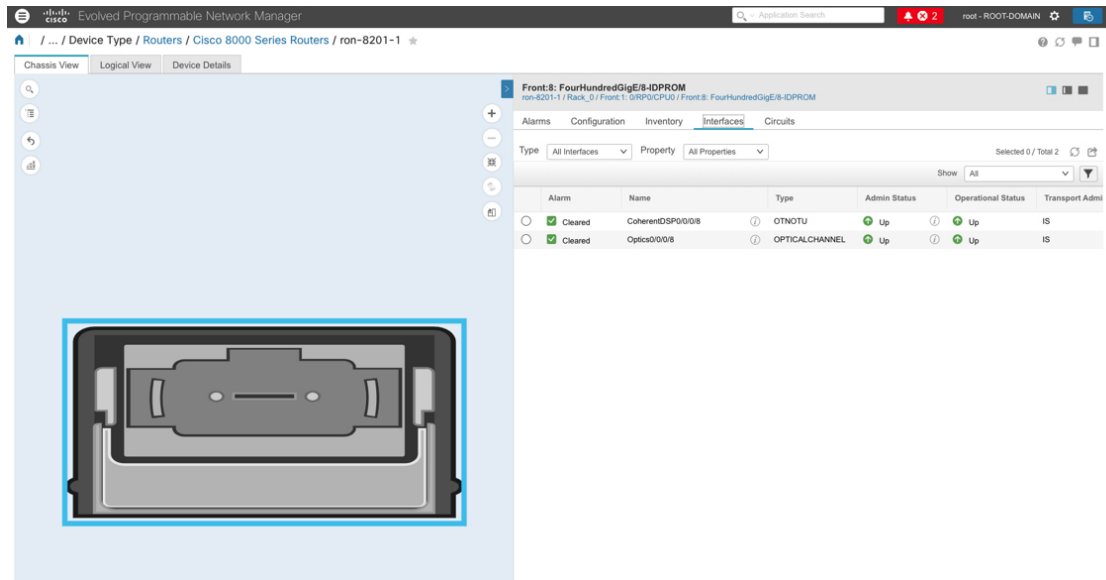

5. Click the QSFP-DD ZR+ port to see specific data about that port.

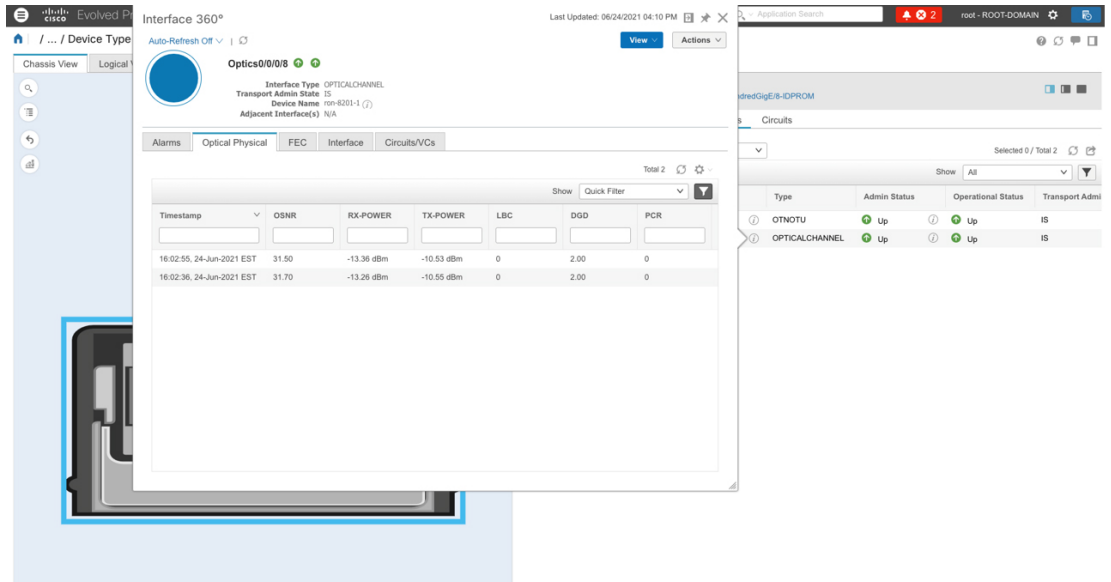

521949

Here you can view the port and specific optical channel and CoherentDSP entities.

521950

- Clicking the additional information icon for the optical channel and then the **Optical Physical** measurement tab displays the relevant optical PM values such as **RX/TX signal power** and **OSNR** values.

521951

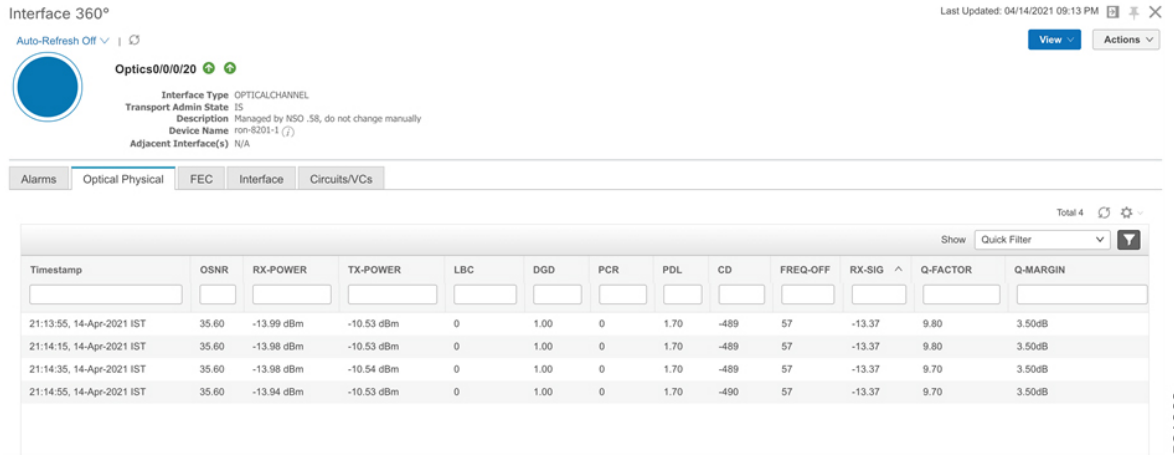

- Clicking the additional information icon for the coherent DSP and then the **FEC** measurement tab displays the relevant coherent DSP FEC statistics such as **PreFEC Bit Error Rate**, **Bit Error Rate Count (BIEC)**, and **Uncorrected Words (UCW)**. The UCW value must remain 0.

521952

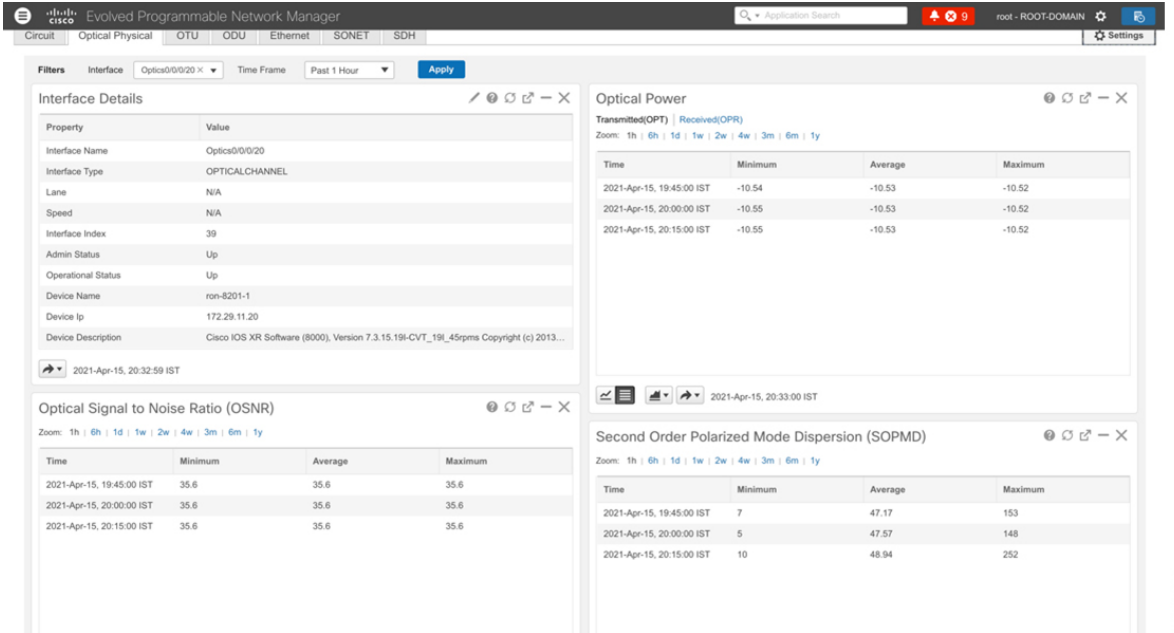

The following figures display the current and historical performance monitoring data in EPNM that is specific to the ZR or ZR+ optics.

Monitor Performance of ZR/ZR+ Optics Using KPIs

Perform the following steps to create KPI Profiles in Health Insights and enable them on the devices to monitor network health.

Note Plan which Cisco-supplied KPIs you want to begin using, based on each device's function and the device performance characteristics you want to monitor. Review the Cisco-supplied KPIs documented in [List of Health Insights KPIs](#). In the following image, you see the available default L1 optics KPIs.

KPI Name	Category	Description	Linked Playbook
<input type="checkbox"/> Layer 1 optical alarms	Layer1-Optics	Monitors per-port optical alarms	
<input type="checkbox"/> Layer 1 optical errors	Layer1-Optics	Monitors per-port Layer 1 errors; generates ale...

<input type="checkbox"/> Layer 1 optical power	Layer1-Optics	Monitors per-port optical power; generates ale...	
<input type="checkbox"/> Layer 1 optical temperature	Layer1-Optics	Monitors per-port optical temperature; generat...	
<input type="checkbox"/> Layer 1 optical voltage	Layer1-Optics	Monitors per-port optical voltage; generates al...	

521913

1. Group the relevant KPIs to form a KPI Profile. A KPI profile can have many different KPIs assigned. In this case, the focus is only on some specific optics KPIs to add to the **optics_profile** KPI profile.

Performance Alerts / KPI Profiles / Create Profile

521914

See [Create a New KPI Profile](#).

2. Enable the appropriate KPI Profiles on the devices you want to monitor. From the main menu, choose **Performance Alerts > Enable/Disable KPI Profiles**. Check the checkboxes of all the nodes to which the profile must be applied to, and click **Enable KPI Profiles**.

Multiple nodes may be selected. In the following figure, we are applying the KPI profile to a single node.

Performance Alerts / Enable/Disable KPI Profiles

521915

3. Select the optics_profile KPI profile that was created in the previous step and click next to finalize enabling the KPI for the selected device.

521916

4. The following image displays the final page before enabling the KPI profile for the router. After you click **Enable**, the appropriate configuration is applied to the router to begin streaming the telemetry sensors data for the selected optical KPIs.

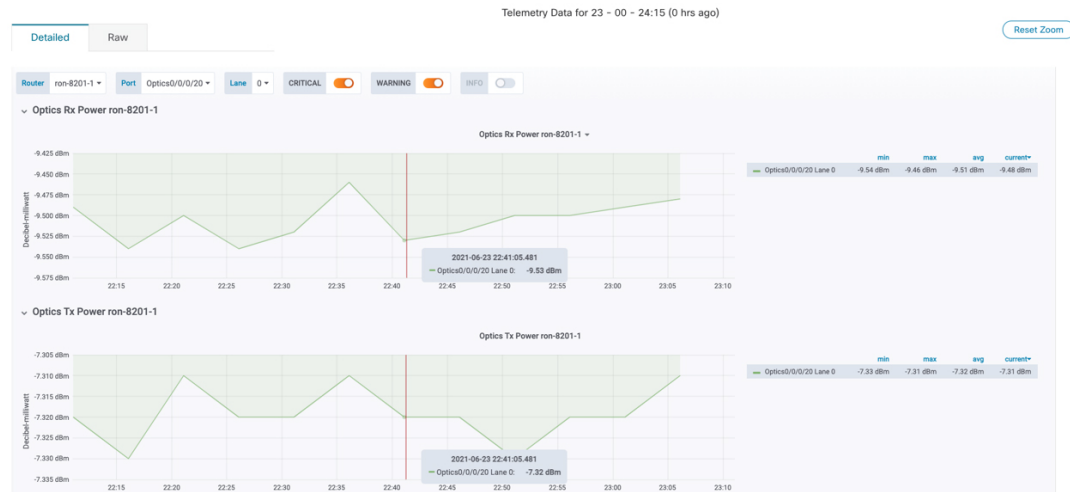

521917

See [Enable KPI Profiles on Devices](#).

5. To view alerts from network devices, see [View Alerts for Network Devices](#).

The following figure displays the RX and TX power of the QDD-400G-ZR-S transceiver.

521918

Optimization Phase

The optimization phase involves:

1. Return to planning stage.
2. Continue to add or change circuits on the network to match packet demands.
