Preface

This preface describes the objectives and organization of this document and explains how to find additional information on related products and services. This preface contains the following sections:

- Objectives, page 7
- Organization, page 7
- Related Documentation, page 8
- Obtaining Documentation, page 8
- Obtaining Technical Assistance, page 9

Objectives

This document describes how to install and configure the OC3 Packet over SONET (POS) line cards (7300-2OC3POS-MM[=], 7300-2OC3POS-SMI[=], 7300-2OC3POS-SML[=], 7300-4OC3POS-MM[=], 7300-4OC3POS-SMI[=], and 7300-4OC3POS-SML[=]), hereafter referred to as the OC3 POS line cards, which are used in the Cisco 7304 router.

Organization

This document contains the following chapters:

<table>
<thead>
<tr>
<th>Section</th>
<th>Title</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chapter 1</td>
<td>Overview</td>
<td>Describes the OC3 POS line cards and their LED displays, cables, and receptacles.</td>
</tr>
<tr>
<td>Chapter 2</td>
<td>Preparing for Installation</td>
<td>Describes safety considerations, tools required, and procedures you should perform before the actual installation.</td>
</tr>
<tr>
<td>Chapter 3</td>
<td>Removing and Installing Line Cards</td>
<td>Describes the procedures for installing and removing the OC3 POS line cards in the supported platform.</td>
</tr>
<tr>
<td>Chapter 4</td>
<td>Configuring the OC3 POS Line Card</td>
<td>Provides instructions for configuring the OC3 POS line cards on the supported platform.</td>
</tr>
</tbody>
</table>
Related Documentation

Your router and the Cisco IOS software running on it contain extensive features and functionality, which are documented in the following resources:

- **Cisco IOS software:**
  
  For configuration information and support, refer to the modular configuration and modular command reference publications in the Cisco IOS software configuration documentation set that corresponds to the software release installed on your Cisco hardware.

  **Note**
  

- **Cisco 7304 router:**
  
  - For hardware installation and maintenance information, refer to the *Cisco 7304 Router Installation and Configuration Guide*.
  
  - For international agency compliance, safety, and statutory information for WAN interfaces:
    
    - *Site Preparation and Safety Guide*
    
    - *Regulatory Compliance and Safety Information for Cisco 7304 Routers*
  
  - To view Cisco documentation or obtain general information about the documentation, refer to the following sources:
    
    - “Obtaining Documentation” section on page 8.
    
    
    - “Obtaining Technical Assistance” section on page 9.
    
    - Customer service at 800 553-6387 or 408 526-7208. Customer service hours are 5:00 a.m. to 6:00 p.m. Pacific time, Monday through Friday (excluding Cisco-observed holidays). You can also send e-mail to cs-rep@cisco.com.

  The *Cisco Information Packet* that shipped with your router.

Obtaining Documentation

The following sections explain how to obtain documentation from Cisco Systems.

World Wide Web

You can access the most current Cisco documentation on the World Wide Web at the following URL:

http://www.cisco.com

Translated documentation is available at the following URL:

Documentation CD-ROM

Cisco documentation and additional literature are available in a Cisco Documentation CD-ROM package, which is shipped with your product. The Documentation CD-ROM is updated monthly and may be more current than printed documentation. The CD-ROM package is available as a single unit or through an annual subscription.

Ordering Documentation

Cisco documentation is available in the following ways:

- Registered Cisco Direct Customers can order Cisco product documentation from the Networking Products MarketPlace:
  http://www.cisco.com/cgi-bin/order/order_root.pl
- Registered Cisco.com users can order the Documentation CD-ROM through the online Subscription Store:
  http://www.cisco.com/go/subscription
- Nonregistered Cisco.com users can order documentation through a local account representative by calling Cisco corporate headquarters (California, USA) at 408 526-7208 or, elsewhere in North America, by calling 800 553-NETS (6387).

Documentation Feedback

If you are reading Cisco product documentation on Cisco.com, you can submit technical comments electronically. Click Leave Feedback at the bottom of the Cisco Documentation home page. After you complete the form, print it out and fax it to Cisco at 408 527-0730.

You can e-mail your comments to bug-doc@cisco.com.

To submit your comments by mail, use the response card behind the front cover of your document, or write to the following address:

Cisco Systems
Attn: Document Resource Connection
170 West Tasman Drive
San Jose, CA 95134-9883

We appreciate your comments.

Obtaining Technical Assistance

Cisco provides Cisco.com as a starting point for all technical assistance. Customers and partners can obtain documentation, troubleshooting tips, and sample configurations from online tools by using the Cisco Technical Assistance Center (TAC) Web Site. Cisco.com registered users have complete access to the technical support resources on the Cisco TAC Web Site.
Cisco.com

Cisco.com is the foundation of a suite of interactive, networked services that provides immediate, open access to Cisco information, networking solutions, services, programs, and resources at any time, from anywhere in the world.

Cisco.com is a highly integrated Internet application and a powerful, easy-to-use tool that provides a broad range of features and services to help you to

- Streamline business processes and improve productivity
- Resolve technical issues with online support
- Download and test software packages
- Order Cisco learning materials and merchandise
- Register for online skill assessment, training, and certification programs

You can self-register on Cisco.com to obtain customized information and service. To access Cisco.com, go to the following URL:

http://www.cisco.com

Technical Assistance Center

The Cisco TAC is available to all customers who need technical assistance with a Cisco product, technology, or solution. Two types of support are available through the Cisco TAC: the Cisco TAC Web Site and the Cisco TAC Escalation Center.

Inquiries to Cisco TAC are categorized according to the urgency of the issue:

- Priority level 4 (P4)—You need information or assistance concerning Cisco product capabilities, product installation, or basic product configuration.
- Priority level 3 (P3)—Your network performance is degraded. Network functionality is noticeably impaired, but most business operations continue.
- Priority level 2 (P2)—Your production network is severely degraded, affecting significant aspects of business operations. No workaround is available.
- Priority level 1 (P1)—Your production network is down, and a critical impact to business operations will occur if service is not restored quickly. No workaround is available.

Which Cisco TAC resource you choose is based on the priority of the problem and the conditions of service contracts, when applicable.

Cisco TAC Web Site

The Cisco TAC Web Site allows you to resolve P3 and P4 issues yourself, saving both cost and time. The site provides around-the-clock access to online tools, knowledge bases, and software. To access the Cisco TAC Web Site, go to the following URL:

http://www.cisco.com/tac

All customers, partners, and resellers who have a valid Cisco services contract have complete access to the technical support resources on the Cisco TAC Web Site. The Cisco TAC Web Site requires a Cisco.com login ID and password. If you have a valid service contract but do not have a login ID or password, go to the following URL to register:

http://www.cisco.com/register/
If you cannot resolve your technical issues by using the Cisco TAC Web Site, and you are a Cisco.com registered user, you can open a case online by using the TAC Case Open tool at the following URL:
http://www.cisco.com/tac/caseopen
If you have Internet access, it is recommended that you open P3 and P4 cases through the Cisco TAC Web Site.

**Cisco TAC Escalation Center**

The Cisco TAC Escalation Center addresses issues that are classified as priority level 1 or priority level 2; these classifications are assigned when severe network degradation significantly impacts business operations. When you contact the TAC Escalation Center with a P1 or P2 problem, a Cisco TAC engineer will automatically open a case.

To obtain a directory of toll-free Cisco TAC telephone numbers for your country, go to the following URL:

Before calling, please check with your network operations center to determine the level of Cisco support services to which your company is entitled; for example, SMARTnet, SMARTnet Onsite, or Network Supported Accounts (NSA). In addition, please have available your service agreement number and your product serial number.
Overview

This chapter describes the OC3 POS line cards and contains the following sections:

- Line Card Overview, page 1-1
- SONET/SDH Overview, page 1-3
- Features, page 1-4
- Interface Specifications, page 1-5
- OC3 POS Line Card Optical Fiber Specifications, page 1-5
- LEDs, page 1-6
- Cables and Connectors, page 1-8
- Encapsulation Method Support, page 1-10
- Using Statistics to Estimate Link Loss and Power Budget, page 1-10
- Slot Locations on the Cisco 7304 Router, page 1-10
- Identifying Interface Addresses, page 1-11

Line Card Overview

The OC3 POS line card interface provides a direct connection between the Cisco 7304 router and external networks. You must use the appropriate optical fiber cables to connect the OC3 POS line card with an external OC-3 network. (See the “OC3 POS Line Card Optical Fiber Specifications” section on page 1-5 and the “Cables and Connectors” section on page 1-8 for more information on optical fiber cables.)

Six models of the OC3 POS line card are available:

- 7300-2OC3POS-MM—Multimode (See Figure 1-1.)
- 7300-2OC3POS-SMI—Single-mode, intermediate reach (See Figure 1-2.)
- 7300-2OC3POS-SML—Single-mode, long reach (See Figure 1-3.)
- 7300-4OC3POS-MM—Multimode (See Figure 1-4.)
- 7300-4OC3POS-SMI—Single-mode, intermediate reach (See Figure 1-5.)
- 7300-4OC3POS-SML—Single-mode, long reach (See Figure 1-6.)
Figure 1-1 7300-2OC3POS-MM—Faceplate View

Figure 1-2 7300-2OC3POS-SMI—Faceplate View

Figure 1-4 7300-4OC3POS-MM—Faceplate View
SONET/SDH Overview

The POS specification addresses the use of PPP encapsulation over SONET/Synchronous Digital Hierarchy (SDH) links. SONET is an American National Standards Institute (ANSI) standard (T1.1051988) for optical digital transmission at hierarchical rates from 51.840 Mbps (STS-1) to 2.488 Gbps (STS-48) and greater. SDH is the international standard for optical digital transmission at hierarchical rates from 155.520 Mbps (STM-1) to 2.488 Gbps (STM-16) and greater.

Because SONET/SDH is by definition a point-to-point circuit, PPP is well suited for use over these links. PPP was designed as a standard method of communicating over point-to-point links.

SONET is an octet-synchronous multiplex scheme that defines a family of standard rates and formats. The basic rate for POS is that of STS-3c/STM-1, which is 155.520 Mbps. The available information bandwidth is 149.760 Mbps, which is the STS-3c/STM-1 Synchronous Payload Envelope (SPE), the payload portion of the SONET frame into which the octet-oriented user data is mapped. (Octet boundaries are aligned with the SPE octet boundaries.) For the SPE with the OC3 POS line card, section, line, and path overhead are removed.
The International Telecommunication Union Telecommunication Standardization Sector (ITU-T) defines a series of SDH transmission rates beginning at 155.520 Mbps as follows:

<table>
<thead>
<tr>
<th>SONET</th>
<th>SDH Equivalent</th>
</tr>
</thead>
<tbody>
<tr>
<td>STS-3c²</td>
<td>STM-1²</td>
</tr>
<tr>
<td>STS-12c</td>
<td>STM-4c</td>
</tr>
<tr>
<td>STS-48c</td>
<td>STM-16c</td>
</tr>
</tbody>
</table>

1. ANSI-defined SONET specifications.
2. Currently supported by the OC3 POS line card.

Despite the name, SONET is not limited to optical links. Electrical specifications have been defined for single-mode fiber, multimode fiber, and CATV 75-ohm coaxial cable. The OC3 POS line card currently allows transmission over single-mode and multimode optical fiber only. Transmission rates are integral multiples of 51.840 Mbps, which can be used to carry T3/E3 bit-synchronous signals.

The following transmission multiples are currently specified and commonly used:
- STS-3c—155.520 Mbps (the OC3 POS line card conforms to STS-3c)
- STS-12c—622.080 Mbps
- STS-48c—2,488.320 Mbps

The following references discuss concepts and specifications of POS and PPP:
- Simpson, W., Editor, PPP in HDLC Framing, RFC 1662, Daydreamer, July 1994.
- Simpson, W., Editor, PPP Over SONET/SDH, RFC 1619, Daydreamer, May 1995.

Features

The OC3 POS line card has the following features:
- Standards-compliant SONET/SDH interface; SONET/STS-3c and SDH/STM-1 framing and signaling overhead
- Full-duplex operation at 155 Mbps (half-duplex operation is not supported)
- Intermediate-reach (7300-2OC3POS-SMI and 7300-4OC3POS-SMI) and long-reach (7300-2OC3POS-SML and 7300-4OC3POS-SML) optical interface with single-mode optical fiber
- Short-reach optical interface (7300-4OC3POS-MM) with multimode optical fiber
- Support for SPE scrambling
- Automatic protection switching (APS)
Chapter 1      Overview

Interface Specifications

For information on the single-mode and multimode cables to use with the OC3 POS line card, see the “OC3 POS Line Card Optical Fiber Specifications” section on page 1-5, and the “Cables and Connectors” section on page 1-8.

- Online insertion and removal (OIR) in the Cisco 7304 router, allowing you to remove, add, or replace an OC3 POS line card online
- Support for 16-bit and 32-bit cyclic redundancy checking (CRC-16 and CRC-32)

The physical layer interface for the OC3 POS line card is Optical Carrier-3 (OC-3c, the specification for SONET STS-3c and SDH STM-1 transmission rates), and the OC3 POS line card is designed to comply with Packet-over-SONET specifications. The OC3 POS line card provides a single 155.520-Mbps Packet OC-3 network interface for all supported platforms.

Each OC3 POS line card has four MT-RJ small form factor type fiber receptacles to allow connection to single-mode or multimode optical fiber. (For more information on the optical fiber cables you should use with this line card, see the “OC3 POS Line Card Optical Fiber Specifications” section on page 1-5 and the “Cables and Connectors” section on page 1-8.)

Packet data is transported using Point-to-Point Protocol (PPP) and is mapped into the STS-3c/STM-1 frame. The encapsulations used add approximately half the number of bytes of transport overhead as that involved with ATM using ATM Adaptation Layer 5 (AAL5) and line card control (LCC) Subnetwork Access Protocol (SNAP) encapsulations.

The OC3 POS line card interface is compliant with RFC 1619, PPP over SONET/SDH, and RFC 1662, PPP in HDLC-like Framing. The OC3 POS line card supports RFC 1619 PPP-over-SONET/SDH encapsulation, and provides support for SNMP agent v1 (RFC 1155-1157), and Management Information Base (MIB) II (RFC 1213).

OC3 POS Line Card Optical Fiber Specifications

The OC3 POS line card specification for optical fiber transmission defines two types of fiber: single-mode and multimode. Within the single-mode category, two types of transmission are defined: intermediate reach and long reach. Within the multimode category, only short reach is available.

Modes can be thought of as bundles of light rays entering the fiber at a particular angle. Single-mode fiber allows only one mode of light to propagate through the fiber, and multimode fiber allows multiple modes of light to propagate through the fiber.

Multiple modes of light propagating through the fiber travel different distances depending on the entry angles, which causes them to arrive at the destination at different times (a phenomenon called modal dispersion); therefore, single-mode fiber is capable of higher bandwidth and greater cable run distances than multimode fiber. Table 1-1 lists nominal OC-3 optical parameters for single-mode and multimode optical fiber transmission.

Note  If the distance between two connected stations is greater than the maximum distances listed, significant signal loss can result, making transmission unreliable.
Table 1-1 lists the OC-3 optical parameters.

### Table 1-1  OC-3 Optical Parameters

<table>
<thead>
<tr>
<th>Transceiver Type(^1)</th>
<th>Transmit Power</th>
<th>Maximum Power to Receiver(^2)</th>
<th>Receiver Sensitivity</th>
<th>Loss Budgets</th>
<th>Nominal Distance Between Stations</th>

<td>0 to 7 dB</td>
<td>Up to 1.2 mi. (2 km)</td>
</tr>
</tbody>
</table>

1. This table gives nominal OC-3 optical parameters.
2. This value represents the maximum power to which any receiver can be exposed.
4. Nominal wavelength is 1310 nm.
5. Complies with Bellcore GR-253-CORE Intermediate Reach Specification (IR-1).

To calculate link losses and dispersion losses for your application, refer to the following specifications and documents:

- EIA/TIA-IVa Dispersion Unshifted Single-Mode Fiber
- EIA/TIA-IVb Dispersion Shifted Single-Mode Fiber
- GR-20-CORE Generic Requirements for Optical Fiber and Fiber-Optic Cable
- ITU-T Recommendation G.957 Optical Interfaces for Equipments and Systems Relating to the Synchronous Digital Hierarchy

### LEDs

The OC3 POS line card faceplate has two LEDs that indicate line card status and two LEDs per port that indicate port status. (See Figure 1-7.)

#### Figure 1-7  LEDs on the OC3 POS Line Card
After system initialization, the STATUS LED goes on to indicate that power is received and that the OC3 POS line card is enabled for operation.

The following conditions must all be met before the OC3 POS line card is enabled:

- The OC3 POS line card is correctly connected and receiving power.
- The system recognizes the OC3 POS line card.
- A valid version of microcode is loaded and running.

If any one of these conditions is not met, or if the initialization fails, the STATUS LED does not go on. Table 1-2 lists LED colors and indications.

### Table 1-2 OC3 POS Line Card LEDs

Cables and Connectors

Use single-mode (for intermediate- or long-reach configurations) or multimode optical fiber cable to connect your router to a network or to connect two OC3 POS line card-equipped routers back to back. The OC3 POS line card has one MT-RJ receptacle for each port (see Figure 1-9). For SONET/SDH single-mode and multimode optical fiber connections, use one MT-RJ-type cable (see Figure 1-8).

Note

For maximum cable lengths between stations, see Table 1-1 on page 1-6. Single-mode and multimode optical fiber cables for the OC3 POS line card are not available from Cisco Systems; they are available from commercial cable vendors.
For important laser and LED safety information, see the “Laser and LED Safety” section on page 2-5.

Attach one MT-RJ fiber cable between the line card and the device to which the line card is connected.

**Warning**

Invisible laser radiation can be emitted from the aperture of the port when no cable is connected. Avoid exposure to laser radiation and do not stare into open apertures.

**Warning**

Class 1 laser product (single-mode).

**Warning**

Class 1 LED product.
Encapsulation Method Support

The following encapsulation methods are supported by the OC3 POS line card:

- RFC 1619 Point-to-Point Protocol over SONET/SDH
  
  We recommend that you refer to the Internet Draft *Enabling Transparency for the PPP over SONET/SDH Mapping*, which is recognized by the Internet Engineering Task Force (IETF) and Internet Engineering Steering Group (IESG) as an approved addendum to RFC 1619.

- High-Level Data Link Control (HDLC)
- Frame Relay
- PPP

Using Statistics to Estimate Link Loss and Power Budget

Statistical models more accurately determine the power budget than standard worst-case methods. Determining the link loss with statistical methods requires accurate knowledge of variations in the data link components. Statistical power budget analysis is beyond the scope of this document. For further information, refer to ITU-T standards and your equipment specifications.

The following publications contain information on determining attenuation and power budget:

Slot Locations on the Cisco 7304 Router

The following section describes the slot locations on the Cisco 7304 router. This section includes the following subsection:

- Cisco 7304 Router Slot Numbering, page 1-10

Cisco 7304 Router Slot Numbering

The OC3 POS line card can be installed in slots 2 through 5 in the Cisco 7304 router. Figure 1-10 shows a Cisco 7304 with OC3 POS line cards installed in slot 3, and slot 4.
Identifying Interface Addresses

This section describes how to identify the interface address for the OC3 POS line card in a Cisco 7304 router. Interface addresses specify the actual physical location of each interface on a router.

The interfaces on the OC3 POS line card installed in a Cisco 7304 router maintain the same interface address regardless of whether other line cards are installed or removed. However, when you move a line card to a different slot, the first number in the interface address changes to reflect the new slot number. 

Table 1-4 explains how to identify interface addresses.

Table 1-4 Identifying Interface Addresses

<table>
<thead>
<tr>
<th>Platform</th>
<th>Interface Address Format</th>
<th>Numbers</th>
<th>Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco 7304 router</td>
<td>Slot-number/interface-port-number</td>
<td>Slot—0 through 5 (^1)</td>
<td>1/0</td>
</tr>
</tbody>
</table>

1. Slot 0 and slot 1 are reserved for the network services engine (NSE) only.

Cisco 7304 Router Interface Addresses

This section describes how to identify the interface addresses used for the OC3 POS line card in a Cisco 7304 router. The interface address is composed of a two-part number in the format slot-number/interface-port-number. See Table 1-4 for the interface address format.
In a Cisco 7304 router, slots are numbered, beginning with slot 0 (a dual-width slot reserved for the NSE-100) on the bottom, and continuing from the lower left to the upper right through slot 5.

**Note**

Slot 0 and slot 1 are for the network services engine (NSE) only.

The interface address of the first interface on an OC3 POS line card in slot 2 is 2/0 (slot 2 and interface 0). If the OC3 POS line card was in slot 4, this same interface would be numbered 4/0 (slot 4 and interface 0).
Preparing for Installation

This chapter provides the general equipment, safety, and site preparation requirements for installing the OC3 POS line card. This chapter contains the following sections:

- Required Tools and Equipment, page 2-1
- Software and Hardware Requirements, page 2-2
- Checking Hardware and Software Compatibility, page 2-2
- Safety Guidelines, page 2-2
- FCC Class A Compliance, page 2-6

Required Tools and Equipment

You need the following tools and parts to install a line card. If you need additional equipment, contact a service representative for ordering information.

- OC3 POS line card (For information about the specific OC3 POS line card models, see the “Line Card Overview” section on page 1-1.)
- MT-RJ optical fiber cables to connect the interfaces with the network (Optical fiber cables for the OC3 POS line cards are not available from Cisco Systems but are available from commercial cable vendors. For information about optical fiber cables, see the “OC3 POS Line Card Optical Fiber Specifications” section on page 1-5 and the “Cables and Connectors” section on page 1-8.)
- Number 1 Phillips screwdriver
- Your own electrostatic discharge (ESD)-prevention equipment or the disposable grounding wrist strap included with all upgrade kits, field-replaceable units (FRUs), and spares
- Antistatic mat and antistatic container
Software and Hardware Requirements

The table below lists the minimum Cisco IOS software release required to use the OC3 POS line card in the Cisco 7304 router.

<table>
<thead>
<tr>
<th>Platform</th>
<th>Recommended Minimum Cisco IOS Release</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco 7304 Router1</td>
<td>Cisco IOS Release 12.1(10)EX or a later release of Cisco IOS Release 12.1 EX</td>
</tr>
</tbody>
</table>

1. The OC3 POS line card requires a Network Services Engine 100 (NSE-100) to operate.

For all systems in which you install the OC3 POS line card, use the `show version` command to display the current configuration of the router, including the system software version that is currently loaded and running. Use the `show diag slot` command to view specific information about the hardware installed in your system.

Checking Hardware and Software Compatibility

To check the minimum software requirements of Cisco IOS software with the hardware installed on your router, Cisco maintains the Software Advisor tool on Cisco.com. This tool does not verify whether modules within a system are compatible, but it does provide the minimum IOS requirements for individual hardware modules or components.

**Note**

Access to this tool is limited to users with Cisco.com login accounts.

To access Software Advisor, click **Login** at Cisco.com and go to **Technical Support Help—Cisco TAC: Tool Index: Software Advisor**. You can also access the tool by pointing your browser directly to http://www.cisco.com/cgi-bin/Support/CompNav/Index.pl

Choose a product family or enter a specific product number to search for the minimum supported software release needed for your hardware.

Safety Guidelines

This section provides safety guidelines that you should follow when working with any equipment that connects to electrical power or telephone wiring.

Safety Warnings

Safety warnings appear throughout this publication in procedures that, if performed incorrectly, might harm you. A warning symbol precedes each warning.
Warning

This warning symbol means danger. You are in a situation that could cause bodily injury. Before you work on any equipment, be aware of the hazards involved with electrical circuitry and be familiar with standard practices for preventing accidents. To see translations of the warnings that appear in this publication, refer to the Regulatory Compliance and Safety Information document that accompanied this device.

Waarschuwing

Dit waarschuwingssymbool betekent gevaar. U verkeert in een situatie die lichamelijk letsel kan veroorzaken. Voordat u aan enige apparatuur gaat werken, dient u zich bewust te zijn van de bij elektrische schakelingen betrokken risico's en dient u op de hoogte te zijn van standaard maatregelen om ongelukken te voorkomen. Voor vertalingen van de waarschuwingen die in deze publicatie verschijnen, kunt u het document Regulatory Compliance and Safety Information (Informatie over naleving van veiligheids- en andere voorschriften) raadplegen dat bij dit toestel is ingesloten.

Varoitus

Attention

Ce symbole d’avertissement indique un danger. Vous vous trouvez dans une situation pouvant causer des blessures ou des dommages corporels. Avant de travailler sur un équipement, soyez conscient des dangers posés par les circuits électriques et familiarisez-vous avec les procédures couramment utilisées pour éviter les accidents. Pour prendre connaissance des traductions d’avertissements figurant dans cette publication, consultez le document Regulatory Compliance and Safety Information (Conformité aux règlements et consignes de sécurité) qui accompagne cet appareil.

Warnung

Avvertenza

Questo simbolo di avvertenza indica un pericolo. La situazione potrebbe causare infortuni alle persone. Prima di lavorare su qualsiasi apparecchiatura, occorre conoscere i pericoli relativi ai circuiti elettrici ed essere al corrente delle pratiche standard per la prevenzione di incidenti. La traduzione delle avvertenze riportate in questa pubblicazione si trova nel documento Regulatory Compliance and Safety Information (Conformità alle norme e informazioni sulla sicurezza) che accompagna questo dispositivo.

Advarsel

Dette varselsymbol betyr fare. Du befinner deg i en situasjon som kan føre til personskade. Før du utøver arbeid på utstyr, må du vare oppmerksom på de faremomentene som elektriske kretser innebærer, samt gjøre deg kjent med vanlig praksis når det gjelder å unngå ulykker. Hvis du vil se oversettelser av de advarslene som finnes i denne publikasjonen, kan du se i dokumentet Regulatory Compliance and Safety Information (Overholdelse av forskrifter og sikkerhetsinformasjon) som ble levert med denne enheten.
Safety Guidelines

Follow these basic guidelines when working with any electrical equipment:

- Before beginning any procedures requiring access to the chassis interior, locate the emergency power-off switch for the room in which you are working.
- Disconnect all power and external cables before moving a chassis.
- Do not work alone if potentially hazardous conditions exist.
- Never assume that power has been disconnected from a circuit; always check.
- Do not perform any action that creates a potential hazard to people or makes the equipment unsafe. Carefully examine your work area for possible hazards such as moist floors, ungrounded power extension cables, and missing safety grounds.

Telephone Wiring Guidelines

Use the following guidelines when working with any equipment that is connected to telephone wiring or to other network cabling:

- Never install telephone wiring during a lightning storm.
- Never install telephone jacks in wet locations unless the jack is specifically designed for wet locations.
- Never touch uninsulated telephone wires or terminals unless the telephone line has been disconnected at the network interface.
- Use caution when installing or modifying telephone lines.
Preventing Electrostatic Discharge Damage

Electrostatic discharge (ESD) damage, which can occur when electronic cards or components are improperly handled, results in complete or intermittent failures. Line cards and processor modules consist of printed circuit boards that are fixed in metal carriers. Electromagnetic interference (EMI) shielding and connectors are integral components of the carrier. Although the metal carrier helps to protect the board from ESD, use a preventive antistatic strap during handling.

Following are guidelines for preventing ESD damage:

- Always use an ESD wrist or ankle strap and ensure that it makes good skin contact.
- Connect the equipment end of the strap to an unfinished chassis surface.
- When installing a component, use line card levers and locking thumbscrews to properly seat the bus connectors in the backplane. These devices prevent accidental removal, provide proper grounding for the system, and help to ensure that bus connectors are properly seated.
- When removing a component, use line card levers and locking thumbscrews to release the bus connectors from the backplane.
- Handle carriers by available handles or edges only; avoid touching the printed circuit boards or connectors.
- Place a removed component board-side-up on an antistatic surface or in a static shielding container. If you plan to return the component to the factory, immediately place it in a static shielding container.
- Avoid contact between the printed circuit boards and clothing. The wrist strap only protects components from ESD voltages on the body; ESD voltages on clothing can still cause damage.
- Never attempt to remove the printed circuit board from the metal carrier.

Caution

For safety, periodically check the resistance value of the antistatic strap. The measurement should be between 1 and 10 megohms (Mohms).

Laser and LED Safety

The single-mode aperture port contains a Class 1 laser warning label, as shown in Figure 2-1.

Figure 2-1  Class 1 Laser Warning Label on OC3 POS Line Card SMI and SML

Warning

Because invisible laser radiation may be emitted from the aperture of the port when no fiber cable is connected, avoid exposure to laser radiation and do not stare into open apertures.

Warning

Class 1 laser product.

The multimode aperture port contains a Class 1 LED warning label, as shown in Figure 2-2.
Warning

Because invisible radiation may be emitted from the aperture of the port when no fiber cable is connected, avoid exposure to radiation and do not stare into open apertures.

Warning

Class 1 LED product.

FCC Class A Compliance

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio-frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference, in which case users will be required to correct the interference at their own expense.

You can determine whether your equipment is causing interference by turning it off. If the interference stops, it was probably caused by the Cisco equipment or one of its peripheral devices. If the equipment causes interference to radio or television reception, try to correct the interference by using one or more of the following measures:

• Turn the television or radio antenna until the interference stops.
• Move the equipment to one side or the other of the television or radio.
• Move the equipment farther away from the television or radio.
• Plug the equipment into an outlet that is on a different circuit from the television or radio. (That is, make certain the equipment and the television or radio are on circuits controlled by different circuit breakers or fuses.)

Note

The OC3 POS line card has been designed to meet these requirements. Modifications to this product that are not authorized by Cisco Systems, Inc., could void the various approvals and negate your authority to operate the product.
Removing and Installing Line Cards

This chapter describes how to remove the OC3 POS line card from its supported platform, how to install a new or replacement line card, and how to connect cables.

This chapter contains the following sections:

- Installation Overview, page 3-1
- Handling Line Cards, page 3-1
- Online Insertion and Removal, page 3-2
- Warnings and Cautions, page 3-2
- Line Card Removal and Installation, page 3-3
- Connecting OC3 POS Line Card Interface Cables, page 3-5

Installation Overview

Each line card circuit board is mounted to a metal carrier and is sensitive to electrostatic discharge (ESD) damage.

Note

When a slot is not in use, a blank line card must fill the empty slot to allow the router to conform to electromagnetic interference (EMI) emissions requirements and to allow proper airflow across the line cards. If you plan to install a new line card in a slot that is not in use, you must first remove the blank line card.

Handling Line Cards

Caution

Always handle the line card by the carrier edges and handle; never touch the line card components or connector pins. (See Figure 3-1.)
Online Insertion and Removal

The Cisco 7304 router supports online insertion and removal (OIR) of line cards; therefore, you do not have to power down the router when removing and replacing an OC3 POS line card on a Cisco 7304 router. The Cisco 7304 router also supports CLI-controlled OIR (see the “CLI-Controlled OIR” section on page 4-13), which allows for the completion of data traffic before the active interfaces are shut down.

**Note**
As you disengage the line card from the router, online insertion and removal (OIR) administratively shuts down all active interfaces in the line card.

**Note**
Before you begin installation, read Chapter 2, “Preparing for Installation,” for a list of parts and tools required for installation.

**Warnings and Cautions**

Observe the following warnings and cautions when installing or removing line cards.

**Caution**
Do not slide a line card all the way into the slot until you have connected all required cables. Trying to do so disrupts normal operation of the router.

**Note**
If a line card lever or other retaining mechanism does not move to the locked position, the line card is not completely seated in the backplane. Carefully pull the line card halfway out of the slot, reinser it, and move the line card lever to the locked position.

**Caution**
To prevent jamming the carrier between the upper and the lower edges of the slot, and to ensure that the edge connector at the rear of the line card mates with the connection at the rear of the slot, make certain that the carrier is positioned correctly, as shown in the cutaway in the following illustration. If the line card does not slide freely into the backplane, loosen the locking thumbscrews on the neighboring line cards.
Warning

When performing the following procedures, wear a grounding wrist strap to avoid ESD damage to the card. Some platforms have an ESD connector for attaching the wrist strap. Do not directly touch the midplane or backplane with your hand or any metal tool, or you could shock yourself.

Line Card Removal and Installation

In this section, the illustration that follows give step-by-step instructions on how to remove and install line cards in the following supported platform:

Cisco 7304 Router—Removing and Installing a Line Card, page 3-4
Cisco 7304 Router—Removing and Installing a Line Card

1. To remove the line card, loosen the locking thumbscrews on both sides of the line card.

2. Pull out the line card levers and carefully slide the line card halfway out of the slot. If you are removing a blank line card, pull the blank line card completely out of the chassis slot.

3. With the line card halfway out of the slot, disconnect all cables from the line card. After disconnecting the cables, pull the line card out of the chassis slot.

4. To insert the line card, carefully align the edges of the carrier or printed circuit board between the upper and the lower edges of the chassis slot.

5. Carefully slide the new line card halfway into the line card slot and connect all required cables.

6. With the cables connected, carefully slide the line card into the slot until the line card makes contact with the backplane.

   **NOTE**: The line card levers must be positioned at a 45-degree angle before the line card makes contact with the backplane.

7. Push the line card levers in until the line card is fully seated in the router backplane.

   **NOTE**: When the chassis is fully populated, seating a new line card may be difficult. In order to properly seat the line card and avoid physical damage, loosen the thumbscrews on the neighboring line cards.

   **CAUTION**: Use of excessive force to seat the line card may damage the router or line card.

8. Tighten the locking thumbscrews on both sides of the line card.
Connecting OC3 POS Line Card Interface Cables

To continue your OC3 POS line card installation, you must connect the interface cables.

Note

Optical fiber cables are not available from Cisco Systems; they are available from outside commercial cable vendors. (For more information on the cables you should use with this line card, see the “OC3 POS Line Card Optical Fiber Specifications” section on page 1-5 and the “Cables and Connectors” section on page 1-8.)

When you are connecting MT-RJ cables to the OC3 POS line card, make sure you firmly press the connector plug into the socket. The upper edge of the plug must snap into the upper front edge of the socket. You may or may not hear an audible click. Gently pull on the plug to confirm whether or not the plug is locked into the socket. To disconnect the plug from the socket, press down on the raised portion on top of the plug (releasing the latch). You should hear an audible click indicating the latch has released. Carefully pull the plug out of the socket.

When you disconnect the optical fiber cable from the line card, grip the body of the connector. Do not grip the connector jacket-sleeve. Gripping the sleeve can, over time, compromise the integrity of the optical fiber cable termination in the MT-RJ connector.

Always make sure that you insert the connector completely into the socket. This is especially important when you are making a connection between the OC3 POS line card and a long distance network (1.24 miles or 2 km) or a suspected highly attenuated network. If the CARRIER/ALARM LED does not light, try removing the network cable plug and reinserting it firmly into the module socket. It is possible that enough dirt or skin oils have accumulated on the plug faceplate (around the optical fiber openings) to generate significant attenuation, reducing the optical power levels below threshold levels so that a link cannot be made.

To clean the MT-RJ plug faceplate, perform these steps:

Step 1 Use a lint-free tissue soaked in 99 percent pure isopropyl alcohol to gently wipe the faceplate.
Step 2 Carefully wipe the faceplate with a dry lint-free tissue.
Step 3 Remove any residual dust from the faceplate with compressed air before installing the cable.

Note Make sure that dust caps are installed on all unused module connectors and unused network optical fiber cable connectors.

Warning Because invisible radiation may be emitted from the aperture of the port when no fiber cable is connected, avoid exposure to radiation and do not stare into open apertures.

Warning Class 1 LED product.
Warning: Because invisible laser radiation may be emitted from the aperture of the port when no fiber cable is connected, avoid exposure to laser radiation and do not stare into open apertures.

Warning: Class 1 laser product.
Configuring the OC3 POS Line Card

To continue your OC3 POS line card installation, you must configure the OC-3 interfaces. This chapter contains the following sections:

- Using the EXEC Command Interpreter, page 4-1
- Configuring the Interfaces, page 4-2
- Checking the Configuration, page 4-6
- OC3 POS Statistics Counters, page 4-13
- OC3 POS Line Card Error Messages, page 4-13
- CLI-Controlled OIR, page 4-13

Using the EXEC Command Interpreter

You modify the configuration of your router through the software command interpreter called the EXEC (also called enable mode). You must enter the privileged level of the EXEC command interpreter with the enable command before you can use the configure command to configure a new interface or change the existing configuration of an interface. The system prompts you for a password if one has been set.

The system prompt for the privileged level ends with a pound sign (#) instead of an angle bracket (>). At the console terminal, use the following procedure to enter the privileged level:

**Step 1**
At the user-level EXEC prompt, enter the enable command. The EXEC prompts you for a privileged-level password as follows:

```
Router> enable
Password:
```

**Step 2**
Enter the password (the password is case sensitive). For security purposes, the password is not displayed. When you enter the correct password, the system displays the privileged-level system prompt (#):

```
Router#
```

To configure the new interfaces, proceed to the “Configuring the Interfaces” section on page 4-2.
Configuring the Interfaces

After you verify that the new OC3 POS line card is installed correctly (the STATUS LED goes on), use the privileged-level `configure` command to configure the new interface. Have the following information available:

- IP address, if you plan to configure the interface for IP routing
- MTU size
- Framing mode
- Transmit clock source
- Loopback modes (if testing is required)

If you installed a new OC3 POS line card or if you want to change the configuration of an existing interface, you must enter configuration mode to configure the new interfaces. If you replaced an OC3 POS line card that was previously configured, the system recognizes the new interfaces and brings each of them up in their existing configuration.

For a summary of the configuration options available and instructions for configuring the interface on an OC3 POS line card, refer to the appropriate configuration publications listed in the “Related Documentation” section on page 8.

You execute configuration commands from the privileged level of the EXEC command interpreter, which usually requires password access. Contact your system administrator, if necessary, to obtain password access. (See the “Using the EXEC Command Interpreter” section on page 4-1 for an explanation of the privileged level of the EXEC.)

On power up, the OC-3 POS interface on a new OC3 POS line card is shut down. To enable the interface, you must enter the `no shutdown` command in configuration mode.

When the OC-3 POS interface is enabled (taken out of shutdown) with no additional arguments, the interface configuration file parameters use the default values. (See Table 4-1 for parameters and default values.)

<table>
<thead>
<tr>

Performing a Basic Configuration

This section describes the procedures for performing a basic configuration: enabling an interface (with the `no shutdown` command) and specifying IP routing. You might also need to enter other configuration subcommands, depending on the requirements for your system configuration and the protocols you plan to route on the interface.

In the following procedure, press the **Return** key after each step unless otherwise noted. At any time you can exit the privileged level and return to the user level by entering `disable` at the prompt as follows:

```
Router# disable
Router>
```

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Enter configuration mode and specify that the console terminal will be the source of the configuration subcommands as follows:</td>
</tr>
<tr>
<td></td>
<td><code>Router# configure terminal</code></td>
</tr>
<tr>
<td></td>
<td><code>Enter configuration commands, one per line. End with CNTL/Z.</code></td>
</tr>
<tr>
<td></td>
<td><code>Router(config)#</code></td>
</tr>
<tr>
<td>Step 2</td>
<td>Specify the new interface to configure by entering the <code>interface pos</code> subcommand, followed by the interface address of the interface you plan to configure. Table 4-2 gives examples.</td>
</tr>
</tbody>
</table>

**Table 4-2 Examples of the interface pos Subcommand**

<table>
<thead>
<tr>
<th>Platform</th>
<th>Command</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco 7304 router</td>
<td><code>interface pos</code>, followed by <code>slot/interface</code> (slot-number/ interface-port-number)</td>
<td>The example is for the first OC-3 POS interface of an OC3 POS line card in slot 5.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><code>Router(config)# interface pos 5/0</code></td>
</tr>
<tr>
<td></td>
<td></td>
<td><code>Router(config-if)#</code></td>
</tr>
</tbody>
</table>

| Step 3 | Assign an IP address and subnet mask to the interface (if IP routing is enabled on the system) with the `ip address` configuration subcommand, as in the following example: |
|        | `Router(config-if)# ip address 10.0.0.10 255.255.255.0` |

| Step 4 | Change the shutdown state to up and enable the interface as follows: |
|        | `Router(config-if)# no shutdown` |
|        | The `no shutdown` command passes an `enable` command to the interface and causes the OC3 POS line card to configure itself based on the previous configuration commands sent. |

| Step 5 | Add any additional configuration subcommands required to enable routing protocols and adjust the interface characteristics. |

| Step 6 | After including all of the configuration subcommands to complete your configuration, press `Ctrl-Z`—hold down the **Control** key while you press **Z**—or enter `end` or `exit` to exit configuration mode and return to the EXEC command interpreter prompt. |

| Step 7 | Write the new configuration to NVRAM as follows: |
|        | `Router# copy running-config startup-config` |
|        | `[OK]` |
|        | `Router#` |
Customizing the Configuration

You can change the default values of all configuration parameters to match your network environment. Use the interface subcommands in the following sections if you need to customize the OC3 POS line card configuration:

- Setting the MTU Size, page 4-4
- Configuring Framing, page 4-4
- Setting the Source of the Transmit Clock, page 4-4
- Configuring Cyclic Redundancy Checks, page 4-5
- Configuring SONET Payload Scrambling, page 4-5
- Configuring SONET Delay Triggers, page 4-5

Note: The interface subcommands that follow function the same regardless of the platform in which your OC3 POS line card is installed; however, all of these commands require that you first enter the `interface pos` subcommand to select the interface that you want to configure.

In all of the configuration examples that follow, the interface address argument for the `interface pos` subcommand is 3/0 (slot 3, interface 0) for a Cisco 7304 router.

For the appropriate `interface pos` subcommand syntax to use for your particular platform, see Table 4-2.

Setting the MTU Size

The default maximum transmission unit (MTU) size is 4470 bytes. To set the MTU size, enter the `mtu bytes` command, where `bytes` is a value in the range of 64 through 9216.

```
Router(config)# interface pos 3/0
Router(config-if)# mtu 3000
```

To restore the default of 4470 bytes, enter the `no mtu` command.

Configuring Framing

The default framing setting is SONET. To configure for SDH, enter the `pos framing sdh` command:

```
Router(config)# interface pos 3/0
Router(config-if)# pos framing sdh
```

To change back to SONET, enter the `no pos framing sdh` command.

Setting the Source of the Transmit Clock

The clocking default specifies that the OC3 POS line card uses the recovered receive (RX) clock to provide transmit (TX) clocking (called `loop timing`). To specify that the OC3 POS line card generates the transmit clock internally, enter the `clock source internal` command:

```
Router(config)# interface pos 3/0
Router(config-if)# clock source internal
```
To restore loop timing, enter the `no clock source internal` command or the `clock source line` command.

### Configuring Cyclic Redundancy Checks

The cyclic redundancy check (CRC) default is for a 16-bit CRC. The CRC is an error-checking technique that uses a calculated numeric value to detect errors in transmitted data. The OC3 POS line card also supports a 32-bit CRC. The sender of a data frame calculates the frame check sequence (FCS). The sender appends the FCS value to outgoing messages. The receiver recalculates the FCS and compares it to the FCS from the sender. If a difference exists, the receiver assumes that a transmission error occurred. To configure an interface for a 32-bit CRC, enter the `crc 32` command:

```plaintext
Router(config)# interface pos 3/0
Router(config-if)# crc 32
```

To disable the 32-bit CRC and return the interface to the default 16-bit CRC, enter the `no crc 32` or `crc 16` command.

**Note** Both ends of the connection must be set to the same CRC mode.

### Configuring SONET Payload Scrambling

SONET payload scrambling applies a self-synchronous scrambler ($x^{43}+1$) to the Synchronous Payload Envelope (SPE) of the OC-3 POS interface to ensure sufficient bit-transition density. The default is for SONET payload scrambling disabled.

**Note** Both ends of the connection must use the same scrambling algorithm.

You enable SONET payload scrambling by using the `pos scramble-atm` command. (This command has no keywords or arguments.)

To enable SONET payload scrambling, use the following command sequence:

```plaintext
Router(config)# interface pos 3/0
Router(config-if)# pos scramble-atm
Router(config-if)# no shutdown
Router(config-if)# end
```

To verify the SONET payload scrambling is enabled on an interface, enter the `show running-config` command. If scrambling is enabled, the following line is displayed in the configuration:

```
pos scramble-atm
```

To disable SONET payload scrambling, use the `no pos scramble-atm` command.

### Configuring SONET Delay Triggers

A trigger is an alarm that, when asserted, causes the line protocol to go down. The following sections discuss line triggers and path triggers, which you configure with the `pos delay triggers` command.

```plaintext
RTR12410-1(config)# interface pos 1/0
RTR12410-1(config-if)# pos delay triggers line ?
line Specify delay for SONET LINE level triggers (S-LOS, S-LOF, L-AIS)
path Enable SONET PATH level triggers (P-AIS, P-RDI), with optional delay
```

To set the holdoff time, enter the `pos delay triggers line <0-511>` command.
Line and Section Triggers

The **pos delay triggers line** command is used for Internet router POS interfaces connected to internally-protected Dense Wavelength Division Multiplexing (DWDM) systems. This command is invalid for interfaces that are configured as APS working or protected. Normally, even a few microseconds of line- or section-level alarms brings down the link until the alarm has been clear for ten seconds. If you configure holdoff, this link-down trigger is delayed for 100 ms. If the alarm stays up for more than 100 ms, the link is brought down as it is now. If the alarm clears before 100 ms, the link is not brought down.

By default, the following line and section alarms are triggers for the line protocol to go down:

- Section loss of signal (SLOS)
- Section loss of frame (SLOF)
- Line alarm indication signal (LAIS)

When one or more of these alarms is asserted, the line protocol of the interface goes down without a delay. You can issue the **pos delay triggers line** command to delay triggering the line protocol of the interface. You can set the delay from 50 to 10000 ms. If you do not specify a time interval, the default delay is set to 100 ms.

Path Level Triggers

The following path alarms are not triggers by default. You can configure these path alarms as triggers and also specify a delay.

- Path alarm indication signal
- Path remote defect indication
- Path loss of pointer
- B3 TCA alarms (starting in Cisco IOS Release 12.2(31)SB13)

You can issue the **pos delay triggers path** command to configure various path alarms as triggers and to specify an activation delay between 50 and 10000 ms. The default delay value is 100 ms, except for B3 TCA alarms.

Beginning in Cisco IOS Release 12.(31)SB13, B3 TCA alarms will bring the line down immediately regardless of the configured delay time when pos delay path trigger is configured; the configured trigger delay time is not applicable to B3 TCA alarms. If pos delay path trigger is not configured, B3 TCA alarms will not bring the line down. In releases prior to Cisco IOS Release 12.2(31)SB13, B3 TCA alarms are not triggers for the line protocol to go down by default.

The **pos delay triggers path** command can also bring down the line protocol when the higher of the B2 and B3 error rates is compared with the signal failure (SF) threshold. If the SF threshold is crossed, the line protocol of the interface goes down.

The **pos delay triggers path** command was introduced in Cisco IOS Release 12.0(16)S.

Checking the Configuration

After configuring the new interface, use the **show** commands to display the status of the new interface or all interfaces, and use the **ping** command to check connectivity. This section includes the following subsections:
• Using show Commands to Verify the New Interface Status, page 4-7
• Using the ping Command to Verify Network Connectivity, page 4-12
• Using loopback Commands, page 4-12

Using show Commands to Verify the New Interface Status

Table 4-3 demonstrates how you can use the show commands to verify that new interfaces are configured and operating correctly and that the OC3 POS line card appears in them correctly. Sample displays of the output of selected show commands appear in the sections that follow. For complete command descriptions and examples, refer to the publications listed in the “Related Documentation” section on page 8.

Note

The outputs that appear in this document may not match the output you receive when running these commands. The outputs in this document are examples only.

</table>
If an interface is shut down and you configured it as up, or if the displays indicate that the hardware is not functioning properly, ensure that the interface is properly connected and terminated. If you still have problems bringing up the interface, contact a service representative for assistance.
This section includes the following subsections:

- Using the `show version` or `show hardware` Commands, page 4-9
- Using the `show diag` Command, page 4-10
- Using the `show c7300` Command, page 4-11
- Using the `show interfaces` Command, page 4-11

Choose the subsection appropriate for your system. Proceed to the “Using the ping Command to Verify Network Connectivity” section on page 4-12 when you have finished using the `show` commands.

### Using the `show version` or `show hardware` Commands

Display the configuration of the system hardware, the number of each interface type installed, the Cisco IOS software version, the names and sources of configuration files, and the boot images by using the `show version` (or `show hardware`) command.

#### Note

The outputs that appear in this document may not match the output you receive when running these commands. The outputs in this document are examples only.

#### Cisco 7304 Router

Following is an example of the `show version` command from a Cisco 7304 router with the OC3 POS line card:

```
Router#show version
Cisco Internetwork Operating System Software
IOS (tm) 7300 Software (C7300-JS-M), Version 12.1(1.23.87),
Copyright (c) 1986-2001 by Cisco Systems, Inc.
Compiled Wed 17-Oct-01 03:53 by

SuperLAT software (copyright 1990 by Meridian Technology Corp).
TN3270 Emulation software.

PXF processor tmc0 running 'system:pxf/ucode1' v1.3 is active
PXF processor tmc1 running 'system:pxf/ucode1' v1.3 is active
1 FastEthernet/IEEE 802.3 interface(s)
2 Gigabit Ethernet/IEEE 802.3 interface(s)
12 Packet over SONET network interface(s)
509K bytes of non-volatile configuration memory.
```
31360K bytes of ATA compact flash in bootdisk (Sector size 512 bytes).
31360K bytes of ATA compact flash in disk0 (Sector size 512 bytes).
Configuration register is 0x100

Using the show diag Command

Display the types of line cards installed in your system (and specific information about each) using the `show diag slot` command, where `slot` is the slot in a Cisco 7304 router.

*Note* The outputs that appear in this document may not match the output you receive when running these commands. The outputs in this document are examples only.

Cisco 7304 Router

Following is an example of the `show diag slot` command for an OC3 POS line card in slot 1 of a Cisco 7304 router:

```
Router# show diag 1
Slot 0/1:
NSE Card state: Primary
Insertion time: 04:06:04 ago
C7300 NSE Mainboard EEPROM:
  Hardware Revision : 2.3
  PCB Serial Number : CAB0528JP19
  Part Number       : 73-5198-02
  Board Revision    : A0
  Fab Version       : 02
  RMA Test History  : 00

```
Checking the Configuration

Using the show c7300 Command

Display the types of line cards installed in your system, their status, and insertion time by using the show c7300 command.

Note

The outputs that appear in this document may not match the output you receive when running these commands. The outputs in this document are examples only.

Cisco 7304 Router

Following is an example of the show c7300 command for a Cisco 7304 router:

```
Router# show c7300
Slot      Card Type           Status          Insertion time
----      ---------           ------          --------------
0,1       NSE-100             Active          00:20:18 ago
4         4OC3-POS            Active          00:20:17 ago
5         1OC48-POS           Active          00:20:15 ago
```

Using the show interfaces Command

The show interfaces command displays status information (including the physical slot and interface address) for the interfaces you specify. All of the examples that follow specify POS interfaces.

Note

The outputs that appear in this document may not match the output you receive when running these commands. The outputs in this document are examples only.

Cisco 7304 Router

Following is an example of the show interfaces command for an OC3 POS line card in slot 4 of a Cisco 7304 router:

```
Router# show interfaces pos 4/0
POS4/0 is up, line protocol is up
    Hardware is Packet over Sonet
    Internet address is 1.1.1.2/8
    MTU 4470 bytes, BW 155000 Kbit, DLY 100 usec,
    reliability 255/255, txload 1/255, rxload 1/255
    Encapsulation HDLC, crc 16, loopback not set
    Keepalive not set
    Scramble disabled
    Last input 00:00:16, output never, output hang never
    Last clearing of "show interface" counters never
    Queueing strategy:fifo
    Output queue 0/40, 0 drops; input queue 0/75, 0 drops
    5 minute input rate 0 bits/sec, 0 packets/sec
    5 minute output rate 0 bits/sec, 0 packets/sec
    7 packets input, 1158 bytes, 0 no buffer
    Received 0 broadcasts, 0 runts, 0 giants, 0 throttles
    0 parity
    10 input errors, 10 CRC, 0 frame, 0 overrun, 0 ignored, 0 abort
    7 packets output, 1158 bytes, 0 underruns
    0 output errors, 0 applique, 1 interface resets
    0 output buffer failures, 0 output buffers swapped out
    0 carrier transitions
```
Using the ping Command to Verify Network Connectivity

Using the ping command, you can verify that an interface port is functioning properly. This section provides a brief description of this command. Refer to the publications listed in the “Related Documentation” section on page 8 for detailed command descriptions and examples.

The ping command sends echo request packets out to a remote device at an IP address that you specify. After sending an echo request, the system waits a specified time for the remote device to reply. Each echo reply is displayed as an exclamation point (!) on the console terminal; each request that is not returned before the specified time-out is displayed as a period (.). A series of exclamation points (!!!!!) indicates a good connection; a series of periods (.....) or the messages [timed out] or [failed] indicate a bad connection.

Following is an example of a successful ping command to a remote server with the address 10.0.0.10:

```bash
Router# ping 10.0.0.10 <Return>
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echoes to 10.0.0.10, timeout is 2 seconds:
!!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/15/64 ms
Router#
```

If the connection fails, verify that you have the correct IP address for the destination and that the device is active (powered on), and repeat the ping command.

Using loopback Commands

The loopback test allows you to troubleshoot, detect, and isolate equipment malfunctions by testing the connection between the OC-3 POS interface and a remote device. The loop subcommand places an interface in internal loopback (also called local loopback) or line loopback mode, which enables test packets that are generated from the ping command to loop through a remote device or a cable. If the packets complete the loop, the connection is good. If not, you can isolate a fault to the remote device or the cable in the path of the loopback test.

Configuring an Interface for Internal Loopback

The default loopback setting is for no loopback. With internal (or local) loopback, packets from the router are looped back in the framer. Outgoing data gets looped back to the receiver without actually being transmitted. Internal loopback is useful for checking that the OC3 POS line card is working.

To configure an interface for internal loopback, enter the loop internal command:

```bash
Router(config)# interface pos 3/0
Router(config-if)# loop internal
```

To disable internal loopback, enter the no loop internal command.
Configuring an Interface for Line Loopback

The default loopback setting is for no loopback. With line loopback, the receive (RX) fiber is logically connected to the transmit (TX) optical fiber cable so that packets from the remote router are looped back to it. Incoming data gets looped around and retransmitted without actually being received. To configure an interface for line loopback, enter the `loop line` command:

```bash
Router(config)# interface pos 3/0
Router(config-if)# loop line
```

To disable line loopback, enter the `no loop line` command.

OC3 POS Statistics Counters

The OC3 POS line card maintains counts of certain errors. Each error counter is 32 bits. Errors include the following:

- CRC errors—Packet corrupted in reception
- Giants received—Packet length too large (greater than MTU size)
- Runts—Packet length too small (less than or equal to 4 bytes)
- Ignores—No receive buffers available; receive buffers full

OC3 POS Line Card Error Messages

The error messages you should see are of the following type and format:

- `%POS-1-INITFAIL:POS OC3(3) initialization failed`
- `%POS-3-FPGAREVNOTSUPPORTED:POS OC3(3) Line card requires fpga revision of (2).Current fpga revision is (0)`
- `%POS-3-FPGAREVNOTMATCH:POS OC3(3) Line card fpga requires min h/w revision of (0.0)`
- `%POS-1-TRESFAIL:POS OC3(3/0) Failed to obtain PXF resources, error=16, shutting down interface`

Note: Contact the Technical Assistance Center (TAC) for assistance with this error message. To contact the TAC, see the “Obtaining Technical Assistance” section on page 9.

CLI-Controlled OIR

Line cards can be removed from the Cisco 7304 router without disrupting data flow by using the `hw-module slot slot # stop/start` command in EXEC mode. The `hw-module slot slot # stop` command will stop traffic, shut down all line card interfaces, and deactivate the line card. The `hw-module slot slot # start` command resets the line card, puts the line card back online, and turns off the OIR LED. To remove and install an active line card in slot 2 proceed as follows:

```bash
Router# hw-module slot 2 stop
```
When the OIR LED turns green, the line card in slot 2 has been deactivated and can be physically removed and replaced with a new line card (see the “Line Card Removal and Installation” section on page 3-3.)

When the new line card is inserted in slot 2 it is automatically reset, put online, and the OIR LED is turned off.
