### Introduction

The Cisco IR1101 Industrial Integrated Services Router is a next generation modular industrial router which has a Base module with additional Pluggable Modules that can be added. The Pluggable Module provides the flexibility of adding different interfaces to the IR1101 platform.

The IR1101 ISR also has an Expansion Module that adds key capabilities such as dual LTE Pluggables, mSATA SSD FRU, SFP, and Digital GPIO connections.

The IR1101 is the first IoT platform to run the Cisco IOS-XE operating system. IOS-XE is a Linux based OS that comes with many enhancements and more features compared to the classic IOS version.

The following figure shows the front panel of the IR1101 and highlights some of its capabilities:

*Figure 1: IR1101 Front Panel*

Cisco IRM-1100-SP Expansion Module

The Expansion Module comes in two types:

- IRM-1100-SPMI
- IRM-1100-SP

The following figure shows the front panel of the IRM-1100-SPMI and highlights some of its capabilities:
The IR-1100-SP Expansion Module is the same as the IR-1100-SPMI module, without the Digital I/O and mSATA components.

More Expansion Module information can be found in this chapter m_expansion_module.ditamap#id_111605.

This section of the guide also includes:

- Accessing the CLI Using a Router Console, on page 4
- Accessing the CLI from a Remote Console, on page 6
- CLI Session Management, on page 8
Accessing the CLI Using a Router Console

Cisco IR1101 routers have console port with only USB support. The console cable (Cisco P/N CAB-CONSOLE-USB, 6ft long) is not included and must be ordered.

The console port is a USB 2.0 mini USB Type B connector which is located on the front panel of the chassis. The default baud rate is 9600.

If your laptop or PC warns you that you do not have the proper drivers to communicate with the router, you can obtain them from your computers manufacturer, or go here: https://www.silabs.com/products/mcu/Pages/USBtoUARTBridgeVCPDrivers.aspx

On a device fresh from the factory, you are greeted with a System Configuration Dialog where you respond to basic configuration questions. If the router was ordered for the use of Cisco PnP connect services, in the case of centralized provisioning, the router skips the initial dialog. The following is an example:

```
--- System Configuration Dialog ---
Would you like to enter the initial configuration dialog? [yes/no]: yes
At any point you may enter a question mark '?' for help.
Use ctrl-c to abort configuration dialog at any prompt.
Default settings are in square brackets '[]'.

Basic management setup configures only enough connectivity for management of the system, extended setup will ask you to configure each interface on the system

Would you like to enter basic management setup? [yes/no]: yes
Configuring global parameters:

Enter host name [Router]: <your-host-name>
The enable secret is a password used to protect access to privileged EXEC and configuration modes. This password, after entered, becomes encrypted in the configuration.
Enter enable secret: <your-password>
The enable password is used when you do not specify an enable secret password, with some older software versions, and some boot images.
Enter enable password: <your-password>
The virtual terminal password is used to protect access to the router over a network interface.
Enter virtual terminal password: <your-password>
Setup account for accessing HTTP server? [yes]: <return>
Username [admin]: <your-username>
Password [cisco]: <your-password>
Password is UNENCRYPTED.
Configure SNMP Network Management? [no]: <return>
```

Current interface summary

Any interface listed with OK? value "NO" does not have a valid configuration
Names and IP addresses in this next section are shown as examples.

Enter interface name used to connect to the management network from the above interface summary: **vlan1**

Configuring interface Vlan1:

Configure IP on this interface? [no]: **yes**

IP address for this interface: **192.168.1.1**

Subnet mask for this interface [255.255.255.0]: <return>

Class C network is 192.168.1.0, 24 subnet bits; mask is /24

Would you like to configure DHCP? [yes/no]: **yes**

Enter DHCP pool name: **wDHCPool**

Enter DHCP network: **192.168.1.0**

Enter DHCP netmask: **255.255.255.0**

Enter Default router: **192.168.1.1**

The following configuration command script was created:

```bash
hostname <your-hostname>
enable secret 9 $9$Z6fl74fvoEdMcUMgUSXZyS8l4phbCpXa4b19bzCng3u4Bc2kh1STsoLoHNes
enable password <your-enable-password>
line vty 0 4
password <your-password>
username <your-username> privilege 15 password <your-password>
no snmp-server
!
interface GigabitEthernet0/0/0
shutdown
no ip address
!
interface FastEthernet0/0/1
!
interface FastEthernet0/0/2
!
interface FastEthernet0/0/3
!
interface FastEthernet0/0/4
!
interface Vlan1
no shutdown
ip address 192.168.1.1 255.255.255.0
no mop enabled
ip dhcp pool wDHCPool
network 192.168.1.0 255.255.255.0
default-router 192.168.1.1
!
end
```

[0] Go to the IOS command prompt without saving this config.
[1] Return back to the setup without saving this config.
[2] Save this configuration to nvram and exit.
Using the Console Interface

Enter your selection [2]: 2
Building configuration...
[OK]
Use the enabled mode 'configure' command to modify this configuration.

Press RETURN to get started! <return>

*Jul 27 21:35:24.369: %CRYPTO_ENGINE-5-KEY_ADDITION: A key named TP-self-signed-3211716068 has been generated or imported by crypto-engine
*Jul 27 21:35:24.372: %SSH-5-ENABLED: SSH 1.99 has been enabled
*Jul 27 21:35:24.448: %PKI-4-NOCONFIGAUTOSAVE: Configuration was modified. Issue "write memory" to save new IOS PKI configuration
*Jul 27 21:35:24.532: %CRYPTO_ENGINE-5-KEY_ADDITION: A key named TP-self-signed-3211716068.server has been generated or imported by crypto-engine hostname>

The device now has a basic configuration that you can build upon.

Using the Console Interface

Step 1
Enter the following command:
Router > enable

Step 2
( Go to Step 3 if the enable password has not been configured. ) At the password prompt, enter your system password:
Password: enablepass
When your password is accepted, the privileged EXEC mode prompt is displayed.
Router#
You now have access to the CLI in privileged EXEC mode and you can enter the necessary commands to complete your desired tasks.

Step 3
To exit the console session, enter the quit command:
Router# quit

Accessing the CLI from a Remote Console

The remote console of the IR1101 can be accessed through Telnet or the more secure SSH. Details on telnet access follow in this chapter. For details on SSH access see the SSH chapter located here: Configuring Secure Shell, on page 39

The following topics describe the procedure to access the CLI from a remote console:
Preparing to Connect to the Router Console Using Telnet

Configuring the diagnostic and wait banners is optional, but recommended. The banners are especially useful as indicators to users about the status of their Telnet or SSH attempts.

To access the router remotely using Telnet from a TCP/IP network, configure the router to support virtual terminal lines using the `line vty` global configuration command. Configure the virtual terminal lines to require users to log in and specify a password.

See the Cisco IOS Terminal Services Command Reference document for more information about the `line vty` global configuration command.

To prevent disabling login on a line, specify a password with the `password` command when you configure the `login` command.

If you are using authentication, authorization, and accounting (AAA), configure the `login authentication` command. To prevent disabling login on a line for AAA authentication when you configure a list with the login authentication command, you must also configure that list using the `aaa authentication login` global configuration command.

For more information about AAA services, see the Cisco IOS XE Security Configuration Guide: Secure Connectivity and the Cisco IOS Security Command Reference documents. For more information about the `login line-configuration` command, see the Cisco IOS Terminal Services Command Reference document.

In addition, before you make a Telnet connection to the router, you must have a valid hostname for the router or have an IP address configured on the router. For more information about the requirements for connecting to the router using Telnet, information about customizing your Telnet services, and using Telnet key sequences, see the Cisco IOS Configuration Fundamentals Configuration Guide.

Using Telnet to Access a Console Interface

**Step 1**
From your terminal or PC, enter one of the following commands:

- `connect host [port] [keyword]`
- `telnet host [port] [keyword]`

Here, `host` is the router hostname or IP address, `port` is a decimal port number (23 is the default), and `keyword` is a supported keyword. For more information about these commands, see the Cisco IOS Terminal Services Command Reference document.

**Note** If you are using an access server, specify a valid port number, such as `telnet 172.20.52.40 2004`, in addition to the hostname or IP address.

The following example shows how to use the `telnet` command to connect to a router named `router`:

```
unix_host% telnet router
Trying 172.20.52.40...
Connected to 172.20.52.40.
Escape character is '^]'.
unix_host% connect
```

**Step 2**
Enter your login password:
Step 3  From user EXEC mode, enter the `enable` command:

```
Router> enable
```

Step 4  At the password prompt, enter your system password:

```
Password: enablepass
```

Step 5  When the `enable` password is accepted, the privileged EXEC mode prompt is displayed:

```
Router#
```

Step 6  You now have access to the CLI in privileged EXEC mode and you can enter the necessary commands to complete your desired tasks.

Step 7  To exit the Telnet session, use the `exit` or `logout` command.

```
Router# logout
```

---

**CLI Session Management**

An inactivity timeout is configurable and can be enforced. Session locking provides protection from two users overwriting changes that the other has made. To prevent an internal process from using all the available capacity, some spare capacity is reserved for CLI session access. For example, this allows a user to remotely access a router.

**Information About CLI Session Management**

An inactivity timeout is configurable and can be enforced. Session locking provides protection from two users overwriting changes that each other has made. To prevent an internal process from using all the available capacity, some spare capacity is reserved for CLI session access. For example, this allows a user to remotely access the router.

**Changing the CLI Session Timeout**

1. **Step 1**
   
   `configure terminal`
   
   Enters global configuration mode

2. **Step 2**
   
   `line console 0`

3. **Step 3**
   
   `session-timeout minutes`
   
   The value of `minutes` sets the amount of time that the CLI waits before timing out. Setting the CLI session timeout increases the security of a CLI session. Specify a value of 0 for `minutes` to disable session timeout.

4. **Step 4**
   
   `show line console 0`
Verifies the value to which the session timeout has been set, which is shown as the value for "Idle Session".

### Locking a CLI Session

#### Before you begin

To configure a temporary password on a CLI session, use the `lock` command in EXEC mode. Before you can use the `lock` command, you need to configure the line using the `lockable` command. In this example the line is configured as `lockable`, and then the `lock` command is used and a temporary password is assigned.

<table>
<thead>
<tr>

Locked
```
CHAPTER 2

Using Cisco IOS XE Software

If your installation will make use of Cisco SDWAN technology, it is important to note that the Cisco IOS-XE SDWAN image (cEdge) has different Command modes, (for example Config-transaction, commit...).

IR1101 SDWAN features are aligned on cEdge IOS-XE 16.12.1 ones. Some features may not be available on the IR1101, i.e. URL Filtering, IPS/IDS, and some IR1101 features may not be available from the SDWAN image.

This chapter contains the following sections:

• Understanding Command Modes, on page 11
• Keyboard Shortcuts, on page 13
• Using the no and default Forms of Commands, on page 14
• Using the History Buffer to Recall Commands, on page 14
• Managing Configuration Files, on page 15
• Saving Configuration Changes, on page 15
• Filtering Output from the show and more Commands, on page 15
• Finding Support Information for Platforms and Cisco Software Images, on page 16

Understanding Command Modes

The command modes available in Cisco IOS XE are the same as those available in traditional Cisco IOS. Use the CLI to access Cisco IOS XE software. Because the CLI is divided into many different modes, the commands available to you at any given time depend on the mode that you are currently in. Entering a question mark (?) at the CLI prompt allows you to obtain a list of commands available for each command mode.

When you log in to the CLI, you are in user EXEC mode. User EXEC mode contains only a limited subset of commands. To have access to all commands, you must enter privileged EXEC mode, normally by using a password. From privileged EXEC mode, you can issue any EXEC command—user or privileged mode—or you can enter global configuration mode. Most EXEC commands are one-time commands. For example, show commands show important status information, and clear commands clear counters or interfaces. The EXEC commands are not saved when the software reboots.

Configuration modes allow you to make changes to the running configuration. If you later save the running configuration to the startup configuration, these changed commands are stored when the software is rebooted. To enter specific configuration modes, you must start at global configuration mode. From global configuration
mode, you can enter interface configuration mode and a variety of other modes, such as protocol-specific modes.

ROM monitor mode is a separate mode used when the Cisco IOS XE software cannot load properly. If a valid software image is not found when the software boots or if the configuration file is corrupted at startup, the software might enter ROM monitor mode.

The following table describes how to access and exit various common command modes of the Cisco IOS XE software. It also shows examples of the prompts displayed for each mode.

Table 2: Accessing and Exiting Command Modes

<table>
<thead>
<tr>
<th>Command Mode</th>
<th>Access Method</th>
<th>Prompt</th>

</tbody>
</table>
IffailureoftheCiscoIOSprocessisthereasonforenteringdiagnosticmode, theCiscoIOSproblemmustberesolvedandtherouterrebootedtogetout ofdiagnosticmode.

Iftherouterisin diagnosticmodebecause ofatransport-map configuration,accessthe routerthroughanother portorbyusingamethod thatiscconfiguredto connecttotheCiscoIOS CLI.

### Command Mode | Access Method | Prompt | Exit Method
--- | --- | --- | ---
Diagnostic | The router boots up or accesses diagnostic mode in the following scenarios:  
- In some cases, diagnostic mode will be reached when the Cisco IOS process or processes fail. In most scenarios, however, the router will reload.  
- A user-configured access policy is configured using the `transport-map` command that directs a user into diagnostic mode.  
- A break signal (Ctrl-C, Ctrl-Shift-6, or the `send break` command) is entered and the router is configured to go to diagnostic mode when the break signal is received. | `Router(diag)#` | If failure of the Cisco IOS process is the reason for entering diagnostic mode, the Cisco IOS problem must be resolved and the router rebooted to get out of diagnostic mode.  
If the router is in diagnostic mode because of a transport-map configuration, access the router through another port or by using a method that is configured to connect to the Cisco IOS CLI. |
ROM monitor | From privileged EXEC mode, use the `reload` EXEC command. Press the `Break` key during the first 60 seconds while the system is booting. | `rommon#>` | To exit ROM monitor mode, manually boot a valid image or perform a reset with autoboot set so that a valid image is loaded. |

**Keyboard Shortcuts**

Commands are not case sensitive. You can abbreviate commands and parameters if the abbreviations contain enough letters to be different from any other currently available commands or parameters.

The following table lists the keyboard shortcuts for entering and editing commands.
### Table 3: Keyboard Shortcuts

<table>
<thead>
<tr>
<th>Key Name</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ctrl-B or the Left Arrow key</td>
<td>Move the cursor back one character.</td>
</tr>
<tr>
<td>Ctrl-F or the Right Arrow key</td>
<td>Move the cursor forward one character.</td>
</tr>
<tr>
<td>Ctrl-A</td>
<td>Move the cursor to the beginning of the command line.</td>
</tr>
<tr>
<td>Ctrl-E</td>
<td>Move the cursor to the end of the command line.</td>
</tr>
<tr>
<td>Esc B</td>
<td>Move the cursor back one word.</td>
</tr>
<tr>
<td>Esc F</td>
<td>Move the cursor forward one word.</td>
</tr>
</tbody>
</table>

### Using the no and default Forms of Commands

Almost every configuration command has a no form. In general, use the no form to disable a function. Use the command without the no keyword to re-enable a disabled function or to enable a function that is disabled by default. For example, IP routing is enabled by default. To disable IP routing, use the no ip routing command; to re-enable IP routing, use the ip routing command. The Cisco IOS software command reference publications provide the complete syntax for the configuration commands and describe what the no form of a command does.

Many CLI commands also have a default form. By issuing the `<command> default command-name`, you can configure the command to its default setting. The Cisco IOS software command reference publications describe the function from a default form of the command when the default form performs a different function than the plain and no forms of the command. To see what default commands are available on your system, enter default ? in the appropriate command mode.

### Using the History Buffer to Recall Commands

The history buffer stores the last 20 commands you entered. History substitution allows you to access these commands without retyping them, by using special abbreviated commands.

The following table lists the history substitution commands.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ctrl-P or the Up Arrow key</td>
<td>Recalls commands in the history buffer, beginning with the most recent command. Repeat the key sequence to recall successively older commands.</td>
</tr>
<tr>
<td>Ctrl-N or the Down Arrow key</td>
<td>Returns to more recent commands in the history buffer after recalling commands with Ctrl-P or the Up Arrow key.</td>
</tr>
</tbody>
</table>
### Managing Configuration Files

The startup configuration file is stored in the nvram: file system and the running configuration files are stored in the system: file system. This configuration file storage setup is also used on several other Cisco router platforms.

As a matter of routine maintenance on any Cisco router, users should back up the startup configuration file by copying the startup configuration file from NVRAM to one of the router’s other file systems and, additionally, to a network server. Backing up the startup configuration file provides an easy method of recovering the startup configuration file if the startup configuration file in NVRAM becomes unusable for any reason.

The `copy` command can be used to back up startup configuration files.

For more detailed information on managing configuration files, see the “Managing Configuration Files” section in the [Cisco IOS XE Configuration Fundamentals Configuration Guide](https://www.cisco.com/c/en/us/support/docs/ip/access-lists/13608-21.html).

### Saving Configuration Changes

Use the `copy running-config startup-config` command to save your configuration changes to the startup configuration so that the changes will not be lost if the software reloads or a power outage occurs. For example:

```
Router# copy running-config startup-config
Building configuration...
```

It may take a few minutes to save the configuration. After the configuration has been saved, the following output is displayed:

```
[OK]
Router#
```

This task saves the configuration to the NVRAM.

### Filtering Output from the show and more Commands

You can search and filter the output of `show` and `more` commands. This functionality is useful if you need to sort through large amounts of output or if you want to exclude output that you need not see.

To use this functionality, enter a `show` or `more` command followed by the “pipe” character ( | ); one of the keywords `begin`, `include`, or `exclude`; and a regular expression on which you want to search or filter (the expression is case sensitive):
**show command** | {append | begin | exclude | include | redirect | section | tee} regular-expression

The output matches certain lines of information in the configuration file.

**Example**

In this example, a modifier of the **show interface** command (**include protocol**) is used to provide only the output lines in which the expression **protocol** is displayed:

```
Router# show interface | include protocol
GigabitEthernet0/0/0 is administratively down, line protocol is down (disabled)
  0 unknown protocol drops
FastEthernet0/0/1 is down, line protocol is down (notconnect)
  0 unknown protocol drops
FastEthernet0/0/2 is down, line protocol is down (notconnect)
  0 unknown protocol drops
FastEthernet0/0/3 is down, line protocol is down (notconnect)
  0 unknown protocol drops
FastEthernet0/0/4 is down, line protocol is down (notconnect)
  0 unknown protocol drops
GigabitEthernet0/0/5 is up, line protocol is up (connected)
  0 unknown protocol drops
Cellular0/1/0 is up, line protocol is up
  0 unknown protocol drops
Cellular0/1/1 is administratively down, line protocol is down
  0 unknown protocol drops
Cellular0/3/0 is up, line protocol is up
  0 unknown protocol drops
Cellular0/3/1 is administratively down, line protocol is down
  0 unknown protocol drops
Async0/2/0 is up, line protocol is down
  0 unknown protocol drops
Vlan1 is up, line protocol is up , Autostate Enabled
  0 unknown protocol drops
Vlan172 is up, line protocol is down, Autostate Enabled
  0 unknown protocol drops
Vlan175 is down, line protocol is down, Autostate Enabled
  0 unknown protocol drops
IRI101#
```

**Finding Support Information for Platforms and Cisco Software Images**

The Cisco IOS XE software is packaged in feature sets consisting of software images that support specific platforms.

The group of feature sets that are available for a specific platform depends on which Cisco software images are included in a release. To identify the set of software images available in a specific release or to find out if a feature is available in a given Cisco IOS XE software image, you can use Cisco Feature Navigator or see the [https://www.cisco.com/c/en/us/support/ios-nx-os-software/ios-xe-16/products-release-notes-list.html](https://www.cisco.com/c/en/us/support/ios-nx-os-software/ios-xe-16/products-release-notes-list.html).
Using Cisco Feature Navigator

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator is a tool that enables you to determine which Cisco IOS XE software images support a specific software release, feature set, or platform. To use the navigator tool, an account on Cisco.com is not required.

Getting Help

Entering a question mark (?) at the CLI prompt displays a list of commands available for each command mode. You can also get a list of keywords and arguments associated with any command by using the context-sensitive help feature.

To get help that is specific to a command mode, a command, a keyword, or an argument, use one of the following commands.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>help</td>
<td>Provides a brief description of the help system in any command mode.</td>
</tr>
<tr>
<td>abbreviated-command-entry?</td>
<td>Provides a list of commands that begin with a particular character string.</td>
</tr>
<tr>
<td></td>
<td>Note: There is no space between the command and the question mark.</td>
</tr>
<tr>
<td>abbreviated-command-entry&lt;Tab&gt;</td>
<td>Completes a partial command name.</td>
</tr>
<tr>
<td>?</td>
<td>Lists all the commands that are available for a particular command mode.</td>
</tr>
<tr>
<td>command ?</td>
<td>Lists the keywords or arguments that you must enter next on the command line.</td>
</tr>
<tr>
<td></td>
<td>Note: There is a space between the command and the question mark.</td>
</tr>
</tbody>
</table>

Finding Command Options: Example

This section provides information about how to display the syntax for a command. The syntax can consist of optional or required keywords and arguments. To display keywords and arguments for a command, enter a question mark (?) at the configuration prompt or after entering a part of a command followed by a space. The Cisco IOS XE software displays a list and brief descriptions of the available keywords and arguments. For example, if you are in global configuration mode and want to see all the keywords and arguments for the arap command, you should type arap ?.

The <cr> symbol in command help output stands for carriage return. On older keyboards, the carriage return key is the Return key. On most modern keyboards, the carriage return key is the Enter key. The <cr> symbol at the end of command help output indicates that you have the option to press Enter to complete the command and that the arguments and keywords in the list preceding the <cr> symbol are optional. The <cr> symbol by
itself indicates that no more arguments or keywords are available, and that you must press Enter to complete the command.

The following table shows examples of using the question mark (?) to assist you in entering commands.

**Table 5: Finding Command Options**

<table>
<thead>
<tr>
<th>Command</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router&gt; <strong>enable</strong></td>
<td>Enter the <strong>enable</strong> command and password to access privileged EXEC commands. You are in privileged EXEC mode when the prompt changes to a “#” from the “&gt;”, for example, <strong>Router&gt;</strong> to <strong>Router#</strong></td>
</tr>
<tr>
<td>Password: &lt;password&gt;</td>
<td></td>
</tr>
<tr>
<td>Router#</td>
<td></td>
</tr>
<tr>
<td><strong>Router# configure terminal</strong></td>
<td>Enter the <strong>configure terminal</strong> privileged EXEC command to enter global configuration mode. You are in global configuration mode when the prompt changes to <strong>Router (config)#</strong></td>
</tr>
<tr>
<td>Enter configuration commands, one per line.</td>
<td></td>
</tr>
<tr>
<td>End with CNTL/Z.</td>
<td></td>
</tr>
<tr>
<td><strong>Router(config)#</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Router(config)# interface GigabitEthernet ?</strong></td>
<td>Enter interface configuration mode by specifying the interface that you want to configure, using the <strong>interface GigabitEthernet</strong> global configuration command. Enter ? to display what you must enter next on the command line. When the &lt;cr&gt; symbol is displayed, you can press Enter to complete the command. You are in interface configuration mode when the prompt changes to <strong>Router(config-if)#</strong></td>
</tr>
<tr>
<td>&lt;0-0&gt; GigabitEthernet interface number</td>
<td></td>
</tr>
<tr>
<td><strong>Router(config)# interface GigabitEthernet 0/?</strong></td>
<td></td>
</tr>
<tr>
<td>&lt;0-5&gt; Port Adapter number</td>
<td></td>
</tr>
<tr>
<td><strong>Router(config)# interface GigabitEthernet 0/0/?</strong></td>
<td></td>
</tr>
<tr>
<td>&lt;0-63&gt; GigabitEthernet interface number</td>
<td></td>
</tr>
<tr>
<td><strong>Router(config)# interface GigabitEthernet 0/0/0/?</strong></td>
<td></td>
</tr>
<tr>
<td>. &lt;0-71&gt;</td>
<td></td>
</tr>
<tr>
<td><strong>Router(config-if)#</strong></td>
<td></td>
</tr>
</tbody>
</table>
Enter `?` to display a list of all the interface configuration commands available for the interface. This example shows only some of the available interface configuration commands.

<table>
<thead>
<tr>

<td>.</td>
</tr>
</tbody>
</table>
## Finding Command Options: Example

<table>
<thead>
<tr>
<th>Command</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Router(config-if)# ip ?</strong></td>
<td>Enter the command that you want to configure for the interface. This example uses the <code>ip</code> command. Enter <code>?</code> to display what you must enter next on the command line. This example shows only some of the available interface IP configuration commands.</td>
</tr>
<tr>
<td><strong>Router(config-if)# ip address ?</strong></td>
<td>Enter the command that you want to configure for the interface. This example uses the <code>ip address</code> command. Enter <code>?</code> to display what you must enter next on the command line. In this example, you must enter an IP address or the <code>negotiated</code> keyword. A carriage return (<code>&lt;cr&gt;</code>) is not displayed. Therefore, you must enter additional keywords or arguments to complete the command.</td>
</tr>
<tr>
<td><strong>Router(config-if)# ip address 172.16.0.1 ?</strong></td>
<td>Enter the keyword or argument that you want to use. This example uses the 172.16.0.1 IP address. Enter <code>?</code> to display what you must enter next on the command line. In this example, you must enter an IP subnet mask. <code>&lt;cr&gt;</code> is not displayed. Therefore, you must enter additional keywords or arguments to complete the command.</td>
</tr>
</tbody>
</table>
Enter the IP subnet mask. This example uses the 255.255.255.0 IP subnet mask.

Enter ? to display what you must enter next on the command line. In this example, you can enter the secondary keyword, or you can press Enter.

<cr> is displayed. Press Enter to complete the command, or enter another keyword.

```
Router(config-if)# ip address 172.16.0.1 255.255.255.0
secondary
<cr>
Router(config-if)# ip address 172.16.0.1 255.255.255.0
```

Press Enter to complete the command.

### Using Software Advisor

Cisco maintains the Software Advisor tool. See Tools and Resources. Use the Software Advisor tool to see if a feature is supported in a Cisco IOS XE release, to locate the software document for that feature, or to check the minimum software requirements of Cisco IOS XE software with the hardware installed on your router. You must be a registered user on Cisco.com to access this tool.

### Using Software Release Notes

See the release notes for information about the following:

- Memory recommendations
- Open and resolved severity 1 and 2 caveats

Release notes are intended to be release-specific for the most current release, and the information provided in these documents may not be cumulative in providing information about features that first appeared in previous releases. For cumulative feature information, refer to the Cisco Feature Navigator at: http://www.cisco.com/go/cfn/.
CHAPTER 3

Basic Router Configuration

This chapter contains the following sections:

- IR1101 Interface Naming, on page 23
- Basic Configuration, on page 24
- Configuring Global Parameters, on page 28
- Configuring the Gigabit Ethernet Interface, on page 29
- Support for sub-interface on GigabitEthernet0/0/0, on page 30
- Configuring a Loopback Interface, on page 30
- Enabling Cisco Discovery Protocol, on page 32
- Configuring Command-Line Access, on page 32
- Configuring Static Routes, on page 34
- Configuring Dynamic Routes, on page 36
- Configuring the Serial Interface, on page 37

IR1101 Interface Naming

The supported hardware interfaces and their naming conventions are in the following table:

<table>
<thead>
<tr>
<th>Hardware Interface</th>
<th>Naming Convention</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gigabit Ethernet combo port</td>
<td>gigabitethernet 0/0/0</td>
</tr>
<tr>
<td>Gigabit Ethernet SFP port on Expansion Module</td>
<td>gigabitethernet 0/0/5</td>
</tr>
<tr>
<td>Fast Ethernet ports</td>
<td>fastethernet0/0/1-0/0/4</td>
</tr>
<tr>
<td>Cellular Interface</td>
<td>cellular 0/1/0 and cellular 0/1/1</td>
</tr>
<tr>
<td>Cellular Interface on Expansion Module</td>
<td>cellular 0/3/0 and 0/3/1</td>
</tr>
<tr>
<td>Asynchronous Serial Interface</td>
<td>asy0/2/0</td>
</tr>
<tr>
<td>USB</td>
<td>usbflash0:</td>
</tr>
<tr>
<td>mSATA</td>
<td>msata</td>
</tr>
<tr>
<td>IR1101 Base Unit Alarm input</td>
<td>alarm contact 0</td>
</tr>
</tbody>
</table>
Basic Configuration

The basic configuration is a result of the entries you made during the initial configuration dialog. This means the router has at least one interface set with an IP address to be reachable, either through WebUI or to allow the PnP process to work. Use the `show running-config` command to view the initial configuration, as shown in the following example:

```
Router# show running-config

Configuring Global Parameters

To configure global parameters for your router, follow these steps.

SUMMARY STEPS

1. configure terminal
2. hostname name
3. enable password password

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode when using the console port.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Use the following to connect to the router with a remote terminal:</td>
</tr>
<tr>
<td>Router&gt; enable</td>
<td>telnet router-name or address</td>
</tr>
<tr>
<td>Router# configure terminal</td>
<td>Login: login-id</td>
</tr>
<tr>
<td>Router(config)#</td>
<td>Password: *********</td>
</tr>
<tr>
<td></td>
<td>Router&gt; enable</td>
</tr>
</tbody>
</table>

| **Step 2** hostname name | Specifies the name for the router. |
| **Example:** | |
| Router(config)# hostname Router | |

| **Step 3** enable password password | Specifies a password to prevent unauthorized access to the router. |
| **Example:** | Note: In this form of the command, password is not encrypted. To encrypt the password use enable secret password as noted in the previously mentioned Device Hardening Guide. |
| Router(config)# enable password criny5ho | |
Configuring the Gigabit Ethernet Interface

The default configuration for the Gigabit Ethernet Interface (GI0/0/0) on the IR1101 is Layer 3 (L3). It is possible to configure the interface as a Layer 2 (L2) interface. The Gigabit Ethernet Interface on the IR1101 is a combo port, which means it is a RJ45+SFP connector.

The Expansion Module also has an SFP port. The Gigabit Ethernet Interface (GI0/0/5) on the IRM-1100-SPMI is Layer 2 (L2) only. This means you can assign this port to any vlan (switchport acc vlan #) and use the SVI interface. You cannot assign an ip address directly under this port.

The correct connector must be selected, refer to the IR1101 Industrial Integrated Services Router Hardware Installation Guide here: https://www.cisco.com/c/en/us/td/docs/routers/access/1101/hardware/installation/guide/1101hwinst.html

To manually define the Gigabit Ethernet interface, follow these steps, beginning from global configuration mode.

**SUMMARY STEPS**

1. interface GigabitEthernet slot/bay/port
2. ip address ip-address mask
3. ipv6 address ipv6-address/prefix
4. ipv6 unicast-routing
5. no shutdown
6. exit

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>interface GigabitEthernet slot/bay/port</td>
<td>Enters the configuration mode for an interface on the router.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router(config)# interface GigabitEthernet 0/0/0</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>ip address ip-address mask</td>
<td>Sets the IP address and subnet mask for the specified interface. Use this Step if you are configuring an IPv4 address.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router(config-if)# ip address 192.168.12.2 255.255.255.0</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>ipv6 address ipv6-address/prefix</td>
<td>Sets the IPv6 address and prefix for the specified interface. Use this step instead of Step 2, if you are configuring an IPv6 address. IPv6 unicast-routing needs to be set-up as well, see further information in the IPv6 Addressing and Basic Connectivity Configuration Guide located here: <a href="https://www.cisco.com/c/en/us/td/docs/ios-xml/ios/ipv6_basic/configuration/xe-16-10/ip6b-xe-16-10-book/read-me-first.html">https://www.cisco.com/c/en/us/td/docs/ios-xml/ios/ipv6_basic/configuration/xe-16-10/ip6b-xe-16-10-book/read-me-first.html</a></td>

### Support for sub-interface on GigabitEthernet0/0/0

Cisco IOS-XE release 16.11.1 and above supports sub-interfaces and dot1q configuration on the g0/0/0 interface. For example:

```
Router(config)#interface g0/0/0 ?
<1-4294967295> GigabitEthernet interface number
Router(config-subif)#encapsulation ?
  dot1Q   IEEE 802.1Q Virtual LAN
```

### Configuring a Loopback Interface

**Before you begin**

The loopback interface acts as a placeholder for the static IP address and provides default routing information. To configure a loopback interface, follow these steps.

**SUMMARY STEPS**

1. `interface type number`
2. (Option 1) `ip address ip-address mask`
3. (Option 2) `ipv6 address ipv6-address/prefix`
4. `exit`
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** interface type number  
Example:  
Router(config)# interface Loopback 0 | Enters configuration mode on the loopback interface. |
| **Step 2** (Option 1) ip address ip-address mask  
Example:  
Router(config-if)# ip address 10.108.1.1 255.255.255.0 | Sets the IP address and subnet mask on the loopback interface. (If you are configuring an IPv6 address, use the **ipv6 address** command described below.) |
| **Step 2** (Option 2) ipv6 address ipv6-address/prefix  
Example:  
Router(config-if)# ipv6 address 2001:db8::fff:1/128 | Sets the IPv6 address and prefix on the loopback interface. |
| **Step 4** exit  
Example:  
Router(config-if)# exit | Exits configuration mode for the loopback interface and returns to global configuration mode. |

### Example

**Verifying Loopback Interface Configuration**

Enter the `show interface loopback` command. You should see an output similar to the following example:

```
Router# show interface loopback 0
Loopback0 is up, line protocol is up
Hardware is Loopback
Internet address is 192.0.2.0/16
MTU 1514 bytes, BW 8000000 Kbit, DLY 5000 usec,
    reliability 255/255, txload 1/255, rxload 1/255
Encapsulation LOOPBACK, loopback not set
Last input never, output never, output hang never
Last clearing of "show interface" counters never
Queueing strategy: fifo
Output queue 0/0, 0 drops; input queue 0/75, 0 drops
5 minute input rate 0 bits/sec, 0 packets/sec
5 minute output rate 0 bits/sec, 0 packets/sec
  0 packets input, 0 bytes, 0 no buffer
  Received 0 broadcasts, 0 runts, 0 giants, 0 throttles
  0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored, 0 abort
  0 packets output, 0 bytes, 0 underruns
  0 output errors, 0 collisions, 0 interface resets
  0 output buffer failures, 0 output buffers swapped out
```
Alternatively, use the `ping` command to verify the loopback interface, as shown in the following example:

```
Router# ping 192.0.2.0
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 192.0.2.0, timeout is 2 seconds:
!!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/2/4 ms
```

### Enabling Cisco Discovery Protocol

Cisco Discovery Protocol (CDP) is enabled by default on the router. It may be disabled if needed for security purposes.

For more information on using CDP, see Cisco Discovery Protocol Configuration Guide, Cisco IOS XE Release 3S.

### Configuring Command-Line Access

To configure parameters to control access to the router, follow these steps.

**Note**

Transport input must be set as explained in the previous Telnet and SSH sections of the guide.

**SUMMARY STEPS**

1. `line [aux | console | tty | vty] line-number`
2. `password password`
3. `login`
4. `exec-timeout minutes [seconds]`
5. `exit`
6. `line [aux | console | tty | vty] line-number`
7. `password password`
8. `login`
9. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters line configuration mode, and specifies the type of line.</td>
</tr>
<tr>
<td>Example:</td>
<td>The example provided here specifies a console terminal for access.</td>
</tr>
<tr>
<td>`line [aux</td>
<td>console</td>
</tr>
<tr>
<td><code>Router(config)# line console 0</code></td>
<td></td>
</tr>
<tr>
<td>Step</td>
<td>Command or Action</td>
</tr>
<tr>
<td>------</td>
<td>------------------</td>
</tr>
</tbody>
</table>
| **Step 2** | `password password`  
Example:  
Router(config-line)# `password 5dr4Hepw3` | Specifies a unique password for the console terminal line. |
| **Step 3** | `login`  
Example:  
Router(config-line)# `login` | Enables password checking at terminal session login. |
| **Step 4** | `exec-timeout minutes [seconds]`  
Example:  
Router(config-line)# `exec-timeout 5 30`  
Router(config-line)# | Sets the interval during which the EXEC command interpreter waits until user input is detected. The default is 10 minutes. Optionally, adds seconds to the interval value.  
The example provided here shows a timeout of 5 minutes and 30 seconds. Entering a timeout of 0 0 specifies never to time out. |
| **Step 5** | `exit`  
Example:  
Router(config-line)# `exit` | Exits line configuration mode to re-enter global configuration mode. |
| **Step 6** | `line [aux | console | tty | vty] line-number`  
Example:  
Router(config)# `line vty 0 4`  
Router(config-line)# | Specifies a virtual terminal for remote console access. |
| **Step 7** | `password password`  
Example:  
Router(config-line)# `password aldf2ad1` | Specifies a unique password for the virtual terminal line. |
| **Step 8** | `login`  
Example:  
Router(config-line)# `login` | Enables password checking at the virtual terminal session login. |
| **Step 9** | `end`  
Example:  
Router(config-line)# `end` | Exits line configuration mode, and returns to privileged EXEC mode. |
Example

The following configuration shows the command-line access commands. Note that transport input none is the default, but if SSH is enabled this must be set to ssh.

You do not have to input the commands marked default. These commands appear automatically in the configuration file that is generated when you use the show running-config command.

```
line console 0
exec-timeout 10 0
password 4youreyesonly
login
transport input none (default)
stopbits 1 (default)
line vty 0 4
password secret
login
```

Configuring Static Routes

Static routes provide fixed routing paths through the network. They are manually configured on the router. If the network topology changes, the static route must be updated with a new route. Static routes are private routes unless they are redistributed by a routing protocol.

To configure static routes, follow these steps.

**SUMMARY STEPS**

1. (Option 1) **ip route prefix mask {ip-address | interface-type interface-number [ip-address]}**
2. (Option 2) **ipv6 route prefix/mask {ipv6-address | interface-type interface-number [ipv6-address]}**
3. **end**

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Specifies a static route for the IP packets. (If you are configuring an IPv6 address, use the <strong>ipv6 route</strong> command described below.)</td>
</tr>
</tbody>
</table>
| (Option 1) **ip route prefix mask {ip-address | interface-type interface-number [ip-address]}** | Example: 
Router(config)# ip route 192.10.2.3 255.255.0.0 10.10.10.2 |
| (Option 2) **ipv6 route prefix/mask {ipv6-address | interface-type interface-number [ipv6-address]}** | Example: 
Router(config)# ipv6 route 2001:db8:2::/64 2001:db8:3::0 |
Exits global configuration mode and enters privileged EXEC mode.

Example:

<table>
<thead>
<tr>
<th>Step 3</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router(config)# end</td>
<td>Exits global configuration mode and enters privileged EXEC mode.</td>
<td></td>
</tr>
</tbody>
</table>

In the following configuration example, the static route sends out all IP packets with a destination IP address of 192.168.1.0 and a subnet mask of 255.255.255.0 on the Gigabit Ethernet interface to another device with an IP address of 10.10.10.2. Specifically, the packets are sent to the configured PVC.

You do not have to enter the command marked default. This command appears automatically in the configuration file generated when you use the running-config command.

```shell
! ip classless (default)
ip route 2001:db8:2::/64 2001:db8:3::0
```

Verifying Configuration

To verify that you have configured static routing correctly, enter the show ip route command (or show ipv6 route command) and look for static routes marked with the letter S.

When you use an IPv4 address, you should see verification output similar to the following:

```
Router# show ip route
Codes: C - connected, S - static, R - RIP, M - mobile, B - BGP
       D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, su - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2
       ia - IS-IS inter area, * - candidate default, U - per-user static route
       o - ODR, p - periodic downloaded static route

Gateway of last resort is not set

10.0.0.0/24 is subnetted, 1 subnets
C 10.108.1.0 is directly connected, Loopback0
S* 0.0.0.0/0 is directly connected, FastEthernet0
```

When you use an IPv6 address, you should see verification output similar to the following:

```
Router# show ipv6 route
IPv6 Routing Table - default - 5 entries
Codes: C - Connected, L - Local, S - Static, U - Per-user Static route
B - BGP, R - RIP, H - NHRP, I1 - ISIS L1
I2 - ISIS L2, IA - ISIS interarea, IS - ISIS summary, D - EIGRP
EX - EIGRP external, ND - ND Default, NDp - ND Prefix, DCE -
Destination
NDr - Redirect, O - OSPF Intra, OI - OSPF Inter, OE1 - OSPF ext 1
OE2 - OSPF ext 2, ON1 - OSPF NSSA ext 1, ON2 - OSPF NSSA ext 2
ls - LISP site, ld - LISP dyn-EID, a - Application

C 2001:DB8:3::/64 [0/0]
   via GigabitEthernet0/0/2, directly connected
S 2001:DB8:2::/64 [1/0]
   via 2001:DB8:3::1
```
Configuring Dynamic Routes

In dynamic routing, the network protocol adjusts the path automatically, based on network traffic or topology. Changes in dynamic routes are shared with other routers in the network.

Configuring Routing Information Protocol

To configure the RIP on a router, follow these steps.

**SUMMARY STEPS**

1. `router rip`
2. `version {1 | 2}`
3. `network ip-address`
4. `no auto-summary`
5. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> router rip</td>
<td>Enters router configuration mode, and enables RIP on the router.</td>
</tr>
<tr>
<td>Example: <code>Router(config)# router rip</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> version {1</td>
<td>2}</td>
</tr>
<tr>
<td>Example: <code>Router(config-router)# version 2</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> network ip-address</td>
<td>Specifies a list of networks on which RIP is to be applied, using the address of the network of each directly connected network.</td>
</tr>
<tr>
<td>Example: <code>Router(config-router)# network 192.168.1.1</code>  <code>Router(config-router)# network 10.10.7.1</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> no auto-summary</td>
<td>Disables automatic summarization of subnet routes into network-level routes. This allows subprefix routing information to pass across classful network boundaries.</td>
</tr>
<tr>
<td>Example: <code>Router(config-router)# no auto-summary</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> end</td>
<td>Exits router configuration mode, and enters privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td>Router(config-router) # end</td>
<td></td>
</tr>
</tbody>
</table>

**Example**

**Verifying Configuration**

To verify that you have configured RIP correctly, enter the `show ip route` command and look for RIP routes marked with the letter R. You should see an output similar to the one shown in the following example:

```
Router# show ip route
Codes:  C - connected, S - static, R - RIP, M - mobile, B - BGP
        D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
        N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
        E1 - OSPF external type 1, E2 - OSPF external type 2
        i - IS-IS, su - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2
        ia - IS-IS inter area, * - candidate default, U - per-user static route
        o - ODR, p - periodic downloaded static route

Gateway of last resort is not set

10.0.0.0/24 is subnetted, 1 subnets

C 10.108.1.0 is directly connected, Loopback0
R 3.0.0.0/8 [120/1] via 2.2.2.1, 00:00:02, Ethernet0/0/0
```

**Configuring Enhanced Interior Gateway Routing Protocol**

The Enhanced Interior Gateway Routing Protocol (EIGRP) is an enhanced version of the Interior Gateway Routing Protocol (IGRP) developed by Cisco. The convergence properties and the operating efficiency of EIGRP have improved substantially over IGRP, and IGRP is now obsolete.

The convergence technology of EIGRP is based on an algorithm called the Diffusing Update Algorithm (DUAL). The algorithm guarantees loop-free operation at every instant throughout a route computation and allows all devices involved in a topology change to synchronize. Devices that are not affected by topology changes are not involved in recomputations.

**Configuring the Serial Interface**

This section describes configuring serial interface management.

The IR1101 supports asynchronous serial interface protocols used for SCADA, Raw Socket, or reverse Telnet. It has a single serial interface, designated async 0/2/0. The serial interface is DTE only.

**Note**

Specifying an Asynchronous Serial Interface

To specify an asynchronous serial interface and enter interface configuration mode, use one of the following commands in global configuration mode.

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router(config)# interface async 0/2/0</td>
<td>Enters interface configuration mode.</td>
</tr>
</tbody>
</table>

Specifying Asynchronous Serial Encapsulation

The asynchronous serial interfaces support the following serial encapsulation methods:

- Raw-TCP
- Raw-UDP
- SCADA
- Encapsulation Relay

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router(config-if)# encapsulation {raw-tcp</td>
<td>raw-udp</td>
</tr>
</tbody>
</table>

Encapsulation methods are set according to the type of protocol or application you configure in the Cisco IOS software.

The remaining encapsulation methods are defined in their respective books and chapters describing the protocols or applications.

Configuring the Serial Port

To configure the serial port perform the steps in the following example:

IR1101# sh run int async 0/2/0
Building configuration...
Current configuration : 62 bytes
!
interface Async0/2/0
no ip address
encapsulation raw-tcp
end
IR1101# show line
Tty Line Typ Tx/Rx A Modem Roty AccO AccIUses Noise Overruns Int
* 0 0 CTY - - - - - 0 0 0/0 -
0/2/0 50 TTY 9600/9600 - - - - - 0 0 0/0 -
74 74 VTY - - - - - 3 0 0/0 -
75 75 VTY - - - - - 0 0 0/0 -
76 76 VTY - - - - - 0 0 0/0 -
77 77 VTY - - - - - 0 0 0/0 -
78 78 VTY - - - - - 0 0 0/0 -

Line(s) not in async mode -or- with no hardware support:

1-49, 51-73, 79-726
CHAPTER 4

Configuring Secure Shell

This section contains the following topics:

• Information About Secure Shell, on page 39
• How to Configure Secure Shell, on page 41
• Information about Secure Copy, on page 46
• Additional References, on page 48

Information About Secure Shell

Secure Shell (SSH) is a protocol that provides a secure, remote connection to a device. SSH provides more security for remote connections than Telnet does by providing strong encryption when a device is authenticated. This software release supports SSH Version 1 (SSHv1) and SSH Version 2 (SSHv2).

Prerequisites for Configuring Secure Shell

The following are the prerequisites for configuring the device for secure shell (SSH):

• For SSH to work, the switch needs an RSA public/private key pair.
• The Secure Shell (SSH) server requires an IPsec (Data Encryption Standard [DES] or 3DES) encryption software image; the SSH client requires an IPsec (DES or 3DES) encryption software image.
• Configure a hostname and host domain for your device by using the hostname and ip domain-name commands in global configuration mode. Use the hostname and ip domain-name commands in global configuration mode.

Restrictions for Configuring Secure Shell

The following are restrictions for configuring the IR1101 for secure shell.

• The router supports RSA authentication.
• SSH supports only the execution-shell application.
• The SSH server and the SSH client are supported only on Data Encryption Standard (DES) (56-bit) and 3DES (168-bit) data encryption software. In DES software images, DES is the only encryption algorithm available. In 3DES software images, both DES and 3DES encryption algorithms are available.
Cisco highly recommends the 3DES encryption as it is stronger.

- This software release supports IP Security (IPSec).
- The IR1101 supports the Advanced Encryption Standard (AES) encryption algorithm with a 128-bit key, 192-bit key, or 256-bit key. However, symmetric cipher AES to encrypt the keys is not supported.
- The login banner is not supported in Secure Shell Version 1. It is supported in Secure Shell Version 2, which Cisco recommends due to its better security.
- The -l keyword and userid : {number} {ip-address} delimiter and arguments are mandatory when configuring the alternative method of Reverse SSH for console access.

### SSH And Router Access

Secure Shell (SSH) is a protocol that provides a secure, remote connection to a device. SSH provides more security for remote connections than Telnet does by providing strong encryption when a device is authenticated. This software release supports SSH Version 1 (SSHv1) and SSH Version 2 (SSHv2). SSH functions the same in IPv6 as in IPv4. For IPv6, SSH supports IPv6 addresses and enables secure, encrypted connections with remote IPv6 nodes over an IPv6 transport.

### SSH Servers, Integrated Clients, and Supported Versions

The Secure Shell (SSH) Integrated Client feature is an application that runs over the SSH protocol to provide device authentication and encryption. The SSH client enables a Cisco device to make a secure, encrypted connection to another Cisco device or to any other device running the SSH server. This connection provides functionality similar to that of an outbound Telnet connection except that the connection is encrypted. With authentication and encryption, the SSH client allows for secure communication over an unsecured network.

The SSH server and SSH integrated client are applications that run on the switch. The SSH server works with the SSH client supported in this release and with non-Cisco SSH clients. The SSH client works with publicly and commercially available SSH servers. The SSH client supports the ciphers of Data Encryption Standard (DES), 3DES, and password authentication.

The SSH client functionality is available only when the SSH server is enabled.

User authentication is performed like that in the Telnet session to the device. SSH also supports the following user authentication methods:

- TACACS+
- RADIUS
- Local authentication and authorization
SSH Configuration Guidelines

Follow these guidelines when configuring the device as an SSH server or SSH client:

- An RSA key pair generated by an SSHv1 server can be used by an SSHv2 server, and the reverse.
- If you get CLI error messages after entering the `crypto key generate rsa` global configuration command, an RSA key pair has not been generated. Reconfigure the hostname and domain, and then enter the `crypto key generate rsa` command.
- When generating the RSA key pair, the message `No hostname specified` might appear. If it does, you must configure an IP hostname by using the `hostname` global configuration command.
- When generating the RSA key pair, the message `No domain specified` might appear. If it does, you must configure an IP domain name by using the `ip domain-name` global configuration command.
- When configuring the local authentication and authorization authentication method, make sure that AAA is disabled on the console.

- Setting Up the IR1101 to Run SSH, on page 41
- Configuring the Router for Local Authentication and Authorization, on page 44

How to Configure Secure Shell

Setting Up the IR1101 to Run SSH

Follow the procedure given below to set up your device to run SSH:

Before you begin

Configure user authentication for local or remote access. This step is required. For more information, see Related Topics below.

SUMMARY STEPS

1. `configure terminal`
2. `hostname hostname`
3. `ip domain-name domain_name`
4. `crypto key generate rsa`
5. `end`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
### Configuring Secure Shell

#### Configuring the SSH Server

Follow these steps to configure the SSH server:

![Note](image)

- This procedure is only required if you are configuring the device as an SSH server.

**SUMMARY STEPS**

1. `configure terminal`
2. `ip ssh version [2]`
3. `ip ssh {timeout seconds | authentication-retries number}`
4. Use one or both of the following:

### Command or Action | Purpose
--- | ---
IR1101# `configure terminal` |  

**Step 2** `hostname hostname`

**Example:**

IR1101(config)# `hostname your_hostname`

**Note** Follow this procedure only if you are configuring the device as an SSH server.

**Step 3** `ip domain-name domain_name`

**Example:**

IR1101(config)# `ip domain-name your_domain_name`

**Step 4** `crypto key generate rsa`

**Example:**

IR1101(config)# `crypto key generate rsa`

**Step 5** `end`

**Example:**

IR1101(config)# `end`

**Note** Follow this procedure only if you are configuring the device as an SSH server.
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: IR1101# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Example: IR1101(config)# ip ssh version 2</td>
<td>If you do not enter this command or do not specify a keyword, the SSH server selects the latest SSH version supported by the SSH client. For example, if the SSH client supports SSHv1 and SSHv2, the SSH server selects SSHv2.</td>
</tr>
<tr>
<td><strong>Step 3</strong> ip ssh {timeout seconds</td>
<td>authentication-retries number}</td>
</tr>
<tr>
<td>Example: IR1101(config)# ip ssh timeout 90 ip ssh authentication-retries 2</td>
<td>• Specify the time-out value in seconds; the default is 120 seconds. The range is 0 to 120 seconds. This parameter applies to the SSH negotiation phase. After the connection is established, the device uses the default time-out values of the CLI-based sessions. By default, up to five simultaneous, encrypted SSH connections for multiple CLI-based sessions over the network are available (session 0 to session 4). After the execution shell starts, the CLI-based session time-out value returns to the default of 10 minutes. • Specify the number of times that a client can re-authenticate to the server. The default is 3; the range is 0 to 5. Repeat this step when configuring both parameters.</td>
</tr>
<tr>
<td><strong>Step 4</strong> Use one or both of the following:</td>
<td>(Optional) Configures the virtual terminal line settings.</td>
</tr>
<tr>
<td>• line vty line_number [ending line number]</td>
<td>• Enters line configuration mode to configure the virtual terminal line settings. For the line_number and ending_line_number arguments, the range is from 0 to 15. • Specifies that the device prevents non-SSH Telnet connections, limiting the device to only SSH connections.</td>
</tr>
<tr>
<td>• transport input ssh</td>
<td></td>
</tr>

</table>

### Configuring the Router for Local Authentication and Authorization

You can configure AAA to operate without a server by setting the switch to implement AAA in local mode. The router then handles authentication and authorization. No accounting is available in this configuration.

Follow these steps to configure AAA to operate without a server by setting the router to implement AAA in local mode:

1. configure terminal
2. aaa new-model
3. aaa authentication login default local
4. aaa authorization exec local
5. aaa authorization network local
6. username name privilege level password encryption-type password
7. end

---

**SUMMARY STEPS**

---

**Note**

To secure the router for HTTP access by using AAA methods, you must configure the router with the `ip http authentication aaa` global configuration command. Configuring AAA authentication does not secure the router for HTTP access by using AAA methods.
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | `configure terminal`  
**Example:**  
IR1101# configure terminal | Enters global configuration mode. |
| Step 2 | `aaa new-model`  
**Example:**  
IR1101(config)# aaa new-model | Enables AAA |
| Step 3 | `aaa authentication login default local`  
**Example:**  
IR1101(config)# aaa authentication login default local | Sets the login authentication to use the local username database. The default keyword applies the local user database authentication to all ports. |
| Step 4 | `aaa authorization exec local`  
**Example:**  
IR1101(config-line)# aaa authorization exec local | Configures user AAA authorization, check the local database, and allow the user to run an EXEC shell. |
| Step 5 | `aaa authorization network local`  
**Example:**  
IR1101(config-line)# aaa authorization network local | Configures user AAA authorization for all network-related service requests. |
| Step 6 | `username name privilege level password encryption-type password`  
**Example:**  
IR1101(config-line)# username your_user_name privilege 1 password 7 secret567 | Enters the local database, and establishes a username-based authentication system. 
Repeat this command for each user.  
**a.** For `name`, specify the user ID as one word. Spaces and quotation marks are not allowed.  
**b.** (Optional) For `level`, specify the privilege level the user has after gaining access. The range is 0 to 15. Level 15 gives privileged EXEC mode access. Level 0 gives user EXEC mode access.  
**c.** For encryption-type, enter 0 to specify that an unencrypted password follows. Enter 7 to specify that a hidden password follows.  
**d.** For password, specify the password the user must enter to gain access to the switch. The password must be from |
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 7</strong> end</td>
<td>Exits line configuration mode and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>IR1101(config-line)# end</td>
<td></td>
</tr>
</tbody>
</table>

**Information about Secure Copy**

The Secure Copy Protocol (SCP) feature provides a secure and authenticated method for copying router configuration or router image files. SCP relies on Secure Shell (SSH), an application and a protocol that provide a secure replacement for the Berkeley r-tools.

**Prerequisites for Secure Copy**

The following are the prerequisites for configuring the device for secure shell (SSH):

- Before enabling SCP, you must correctly configure SSH, authentication, and authorization on the switch.
- Because SCP relies on SSH for its secure transport, the router must have an RSA key pair.
- SCP relies on SSH for security.
- SCP requires that authentication, authorization, and accounting (AAA) authorization be configured so the router can determine whether the user has the correct privilege level.
- A user must have appropriate authorization to use SCP.
- A user who has appropriate authorization can use SCP to copy any file in the Cisco IOS File System (IFS) to and from a switch by using the copy command. An authorized administrator can also do this from a workstation.

**Restrictions for Configuring Secure Copy**

- Before enabling SCP, you must correctly configure SSH, authentication, and authorization on the router.
- When using SCP, you cannot enter the password into the copy command. You must enter the password when prompted.

**Configuring Secure Copy**

To configure the Cisco IR1101 for Secure Copy (SCP) server-side functionality, perform the following steps.
### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `aaa new-model`
4. `aaa authentication login` `{default | list-name} method1 [ method2... ]`
5. `username name [privilege level] password encryption-type encrypted-password`
6. `ip scp server enable`
7. `exit`
8. `show running-config`
9. `debug ip scp`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device&gt; enable</td>
<td>- Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> aaa new-model</td>
<td>Sets AAA authentication at login.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# aaa new-model</td>
<td></td>

</tr>
<tr>
<td><strong>Step 5</strong> username name [privilege level] password encryption-type encrypted-password</td>
<td>Establishes a username-based authentication system.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# username superuser privilege 2 password 0 superpassword</td>
<td><strong>Note</strong> You may omit this step if a network-based authentication mechanism, such as TACACS+ or RADIUS, has been configured.</td>
</tr>
<tr>
<td><strong>Step 6</strong> ip scp server enable</td>
<td>Enables SCP server-side functionality.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# ip scp server enable</td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

#### Step 7
- **Command**: exit
- **Example**: `Device(config)# exit`
  - **Purpose**: Exits global configuration mode and returns to privileged EXEC mode.

#### Step 8
- **Command**: show running-config
- **Example**: `Device# show running-config`
  - **Purpose**: (Optional) Displays the SCP server-side functionality.

#### Step 9
- **Command**: debug ip scp
- **Example**: `Device# debug ip scp`
  - **Purpose**: (Optional) Troubleshoots SCP authentication problems.

### Additional References

The following sections provide references related to the SSH feature.

IR1101# **copy scp <somefile> your_username@remotehost:/<some/remote/directory>**
New Features for Cisco IOS-XE 17.1.1

This section contains the following topics:

- Support for the X25 over TCP (XOT), on page 49
- Support for YANG Data Models (Call-home), on page 49
- Yang Data Model Support for Scada, on page 50
- Support for Model Driven support for GNMI Telemetry Dial-In, on page 50
- Option to Enable or Disable USB Access, on page 50
- Day 0 Web User Interface, on page 50

Support for the X25 over TCP (XOT)

X.25 is an ITU standard for packet switching Wide Area Network (WAN). This is used in the Telecommunication industry over serial interfaces that are replaced by IP Network. An X25 connection can be established by using a PAD connection similar to Telnet/SSH. The IR1101 router has only one asynchronous serial interface where features of X25 are not supported. However, we can communicate to the X25 edge devices using by using feature TCP over X25 (XOT). With XOT, we can directly establish a PAD connection to X25 edge devices. Also, we can assign default or customized profiles to the access-groups by changing various parameters of X25 packets.

For additional information about XOT for IOS-XE, see the following:

Wide-Area Networking Configuration Guide: X.25 and LAPB, Cisco IOS XE

Support for YANG Data Models (Call-home)

The YANG models supported for the call-home feature are similar to the earlier releases of Cisco-IOS-XE, and the same is supported on 17.1 release of IOS-XE on IR1101. The following references are available for earlier YANG models:

https://github.com/YangModels/yang/tree/master/vendor/cisco/xe/1651

For additional information about call-home for IOS-XE, see the following:

Software Activation Configuration Guide, Cisco IOS XE Release 3S
Yang Data Model Support for Scada

The Cisco IOS XE 17.1.1 introduces support for the Cisco IOS XE YANG model for the Scada System. Previous releases already provided Yang models in other areas.

For configuration information, refer to Information About SCADA, on page 173.

Support for Model Driven support for GNMI Telemetry Dial-In

Similar to YANG models, there is support on IOS-XE for open source models defined by Google and is referred as Google Network Management Interface (GNMI). Configurations of GNMI can be verified either with Secure or Insecure Mode.

• Secure Mode
Secure Mode establishes secure connection using OpenSSL certificates between client and server. It sends GNMI telemetry updates using open source gnmi cli tool.

• Insecure Mode
Insecure Mode sends GNMI telemetry updates between client and server using open source pygnmi tool.

For additional information about GNMI Telemetry see the following reference:
Programmability Configuration Guide, Cisco IOS XE

Option to Enable or Disable USB Access

USB flash drives offer inexpensive and easy storage space for the routers to store the images, configuration files and other files. However, the USB port could be considered a potential security risk. Functionality was added to enable or disable the USB access. Details can be found at Option to Enable or Disable USB Access, on page 55.

Day 0 Web User Interface

Effective with IOS-XE Release 17.1.1, the Day 0 Web User Interface (WebUI) will be supported on the IR1101. Day 0 WebUI is supported only on LAN ports. These are FastEthernet ports 0/0/1 – 0/0/4 on the IR1101. Connect either a Windows, Linux or Mac PC/Laptop to one of the LAN ports of the IR1101 and boot the router on Day 0. The PC/Laptop should be configured to obtain an IP address through DHCP. Details can be found at Day 0 Web User Interface, on page 79.
Installing the Software

Installing software on the router involves installing a consolidated package (bootable image). This consists of a bundle of subpackages (modular software units), with each subpackage controlling a different set of functions.

These are the two main methods to install the software:

- Managing and Configuring a Router to Run Using Consolidated Packages — This method allows for individual upgrade of subpackages and generally has reduced boot times compared to the method below. Use this method if you want to individually upgrade a module's software.
- Managing and Configuring a Router to Run Using Individual Packages — This simple method is similar to a typical Cisco router image installation and management that is supported across Cisco routers.

It is better to upgrade software in a planned period of maintenance when an interruption in service is acceptable. The router needs to be rebooted for a software upgrade to take effect.

Licensing

Cisco Software Licensing

Cisco software licensing consists of processes and components to activate Cisco IOS software feature sets by obtaining and validating Cisco software licenses.
You can enable licensed features and store license files in the bootflash of your router. Licenses pertain to consolidated packages, technology packages, or individual features.

The IR1101 uses Smart Licensing, which is discussed in detail in the next chapter.

The IR1101 does not support the Right to Use licenses, and supports only the Specific License Reservation (SLR)

## Consolidated Packages

To obtain software images for the router, go to: https://software.cisco.com/download/home/286319772/type/282046477/release/Gibraltar-16.11.1

---

### Note

All of the IOS-XE feature set may not apply to the IR1101. Some features may not have been implemented yet, or are not appropriate for this platform.

An image-based license is used to help bring up all the subsystems that correspond to a license. This license is enforced only at boot time.

One of the following image-based licenses can be pre-installed on the IR1101 router:

- Network-Essentials
- Network-Advantage

---

### Note

## Network-Essentials

The **Network-Essentials** technology package includes the baseline features. It also supports security features.

The **Network-Essentials_npe** technology package (npe = No Payload Encryption) includes all the features in the Network-Essentials technology package without the payload encryption functionality. This is to fulfill export restriction requirements. The Network-Essentials_npe is available only in the Network-Essentials_npe image. The difference in features between the Network-Essentials package and the Network-Essentials_npe package is therefore the set of payload encryption features such as IPsec and Secure VPN.

## Network-Advantage

The **Network-Advantage** technology package includes all crypto features.

The **Network-Advantage_npe** package (npe = No Payload Encryption) includes all the features in the **Network-Advantage** technology package without the payload-encryption functionality. This is to fulfill export restriction requirements. The **Network-Advantage_npe** package is available only in the **Network-Advantage_npe** image. The difference in features between the **Network-Advantage** package and the **Network-Advantage_npe** package is therefore the set of payload-encryption-enabling features such as IPsec and Secure VPN.
Related Documentation

For further information on software licenses, see Information About Smart Licensing, on page 59.

How to Install the Software for Cisco IOS XE

To install the software, use one of the following methods to use the software from a consolidated package or an individual package. Also see Overview section.

- Managing and Configuring a Router to Run Using a Consolidated Package section
- Managing and Configuring a Router to Run Using Individual Packages section
- Configuring a Router to Boot the Consolidated Package via TFTP Using the boot Command: Example section

Installing the Cisco IOS XE Release

When the device boots up with Cisco IOS XE image for the first time, the device checks the installed version of the ROMMON, and upgrades if the system is running an older version. During the upgrade, do not power cycle the device. The system automatically power cycles the device after the new ROMMON is installed. After the installation, the system will boot up with the Cisco IOS XE image as normal.

Note

When the device boots up for first time and if the device requires an upgrade, the entire boot process may take several minutes. This process will be longer than a normal boot due to the ROMMON upgrade.

The following example illustrates the boot process of a consolidated package:

```
Router# configure terminal
Router(config)# boot sys bootflash:ir1101-universalk9.16.10.01.SPA.bin
Router(config)# config-register 0x2102
Router(config)# exit
Nov 7 00:07:06.784: %SYS-5-CONFIG_I: Configured from console by console
Router# show run inc license
license udi pid IR1101-K9 sn FCW2150TH0F
license boot level network-advantage
Router# reload
? /notverify Don't verify file signature before reload.
/verify Verify file signature before reload.
at Reload at a specific time/date
cancel Cancel pending reload
in Reload after a time interval
pause Pause during reload
reason Reload reason
<cr> <cr>
Router# reload /verify
System configuration has been modified. Save? [yes/no]: yes
Building configuration...

[OK]
Nov 7 00:08:48.101: %SYS-2-PRIVCFG_ENCRYPT: Successfully encrypted private config file
Verifying file integrity of bootflash:/ir1101-universalk9.16.10.01.SPA.bin...........
```

---

Cisco IR1101 Integrated Services Router Software Configuration Guide 53
ROMMON Images

A ROMMON image is a software package used by ROM Monitor (ROMMON) software on a router. The software package is separate from the consolidated package normally used to boot the router.

An independent ROMMON image (software package) may occasionally be released and the router can be upgraded with the new ROMMON software. For detailed instructions, see the documentation that accompanies the ROMMON image.

Note

A new version of the ROMMON image is not necessarily released at the same time as a consolidated package for a router.

File Systems

The following table provides a list of file systems that can be seen on the Cisco IR1101 router.

Table 7: Router File Systems

<table>
<thead>
<tr>
<th>File System</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bootflash:</td>
<td>Boot flash memory file system.</td>
</tr>
<tr>
<td>File System</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-------------</td>
</tr>
<tr>
<td>flash:</td>
<td>Alias to the boot flash memory file system above.</td>
</tr>
<tr>
<td>cns:</td>
<td>Cisco Networking Services file directory.</td>
</tr>
<tr>
<td>nvram:</td>
<td>Router NVRAM. You can copy the startup configuration to NVRAM or from NVRAM.</td>
</tr>
<tr>
<td>obfl:</td>
<td>File system for Onboard Failure Logging (OBFL) files.</td>
</tr>
<tr>
<td>system:</td>
<td>System memory file system, which includes the running configuration.</td>
</tr>
<tr>
<td>tar:</td>
<td>Archive file system.</td>
</tr>
<tr>
<td>tmpsys:</td>
<td>Temporary system files file system.</td>
</tr>
<tr>
<td>usbflash0:</td>
<td>The Universal Serial Bus (USB) flash drive file systems.</td>
</tr>
</tbody>
</table>

Note: The USB flash drive file system is visible only if a USB drive is installed in the USB port.

Use the `?` help option if you find a file system that is not listed in the table above.

## Option to Enable or Disable USB Access

USB flash drives offer inexpensive and easy storage space for the routers to store the images, configuration files and other files.

**Note:** The IR1101 supports ext2 and vfat file systems for USB flash drives.

The IR1101 supports hot plug/unplug of USB flash drives. To access the USB flash drive, insert the device into Router's USB interface. Once the USB is recognized, an alert message is seen on the console:

Aug 1 11:08:53.198 PDT: %IOSD_INFRA-6-IFS_DEVICE_OIR: Device usbflash0 added

After this message is seen, the USB flash drive is accessible. Users can access the USB contents using the `dir usbflash0:` command:

Device#`dir usbflash0:`
Directory of usbflash0:/
  5 drwx 512 Aug 23 2019 10:42:18 -07:00 System Volume Information
  6 -rwx 35 Aug 27 2019 17:40:38 -07:00 test.txt
206472192 bytes total (206470144 bytes free)
Device#

Contents can be copied to and from the USB flash drive using the `copy` command. Once the copy is complete, a log message showing number of bytes copied is displayed.

Device#`copy flash:test.txt usbflash0:`
Destination filename [test.txt]? <Enter>
Copy in progress...C
35 bytes copied in 0.020 secs (1750 bytes/sec)
Device#
While hot plug/unplug of a USB flash drive is supported, the functionality comes with security vulnerabilities. To prevent users from copying sensitive information to the USB flash drive, USB enable/disable functionality has been added.

By default, the USB flash drive is enabled. If a user wishes to disable USB, they can do so using the disable command:

```
Device(config)# platform usb disable

Device(config)# end
```

Once the USB flash drive has been disabled, the file system is not shown on the Device and syslog messages will not be displayed when the USB is inserted. Users will not be able to access the contents of the USB.

For example:

```
Device# dir usbflash0:
% Invalid input detected at '^' marker.
Device#
```

The USB is enabled by issuing a `no` with the disable command:

```
Device(config)# no platform usb disable

Device(config)# end
```

The USB status can be displayed using the following command:

```
Device# show platform usb status
USB enabled
Device#
```

The USB port could be considered a potential security risk. If you wish to disable the USB port, use these steps:

```
Configure terminal
platform usb disable
exit

show platform usb
```

# Autogenerated File Directories and Files

This section discusses the autogenerated files and directories that can be created, and how the files in these directories can be managed.
Table 8: Autogenerated Files

<table>
<thead>
<tr>
<th>File or Directory</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>crashinfo files</td>
<td>Crashinfo files may appear in the bootflash: file system. These files provide descriptive information of a crash and may be useful for tuning or troubleshooting purposes. However, the files are not part of router operations, and can be erased without impacting the functioning of the router.</td>
</tr>
<tr>
<td>core directory</td>
<td>The storage area for .core files. If this directory is erased, it will automatically regenerate itself at bootup. The .core files in this directory can be erased without impacting any router functionality, but the directory itself should not be erased.</td>
</tr>
<tr>
<td>managed directory</td>
<td>This directory is created on bootup if a system check is performed. Its appearance is completely normal and does not indicate any issues with the router.</td>
</tr>
<tr>
<td>tracelogs directory</td>
<td>The storage area for trace files. Trace files are useful for troubleshooting. If the Cisco IOS process fails, for instance, users or troubleshooting personnel can access trace files using diagnostic mode to gather information related to the Cisco IOS failure. Trace files, however, are not a part of router operations, and can be erased without impacting the router's performance.</td>
</tr>
</tbody>
</table>

Important Notes About Autogenerated Directories

Important information about autogenerated directories include:

- Autogenerated files on the bootflash: directory should not be deleted, renamed, moved, or altered in any way unless directed by Cisco customer support.

  Note
  Altering autogenerating files on the bootflash: may have unpredictable consequences for system performance.

- Crashinfo files and files in the core and tracelogs directory can be deleted.

Flash Storage

Subpackages are installed to local media storage, such as flash. For flash storage, use the `dir bootflash:` command to list the file names.

  Note
  Flash storage is required for successful operation of a router.
LED Indicators

For information on LEDs on the router, see "LED Indicators" in the "Product Overview" section of the Hardware Installation Guide for the Cisco IR1101 Industrial Integrated Services Router.

To monitor the LED status of the system, the alarm and interface ports, the show LED command line is supported in IOS mode.

Router# show LED

Information About Smart Licensing

Smart Licensing is a cloud-based, software license management solution that allows you to manage and track the status of your license, hardware and software usage trends. Smart Licensing also enables you to automate time-consuming, manual licensing tasks. Smart Licensing helps simplify three core functions:

- Purchasing: The software that you have installed in your network can automatically self-register themselves, without using traditional licenses like Product Activation Keys (PAKs), CSL, Honor Based License (HBL) or Right-to-Use (RTU).
- Management: You can automatically track activations against your license entitlements. Additionally, there is no need to install the license file on every node. You can create license pools (logical grouping of licenses) to reflect your organization structure. Smart Licensing offers you Cisco Smart Software Manager, a centralized portal that enables you to manage all your Cisco software licenses from one centralized website.
• Reporting: Through the portal, Smart Licensing offers an integrated view of the licenses you have purchased and what has been actually deployed in your network. You can use this data to make better purchase decisions, based on your consumption.

Overview of Cisco Smart Software Manager

Cisco Smart Software Manager enables you to manage all of your Cisco Smart software licenses from one centralized website. With Cisco Smart Software Manager, you organize and view your licenses in groups called virtual accounts (collections of licenses and product instances). Use the Cisco Smart Software Manager to do the following tasks:

• Create, manage or view virtual accounts.
• Create and manage Product Instance Registration Tokens.
• Transfer licenses between virtual accounts or view licenses.
• Transfer, remove or view product instances.
• Run reports against your virtual accounts.
• Modify your email notification settings.
• View overall account information.

The Cisco Smart Software Manager Help describes the procedures for carrying out these tasks. You can access the Cisco Smart Software Manager on https://software.cisco.com/#, by clicking Smart Software Licensing link under License tab. Login using the username and password provided by Cisco.

Note
Use Chrome 32.0, Firefox 25.0 or Safari 6.0.5 web browsers to access the Cisco Smart Software Manager. Also, ensure that Javascript 1.5 or a later version is enabled in your browser.

Deployment Options for IR1101 Licensing

The only supported licensing deployment for IR1101 is Specific License Reservation.

Specific License Reservation

Specific License Reservation (SLR) allows devices, in highly secure networks, to be associated with smart licenses without connecting to Cisco Smart Software Manager. Excess Licenses can be reserved in Cisco Smart Software Manager and associated with devices with their unique device information (UDI).

Note
Pre-authorization is required from Cisco to enable Specific License Reservation.
Specific License Reservations provides limited or no functionality to certain Smart Licensing features such as transfer of licenses between products, license usage, asset management etc.

To Register a Device in Cisco Smart Software Manager

To register a device with token in Cisco Smart Software Manager, perform this procedure:

**SUMMARY STEPS**

1. `enable`
2. `license smart register token_ID`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: <code>device&gt; enable</code></td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>license smart register token_ID</code></td>
<td>Registers the device with the back-end server. Registration of the device changes the License Authorization Status from Eval Mode to Authorized shown in “show license summary”.</td>
</tr>
<tr>
<td>Example: <code>device# license smart register idtoken NmE1Yzg0OWMtYmJ4</code></td>
<td></td>
</tr>
</tbody>
</table>
Enabling Specific License Reservation and Generating a Request Code

To enable Specific License Reservation and to generate a request code, perform this procedure:

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **license smart reservation**
4. **exit**
5. **license smart reservation request local**
6. **license smart reservation install {auth-code | file <filename>]**
7. **license smart reservation cancel**

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>enable</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;<code>device&gt; enable</code>&lt;br&gt;Enables privileged EXEC mode.&lt;br&gt;Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>configure terminal</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;<code>device# configure terminal</code>&lt;br&gt;Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>license smart reservation</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Enables Specific License Reservation. Use the no form of this command to disable Specific License Reservation.</td>
</tr>
</tbody>
</table>
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>device(config)# license smart reservation</td>
<td>Exits configuration mode, and returns the device to global configuration mode.</td>
</tr>
</tbody>
</table>

### Step 4

**Example:**

```
device(config)# exit
```

### Step 5

**license smart reservation request local**

**Example:**

```
device# license smart reservation request local
```

Generates a request code to be entered in the Cisco Smart Software Manager. The request code can be generated for the following:

- **all** - Generates a request code for all connected devices.
- **local** - Generates a request code for the active device.
- **universal** - Generates a universal request code. This mode of request is deprecated and will not be supported for further releases.

### Step 6

**license smart reservation install [auth-code | file <filename>]**

**Example:**

```
device# license smart reservation install
```

To install the authorization code which is generated by the CSSM server, with the given request code generated via the command "license smart reservation request local".

### Step 7

**license smart reservation cancel**

**Example:**

```
device# license smart reservation cancel
```

This command is used to cancel the reservation request made via the command "license smart reservation request local", and transition back to an unregistered state.

---

# Reserving a License in Cisco Smart Software Manager

**Step 1**
Login to Cisco Smart Software Manager at [https://software.cisco.com/#](https://software.cisco.com/#).

**Step 2**
Select Smart Software Licensing then the Inventory tab.
You must log in to the portal using a Cisco provided username and password.

**Step 3**
From the Virtual Account sub-page, select the Licenses tab and click on the License Reservation button as shown in the following image.

**Step 4**
On the Smart License Reservation page, enter the request code generated by the device from the `license smart reservation request local` command. Hit the Enter key then click on the Next button.
Step 5  Enable the **Reserve a Specific License** checkbox. For the required license, enter the number in the Quantity to Reserve field (normally 1 for a device). In the following example we enter “1” for Cisco IR1101 Network Advantage and “1” for Cisco IR1101 Network Essentials”. Then click the **Next** button.

**Figure 6: Select Licenses**

### Smart License Reservation

<table>
<thead>
<tr>
<th>License</th>
<th>Description</th>
<th>Expires</th>
<th>Available</th>
<th>Quantity To Reserve</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IR1101 IPBase License</td>
<td>Cisco IP Base Smart License for Cisco IR1101 Ind...</td>
<td>2019-Dec-10</td>
<td>9</td>
<td></td>
</tr>
<tr>
<td>Cisco IR1101 Security License</td>
<td>Cisco Security Smart License for Cisco IR1101 Ind...</td>
<td>2018-Dec-11</td>
<td>9</td>
<td></td>
</tr>
<tr>
<td>Cisco IR1101 Network Advantage</td>
<td>Cisco IP Base Smart License for Cisco IR1101 Ind...</td>
<td>2018-Dec-10</td>
<td>10</td>
<td></td>
</tr>
<tr>
<td>Cisco IR1101 Security with No Payload Encryption</td>
<td>Cisco Security No Payload Encryption Smart Lic...</td>
<td>2018-Dec-10</td>
<td>10</td>
<td></td>

<tr>
<td>Cisco IR1101 Network Essentials</td>
<td>Cisco IP Base Smart License for Cisco IR1101 Ind...</td>
<td>2018-Dec-10</td>
<td>10</td>
<td></td>
</tr>
</tbody>
</table>

Step 6  The **Review and Confirm** tab is displayed. Make sure that you have the correct licenses reserved. When done, click the **Generate Authorization Code** button.
Step 7

Once the authorization code is generated, click either the **Download as File** or the **Copy to Clipboard** button for use in the `license smart reservation install [auth-code] file <filename>` command.

**Figure 8: Authorization Code**

![Authorization Code Image]

The Authorization Code below has been generated for this product instance. Enter this code into the Smart Licensing settings for the product, to enable the licensed features.
Registering Device with Specific License Reservation

To register device with specific license reservation, perform this procedure:

**SUMMARY STEPS**

1. **enable**
2. **license smart reservation install** `auth-code | auth-code-file`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>
<td>Example: <code>device&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> license smart reservation install `auth-code</td>
<td>auth-code-file`</td>
</tr>
<tr>
<td>Example: <code>device&gt; license smart reservation install file bootflash:network-advantage_auth_code.txt</code></td>
<td></td>
</tr>
</tbody>
</table>
# Monitoring Smart Licensing Configuration

Use the privileged EXEC commands in the following table to monitor your PIM snooping configurations.

### Table 9: Commands to Monitor Smart Licensing Configuration

<table>

Device> enable
Device# license smart register idtoken NmE1Yzg0OWMtYmJ4
license smart register: Registration process is in progress. Please check the syslog for the registration status and result.

IR1101 Licensing for Cisco IOS-XE

With IOS-XE release 16.10.1 and above, the IR1101 supports boot level licenses Network-Essentials and Network-Advantage. Both of these licenses are available in the universalk9 and universalk9_npe images. With release 16.10.1 and above, Network-Advantage is a superset of Network-Essentials, so the license are mutually exclusive and Network-Essentials will be the default license level. Displaying the license consumption and boot level configuration will have either Network-Essentials or Network-Advantage but not both at the same time.

There are two important things to consider with licensing the IR1101:

If you have performed a write erase, or used the reset button, you will need to add the license.

```
IR1101# config term
IR1101# license smart reservation
```

If you perform a factory reset all, this will erase the license with no way to recover it unless you get the authorization file from the smart account.

The following shows an example of the different licensing:

```

Smart Licensing Status: UNREGISTERED/EVAL EXPIRED

cisco IR1101-K9 (ARM64) processor (revision 1.2 GHz) with 708327K/6147K bytes of memory.
Processor board ID FCM222700KS
3 Virtual Ethernet interfaces
4 FastEthernet interfaces
2 Gigabit Ethernet interfaces
1 Serial interface
1 terminal line
Smart Licensing Support for Evaluation Expired Syslog after 365 Days

For the 16.11.1 release, evaluation expired syslog messages will be displayed after 365 days, and it is enabled by default. Customers will not see the evaluation period syslog messages for one year. There are no CLI or show command changes.

This feature changes only when the evaluation syslog messages are sent if the product instance is not registered, for example, the license usage is in Evaluation Mode. The actual 90-day evaluation period will not change. The only change is when these evaluation period syslog messages are sent, which is one year from the date the license has actually expired.

This one-year period will include the 90-day evaluation period, such that after the evaluation period expires, the smart agent will not send the evaluation mode syslog messages for another 275 calendar days.

The 90-day evaluation period will still trigger the following events:

- After 90 days of usage the evaluation period will expire.
- The show usage and show status CLI commands will show that the evaluation period has expired.

The following three evaluation period syslog messages are at issue. With the previous 90-day evaluation period, these are sent only if the product instance is not registered. However, with the evaluation expired syslog after 365-days in effect, none of these messages are logged in the syslog.

\%SMART_LIC-3-EVAL_EXPIRED

- Evaluation period just expired.
- Sent at the time the evaluation period expires

\%SMART_LIC-4-EVAL_WILL_EXPIRE_WARNING

- Evaluation period will expire soon.
- Currently sent prior to expiration on the following schedule.
  - 60 days before.
  - 30 days before.
  - Every week in the last month
  - Every day in the last week
  - Every hour on the last day.
%SMART_LIC-4-EVAL_EXPIRED_WARNING

- The evaluation period expired in the past.
- Sent once per week after the expiration. Includes the timestamp of the expiration.

Licensing Event History Logging

This feature will always be on for continuous logging of events, and available across a reboot. These logs will be independent of btrace, and will contain:

- Boot log
- Registration & Renewal log
- Authorization log
- The regular log will contain all of the information.

This event history logging would be present across all the subsystems like smart agent, smart licensing infrastructure and platforms.

To display the licensing event history log, execute the `show license eventlog` CLI.

Sample output from the CLI:

```
Router# show license eventlog
**** Event Log ****

```
Web User Interface (WebUI)

This section contains the following topics:

- Day 0 Web User Interface, on page 79

Day 0 Web User Interface

**Note**: A Day 0 configuration is defined as a device that is fresh out of the box with no startup-configuration. Effective with IOS-XE Release 17.1.1, the Day 0 Web User Interface (WebUI) will be supported on the IR1101. Day 0 WebUI is supported only on LAN ports. These are FastEthernet ports 0/0/1 – 0/0/4 on the IR1101. Connect either a Windows, Linux or Mac PC/Laptop to one of the LAN ports of the IR1101 and boot the router on Day 0. The PC/Laptop should be configured to obtain an IP address through DHCP.

Once the router boots up in Day 0, the PC/Laptop will acquire IP address in 192.168.1.x network and can access WebUI using the IP address of 192.168.1.1 with any browser. After the configuration is applied through the WebUI, the router will display the message "Day 0 config done. Stopping autoinstall".

---

**Note**

Issue a `write memory` command once the configuration is applied through the WebUI.

Configuration Notes

The following are limitationto the Day 0 feature:

- The WebUI is not supported on the GigabitEthernet 0/0/0 port. It is only supported on the LAN ports 0/0/1 – 0/0/4.
- Plug and Play (PNP) cannot be used if router is being used to configure using Day 0 WebUI as PNP will be aborted once the configuration is applied through Day 0 WebUI.
- Starting from release 17.1.2, an explicit `write memory` is not needed once config is applied through WebUI.

Configuring Your Computer to Connect to the Router

The following section provides guidance for configuring your computer to properly interface with the IR1101.
You can access the application from a client web browser. Ensure that the following web client requirements are met:

- **Hardware**—A Mac (OS version 10.9.5) or Windows (OS version 10) laptop or desktop compatible with one of the following tested and supported browsers:
  - Google Chrome 59 or later
  - Mozilla Firefox 54 or later
  - Apple Safari 10 or later
  - Microsoft Edge browser
- **Display resolution**—We recommend that you set the screen resolution to 1280 x 800 or higher.

## Windows Users

Navigate to Registry Edit -> HKEY_LOCAL_MACHINE -> SYSTEM -> CurrentControlSet -> Services 'TCP/IP -> Interfaces Add a binary file and name it DhcpClientIdentifier then modify the data as 7765627569 (See #1) in Figure 9: Registry Editor, on page 80.

**Figure 9: Registry Editor**

Make sure the interface that you have connected is the interface where this file is added. There will be many other interfaces so sometimes it becomes difficult to identify the interface. An easy way to find out is to configure a dummy IP address on interface that is connected and just try to see which Interface acquires that IP address in the registry edit.

## Mac Users

Navigate to System Preference -> Network and then select the interface which is connected. Click advanced. Under advanced, Select Configure IPv4. Beside Configure IPv4 select Using DHCP (See #1 in Figure 10: Mac Interface Configuration, on page 81.) Beside DHCP Client ID enter webui (See #2 in Figure 10: Mac Interface Configuration, on page 81.)

Click OK.
Linux Users

Navigate to **Edit Connections**. Select the Interface and go to **IPv4 settings**. While in this window, configure the following:

Ip address acquire method as Automatic (DHCP) - (See #1 in Figure 11: Editing Wired Connection in UBUNTU, on page 82.)

DHCP Client ID as webui (See #2 in Figure 11: Editing Wired Connection in UBUNTU, on page 82.)
Configuring the WebUI through the Browser

The following steps guide you through the process of using the browser on your PC/laptop to configure the WebUI.

**SUMMARY STEPS**

1. Open your browser and enter 192.168.1.1 in the address bar. The Login Screen appears. Enter the Username `webui` and the Password `cisco`. Then click **Log In**.
2. The Welcome Screen appears. Select Advanced Mode or Basic Mode. Basic Mode allows for configuring Basic settings, LAN, and a Primary WAN. Advanced Mode allows you to configure an additional Backup WAN, AVC, as well as additional settings. For the purposes of this guide, Basic Mode is used. Select **Basic Mode**, then click **Go To Account Creation Page**.
3. The Create New Account Screen appears. Create a new Login Name and Password to access the WebUI. Click **Create and Launch Wizard**.
4. The Basic Settings Screen appears. Provide a Router Name (hostname), Domain Name, Time Zone and Date & Time Mode. Click **LAN SETTINGS**.
5. The LAN Configuration Screen appears. Enter the `webui dhcp` Pool Name, VLAN interface IP address, and select the interface that is connected to your laptop from the list of available interfaces. Click **PRIMARY WAN SETTINGS**.
6. The PRIMARY WAN SETTINGS Screen appears. Configure the WAN interface by selecting the WAN Type and Interface from the available options. Next enter your DNS IP address information and select Enable/Disable NAT. Click Day 0 Config Summary.

7. The Review Summary Screen appears. Verify your entries before applying the configuration.

8. (Optional) You can click on CLI Preview to see the Configuration that is being applied to the router. Close the CLI Preview and if you are ready, Click Submit.

9. After clicking on Submit, a dialog box will appear which informs you that the configuration has been applied successfully. The new WebUI ip address is also presented.

10. If you have web connectivity, the device will try to connect. It is recommended that you close the browser session and move to the newly configured WebUI ip address.

**DETAILED STEPS**

**Step 1**
Open your browser and enter 192.168.1.1 in the address bar. The Login Screen appears. Enter the Username `webui` and the Password `cisco`. Then click Log In.

*Figure 12: Login Screen*

**Step 2**
The Welcome Screen appears. Select Advanced Mode or Basic Mode. Basic Mode allows for configuring Basic settings, LAN, and a Primary WAN. Advanced Mode allows you to configure an additional Backup WAN, AVC, as well as additional settings. For the purposes of this guide, Basic Mode is used. Select Basic Mode, then click Go To Account Creation Page.
**Step 3**  
The Create New Account Screen appears. Create a new Login Name and Password to access the WebUI. Click **Create and Launch Wizard**.

**Example:**

**Step 4**  
The Basic Settings Screen appears. Provide a Router Name (hostname), Domain Name, Time Zone and Date & Time Mode. Click **LAN SETTINGS**.
Step 5

The LAN Configuration Screen appears. Enter the webui_dhcp Pool Name, VLAN interface IP address, and select the interface that is connected to your laptop from the list of available interfaces. Click PRIMARY WAN SETTINGS.

Step 6

The PRIMARY WAN SETTINGS Screen appears. Configure the WAN interface by selecting the WAN Type and Interface from the available options. Next enter your DNS IP address information and select Enable/Disable NAT. Click Day 0 Config Summary.
Step 7  
The Review Summary Screen appears. Verify your entries before applying the configuration.

Step 8  
(Optional) You can click on **CLI Preview** to see the Configuration that is being applied to the router. Close the CLI Preview and if you are ready, Click **Submit**.
Step 9  
After clicking on Submit, a dialog box will appear which informs you that the configuration has been applied successfully. The new WebUI ip address is also presented.

Step 10  
If you have web connectivity, the device will try to connect. It is recommended that you close the browser session and move to the newly configured WebUI ip address.
Figure 21: Test VLAN Connection Screen
CHAPTER 9

Configuring Ethernet Switch Ports

This chapter contains the following sections:

• Configuring VLANs, on page 89
• VLAN Trunking Protocol (VTP), on page 90
• Configuring 802.1x Authentication, on page 91
• Configuring Spanning Tree Protocol, on page 92
• Configuring MAC Address Table Manipulation, on page 93
• Configuring Switch Port Analyzer, on page 94
• Configuring IGMP Snooping, on page 95

Configuring VLANs

A VLAN is a switched network that is logically segmented by function, project team, or application, without regard to the physical locations of the users. VLANs have the same attributes as physical LANs, but you can group end stations even if they are not physically located on the same LAN segment. Any switch port can belong to a VLAN, and unicast, broadcast, and multicast packets are forwarded and flooded only to end stations in the VLAN. Each VLAN is considered a logical network, and packets destined for stations that do not belong to the VLAN must be forwarded through a router.

On the IR1101, all the Fast Ethernet ports are set up in vlan1, which does not need to be created. The default for the Gigabit Ethernet port (gi0/0/0) is Layer 3. If needed, the Gigabit Ethernet port (gi0/0/0) could be set up as Layer 2 and added into vlan1.

Note

On the Expansion Module, GigabiEthernet 0/0/5 is in VLAN 1 by default, and is an SFP.

For example:

# config terminal
interface gi0/0/0
switchport
exit

The following is an example of a vlan configuration:

IR1101#show vlan
VLAN Name       Status   Ports
-------------   --------   ---------------
1   default     active     Fa0/0/1, Fa0/0/2, Fa0/0/3, Fa0/0/4
### VLAN Trunking Protocol (VTP)

VTP is a Layer 2 messaging protocol that maintains VLAN configuration consistency by managing the addition, deletion, and renaming of VLANs on a network-wide basis. VTP minimizes misconfigurations and configuration inconsistencies that can cause several problems, such as duplicate VLAN names, incorrect VLAN-type specifications, and security violations.

Before you create VLANs, you must decide whether to use VTP in your network. Using VTP, you can make configuration changes centrally on one or more switches and have those changes automatically communicated to all the other switches in the network. Without VTP, you cannot send information about VLANs to other switches. VTP is designed to work in an environment where updates are made on a single switch and are sent through VTP to other switches in the domain. It does not work well in a situation where multiple updates to the VLAN database occur simultaneously on switches in the same domain, which would result in an inconsistency in the VLAN database.

---

You can assign a given port to a VLAN by following these steps:

```
interface fastethernet0/0/4
switchport access vlan 4

interface vlan 4
ip v4 address ...
ipv6 address autoconf

show vlan
```

IOS-XE supports Embedded Packet Capture (EPC), which provides an embedded systems management facility that helps in tracing and troubleshooting packets. This feature allows network administrators to capture data packets flowing through, to, and from a Cisco device. The network administrator may define the capture buffer size and type (circular or linear), the maximum number of bytes of each packet to capture, and the direction of the traffic flow - ingress or egress, or both. The packet capture rate can be throttled using further administrative controls. For example, you can use the available options for filtering the packets to be captured using an Access Control List; and, optionally, further defined by specifying a maximum packet capture rate or by specifying a sampling interval. For additional details see the guide located here: [https://www.cisco.com/c/en/us/td/docs/ios-xml/ios/vlan/configuration/vtp/vtp-admin-guide.html](https://www.cisco.com/c/en/us/td/docs/ios-xml/ios/vlan/configuration/vtp/vtp-admin-guide.html)
Configuring 802.1x Authentication

IEEE 802.1x port-based authentication defines a client-server-based access control and authentication protocol to prevent unauthorized clients from connecting to a LAN through publicly accessible ports. The authentication server authenticates each client connected to a switch port before allowing access to any switch or LAN services. Until the client is authenticated, IEEE 802.1x access control allows only Extensible Authentication Protocol over LAN (EAPOL), Cisco Discovery Protocol (CDP), and Spanning Tree Protocol (STP) traffic through the port to which the client is connected. After authentication, normal traffic passes through the port.

With IEEE 802.1x authentication, the devices in the network have specific roles:

- **Supplicant**—Device (workstation) that requests access to the LAN and switch services and responds to requests from the router. The workstation must be running IEEE 802.1x-compliant client software such as that offered in the Microsoft Windows XP operating system. (The supplicant is sometimes called the client.)

- **Authentication server**—Device that performs the actual authentication of the supplicant. The authentication server validates the identity of the supplicant and notifies the router whether or not the supplicant is authorized to access the LAN and switch services. The Network Access Device transparently passes the authentication messages between the supplicant and the authentication server, and the authentication process is carried out between the supplicant and the authentication server. The particular EAP method used will be decided between the supplicant and the authentication server (RADIUS server). The RADIUS security system with EAP extensions is available in Cisco Secure Access Control Server Version 3.0 or later. RADIUS operates in a client and server model in which secure authentication information is exchanged between the RADIUS server and one or more RADIUS clients.

- **Authenticator**—Router that controls the physical access to the network based on the authentication status of the supplicant. The router acts as an intermediary between the supplicant and the authentication server, requesting identity information from the supplicant, verifying that information with the authentication server, and relaying a response to the supplicant. The router includes the RADIUS client, which is responsible for encapsulating and decapsulating the EAP frames and interacting with the authentication server.

For detailed information on how to configure 802.1x port-based authentication, see the following link:

Example: Enabling IEEE 802.1x and AAA on a Switch Port

This example shows how to configure an IR1101 router as 802.1x authenticator:

```
Router> enable
Router# configure terminal
Router(config)# dot1x system-auth-control
Router(config)# aaa new-model
Router(config)# aaa authentication dot1x default group radius
Router(config)# interface FastEthernet 0/0/1
Router(config-if)# switchport mode access
Router(config-if)# access-session port-control auto
Router(config-if)# dot1x pae authenticator
Router(config-if)# access-session closed
Router(config-if)# access-session host-mode single-host
Router(config-if)# end
```
Configuring Spanning Tree Protocol

Spanning Tree Protocol (STP) is a Layer 2 link management protocol that provides path redundancy while preventing loops in the network. For a Layer 2 Ethernet network to function properly, only one active path can exist between any two stations. Multiple active paths among end stations cause loops in the network. If a loop exists in the network, end stations might receive duplicate messages. Switches might also learn end-station MAC addresses on multiple Layer 2 interfaces. These conditions result in an unstable network. Spanning-tree operation is transparent to end stations, which cannot detect whether they are connected to a single LAN segment or a switched LAN of multiple segments.

The STP uses a spanning-tree algorithm to select one switch of a redundantly connected network as the root of the spanning tree. The algorithm calculates the best loop-free path through a switched Layer 2 network by assigning a role to each port based on the role of the port in the active topology:

- **Root**—A forwarding port elected for the spanning-tree topology
- **Designated**—A forwarding port elected for every switched LAN segment
- **Alternate**—A blocked port providing an alternate path to the root bridge in the spanning tree
- **Backup**—A blocked port in a loopback configuration

The switch that has all of its ports as the designated role or as the backup role is the root switch. The switch that has at least one of its ports in the designated role is called the designated switch. Spanning tree forces redundant data paths into a standby (blocked) state. If a network segment in the spanning tree fails and a redundant path exists, the spanning-tree algorithm recalculates the spanning-tree topology and activates the standby path. Switches send and receive spanning-tree frames, called bridge protocol data units (BPDUs), at regular intervals. The switches do not forward these frames but use them to construct a loop-free path. BPDUs contain information about the sending switch and its ports, including switch and MAC addresses, switch priority, port priority, and path cost. Spanning tree uses this information to elect the root switch and root port for the switched network and the root port and designated port for each switched segment.

When two ports on a switch are part of a loop, the spanning-tree port priority and path cost settings control which port is put in the forwarding state and which is put in the blocking state. The spanning-tree port priority value represents the location of a port in the network topology and how well it is located to pass traffic. The path cost value represents the media speed.

For detailed configuration information on STP see the following link:

Example: Spanning Tree Protocol Configuration

The following example shows configuring spanning-tree port priority of a Gigabit Ethernet interface. If a loop occurs, spanning tree uses the port priority when selecting an interface to put in the forwarding state.

```
Router# configure terminal
Router(config)# interface FastEthernet 0/0/1
Router(config-if)# spanning-tree vlan 1 port-priority 64
Router(config-if)# end
```

The following example shows how to change the spanning-tree port cost of a Gigabit Ethernet interface. If a loop occurs, spanning tree uses cost when selecting an interface to put in the forwarding state.
Configuring Ethernet Switch Ports

Configuring MAC Address Table Manipulation

The MAC address table contains address information that the switch uses to forward traffic between ports. All MAC addresses in the address table are associated with one or more ports. The address table includes these types of addresses:

- Dynamic address: a source MAC address that the switch learns and then drops when it is not in use. You can use the aging time setting to define how long the switch retains unseen addresses in the table.
- Static address: a manually entered unicast address that does not age and that is not lost when the switch resets.

The address table lists the destination MAC address, the associated VLAN ID, and port associated with the address and the type (static or dynamic).

See the “Example: MAC Address Table Manipulation” for sample configurations for enabling secure MAC address, creating a state entry, set the maximum number of secure MAC addresses and set the aging time.
For detailed configuration information on MAC address table manipulation see the following link:

Example: MAC Address Table Manipulation

The following example shows creating a static entry in the MAC address table.

Router# configure terminal
Router(config)# mac address-table static 0002.0003.0004 interface FastEthernet 0/0/1 vlan 3
Router(config)# end

The following example shows setting the aging timer.

Router# configure terminal
Router(config)# mac address-table aging-time 300
Router(config)# end

Configuring Switch Port Analyzer

The Cisco IR1101 supports local SPAN only, and up to one SPAN session. You can analyze network traffic passing through ports by using SPAN to send a copy of the traffic to another port on the switch or on another switch that has been connected to a network analyzer or other monitoring or security device. SPAN copies (or mirrors) traffic received or sent (or both) on source ports to a destination port for analysis. SPAN does not affect the switching of network traffic on the source ports. You must dedicate the destination port for SPAN use. Except for traffic that is required for the SPAN or RSPAN session, destination ports do not receive or forward traffic.

Only traffic that enters or leaves source ports or traffic that enters or leaves source can be monitored by using SPAN; traffic routed to a source cannot be monitored. For example, if incoming traffic is being monitored, traffic that gets routed from another source cannot be monitored; however, traffic that is received on the source and routed to another can be monitored.

For detailed information on how to configure a switched port analyzer (SPAN) session, see the following web link:

Example: SPAN Configuration

The following example shows how to configure a SPAN session to monitor bidirectional traffic from a Gigabit Ethernet source interface:

Router# configure terminal
Router(config)# monitor session 1 source FastEthernet 0/0/1
Router(config)# end

The following example shows how to configure a gigabit ethernet interface as the destination for a SPAN session:

Router# configure terminal
Router(config)# monitor session 1 destination FastEthernet 0/0/1
Router(config)# end

The following example shows how to remove gigabit ethernet as a SPAN source for SPAN session 1:
Configuring IGMP Snooping

IGMP snooping constrains the flooding of multicast traffic by dynamically configuring Layer 2 interfaces so that multicast traffic is forwarded to only those interfaces associated with IP multicast devices. As the name implies, IGMP snooping requires the LAN switch to snoop on the IGMP transmissions between the host and the router and to keep track of multicast groups and member ports. When the switch receives an IGMP report from a host for a particular multicast group, the switch adds the host port number to the forwarding table entry; when it receives an IGMP Leave Group message from a host, it removes the host port from the table entry. It also periodically deletes entries if it does not receive IGMP membership reports from the multicast clients.

The multicast router sends out periodic general queries to all VLANs. All hosts interested in this multicast traffic send join requests and are added to the forwarding table entry.

Use the `ip igmp snooping enable` command to configure IGMP Snooping on the IR1101.

By default, IGMP snooping is globally enabled in the IR1101.

MLD snooping is also supported on the IR1101, and further information can be found in this documentation set: https://www.cisco.com/c/en/us/td/docs/switches/lan/catalyst3850/software/release/16-1/configuration_guide/b_161_consolidated_3850_cg/b_161_consolidated_3850_cg_chapter_01100.html
Cisco 4G LTE-Advanced Configuration

This section contains the following topics:

- Cisco Fourth-Generation LTE Advanced on the Cisco IR1101 Series Integrated Services Router, on page 97

Cisco Fourth-Generation LTE Advanced on the Cisco IR1101 Series Integrated Services Router

The IR1101 offers LTE support through the use of Pluggable Modules. You can find a list of the supported Pluggable Modules in the IR1101 Industrial Integrated Services Router Hardware Installation Guide.

Cisco LTE Pluggable Module support the following 4G/3G modes:

- **4G LTE**—4G LTE mobile specification provides multi-megabit bandwidth, more efficient radio network, latency reduction, and improved mobility. LTE solutions target new cellular networks. These networks initially support up to 100 Mb/s peak rates in the downlink and up to 50 Mb/s peak rates in the uplink. The throughput of these networks is higher than the existing 3G networks

- **3G Evolution High-Speed Packet Access (HSPA/HSPA+)**—HSPA is a UMTS-based 3G network. It supports High-Speed Downlink Packet Access (HSDPA) and High-Speed Uplink Packet Access (HSUPA) data for improved download and upload speeds. Evolution High-Speed Packet Access (HSPA+) supports Multiple Input/Multiple Output (MIMO) antenna capability.

- **3G Evolution-Data Optimized (EVDO or DOrA) Mode**—EVDO is a 3G telecommunications standard for the wireless transmission of data through radio signals, typically for broadband Internet access. DOrA refers to EVDO Rev-A. EVDO uses multiplexing techniques including Code Division Multiple Access (CDMA), as well as Time Division Multiple Access (TDMA), to maximize both individual users' throughput and the overall system throughput.

It is important to understand the architecture of the IR1101 series and the relationship between Modems, SIMs, Interface and Controller. The following table helps to illustrate these relationships.

<table>
<thead>
<tr>
<th>Router</th>
<th>Controller</th>
<th>SIM</th>
<th>Modem SubSlot</th>
<th>PDN Interface</th>
<th>Line</th>
</tr>
</thead>
<tbody>
<tr>
<td>IR1101</td>
<td>0/1/0</td>
<td>0/1</td>
<td>0/1</td>
<td>Cellular 0/1/0</td>
<td>N/A</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Cellular 0/1/1</td>
<td></td>
</tr>
</tbody>
</table>
### Prerequisites for Configuring Cisco 4G LTE Advanced

- If the signal is not good at the router, use the Cisco offered antenna accessories and extension cables to place the antenna away from router in a better coverage area. Please refer to the RSSI/SNT values as displayed through `show cellular 0/1/0 all` or the LED of the pluggable modem.
- You must have 4G LTE network coverage where your router is physically placed. For a complete list of supported carriers.
- You must subscribe to a service plan with a wireless service provider and obtain a Subscriber Identity Module (SIM) card. Only micro SIM is supported.
- You must install the SIM card before configuring the 4G LTE or router.
- The standalone antenna that supports GPS capabilities must be installed for the GPS feature to work.

### Restrictions for Configuring Cisco 4G LTE Advanced

- Currently, cellular networks support only user initiated bearer establishment.
- Due to the shared nature of wireless communications, the experienced throughput varies depending on the number of active users or congestion in a given network.
- Cellular bandwidth is asymmetric with the downlink data rate being greater than the uplink data rate.
- Cellular networks have higher latency compared to wired networks. Latency rates depend on the technology and carrier. Latency also depends on the signal conditions and can be higher because of network congestion.
- CDMA-EVDO, CDMA-1xRTT, and GPRS technology modes are not supported.
- Any restrictions that are part of the terms of service from your carrier.
- SMS—Only one text message up to 160 characters to one recipient at a time is supported. Larger texts are automatically truncated to the proper size before being sent.
- It is strongly recommended that you configure SNMP V3 with authentication/privacy.
Features not Supported in 4G LTE Advanced

The following features are not supported on Cisco 4G LTE Advanced on the IR1101, when compared to Classic IOS:

- TTY support or Line
- Chat script/dialer string
- DM log output to USB flash is not supported.

4G LTE-Advanced LEDs

LED status can be obtained through the show led CLI, or visually on the pluggable modem card. The following is an example of the show led CLI:

```
IR1101#show led
SYSTEM LED : Green
Custom LED : Off
VPN LED : Off
ALARM LED : Off
GigabitEthernet0/0/0 LED : Off
FastEthernet0/0/1 LED : Off
FastEthernet0/0/2 LED : Off
FastEthernet0/0/3 LED : Off
FastEthernet0/0/4 LED : Off
GigabitEthernet0/0/5 LED : On
EM Module digital I/O 1 LED : Off
EM Module digital I/O 2 LED : Off
EM Module digital I/O 3 LED : Off
EM Module digital I/O 4 LED : Off
*System LTE Pluggable*
LTE module Enable LED : Green
LTE module SIM 0 LED : Green
LTE module SIM 1 LED : Off
LTE module GPS LED : Off
LTE module RSSI 0 LED : On
LTE module RSSI 1 LED : On
LTE module RSSI 2 LED : On
LTE module RSSI 3 LED : On
*EM Module LTE Pluggable*
LTE module Enable LED : Green
LTE module SIM 0 LED : Green
LTE module SIM 1 LED : Off
LTE module GPS LED : Off
LTE module RSSI 0 LED : On
LTE module RSSI 1 LED : On
LTE module RSSI 2 LED : On
LTE module RSSI 3 LED : On
```

The following table describes the LED behavior in 4G LTE-Advanced.
Table 10: 4G LTE-Advanced LED Indicators

<table>

Cisco 4G LTE-Advanced Features

Cisco 4G LTE-Advanced supports the following major features:

- Global Navigation Satellite System (GNSS) (requires a GNSS compliant antenna) and National Marine Electronics Association (NMEA) streaming.
- Short Message Service (SMS)
- 3G/4G Simple Network Management Protocol (SNMP) MIB
- SIM lock and unlock capabilities
- Dual SIM (Only SIM slot 0 is functional on the P-LTE-VZ pluggable)
- Auto SIM
- NeMo
- Mobile Network IPv6
• Public Land Mobile Network (PLMN) selection
• IPv6
• Multiple PDN
• LTE Link Recovery

4G GNSS and NMEA

Active GNSS is supported on the SubMiniature version A (SMA) port. Active GNSS antenna is supported only in the standalone mode. An Active GNSS antenna includes a built-in Low-Noise Amplifier that provides sufficient gain to overcome coaxial cable losses while providing the proper signal level to the GNSS receiver. Active GNSS antennae require power from the GNSS receiver SMA port to operate.

National Marine Electronics Association (NMEA) streams GNSS data either from a 4G LTE through a virtual COM port and a TCP/IP Ethernet connection to any marine device (such as a Windows-based PC) that runs a commercially available GNSS-based application.

The following GNSS and NMEA features are supported on the Cisco 4G LTE-Advanced:
• GNSS standalone mode (satellite-based GNSS)
• Cisco IOS-XE CLI display coordinates.
• External application displays router map location
• Objects in the CISCO-WAN-3G-MIB supports GNSS and NMEA features
• The Cisco 4G LTE-Advanced only support NMEA over IP and uses show commands in the platform

Note
Assisted GNSS mode is not supported.

Example: Connecting to a Server Hosting a GPS Application

You can feed the NMEA data to a remote server that hosts the GPS application. The server can be connected to the router either directly using an Ethernet cable or through a LAN or WAN network. If the application supports serial port, run a serial port emulation program to create a virtual serial port over the LAN or WAN connection.

Note
Microsoft Streets & Trips is a licensed software that you can download from the Microsoft website.

To connect a Cisco 4G LTE-Advanced through IP to a PC running Microsoft Streets & Trips, perform the following steps:
1. Connect the PC to the router using an Ethernet cable.
2. Ensure that the PC and router can ping.
3. Launch the serial port redirector on the PC.
4. Create a virtual serial port that connects to the NMEA port on the router.

5. Launch Microsoft Streets & Trips on your PC.

6. Select the GPS Menu.

7. Click Start Tracking.

8. If you have acquired a location fix from the `show cellular 0/1/0 gps` command output on the router, the current location is plotted on the graph, and a reddish brown dotted cursor with a circle around it is seen on the map.

Note
If you have not acquired a location fix, the Microsoft application times out and disconnects.

---

**Dual SIM Card**

Note
The P-LTE-VZ pluggable which supports Verizon is a single SIM.

SIM card primary slot is selected when router boots up or when NIM reloads. The default slot is 0. If SIM card is not present in the primary slot, select the alternative slot if SIM card is present.

```
controller cellular 0/1/0
lte sim primary slot <slot#>
```

If the active SIM card loses connectivity to the network a failover to the alternative SIM card slot occurs.

By default the failover timer is 3 minutes. The failover timer can be set from 3 to 7 minutes.

```
controller cellular 0/1/0
lte failovertimer <3–7>
```

You can also manually switch the SIM slot via the command line interface.

```
cellular 0/1/0 lte sim activate slot <0–1>
```

**Auto SIM**

The Auto SIM feature detects the SIM and loads the corresponding firmware. For example, if an AT&T SIM is detected, the modem loads the AT&T firmware.

When Auto-SIM is enabled, it is said to be in Auto-SIM mode and when disabled, it is known as Manual mode. In Auto-SIM mode, the modem selects the right carrier firmware from the list of firmware's available. When in manual mode, you can select the firmware manually. Modem resets every time you make a config change from Auto-SIM enabled to disabled or vice-versa.

The P-LTE-US and P-LTE-GB pluggable modules on the IR1101 support Auto SIM.

Note
Auto SIM is always enabled by default.

---
Enable Auto SIM

SUMMARY STEPS

1. `configure terminal`
2. `cellular slots/sub-slots/interface lte firmware-activate firmware-index`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** configure terminal  
Example:  
Router# configure terminal | Enters configuration mode. |
| **Step 2** cellular slots/sub-slots/interface lte firmware-activate firmware-index  
Example:  
Router(config)# cellular 0/1/0 lte firmware-activate 1 | Activates the firmware index.  
**Note** For the 4G LTE Advanced, the `unit` argument identifies the slot, subslot, and the interface separated by slashes (0/1/0). |

Example: List the firmware when Auto-SIM is Enabled

```
Device# show cellular 0/1/0
firmware Idx Carrier FwVersion PriVersion Status
1 ATT 02.28.00.00 002.035_000 Inactive
2 GENERIC 02.28.00.00 002.035_000 Active
3 ROGERS 02.28.00.00 001.012_000 Inactive
4 SPRINT 02.14.03.02 002.012_000 Inactive
5 VERIZON 02.28.00.00 002.042_000 Inactive
Firmware Activation mode = AUTO
```

Disable Auto SIM

SUMMARY STEPS

1. `configure terminal`
2. `controller cellular slots/sub-slots/interface`
3. `no lte firmware auto-sim`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** configure terminal  
Example:  
Router# configure terminal | Enters configuration mode. |
### Purpose

**Command or Action**

**Specifiesthe controller interface.**

**Controller:**

Example:

```
Router(config)# controller cellular 0/1/0
```

**Step 2**

**Step 3**

**Disable auto SIM.**

Example:

```
Router(config-if)# no lte firmware auto-sim
```

### Example: List the firmware when Auto-SIM is Disabled

<table>
<thead>
<tr>
<th>Device</th>
<th>show cellular 0/1/0 firmware</th>

**Firmware Activation mode = Manual**

### Using a SIM Card

Cisco 4G LTE-Advanced needs an active SIM card provided by a service provider. The SIM cards are usually provided in an unlocked state so that it can be used without a Personal Identification Number (PIN). If the SIM is unlocked, it can be inserted into a 4G LTE-Advanced and used without an authorization code.

The SIM can be initially locked with a PIN code (4 to 8 digits long) defined by the service provider. Contact your service provider for the PIN code.

The SIM-Lock feature allows a SIM to be locked or unlocked with a PIN code so that it is used only in an authorized device. Perform the SIM lock and unlock procedures using the Cisco IOS CLI through a console or Telnet/SSH to the ISR.

After the SIM is locked, it cannot initiate a call unless authentication is done using the same PIN. Authentication is done automatically by Cisco IOS through configuration of the PIN. This mandatory configuration for automatic SIM authentication is done using the Cisco IOS CLI as part of the router startup configuration.

After the Cisco IOS configuration is in place, the ISR can initiate an LTE connection. The ISR uses the configured PIN to authenticate prior to the LTE connection. If the Cisco IOS PIN configuration is missing or if the PIN is incorrect, the SIM authentication will fail and the connection will not be initiated.

If the locked SIM is moved to a different ISR or to another device, or if the 4G LTE-Advanced in which the locked SIM resides is moved to a different 4G LTE-Advanced slot in the same ISR, the ISR configuration should be changed. The configuration is associated with the cellular controller that is specific to an ISR 4G LTE-Advanced slot number. This will ensure that the SIM card will not be used in any unauthorized device, or, if there are multiple 4G LTE-Advanced in a single ISR, that the appropriate PIN is applied to each 4G LTE-Advanced SIM. An authentication command (with the same PIN used to lock the SIM) must be defined on the new device or on the new cellular controller slot to successfully initiate the LTE connection.
The following procedures are used to configure a SIM:

**Caution**

It is very important to use the correct PIN after it is configured. The SIM card will be blocked if the wrong PIN is entered three consecutive times on a locked SIM during authentication or when trying to unlock a locked SIM. You can unblock a blocked SIM card using the PUK code. Contact your service provider for the PUK code. Use the `cellular <slot> lte sim unblock <PUK code> <new PIN code>` command to unblock the SIM.

**Changing the PIN**

Ensure to enter the correct PIN, the SIM card gets blocked if the wrong PIN is entered three consecutive times.

**SUMMARY STEPS**

1. `cellular interface lte sim change-pin current-pin new-pin`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Locks or unlocks the SIM card using a PIN code.</td>
</tr>
<tr>
<td><code>cellular interface lte sim change-pin current-pin new-pin</code></td>
<td>Example:</td>
</tr>
<tr>
<td><code>Router# cellular 0/1/0 lte sim lock 1111 1234</code></td>
<td>Note: Locks or unlocks the SIM card using a PIN code.</td>
</tr>
<tr>
<td><code>pin</code>—A code (4 to 8 digits long) provided by your service provider to lock or unlock the SIM card.</td>
<td>Note: SIM should be in locked state when the PIN is being changed.</td>
</tr>
</tbody>
</table>

**Locking and Unlocking a SIM Card Using a PIN**

Perform this task to lock or unlock a SIM card given by your service provider. Make sure you enter the correct PIN, the SIM card gets blocked if the wrong PIN is entered three consecutive times.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Locks or unlocks the SIM card using a PIN code.</td>
</tr>
<tr>
<td>`cellular unit lte sim {lock</td>
<td>unlock} pin`</td>
</tr>
<tr>
<td><code>Router# cellular 0/1/0 lte sim lock 1111</code></td>
<td>Note: <code>pin</code>—A code (4 to 8 digits long) provided by your service provider to lock or unlock the SIM card.</td>
</tr>
</tbody>
</table>

**Configure CHV1 for Unencrypted Levels**

Use either of these commands:

- `lte sim authenticate 0 pin`
- `lte sim authenticate 0 pin slot {0 | 1}`
Configure CHV1 for Unencrypted Level7

To configure an encrypted PIN, the scrambled value of the PIN must be obtained. To get the scrambled Level 7 PIN and to configure the SIM CHV1 code for verification using this encrypted PIN, enter the following commands in the EXEC mode. When obtaining the encrypted PIN for a SIM, a username and password are created by configuring password encryption, defining the username and associated password, copying the resulting scrambled password, and using this scrambled password in the SIM authentication command.

After the scrambled PIN has been obtained and used in SIM authentication, the username created can be deleted from the Cisco IOS configuration. A SIM should be locked for SIM authentication to work.

Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>controller cellular interface</td>
<td>Enters the cellular controller configuration mode or</td>
</tr>
<tr>
<td>Example:</td>
<td>lte sim authenticate 7 1111 slot 0</td>
<td></td>
</tr>
</tbody>
</table>

Configure CHV1 for Unencrypted Level7

Step 1

Example: 

Router (config)# controller cellular 0/1/0
lte sim authenticate 7 1111 slot 0

Step 2

Example: 

Router (config)# username SIM privilege 0 password 1111

Step 3

Example: 

Router(config)# do show run | i SIM

Step 4

Example: 

Router(config)# controller cellular 0/1/0

Step 5

Example: 

lte sim authenticate 7 pin OR lte sim authenticate 7 pin slot {0 | 1}
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Device(config-controller)# lte sim authenticate 055A575E70</code></td>
<td>configured PIN, the data call is allowed. If authentication fails, the modem does not initiate the data call. <strong>Note</strong> The slot keyword and its options are available only on platforms that supports Dual-SIM feature.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>(Optional) Exits the cellular controller configuration mode. <strong>Example:</strong></td>
</tr>
<tr>
<td><code>exit</code></td>
<td></td>
</tr>
<tr>
<td><code>Example:</code></td>
<td><code>Router(config-controller)# exit</code></td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>(Optional) Removes the username and password created in Step 3 <strong>Example:</strong></td>
</tr>
<tr>
<td><code>no username name</code></td>
<td><code>Router(config-controller)# no username SIM</code></td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>(Optional) Removes the username and password created in Step 3 <strong>Example:</strong></td>
</tr>
<tr>
<td><code>no service password-encryption name</code></td>
<td><code>Router(config-controller)# no service password-encryption</code></td>
</tr>
</tbody>
</table>

**Short Message Service (SMS) Capabilities**

Cisco 4G LTE-Advanced support receiving, transmitting, archiving, and deleting of SMS messages. This support includes the ability to view up to 25 received texts, and archive more messages in a custom file location. SMS is supported on multiple carriers. Cisco 4G LTE-Advanced also have the capability to revert from LTE SMS to 3G technology if necessary.

A sending device behind a Cisco 4G LTE-Advanced transmits an SMS text message over the 4G cellular link through cellular towers until it the message reaches the recipient’s router, which then notifies the recipient device, such as a cell phone. The receiving device uses the same process to return a reply to the sending device. The following figure describes the flow from a mobile device to a sending device. For SMS transmission to work, end users must have a text-capable device, and optionally, a text plan. If end users do not have a text plan, standard SMS rates apply to their text transmissions.
Data Account Provisioning

One or more modem data profiles can be created to provision a modem on a 4G LTE SKU. An active wireless account with a service provider with one or more (dual) SIM cards must be installed. The modem data profile is pre-configured on the modem.

The following tasks are used to verify the signal strength and service availability of the modem and to create, modify, and delete modem data profiles:

IP Multimedia Subsystem Profiles

IP Multimedia Subsystem (IMS) profiles establish a session, and are a part of the modem configuration and are stored in the modem's NVRAM. An IMS network is an access-independent and standard-based IP connectivity service that enables different types of multimedia services to end users using common Internet-based protocols.

Configuring Cisco 4G LTE Advanced

For 4G-LTE-Advanced, the numbering on the IR1101 for slot 0, module 0, and port 0 is 0/1/0 for all commands on the base unit. On the Expansion Module, the numbering for slot 0, module 0, and port 0 is 0/3/0 for all commands.
4G modems in the Expansion Module will support the same feature set, including GPS, as supported by the same modem in the Base Module.

Verifying Modem Signal Strength and Service Availability

For the 4G LTE Advanced, the *unit* argument identifies the router slot, module slot, and port separated by slashes (0/1/0).

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>

<tr>
<td>unit all</td>
<td>signal strength, network security, and so on.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router# show cellular 0/1/0 all</td>
</tr>
</tbody>
</table>

Guidelines for Creating, Modifying, or Deleting Modem Data Profiles

Customized profiles (Access Point Name (APN) in mobile networks) can be created and used on Cisco 4G LTE Advanced SKU's. Maximum number of profiles that can be created are 16.

Cisco SKU’s shipping with specific carrier provisioning file (Can be found in Carrier label under "show cellular <slot> hardware"), default profiles are already populated and can be deployed readily.

In all other cases where profile configurations are not available, separate profiles should be created with required parameters.

You can create multiple profiles on Cisco 4G LTE Advanced. The following are the default internet profile numbers for the modems:
Follow these guidelines when you configure a data profile using EXEC mode or Config mode:

- You do not have to make any profile-related changes if your modem comes with a data profile, for instance, AT&T, Sprint and Verizon.
- If any profile parameter changes are required for a connection type, the changes will likely be carried out in the default profiles.
- To configure different profile types and use them for a different connection, you can create separate profiles with different parameters (for instance, APN names). Note that only one profile is active at a given time.
- Use the `show cellular <unit> profile` command to view the data profile. An asterisk(*) symbol is displayed against the data profile. Double asterisk(**) symbol is displayed against the attach profile.
- The data profile is used to set up a data call. If you want to use a different profile, that profile needs to be made the default one. Use the `lte sim data-profile number` command to change the default profile under `controller cellular 0/1/0`.

### Creating, Modifying, or Deleting Data Profiles Using EXEC Mode

Customized profiles (Access Point Name(APN) in mobile networks) can be created and used on Cisco 4G LTE Advanced SKU's. Maximum number of profiles that can be created are 16.

Cisco SKU's shipping with specific carrier provisioning file (can be found in carrier label under `show cellular slot hardware`) default profiles are already populated and can be deployed readily.

---

**Note**

For the 4G LTE Advanced, the `unit` argument identifies the router slot, module slot, and port separated by slashes (0/1/0).

---

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`cellular unit lte profile [create</td>
<td>delete] profile-number [apn [authentication [username password [bearer-type]]]]`</td>
</tr>
</tbody>
</table>

**Example:**

```
Router# cellular 0/1/0 lte profile create 2 apn.com pap username pwd ipv4
```

- The `profile-number` argument specifies the profile number created for the modem.
- (Optional) The `apn` argument specifies an Access Point Name (APN). An APN is provided by your service provider. Only a single APN can be specified for a single profile.
- (Optional) The `authentication` parameter specifies the authentication type used. Acceptable parameters are `chap`, `none` (no authentication), `pap`, and `pap_chap` (PAP or CHAP authentication).
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>

Authentication = None
Primary DNS address = 198.224.173.135
Secondary DNS address = 198.224.174.135
Primary DNS IPV6 address = 2001:4888:68:FF00:608:D:0:0
Secondary DNS IPV6 address = 2001:4888:61:FF00:604:D:0:0

Profile 4 = INACTIVE
--------
PDP Type = IPv4v6
Access Point Name (APN) = vzwapp
Configuring a SIM for Data Calls

Locking and Unlocking a SIM Card Using a PIN Code

Perform this task to lock or unlock a SIM card given by your service provider.

The SIM card gets blocked if the wrong PIN is entered three consecutive times. Make sure you enter the correct PIN the SIM is configured with. If your SIM card gets blocked, contact your service provider for a PUK code. Using the PUK code, you can unblock the SIM card.

For the 4G LTE Advanced, the unit argument identifies the router slot, module slot, and port separated by slashes (0/1/0).

### Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>cellular unit lte sim {lock</td>
<td>unlock} pin</td>
</tr>
<tr>
<td>Example:</td>
<td>Router# cellular 0/1/0 lte sim lock 1111</td>
<td>• pin—A code (4 to 8 digits long) provided by your carrier to lock or unlock the SIM card.</td>
</tr>
</tbody>
</table>

Changing the PIN Code

Perform this task to change the PIN code of a SIM.

For the 4G LTE Advanced, the unit argument identifies the router slot, module slot, and port separated by slashes (0/1/0).

### Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>cellular unit lte sim change-pin pin new-pin</td>
<td>Changes the assigned PIN code. SIM should be in locked state when the PIN is being changed.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router# cellular 0/1/0 lte sim change-pin 1111 1234</td>
<td></td>
</tr>
</tbody>
</table>
Verifying the Security Information of a Modem

Perform this task to verify the security information of a modem.

For the 4G LTE Advanced, the unit argument identifies the router slot, module slot, and port separated by slashes (0/1/0).

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> show cellular unit security</td>
<td>Shows the security information of the modem, including the SIM lock status.</td>
</tr>
<tr>
<td>Example: Router# show cellular 0/1/0 security</td>
<td></td>
</tr>
</tbody>
</table>

Configuring Automatic Authentication for a Locked SIM

An unencrypted PIN can be configured to activate the Card Holder Verification (CHV1) code that authenticates a modem.

The SIM card gets blocked if the wrong PIN is entered three consecutive times. Make sure you enter the correct PIN the SIM is configured with. If your SIM card gets blocked, contact your service provider for a PUK code.

Follow these procedures when using an unencrypted Level 0 PIN to configure CHV1. For instructions on how to configure CHV1 using an encrypted Level 7 PIN, see the Configuring an Encrypted PIN for a SIM, on page 116.

A SIM should be locked for SIM authentication to work. To verify the SIM’s status, use the show cellular unit security command.

For the 4G LTE Advanced, the unit argument identifies the router slot, module slot, and port separated by slashes (0/1/0).

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> controller cellular unit</td>
<td>Enters the cellular controller configuration mode.</td>
</tr>
<tr>
<td>Example: Router(config)# controller cellular 0/1/0</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> lte sim authenticate 0 pin</td>
<td>Authenticates the SIM CHV1 code by using an unencrypted (0) keyword and PIN. This PIN is sent to the modem for</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td></td>
<td>authentication with each subsequent LTE connection. If authentication passes based on the configured PIN, the data call is allowed. If authentication fails, the modem does not initiate the data call.</td>
</tr>
<tr>
<td>Note</td>
<td>This command is valid only when an unencrypted PIN is used. To configure CHV1 code using an encrypted PIN, see the Configuring an Encrypted PIN for a SIM, on page 116.</td>
</tr>
</tbody>
</table>

**Configuring an Encrypted PIN for a SIM**

To configure an encrypted PIN, the scrambled value of the PIN must be obtained. To get the scrambled Level 7 PIN and to configure the SIM CHV1 code for verification using this encrypted PIN, enter the following commands in the EXEC mode.

1. `configure terminal`
2. `service password-encryption`
3. `username name privilege 0 password pin`
4. `do show run | i name`
5. `controller cellular unit`
6. `lte sim authenticate {0 | 7} pin`
7. `exit`
8. `no username name`
9. `no service password-encryption`

**Note**
When obtaining the encrypted PIN for a SIM, a username and password are created by configuring password encryption, defining the username and associated password, copying the resulting scrambled password, and using this scrambled password in the SIM authentication command. After the scrambled PIN has been obtained and used in SIM authentication, the username created can be deleted from the Cisco IOS configuration.

**Note**
A SIM should be locked for SIM authentication to work. To verify the SIM’s status, use the `show cellular <unit> security` command.

**Note**
For the 4G LTE SKU, the `unit` argument identifies the router slot, module slot, and port separated by slashes (0/1/0).

Applying a Modem Profile in a SIM Configuration

SUMMARY STEPS

1. configure terminal
2. controller cellular unit
3. lte sim data-profile number attach-profile number

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td>Example: Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> controller cellular unit</td>
<td>Enters the cellular controller configuration mode.</td>
</tr>
<tr>
<td>Example: Router(config)# controller cellular 0/1/0</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> lte sim data-profile number attach-profile number</td>
<td>Applies the configured profile number to the SIM and its slot number. The default (primary) slot is 0. The attach profile is the profile used by the modem to attach to the LTE network. The data profile is the profile used to send and receive data over the cellular network.</td>
</tr>
</tbody>
</table>

Data Call Setup

To set up a data call, use the following procedures:

Configuring the Cellular Interface

To configure the cellular interface, enter the following commands starting in EXEC mode.

For the 4G LTE Advanced, the unit argument identifies the router slot, module slot, and port separated by slashes (0/1/0).

If a tunnel interface is configured with ip unnumbered cellular 0/1/0, it is necessary to configure the actual static IP address under the cellular interface, in place of ip address negotiated.

SUMMARY STEPS

1. configure terminal
2. interface cellular unit
3. `ip address negotiated`
4. `dialer in-band`
5. `dialer watch-group group-number`
6. `exit`
7. `ip route network-number network-mask {ip-address | interface} [administrative distance] [name name]`
8. `dialer-list dialer-group protocol protocol-name {permit | deny | list access-list-number | access-group}`

### DETAILED STEPS

<td><code>interface cellular unit</code></td>
<td>Example: Router(config)# interface cellular 0/1/0</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Specifies that the IP address for a particular interface is dynamically obtained.</td>
</tr>
<tr>
<td><code>ip address negotiated</code></td>
<td>Example: Router(config-if)# ip address negotiated</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Enables DDR and configures the specified serial interface to use in-band dialing.</td>
</tr>
<tr>
<td><code>dialer in-band</code></td>
<td>Example: Router(config-if)# dialer in-band</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Specifies the number of the dialer access group to which the specific interface belongs.</td>
</tr>
<tr>
<td><code>dialer watch-group group-number</code></td>
<td>Example: Router(config-if)# dialer watch-group 1</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td><code>exit</code></td>
<td>Example: Router(config-if)# exit</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>Establishes a floating static route with the configured administrative distance through the specified interface.</td>
</tr>
<tr>
<td>`ip route network-number network-mask {ip-address</td>
<td>interface} [administrative distance] [name name]`</td>
</tr>
</tbody>
</table>

**Note**
A higher administrative distance should be configured for the route through the backup interface so that it is used only when the primary interface is down.
Configure Cellular Interface with dialer watch-group

To configure the cellular interface with dialer watch-group, enter the following commands starting in EXEC mode.

```
Note
For the 4G LTE Advanced, the unit argument identifies the router slot, module slot, and port separated by slashes (0/1/0).
```

### SUMMARY STEPS

1. configure terminal
2. interface cellular unit
3. ip address negotiated
4. dialer in-band
5. ip address negotiated
6. dialer idle-timeout seconds
7. dialer watch-group group-number
8. exit
9. dialer-list dialer-group protocol protocol-name {permit | deny | list access-list-number | access-group}
10. access-list access-list-number permit ip-source-address
11. dialer watch-list watch-group number ip ip mask
12. dialer watch-list watch-group number delay route-check initial time in seconds
13. dialer watch-list watch-group number delay connected seconds

Enabling 4G GPS and NMEA Data Streaming

GPS NMEA data streaming to external NMEA 2.0-compliant GPS plotter applications can be enabled on Cisco 4G LTE Advanced.

Note

For a 4G LTE-Advanced, the unit argument identifies the router slot, module slot, and the port, and is separated by slashes (0/1/0).

SUMMARY STEPS

1. configure terminal
2. controller cellular unit
3. lte gps enable
4. lte gps mode standalone
5. lte gps nmea {ip | udp [source address][destination address][destination port] }
6. end
7. test cellular unit modem-power-cycle
8. show cellular unit gps
9. show cellular unit gps detail

</table>
### Configuring Modem DM Log Collection

Diagnostic Monitor (DM) Log is a modem's feature that captures data transactions between the modem and the network over the radio frequency interface. This feature is a useful tool for troubleshooting 3G and 4G data connectivity or performance issues.

Once a DM log file is captured, diagnostic software tools, such as Sierra Wireless SwiLog and Qualcomm QXDM, can be used to decode the DM log file to understand the issues. A member of Cisco TAC can help with decoding the DM log files.

To configure DM log collection, enter the following commands, starting in privileged EXEC mode.

#### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>controller cellular slot</td>
<td>Enters cellular controller configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>

#### Examples

**Step 7**

```
cellular unit lte sms send number
```

Example:

```
Router# cellular 0/1/0 lte sms send 15554443333 <sms text>
```

Enables a user to send a 4G LTE band SMS message to other valid recipients, provided they have a text message plan. The `number` argument is the telephone number of the SMS message recipient.

**Note**

10-digit or 11-digit (phone) numbers are the proper numerical format for sending a text. For example, `##########` or `1##########`. Seven digits are not supported.

**Step 8**

```
cellular unit lte sms delete [ all | id ]
```

Example:

```
Router# cellular 0/1/0 lte sms delete [ all | id ]
```

(Optional) Deletes one message ID or all of the stored messages from memory.
### Command or Action

| Step 3 | **lte modem dm-log** [autosleep | link-down | timer time]  
|        | | enable | filesize size | filter | bootflash:file | flash:file | rotation | size log-size]  

**Example:**

```bash
Router(config)# lte modem dm-log enable
```

### Purpose

- **Configure** DM logging for LTE modem.
- **autosleep** — Automatically stops DM log capturing based on:
  - link-down — cellular interface link down event
  - timer timer — amount of time in minutes
- **enable** — Starts DM log capturing.
- **filesize size** — Specifies the maximum log file size, in MB for each DM log file before creating another DM log file. Range is from 1 to 64. Default is 20.
- **filter location:filename** — Specifies the DM log filter to use from the following locations:
  - bootflash:file
  - flash:file

**Note**

- Bootflash and flash are the only valid locations to store the DM log filter file.
- If the DM log filter file is not specified, the generic filter file, which comes with the router will be used.
- The DM log filter file needs to be in .sqf format.

- **rotation** — Enables continuous DM log capturing by replacing the oldest DM log files with the latest.
- **size log-size** — Specifies the maximum total size in MB of all DM log files that can be allowed in the bootflash or flash before modem stops capturing DM log files. If rotation is enabled, the oldest DM files is replaced with the latest DM file to meet this size configuration.

### Step 4

**end**

**Example:**

```bash
Router(config-controller)# end
```

**Returns to privileged EXEC mode.**

### Step 5

**show cellular unit logs dm-log**

**Example:**

```bash
Router# show cellular 0/1/0 logs dm-log
Integrated DM logging is on
```

**(Optional) Displays DM log configuration and statistics.**
The following example shows how to:

- Specifies the maximum size of all DM log files that can be stored in bootflash or flash to 512 MB

- Specifies the maximum size of each DM log file to 32 MB

- Uses MC7xxx_GPS_Log.sqf DM log filter in the flash

- Enable rotation

- Enables DM log capturing

```
Router(config-controller)# controller cell 0/1/0
Router(config-controller)# lte modem dm-log filesize 512
```

The following example shows how to specify the filter file for LTE:

```
Router(config-controller)# controller cell 0/1/0
Router(config-controller)# lte modem dm-log filter flash:MC7xxx_GPS_Log.sqf
```

The following example shows how to enable DM log rotation for LTE:

```
Router(config-controller)# controller cell 0/1/0
Router(config-controller)# lte modem dm-log rotation
```

The following example shows how to specify the maximum log size for LTE:

```
Router(config-controller)# controller cell 0/1/0
Router(config-controller)# lte modem dm-log enable
```

The following example shows how to enable DM log rotation for LTE:

```
Router(config-controller)# controller cell 0/1/0
Router(config-controller)# end
```

The following example shows how to specify the maximum log size for LTE:

```
Router(config-controller)# controller cell 0/1/0
Router(config-controller)# lte modem dm-log size 1024
```

The following example shows what was configured on the router for DM log feature:
Router#show running-config | section controller
controller Cellular 0/1/0
lte modem dm-log filter flash:MC7xxx_GPS_Log.sqf
lte modem dm-log size 512
lte modem dm-log filesize 32
lte modem dm-log rotation
lte modem dm-log enable
lte modem dm-log size 1024

The following displays DM log configuration and statistics

Router#show cellular 0/1/0 logs dm-log
Integrated DM logging is on
output path = Utility Flash
filter = flash:MC7xxx_GPS_Log.sqf
maximum log size = 536870912
maximum file size = 33554432
log rotation = enabled

32 packets sent to the modem, 3879 bytes, 0 errors
158324 packets received from the modem, 75971279 bytes, 0 input drops
158324 packets stored in utility flash, 75971279 bytes

current file size = 8863042
current log size = 75971279
total log size = 75971279
Utility Flash DM log files = (3) files

end

The following shows the DM log files created:

Router#dir flash:dmlog*
Directory of bootflash:/dmlog*

Directory of bootflash:/

27 -rw- 33554069 Jun 7 2018 18:08:46 -08:00 dmlog-slot2-20180607-180628.bin
28 -rw- 33554168 Jun 7 2018 18:11:25 -08:00 dmlog-slot2-20180607-180846.bin
29 -rw- 14188544 Jun 7 2018 18:12:37 -08:00 dmlog-slot2-20180607-181125.bin

2885718016 bytes total (521891840 bytes free)

lte modem dm-log size 1024

The following shows how to disable/stop DM log capturing:

Router(config)#controller cellular 0/1/0
Router(config-controller)#no lte modem dm-log enable
Router(config-controller)#end

**Enabling Modem Crashdump Collection**

Modem crashdump collection is useful in debugging firmware crash. To collect crash data, the modem has to be pre-configured so that it will stay in memdump mode after a crash. Memdump mode is a special boot-and-hold mode for the memdump utility to collect crash data.

To enable modem crashdump collection, perform the following steps.

---

**Note**

The integrated modem crashdump collection feature is supported only on 3G HSPA and 4G LTE Advanced based SKUs.
Before you begin

The device will need to be in boot-and-hold mode.

Router# conf t
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# controller cel 0/1/0
Router(config-controller)# lte modem crash-action ?
boot-and-hold Remain in crash state

Router(config-controller)# lte modem crash-action boot-and-hold

This ensures that whenever the router crashes, it will stay in that state and will not try to recover. By default the crash-action is reset which means the modem will reset and try to recover itself whenever it crashes. The above boot-and-hold command is used to keep the modem in a crashed state so that you can capture crashdump using the following command:

Router# test cell-cwan 0/1/0 modem-crashdump ?
off Disable Modem firmware crash dump
on Enable Modem firmware crash dump

Router# test cell-cwan 0/1/0 modem-crashdump on

This will capture the crashdump and store it in flash.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>

</tr>
</tbody>
</table>
Displaying Modem Log Error and Dump Information

As part of the 3G serviceability enhancement, commands strings (`at!err` and `at!gcdump`) can be sent to the modem using Cisco IOS CLI rather than setting up a reverse telnet session to the cellular modem to obtain log error and dump information.

To obtain log error and dump information, perform the following steps.

---

**Note**

The modem log error and dump collection feature is supported only on 3G SKUs.

---

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>

<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router# show cellular 0/1/0 log error</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2**        |         |
| `test cellular unit modem-error-clear` | (Optional) Clears out the error and dump registers. By default, error and dump registers are not cleared out after a read. This command changes the operation so that registers are cleared once they are read. As a result, the AT command strings are changed to “at!errclr=–1” for CDMA and “at!err=0” for GSM modems. |
| Example:           |         |
| Router# test cellular 0/1/0 modem-error-clear |         |

**Verifying the 4G LTE Advanced Router Information**

You can verify the configuration by using the following show commands:

**show version**

Router#show version

Configuring Cellular Modem Link Recovery

The cellular modem link recovery feature is disabled by default and it is recommended to enable the link recovery feature.

---

**Note**

No manual operations or automated scripts interacting with 4G modems may be possible until and unless the modems have come fully in-service. Modems may take approximately 4 minutes after platform bootup and CLI available to be able to allow full interaction and establish IP connectivity. A typical modem power-cycle may also take approximately 4 minutes before any interaction is possible. Modems are in-service after the console displays “%CELLWAN-2-MODEM_RADIO: Cellular0/x/0 Modem radio has been turned on” – where x is the modem slot number.

To enable or disable the cellular modem link recovery feature, if required, perform the following steps:

### SUMMARY STEPS

1. configure terminal
2. controller cellular unit
3. {lte} modem link-recovery disable | no lte | modem link-recovery disable
4. end

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>controller cellular unit</td>
<td>Enters cellular controller configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router(config)# controller cellular 0/1/0</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>{lte} modem link-recovery disable</td>
<td>Enables or disables the cellular modem link recovery feature.</td>
</tr>
<tr>
<td>Example:</td>
<td>Router(config-controller)# lte modem link-recovery disable</td>
<td>no lte</td>
</tr>
<tr>
<td></td>
<td>Enables or disables the cellular modem link recovery feature.</td>
<td></td>
</tr>
</tbody>
</table>

---
Once we enable link-recovery, the default Cisco recommended values for link-recovery parameters are populated.

We can change the values of link-recovery parameters from the default Cisco recommended values, by using cli for each parameter like in example.

Example:

Router(config-controller)# no lte modem
lte modem link-recovery disable

Device#show run | sec controller Cellular 0/1/0
cellular 0/1/0
lte modem link-recovery rssi onset-threshold -110
lte modem link-recovery monitor-timer 20
lte modem link-recovery wait-timer 10
lte modem link-recovery debounce-count 6

Example:

Device#configure terminal
Device(config)#controller Cellular 0/1/0
Device(config-controller)#lte modem link-recovery
monitor-timer 30
lte modem link-recovery monitor-timer 15
lte modem link-recovery wait-timer 15
lte modem link-recovery debounce-count 8
lte modem rssi onset-threshold -100

Exiting the configuration mode and returns to the privileged EXEC mode.

Step 4

Example:

Router(config)# end

Cellular Modem Link Recovery Parameters

There are four configurable parameters to adjust the behavior of cellular link recovery. The default values optimized for the best performance of the feature and changing it is not recommended unless advised by Cisco.

The following table explains the link recovery parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rssi onset-threshold</td>
<td>This parameter defines the RSSI value below which the link recovery feature triggers additional scrutiny to look for potential issues and take action if needed. The range of this parameter can be set from -90 dBm to -125 dBm. The recommended and default value is -110 dBm.</td>
</tr>
</tbody>
</table>
Verifying the Cellular Modem Link Recovery Configuration

To determine if the cellular modem link recovery is enabled, use the `show controller cellularunit` command. In this example, the cellular modem link recovery feature related information is highlighted.

Router# show controller cellular 0/1/0 Interface Cellular0/1/0
LTE Module = Multimode LTE/DC-HSPA+/HSPA+/HSPA/UMTS/EDGE/GPRS unit 2

Cellular Modem Configuration
---------------------------------------------
Modem is recognized as valid
Power save mode is OFF
man manufacture id = 0x00001199 product id = 0x000068C0
Sierra Wireless unknown modem
Modem Uplink Speed = 50000 kbit.
Modem Downlink Speed = 300000 kbit.

GPS Feature = enabled
GPS Status = NMEA Disabled
GPS Mode = not configured

Cellular Dual SIM details:
----------------------------
SIM 0 is present
SIM 1 is not present
SIM 0 is active SIM
Module Reload Statistics
----------------------------
Soft OIR reloads = 0
Hard OIR reloads = 0
----------------------------

Modem Management Statistics
----------------------------
Modem resets = 1
Modem timeouts = 0
Link recovery is ON

Registration check is ON
RSSI threshold value is -110 dBm
Monitor Timer value is 20 seconds
Wait Timer value is 10 seconds
Debounce Count value is 6

Link recovery count is 0

When the cellular modem link recovery occurs and modem is power cycled, you can see the %CELLWAN-2-MODEM_DOWN message on the console logs and additionally there is a %CELLWAN-2-LINK_RECOVERY message which indicates that action has been taken by the cellular modem link recovery feature.

Whenever the cellular modem link recovery has occurred, it updates the Modem timeouts counter under the Modem Management Statistics section of the show controller cellular unit command output. Modem parameters at the last timeout section has information that helps to identify the cause of the issue that triggered link recovery.

In the following example log, the messages, modem time out counter, and modem parameters at the last time out are highlighted.

*Jul 19 17:15:18.980 PDT: %CELLWAN-2-LINK_RECOVERY: Cellular0/1/0: Cellular Modem has been power cycled

Device#show controller Cellular 0/1/0
Interface Cellular0/1/0
LTE Module - Multimode LTE/DC-HSPA+/HSPA+/HSPA/UMTS/EDGE/GPRS unit 2

Cellular Modem Configuration
----------------------------
Modem is recognized as valid
Power save mode is OFF
manufacture id = 0x00001199 product id = 0x000068C0
Sierra Wireless unknown modem
Modem Uplink Speed = 50000 kbit.
Modem Downlink Speed = 300000 kbit.

GPS Feature = enabled

----------------------------
Soft OIR reloads = 0
Hard OIR reloads = 0
Modem Management Statistics

-----------------------------

Modem resets = 1
Modem user initiated resets = 0
Modem user initiated power-cycles = 0

Modem timeouts = 1

Modem parameters at the last timeout:
- LTE first time attach State was No
- Radio Interface Technology Mode was AUTO
- Operating Mode was Online
- RSSI was -0 dBm
- Packet switch domain status was Not Attached
- Registration state (EMM) was Not Registered
- Downlink traffic was not present

Link recovery is ON
Registration check is ON
RSSI threshold value is -110 dBm
Monitor Timer value is 20 seconds
Wait Timer value is 10 seconds
Debounce Count value is 6

Configuration Examples for 3G and 4G Serviceability Enhancement

Example: Sample Output for the show cellular logs dm-log Command

The following shows a sample output of the `show cellular logs dm-log` command:

```
Router# show cellular 0/1/0 logs dm-log
Integrated DM logging is on
filter = generic
maximum log size = 67108864
maximum file size = 20971520
log rotation = disabled
7 packets sent to the modem, 3232 bytes, 0 errors
75 packets received from the modem, 57123 bytes, 0 input drops
75 packets stored in file system, 57123 bytes, 0 errors, 0 aborts
2 max rcv queue size
current file size = 57123
current log size = 57123
total log size = 57123
DM log files: (1 files)
```

Example: Sample Output for the show cellular logs modem-crashdump Command

The following shows a sample output of the `show cellular logs modem-crashdump` command:

```
Router# show cellular 0/1/0 logs modem-crashdump
Modem crashdump logging: off
Progress = 100%
Last known State = Getting memory chunks
Total consecutive NAKs = 0
Number of retries = 0
Memory Region Info:
1: Full SDRAM [Base:0x0, Length:0x2000000]
2: MDSP RAM A region [Base:0x9100000, Length:0x8000]
3: MDSP RAM B region [Base:0x9120000, Length:0x8000]
4: MDSP RAM C region [Base:0x91400000, Length:0xC000]
```
Configuration Examples for 4G LTE Advanced

Configuration examples follow based upon the following hardware shown in the two examples.

Cellular Back-off

Cellular Backoff is a feature introduced in IOS which addresses the concerns about Cisco LTE router not performing backoff in error handling. When PDP Context activation is failing, modems may receive from a cellular service provider. As a result, when some specific error codes (for example: 29, 33) are received by the modem from a cellular network, the router’s IOS incrementally adds interval in sending PDP Context Activation requests and any IP traffic such as not to load service provider network with requests that are known to IOS as failing. Once PDP Context is established and IP traffic is successful, the Cellular Backoff is removed for normal operation.

This back-off implementation will be a generic design and will NOT be specific to a particular service provider. There will be NO IOS CLI command to disable this new feature either.

Example: GRE Tunnel over Cellular Interface Configuration

The following example shows how to configure the static IP address when a GRE tunnel interface is configured with `ip address unnumbered cellular interface`:

```
interface Tunnel2
  ip unnumbered <internal LAN interface GE0/0 etc.>
  tunnel source Cellular0/1/0
  tunnel destination a.b.c.d
  interface Cellular0/1/0
  ip address negotiated
  no ip mroutecache
  dialer in-band
dialer-group 1
```

Example: 4G LTE Advanced as Backup with NAT and IPSec

The following example shows how to configure the 4G LTE Advanced on the router as backup with NAT and IPSec:

The receive and transmit speeds cannot be configured. The actual throughput depends on the cellular network service.

For service providers using a private IP address, use the `crypto ipsec transform-set esp` command (that is, esp-aes esp-sha256-hmac...).

```
ip dhcp excluded-address 10.4.0.254
!ip dhcp pool lan-pool
  network 10.4.0.0 255.255.0.0
dns-server 10.4.0.254
default-router 10.4.0.254

Example: SIM Configuration

Locking the SIM Card

The following example shows how to lock the SIM. The italicized text in this configuration example is used to indicate comments and are not be seen when a normal console output is viewed.

Router# sh cellular 0/1/0 security
Card Holder Verification (CHV1) = Disabled
SIM Status = OK
SIM User Operation Required = None
Number of CHV1 Retries remaining = 3
Router# !! SIM is in unlocked state.
Router# cellular 0/1/0 lte sim lock 1111
!!!WARNING: SIM will be locked with pin=1111(4).
Do not enter new PIN to lock SIM. Enter PIN that the SIM is configured with.
Call will be disconnected!!!
Are you sure you want to proceed?[confirm]
Router#
Apr 26 19:35:28.339: %CELLWAN-2-MODEM_DOWN: Modem in NIM slot 0/2 is DOWN
Apr 26 19:35:59.967: %CELLWAN-2-MODEM_UP: Modem in NIM slot 0/2 is now UP
Router#
Router# sh cellular 0/1/0 security
Card Holder Verification (CHV1) = Enabled
SIM Status = Locked
SIM User Operation Required = Enter CHV1
Number of CHV1 Retries remaining = 3
Router# !! SIM is in locked state.
Unlocking the SIM Card

The following example shows how to unlock the SIM. The italicized text throughout this configuration example is used to indicate comments and will not be seen when a normal console output is viewed.

Router# sh cellular 0/1/0 security
Card Holder Verification (CHV1) = Enabled
SIM Status = Locked
SIM User Operation Required = Enter CHV1
Number of CHV1 Retries remaining = 3
Router# !! SIM is in locked state.!
!!!WARNING: SIM will be unlocked with pin=1111(4).
Do not enter new PIN to unlock SIM. Enter PIN that the SIM is configured with.
Call will be disconnected!!!
Are you sure you want to proceed?[confirm]
Router#
Router# sh cellular 0/1/0 security
Card Holder Verification (CHV1) = Disabled
SIM Status = OK
SIM User Operation Required = None
Number of CHV1 Retries remaining = 3
Router# !! SIM is in unlocked state.!

Automatic SIM Authentication

The following example shows how to configure automatic SIM authentication. The italicized text throughout this configuration example is used to indicate comments and will not be seen when a normal console output is viewed.

Router# show cellular 0/1/0 security
Card Holder Verification (CHV1) = Disabled
SIM Status = OK
SIM User Operation Required = None
Number of CHV1 Retries remaining = 3
Router# !! SIM is in unlocked state.!
!!!WARNING: SIM will be locked with pin=1111(4).
Do not enter new PIN to lock SIM. Enter PIN that the SIM is configured with.
Call will be disconnected!!!
Are you sure you want to proceed?[confirm]
Router#
Router# sh cellular 0/1/0 security
Card Holder Verification (CHV1) = Enabled
SIM Status = Locked
SIM User Operation Required = Enter CHV1
Number of CHV1 Retries remaining = 3
Router# !! SIM is in locked state. SIM needs to be in locked state for SIM authentication to work.!

Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# controller cellular 0/1/0
Router(config-controller)# lte sim authenticate 0 1111
CHV1 configured and sent to modem for verification
Router(config-controller)# end
Router#
Apr 26 21:23:50.571: %SYS-5-CONFIG_I: Configured from console by console
Router#
Router# sh cellular 0/1/0 security
Card Holder Verification (CHV1) = Enabled
SIM Status = OK
SIM User Operation Required = None
Number of CHV1 Retries remaining = 3

Router#!! SIM is now in locked state but it can be used for connectivity since authentication is good. Authentication can be saved in the router configuration so that when you boot up the router with the same locked SIM, connection can be established with the correct!
Cisco IOS configuration.

Changing the PIN Code

The following example shows how to change the assigned PIN code. The italicized text throughout this configuration example is used to indicate comments and will not be seen when a normal console output is viewed.

Router# sh cellular 0/1/0 security
Card Holder Verification (CHV1) = Disabled
SIM Status = OK
SIM User Operation Required = None
Number of CHV1 Retries remaining = 3

Router#!! SIM is in unlocked state. (Router#)
Router# cellular 0/1/0 lte sim lock 1111
!!!WARNING: SIM will be locked with pin=1111(4).
Do not enter new PIN to lock SIM. Enter PIN that the SIM is configured with.
Call will be disconnected!!!
Are you sure you want to proceed?[confirm]

Router#
Apr 26 21:58:11.903: %CELLWAN-2-MODEM_DOWN: Modem in NIM slot 0/2 is DOWN
Apr 26 21:58:43.775: %CELLWAN-2-MODEM_UP: Modem in NIM slot 0/2 is now UP

Router# sh cellular 0/1/0 security
Card Holder Verification (CHV1) = Enabled
SIM Status = Locked
SIM User Operation Required = Enter CHV1
Number of CHV1 Retries remaining = 3

Router#!! SIM is in locked state. SIM needs to be in locked state to change its PIN. (Router#)
Router# cellular 0/1/0 lte sim change-pin 1111 0000
!!!WARNING: SIM PIN will be changed from:1111(4) to:0000(4)
Call will be disconnected. If old PIN is entered incorrectly in 3 attempt(s), SIM will be blocked!!!
Are you sure you want to proceed?[confirm]
Resetting modem, please wait...

CHV1 code change has been completed. Please enter the new PIN in controller configuration for verification

Router#
Apr 26 21:59:16.735: %CELLWAN-2-MODEM_DOWN: Modem in NIM slot 0/2 is DOWN
Apr 26 21:59:48.387: %CELLWAN-2-MODEM_UP: Modem in NIM slot 0/2 is now UP

Router#

Router# sh cellular 0/1/0 security
Card Holder Verification (CHV1) = Enabled
SIM Status = Locked
SIM User Operation Required = Enter CHV1
Number of CHV1 Retries remaining = 3

Router#!! SIM stays in locked state, as expected, but with new PIN. (Router#)
Router# cellular 0/1/0 lte sim unlock 0000
!!!WARNING: SIM will be unlocked with pin=0000(4).
Do not enter new PIN to unlock SIM. Enter PIN that the SIM is configured with.
Call will be disconnected!!!
Are you sure you want to proceed?[confirm]

Router#

Router# show cellular 0/1/0 security
Card Holder Verification (CHV1) = Disabled
SIM Status = OK
Configuring an Encrypted PIN

The following example shows how to configure automatic SIM authentication using an encrypted PIN. The italicized text throughout this configuration example is used to indicate comments and will not be seen when a normal console output is viewed.

Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# service password-encryption
Router(config)# username SIM privilege 0 password 1111
Router(config)# do sh run | i SIM
username SIM privilege 0 password 7 055A575E70.!! Copy the encrypted level 7 PIN. Use this scrambled PIN in the SIM authentication command.

Router(config)# controller cellular 0/1/0
Router(config-controller)# lte sim authenticate 7 055A575E70
CHV1 configured and sent to modem for verification
Router(config-controller)# exit
Router(config)# no username SIM
Router(config)# end
May 14 20:20:52.603: %SYS-5-CONFIG_I: Configured from console by console

Upgrading the Modem Firmware

The IR1101 uses Sierra Wireless modems that are supported on Cisco 4G LTE Advanced. The firmware for the modem is upgradable using Cisco IOS commands. The firmware is typically a Crossword Express (cwe) file and can be downloaded from the wireless software download page on Cisco.com. For some modems, such as the EM74XX series, the file type is an *.spk file.

Prior to performing the cellular modem firmware upgrade, make sure of the following:

- The "microcode reload ..." command is issued only from router's base directory.
- The modem firmware directory must contain the following:
  - Only the *.spk file
  - Only the *.cwe file
  - Only the *.nvu file
  - Only a matching pair of *.cwe and *.nvu files for the exact same version
- The modem firmware directory MUST NOT contain any other files

**Note**
Firmware upgrade is supported on utility flash.

Use only Cisco certified firmware. Using a firmware version not certified by Cisco may impact the wireless service provider network adversely.

**Caution**
Do not disconnect power or switch the router off during the firmware upgrade process. This may result in permanent modem failure.
Firmware downgrade is not supported.

Not all IR1101 cellular interfaces can support 2G (only P-LTE-GB), and may not support 3G (P-LTE-VZ).

Details about supported cellular pluggable module SKUs and modems can be found in the IR1101 Hardware Installation Guide here: https://www.cisco.com/c/en/us/td/docs/routers/access/1101/hardware/installation/guide/1101hwinst/pview.html#72641

You can determine which radio bands are supported by using the following command:

IR1101# show cellu 0/1/0 radio band

LTE bands supported by modem:
- Bands 1 3 7 8 20 28.
LTE band Preference settings for the active sim(slot 0):
- Bands 1 3 7 8 20 28.

Non-LTE bands supported by modem:
Index:
  72 - GSM DCS band (1800)
  73 - GSM Extended GSM (E-GSM) band (900)
  87 - WCDMA (Europe, Japan, and China) 2100 band
  114 - WCDMA Europe and Japan 900 band
Non-LTE band Preference settings for the active sim(slot 0):
Index:
  72 - GSM DCS band (1800)
  73 - GSM Extended GSM (E-GSM) band (900)
  87 - WCDMA (Europe, Japan, and China) 2100 band
  114 - WCDMA Europe and Japan 900 band

================================================================================================

Band index reference list:

Indices 1-64 correspond to LTE bands 1-64.
Indices 65-128 correspond to Non-LTE bands.

IR1101#

**Upgrading the Modem Firmware Manually With CLI**

**SUMMARY STEPS**

2. On the Cisco Wireless WAN software page, go to **Products -> Cisco Interfaces and Modules -> Cisco High-Speed WAN interface Cards** and select your product from the list of available cards.
3. Select and download the appropriate firmware.
4. terminal monitor
5. microcode reload cellular pa-bay slot modem-provision [flash:<firmware_directory_name>]
6. show cellular 0/1/0 hardware
**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Go to the Cisco Wireless WAN software download website at: <a href="http://software.cisco.com/download/navigator.html">http://software.cisco.com/download/navigator.html</a></td>
<td>Provides access to Cisco Wireless WAN software downloads page to select the firmware for Cisco 4G.</td>
</tr>
<tr>
<td>Note</td>
<td>This website is only available to registered Cisco.com users.</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>On the Cisco Wireless WAN software page, go to Products -&gt; Cisco Interfaces and Modules -&gt; Cisco High-Speed WAN interface Cards and select your product from the list of available cards.</td>
<td>Select your product for firmware upgrade.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Select and download the appropriate firmware.</td>
<td>Download the modem firmware file to flash memory on the router.</td>
</tr>
</tbody>
</table>
| Step 4 | **Example:**

```
Router# terminal monitor
```
| Enables the logging console in privileged EXEC mode. |
| Step 5 | **Example:**

```
Router# microcode reload cellular 0 pa-bay slot 0 modem-provision [flash:<firmware_directory_name>]
```
| Initiates the firmware upgrade process. | For the IR1101 Base, the firmware upgrade would use microcode reload cellular 0 1 ...
For the IR1101 Expansion Module, the firmware upgrade would use microcode reload cellular 0 3 ...
| Note | Modem firmware upgrade may take 10-15 mins from issuing the *microcode reload* command to the modem coming up. The routerconsole will display 'FW_UPGRADE: Firmware upgrade success.....' message to indicate the firmware upgrade completed. The modem will reset itself and may take an additional 5 minutes to be up-in-service. |
| | * pa-bay—Use 0 for 4G LTE Advanced. |
| | * slot—For 4G LTE Advanced, slot number, 0 to 3, where the 4G LTE Advanced is plugged in. |
| | * For remote download, you can transfer this using the wireless link from Cisco.com onto flash. |
| Step 6 | **Example:**

```
Router# show cellular 0/1/0 hardware
```
| Verifies the cellular modem type, model, carrier, firmware, PRI, SKU, IMEI and other modem details. |

**Manual Modem Firmware Upgrade: Example**

```
Router# sh cellu 0/1/0 hardware
Modem Firmware Version = SWI9X30C_02.20.03.00
Modem Firmware built = 2016/06/30 10:54:05
```
Hardware Version = 1.0
Device Model ID: EM7455
International Mobile Subscriber Identity (IMSI) = <imsi>
International Mobile Equipment Identity (IMEI) = <imei>
Integrated Circuit Card ID (ICCID) = <iccid>
Mobile Subscriber Integrated Services
Digital Network-Number (MSISDN) =
Modem Status = Modem Online
Current Modem Temperature = 44 deg C
PRI SKU ID = 1102526, PRI version = 002.020_000, Carrier = AT&T
OEM PRI version = 006
Router#cd fw_22_vzw
Router#dir

Configuring dm-log to Utility Flash: Example

Router(config)# controller cellular 0/1/0
Router(config-controller)# lte modem dm-log enable
Router(config-controller)#
*May 8 17:57:09.905: %SYS-5-CONFIG_I: Configured from console by console
Router#
Router# show cellular 0/1/0 log dm-log
Integrated DM logging is off
Output path = bootflash:
Filter Type = Default
Filter Name = v11026_Generic_GSM_WCDMA_LTE_IP-no-data-packets.sqf
Maximum log size = 0 MB
Maximum file size = 0 MB
Log rotation = Disabled
IR1101# show cellular 0/1/0 log dm-log details
Integrated DM logging is off
Output path = bootflash:
Filter Type = Default
Filter Name = v11026_Generic_GSM_WCDMA_LTE_IP-no-data-packets.sqf
Maximum log size = 0 MB
Maximum file size = 0 MB
Log rotation = Disabled
0 Packets sent to the modem, 0 Bytes, 0 Errors
0 Packets received from the modem, 0 Bytes, 0 Input drops
0 Packets stored in file system, 0 Bytes, 0 Errors, 0 Aborts
0 Max rcv queue size
Current file size = 0 MB
Current log size = 0 MB
Total log size = 0 MB
IR1101#

SNMP MIBs

A MIB (Management Information Base) is a database of the objects that can be managed on a device. The managed objects, or variables, can be set or read to provide information on the network devices and interfaces.
You can find complete information on MIBs and the MIB locator here: https://mibs.cloudapps.cisco.com/ITDIT/MIBS/servlet/index

Note

It is recommended that you configure SNMP V3 with authentication/privacy when implementing SNMP SET operation.

The following Simple Management Network Protocol (SNMP) MIBs are supported on Cisco 4G LTE Advanced:

- IF-MIB
- ENTITY-MIB
- CISCO-WAN-3G-MIB
- CISCO-WAN-CELL-EXT-MIB

For the CISCO-WAN-3G-MIB, the following tables and sub-tables are supported for 3G and LTE technologies:

- ciscoWan3gMIB(661)
- ciscoWan3gMIBNotifs(0)
- ciscoWan3gMIBObjects(1)
- c3gWanCommonTable(1)
- c3gWanGsm(3)
- c3GsmIdentityTable(1)
- c3gGsmNetworkTable(2)
- c3gGsmPdpProfile(3)
- c3gGsmPdpProfileTable(1)
- c3gGsmPacketSessionTable(2)
- c3GsmRadio(4)
- c3gGsmRadioTable(1)
- c3gGsmSecurity(5)
- c3gGsmSecurityTable(1)

For the CISCO-WAN-CELL-EXT-MIB, the following tables and sub-tables are supported for LTE technology only:

- ciscoWanCellExtMIB(817)
- ciscoWanCellExtMIBNotifs(0)
- ciscoWanCellExtMIBObjects(1)
- ciscoWanCellExtLte(1)
You can download the MIBs from the Cisco MIB Locator at http://www.cisco.com/go/mibs.

**SNMP 4G LTE Advanced Configuration: Example**

The following example describes how to configure 3G 4G MIB trap on the router:

```
controller Cellular 0/1/0
lte event rssi onset mib-trap All-lte
lte event rssi onset threshold -100
lte event rssi abate mib-trap All-lte
lte event rssi abate threshold -90
lte event temperature onset mib-trap
lte event temperature onset threshold 55
lte event temperature abate mib-trap
lte event temperature abate threshold 50
lte event modem-state mib-trap all
lte event service mib-trap
lte event network mib-trap
lte event connection-status mib-trap All-lte
lte event rsrp onset mib-trap All-lte
lte event rsrp onset threshold -85
lte event rsrp abate mib-trap All-lte
lte event rsrp abate threshold -80
lte event rsrq onset mib-trap All-lte
lte event rsrq onset threshold -8
lte event rsrq abate mib-trap All-lte
lte event rsrq abate threshold -6
```

The following example describes how to configure SNMP capability on the router:

```
snmp-server group neomobilityTeam v3 auth notify 3gView
snmp-server view 3gView ciscoWan3gMIB included
snmp-server community neomobility-test RW
snmp-server enable traps c3g
snmp server enable traps LTE
snmp-server host 172.19.153.53 neomobility c3g snmp-server host 172.19.152.77 public c3g
snmp-server host 172.19.152.77 public udp-port 6059
```

The following example describes how to configure an external host device to communicate with the router through SNMP:

```
setenv SR_MGR_CONF_DIR /users/<userid>/mibtest
setenv SR_UTIL_COMMUNITY neomobility-test
setenv SR_UTIL_SNMP_VERSION -v2c
setenv SR_TRAP_TEST_PORT 6059
```

**Troubleshooting**

This section provides the essential information and resources available for troubleshooting the Cisco 4G LTE Advanced feature.

**Verifying Data Call Setup**

To verify the data call setup, follow these steps:
1. After you create a modem data profile using the cellular profile create command and configuring DDR on the cellular interface, send a ping from the router to a host across the wireless network.

2. If the ping fails, debug the failure by using the following debug and show commands:
   3. debug chat
   4. debug modem
   5. debug dialer
   6. show cellular all
   7. show controller cell/0/1/0
   8. show interface cellular
   9. show running-config
   10. show ip route
   11. show platform
   12. Save the output from these commands and contact your system administrator.

Checking Signal Strength

If the Received Signal Strength Indication (RSSI) level is very low (for example, if it is less than –110 dBm), follow these steps:

**SUMMARY STEPS**

1. Ensure at least one antenna is connected to the 'MAIN' RF port on the 4G module. Preferably both MAIN and DIV RF ports should be connected to antenna for better RF signal. Check to ensure the antenna are threaded and tightened.

2. If you are using a remote antenna, move the antenna cradle and check if the RSSI has improved.

3. Contact your wireless service provider to verify if there is service availability in your area.

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Ensure at least one antenna is connected to the 'MAIN' RF port on the 4G module. Preferably both MAIN and DIV RF ports should be connected to antenna for better RF signal. Check to ensure the antenna are threaded and tightened.</td>

Successful Call Setup

The following is a sample output when a call is set up. It shows a received IP address from the network. Call setup is successful and data path is open.

dbg cellular 0/1/0 messages callcontrol

Modem Troubleshooting Using Integrated Modem DM Logging

As part of the 3G and 4G serviceability enhancement in Cisco IOS, DM log collection has been integrated into Cisco IOS, eliminating the need for an external PC and simplifying the DM log collection process. The lte modem dm-log command can be used in controller cellular configuration mode to configure integrated DM logging to monitor traffic on the modem. See the Cisco 3G and 4G Serviceability Enhancement User Guide for more information on configuring Integrated DM Logging parameters.

Modem Settings for North America and Carriers Operating on 700 MHz Band

For LTE-EA deployments in North America and for carriers operating in the 700 MHz band, the following changes to the modem settings are required to prevent long network attach times.

The output of show cellular 0/1/0 all command shows the following:

- Current RSSI is −125 dBm
- LTE Technology Preference = No preference specified (AUTO)

The following sections explain useful commands for changing modem settings:

Changing Modem Settings

To change the modem settings to force the modem to scan different technologies, use the following Cisco IOS command:

```
Router# cellular 0/1/0 lte technology ?
auto Automatic LTE Technology Selection
lte LTE
umts UMTS
```

Electronic Serial Number (ESN)

The ESN number is located directly on the modem label in hexadecimal notation. It can also be retrieved using the Cisco IOS CLI using the show cellular slot/port/module hardware command.

The sample output below shows the ESN number:

```
Hardware Information
---------------------
Electronic Serial Number (ESN) = 0x603c9854 [09603971156]
Electronic Serial Number (ESN) = <specific ESN in hexadecimal> [specific ESN in decimal]
```
CHAPTER 11

Configuring Cellular IPv6 Address

This chapter contains the following sections:

- Cellular IPv6 Address, on page 165
- Configuring a Deterministic IPv6 Host Address, on page 169

Cellular IPv6 Address

IPv6 addresses are represented as a series of 16-bit hexadecimal fields separated by colons (:) in the format: x:x:x:x:x:x:x. Following are two examples of the same IPv6 address:

- 2001:CDBA::3257:9652 (zeros can be omitted)

IPv6 addresses commonly contain successive hexadecimal fields of zeros. Two colons (::) may be used to compress successive hexadecimal fields of zeros at the beginning, middle, or end of an IPv6 address (the colons represent successive hexadecimal fields of zeros). The table below lists compressed IPv6 address formats.

An IPv6 address prefix, in the format ipv6-prefix/prefix-length, can be used to represent bit-wise contiguous blocks of the entire address space. The ipv6-prefix must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons. The prefix length is a decimal value that indicates how many of the high-order contiguous bits of the address comprise the prefix (the network portion of the address). For example, 2001:cdba::3257:9652 /64 is a valid IPv6 prefix.

IPv6 Unicast Routing

An IPv6 unicast address is an identifier for a single interface, on a single node. A packet that is sent to a unicast address is delivered to the interface identified by that address.

The IR1101 supports the following address types:

Link-Local Address

A link-local address is an IPv6 unicast address that can be automatically configured on any interface using the link-local prefix FE80::/10 (1111 1110 10) and the interface identifier in the modified EUI-64 format. An link-local address is automatically configured on the cellular interface when an IPv6 address is enabled.
After the data call is established, the link-local address on the cellular interface is updated with the host generated link-local address that consists of the link-local prefix FF80::/10 (1111111010) and the auto-generated interface identifier from the USB hardware address. The figure below shows the structure of a link-local address.

### Global Address

A global IPv6 unicast address is defined by a global routing prefix, a subnet ID, and an interface ID. The routing prefix is obtained from the PGW. The Interface Identifier is automatically generated from the USB hardware address using the interface identifier in the modified EUI-64 format. The USB hardware address changes after the router reloads.

### Configuring Cellular IPv6 Address

To configure the cellular IPv6 address, perform these steps:

#### SUMMARY STEPS

1. configure terminal
2. ipv6 unicast-routing
3. interface cellular <slot/port/interface>
4. description <text>
5. ipv6 address <options>
6. load-interval <seconds>
7. dialer in-band
8. dialer idle-timeout <seconds>
9. dialer watch-group <group number>
10. ipv6 enable
11. pulse time <seconds>
12. ip virtual-reassembly
13. no shutdown
14. exit
15. access-list 1 permit any
16. dialer watch-list 1 <ipaddress> < mask>
17. dialer watch-list 1 delay route-check initial 60
18. dialer watch-list 1 delay connect 1
19. dialer-list 1 protocol ip permit
20. dialer-list 1 protocol ipv6 permit
21. ipv6 route <destination ipv6 prefix> / <destination mask> {forwarding router address | interface | other options}
22. end

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>

<td></td>
</tr>
<tr>
<td>Router# configure terminal</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Step 2**

ipv6 unicast-routing  
*Example:*  
Router# ipv6 unicast-routing

Enable IPv6 routing globally on the router.

**Step 3**

interface cellular `<slot/port/interface>`  
*Example:*  
Router(config)# interface cellular 0/1/0

Specifies the cellular interface. The IR1101 has the primary Cellular interface as 0/1/0.

**Step 4**

description `<text>`  
*Example:*  
Router(config-if)# description text

Provides a description for the cellular interface, if desired.

**Step 5**

ipv6 address `<options>`  
*Example:*  
Router(config-if)# ipv6 address negotiated

Specifies that the IP address for a particular interface is dynamically obtained.

**Step 6**

load-interval `<seconds>`  
*Example:*  
Router(config-if)# load-interval 30

Specifies the length of time for which data is used to compute load statistics.

**Step 7**

dialer in-band  
*Example:*  
Router(config-if)# dialer in-band

Enables DDR and configures the specified serial interface to use in-band dialing.

**Step 8**

dialer idle-timeout `<seconds>`  
*Example:*  
Router(config-if)# dialer idle-timeout 0

Specifies the dialer idle timeout period.

**Step 9**

dialer watch-group `<group number>`  
*Example:*  
Router(config-if)# dialer watch-group 1

Specifies the number of the dialer access group to which the specific interface belongs.

**Step 10**

ipv6 enable  
*Example:*  
Router(config-if)# ipv6 enable

Enables IPv6.

**Step 11**

pulse time `<seconds>`  
*Example:*  
Router(config-if)# pulse-time 1

Define pulse time

**Step 12**

ip virtual-reassembly  
*Example:*  
Router(config-if)# ip virtual-reassembly

Enable Virtual Fragment Reassembly (default is ‘in’ only).

dialer-list 1 protocol ip permit
dialer-list 1 protocol ipv6 permit
```

Configuring a Deterministic IPv6 Host Address

Deterministic IPv6 addresses allow a user to configure a static, user-specified IPv6 address host portion for the interface. While IPv6 address network and subnet parts may be assigned by the ISP, the host part remains unchanged using this configuration. This allows devices to have known, pre-determined IPv6 addresses in their network.

To configure the a deterministic IPv6 host address, perform these steps:
### SUMMARY STEPS

1. config terminal
2. ipv6 unicast-routing
3. interface Cellular <slot/port/interface>
4. enable ipv6
5. ipv6 address autoconfig
6. no shut
7. controller cellular <controller slot/port adapter/port>
8. lte interface <interface number> <address length 48-80> <deterministic address suffix>
9. end
10. clear int cellular 0/1/0

Information About SCADA

SCADA refers to a control and management system employed in industries such as water management, electric power, and manufacturing. A SCADA system collects data from various types of equipment within the system and forwards that information back to a Control Center for analysis. Generally, individuals located at the Control Center monitor the activity on the SCADA system and intervene when necessary.

The Remote Terminal Unit (RTU) acts as the primary control system within a SCADA system. RTUs are configured to control specific functions within the SCADA system, which can be modified as necessary through a user interface.

On the IR1101, line is 0/2/0 same as the Async interface.

Role of the IR1101

In the network, the Control Center always serves as the master in the network when communicating with the IR1101. The IR1101 serves as a proxy master station for the Control Center when it communicates with the RTU.

The IR1101 provides protocol translation to serve as a SCADA gateway to do the following:
- Receive data from RTUs and relay configuration commands from the Control Center to RTUs.
- Receive configuration commands from the Control Center and relay RTU data to the Control Center.
- Terminate incoming requests from the Control Center, when an RTU is offline.

The IR1101 performs Protocol Translation for the following protocols:
- IEC 60870 T101 to/from IEC 60870 T104.
- DNP3 serial to DNP3 IP.
Key Terms

The following terms are relevant when you configure the T101 and T104 protocol stacks on the IR1101:

• Channel–A channel is configured on each IR1101 serial port interface to provide a connection to a single RTU for each IP connection to a remote Control Center. Each connection transports a single T101 (RTU) or T104 (Control Center) protocol stack.
• Link Address–Refers to the device or station address.
• Link Mode (Balanced and Unbalanced)–Refers to the modes of data transfer.
  • An Unbalanced setting refers to a data transfer initiated from the master.
  • A Balanced setting can refer to either a master or slave initiated data transfer.
• Sector–Refers to a single RTU within a remote site.
• Sessions–Represents a single connection to a remote site.

The following terms are relevant when you configure the DNP3 protocol stacks on the IR1101:

• Channel–A channel is configured on the IR1101 serial port interface to provide a connection to a single RTU for each IP connection to a remote Control Center. Each connection transports a single DNP3 serial (RTU) or DNP3 IP (Control Center) protocol stack.
• Link Address–Refers to the device or station address.
• Sessions–Represents a single connection to a remote site.

Protocol Translation Application

In Figure 23: Routers Within a SCADA System, on page 175 the IR1101 (installed within a secondary substation of the Utility Network) employs Protocol Translation to provide secure, end-to-end connectivity between Control Centers and RTUs within a SCADA System.

The IR1101 connects to the RTU (slave) through a RS232 connection. To protect the traffic when forwarded over public infrastructures (for example, cellular), the IR1101 forwards SCADA data from the RTU to the Control Center in the SCADA system through an IPSec tunnel (FlexVPN site-to-site or hub and spoke). The IPSec tunnel protects all traffic between the IR1101 and the Head-end aggregation router. SCADA traffic can be inspected through an IPS device positioned in the path of the SCADA traffic before it is forwarded to the proper Control Center.
Prerequisites

RTUs must be configured and operating in the network.

For each RTU that connects to the IR1101, you will need the following information for T101/T104:

- Channel information
  - Channel name
  - Connection type: serial
  - Link transmission procedure setting: unbalanced or balanced
  - Address field of the link (number expressed in octets)

- Session information
  - Session name
  - Size of common address of Application Service Data Unit (ASDU) (number expressed in octets)
  - Cause of transmission (COT) size (number expressed in octets)
  - Information object address (IOA) size (number expressed in octets)

- Sector information
  - Sector name
  - ASDU address, (number expressed in octets)

For each RTU that connects to the IR1101, you will need the following information for DNP3:

- Channel information
  - Channel name
  - Connection type: serial
Guidelines and Limitations

Each channel supports only one session.

Each sessions supports only one sector.

Configuring Protocol Translation

This section includes the following topics:

- Enabling the IR1101 Serial Port and SCADA Encapsulation

   Before you can enable and configure Protocol Translation on the IR1101, you must first enable the serial port on the IR1101 and enable SCADA encapsulation on that port.

   Before you begin

   Determine availability of serial port on the IR1101.

   SUMMARY STEPS

   1. configure terminal
   2. interface async slot/port/interface
   3. no shutdown

   Note

   Before making any configuration changes to a IR1101 operating with Protocol Translation, please review the section on Starting and Stopping the Protocol Translation Engine, on page 191.
4. encapsulation scada

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> interface async slot/port/interface</td>
<td>Enters the interface command mode for the async slot/port/interface.</td>
</tr>
<tr>
<td>slot – value of 0</td>
<td></td>
</tr>
<tr>
<td>port – value of 2</td>
<td></td>
</tr>
<tr>
<td>interface – value of 0</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> no shutdown</td>
<td>Brings up the port, administratively.</td>
</tr>
<tr>
<td><strong>Step 4</strong> encapsulation scada</td>
<td>Enables encapsulation on the serial port for protocol translation and other SCADA protocols.</td>
</tr>
</tbody>
</table>

EXAMPLE

This example shows how to enable serial port 0/2/0 and how to enable encapsulation on that interface to support SCADA protocols.

```
router# configure terminal
router(config)# interface async 0/2/0
router (config-if)# no shutdown
router (config-if)# encapsulation scada
```

Configuring T101 and T104 Protocol Stacks

You can configure T101 and T104 protocol stacks, which allow end-to-end communication between Control Centers (T104) and RTUs (T101) within a SCADA system.

- Configuring the T101 Protocol Stack, on page 177
- Configuring the T104 Protocol Stack, on page 180
- Starting and Stopping the Protocol Translation Engine, on page 191

Prerequisites

Ensure that you have gathered all the required configuration information.

Enable the serial port and SCADA encapsulation.

Configuring the T101 Protocol Stack

Configure the channel, session, and sector parameters for the T101 protocol stack.

SUMMARY STEPS

1. configure terminal
2. scada-gw protocol t101
### Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2 scada-gw protocol t101</td>
<td>Enters the configuration mode for the T101 protocol.</td>
</tr>
</tbody>
</table>
| Step 3 channel channel_name | Enters the channel configuration mode for the T101 protocol.  
channel_name – Identifies the channel on which the serial port of the IR1101 communicates to the RTU.  
Note When the entered channel name does not already exist, the router creates a new channel.  
Entering the no form of this command deletes an existing channel. However, all sessions must be deleted before you can delete a channel. |
| Step 4 role master | Assigns the master role to the T101 protocol channel (default). |
| Step 5 link-mode {balanced | unbalanced} | Configures the link-mode as either balanced or unbalanced.  
unbalanced–Refers to a data transfer initiated from the master.  
balanced–Refers to either a master or slave data transfer. |
<p>| Step 6 link-addr-size {none | one | two} | Defines the link address size in octets. |</p>
<table>

router(config-t101-session)# link-addr 3
router(config-t101-session)# exit
router(config-t101)# sector rtu_sector
router(config-t101-sector)# attach-to-session rtu_session
router(config-t101-sector)# asdu-addr 3
router(config-t101-sector)# exit
router(config-t101)# exit
router(config)#
```

### Configuring the T104 Protocol Stack

Follow the steps below for each Control Center that you want to connect to over a T104 protocol.

**Before you begin**

Ensure that you have gathered all the required configuration information. (See Prerequisites, on page 175)

Enable the serial port and SCADA encapsulation. (See Enabling the IR1101 Serial Port and SCADA Encapsulation, on page 176)

### SUMMARY STEPS

1. configure terminal
2. scada-gw protocol t104
3. channel channel_name
4. k-value value
5. w-value value
6. t0-timeout value
7. t1-timeout value
8. t2-timeout value
9. t3-timeout value
10. tcp-connection \{0|1\} local-port \{port_number | default\} remote-ip \{A.B.C.D | A.B.C.D/LEN | any\} [vrf WORD]
11. exit
12. session session_name
13. attach-to-channel channel_name
14. `cot size {one | two | three}`
15. `exit`
16. `sector sector_name`
17. `attach-to-session session_name`
18. `asdu-addr asdu_address`
19. `map-to-sector sector_name`
20. Return to Step 1.

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> scada-gw protocol t104</td>
<td>Enters the configuration mode for the T104 protocol.</td>
</tr>
<tr>
<td><strong>Step 3</strong> channel channel_name</td>
<td>Enters the channel configuration mode for the T104 protocol.</td>
</tr>
<tr>
<td></td>
<td><code>channel_name</code> – Identifies the channel on which the router communicates with the Control Center.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> When the entered channel name does not already exist, the router creates a new channel.</td>
</tr>
<tr>
<td></td>
<td>Entering the no form of this command deletes an existing channel. However, all sessions must be deleted before you can delete a channel.</td>
</tr>
<tr>
<td><strong>Step 4</strong> k-value value</td>
<td>Sets the maximum number of outstanding Application Protocol Data Units (APDUs) for the channel.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> An APDU incorporates the ASDU and a control header.</td>
</tr>
<tr>
<td></td>
<td><code>value</code> – Range of values from 1 to 32767. Default value is 12 APDUs.</td>
</tr>
<tr>
<td><strong>Step 5</strong> w-value value</td>
<td>Sets the maximum number of APDUs for the channel.</td>
</tr>
<tr>
<td></td>
<td><code>value</code> – Range of values from 1 to 32767. Default value is 8 APDUs.</td>
</tr>
<tr>
<td><strong>Step 6</strong> t0-timeout value</td>
<td>Defines the t0-timeout value for connection establishment of the T104 channel.</td>
</tr>
<tr>
<td><strong>Step 7</strong> t1-timeout value</td>
<td>Defines the t1-timeout value for send or test APDUs on the T104 channel.</td>
</tr>
<tr>
<td><strong>Step 8</strong> t2-timeout value</td>
<td>Defines the t2-timeout value for acknowledgements when the router receives no data message.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> The t2 value must always be set to a lower value than the t1 value on the T104 channel.</td>
</tr>
<tr>
<td>Step</td>
<td>Command or Action</td>
</tr>
<tr>
<td>------</td>
<td>------------------</td>
</tr>
</tbody>
</table>
| 9    | t3-timeout value  | Defines the t3-timeout value for sending s-frames in case of a long idle state on the T104 channel.  
**Note** The t3 value must always be set to a higher value than the t1 value on the T104 channel. |
| 10   | tcp-connection {0|1} local-port {port_number | default} remote-ip {A.B.C.D | A.B.C.D/LEN | any} [vrf WORD] | In a configuration where there are redundant Control Centers, sets the connection value for the secondary Control Center as defined on the primary Control Center.  
port-number – value between 2000 and 65535.  
default – value of 2404.  
A.B.C.D – single host.  
A.B.C.D/nn – subnet A.B.C.D/LEN.  
any– any remote hosts 0.0.0.0/0.  
WORD– VRF name. |
| 11   | exit             | Exits the channel configuration mode. |
| 12   | session session_name | Enters the session configuration mode and assigns a name to the session.  
session_name – Use the same name that you assigned to the channel in Step 3. |
| 13   | attach-to-channel channel_name | Defines the name of the channel that transports the session traffic. |
| 14   | cot size {one | two | three} | Defines the cause of transmission (cot), such as spontaneous or cyclic data schemes in octets. |
| 15   | exit             | Exits the session configuration mode. |
| 16   | sector sector_name | Enters the sector configuration mode and assigns a name to the sector for the Control Center. |
| 17   | attach-to-session session_name | Attaches the Control Center sector to the channel.  
session_name – Use the same name that you assigned to the channel in Step 3. |
| 18   | asdu-addr asdu_address | Refers to the ASDU structure address. Value entered here must match the ASDU value on the RTU.  
asdu_address – asdu_address – Value of 1 or 2. |
| 19   | map-to-sector sector_name | Maps the Control Center (T104) sector to the RTU (T101) sector. |
| 20   | Return to Step 1. | Repeat all steps in this section for each Control Center active in the network. |
This example shows how to configure the parameters for the T104 protocol stack on Control Center 1 and Control Center 2, both of which are configured as masters, and how to map the T104 sector to the T101 sector.

To configure Control Center 1 (cc_master1), enter the following commands.

```
router# configure terminal
router(config)# scada-gw protocol t104
router(config-t104)# channel cc_master1
router(config-t104-channel)# k-value 12
router(config-t104-channel)# w-value 8
router(config-t104-channel)# t0-timeout 30
router(config-t104-channel)# t1-timeout 15
router(config-t104-channel)# t2-timeout 10
router(config-t104-channel)# t3-timeout 30
router(config-t104-channel)# tcp-connection 0 local-port 2050 remote-ip 209.165.200.225
router(config-t104-channel)# tcp-connection 1 local-port 2051 remote-ip 209.165.201.25
router(config-t104-channel)# exit
router(config-t104)# session cc_master1
router(config-t104-session)# attach-to-channel cc_master1
router(config-t104-session)# cot-size two
router(config-t104-session)# exit
router(config-t104)# sector cc_master1-sector
router(config-t104-sector)# attach-to-session cc_master1
router(config-t104-sector)# asdu-adr 3
router(config-t104-sector)# map-to-sector rtu_sector
router(config-t104)# exit
router(config)#
```

To configure Control Center 2 (cc_master2), enter the following commands.

```
router(config)# scada-gw protocol t104
router(config-t104)# channel cc_master2
router(config-t104-channel)# k-value 12
router(config-t104-channel)# w-value 8
router(config-t104-channel)# t0-timeout 30
router(config-t104-channel)# t1-timeout 15
router(config-t104-channel)# t2-timeout 10
router(config-t104-channel)# t3-timeout 30
router(config-t104-channel)# tcp-connection 0 local-port 2060 remote-ip 209.165.201.237
router(config-t104-channel)# tcp-connection 1 local-port 2061 remote-ip 209.165.200.27
router(config-t104-channel)# exit
router(config-t104)# session cc_master2
router(config-t104-session)# attach-to-channel cc_master2
router(config-t104-session)# cot-size two
router(config-t104-session)# exit
router(config-t104)# sector cc_master2-sector
router(config-t104-sector)# attach-to-session cc_master2
router(config-t104-sector)# asdu-adr 3
router(config-t104-sector)# map-to-sector rtu_sector
router(config-t104-sector)# exit
router(config-t104)# exit
router(config)#
```
Configuration Example

The following example shows how to configure the serial port interface for T101 connection, configure T101 and T104 protocol stacks, and starts the Protocol Translation Engine on the IR1101.

```
routing# configure terminal
router(config)# interface async 0/2/0
router (config-if)# no shutdown
router (config-if)# encapsulation scada
router (config-if)# exit
router(config)# scada-gw protocol t101
router(config-t101)# channel rtu_channel
router(config-t101-channel)# role master
router(config-t101-channel)# link-mode unbalanced
router(config-t101-channel)# link-addr-size one
router(config-t101-channel)# bind-to-interface async 0/2/0
router(config-t101-channel)# exit
router(config-t101)# session rtu_session
router(config-t101-session)# attach-to-channel rtu_channel
router(config-t101-session)# common-addr-size two
router(config-t101-session)# cot-size one
router(config-t101-session)# info-obj-addr-size two
router(config-t101-session)# link-addr 3
router(config-t101-session)# exit
router(config-t101)# sector rtu_sector
router(config-t101-sector)# attach-to-session rtu_session
router(config-t101-sector)# asdu-addr 3
router(config-t101-sector)# exit
router(config-t101)# exit
router(config)# scada-gw protocol t104
router(config-t104)# channel cc_master1
router(config-t104-channel)# k-value 12
router(config-t104-channel)# w-value 8
router(config-t104-channel)# t0-timeout 30
router(config-t104-channel)# t1-timeout 15
router(config-t104-channel)# t2-timeout 10
router(config-t104-channel)# t3-timeout 30
router(config-t104-channel)# tcp-connection 0 local-port 2050 remote-ip any
router(config-t104-channel)# tcp-connection 1 local-port 2051 remote-ip any
router(config-t104-channel)# exit
router(config-t104)# session cc_master1
router(config-t104-session)# attach-to-channel cc_master1
router(config-t104-session)# cot-size two
router(config-t104-session)# exit
router(config-t104)# sector cc_master1-sector
router(config-t104-sector)# attach-to-session cc_master1
router(config-t104-sector)# asdu-addr 3
router(config-t104-sector)# map-to-sector rtu_sector
router(config-t104)# exit
router(config-t104)# session cc_master2
router(config-t104-session)# attach-to-channel cc_master2
router(config-t104-session)# cot-size two
router(config-t104-session)# exit
router(config-t104)# sector cc_master2-sector
router(config-t104-sector)# attach-to-session cc_master2
router(config-t104-sector)# asdu-addr 3
router(config-t104-sector)# map-to-sector rtu_sector
```
router(config-t104-sector)# exit
router(config-t104)# exit
router(config)# scada-gw enable

This example configures end-to-end communication between Control Centers and RTUs within a SCADA system using the DNP3 protocol stacks and starts the Protocol Translation Engine on the IR1101:

router# configure terminal
router(config)# interface async 0/2/0
router (config-if)# no shutdown
router (config-if)# encapsulation scada
router (config-if)# exit
router(config)# scada-gw protocol dnp3-serial
router(config-dnp3s)# channel rtu_channel
router(config-dnp3s-channel)# bind-to-interface async 0/2/0
router(config-dnp3s-channel)# link-addr source 3
router(config-dnp3s-channel)# unsolicited-response enable
router(config-dnp3s-channel)# exit
router(config-dnp3s)# session rtu_session
router(config-dnp3s-session)# attach-to-channel rtu_channel
router(config-dnp3s-session)# link-addr dest 3
router(config-dnp3s-session)# exit
router(config-dnp3s)# exit
router(config)# scada-gw protocol dnp3-ip
router(config-dnp3n)# channel cc_channel
router(config-dnp3n-channel)# link-addr dest 3
router(config-dnp3n-channel)# top-connection local-port default remote-ip any
router(config-dnp3n-channel)# exit
router(config-dnp3n)# session cc_session
router(config-dnp3n-session)# attach-to-channel cc_channel
router(config-dnp3n-session)# link-addr source 3
router(config-dnp3n-session)# map-to-session rtu_session
router(config-dnp3n)# exit
router(config)# exit
router(config)# scada-gw enable

Yang Data Model Support for Scada

The Cisco IOS XE 17.1.1 introduces support for the Cisco IOS XE YANG model for the Scada System. Previous releases already provided Yang models in other areas.

Scada Yang Models

There are two feature modules available for Scada that belong to the main Cisco-IOS-XE-native model:

- Cisco-IOS-XE-scada-gw.yang
  
  This module contains a collection of YANG definitions for Scada Gateway Configuration commands.

- Cisco-IOS-XE-scada-gw-oper.yang
  
  This module contains a collection of YANG definitions for Scada Gateway operational data.

There are 8 dependent modules (also belonging to the main Cisco-IOS-XE-native model), that should be imported for the Scada models to work. The following section shows the Scada Yang Models list, configuration CLI commands, and the dependent modules that each feature module covers.
Cisco-IOS-XE-scada-gw

This module has the following corresponding Cli commands:

```plaintext
(config)# scada-gw protocol t101
(config-t101)# channel <
channel-name>
(config-t101)# bind-to-interface
<interface-name>
(config-t101)# link-mode
<link-mode>
(config-t101)# link-addr-size
<size>
(config-t101)# day-of-week <enable>
(config-t101)# session
<session_name>
(config-t101)# attach-to-channel
<channel-name>
(config-t101)# cot-size
<size>
(config-t101)# common-addr-size
<size>
(config-t101)# info-obj-addr-size
<size>
(config-t101)# link-addr
<addr>
(config-t101)# request
(config-t101)# sector <sector_name>
> (config-t101)# attach-to-session <
session-name>
(config-t101)# asdu-addr
<addr>
(config-t101)# request
(config)# scada-gw protocol t104
(config-t104)# channel <channel-name>
(config-t104)# tcp connection

(config-t104)# to-timeout
<value>
(config-t104)# t1-timeout
<value>

(config-t104)# t2-timeout
<value>

(config-t104)# t3-timeout
<value>

(config-t104)# k-value
<value>

(config-t104)# w-value
<value>

(config-t101)# day-of-week
<enable>
(config-t101)# send-ei <
enable>
(config-t104)# session
<session_name>
(config-t104)# attach-to-channel
```
The Cisco-IOS-XE-scada-gw module has the following dependent modules:

- Cisco-IOS-XE-native
- Cisco-IOS-XE-features
- ietf-inet-types
- Cisco-IOS-XE-interfaces
- Cisco-IOS-XE-ip
- Cisco-IOS-XE-vlan
- ietf-yang-types @ (any revision)
- cisco-semver

**Cisco-IOS-XE-scada-gw-oper**

This module has the following corresponding Cli commands:

```
# show scada statistics
# show scada tcp
```

The Cisco-IOS-XE-scada-gw-oper module has the following dependent modules:

- Cisco-IOS-XE-native
- Cisco-IOS-XE-features
- ietf-inet-types
- Cisco-IOS-XE-interfaces
- Cisco-IOS-XE-ip
- Cisco-IOS-XE-vlan
- ietf-yang-types @ (any revision)
- cisco-semver

**Configuring the DNP3 Protocol Stacks**

You can configure the DNP3 serial and DNP3 IP protocol stacks, which allow end-to-end communication between Control Centers and RTUs within a SCADA system.

**Configuring DNP3 Serial**

Configure the channel and session parameters for the DNP serial communication with an RTU.

**SUMMARY STEPS**

1. `configure terminal`
2. `scada-gw protocol dnp3-serial`
3. `channel channel_name`
4. `bind-to-interface async0/2/0`
5. `link-addr source source_address`
6. `unsolicited-response enable`
7. `exit`
8. `session session_name`
9. `attach-to-channel channel_name`
10. `link-addr dest destination_address`
11. `exit`
12. `exit`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> scada-gw protocol dnp3-serial</td>
<td>Enters configuration mode for the DNP3 serial protocol.</td>
</tr>
<tr>
<td><strong>Step 3</strong> channel channel_name</td>
<td>Enters channel configuration mode for the DNP3 serial protocol.</td>
</tr>
<tr>
<td><em>channel_name</em> – Identifies the channel on which the router serial port communicates to the RTU. Note: When the entered channel name does not already exist, the router creates a new channel. Entering the <em>no</em> form of this command deletes an existing channel. However, all sessions must be deleted before you can delete a channel.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> bind-to-interface async0/2/0</td>
<td>Defines the router async interface on which the system sends its DNP3 protocol traffic.</td>
</tr>
<tr>
<td><strong>Step 5</strong> link-addr source source_address</td>
<td>Refers to the link address of the master. source_address – Range of values from 1 to 65535.</td>
</tr>
<tr>
<td><strong>Step 6</strong> unsolicited-response enable</td>
<td>(Optional) Allows unsolicited responses. Entering the <em>no</em> form of this command disables unsolicited responses. The default is disabled.</td>
</tr>
<tr>
<td><strong>Step 7</strong> exit</td>
<td>Ends configuration of the channel and exits channel configuration mode. Saves all settings.</td>
</tr>
<tr>
<td><strong>Step 8</strong> session session_name</td>
<td>Enters session configuration mode and assigns a name to the session. Note: When the entered session name does not already exist, the router creates a new session.</td>
</tr>
</tbody>
</table>
### Command or Action | Purpose
--- | ---
| | Entering the no form of this command deletes an existing session.
| **Step 9** | attach-to-channel *channel_name*
| | Attaches the session to the channel. Note: Enter the same channel name that you entered in Step 3 above.
| | *channel_name* – Identifies the channel.
| **Step 10** | link-addr dest *destination_address*
| | Refers to the link address of the slave.
| | *destination_address* – Range of values from 1 to 65535.
| **Step 11** | exit
| | Exits session configuration mode.
| **Step 12** | exit
| | Exits protocol configuration mode.

**EXAMPLE**

This example shows how to configure the parameters for the DPN3-serial protocol stack:

```
router# configure terminal
router(config)# scada-gw protocol dnp3-serial
router(config-dnp3s)# channel rtu_channel
router(config-dnp3s-channel)# bind-to-interface async 0/2/0
router(config-dnp3s-channel)# link-addr source 3
router(config-dnp3s-channel)# unsolicited-response enable
router(config-dnp3s-channel)# exit
router(config-dnp3s)# session rtu_session
router(config-dnp3s-session)# attach-to-channel rtu_channel
router(config-dnp3s-session)# link-addr dest 3
router(config-dnp3s-session)# exit
router(config-dnp3s)# exit
router(config)#
```

**Configuring DNP3 IP**

Follow the steps below for the Control Center that you want to connect to over DNP3 IP. For redundancy, you can create multiple connections that share the same session configuration under the same session.

**SUMMARY STEPS**

1. configure terminal
2. scada-gw protocol dnp3-ip
3. channel *channel_name*
4. link-addr dest *destination_address*
5. send-unsolicited-msg enable
6. tcp-connection local-port [default | local_port] remote-ip [any | remote_ip | remote_subnet]
7. exit
8. session *session_name*
9. attach-to-channel *channel_name*
10. `link-addr source source_address`
11. `map-to-session session_name`
12. `exit`
13. `exit`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><code>configure terminal</code></td>
<td>Enters configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td><code>scada-gw protocol dnp3-ip</code></td>
<td>Enters configuration mode for the DNP-IP protocol.</td>
</tr>
</tbody>
</table>
| 3    | `channel channel_name` | Enters channel configuration mode for the DNP-IP protocol.  
channel_name – Identifies the channel on which the router communicates with the Control Center.  
Note: When the entered channel name does not already exist, the router creates a new channel.  
Entering the no form of this command deletes an existing channel. However, all sessions must be deleted before you can delete a channel. |
| 4    | `link-addr dest destination_address` | Refers to the link address of the master.  
destination_address – Range of values from 1 to 65535. |
| 5    | `send-unsolicited-msg enable` | (Optional) Allow unsolicited messages.  
The default is enabled. |
| 6    | `tcp-connection local-port [default | local_port ] remote-ip [any | remote_ip | remote_subnet ]` | Configures the local port number and remote IP address for the TCP connection:  
• default – 20000.  
• local_port – Range of values from 2000 to 65535.  
• any – Any remote hosts 0.0.0.0/0  
• remote_ip – Single host: A.B.C.D  
• remote_subnet – Subnet: A.B.C.D/LEN  
If remote_subnet is specified, when two channels have the same local ports, the remote subnets cannot overlap each other.  
Note: Every <local-port, remote-ip> must be unique per channel. If remote_subnet is specified, when two channels have the same local ports, the remote subnets cannot overlap each other. |
| 7    | `exit` | Exits channel configuration mode. |
| 8    | `session session_name` | Enters session configuration mode and assigns a name to the session. |
### Purpose

**Command or Action** | **Purpose**
--- | ---

Note: When the entered session name does not already exist, the router creates a new session.

Entering the no form of this command deletes an existing session.

**Step 9** **attach-to-channel** *channel_name*

Attaches the session to the channel.

Enter the same channel name that you entered in Step 3. *channel_name* – Identifies the channel.

**Step 10** **link-addr** *source_address*

Refers to the link address of the slave.

*source_address* – Value of 1-65535.

**Step 11** **map-to-session** *session_name*

Maps the dnp3-ip session to an existing dnp3-serial session.

Note: One dnp3-ip session can be mapped to only one dnp3-serial session.

**Step 12** **exit**

Exits session configuration mode.

**Step 13** **exit**

Exits protocol configuration mode.

---

### EXAMPLE

This example shows how to configure the DNP3 IP parameters:

```
router# configure terminal
router(config)# scada-gw protocol dnp3-ip
router(config-dnp3n)# channel cc_channel
router(config-dnp3n-channel)# link-addr dest 3
cisco IR1101 Integrated Services Router Software Configuration Guide
191
```

Starting and Stopping the Protocol Translation Engine

You must start the Protocol Translation Engine to use Protocol Translation on the IR1101.

**Starting** – After enabling SCADA encapsulation on the IR1101 serial port and configuring the T101 and T104 protocols on the IR1101, you can start the Protocol Translation Engine.

**Stopping** – Before you can make any configuration changes to Protocol Translation on the IR1101 with an active Protocol Translation Engine, you must stop the engine.
Before you begin

Before starting the Protocol Translation Engine on the router for the first time, make sure you complete the following items:

- Enabling the IR1101 Serial Port and SCADA Encapsulation, on page 176
- Configuring T101 and T104 Protocol Stacks, on page 177

SUMMARY STEPS

1. configure terminal
2. [no] scada-gw enable

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2 [no] scada-gw enable</td>
<td>Starts (scada-gw enable) or stops (no scada-gw enable) the Protocol Translation Engine on the IR1101.</td>
</tr>
</tbody>
</table>

EXAMPLE

To start the protocol translation engine on the router, enter the following commands:

```
routing# configure terminal
router(config)# scada-gw enable
```

To stop the protocol translation engine on the router, enter the following commands:

```
routing# configure terminal
router(config)# no scada-gw enable
```

Verifying Configuration

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show running-config</td>
<td>Shows the configuration of the router including active features and their settings.</td>
</tr>
<tr>
<td>show scada database</td>
<td>Displays details on the SCADA database.</td>
</tr>
<tr>
<td>show scada statistics</td>
<td>Shows statistics for the SCADA gateway, including the number of messages sent and received, timeouts, and errors.</td>
</tr>
<tr>
<td>show scada tcp</td>
<td>Displays TCP connections associated with the SCADA gateway.</td>
</tr>
</tbody>
</table>

This example shows the output from the show scada tcp and show scada statistics commands:
Debug Commands

This section lists some debug commands that are helpful when troubleshooting.

CHAPTER 13

Raw Socket Transport

This section contains the following topics:

- Raw Socket Transport, on page 197

Raw Socket Transport

Raw Socket Transport transports streams of characters from one serial interface to another over an IP network for utility applications.

This document describes Raw Socket Transport for the IR1101 and provides a reference section describing the Raw Socket Transport commands.

This document includes the following sections:

Information About Raw Socket Transport

Raw Socket is a method for transporting serial data through an IP network. The feature can be used to transport Supervisory Control and Data Acquisition (SCADA) data from Remote Terminal Units (RTUs). This method is an alternative to the Block Serial Tunnel (BSTUN) protocol.

Raw Socket Transport supports TCP or UDP as the transport protocol. An interface can be configured to use either protocol but not both at the same time. TCP transport is suitable for applications such as control applications that require acknowledged and sequenced delivery of data. For latency-sensitive applications such as line SEL relays, UDP transport provides faster transport of serial data than TCP.

Raw Socket Transport supports the following for the asynchronous serial interface:

- TCP as the transport protocol, with built-in auto TCP connection retry mechanism.
- Up to 32 TCP sessions.
- Interface configuration as a server, client, or a combination of both.
- One server interface, but multiple clients.
- VRF-awareness, which enables the router to send Raw Socket Transport traffic to a server host connected through a Virtual Private Network (VPN) Virtual Routing and Forwarding (VRF) interface.

This section includes the following topics:
TCP Transport

TCP Raw Socket transport uses a client-server model. At most one server and multiple clients can be configured on a single asynchronous serial line. In client mode, the IR1101 can initiate up to 32 TCP sessions to Raw Socket servers, which can be other IR1101 routers or third-party devices.

Figure 1 shows a sample Raw Socket TCP configuration. In this example, serial data is transferred between RTUs and a utility management system across an IP network that includes several IR1101 routers. One IR1101 router (Router 1) acts as a Raw Socket server, listening for TCP connection requests from the other IR1101 routers (Router 2 and Router 3), which are configured as Raw Socket clients.

A Raw Socket client receives streams of serial data from the RTUs and accumulates this data in its buffer, then places the data into packets, based on user-specified packetization criteria. The Raw Socket client initiates a TCP connection with the Raw Socket server and sends the packetized data across the IP network to the Raw Socket server, which retrieves the serial data from the packets and sends it to the serial interface, and on to the utility management system.

Note

When you configure the serial link interface on the router as a server, the interface’s peer is the serial link interface on the client router and vice versa.

UDP Transport

UDP transport uses a peer-to-peer model. Multiple UDP connections can be configured on an asynchronous serial line.

Figure 2 shows a sample Raw Socket UDP configuration. In this example, serial data is transferred between RTUs and a utility management system across an IP network that includes two routers (Router 1 which is an IR1101 and Router 2 which is an IR807) that are configured as Raw Socket UDP peers.

In this example, the Raw Socket UDP peer receives streams of serial data from the RTUs and accumulates this data in its buffer, then places the data into packets, based on user-specified packetization criteria. The Raw Socket UDP peer sends the packetized data across the IP network to the Raw Socket peer at the other end, which retrieves the serial data from the packets and sends it to the serial interface, and on to the utility management system.
Serial Data Processing

When the default serial protocol, Asynchronous Communication Protocol, is used, the streams of serial data received by a Raw Socket peer can be packetized based on the following criteria:

- **Packet length**—You can specify a packet length that triggers the IR1101 to transmit the serial data to the peer. Once the IR1101 collects this much data in its buffer, it packetizes the accumulated data and forwards it to the Raw Socket peer.

- **Packet-timer value**—The packet timer specifies the amount of time the IR1101 waits to receive the next character in a stream. If a character is not received by the time the packet timer expires, the data the IR1101 has accumulated in its buffer is packetized and forwarded to the Raw Socket peer.

- **Special character**—You can specify a character that will trigger the IR1101 to packetize the data accumulated in its buffer and send it to the Raw Socket peer. When the special character (for example, a CR/LF) is received, the IR1101 packetizes the accumulated data and sends it to the Raw Socket peer.

See the “Configuring Common Raw Socket Line Options” procedure on page 6 for information about configuring the processing options.

VRF-Aware Raw Socket

The VRF-aware Raw Socket Transport feature enables you to isolate Raw Socket traffic using a VRF for efficient management and control of serial data. After configuring a VRF, you can associate the serial interface configured for Raw Socket Transport with the VRF. See the Raw Socket VRF, on page 208 for a configuration example.

Prerequisites

Determine how you want Raw Socket traffic transported in your network, including the network devices and interfaces to use, how the router packetizes the serial data, and whether to use VRF.

Guidelines and Limitations

Typically, UDP traffic is blocked by firewalls in the network. If the network has such firewalls, make sure to configure pinholes to allow the raw socket UDP traffic.
Default Settings

Configuring Raw Socket Transport

This section includes the following topics:

Enabling Raw Socket Transport on the Serial Interface

To enable Raw Socket Transport on the IR1101 router, you must first enable an asynchronous serial port and enable Raw Socket TCP or UDP encapsulation for that port.

Before you begin

Determine availability of the serial port on the IR1101.

SUMMARY STEPS

1. configure terminal
2. interface async0/slot/port
3. no ip address
4. Do one of the following:
   • encapsulation raw-tcp
     •
   • encapsulation raw-udp

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>interface async0/slot/port</td>
</tr>
<tr>
<td></td>
<td>Enters the interface command mode for the async slot/port.</td>
</tr>
<tr>
<td>Step 3</td>
<td>no ip address</td>
</tr>
<tr>
<td></td>
<td>Disables IP processing on the interface.</td>
</tr>
</tbody>
</table>
Purpose
Command or Action
Step 4
Enables Raw Socket TCP encapsulation or UDP encapsulation for the serial port.
Do one of the following:
• encapsulation raw-tcp
• encapsulation raw-udp

EXAMPLE
This example shows how to enable serial port 0/2/0 and how to enable Raw Socket TCP encapsulation on that port.

```
router# configure terminal
router(config)# interface async0/2/0
router(config-if)# no ip address
router(config-if)# encapsulation raw-tcp
router(config-if)# exit
```

Configuring Common Raw Socket Line Options
You can configure options common to all connections on a line. The common options apply to both TCP and UDP.

**Before you begin**
Enable Raw Socket Transport as described in Enabling Raw Socket Transport on the Serial Interface, on page 200.

**SUMMARY STEPS**
1. configure terminal
2. line 0/slot/port
3. raw-socket packet-length length
4. raw-socket packet-timer timeout
5. raw-socket spec-char ascii_char

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2 line 0/slot/port</td>
<td>Enters line command mode for the serial slot/port.</td>
</tr>
<tr>
<td>Step 3 raw-socket packet-length length</td>
<td>Specifies the packet size that triggers the IR1101 to transmit the data to the peer. When the IR1101 accumulates this much data in its buffer, it packetizes the data and forwards it to the Raw Socket peer. length—2 to 1400 bytes. By default, the packet-length trigger is disabled.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>--------------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Step 4</td>
<td>raw-socket packet-timer <em>timeout</em></td>
</tr>
<tr>
<td></td>
<td>Specifies the maximum time in milliseconds the IR1101 waits to receive the next character in a stream. If a character is not received by the time the packet-timer expires, the accumulated data is packetized and forwarded to the Raw Socket peer.</td>
</tr>
<tr>
<td></td>
<td><em>timeout</em> — 3 to 1000 ms.</td>
</tr>
<tr>
<td></td>
<td>The default is 15 ms.</td>
</tr>
<tr>
<td>Step 5</td>
<td>raw-socket spec-char <em>ascii_char</em></td>
</tr>
<tr>
<td></td>
<td>Specifies a character that will trigger the IR1101 to packetize the data accumulated in its buffer and send it to the Raw Socket peer.</td>
</tr>
<tr>
<td></td>
<td><em>ascii_char</em> — 0 to 255.</td>
</tr>
<tr>
<td></td>
<td>By default, the special character trigger is disabled.</td>
</tr>
</tbody>
</table>

**What to do next**

Use the `no` form of these commands to return to the default values.

**EXAMPLE**

```
router# configure terminal
router(config)# line 0/2/0
router(config-line)# raw-socket packet-length 32
router(config-line)# raw-socket packet-timer 500
router(config-line)# raw-socket special-char 3
```

**Configuring Raw Socket TCP**

After enabling Raw Socket TCP encapsulation, you configure the TCP server and/or clients.

**Configuring the Raw Socket TCP Server**

**Before you begin**

Enable a serial port and Raw Socket TCP encapsulation for that port, as described in Enabling Raw Socket Transport on the Serial Interface, on page 200.

**SUMMARY STEPS**

1. configure terminal
2. line 0/slot/port
3. raw-socket tcp server port [ip_address ]
4. raw-socket tcp idle-timeout session_timeout

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>---------------------------</td>
<td>--------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>line 0/slot/port</code></td>
<td>Enters line command mode for the serial slot/port.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
</tbody>
</table>
| `raw-socket tcp server port [ip_address ]` | Starts the Raw Socket Transport TCP server for an asynchronous line interface. In Raw Socket server mode, the IR1101 listens for incoming connection requests from Raw Socket clients.  
  *port* – Port number the server listens on.  
  *ip_address* – (Optional) Local IP address on which the server listens for connection requests. |
| **Step 4**                |                                                              |
| `raw-socket tcp idle-timeout session_timeout` | Sets the Raw Socket Transport TCP session timeout for the asynchronous line interface. If no data is transferred between the client and server over this interval, then the TCP session closes. The client then automatically attempts to reestablish the TCP session with the server.  
  This timeout setting applies to all Raw Socket Transport TCP sessions under this particular line.  
  *session_timeout* – Currently configured session idle timeout in minutes. The default is 5 minutes. |

**What to do next**

To remove a Raw Socket TCP server, use the **no raw-socket tcp server** command.

**EXAMPLE**

This example shows how to configure a Raw Socket TCP server for an asynchronous serial line. The TCP server listens for TCP client connection requests on local port 4000 and local IP address 10.0.0.1. If no data is exchanged between the Raw Socket TCP server and one of the TCP clients for 10 minutes, then the TCP session closes, and the Raw Socket client attempts to reestablish the session with the Raw Socket server.

```
router# configure terminal
router(config)# line 0/2/0
router(config-line)# raw-socket tcp server 4000 10.0.0.1
router(config-line)# raw-socket tcp idle-timeout 10
router(config-line)# exit
router(config)#
```

**Configuring the Raw Socket TCP Client**

**Before you begin**

Enable a serial port and Raw Socket TCP encapsulation for that port, as described in Enabling Raw Socket Transport on the Serial Interface, on page 200.

**SUMMARY STEPS**

1. configure terminal
### Configuring the Raw Socket TCP Client

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enters configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>line 0/slot/port</td>
<td>Enters line command mode for the serial slot/port.</td>
</tr>
</tbody>
</table>
| Step 3 | raw-socket tcp client dest_ip_address dest_port [local_ip_address ] [local_port ] | Specifies settings for Raw Socket Transport TCP client sessions.  
dest_ip_address – Destination IP address of the remote Raw Socket server.  
dest_port – Destination port number to use for the TCP connection to the remote server.  
local_ip_address – (Optional) Local IP address that the client can also bind to.  
local_port – (Optional) Local port number that the client can also bind to. |
| Step 4 | raw-socket tcp idle-timeout session_timeout | Sets the Raw Socket Transport TCP session timeout for the asynchronous line interface. If no data is transferred between the client and server over this interval, then the TCP session is closed. The client then automatically attempts to reestablish the TCP session with the server.  
This timeout setting applies to all Raw Socket Transport TCP sessions under this particular line.  
session_timeout – Currently configured session idle timeout in minutes. The default is 5 minutes. |
| Step 5 | raw-socket tcp keepalive interval | Sets the Raw Socket Transport TCP session keepalive interval for the asynchronous line interface. The router sends keepalive messages based on the configured interval. You may need to configure this interval, for example, when sending raw TCP traffic over a cellular interface.  
interval – Currently configured keepalive interval in seconds. Range is 1-864000 seconds. The default is 1 second. |

#### What to do next

To remove a Raw Socket TCP client, use the **no raw-socket tcp client** command.
EXAMPLE

This example shows how to configure a Raw Socket TCP client for an asynchronous serial line. The IR1101 (router), serving as a Raw Socket client, initiates TCP sessions with a Raw Socket server and forwards packetized serial data to it. The router collects streams of serial data in its buffer; when it accumulates 827 bytes in its buffer, the router packetizes the data and forwards it to the Raw Socket server. If the router and the Raw Socket server do not exchange any data for 10 minutes, then the TCP session with the Raw Socket server closes, and the router attempts to reestablish the session with the Raw Socket server.

```
router# configure terminal

router(config)# line 0/2/0
router(config-line)# raw-socket tcp client 10.0.0.1 4000
router(config-line)# raw-socket packet-length 827
router(config-line)# raw-socket tcp idle-timeout 10
router(config-line)# exit
router(config)#
```

Configuring a Raw Socket UDP Peer-to-Peer Connection

After enabling Raw Socket UDP encapsulation and the common line options, you configure the Raw Socket UDP peer-to-peer connection. The local port on one end of the connection should be the destination port on the other end.

**Before you begin**

Enable a serial port and Raw Socket UDP encapsulation for that port, as described in Enabling Raw Socket Transport on the Serial Interface, on page 200.

**SUMMARY STEPS**

1. configure terminal
2. line 0/slot/port
3. raw-socket udp connection dest_ip_address dest_port local_port [local_ip_address]

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enters configuration mode.</td>
</tr>
<tr>
<td>Step 2 line 0/slot/port</td>
<td>Enters line command mode for the serial slot/port.</td>
</tr>
<tr>
<td>Step 3 raw-socket udp connection dest_ip_address dest_port local_port [local_ip_address]</td>
<td>Specifies settings for Raw Socket Transport UDP connections.</td>
</tr>
<tr>
<td></td>
<td>dest_ip_address – Destination IP address to use for the UDP connection.</td>
</tr>
<tr>
<td></td>
<td>dest_port – Destination port number to use for the UDP connection.</td>
</tr>
<tr>
<td></td>
<td>local_port – Local port number for the UDP connection.</td>
</tr>
<tr>
<td></td>
<td>local_ip_address – (Optional) Local IP address for the UDP connection.</td>
</tr>
</tbody>
</table>
What to do next

To remove a Raw Socket UDP connection, use the `no raw-socket udp connection` command.

**EXAMPLE**

This example shows how to configure a Raw Socket UDP connection between router A (local IP address 192.168.0.8) and router B (local IP address 192.168.0.2).

**Router A**

```bash
router# configure terminal
router(config)# line 0/2/0
router(config-line)# raw-socket udp connection 192.168.0.2 5000 7000
router(config-line)# exit
router(config)#
```

**Router B**

```bash
router# configure terminal
router(config)# line 0/2/0
router(config-line)# raw-socket udp connection 192.168.0.8 7000 5000
router(config-line)# exit
router(config)#
```

**Verifying Configuration**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show running-config</code></td>
<td>Shows the configuration of the IR1101, including those features that are active and their settings.</td>
</tr>
<tr>
<td><code>show raw-socket tcp detail</code></td>
<td>Displays information about Raw Socket Transport TCP activity.</td>
</tr>
<tr>
<td><code>show raw-socket tcp sessions</code></td>
<td>Displays information about Raw Socket Transport TCP sessions.</td>
</tr>
<tr>
<td><code>show raw-socket tcp statistics</code></td>
<td>Displays Raw Socket Transport TCP statistics for each asynchronous serial line.</td>
</tr>
<tr>
<td><code>show raw-socket udp detail</code></td>
<td>Displays information about Raw Socket Transport UDP activity.</td>
</tr>
<tr>
<td><code>show raw-socket udp sessions</code></td>
<td>Displays information about Raw Socket Transport UDP sessions.</td>
</tr>
<tr>
<td><code>show raw-socket udp statistics</code></td>
<td>Displays Raw Socket Transport UDP statistics for each asynchronous serial line.</td>
</tr>
<tr>
<td><code>clear raw-socket statistics</code></td>
<td>Clears Raw Socket Transport statistics for a specific TTY interface or for all asynchronous serial lines.</td>
</tr>
</tbody>
</table>

**Configuration Example**

The following sections include Raw Socket Transport configuration examples:
Raw Socket TCP

The following example shows a Raw Socket Transport configuration in which an IR1101 router (Router 1) acts as the server, and another IR809 (Router 2) acts as the client.

The following table displays the configuration of the server and client IR1101s highlighted in Figure 3:

<table>
<thead>
<tr>
<th>IR1101 Server Configuration</th>
<th>IR807 Client Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>...</td>

</tbody>
</table>

Raw Socket UDP

This example shows the configuration for a Raw Socket UDP connection between two IR1101 routers:

From Router1

```
interface GigabitEthernet0/1
ip address 192.168.0.8 255.255.255.0
duplex auto
speed auto
interface async0/2/0
no ip address
encapsulation raw-udp
line 0/2/0
raw-socket udp connection 192.168.0.2 2 2
```
From Router2

interface GigabitEthernet0/1
ip address 192.168.0.2 255.255.255.0
load-interval 60
duplex auto
speed auto
no keepalive
interface async0/2/0
no ip address
encapsulation raw-udp
line 0/2/0
raw-socket udp connection 192.168.0.8 2 2

Raw Socket VRF

The following example shows a Raw Socket VRF configuration in which two routers, configured for Raw Socket Transport, connect through a VRF. Router1 is an IR1101, serves as the Raw Socket TCP server, and Router2 is an IR807 serves as the Raw Socket TCP client.

Following are the configurations of Router1 and Router2 as shown in Figure 4:

Router1 Configuration

Defining VRF on the router:

vrf definition router1
rd 100:1
route-target export 100:3
route-target import 100:3

Applying VRF configuration on the interface:

interface GigabitEthernet0/0
vrf forwarding router1
ip address 100.100.100.2 255.255.255.0
duplex auto
speed auto

Applying raw-tcp on the serial interface:
interface async0/2/0
  vrf forwarding router1
  no ip address
  encapsulation raw-tcp

Applying raw-tcp on the line:

  line 0/2/0
  raw-socket tcp server 5000 4.4.4.4

**Router2 Configuration**

Defining VRF on the router:

vrf definition router1
  rd 100:1
  route-target export 100:3
  route-target import 100:3
  !
  address-family ipv4
  exit-address-family

Applying VRF configuration on the interface:

interface GigabitEthernet0/0
  vrf forwarding router1
  ip address 100.100.100.1 255.255.255.0
  duplex auto
  speed auto

Applying raw-tcp on the serial interface:

interface async0
  vrf forwarding router1
  no ip address
  encapsulation raw-tcp

Applying raw-tcp on line:

  line 1
  raw-socket tcp client 4.4.4.4 5000
Expansion Module

This section contains the following topics:

- Expansion Module Overview, on page 211
- mSATA Overview, on page 212
- Digital IO, on page 215
- New Cellular Pluggable Modules, on page 218
- SFP Support, on page 219

Expansion Module Overview

The IR1101 ISR has an Expansion Module that adds key capabilities such as dual LTE Pluggables, mSATA SSD FRU, SFP, and Digital GPIO connections.

The Expansion Module comes in two types:

- IRM-1100-SPMI
- IRM-1100-SP

Warning

It is important to note that just like the Base IR1101, Online Insertion and Removal (OIR) is not supported on The Expansion Module. If the 4G module (or mSATA) is inserted or pulled out while the device is powered up, it may damage the module.

The following figure shows the front panel of the IRM-1100-SPMI and highlights some of its capabilities:
mSATA Overview

IOx/Guest-OS legacy systems on which end users can host applications, typically came with a disk storage of 4GB to store user data. Functionality has been added allowing for a Cisco supported Pluggable mSATA SSD PID to add 50 GB of available storage. Support for a 100 GB mSATA SSD has the following limitations:

- There is no support for the `show inventory` command.
- Supports 55GB (IOx allocation for applications and packages alike), 32B (IOS allocation for storage can be viewed in ‘dir msata’ on IOS).
It is important to note that Online Insertion and Removal (OIR) is not supported. If the mSATA SSD is inserted or pulled out while the device is powered up, it may damage the module.

**Warning**

As with any IoT platform, for IOx, use the Fog Director, Local Manager, or app-hosting CLI's to install applications and access the new mSATA disk storage provided.

### 50 GB mSATA Partitioning

IOS-XE divides the mSATA SSD into 2 partitions. One for IOS-XE and the other for IOx. The percentage of usage is:

- **IOS**: 33.33%
- **IOx**: 66.66%

Using these percentages, the space allocation breaks down as follows:

**50GB mSATA:**

- **IOS**: 16.51 GB
- **IOx**: 31.43 GB

### Using the mSATA SSD

Functionality-wise, there are no configuration and troubleshooting differences to the end-user in IOS or IOx, with or without mSATA. The system simply recognizes the additional storage. There are some CLI commands that will show information that pertains to the mSATA storage. Examples are show inventory, and show platform msata.

```
Router# show inventory
+++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
INFO: Please use "show license UDI" to get serial number for licensing.
+++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
```

```
Router# show platform hardware msata lifetime
SSD Lifetime Remaining: 99% -> 99% of the net disk read/write lifetime is remaining
```

```
Router# show platform hardware msata status
SSD is present
```

```
Router# show platform hardware msata
SSD Lifetime remaining(%): 99
```

**Display the mSATA Partitioning:**

Display mSATA partition 1 in IOS-XE:

```
Router# dir msata:
Directory of msata:/
11 drwx 16384 Jun 4 2019 17:59:45 +00:00 lost+found
33820622848 bytes total (32052379648 bytes free)
```
Copy contents to and from mSATA partition:

Router#copy bootflash: mSATA:
Source filename [ ] ? sparrow-uefi-rommon.SSA
Destination filename [sparrow-uefi-rommon.SSA]? 
Copy in progress...CCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCC
2097152 bytes copied in 0.164 secs (12787512 bytes/sec)

Display disk space allocated by mSATA to IOx:

Router#show app-hosting resource
CPU:
Quota: 1000(Units)
Available: 1000(Units)
Memory:
Quota: 862(MB)
Available: 862(MB)
Storage space:
Total: 58313(MB)
Available: 58313(MB)

Displaying the Wear Leveling Data for the mSATA SSD
IOx Local Manager/ Fog Director can now display the wear leveling data for the mSATA SSD on the IR1101. In the IOx Local Manager, it is observed by selecting System > Storage.
From the IOS command line, you can monitor the lifetime using the show platform hardware msata command.

Router#show platform hardware msata lifetime
SSD Lifetime remaining(%): 98

After a router reload, it will take a few minutes (approximately 5) before this data will be populated again. When the SSD lifetime reduces to 15% and 5% of the lifetime limit, errors start getting reported in syslog. For example:

*Jan 30 19:03:00.257: %IOX-4-IOX_SSD_LIFETIME_WARN: SSD Lifetime remaining in module:15

MIB support for mSATA Wear Ratio and Usage
msATA functionality was added to the router to add extra storage for IOx apps. The following table shows the router with the OID:

Table 20: mSATA OIDs

<table>
<thead>
<tr>
<th>SKU</th>
<th>OID</th>
</tr>
</thead>
<tbody>
<tr>
<td>IR1100-SSD-100G</td>
<td>1.3.6.1.4.1.9.12.3.1.9.96.176</td>
</tr>
</tbody>
</table>

As part of this enhancement, SNMP support has been added for the following mSATA parameters on the router:

- lifetime remaining (wear leveling)
- memory usage for the mSATA SSD
The **show platform hardware msata** command gives information about this MIB.

Related documentation:

https://developer.cisco.com/docs/iox/

### Example: Actual OID and output of SNMP get/walk on OID

<OID> = STRING: "Lifetime Remaining: 99%, Usage: 30%"

### Feature Details

The following conditions must be met before performing SNMP requests on the Router:

- An active mSATA module must be configured in the router.
- The Integrator must have incorporated the supported pluggable mSATA into their design.
- Verify this using the **show platform hardware msata** CLI.

### Feature Assumptions

- After a router reload it will take approximately 5 minutes before mSATA data will be populated again. Only SNMP get is allowed on the OID and is marked as read-only. Setting its value will not be allowed.
- Configurations to enable SNMP on the router are necessary for fetching MIB value.

### Digital IO

The IR1101 has two different Expansion Modules, the IRM-1100-SP and IRM-1100-SPMI. The IRM-1100-SPMI comes with a Digital I/O connector which has 4 GPIO connections plus 1 Return connection. Both Dry and Wet contacts up to 60Volts.

- Dry contact is isolated from a voltage source (or “No Volt”), with an embedded relay function (NPN transistor), usually used to indicate an event. For example: open/close, alarm.
- Wet contact is a contact with external power (+3.3V to +60V, max 150mA of current allowed at high voltage) applied, usually used to energize something. For example: solenoid, light.

Digital IO is similar to the ALARM IN and ALARM OUT supported on the IR800 series routers. The differences are that on the IR800 series, ALARM IN is a dedicated input, the ALARM OUT is a dedicated output. With Digital IO, it can be input or output. ALARM OUT includes a relay to provide the Normally Open (NO) or Normally Close (NC) terminals. Digital IO does not include a relay.

There are no traps for alarms on the GPIO.

More information on the Digital IO hardware capabilities can be found in the **IR1101 Industrial Integrated Services Router Hardware Installation Guide**.

### Configuration Commands

You can set the alarm severity to critical, major, minor, or none. The severity is included in the alarm message when the alarm is triggered.
To configure and show alarms on the IR1101, use the Command Line Interface (CLI).

<table>
<thead>
<tr>

Verify alarm contacts using the CLI:

```
Router(config)#alarm contact ?
<0-4> Alarm contact number (0: Alarm port, 1-4: Digital I/O)
```

**Configuration Examples**

**Configure an alarm.**

```
ir1101#conf term
Enter configuration commands, one per line.  End with CNTL/Z.
ir1101(config)#alarm contact 1 description
```
Your Descriptive Text Here

ir1101(config)#alarm contact 1 severity critical

ir1101(config)#alarm contact 1 trigger closed

ir1101#

To show the alarm status:

ir1101#show alarm
Alarm contact 0:
Enabled: Yes
Status: Not Asserted
Application: Dry
Description: test
Severity: Critical
Trigger: Open
Threshold: 2000

Example of an alarm being generated:

ir1101# !
*Nov 27 14:54:52.573: %IR1101_ALARM_CONTACT-0-EXTERNAL_ALARM_CONTACT_ASSERT: External alarm asserted, Severity: Critical

To show the alarm status during an event:

ir1101#show alarm
ALARM CONTACT
Enabled: Yes
Status: Asserted
Application: Dry
Description: test
Severity: Critical
Trigger: Open
Threshold: 2000
Digital I/O 1:
Enabled: No
Status: Not Asserted
Application: Dry
Description: External digital I/O port 1
Severity: Minor
Trigger: Closed
Threshold: 1600
Digital I/O 2:
Enabled: No
Status: Not Asserted
Application: Dry
Description: External digital I/O port 2
Severity: Minor
Trigger: Closed
Threshold: 1600
Digital I/O 3:
Enabled: No
Status: Not Asserted
Application: Dry
Description: External digital I/O port 3
Severity: Minor
Trigger: Closed
New Cellular Pluggable Modules

Release 16.12.1 supports new pluggable modules/modems. The IR1101 with an Expansion Module supports DUAL LTE (Active/Active), DUAL SIM and DUAL Radio.

- Dual LTE (active/active or active/backup) is supported on the IR1101 equipped with an expansion module and two LTE pluggable interfaces. One on the base unit, the other on the expansion module.
- With DUAL SIM, the two SIMs operate in active/backup mode on the single LTE pluggable module.

With DUAL Radio the two LTE pluggable modules operate in active/active mode with each of the two SIMs assigned to a specific cellular radio on the DUAL Radio.

See the following table for details on the new SKUs.

**SFP Support**

The SFP interface on the Expansion Module operates differently than on the Base unit. The SFP interface on the IR1101 base module is part of the combo port (SFP/RJ45) for GigabitEthernet0/0/0. It may be configured as Layer-3 (default) or Layer-2 interface.

The SFP interface on the Expansion Module is only an SFP interface. It is named GigabitEthernet0/0/5, and is a Layer-2 interface. For Layer-3 feature set, it must be assigned to a VLAN interface.

Details about the SFP Interface can be displayed using the `show interfaces transceiver detail` CLI, for example:

```
Router#show interfaces transceiver detail
IDPROM for transceiver Gigabitethernet0/0/0:
  Description                = SFP or SFP+ optics (type 3)
  Transceiver Type:          = GE T (26)
  Product Identifier (PID)   = ABCU-5710RZ-CS4
  Vendor Revision            =
  Serial Number (SN)         = AGM151124J4
  Vendor Name                = CISCO-AVAGO
  Vendor OUI (IEEE company ID) = 00.17.6A (5994)
  CLEI code                  =
  Cisco part number          =
  Device State               = Enabled.
```
Date code (yy/mm/dd) = 11/03/21
Connector type = Unknown.
Encoding = 8B10B (1)
Nominal bitrate = GE (1300 Mbits/s)
Minimum bit rate as % of nominal bit rate = not specified
Maximum bit rate as % of nominal bit rate = not specified

SFP Support
CHAPTER 15

System Messages

This chapter contains the following sections:

- Information About Process Management, on page 223
- How to Find Error Message Details, on page 223

Information About Process Management

You can access system messages by logging in to the console through Telnet protocol and monitoring your system components remotely from any workstation that supports the Telnet protocol.

Starting and monitoring software is referred to as process management. The process management infrastructure for a router is platform independent, and error messages are consistent across platforms running on Cisco IOS XE. You do not have to be directly involved in process management, but we recommend that you read the system messages that refer to process failures and other issues.

How to Find Error Message Details

To show further details about a process management or a syslog error message, enter the error message into the Error Message Decoder tool at: https://www.cisco.com/cgi-bin/Support/Errordecoder/index.cgi.

For example, enter the message %PMAN-0-PROCESS_NOTIFICATION into the tool to view an explanation of the error message and the recommended action to be taken.

The following are examples of the description and the recommended action displayed by the Error Message Decoder tool for some of the error messages.

| Error Message: %PMAN-0-PROCESS_NOTIFICATION : The process lifecycle notification component failed because [chars] |
|---|---|
| Explanation | Recommended Action |

Cisco IR1101 Integrated Services Router Software Configuration Guide
The process lifecycle notification component failed, preventing proper detection of a process start and stop. This problem is likely the result of a software defect in the software subpackage.

### Error Message

**%PMAN-0-PROCFAILCRIT** A critical process [chars] has failed (rc [dec])

<table>
<thead>
<tr>
<th>Explanation</th>
<th>Recommended Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>A process important to the functioning of the router has failed.</td>
<td>Note the time of the message and investigate the kernel error message logs to learn more about the problem and see if it is correctable. If the problem cannot be corrected or the logs are not helpful, copy the error message exactly as it appears on the console along with the output of the <code>show tech-support</code> command and provide the gathered information to a Cisco technical support representative.</td>
</tr>
</tbody>
</table>

### Error Message

**%PMAN-3-PROCFAILOPT** An optional process [chars] has failed (rc [dec])

<table>
<thead>
<tr>
<th>Explanation</th>
<th>Recommended Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Note the time of the message and investigate the error message logs to learn more about the problem. If the problem persists, copy the message exactly as it appears on the console or in the system log. Research and attempt to resolve the issue using the tools and utilities provided at: <a href="http://www.cisco.com/tac">http://www.cisco.com/tac</a>. With some messages, these tools and utilities will supply clarifying information. Search for resolved software issues using the Bug Search Tool at: <a href="http://www.cisco.com/cisco/psn/bssprt/bss">http://www.cisco.com/cisco/psn/bssprt/bss</a>. If you still require assistance, open a case with the Technical Assistance Center at: <a href="http://tools.cisco.com/ServiceRequestTool/create/">http://tools.cisco.com/ServiceRequestTool/create/</a>, or contact your Cisco technical support representative and provide the representative with the information you have gathered. Attach the following information to your case in nonzipped, plain-text (.txt) format: the output of the <code>show logging</code> and <code>show tech-support</code> commands and your pertinent troubleshooting logs.</td>
<td></td>
</tr>
</tbody>
</table>
A process that does not affect the forwarding of traffic has failed.

Note the time of the message and investigate the kernel error message logs to learn more about the problem. Although traffic will still be forwarded after receiving this message, certain functions on the router may be disabled because of this message and the error should be investigated. If the logs are not helpful or indicate a problem you cannot correct, copy the message exactly as it appears on the console or in the system log. Research and attempt to resolve the issue using the tools and utilities provided at http://www.cisco.com/tac. With some messages, these tools and utilities will supply clarifying information. Search for resolved software issues using the Bug Search Tool at: http://www.cisco.com/cisco/psn/bssprt/bss. If you still require assistance, open a case with the Technical Assistance Center at: http://tools.cisco.com/ServiceRequestTool/create/, or contact your Cisco technical support representative and provide the representative with the information you have gathered. Attach the following information to your case in nonzipped, plain-text (.txt) format: the output of the `show logging` and `show tech-support` commands and your pertinent troubleshooting logs.

<table>

Environmental Monitoring

The router provides a robust environment-monitoring system with several sensors that monitor the system temperatures. The following are some of the key functions of the environmental monitoring system:

- Monitoring temperature of CPUs and Motherboard
- Recording abnormal events and generating notifications
- Monitoring Simple Network Management Protocol (SNMP) traps
- Generating and collecting Onboard Failure Logging (OBFL) data
- Sending call home event notifications
- Logging system error messages
- Displaying present settings and status

Environmental Monitoring and Reporting Functions

Monitoring and reporting functions allow you to maintain normal system operation by identifying and resolving adverse conditions prior to loss of operation.

- Environmental Monitoring Functions, on page 230
- Environmental Reporting Functions, on page 231
Environmental Monitoring Functions

Environmental monitoring functions use sensors to monitor the temperature of the cooling air as it moves through the chassis.

The router is expected to meet the following environmental operating conditions:

- **Non-operating Temperature:** -40°F to 158°F (-40°C to 70°C)
- **Non-operating Humidity:** 5 to 95% relative humidity (non-condensing)
- **Operating Temperature:**
  - -40°F to 140°F (-40°C to 60°C) in a sealed NEMA cabinet with no airflow
  - -40°F to 158°F (-40°C to 70°C) in a vented cabinet with 40 lfm of air
  - -40°F to 167°F (-40°C to 75°C) in a forced air enclosure with 200 lfm of air
- **Operating Humidity:** 10% to 95% relative humidity (non-condensing)
- **Operating Altitude:** -500 to 5,000 feet. Derate max operating temperature 1.5°C per 1000 feet.

The following table displays the levels of status conditions used by the environmental monitoring system.

<table>
<thead>
<tr>
<th>Status Level</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal</td>
<td>All monitored parameters are within normal tolerance.</td>
</tr>
<tr>
<td>Warning</td>
<td>The system has exceeded a specified threshold. The system continues to operate, but operator action is recommended to bring the system back to a normal state.</td>
</tr>
<tr>
<td>Critical</td>
<td>An out-of-tolerance temperature or voltage condition exists. Although the system continues to operate, it is approaching shutdown. Immediate operator action is required.</td>
</tr>
</tbody>
</table>

The environmental monitoring system sends system messages to the console, for example, when the conditions described here are met:

**Temperature and Voltage Exceed Max/Min Thresholds**

The following example shows the warning messages indicating the maximum and minimum thresholds of the temperature or voltage:

Warnings :
---------
For all the temperature sensors (name starting with "Temp:"),
the critical warning threshold is 100°C (100°C and higher)
the warning threshold is 80°C (range from 80°C to 99°C)
the low warning threshold is 1°C (range from -inf to 1°C).

For all voltage sensors (names starting with "V:"),
the high warning threshold starts at that voltage +10%. (voltage + 10% is warning)
the low warning threshold starts at the voltage -10%. (voltage - 10% is warning)
Environmental Reporting Functions

You can retrieve and display environmental status reports using the following commands:

Can someone provide me the output of a full Sparrow/Snowfinch device?

- show diag all eeprom
- show environment
- show environment all
- show inventory
- show platform
- show platform diag
- show platform software status control-processor
- show diag slot R0 eeprom detail
- show version
- show power

These commands show the current values of parameters such as temperature and voltage.

The environmental monitoring system updates the values of these parameters every 60 seconds. Brief examples of these commands are shown below:

**show diag all eeprom: Example**

```

CHAPTER 17

IOx Application Hosting

This section contains the following topics:

- Application Hosting, on page 239

Application Hosting

A hosted application is a software as a service solution, and it can be run remotely using commands. Application hosting gives administrators a platform for leveraging their own tools and utilities.

This module describes the Application Hosting feature and how to enable it.

Information About Application Hosting

Need for Application Hosting

The move to virtual environments has given rise to the need to build applications that are reusable, portable, and scalable. Application hosting gives administrators a platform for leveraging their own tools and utilities. An application, hosted on a network device, can serve a variety of purposes. This ranges from automation, configuration management monitoring, and integration with existing tool chains.

Cisco devices support third-party off-the-shelf applications built using Linux tool chains. Users can run custom applications cross-compiled with the software development kit that Cisco provides.

IOx Overview

IOx is a Cisco-developed end-to-end application framework that provides application hosting capabilities for different application types on Cisco network platforms.

IOx architecture for the IR1101 is different compared to other Cisco platforms that use the hypervisor approach. In other platforms, IOx runs as a virtual machine. IOx is running as a process on the IR1101.

Cisco Application Hosting Overview

The IR1101 enables the user to deploy the application using the app-hosting CLIs. These app-hosting CLIs are not available on the other older platforms. There are additional ways to deploy the applications using the Local Manager and Fog Director.

Application hosting provides the following services:
• Launches designated applications in containers.
• Checks available resources (memory, CPU, and storage), and allocates and manages them.
• Provides support for console logging.
• Provides access to services via REST APIs.
• Provides a CLI endpoint.
• Provides an application hosting infrastructure referred to as Cisco Application Framework (CAF).
• Helps in the setup of platform-specific networking (packet-path) via VirtualPortGroup and management interfaces.

The container is referred to as the virtualization environment provided to run the guest application on the host operating system. The Cisco IOS-XE virtualization services provide manageability and networking models for running guest applications. The virtualization infrastructure allows the administrator to define a logical interface that specifies the connectivity between the host and the guest. IOx maps the logical interface into the Virtual Network Interface Card (vNIC) that the guest application uses.

Applications to be deployed in the containers are packaged as TAR files. The configuration that is specific to these applications is also packaged as part of the TAR file.

The management interface on the device connects the application hosting network to the IOS management interface. The Layer 3 interface of the application receives the Layer 2 bridged traffic from the IOS management interface. The management interface connects through the management bridge to the container/application interface. The IP address of the application must be on the same subnet as the management interface IP address.

**IOXMAN**

IOXMAN is a process that establishes a tracing infrastructure to provide logging or tracing services for guest applications, except Libvirt, that emulates serial devices. IOXMAN is based on the lifecycle of the guest application to enable and disable the tracing service, to send logging data to IOS syslog, to save tracing data to IOx tracelog, and to maintain IOx tracelog for each guest application.

**Application Hosting on the IR1101 Industrial Integrated Services Router**

This section describes the application-hosting characteristics specific to the IR1101 Industrial Integrated Services Router.

**Note**

The IR1101 CPU is not based on x86 architecture like other Routers. Therefore, this requires the application to comply with the ARM 64-bits architecture.

Application hosting can be achieved using the app-hosting cli's as well using the Local Manager and Fog Director. Application hosting using Local Manager is done through the WebUI. In order to deploy the applications using Local Manager, WebUI should be enabled and then login to the Local Manager.
1. From the WebUI, click on **Configuration > Services > IOx**

2. Login using the username and password configured.

3. Follow the steps for the application lifecycle in the **Cisco IOx Local Manager Reference Guide** using this link: https://www.cisco.com/c/en/us/td/docs/routers/access/800/software/guides/iox/lm/reference-guide/1-7/b_iox_lm_ref_guide_1_7/b_iox_lm_ref_guide_1_7_chapter_011.html

   The next section explains the deployment of an application using the app-hosting cli's.

### VirtualPortGroup

The VirtualPortGroup is a software construct on Cisco IOS that maps to a Linux bridge IP address. As such, the VirtualPortGroup represents the switch virtual interface (SVI) of the Linux container. Each bridge can contain multiple interfaces; each mapping to a different container. Each container can also have multiple interfaces.

VirtualPortGroup interfaces are configured by using the interface virtualportgroup command. Once these interfaces are created, IP address and other resources are allocated.

The VirtualPortGroup interface connects the application hosting network to the IOS routing domain. The Layer 3 interface of the application receives routed traffic from IOS. The VirtualPortGroup interface connects through the SVC Bridge to the container/application interface.

The following graphic helps to understand the relationship between the VirtualPortGroup and other interfaces, as it is different than the IR8x9 routers.
For the container life cycle management, the Layer 3 routing model that supports one container per internal logical interface is used. This means that a virtual Ethernet pair is created for each application; and one interface of this pair, called vNIC is part of the application container. The other interface, called vpgX is part of the host system.

NIC is the standard Ethernet interface inside the container that connects to the platform dataplane for the sending and receiving of packets. IOx is responsible for the gateway (VirtualPortGroup interface), IP address, and unique MAC address assignment for each vNIC in the container.

The vNIC inside the container/application are considered as standard Ethernet interfaces.

### How to Configure Application Hosting

#### Enabling IOx

Perform this task to enable access to the IOx Local Manager. The IOx Local Manager provides a web-based user interface that you can use to manage, administer, monitor, and troubleshoot apps on the host system, and to perform a variety of related activities.
In the steps that follow, IP HTTP commands do not enable IOX, but allow the user to access the WebUI to connect the IOX Local Manager.

SUMMARY STEPS

1. enable
2. configure terminal
3. iox
4. ip http server
5. ip http secure-server
6. username name privilege level password {0 | 7 | user-password | encrypted-password}
7. end

DETAILED STEPS

<table>
<thead>

### Configuring a VirtualPortGroup to a Layer 3 Data Port

Multiple Layer 3 data ports can be routed to one or more VirtualPortGroups or containers. VirtualPortGroups and Layer 3 data ports must be on different subnets.

Enable the `ip routing` command to allow external routing on the Layer 3 data-port.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `ip routing`
4. `interface type number`
5. `no switchport`
6. `ip address ip-address mask`
7. `exit`
8. `interface type number`
9. `ip address ip-address mask`
10. `end`

## DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 1.   | enable  | Enables privileged EXEC mode. Enter your password if prompted.  
Example:  
Device>enable |
| 2.   | configure terminal | Enters global configuration mode.  
Example:  
Device#configure terminal |
| 3.   | ip routing | Enables IP routing. The `ip routing` command must be enabled to allow external routing on Layer 3 data ports.  
Example:  
Device(config)#ip routing |
| 4.   | interface type number | Configures an interface and enters interface configuration mode  
Example:  
Device(config)#interface gigabitethernet 0/0/0 |
| 5.   | no switchport | Places the interface in Layer 3 mode, and makes it operate more like a router interface rather than a switch port.  
Example:  
Device(config-if)#no switchport |
| 6.   | ip address ip-address mask | Configures an IP address for the interface.  
Example:  
Device(config-if)#ip address 10.1.1.1 255.255.255.0 |
| 7.   | exit | Exits interface configuration mode and returns to global configuration mode.  
Example:  
Device(config-if)#exit |
| 8.   | interface type number | Configures an interface and enters interface configuration mode.  
Example:  
Device(config)#interface virtualportgroup 0 |

4. show app-hosting list
Displays the list of applications and their status.
Example:

Device# show app-hosting list
App id State
-------------------------------
app1 RUNNING

Configuration Examples for Application Hosting
See the following examples:

Example: Enabling IOx

Device> enable
Device# configure terminal
Device(config)# iox
Device(config)# ip http server
Device(config)# ip http secure-server
Device(config)# username cisco privilege 15 password 0 cisco
Device(config)# end

Example: Configuring a VirtualPortGroup to a Layer 3 Data Port

Device> enable
Device# configure terminal
Device(config)# ip routing
Device(config)# interface gigabitethernet 0/0/0
Device(config-if)# no switchport
Device(config-if)# ip address 10.1.1.1 255.255.255.0
Device(config-if)# exit
Device(config)# interface virtualportgroup 0
Device(config-if)# ip address 192.168.0.1 255.255.255.0
Device(config-if)# end

Example: Installing and Uninstalling Apps

Device> enable
Device# app-hosting install appid app1 package flash:my_iox_app.tar
Device# app-hosting activate appid app1
Device# app-hosting start appid app1
Device# app-hosting stop appid app1
Device# app-hosting deactivate appid app1
Device# app-hosting uninstall appid app1

Example: Overriding the App Resource Configuration

Device# configure terminal
Device(config)# app-hosting appid app1
Device(config-app-hosting)# app-resource profile custom
Device(config-app-resource-profile-custom)# cpu 800
Device(config-app-resource-profile-custom)# memory 512
Device(config-app-resource-profile-custom)# vcpu 2
Device(config-app-resource-profile-custom)# end
Serial Relay Service

This chapter contains the following:

- Serial Relay Service, on page 253

Serial Relay Service

Serial Relay service on the IR1101 enables IOx apps to communicate with the Async Serial port (/dev/ttyS1 under IOS-XE). The configuration of Serial Relay service is similar to that of the IR800.

Data Paths

On the IR1101, IOS-XE has complete control over the data path and control path of the Async Serial port. This aspect is essential to other encapsulations supported on the Async port such as PPP, raw-socket, SCADA, etc. The IOx app is never allowed to exercise full control over the device. All data and configurations are passed through IOS-XE before going to the device. Instead of exposing the actual Serial port to IOx apps, the Serial relay service creates a software emulated serial tty device enumerated as /dev/ttyTun0 (shown below). The pair of devices /dev/ttyTun0 and /dev/ttyTun1 represent a data tunnel whose primary function is to act as a pass-through gateway during any data transfer. /dev/ttyTun1 is open by IOS-XE and all the ingress/egress data from IOS to the app uses this device during data transfer. Line 0/0/0 is used to communicated with /dev/ttyTun1. Serial relay service should be configured beforehand to allow the connection between two lines.
Data Path:
1. When the IOx app sends a character to /dev/ttyTun0, the tunnel driver automatically pushes the data to /dev/ttyTun1.
2. IOS reads the data which it then passes to the Serial relay service.
3. The Serial relay service retrieves information about the other end of the relay service (Line 0/2/0 in this case) and forwards the data to the Line's buffer.
4. The line driver actively pushes the data into the actual serial device (/dev/ttyS1) based on buffer availability.
5. The reverse path functions the same with the roles of /dev/ttyS1 and /dev/tun0 reversed.

Control Path:
1. When the IOx app performs TCGETS ioctl call on /dev/ttyTun0, the tunnel driver uses /dev/cttyTun to send request to the CTTY handler service running in IOS.
2. CTTY handler service and the kernel driver use a client-server architecture to communicate configuration objects.
3. Upon receiving the request about TCGETS from /dev/cttyTun, the CTTY handler examines the request and requests Line driver to populate the required data into control data structures.
4. Upon receiving the control data structures, CTTY handler sends out a response to /dev/cttyTun which eventually goes back to /dev/ttyTun0.
5. /dev/ttyTun0 passes the control data to IOx app as requested.
6. Similar path can be extrapolated for TCSETS where the CTTY handler requests the Line driver to update the settings of the underneath /dev/ttyS1 driver.
7. Line driver of Line 0/2/0 and driver config on /dev/ttyTun0 are always in sync with each other. Any configuration changes such as baud rate modification is transparently propagated to the Line driver without any additional configuration overhead. This emulates the propagation feature of Serial relay on the IR800 series where the virtual serial port can configure the parameters of the real serial port.
Configuration Commands

IR1101#configure terminal
IR1101(config)#interface async 0/2/0
IR1101(config-if)#encapsulation relay-line
IR1101(config-if)#exit
IR1101(config)#relay line 0/2/0 0/0/0
IR1101(config)#exit
IR1101#
Cisco SD-WAN Support

This chapter contains the following:

• Cisco SD-WAN Support, on page 257

Cisco SD-WAN Support

Cisco SD-WAN is a cloud-first architecture that separates data and control planes, managed through the Cisco vManage console. You can quickly establish an SD-WAN overlay fabric to connect data centers, branches, campuses, and co-location facilities to improve network speed, security, and efficiency.

Cisco SD-WAN Overview

Cisco SDWAN adopts a cloud based solution, it consists of vOrchestrator, vManage, vSmart and vEdge.

• vOrchestrator is responsible for launching all controllers VMs in the cloud.
• vManage is the management plane for the overall SDWAN solution. It uses netconf/YANG to talk to vEdge devices.
• vSmart is the control plane for the overall SDWAN solution. It talks to the vEdge device, acts as the route reflector, key reflector, and policy engine.
• vEdge is the data plane of the overall SDWAN solution. The IR1101 platform talks to vSmart, vManage, as part of the SDWAN network.

The follow diagram shows the high level architecture of SDWAN:
Frequently Asked Questions

**Question:** What is the minimum cEdge software version supporting SDWAN on the IR1101?

**Answer:** The minimum cEdge software version supporting SDWAN on the IR1101 is IOS-XE 16.12.1, the ir1101-ucmk9-XX image.

**Question:** What is the minimum SDWAN controller software version supporting the IR1101?

**Answer:** The minimum SDWAN controller software version supporting the IR1101 is 19.2.

**Question:** Where can I find SDWAN documentation?

**Answer:** Cisco SDWAN documentation is available from https://www.cisco.com/c/en/us/support/routers/sd-wan/tsd-products-support-series-home.html
https://sdwan-docs.cisco.com/Product_Documentation/Software.Features

**Question:** Can I use 2 LTE pluggables with SDWAN?

**Answer:** Cisco IOS-XE SDWAN version 16.12.1 does not support 2 LTE pluggable interfaces. Both the Base or Expansion Module can support 4G module, but still only one 4G module, in current May 2019 vManage and IOS XE 16.12.1 releases.

**Question:** Can I convert an IR1101 IOS-XE to a cEdge IR1101?

**Answer:** For migration from Cisco IOS-XE to cEdge image, please refer to https://www.cisco.com/c/dam/en/us/td/docs/routers/sd-wan/migration-guide/SDWAN-migration-guide.pdf

**Question:** Is IOx supported when running a cEdge image?

**Answer:** IOx is not supported on the IR1101 SDWAN 16.12.1 version.

All of the technical documentation for Cisco SD-WAN can be found here:
ROM Monitor Overview

This chapter provides an overview of ROM Monitor concepts and operations.

This chapter includes the following main topics:

---

**ROM Monitor Overview**

The ROM Monitor is a bootstrap program that initializes the hardware and boots the Cisco IOS XE software when you power on or reload a router. When you connect a terminal to the router that is in ROM Monitor mode, the ROM Monitor (rommon 1>) prompt is displayed.

During normal operation, users do not use ROM Monitor mode. ROM Monitor mode is used only in special circumstances, such as reinstalling the entire software set, resetting the router password, or specifying a configuration file to use at startup.

The ROM Monitor software is known by many names. It is sometimes called ROMMON because of the CLI prompt in ROM Monitor mode. The ROM Monitor software is also called the boot software, boot image, or boot helper. Although it is distributed with routers that use the Cisco IOS XE software, ROM Monitor is a separate program from the Cisco IOS XE software. During normal startup, the ROM Monitor initializes the router, and then control passes to the Cisco IOS XE software. After the Cisco IOS XE software takes over, the ROM Monitor is no longer in use.

**Environmental Variables and the Configuration Register**

Two primary connections exist between ROM Monitor and the Cisco IOS XE software: the ROM Monitor environment variables and the configuration register.

The ROM Monitor environment variables define the location of the Cisco IOS XE software and describe how to load it. After the ROM Monitor has initialized the router, it uses the environment variables to locate and load the Cisco IOS XE software.

The configuration register is a software setting that controls how a router starts up. One of the primary uses of the configuration register is to control whether the router starts in ROM Monitor mode or Administration EXEC mode. The configuration register is set in either ROM Monitor mode or Administration EXEC mode as needed. Typically, you set the configuration register using the Cisco IOS XE software prompt when you
need to use ROM Monitor mode. When the maintenance in ROM Monitor mode is complete, you change the configuration register so the router reboots with the Cisco IOS XE software.

**Accessing ROM Monitor Mode with a Terminal Connection**

When the router is in ROM Monitor mode, you can access the ROM Monitor software only from a terminal connected directly to the console port of the card. Because the Cisco IOS XE software (EXEC mode) is not operating, nonmanagement interfaces are not accessible. Basically, all Cisco IOS XE software resources are unavailable. The hardware is available, but no configuration exists to make use of the hardware.

**Network Management Access and ROM Monitor Mode**

It is important to remember that ROM Monitor mode is a router mode, not a mode within the Cisco IOS XE software. It is best to remember that ROM Monitor software and the Cisco IOS XE software are two separate programs that run on the same router. At any given time, the router runs only one of these programs.

One area that can be confusing when using ROM Monitor and the Cisco IOS XE software is the area that defines the IP configuration for the Management Ethernet interface. Most users are comfortable with configuring the Management Ethernet interface in the Cisco IOS XE software. When the router is in ROM Monitor mode, however, the router does not run the Cisco IOS XE software, so that Management Ethernet interface configuration is not available.

When you want to access other devices, such as a TFTP server, while in ROM Monitor mode on the router, you must configure the ROM Monitor variables with IP access information.

---

**Note**

TFTP access variables are currently not supported on the IR1101 platform.

---

**Access ROM Monitor Mode**

The following sections describe how to enter the ROMMON mode, and contains the following sections:

**Checking the Current ROMMON Version**

To display the version of ROMmon running on a router, use the `show rom-monitor` command. To show all variables that are set in ROMmon, use `show romvar`.

```
Router# show rom-monitor r0
System Bootstrap, Version 1.2, RELEASE SOFTWARE
Copyright (c) 1994-2018 by cisco Systems, Inc.

Router# show romvar
ROMMON variables:
PS1 = rommon ! >
MCP_STARTUP_TRACEFLAGS = 00000000:00000000
LICENSE_SUITE =
RET_2_RTS =
Diagnostic = 1
THRPUT =
USER_BOOT_PARAM = DEBUG_CONF=/bootflash/debug.conf
EULA_ACCEPTED = TRUE
BOOT_WDOG = DISABLE
LICENSE_BOOT_LEVEL =
BOOT = bootflash:sparrow_crashkernel.bin,1;
```
If your configuration register was set to hex value 0x0 or 0x1820, reload operation will bring you to the ROMmon mode command prompt (rommon 1>). Invoking the set command at the prompt (rommon 1> set) will display the same information as "show romvar" above in IOS/XE exec mode.

```
rommon 1 > set
PS1=rommon ! >
MCP_STARTUP_TRACEFLAGS = 00000000:00000000
LICENSE_SUITE =
RET_2_RTS =
Diagnostic = 1
THRPOT =
USER_BOOT_PARAM = DEBUG_CONF=/bootflash/debug.conf
EULA_ACCEPTED = TRUE
BOOT_WDOG = DISABLE
LICENSE_BOOT_LEVEL =
BOOT = bootflash:sparrow_crashkernel.bin,1;
CRASHINFO = bootflash:crashinfo_RP_00_00_20180619-204307-UTC
RET_2_RCALTS =
BSI = 0
RANDOM_NUM = 1662155698
```

**Commonly Used ROM Monitor Commands**

The following table summarizes the commands commonly used in ROM Monitor. For specific instructions on using these commands, refer to the relevant procedure in this document.

<table>
<thead>
<tr>
<th>ROMMON Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boot image</td>
<td>Manually boots a Cisco IOS XE software image.</td>
</tr>
<tr>
<td>boot image –o config-file-path</td>
<td>Manually boots the Cisco IOS XE software with a temporary alternative administration configuration file.</td>
</tr>
<tr>
<td>confreg</td>
<td>Changes the config-register setting.</td>
</tr>
<tr>
<td>dev</td>
<td>Displays the available local storage devices.</td>
</tr>
<tr>
<td>dir</td>
<td>Displays the files on a storage device.</td>
</tr>
<tr>
<td>reset</td>
<td>Resets the node.</td>
</tr>
<tr>
<td>set</td>
<td>Displays the currently set ROM Monitor environmental settings.</td>
</tr>
<tr>
<td>sync</td>
<td>Saves the new ROM Monitor environmental settings.</td>
</tr>
<tr>
<td>unset</td>
<td>Removes an environmental variable setting.</td>
</tr>
</tbody>
</table>
Examples

The following example shows what appears when you enter the `?` command on a router:

```
rommon 1 > ?
alias set and display aliases command
boot boot up an external process
confreg configuration register utility
dev list the device table
dir list files in file system
help monitor builtin command help
history monitor command history
meminfo main memory information
repeat repeat a monitor command
reset system reset
set display the monitor variables
showmon display currently selected ROM monitor
sync write monitor environment to NVRAM
token display board's unique token identifier
unalias unset an alias
unset unset a monitor variable
```

Changing the ROM Monitor Prompt

You can change the prompt in ROM Monitor mode by using the `PS1=` command as shown in the following example:

```
rommon 8 > PS1="IR1101 rommon ! > "
IR1101 rommon 9 >
```

Changing the prompt is useful if you are working with multiple routers in ROM Monitor at the same time. This example specifies that the prompt should be “IR1101 rommon “, followed by the line number, and then followed by “ > “ by the line number.

Displaying the Configuration Register Setting

To display the current configuration register setting, enter the `confreg` command without parameters as follows:

```
rommon > confreg
Configuration Summary
(Virtual Configuration Register: )
enabled are:
[ 0 ] break/abort has effect
[ 1 ] console baud: 9600
boot:...... the ROM Monitor
do you wish to change the configuration? y/n [n]:
```

The configuration register setting is labeled `Virtual Configuration Register`. Enter the `no` command to avoid changing the configuration register setting.

Environment Variable Settings

The ROM Monitor environment variables define the attributes of the ROM Monitor. Environmental variables are entered like commands and are always followed by the equal sign (=). Environment variable settings are entered in capital letters, followed by a definition. For example:
IP_ADDRESS=10.0.0.2

Under normal operating conditions, you do not need to modify these variables. They are cleared or set only when you need to make changes to the way ROM Monitor operates.

This section includes the following topics:

Frequently Used Environmental Variables

The following table shows the main ROM Monitor environmental variables. For instructions on how to use these variables, see the relevant instructions in this document. The IR1101 boot loader does not support netboot, so any setting like environment variables IP_ADDRESS, IP_SUBNET_MASK, DEFAULT_GATEWAY, TFTP_SERVER, TFTP_FILE are not used.

Table 23: Frequently Used ROM Monitor Environmental Variables

<table>
<thead>
<tr>
<th>Environmental variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOT=path/file</td>
<td>Identifies the boot software for a node. This variable is usually set automatically when the router boots.</td>
</tr>
</tbody>
</table>

Displaying Environment Variable Settings

To display the current environment variable settings, enter the set command:

```
rommon 1 > showmon
System Bootstrap, Version 1.3(REL), RELEASE SOFTWARE
Copyright (c) 1994-2018 by cisco Systems, Inc.
IR1101-K9 platform with 4188160 Kbytes of main memory
MCU Version - Bootloader: 4, App: 4
MCU is in application mode.
```

Entering Environment Variable Settings

Environment variable settings are entered in capital letters, followed by a definition. The following example shows the environmental variables that can be configured in ROMmon mode:

```
rommon 1 > confreg 0x0
rommon 1> BOOT_WDOG = DISABLE
rommon 1> BOOT = IR1101-K9_image_name
```

Saving Environment Variable Settings

To save the current environment variable settings, enter the sync command:

```
rommon > sync
```

Note

Environmental values that are not saved with the sync command are discarded whenever the system is reset or booted.
Exiting ROM Monitor Mode

To exit ROM Monitor mode, you must change the configuration register and reset the router.

SUMMARY STEPS

1. confreg
2. Respond to each prompt as instructed.
3. reset

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 confreg</td>
<td>Initiates the configuration register configuration prompts.</td>

change the boot characteristics? y/n [n]:
Configuration Summary
(Virtual Configuration Register: 0x0)
enabled are:
[ 0 ] break/abort has effect
[ 1 ] console baud: 9600
boot: ...... the ROM Monitor
do you wish to change the configuration? y/n [n]:
**Upgrading the ROMmon for a Router**

ROMmon upgrade on the IR1101-K9 router is automatically done when the image is booted. The latest version of the ROMmon is bundled with the IOSXE image. An algorithm detects if the current running version is older than the bundled version, if so, it is automatically upgraded. If the current running version is equal to the bundled version no upgrade is executed. For every successful upgrade, the router is automatically rebooted in order for the new version to get loaded and executed.

**SUMMARY STEPS**

1. (Optional) Run the `show rom-monitor slot` command on the router to see the current release numbers of ROMmon on the hardware. See the Checking the Current ROMMON Version, on page 262 for information about interpreting the output of the command that you run.
2. If autoboot has not been enabled by using the `config-register 0x2102` command, run the `boot filesystem:/file-location` command at the ROMmon prompt to boot the Cisco IOSXE image, where `filesystem:/file-location` is the path to the consolidated package file. The ROMmon upgrade is not permanent for any piece of hardware until the Cisco IOSXE image is booted.
3. Run the `enable` command at the user prompt to enter the privileged EXEC mode after the boot is complete.
4. Run the `show rom-monitor slot` command to verify whether the ROMmon has been upgraded.

**DETAILED STEPS**

**Step 1**  
(Optional) Run the `show rom-monitor slot` command on the router to see the current release numbers of ROMmon on the hardware. See the Checking the Current ROMMON Version, on page 262 for information about interpreting the output of the command that you run.

**Step 2**  
If autoboot has not been enabled by using the `config-register 0x2102` command, run the `boot filesystem:/file-location` command at the ROMmon prompt to boot the Cisco IOSXE image, where `filesystem:/file-location` is the path to the consolidated package file. The ROMmon upgrade is not permanent for any piece of hardware until the Cisco IOSXE image is booted.

**Step 3**  
Run the `enable` command at the user prompt to enter the privileged EXEC mode after the boot is complete.

**Step 4**  
Run the `show rom-monitor slot` command to verify whether the ROMmon has been upgraded.
Upgrading the ROMmon for a Router
Process Health Monitoring

This chapter describes how to manage and monitor the health of various components of your router. It contains the following sections:

- Monitoring Control Plane Resources, on page 269
- Monitoring Hardware Using Alarms, on page 275

Monitoring Control Plane Resources

The following sections explain the details of memory and CPU monitoring from the perspective of the Cisco IOS process and the overall control plane:

- Avoiding Problems Through Regular Monitoring, on page 269
- Cisco IOS Process Resources, on page 269
- Overall Control Plane Resources, on page 273

Avoiding Problems Through Regular Monitoring

Processes should provide monitoring and notification of their status/health to ensure correct operation. When a process fails, a syslog error message is displayed and either the process is restarted or the router is rebooted. A syslog error message is displayed when a monitor detects that a process is stuck or has crashed. If the process can be restarted, it is restarted; else, the router is restarted.

Monitoring system resources enables you to detect potential problems before they occur, thus avoiding outages. It also establishes a baseline for a normal system load. You can use this information as a basis for comparison, when you upgrade hardware or software to see if the upgrade has affected resource usage.

Cisco IOS Process Resources

You can view CPU utilization statistics on active processes and see the amount of memory being used in these processes using the `show memory` command and the `show process cpu` command. These commands provide a representation of memory and CPU utilization from the perspective of only the Cisco IOS process; they do not include information for resources on the entire platform. When the `show memory` command is used in a system with 4 GB RAM running a single Cisco IOS process, the following memory usage is displayed:
Router# show memory

--More--
Overall Control Plane Resources

Control plane memory and CPU utilization on each control processor allows you to keep a tab on the overall control plane resources. You can use the `show platform software status control-processor brief` command (summary view) or the `show platform software status control-processor` command (detailed view) to view control plane memory and CPU utilization information.

All control processors should show status, Healthy. Other possible status values are Warning and Critical. Warning indicates that the router is operational, but that the operating level should be reviewed. Critical implies that the router is nearing failure.

If you see a Warning or Critical status, take the following actions:

- Reduce the static and dynamic loads on the system by reducing the number of elements in the configuration or by limiting the capacity for dynamic services.
- Reduce the number of routes and adjacencies, limit the number of ACLs and other rules, reduce the number of VLANs, and so on.

The following sections describe the fields in the `show platform software status control-processor` command output.

**Load Average**

Load average represents the process queue or process contention for CPU resources. For example, on a single-core processor, an instantaneous load of 7 would mean that seven processes are ready to run, one of which is currently running. On a dual-core processor, a load of 7 would mean that seven processes are ready to run, two of which are currently running.

**Memory Utilization**

Memory utilization is represented by the following fields:

- **Total**—Total system memory
- **Used**—Consumed memory
- **Free**—Available memory
- **Committed**—Virtual memory committed to processes

**CPU Utilization**

CPU utilization is an indication of the percentage of time the CPU is busy, and is represented by the following fields:

- **CPU**—Allocated processor
- **User**—Non-Linux kernel processes
- **System**—Linux kernel process
- **Nice**—Low-priority processes
- **Idle**—Percentage of time the CPU was inactive
- **IRQ**—Interrupts
• SIRQ—System Interrupts
• IOwait—Percentage of time CPU was waiting for I/O

Example: show platform software status control-processor Command

The following are some examples of using the show platform software status control-processor command:

Router# show platform software status control-processor
RP0: online, statistics updated 4 seconds ago
Load Average: healthy
1-Min: 0.29, status: healthy, under 5.00
5-Min: 0.51, status: healthy, under 5.00
15-Min: 0.54, status: healthy, under 5.00
Memory (kb): healthy
Total: 4038072
Used: 2872136 (71%), status: healthy
Free: 1165936 (29%)
Commited: 2347228 (58%), under 90%

Per-core Statistics
CPU0: CPU Utilization (percentage of time spent)
User: 1.00, System: 0.70, Nice: 0.00, Idle: 97.88
IRQ: 0.30, SIRQ: 0.10, IOwait: 0.00
CPU1: CPU Utilization (percentage of time spent)
User: 0.70, System: 0.30, Nice: 0.00, Idle: 98.48
IRQ: 0.30, SIRQ: 0.20, IOwait: 0.00
CPU2: CPU Utilization (percentage of time spent)
User: 0.20, System: 1.11, Nice: 0.00, Idle: 97.87
IRQ: 0.40, SIRQ: 0.00, IOwait: 0.00
CPU3: CPU Utilization (percentage of time spent)
User: 8.23, System: 24.37, Nice: 0.00, Idle: 58.00
IRQ: 9.26, SIRQ: 0.11, IOwait: 0.00

Router# show platform software status control-processor brief
Load Average
Slot Status 1-Min 5-Min 15-Min
RP0 Healthy 0.28 0.46 0.52

Monitoring Hardware Using Alarms

Router Design and Monitoring Hardware

The router sends alarm notifications when problems are detected, allowing you to monitor the network remotely. You do not need to use `show` commands to poll devices on a routine basis; however, you can perform onsite monitoring if you choose.

BootFlash Disk Monitoring

The bootflash disk must have enough free space to store two core dumps. This condition is monitored, and if the bootflash disk is too small to store two core dumps, a syslog alarm is generated, as shown in the following example:

```
Oct 6 14:10:56.292: %FLASH_CHECK-3-DISK_QUOTA: R0/0: flash_check: Flash disk quota exceeded
[free space is 1429020 kB] - Please clean up files on bootflash.
```

Approaches for Monitoring Hardware Alarms

Viewing the Console or Syslog for Alarm Messages

The network administrator can monitor alarm messages by reviewing alarm messages sent to the system console or to a system message log (syslog).

Enabling the logging alarm Command

The `logging alarm` command must be enabled for the system to send alarm messages to a logging device, such as the console or a syslog. This command is not enabled by default.

You can specify the severity level of the alarms to be logged. All the alarms at and above the specified threshold generate alarm messages. For example, the following command sends only critical alarm messages to logging devices:

```
Router(config)# logging alarm critical
```

If alarm severity is not specified, alarm messages for all severity levels are sent to logging devices.

Network Management System Alerts a Network Administrator when an Alarm is Reported Through SNMP

The SNMP is an application-layer protocol that provides a standardized framework and a common language used for monitoring and managing devices in a network.

SNMP provides notification of faults, alarms, and conditions that might affect services. It allows a network administrator to access router information through a network management system (NMS) instead of reviewing logs, polling devices, or reviewing log reports.

To use SNMP to get alarm notification, use the following MIBs:
Network Management System Alerts a Network Administrator when an Alarm is Reported Through SNMP

- ENTITY-MIB, RFC4133 (required for the CISCO-ENTITY-ALARM-MIB, ENTITY-STATE-MIB and CISCO-ENTITY-SENSOR-MIB to work)
- CISCO-ENTITY-ALARM-MIB
- ENTITY-STATE-MIB
- CISCO-ENTITY-SENSOR-MIB (for transceiver environmental alarm information, which is not provided through the CISCO-ENTITY-ALARM-MIB)
Troubleshooting

This section describes the troubleshooting scenarios.

Before troubleshooting a software problem, you must connect a PC to the router via the console port. With a connected PC, you can view status messages from the router and enter commands to troubleshoot a problem. You can also remotely access the interface by using Telnet. The Telnet option assumes that the interface is up and running.

- Understanding Diagnostic Mode, on page 277
- Before Contacting Cisco or Your Reseller, on page 278
- show interfaces Troubleshooting Command, on page 278
- Software Upgrade Methods, on page 278
- Change the Configuration Register, on page 279
- Recovering a Lost Password, on page 282

Understanding Diagnostic Mode

The router boots up or accesses diagnostic mode in the following scenarios:

- The IOS process or processes fail, in some scenarios. In other scenarios, the system resets when the IOS process or processes fail.
- A user-configured access policy was configured using the transport-map command that directs the user into the diagnostic mode.
- A send break signal (Ctrl-C or Ctrl-Shift-6) was entered while accessing the router, and the router was configured to enter diagnostic mode when a break signal was sent.

In the diagnostic mode, a subset of the commands that are available in user EXEC mode are made available to the users. Among other things, these commands can be used to:

- Inspect various states on the router, including the IOS state.
- Replace or roll back the configuration.
- Provide methods of restarting the IOS or other processes.
- Reboot hardware, such as the entire router, a module, or possibly other hardware components.
- Transfer files into or off of the router using remote access methods such as FTP, TFTP, and SCP.
The diagnostic mode provides a more comprehensive user interface for troubleshooting than previous routers, which relied on limited access methods during failures, such as ROMMON, to diagnose and troubleshoot Cisco IOS problems. The diagnostic mode commands can work when the Cisco IOS process is not working properly. These commands are also available in privileged EXEC mode on the router when the router is working normally.

Before Contacting Cisco or Your Reseller

If you cannot locate the source of a problem, contact your local reseller for advice. Before you call, you should have the following information ready:

- Chassis type and serial number
- Maintenance agreement or warranty information
- Type of software and version number
- Date you received the hardware
- Brief description of the problem
- Brief description of the steps you have taken to isolate the problem

show interfaces Troubleshooting Command

Use the show interfaces command to display the status of all physical ports and logical interfaces on the router. #unique_350 unique_350_Connect_42_tab_1055127 describes messages in the command output.

The IR1101 supports the following interfaces:

- GigabitEthernet 0/0/0
- Cellular 0/1/0
- FastEthernet 0/0/1 to 0/0/4
- Async 0/2/0

Software Upgrade Methods

Several methods are available for upgrading software on the Cisco IR1101 Routers, including:

- Copy the new software image to flash memory over LAN or WAN when the existing Cisco IOS software image is in use.
- Copy the new software image to flash memory over the LAN while the boot image (ROM monitor) is operating.
- Copy the new software image over the console port while in ROM monitor mode.
- From ROM monitor mode, boot the router from a software image that is loaded on a TFTP server. To use this method, the TFTP server must be on the same LAN as the router.
Change the Configuration Register

To change a configuration register, follow these steps:

**SUMMARY STEPS**

1. Connect a PC to the CONSOLE port on the router.
2. At the privileged EXEC prompt (router_name #), enter the show version command to display the existing configuration register value (shown in bold at the bottom of this output example):
3. Record the setting of the configuration register.
4. To enable the break setting (indicated by the value of bit 8 in the configuration register), enter the config-register 0x01 command from privileged EXEC mode.

**DETAILED STEPS**

**Step 1**
Connect a PC to the CONSOLE port on the router.

**Step 2**
At the privileged EXEC prompt (router_name #), enter the show version command to display the existing configuration register value (shown in bold at the bottom of this output example):

**Example:**

```
Router# show version
Cisco IOS XE Software, Version 16.10.01
Cisco IOS Software [Gibraltar], ISR Software (ARMV8EL_LINUX_IOSD-UNIVERSALK9-M), Version 16.10.1, RELEASE SOFTWARE (fc1)
Technical Support: http://www.cisco.com/techsupport
Copyright (c) 1986-2018 by Cisco Systems, Inc.
Compiled Fri 09-Nov-18 18:08 by mcpres

Smart Licensing Status: UNREGISTERED/EVAL MODE

cisco IR1101-K9 (ARM64) processor (revision 1.2 GHz) with 711861K/6147K bytes of memory.
Processor board ID FCW222700MY
3 Virtual Ethernet interfaces
4 FastEthernet interfaces
1 Gigabit Ethernet interface
1 Serial interface
1 terminal line
2 Cellular interfaces
32768K bytes of non-volatile configuration memory.
4038072K bytes of physical memory.
3110864K bytes of Bootflash at bootflash:
0K bytes of WebUI ODM Files at webui:

Configuration register is 0x1821

Router#

Step 3 Record the setting of the configuration register.

Step 4 To enable the break setting (indicated by the value of bit 8 in the configuration register), enter the config-register 0x01 command from privileged EXEC mode.

- Break enabled—Bit 8 is set to 0.
- Break disabled (default setting)—Bit 8 is set to 1.

---

**Configuring the Configuration Register for Autoboot**

*Note* Altering the configuration register is only for advanced troubleshooting and should only be done with guidance from Cisco support.
The configuration register can be used to change router behavior. This includes controlling how the router boots. Set the configuration register to 0x0 to boot into ROM, by using one of the following commands:

• In Cisco IOS configuration mode, use the `config-reg 0x0` command.

• From the ROMMON prompt, use the `confreg 0x0` command.

**Note**

Setting the configuration register to 0x2102 will set the router to autoboot the Cisco IOS XE software.

### Reset the Router

To reset the router, follow these steps:

**SUMMARY STEPS**

1. If break is disabled, turn the router off (O), wait 5 seconds, and turn it on (I) again. Within 60 seconds, press the **Break** key. The terminal displays the ROM monitor prompt.
2. Press break. The terminal displays the following prompt:
3. Enter `confreg 0x142` to reset the configuration register:
4. Initialize the router by entering the `reset` command:
5. Enter `no` in response to the prompts until the following message is displayed:
6. Press **Return**. The following prompt appears:
7. Enter the `enable` command to enter enable mode. Configuration changes can be made only in enable mode:
8. Enter the `show startup-config` command to display an enable password in the configuration file:

**DETAILED STEPS**

---

**Step 1**

If break is disabled, turn the router off (O), wait 5 seconds, and turn it on (I) again. Within 60 seconds, press the **Break** key. The terminal displays the ROM monitor prompt.

**Note**

Some terminal keyboards have a key labeled **Break**. If your keyboard does not have a Break key, see the documentation that came with the terminal for instructions on how to send a break.

**Step 2**

Press break. The terminal displays the following prompt:

**Example:**

```
rommon 2>
```

**Step 3**

Enter `confreg 0x142` to reset the configuration register:

**Example:**

```
rommon 2> confreg 0x142
```

**Step 4**

Initialize the router by entering the `reset` command:

**Example:**
rommon 2> reset

The router cycles its power, and the configuration register is set to 0x142. The router uses the boot ROM system image, indicated by the system configuration dialog:

Example:

--- System Configuration Dialog ---

Step 5 Enter no in response to the prompts until the following message is displayed:

Example:

Press RETURN to get started!

Step 6 Press Return. The following prompt appears:

Example:

Router>

Step 7 Enter the enable command to enter enable mode. Configuration changes can be made only in enable mode:

Example:

Router> enable

The prompt changes to the privileged EXEC prompt:

Example:

Router#

Step 8 Enter the show startup-config command to display an enable password in the configuration file:

Example:

Router# show startup-config

What to do next

If you are recovering an enable password, do not perform the steps in the Reset the Password and Save Your Changes section. Instead, complete the password recovery process by performing the steps in the Reset the Configuration Register Value section.

If you are recovering an enable secret password, it is not displayed in the show startup-config command output. Complete the password recovery process by performing the steps in the Reset the Password and Save Your Changes section.

Recovering a Lost Password

To recover a lost enable or lost enable-secret password, refer to the following sections:

1. Change the Configuration Register
2. Reset the Router

3. Reset the Password and Save your Changes (for lost enable secret passwords only)

4. Reset the Configuration Register Value.

5. If you have performed a write erase, or used the reset button, you will need to add the license.

   IR1101#config term
   IR1101#license smart reservation

---

**Note**

Recovering a lost password is only possible when you are connected to the router through the console port. These procedures cannot be performed through a Telnet session.

---

**Tip**

See the “Hot Tips” section on Cisco.com for additional information on replacing enable secret passwords.

---

**Reset the Password and Save Your Changes**

To reset your password and save the changes, follow these steps:

**SUMMARY STEPS**

1. Enter the `configure terminal` command to enter global configuration mode:
2. Enter the `enable secret` command to reset the enable secret password in the router:
3. Enter `exit` to exit global configuration mode:
4. Save your configuration changes:

**DETAILED STEPS**

**Step 1**

Enter the `configure terminal` command to enter global configuration mode:

**Example:**

```
Router# configure terminal
```

**Step 2**

Enter the `enable secret` command to reset the enable secret password in the router:

**Example:**

```
Router(config)# enable secret
password
```

**Step 3**

Enter `exit` to exit global configuration mode:

**Example:**

```
Router(config)# exit
```

**Step 4**

Save your configuration changes:
Example:

Router# copy running-config startup-config

Reset the Configuration Register Value

To reset the configuration register value after you have recovered or reconfigured a password, follow these steps:

**SUMMARY STEPS**

1. Enter the `configure terminal` command to enter global configuration mode:
2. Enter the `configure register` command and the original configuration register value that you recorded.
3. Enter `exit` to exit configuration mode:
4. Reboot the router, and enter the recovered password.

**DETAILED STEPS**

**Step 1**

Enter the `configure terminal` command to enter global configuration mode:

*Example:*

Router# configure terminal

**Step 2**

Enter the `configure register` command and the original configuration register value that you recorded.

*Example:*

Router(config)# config-reg value

**Step 3**

Enter `exit` to exit configuration mode:

*Example:*

Router(config)# exit

*Note* To return to the configuration being used before you recovered the lost enable password, do not save the configuration changes before rebooting the router.

**Step 4**

Reboot the router, and enter the recovered password.

Configuring a Console Port Transport Map

This task describes how to configure a transport map for a console port interface on the router.
SUMMARY STEPS

1. enable
2. configure terminal
3. transport-map type console transport-map-name
4. connection wait [allow [interruptible] | none [disconnect]]
5. (Optional) banner [diagnostic | wait] banner-message
6. exit
7. transport type console console-line-number input transport-map-name

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>enable</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router&gt; enable</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router# configure terminal</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>transport-map type console transport-map-name</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router(config)# transport-map type console consolehandler</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>connection wait [allow [interruptible]</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router(config-tmap)# connection wait none</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>(Optional) banner [diagnostic</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router(config-tmap)# banner diagnostic X</td>
</tr>
<tr>
<td><strong>Enter TEXT message. End with the character 'X'.</strong></td>
<td></td>
</tr>
</tbody>
</table>

Note

- **allow interruptible**—The console connection waits for a Cisco IOS VTY line to become available, and also allows users to enter diagnostic mode by interrupting a console connection that is waiting for a Cisco IOS VTY line to become available. This is the default setting.

- **none**—The console connection immediately enters diagnostic mode.
**Viewing Console Port, SSH, and Telnet Handling Configurations**

Use the following commands to view console port, SSH, and Telnet handling configurations:

- `show transport-map`
- `show platform software configuration access policy`
Use the `show transport-map` command to view transport map configurations.

`show transport-map [all | name transport-map-name | type [console]]`

This command can be used either in user EXEC mode or privileged EXEC mode.

**Example**

The following example shows transport maps that are configured on the router: console port (consolehandler):

```
Router# show transport-map all
Transport Map:
Name: consolehandler Type: Console Transport

Connection:
Wait option: Wait Allow Interruptible Wait banner:
Waiting for the IOS CLI bshell banner:
Welcome to Diagnostic Mode

Router# show transport-map type console
Transport Map:
Name: consolehandler

Type: Console Transport

Connection:
Wait option: Wait Allow Interruptible Wait banner:
Waiting for the IOS CLI Bshell banner:
Welcome to Diagnostic Mode

Router# show transport-map type persistent ssh
Transport Map:
Name: consolehandler Type: Console Transport

Connection:
Wait option: Wait Allow Interruptible Wait banner:
Waiting for the IOS CLI Bshell banner:
Welcome to Diagnostic Mode
```

Use the `show platform software configuration access policy` command to view the current configurations for handling the incoming console port, SSH, and Telnet connections. The output of this command provides the current wait policy for each type of connection (Telnet, SSH, and console), as well as information on the currently configured banners.

Unlike the `show transport-map` command, the `show platform software configuration access policy` command is available in diagnostic mode so that it can be entered in scenarios where you need transport map configuration information, but cannot access the Cisco IOS CLI.
Using the factory reset Commands

The factory reset commands are used to remove all the customer specific data on a router/switch that has been added. The data can be configuration, log files, boot variables, core files, and so on.

The factory-reset all command erases the bootflash, nvram, rommon variables, licenses, and logs.

Router# factory-reset all
The factory reset operation is irreversible for all operations. Are you sure? [confirm]
*Enter*

***Return to ROMMON Prompt
