Introduction to Cisco 1800 Series Routers (Modular) Hardware Documentation

This introduction discusses the objectives, audience, organization, and conventions of the hardware documents for the Cisco 1800 series integrated services routers (modular), and describes related documents that have additional information. It contains the following sections:

- Objectives, page 1-5
- Audience, page 1-6
- Organization, page 1-6
- Conventions, page 1-7
- Safety Warnings, page 1-7
- Related Documentation, page 1-13
- Cisco One-Year Limited Hardware Warranty Terms, page 1-14
- Searching for Cisco Documents, page 1-15
- Obtaining Documentation and Submitting a Service Request, page 1-15

Objectives

This documentation explains how to install, maintain, and troubleshoot your router hardware. Although this documentation provides minimum software configuration information, it is not comprehensive. For detailed software configuration information, see Cisco 1800 series software configuration documentation and the Cisco IOS configuration guide and command reference publications. These publications are available online. See the “Obtaining Documentation and Submitting a Service Request” section on page 1-15 for more information.

This documentation describes the Cisco 1800 series (modular), currently consisting of the Cisco 1841 router and the Cisco 1861 integrated services router (ISR).

Note

With the exception of when the Cisco 1861 ISR is specifically mentioned, all information in this document describes the Cisco 1841 router.

To access the warranty, service, and support information, see the “Cisco One-Year Limited Hardware Warranty Terms” section on page 1-14.
Chapter 1      Introduction to Cisco 1800 Series Routers (Modular) Hardware Documentation

Audience

This documentation is designed for the person installing, configuring, and maintaining the router, who should be familiar with electronic circuitry and wiring practices and has experience as an electronic or electromechanical technician. The documentation identifies those procedures that should be performed only by trained and qualified personnel.

Organization

Table 1-1 lists the topics covered by these hardware documents.

Note Means reader take note. Notes contain helpful suggestions or references to material not covered in the manual.

Timesaver Means the described action saves time. You can save time by performing the action described in the paragraph.

Tip Means the following information will help you solve a problem. The tips information might not be troubleshooting or even an action, but could be useful information, similar to a Timesaver.

Caution Means reader be careful. In this situation, you might do something that could result in equipment damage or loss of data.

Safety Warnings

Safety warnings appear throughout this publication in procedures that, if performed incorrectly, may harm you. A warning symbol precedes each warning statement. To see translations of the warnings that appear in this publication, see Regulatory Compliance and Safety Information for Cisco 1840 Routers.
The title Regulatory Compliance and Safety Information for Cisco 1840 Routers refers to a specific chassis model: the Cisco 1840. The Cisco 1841 router received compliance certification under the chassis model Cisco 1840. The same regulatory compliance and safety information for the Cisco 1841 router is applicable to the Cisco 1861 ISR.

Avvertenza  IMPORTANTI ISTRUZIONI SULLA SICUREZZA

Questo simbolo di avvertenza indica un pericolo. La situazione potrebbe causare infortuni alle persone. Prima di intervenire su qualsiasi apparecchiatura, occorre essere al corrente dei pericoli relativi ai circuiti elettrici e conoscere le procedure standard per la prevenzione di incidenti. Utilizzare il numero di istruzione presente alla fine di ciascuna avvertenza per individuare le traduzioni delle avvertenze riportate in questo documento.

CONSERVARE QUESTE ISTRUZIONI

Advarsel  VIKTIGE SIKKERHETSINSTRUKSJONER

Dette advarselssymbolet betyr fare. Du er i en situasjon som kan føre til skade på person. Før du begynner å arbeide med noe av utstyret, må du være oppmerksom på farene forbundet med elektriske kretser, og kjenne til standardprosedyrer for å forhindre ulykker. Bruk nummeret i slutten av hver advarsel for å finne oversettelsen i de oversatte sikkerhetsadvarslene som fulgte med denne enheten.

TA VARE PÅ DISSE INSTRUKSJONENE

Aviso  INSTRUÇÕES IMPORTANTES DE SEGURANÇA

Este símbolo de aviso significa perigo. Você está em uma situação que poderá ser causadora de lesões corporais. Antes de iniciar a utilização de qualquer equipamento, tenha conhecimento dos perigos envolvidos no manuseio de circuitos elétricos e familiarize-se com as práticas habituais de prevenção de acidentes. Utilize o número da instrução fornecido ao final de cada aviso para localizar sua tradução nos avisos de segurança traduzidos que acompanham este dispositivo.

Related Documentation

The Cisco IOS software that runs your Cisco 1800 series router includes extensive features and functionality. For information that is beyond the scope of this document, or for additional information, see Table 1-3.

Make sure that you have access to the documents listed in Table 1-3. Some of these documents are available in print, and all are available on Cisco.com. To order printed documents, see the “Obtaining Documentation and Submitting a Service Request” section on page 1-15.
### Cisco One-Year Limited Hardware Warranty Terms

There are special terms applicable to your hardware warranty and various services that you can use during the warranty period. Your formal Warranty Statement, including the warranties and license agreements applicable to Cisco software, is available on Cisco.com. Follow these steps to access and download the *Cisco Information Packet* and your warranty and license agreements from Cisco.com.

1. Launch your browser, and go to this URL:
   
   
   The Warranties and License Agreements page appears.

2. To read the *Cisco Information Packet*, follow these steps:
   a. Click the *Cisco Limited Warranty, Disclaimer of Warranty, End User License Agreement, and US FCC Notice* link.
      
      The Cisco Limited Warranty and Software License page from the Information Packet appears.
   b. Read the document online, or click the PDF icon to download and print the document in Adobe Portable Document Format (PDF).

   **Note** You must have Adobe Acrobat Reader to view and print PDF files. You can download the reader from Adobe’s website: [http://www.adobe.com](http://www.adobe.com)

You can also contact the Cisco service and support website for assistance:

OL-5876-03
**Replacement, Repair, or Refund Policy for Hardware**

Cisco or its service center will use commercially reasonable efforts to ship a replacement part within ten (10) working days after receipt of a Return Materials Authorization (RMA) request. Actual delivery times can vary, depending on the customer location.

Cisco reserves the right to refund the purchase price as its exclusive warranty remedy.

**To Receive a Return Materials Authorization (RMA) Number**

Contact the company from whom you purchased the product. If you purchased the product directly from Cisco, contact your Cisco Sales and Service Representative.

Complete the following information, and keep it for reference.

<table>
<thead>
<tr>
<th>Company product purchased from</th>
<th>Company telephone number</th>
<th>Product model number</th>
<th>Product serial number</th>
<th>Maintenance contract number</th>

**Searching for Cisco Documents**

To search an HTML document using a web browser, press `Ctrl-F` (Windows) or `Cmd-F` (Apple). In most browsers, the option to search whole words only, invoke case sensitivity, or search forward and backward is also available.

To search a PDF document in Adobe Reader, use the basic Find toolbar (`Ctrl-F`) or the Full Reader Search window (`Shift-Ctrl-F`). Use the Find toolbar to find words or phrases within a specific document. Use the Full Reader Search window to search multiple PDF files simultaneously and to change case sensitivity and other options. Adobe Reader online help has more information about how to search PDF documents.

---

**Obtaining Documentation and Submitting a Service Request**

For information on obtaining documentation, submitting a service request, and gathering additional information, see the monthly *What’s New in Cisco Product Documentation*, which also lists all new and revised Cisco technical documentation, at:

Subscribe to the *What’s New in Cisco Product Documentation* as a Really Simple Syndication (RSS) feed and set content to be delivered directly to your desktop using a reader application. The RSS feeds are a free service and Cisco currently supports RSS Version 2.0.
Overview of Cisco 1800 Series Routers (Modular)

Cisco 1800 series integrated services routers (ISR) (modular) are modular routers with LAN and WAN connections that can be configured by means of interchangeable interface cards and advanced integration modules (AIMs). The modular design of the routers provides flexibility, allowing you to configure or reconfigure your router according to your needs.

The Cisco 1841 router is a data-only device for desktop use. Figure 2-1 shows the Cisco 1841 router.

Figure 2-1 The Cisco 1841 Router

The Cisco 1861 ISR, which is part of the Cisco 1800 series ISR family, is a unified communications solution for small- to medium-sized businesses and enterprise small branch offices that provides voice, data, voice-mail, automated attendant, video, and security capabilities while integrating with existing desktop applications such as calendar, e-mail, and customer relationship management (CRM) programs and with built-in security. It has the following core components:

- Integrated Cisco Unified Communications Manager Express or Survivable Remote Site Telephony for call processing for up to 12 users
- Optional Cisco Unity Express for voice messaging and automated attendant
- Integrated LAN switching with Power over Ethernet (POE) expandable via Cisco Catalyst Switches
- Optional support for a range of WAN interface cards

Figure 2-2 and Figure 2-3 show the Cisco 1861 ISR.
This chapter describes the features and specifications of the router and includes the following sections:

- Hardware Features, page 2-2
- Chassis Views, page 2-8
- Interface Numbering, page 2-9
- Interface Numbering on the 1861 Integrated Services Router, page 2-10
- Specifications, page 2-11
- Regulatory Compliance, page 2-11

## Hardware Features

This section describes the basic features of Cisco 1800 series routers. It contains the following:

- Product Serial Number Location, page 2-3
Product Serial Number Location

The serial number label for the Cisco 1841 router and the Cisco 1861 ISR is located on the rear of the chassis, underneath interface card slot 0. (See Figure 2-4.)

Cisco Product Identification Tool

The Cisco Product Identification (CPI) tool provides detailed illustrations and descriptions showing where to locate serial number labels on Cisco products. It includes the following features:

- Search option allows browsing for models using a tree-structured product hierarchy.
- Search field on the final results page makes it easier to look up multiple products.
- End-of-sale products are clearly identified in results lists.

The tool streamlines the process of locating serial number labels and identifying products. Serial number information expedites the entitlement process and is important for access to support services.

The Cisco Product Identification tool can be accessed at the following URL:

Interfaces

This section summarizes the interfaces available on the Cisco 1800 series routers.
**Interfaces on the Cisco 1841 Router**

The following interfaces exist on the Cisco 1841 router:

- Two Fast Ethernet ports (RJ-45 connectors)
- High-speed console and auxiliary ports, up to 115.2 kbps each (RJ-45 connectors)
- One USB port (version 1.1), intended for future use

**Interfaces on the Cisco 1861 Integrated Services Router**

The Cisco 1861 Integrated Services Router comes with various possible configurations, based on built-in ports and other hardware features of the Cisco 1861 Integrated Services Router and organized by model. Table 2-1 lists the labels and descriptions for the WAN, LAN, voice interface card (VIC), and other interfaces, along with the values for these interfaces in the preconfigured router software configuration.

In Table 2-1, all slots/ports are numbered right to left, unless otherwise noted.

* Only one optional VIC can be factory installed in a Cisco 1861 Integrated Services Router.

Removable and Interchangeable Modules

Various optional modules can be installed in the router to provide specific capabilities. These modules can be installed either by inserting them into slots on the chassis, or by opening the chassis and plugging them into connectors inside the chassis.

- Flash memory and interface cards fit into slots on the chassis and can be installed or removed without opening the chassis.

There are three types of interface cards for the 1800 series modular routers:

- WAN interface cards (WICs)
- Voice WAN interface cards (VWICs—in data mode only on the Cisco 1841)
- High-speed WAN interface cards (HWICs)

- The following components plug into connectors inside the chassis and can be installed or removed only by opening the chassis:
  - Advanced integration module (AIM)
  - Synchronous dynamic RAM (SDRAM) small-outline dual in-line memory module (SODIMM)

Table 2-2 summarizes the optional modules:

Table 2-2   Summary of Cisco 1800 Series Removable and Interchangeable Modules

Memory

Cisco 1800 series routers contain the following types of memory:

- SDRAM—Serves two functions. It stores the running configuration and routing tables, and it is used for packet buffering by the network interfaces. Cisco IOS software executes from SDRAM.
- Flash memory—Stores the operating system software image, configuration files, and log files. It is implemented in an external CompactFlash memory card.
• Boot/NVRAM—Serves two functions. It stores the ROM monitor, which allows you to boot an operating system software image from flash memory. It also stores the system configuration file and the virtual configuration register.

Table 2-3 lists the memory specifications for Cisco 1800 series routers.

<table>
<thead>
<tr>
<th>Description</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>SDRAM</td>
<td>128 MB, expandable to 384 MB; default is 128 MB</td>
</tr>

Chassis Ventilation

An internal three-speed fan provides chassis cooling. An onboard temperature sensor controls the fan speed. The fan is always on when power is applied to the router. Under most conditions, the fan operates at the slowest speed to conserve power and reduce fan noise. It operates at the higher speeds when necessary under conditions of higher ambient temperature.

Real-Time Clock

An internal real-time clock with battery backup provides the system software with time of day on system power up. This allows the system to verify the validity of a certification authority (CA) certificate. The backup battery is a socketed lithium battery. This battery lasts the life of the router under the operating environmental conditions specified for the router, and is not field replaceable.
### Chassis Views

This section contains views of the front and rear panels of Cisco 1841 router, showing the locations of the power and signal interfaces, the interface card slots, and the status indicators.

**Figure 2-6** *Front Panel of the Cisco 1841 Router*

1. System Power (SYS PWR) LED
2. System Activity (SYS ACT) LED

**Figure 2-7** *Back Panel of the Cisco 1841 Router*

1. 2. 3. 4. 5. 6. 7. 8. 9. 10. 11. 12. 13.
### Interface Numbering

Each individual interface (port) on a Cisco 1841 router is identified by a number. A Cisco 1841 router contains the following wide-area network (WAN) and local-area network (LAN) interface types:

- Two onboard Fast Ethernet LAN interfaces
- Two slots in which you can install WICs, VWICs (data only), and HWICs.

The numbering format for the slots is `interface-type 0/slot-number/interface-number`. Table 2-6 summarizes the interface numbering.

<table>
<thead>
<tr>
<th>Slot Number</th>
<th>Slot Type</th>
<th>Slot Numbering Range</th>
<th>Example¹</th>
</tr>
</thead>
<tbody>
<tr>
<td>Onboard Ports</td>
<td>Fast Ethernet</td>
<td>0/0 and 0/1</td>
<td><code>interface fastethernet 0/0</code></td>
</tr>
<tr>
<td>Slot 0</td>
<td>HWIC/WIC/VWIC²</td>
<td>0/0/0 to 0/0/3</td>
<td><code>interface serial 0/0/0</code> line async 0/0/0</td>
</tr>
<tr>
<td>Slot 1</td>
<td>HWIC/WIC/VWIC²</td>
<td>0/1/0 to 0/1/3</td>
<td><code>interface serial 0/1/0</code> line async 0/1/0</td>
</tr>
</tbody>
</table>

1. The interfaces listed are examples only; other possible interface types are not listed.
2. VWICs are data-only in a Cisco 1841 router.

---

**Note**

On the Cisco 1841 router, the numbering format for configuring an async interface is `0/slot/port`. To configure the line associated with an async interface, simply use the interface number to specify the async line. For example, line 0/0/0 specifies the line associated with interface serial 0/0/0 on a WIC-2A/S in slot 0. Similarly, line 0/1/1 specifies the line associated with interface async 0/1/1 on a WIC-2AM in slot 1.
Interface Numbering on the 1861 Integrated Services Router

Each interface (port) on a Cisco 1861 ISR is identified by a number. The Cisco 1861 router contains the following WANLAN interface types:

- One onboard Fast Ethernet LAN interface (FastEthernet0/0)
- One onboard Ethernet switch
- One fixed VIC slot with 4 FXS ports
- One fixed VIC slot with 4 FXO or 2 BRI ports
- One modular HWIC/WIC/VWIC slot

The numbering format for the slots is interface-type 0/slot-number/port-number. Table 2-7 summarizes the interface numbering.

Table 2-7 Interface Numbering

<table>
<thead>
<tr>
<th>Slot Number</th>
<th>Slot Type</th>
<th>Slot Numbering Range</th>
<th>Example¹</th>
</tr>
</thead>
<tbody>
<tr>
<td>Onboard Ports</td>
<td>Fast Ethernet</td>
<td>0/0</td>
<td>interface fastethernet 0/0</td>
</tr>
<tr>
<td>Onboard Slot 1</td>
<td>Fast Ethernet Switch</td>
<td>0/1/0 to 0/1/7</td>
<td>interface fastethernet 0/1/0</td>
</tr>
<tr>
<td>Fixed HWIC slot 0</td>
<td>FXS</td>
<td>0/0/0 to 0/0/3</td>
<td>voice-port 0/0/0/</td>
</tr>
<tr>
<td>Fixed HWIC slot 1</td>
<td>FXO</td>
<td>0/0/1 to 0/0/1/3</td>
<td>voice-port 0/1/0</td>
</tr>
<tr>
<td>Fixed HWIC Slot</td>
<td>BRI</td>
<td>0/1/0 to 0/1/1</td>
<td></td>
</tr>
<tr>
<td>Modular HWIC Slot</td>
<td>HWIC/WIC/VWIC</td>
<td>0/3/0 to 0/3/</td>
<td></td>
</tr>
</tbody>
</table>

¹. The interfaces listed are examples only; other possible interface types are not listed.

Note On the Cisco 1861 ISR, the numbering format for configuring an asynchronous, or async, interface is 0/slot/port. To configure the line associated with an async interface, simply use the interface number to specify the async line. For example, line 0/0/0 specifies the line associated with interface serial 0/0/0 on a WIC-2A/S in slot 0. Similarly, line 0/1/1 specifies the line associated with interface async 0/1/1 on a WIC-2AM in slot 1.

Note If you have specified the use of a private line automatic ringdown (PLAR) off-premises extension (OPX) connection mode for an FXO voice port (with loop resistance less than 8000 Ohm), you must ensure that the soft-offhook option is enabled on the port.

This option allows a stepped offhook resistance during seizure, which avoids overloading the circuit during offhook in the event that ringing voltage is present on the circuit at the same time as the trunk seizure. The stepped offhook resistance is initially set to 800 Ohms, then adjusts to 50 Ohms when ringing voltage is not present.

To enable the soft-offhook command on the port, and to access the connection command with plar opx syntax, see Cisco Command Lookup Tool.
Specifications

Table 2-8 lists the specifications for Cisco 1800 series routers.

</table>

Regulatory Compliance

For compliance information, see Regulatory Compliance and Safety Information for Cisco 1840 Routers document that accompanies the router.
Preinstallation Requirements and Planning for Cisco 1800 Series Routers (Modular)

This chapter describes the site requirements and equipment needed to install your Cisco 1800 series integrated services router (modular). It includes the following sections:

- Safety Recommendations, page 3-1
- General Site Requirements, page 3-3
- Installation Checklist, page 3-4
- Site Log, page 3-5
- Inspecting the Router, page 3-6
- Required Tools and Equipment for Installation and Maintenance, page 3-7

Note
To see translations of the warnings that appear in this publication, see Regulatory Compliance and Safety Information for Cisco 1840 Routers.

Safety Recommendations

Follow these guidelines to ensure general safety:

- Keep the chassis area clear and dust-free during and after installation.
- If you remove the chassis cover, put it in a safe place.
- Keep tools and chassis components away from walk areas.
- Do not wear loose clothing that could get caught in the chassis. Fasten your tie or scarf, and roll up your sleeves.
- Wear safety glasses when working under conditions that might be hazardous to your eyes.
- Do not perform any action that creates a hazard to people or makes the equipment unsafe.

Warning
Read the installation instructions before connecting the system to the power source. Statement 1004
Safety Recommendations

**Warning**

Blank faceplates and cover panels serve three important functions: they prevent exposure to hazardous voltages and currents inside the chassis; they contain electromagnetic interference (EMI) that might disrupt other equipment; and they direct the flow of cooling air through the chassis. Do not operate the system unless all cards, faceplates, front covers, and rear covers are in place. Statement 1029

**Warning**

To prevent personal injury or damage to the chassis, never attempt to lift or tilt the chassis using the handles on modules (such as power supplies, fans, or cards); these types of handles are not designed to support the weight of the unit. Statement 1032

**Warning**

Ultimate disposal of this product should be handled according to all national laws and regulations. Statement 1040

**Warning**

When installing or replacing the unit, the ground connection must always be made first and disconnected last. Statement 1046

Safety with Electricity

Follow these guidelines when working on equipment powered by electricity.

**Warning**

Do not work on the system or connect or disconnect cables during periods of lightning activity. Statement 1001

**Warning**

Read the installation instructions before connecting the system to the power source. Statement 1004

**Warning**

When installing or replacing the unit, the ground connection must always be made first and disconnected last. Statement 1046

- Locate the emergency power-off switch in the room in which you are working. Then, if an electrical accident occurs, you can quickly turn off the power.
- Disconnect all power before doing the following:
  - Installing or removing a chassis
  - Working near power supplies
  - Removing the top cover of a chassis
- Look carefully for possible hazards in your work area, such as moist floors, ungrounded power extension cables, frayed power cords, and missing safety grounds.
- Do not work alone if hazardous conditions exist.
- Never assume that power is disconnected from a circuit. Always check.
Never open the enclosure of the router's internal power supply.

If an electrical accident occurs, proceed as follows:
- Use caution; do not become a victim yourself.
- Turn off power to the device.
- If possible, send another person to get medical aid. Otherwise, assess the victim’s condition and then call for help.
- Determine whether the person needs rescue breathing or external cardiac compressions; then take appropriate action.

In addition, use the following guidelines when working with any equipment that is disconnected from a power source, but is still connected to telephone wiring or other network cabling:
- Never install telephone wiring during a lightning storm.
- Never install telephone jacks in wet locations unless the jack is specifically designed for it.
- Never touch uninsulated telephone wires or terminals unless the telephone line is disconnected at the network interface.
- Use caution when installing or modifying telephone lines.

Preventing Electrostatic Discharge Damage

Electrostatic discharge (ESD) can damage equipment and impair electrical circuitry. ESD can occur if electronic printed circuit cards are improperly handled and can cause complete or intermittent failures. Always follow ESD prevention procedures when removing and replacing modules:
- Ensure that the router chassis is electrically connected to earth ground.
- Wear an ESD-preventive wrist strap, ensuring that it makes good skin contact. Connect the clip to an unpainted surface of the chassis frame to channel unwanted ESD voltages safely to ground. To guard against ESD damage and shocks, the wrist strap and cord must operate effectively.
- If no wrist strap is available, ground yourself by touching a metal part of the chassis.

Caution

For the safety of your equipment, periodically check the resistance value of the antistatic strap. It should be between 1 and 10 megohms (Mohm).

General Site Requirements

This section describes the requirements that your site must meet for safe installation and operation of your router. Ensure that the site is properly prepared before beginning installation. If you are experiencing shutdowns or unusually high errors with your existing equipment, this section can also help you isolate the cause of failures and prevent future problems.

Power Supply Considerations

Check the power at your site to ensure that you are receiving “clean” power (free of spikes and noise). Install a power conditioner if necessary.
Warning

The device is designed for connection to TN and IT power systems. Statement 1007

The AC power supply includes the following features:

- Autoselects either 110 V or 220 V operation.
- All units include a 6-foot (1.8-meter) electrical power cord. (A label near the power cord indicates the correct voltage, frequency, current draw, and power dissipation for the unit.)

Site Environment

The location of your router is an extremely important consideration for proper operation. Equipment placed too close together-, or with inadequate ventilation-, or with inaccessible panels, can cause malfunctions and shutdowns, and can also make maintenance difficult. Plan for access to both front and back panels of the router.

When planning your site layout and equipment locations, remember the precautions described in the “Site Configuration” section on page 3-4 to help avoid equipment failures and reduce the possibility of environmentally caused shutdowns. If you are currently experiencing shutdowns or an unusually high number of errors with your existing equipment, these precautions may help you isolate the cause of the failures and prevent future problems.

Site Configuration

The following precautions will help you plan an acceptable operating environment for your router and will help you avoid environmentally caused equipment failures:

- Make sure that the room where your router operates has adequate circulation. Electrical equipment generates heat. Without adequate circulation, ambient air temperature may not cool equipment to acceptable operating temperatures.
- Always follow the ESD-prevention procedures described in the “Preventing Electrostatic Discharge Damage” section on page 3-3 to avoid damage to equipment. Damage from static discharge can cause immediate or intermittent equipment failure.
- Make sure that the chassis cover and module back panels are secure. All empty interface card slots must have filler panels installed. The chassis is designed to allow cooling air to flow within it, through specially designed cooling slots. A chassis with uncovered openings creates air leaks, which may interrupt and reduce the flow of air across internal components.

Installation Checklist

The sample installation checklist lists items and procedures for installing a new router. Make a copy of this checklist, and mark each item when you complete it. Include a copy of the checklist for each router in your Site Log (described in the “Site Log” section on page 3-5).
The Site Log is a record of all actions related to the router. Keep it in an accessible place near the chassis so that anyone who performs tasks has easy access to it. Use the Installation Checklist to verify steps in installation and maintenance of the router. Site Log entries might include the following information:

- Installation progress—Make a copy of the Installation Checklist, and insert it into the Site Log. Record the pertinent information as each procedure is completed.

- Upgrade and maintenance procedures—Use the Site Log as a record of ongoing router maintenance and expansion history. A Site Log might include the following events:
  - Installation of network modules
  - Removal or replacement of network modules and other upgrades
  - Configuration changes
  - Maintenance schedules and requirements
  - Maintenance procedures performed
Inspecting the Router

Do not unpack the router until you are ready to install it. If the final installation site will not be ready for some time, keep the chassis in its shipping container to prevent accidental damage. When you are ready to install the router, proceed with unpacking it.

Items in the Box for the Cisco 1841 Router

The router, cables, publications, and any optional equipment that you ordered may be shipped in more than one container. When you unpack the containers, check the packing list to ensure that you have received all the following items:

- Router
- 6-foot (1.8-meter) power cord
- Ground lug
- RJ-45-to-DB-9 console cable
- DB-9-to-DB-25 modem adapter
- Cisco 1800 Series Integrated Services Routers (Modular) Quick Start Guide
- Regulatory Compliance and Safety Information for Cisco 1840 Routers
- Cisco Router and Security Device Manager (SDM) Quick Start Guide
- Cisco.com card
- Product registration card

Inspect all items for shipping damage. If anything appears to be damaged, or if you encounter problems installing or configuring your router, contact customer service.

Items in the Box for the Cisco 1861 Integrated Services Router

The following items ship with the Cisco 1861 Integrated Services Router:

- Accessory kit containing:
  - Rubber feet for desktop installation
  - RJ-45-to-RJ-45 Ethernet cable
  - Light blue RJ-45-to-DB9 console cable
  - Wall-mount bracket for power supply
- Quick Start Guide for Cisco 1861 Integrated Services Router (this guide)
- Regulatory Compliance and Safety Information Roadmap

A separate rack-mount kit can be ordered which includes the following:

- Power supply bracket
- Rack-mount brackets for chassis
Items not Included in the Box for the Cisco 1861 Integrated Services Router

You may need individual items in this list which are not shipped in the box:

- Cisco Unified IP phones
- Cables for connecting phones
- Cable for connecting external audio device to the 3.5-mm MoH port
- Cables for WAN interfaces, voice interfaces, or additional LAN interfaces
- PC with Microsoft Internet Explorer 6.0 or later, for using web-based system management tools

Required Tools and Equipment for Installation and Maintenance

You need the following tools and equipment for installing and upgrading the router and its components:

- ESD-preventive cord and wrist strap
- Number 2 Phillips screwdriver
- Flat-blade screwdrivers: small, 3/16-inch (0.48 centimeter) and medium, 1/4-inch (0.63 centimeter)
  - For installing or removing modules
  - For removing the cover if you are upgrading memory or other components
- Wire crimper
- AWG 14 wire for connecting the router chassis to earth ground

In addition, depending on the type of modules you plan to use, you might need the following equipment to connect a port to an external network:

- Cables for connection to WAN and LAN ports (dependent on configuration)

Note: For more information on cable specifications, see the online document Cisco Modular Access Router Cable Specifications, which is located on Cisco.com.

- Ethernet hub or PC with a network interface card for connection to Ethernet (LAN) ports
- Console terminal (an ASCII terminal or a PC running terminal emulation software) configured for 9600 baud, 8 data bits, no parity, and 1 stop bit
- Modem for connection to the auxiliary port for remote administrative access
- Data service unit (DSU) or channel service unit/data service unit (CSU/DSU) as appropriate for serial interfaces
- External CSU for any CT1/PRI modules without a built-in CSU
- NT1 device for ISDN BRI S/T interfaces (if not supplied by your service provider)
Chassis Installation Procedures for Cisco 1800 Series Routers (Modular)

This chapter tells how to physically set up Cisco 1800 series integrated services routers (ISR) (modular). It contains the following sections:

- Setting Up the Chassis, page 4-3
- Installing the Chassis Ground Connection, page 4-11

Cisco 1800 series routers are normally shipped with a complement of components that can be upgraded or replaced to expand and enhance the router’s functionality. These components either are inserted internally into the router or are plugged into slots in the router chassis.

To see translations of the warnings that appear in this publication, see Regulatory Compliance and Safety Information for Cisco 1840 Routers.

Internal Components
The router’s internal components include the following:

- SDRAM
- Advanced integration module (AIM)

If you need to remove or upgrade either of these items, follow the procedures given in the “Installing and Upgrading Internal Modules in Cisco 1800 Series Routers (Modular)” document.

Plug-In Components
The following components plug into the router chassis:

- WAN interface cards (WICs)
- Voice/WAN interface cards (VWICs), data mode only
- High-speed WICs (HWICs)
- CompactFlash memory card

If you need to remove or install WICs, VWICs, or HWICs, follow the procedures in the “Installing Interface Cards in Cisco 1800 Series Routers (Modular)” document.

If you need to remove or upgrade the CompactFlash memory card, follow the procedure in the “Installing and Replacing CompactFlash Memory Cards on Cisco 1800 Series Routers (Modular)” document.
Interfaces on the Cisco 1861 Integrated Services Router

The Cisco 1861 Integrated Services Router comes with various possible configurations, based on built-in ports and other hardware features of the Cisco 1861 Integrated Services Router and organized by model. Table 4-1 lists the labels and descriptions for the WAN, LAN, voice interface card (VIC), and other interfaces, along with the values for these interfaces in the preconfigured router software configuration.

In Table 4-1, all slots/ports are numbered right to left, unless otherwise noted.

* Only one optional VIC can be factory installed in a Cisco 1861 Integrated Services Router.
** The label on the front panel is build-specific. Functionality is unaffected.
Setting Up the Chassis

The Cisco 1841 router and the Cisco 1861 ISR can be installed on a desktop, and can also be mounted on a wall. Select the setup that best meets the needs of your network. These setups are described in the following sections:

- Setting the Chassis on a Desktop, page 4-3
- Rack-Mounting a Cisco 1800 Series Modular-Configuration Router, page 4-3
- Wall-Mounting the Chassis, page 4-6

**Caution**

The front panel bezel must not be removed from the Cisco 1841 router. It is part of the product’s enclosure, and must be left in place to prevent damage from foreign objects entering the router, to provide a shield from internal electromagnetic interference (EMI), and to direct the flow of cooling air properly through the chassis.

## Setting the Chassis on a Desktop

You can place Cisco 1841 routers on a desktop or shelf. The Cisco 1841 router is shipped with the rubber feet attached to the chassis to provide space for air circulation.

To install a chassis on a desktop, table, or other flat surface, place the unit upside-down on a flat surface. Attach the four rubber pads to the recessed areas on the bottom of the unit. Place the unit on a desktop.

**Warning**

To prevent personal injury or damage to the chassis, never attempt to lift or tilt the chassis using the handles on modules (such as power supplies, fans, or cards); these types of handles are not designed to support the weight of the unit. Statement 1032

**Caution**

Do not place anything on top of the router that weighs more than 10 lbs (4.5 kg). Excessive weight on top of the router could damage the chassis.

**Caution**

The Cisco 1861 Integrated Services Router installation must allow unrestricted airflow for cooling. For placing the platform on a desktop, keep at least 1 in. (2.54 cm) of clear space beside the cooling inlet and exhaust vents.

## Rack-Mounting a Cisco 1800 Series Modular-Configuration Router

If you are planning to rack-mount the router, rack-mount it before you make the network and power connections. If you need to install any internal modules, such as an expansion DIMM or an inline power supply card, install these prior to rack-mounting.
Setting Up the Chassis

Note
To install a Cisco 1800 series modular-configuration router in a 19-inch rack, use the brackets included in the optional rack-mount kit (SKU: ACS-1841-RM-19=). All Cisco 1841 chassis shipping since Q4FY06 are rack-mountable. Cisco 1841 chassis with the following starting serial numbers have the rack-mount screw holes: FTX1009W0Z3 (United States), FCZ100812UR (Europe, Middle East, and Africa), and FHK100653JL (Asia Pacific).

Note
Brackets for 23-inch equipment racks are not available for Cisco 1800 series modular-configuration routers.

Figure 4-1 shows the brackets.

Figure 4-1 Rack-Mounting Brackets

Attaching Rack-Mount Brackets

Use four of the supplied number-8 Phillips flat-head screws to attach each bracket to the router. Figure 4-2 shows how to attach the brackets to the sides of the router with the back panel forward.

Figure 4-2 Attaching Rack-Mounting Brackets to a Cisco 1800 Series Modular-Configuration Router

Figure 4-1 Rack-Mounting Brackets

Figure 4-2 Attaching Rack-Mounting Brackets to a Cisco 1800 Series Modular-Configuration Router
Installing the Router in a Rack

After you attach the brackets to the router chassis, use the screws provided with the rack to install the chassis in the rack. (See Figure 4-3.) Start with the lower pair of screws first, and rest the brackets on the lower screws while you insert the upper pair of screws.

**Tip**

The screw slots in the brackets are spaced to line up with every second pair of screw holes in the rack. When the correct screw holes are used, the small threaded holes in the brackets line up with unused screw holes in the rack. If the small holes do not line up with the rack holes, you must raise or lower the brackets to the next rack hole.

**Warning**

To prevent bodily injury when mounting or servicing this unit in a rack, you must take special precautions to ensure that the system remains stable. The following guidelines are provided to ensure your safety:

- This unit should be mounted at the bottom of the rack if it is the only unit in the rack.
- When mounting this unit in a partially filled rack, load the rack from the bottom to the top with the heaviest component at the bottom of the rack.
- If the rack is provided with stabilizing devices, install the stabilizers before mounting or servicing the unit in the rack. Statement 1006

**Warning**

Take care when connecting units to the supply circuit so that wiring is not overloaded. Statement 1018

**Warning**

To prevent the system from overheating, do not operate it in an area that exceeds the maximum recommended ambient temperature of 50°C (122°F). Statement 1047

**Caution**

Be sure to leave space above and below each router in a rack, to allow for cooling air circulation.

*Figure 4-3  Mounting the Chassis in a Rack (Typical)*
**Chassis Grounding**

After the router has been installed, you must connect the chassis to a reliable earth ground. For the chassis ground connection procedure, see the “Wall-Mounting the Cisco 1861 Integrated Services Router” section on page 4-8.

---

**Wall-Mounting the Chassis**

The Cisco 1841 router and the Cisco 1861 ISR can be mounted on a wall.

---

**Warning**

This unit is intended to be mounted on a wall. Please read the wall mounting instructions carefully before beginning installation. Failure to use the correct hardware or to follow the correct procedures could result in a hazardous situation to people and damage to the system. Statement 248

---

**Wall-Mounting the Cisco 1841 Router**

To mount the Cisco 1841 router on a wall, use two number six, 3/4-inch screws and the mounting features on the bottom of the router. You must provide the screws. We recommend using pan-head or round-head screws.

The wall-mounting features on the router are shown in Figure 4-4.

*Figure 4-4  Wall-Mounting Features on the Cisco 1841 Router*
To mount the router on a wall or other surface, follow these steps:

**Step 1**
Install the two screws 6.00 in. (15.2 cm) horizontally apart on a wall or other vertical surface. The screws should protrude 0.25 in. (0.6 cm) from the surface of the wall.

**Step 2**
Remove the rubber feet from the router.

**Step 3**
Hang the router on the screws, front panel down. This is the appropriate orientation for safe use. See Figure 4-5.

*Figure 4-5  Wall-Mounting the Cisco 1841 Router*

<table>
<thead>
<tr>
<th>1</th>
<th>Wall-mounting features</th>
</tr>
</thead>
</table>

**Caution**
If you install the screws in drywall, use hollow-wall anchors (1/8 in. (31.75 cm) by 5/16 in. (79.38 cm)) to secure the screws. If the screws are not properly anchored, the strain of the cables connected to the router back panel could pull the router from the wall.
Wall-Mounting the Cisco 1861 Integrated Services Router

The Cisco 1861 Integrated Services Router has two keyholes on the bottom of the chassis for mounting the unit on a wall or other vertical surface. The power supply is mounted to the wall by using the wall-mount bracket.

Figure 4-6 shows the bottom of the Cisco 1861 Integrated Services Router and the locations of the wall-mount holes.

**Figure 4-6 Wall-Mount Holes on Bottom of Cisco 1861 Integrated Services Router**

To mount the router on a wall or other surface, follow these steps:

**Step 1**
Align the mounting-screw holes with a wall stud, or use wall anchors.

a. For attaching to a wall stud, use two #10 wood screws (round- or pan-head) with #10 washers, or two #10 washer-head screws. The screws must be long enough to penetrate at least 3/4 in. (20 mm) into the supporting wood or into a metal wall stud.

b. For hollow-wall mounting, the wall must be at least 1/2 in. (12.7 mm) thick. Use two wall anchors with washers. The wall anchors and washers must be a size suitable for the wall to which they are mounted.

**Step 2**
Position the chassis on the wall.

a. Orient the front and back of the chassis vertically.

b. The unit must be oriented with the front panel (TNV connection side) facing up and the connection to the power cord facing down.
Step 3  Align the mounting-screw holes with a wall stud, or use wall anchors.

a. For attaching to a wall stud, use two #10 wood screws (round- or pan-head) with #10 washers, or two #10 washer-head screws. The screws must be long enough to penetrate at least 3/4 inch (20 mm) into supporting wood or into a metal wall stud.

b. For hollow-wall mounting, the wall must be at least 1/2 in. (12.7 mm) thick. Use two wall anchors with washers. Wall anchors and washers must be a size suitable for the wall to which they are mounted. Figure 4-7 shows the wall-mount bracket for the power supply and the mounting-screw holes on the back of the bracket.

Figure 4-7  Wall-Mount Bracket for Power Supply

Step 4  Position the power supply in the bracket.

a. Orient the front and back of the power supply vertically.

b. Position the end nearest the power cable at the top.

Rack-Mounting the Cisco 1861 Integrated Services Router

To attach the brackets to the Cisco 1861 Integrated Services Router, perform the following steps.

Caution  Do not overtorque the screws. The recommended torque is 6 to 8 in-lb (0.7 to 0.9 N-m).

Step 1  Attach the mounting brackets to the Cisco 1861 Integrated Services Router chassis as shown in Figure 4-8, using the screws provided. Use four screws on each side. Use a number 2 Phillips screwdriver to install the bracket screws on both sides of the chassis.

Figure 4-8  Attaching Rack-Mount Brackets to the Cisco 1861 Integrated Services Router
Figure 4-9 shows the brackets in the rack-mount kit for the power supply.

**Figure 4-9  Brackets for Rack-Mounting Power Supply**

![Brackets for Rack-Mounting Power Supply](image)

<table>
<thead>
<tr>
<th>1</th>
<th>Wall-mount bracket</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>Rack-mount bracket</td>
</tr>
</tbody>
</table>

**Step 2** Position the power supply in the wall-mount bracket.

a. Orient the front and back of the power supply vertically.

b. Position the end nearest the power cable at the top.

**Step 3** Assemble the brackets for rack-mounting the power supply as shown in Figure 4-10, using the four screws provided. Use a number 2 Phillips screwdriver to install the bracket screws.

**Figure 4-10  Assembling Rack-Mount Kit for the Power Supply**

![Assembling Rack-Mount Kit for the Power Supply](image)

To mount the chassis and power supply, use two screws for each side (supplied with the rack) to attach the Cisco 1861 ISR with rack-mount brackets, then attach the power supply with rack-mount bracket to a 19-in. rack. Start the lower pair of screws first, resting the brackets on the lower screws while you insert the upper pair of screws.
## Warning

To prevent bodily injury when mounting or servicing this unit in a rack, you must take special precautions to ensure that the system remains stable. The following guidelines are provided to ensure your safety:

-- This unit should be mounted at the bottom of the rack if it is the only unit in the rack.
-- When mounting this unit in a partially filled rack, load the rack from the bottom to the top with the heaviest component at the bottom of the rack.
-- If the rack is provided with stabilizing devices, install the stabilizers before mounting or servicing the unit in the rack.  

### Caution

Chassis installation must allow unrestricted airflow for chassis cooling.

### Tip

The screw slots in the brackets are spaced to line up with every second pair of screw holes in the rack. When the correct screw holes are used, the small threaded holes in the brackets line up with unused screw holes in the rack. If the small holes do not line up with the rack holes, you must raise or lower the brackets to the next rack hole.

## Installing the Chassis Ground Connection

### Warning

This equipment must be grounded. Never defeat the ground conductor or operate the equipment in the absence of a suitably installed ground conductor. Contact the appropriate electrical inspection authority or an electrician if you are uncertain that suitable grounding is available.  

## Installing the Chassis Ground Connection on the Cisco 1841 Router

You must connect the chassis to a reliable earth ground, using a ground lug and size 14 AWG (2 mm²) wire. To install the ground connection for a Cisco 1800 series router, follow these steps:

### Step 1
Strip one end of the ground wire to expose approximately 0.75 in. (20 mm) of conductor.

### Step 2
Crimp the 14 AWG green ground wire to a UL Listed/CSA certified ring terminal that is suitably sized for the number 6 ground screw provided on the rear panel of the router. The crimping tool should be one that is recommended by the ring lug terminal manufacturer.

### Step 3
Attach the ring terminal to the chassis. The attachment points for the Cisco 1841 router are shown in Figure 4-11. Use a number 2 Phillips screwdriver and the screw supplied with the ground lug. Tighten the screw to a torque of 8 to 10 in-lb. (0.9 to 1.1 N-m).
Installing the Chassis Ground Connection

Connect the other end of the ground wire to a known good electrical ground point. Consult with a licensed electrician if you have any questions about the suitability of the ground connection.

After the router is installed and properly grounded, you can connect the WAN and LAN cables as required for your installation. For cable connection procedures, see “Cable Connection Procedures for Cisco 1800 Series Routers (Modular)”.

Installing the Chassis Ground Connection on the Cisco 1861 Integrated Services Router

You must connect the chassis to a reliable earth ground; the ground wire must be installed in accordance with local electrical safety standards.

For NEC-compliant grounding, use size 14 AWG (2 mm) or larger copper wire and an appropriate user-supplied ring terminal with an inner diameter of 1/4 in. (5 to 7 mm).

Note

The Cisco 1861 Integrated Services Router is not NEBS-compliant.

Warning

This equipment needs to be grounded. Use a green and yellow 14 AWG ground wire to connect the host to earth ground during normal use. Statement 190

To connect the chassis to a reliable earth ground, perform the following steps:

Step 1 Strip one end of the ground wire to the length required for the ground lug or terminal.
   - For the ground lug, approximately 0.75 in. (20 mm)
   - For the user-provided ring terminal, as required

Step 2 Crimp the ground wire to the ground lug or ring terminal, using a crimp tool of the appropriate size.

Step 3 Attach the ground lug or ring terminal to the chassis as shown in Figure 4-12. Tighten the screws to a torque of 8-10 in-lb (0.9-1.1 N-m).
Step 4  Connect the other end of the ground wire to a known reliable earth ground point.

Note  If there is any doubt as to the reliability of the ground point, contact a licensed electrician for assistance.
CHAPTER 5

Cable Information and Specifications for Cisco 1800 Series Routers (Modular)

This chapter gives cable information and specifications for the console port, auxiliary port, and network ports on your Cisco 1800 series integrated services router (modular). It contains the following sections:

- Console and Auxiliary Port Considerations, page 5-1
- Preparing to Connect to a Network, page 5-2

For cable connection procedures, see “Cable Connection Procedures for Cisco 1800 Series Routers (Modular)”.

Console and Auxiliary Port Considerations

The router includes an asynchronous serial console port and an auxiliary port. The console and auxiliary ports provide access to the router either locally using a console terminal connected to the console port, or remotely, using a modem connected to the auxiliary port. This section provides important cabling information to consider before connecting the router to a console terminal or modem.

The main difference between the console and auxiliary ports is that the auxiliary port supports flow control, whereas the console port does not. Flow control paces the transmission of data between a sending device and a receiving device. Flow control ensures that the receiving device can absorb the data sent to it before the sending device sends more. When the buffers on the receiving device are full, a message is sent to the sending device to suspend transmission until the data in the buffers has been processed. Because the auxiliary port supports flow control, it is ideally suited for use with the high-speed transmissions of a modem. Console terminals send data at slower speeds than modems; therefore, the console port is ideally suited for use with console terminals.

Console Port Connections

The router has an EIA/TIA-232 asynchronous serial console port (RJ-45). Depending on the cable and the adapter used, this port will appear as a data terminal equipment (DTE) or data communications equipment (DCE) device at the end of the cable.

For connection to a PC running terminal emulation software, your router is provided with an RJ-45-to-DB-9 cable.

To connect the router to an ASCII terminal, use the RJ-45-to-DB-9 cable and a DB-9-to-DB-25 adapter (provided).
Preparing to Connect to a Network

The default parameters for the console port are 9600 baud, 8 data bits, no parity, and 1 stop bit. The console port does not support mode control.

For cable and port pinouts, see *Cisco Modular Access Router Cable Specifications*.

### Auxiliary Port Connections

The router has an EIA/TIA-232 asynchronous serial auxiliary port (RJ-45) that supports flow control. Depending on the cable and the adapter used, this port will appear as a DTE or DCE device at the end of the cable.

For connection to a modem, your router is provided with an RJ-45-to-DB-9 cable and a DB-9-to-DB-25 adapter.

For detailed information about connecting devices to the auxiliary port, see the “Connecting to the Auxiliary Port” section on page 6-4 of the “Cable Connection Procedures for Cisco 1800 Series Routers (Modular)” chapter.

For cable and port pinouts, see the *Cisco Modular Access Router Cable Specifications* document.

### Preparing to Connect to a Network

When setting up your router, consider distance limitations and potential electromagnetic interference (EMI) as defined by the applicable local and international regulations.

The following sections describe network connection considerations for several types of network interfaces:

- **Ethernet Connections**, page 5-2
- **Serial Connections**, page 5-3
- **ISDN BRI Connections**, page 5-5
- **CSU/DSU Connections**, page 5-5

See the following online documents for more information about network connections and interfaces:

- *Cisco Interface Cards Installation Guide*
- *Cisco Modular Access Router Cable Specifications*

⚠️ **Warning**

Only trained and qualified personnel should be allowed to install, replace, or service this equipment.

Statement 1030

### Ethernet Connections

The IEEE has established Ethernet as standard IEEE 802.3. The Cisco 1800 series Ethernet implementations are as follows:

- **100BASE-T**—2-pair Category 5 or unshielded twisted-pair (UTP) straight-through RJ-45 cable. The maximum segment distance is 328 feet (100 meters).
- **10BASE-T**—Ethernet on UTP cable. The maximum segment distance is 328 feet (100 meters). UTP cables look like the wiring used for ordinary telephones; however, UTP cables meet certain electrical standards that telephone cables might not meet.
See *Cisco Modular Access Router Cable Specifications* for information about Ethernet cables, connectors, and pinouts.

**Serial Connections**

Serial connections are provided by serial WAN interface cards (WICs). For more information on WICs, see *Installing Cisco Interface Cards in Cisco Access Routers*.

Before you connect a device to a serial port, you need to know the following:

- **Type of device**—data terminal equipment (DTE) or data communications equipment (DCE)—that you are connecting to the synchronous serial interface
- **Type of connector**—male or female—that is required for connecting to the device
- **Signaling standard** that is required by the device

**Configuring Serial Connections**

The serial ports on the serial WICs use DB-60 connectors. Serial ports can be configured as DTEs or DCEs, depending on the serial cable used.

**Serial DTE or DCE Devices**

A device that communicates over a synchronous serial interface is either a DTE or DCE device. A DCE device provides a clock signal that paces the communications between the device and the router. A DTE device does not provide a clock signal. DTE devices usually connect to DCE devices. The documentation for the device should indicate whether it is a DTE or DCE device. (Some devices have a jumper that allows you to select either DTE mode or DCE mode.) Table 5-1 lists typical DTE and DCE devices.

<table>
<thead>
<tr>
<th>Device Type</th>
<th>Gender</th>
<th>Typical Devices</th>
</tr>
</thead>
<tbody>
<tr>
<td>DTE</td>
<td>Male(^1)</td>
<td>• Terminal</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• PC</td>
</tr>
<tr>
<td>DCE</td>
<td>Female(^2)</td>
<td>• Modem</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• CSU/DSU</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Multiplexer</td>
</tr>
</tbody>
</table>

\(^1\) If pins protrude from the base of the connector, the connector is male.
\(^2\) If the connector has holes to accept pins, the connector is female.

**Signaling Standards Supported**

The synchronous serial ports available for the router support the following signaling standards: EIA/TIA-232, EIA/TIA-449, V.35, X.21, and EIA-530. You can order a Cisco DB-60 shielded serial transition cable that has the appropriate connector for the standard you specify. The documentation for the device that you want to connect should indicate the standard used for that device. The router end of the shielded serial transition cable has a DB-60 connector, which connects to the DB-60 port on a serial WIC. The other end of the serial transition cable is available with a connector appropriate for the standard that you specify.
Preparing to Connect to a Network

The synchronous serial port can be configured as DTE or DCE, depending on the attached cable (except EIA-530, which is DTE only). To order a shielded cable, contact customer service. See the “Obtaining Documentation and Submitting a Service Request” section on page 1-15.

**Note**

All serial ports configured as DTE require external clocking from a channel service unit/data service unit (CSU/DSU) or other DCE device.

Although we do not recommend manufacturing your own serial cables (because of the small size of the pins on the DB-60 serial connector), cable pinouts are provided in *Cisco Modular Access Router Cable Specifications*.

### Distance Limitations

Serial signals can travel a limited distance at any given bit rate; generally, the slower the data rate, the greater the distance. All serial signals are subject to distance limits, beyond which a signal is significantly degraded or completely lost.

**Table 5-2** lists the recommended maximum speeds and distances for each serial interface type; however, you might get good results at speeds and distances greater than those listed, if you understand the electrical problems that might arise and can compensate for them. For instance, the recommended maximum rate for V.35 is 2 Mbps, but 4 Mbps is commonly used.

**Table 5-2  Serial Signal Transmission Speeds and Distances**

<table>
<thead>
<tr>
<th>Rate (bps)</th>
<th>Distance for EIA/TIA-232</th>
<th>Distance for EIA/TIA-449, X.21, V.35, and EIA-530</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Feet</td>
<td>Meters</td>
</tr>
<tr>
<td>2400</td>
<td>200</td>
<td>60</td>
</tr>
<tr>
<td>4800</td>
<td>100</td>
<td>30</td>
</tr>
<tr>
<td>9600</td>
<td>50</td>
<td>15</td>
</tr>
<tr>
<td>19200</td>
<td>25</td>
<td>7.6</td>
</tr>
<tr>
<td>38400</td>
<td>12</td>
<td>3.7</td>
</tr>
<tr>
<td>56000</td>
<td>8.6</td>
<td>2.6</td>
</tr>
<tr>
<td>1544000 (T1)</td>
<td>—</td>
<td>—</td>
</tr>
</tbody>
</table>

Balanced drivers allow EIA/TIA-449 signals to travel greater distances than EIA/TIA-232 signals. Typically, EIA/TIA-449 and EIA-530 can support a 2-Mbps rate, and V.35 can support a 4-Mbps rate.

### Asynchronous/Synchronous Serial Module Baud Rates

The following baud-rate limitations apply to the slow-speed serial interfaces in the asynchronous/synchronous serial modules:

- Asynchronous interface—Maximum baud rate is 115.2 kbps.
- Synchronous interface—Maximum baud rate is 128 kbps, full-duplex.
ISDN BRI Connections

The BRI WICs provide ISDN and BRI connections. BRI WICs are available with either an S/T interface that requires an external Network Termination 1 (NT1), or a U interface that has a built-in NT1. You can install the BRI WICs in any available WIC slots in the chassis.

**Warning**

The ISDN connection is regarded as a source of voltage that should be inaccessible to user contact. Do not attempt to tamper with or open any public telephone operator (PTO)-provided equipment or connection hardware. Any hardwired connection (other than by a nonremovable, connect-one-time-only plug) must be made only by PTO staff or suitably trained engineers.

**Statement 23**

Hazardous network voltages are present in WAN ports regardless of whether power to the unit is OFF or ON. To avoid electric shock, use caution when working near WAN ports. When detaching cables, detach the end away from the unit first.

**Statement 1026**

Use a BRI cable (not included) to connect the BRI WIC directly to an ISDN. Table 5-3 lists the specifications for ISDN BRI cables. For information about pinouts, see *Cisco Modular Access Router Cable Specifications*.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

1. nF = nanofarad.

For more information on BRI WICs, see *Installing Cisco Interface Cards in Cisco Access Routers*.

CSU/DSU Connections

CSU/DSU WICs are available that provide switched 56-kbps connections, or full or fractionalized T1 connections.

For more information on CSU/DSU WICs, see *Installing Cisco Interface Cards in Cisco Access Routers*. 
Cable Connection Procedures for Cisco 1800 Series Routers (Modular)

This chapter describes how to connect your Cisco 1800 series integrated services router (modular) to a power source and to networks and external devices. It includes the following sections:

- Power Connections, page 6-1
- Connecting WAN and LAN Cables, page 6-2
- Connecting to a Console Terminal or Modem, page 6-3

For cable information and specifications, see the “Cable Information and Specifications for Cisco 1800 Series Routers (Modular)” document.

Note
To see translations of the warnings that appear in this publication, see the Regulatory Compliance and Safety Information for Cisco 1840 Routers.

Power Connections

Warning
Read the installation instructions before connecting the system to the power source. Statement 1004.

Note
The installation must comply with all required electrical codes applicable at the installation site.

Connect your router to a 15 A, 120 VAC (10 A, 240 VAC) circuit with overcurrent protection.

Note
The input voltage tolerance limits for AC power are 85 and 264 VAC.

Warning
This product relies on the building’s installation for short-circuit (overcurrent) protection. Ensure that the protective device is rated not greater than: 15A, 120VAC (10A, 240VAC). Statement 1005
Connecting WAN and LAN Cables

This section describes how to connect the WAN and LAN interface cables. It includes the following:

- **Ports and Cabling, page 6-2**
- **Connection Procedures and Precautions, page 6-3**

**Note**

One or two Ethernet cables are typically provided with the router. You can order additional network connection cables and transceivers from Cisco. For ordering information, contact Cisco customer service. For cable pinouts, see *Cisco Modular Access Router Cable Specifications*.

**Warning**

Do not work on the system, or connect or disconnect cables during periods of lightning activity.

Statement 1001

Ports and Cabling

Table 6-1 summarizes some typical WAN and LAN connections for Cisco 1800 series routers.

The connections summarized in Table 6-1 are also described in detail in the following documents:

- *Cisco Modular Access Router Cable Specifications*
- *Cisco Interface Cards Installation Guide*

**Table 6-1**

Chapter 6  Cable Connection Procedures for Cisco 1800 Series Routers (Modular)

Connecting to a Console Terminal or Modem

Connecting to a Console Terminal or Modem

Your router has asynchronous serial console and auxiliary ports. These ports provide administrative access to your router either locally (with a console terminal or PC) or remotely (with a modem).

Cisco provides the following cables and adapters for connecting your router to a console terminal, PC, or modem:

- One console cable (RJ-45-to-DB-9, blue)
- One modem adapter (DB-9-to-DB-25)

This section describes how to connect a console terminal or PC to the console port and how to connect a modem to the auxiliary port.

For information about cable pinouts, see *Cisco Modular Access Router Cable Specifications*.

¹. The color codes are specific to cables shipped by Cisco.
². NT1 = Network Termination 1.
³. PINX = Private integrated network exchange.

---

Connection Procedures and Precautions

Connect each WAN and LAN cable to the appropriate connector on the chassis or interface card.

- Position the cables carefully, so that they do not put strain on the connectors.
- Organize the cables in bundles so that cables do not intertwine.
- Inspect the cables to make sure that the routing and bend radiuses are satisfactory. Reposition the cables, if necessary.
- Install cable ties in accordance with your site requirements.

For cable pinouts, see *Cisco Modular Access Router Cable Specifications*. 
Chapter 6      Cable Connection Procedures for Cisco 1800 Series Routers (Modular)

Connecting to the Console Port

To configure the router through the Cisco IOS CLI, you must connect the router console port to a terminal or PC. The cable required for this connection is included with the router.

The PC must have HyperTerminal or similar terminal emulation software installed. The software should be configured with the following parameters: 9600 baud, 8 data bits, no parity, 1 stop bit, and no mode control. See Cisco 1800 series router software configuration documents on Cisco.com for detailed information about using Cisco IOS software for configuring the router.

To connect the router to a terminal or PC, follow these steps:

**Step 1**  
Connect the end of the light blue console cable with the RJ-45 connector to the light blue console port on the router, as shown in Figure 6-1.

**Figure 6-1   Connecting the Console Cable to the Router**

![Figure 6-1](image)

1. Light blue console port
2. Light blue console cable
3. To PC or terminal

**Step 2**  
Connect the end of the cable with the DB-9 connector to the terminal or PC. If your terminal or PC has a console port that does not accommodate a DB-9 connector, you must provide an appropriate adapter for that port. (A DB-9-to-DB-25 adapter is provided with your router.)

**Note**  
Because mode control is not possible on the console port, we do not recommend connecting modems to the console port. Modems should always be connected to the auxiliary port.

Connecting to the Auxiliary Port

When a modem is connected to the auxiliary port, a remote user can dial in to the router and configure it. Use the light blue console cable and the DB-9-to-DB-25 connector adapter that came in the router accessory kit.

To connect a modem to the router, follow these steps:
Step 1  Connect the RJ-45 end of the adapter cable to the black AUX port on the router. (See Figure 6-2.)

Figure 6-2 Connecting a Modem to the Router

1. Aux port (RJ-45)  3. DB-9-to-DB-25 modem adapter
2. Light blue console cable  4. Modem

Step 2  Connect the DB-9 end of the console cable to the DB-9 end of the modem adapter.
Step 3  Connect the DB-25 end of the modem adapter to the modem.
Step 4  Make sure that your modem and the router auxiliary port are configured for the same transmission speed (up to 115200 bps is supported) and for mode control with data carrier detect (DCD) and data terminal ready (DTR) operations.

Connecting Power to the Cisco 1861 Integrated Services Router

To connect the power supply to the Cisco 1861 Integrated Services Router, perform the following steps:

Step 1  Connect the AC power cord to the the power supply.
Step 2  Connect the power interface cable to the power connector port on the back of the Cisco 1861 Integrated Services Router.
Power-Up Procedures for Cisco 1800 Series Routers (Modular)

This chapter describes how to power up Cisco 1800 series integrated services routers (modular) and perform an initial configuration to provide network access. It includes the following sections:

Powering Up Cisco 1800 Series Routers, page 7-1
Verifying the LED Indicators on the 1841 Router, page 7-4
Verifying the Hardware Configuration, page 7-5
Initial Configuration of the Router, page 7-5
Software Components of the Cisco 1861 Integrated Services Router, page 7-7

Note
To see translations of the warnings that appear in this publication, see the Regulatory Compliance and Safety Information for Cisco 1840 Routers.

Note
The Cisco 1861 Integrated Services Router supports a maximum of 12 user licenses based on different models.

Powering Up Cisco 1800 Series Routers

⚠️ Warning
The plug-socket combination must be accessible at all times because it serves as the main disconnecting device. Statement 1019

⚠️ Warning
Blank faceplates and cover panels serve three important functions: they prevent exposure to hazardous voltages and currents inside the chassis; they contain electromagnetic interference (EMI) that might disrupt other equipment; and they direct the flow of cooling air through the chassis. Do not operate the system unless all cards, faceplates, front covers, and rear covers are in place. Statement 1029.

⚠️ Caution
To ensure adequate cooling, never operate the router unless the unit is completely closed.
Chapter 7  Power-Up Procedures for Cisco 1800 Series Routers (Modular)

Powering Up Cisco 1800 Series Routers

This section covers the following topics:

- Checklist for Power Up, page 7-2
- LED Indicators, page 7-2
- Power-Up Procedure, page 7-2

Checklist for Power Up

You may power up the Cisco router if the following steps have been completed:

- Mount and ground the chassis securely.
- Connect the power and interface cables.
- Make sure that the external CompactFlash memory card is properly seated into its slot. For installation instructions, see “Installing and Replacing CompactFlash Memory Cards on Cisco 1800 Series Routers (Modular)”.
- Connect a PC to the router’s console port.
- Start HyperTerminal or a similar terminal emulation program on your PC. Select the appropriate PC COM port. Set the terminal emulation program configuration for 9600 baud, 8 data bits, 1 stop bit, no flow control, and no parity.

Note

For initial power up, we recommend a direct console connection. After the intial configuration is completed, a remote modem connection can be used for router management.

Caution

To ensure adequate cooling, never operate the router unless the cover and all modules and cover plates are installed.

Caution

To prevent damage to the ejector mechanism, the ejector button next to the CompactFlash memory card must remain fully seated when not being used to eject a CompactFlash memory card.

LED Indicators

The meanings of the LED indicators for Cisco 1800 series routers are summarized in Table 2-5. For more detailed information about the LEDs, see Chapter 8, “Troubleshooting Cisco 1800 Series Routers (Modular).”

Power-Up Procedure

To power up your Cisco router and verify that it completes its initialization and self-test, follow this procedure. When you have completed the procedure you may begin configuring the router.
If you encounter problems when you power up the router, see Chapter 8, “Troubleshooting Cisco 1800 Series Routers (Modular).” For information about the ROM monitor and the bootstrap program, see the “Using the ROM Monitor” section of the Cisco 1800 Series Router Software Configuration. For information about the configuration register, see the “Changing the Configuration Register Settings” section of Cisco 1800 Series Router Software Configuration.

**Note**

To view the boot sequence through a terminal session, you must have a console connection to the Cisco router before the router powers up.

To power up the router, perform the following steps:

**Step 1**

Make sure that your PC is powered up and connected as described in the “Checklist for Power Up” section on page 7-2.

**Step 2**

Move the power switch to the ON position.

The following indications appear:

- The green SYS PWR LED on the front of the chassis comes on.
- The fan operates.

The LEDs on the chassis come on (although not necessarily at the same time), and some LEDs may go off again. The actual LED activity depends on your installation.

If you encounter problems when you power up the router, see “Troubleshooting Cisco 1800 Series Routers (Modular)”

Startup messages appear in your terminal emulation program window.

**Caution**

*Do not press any keys on the keyboard until the messages stop.* Any keys pressed during this time are interpreted as the first command typed when the messages stop, which might cause the router to power off and start over. It takes a few minutes for the messages to stop.

The startup messages vary, depending on the software installed on your router.

- If the startup messages end with the following lines, you know that the Cisco Router and Security Device Manager (SDM) software is installed on the router.

  `yourname con0 is now available
  Press RETURN to get started!`

  For instructions on configuring your router by using SDM, see Cisco Router and Security Device Manager (SDM) Quick Start Guide.

  **Note** Because SDM is installed on your router by default, we recommend using SDM to perform the initial configuration.

- If the startup messages end with the following lines, the router is ready for initial configuration using the setup facility (system configuration dialog) or the command-line interface (CLI). Enter yes to continue with the setup facility; enter no to continue with the CLI.
Verifying the LED Indicators on the 1841 Router

Verify that you have correctly installed the router by checking the LEDs shown in Table 7-1.

<table>
<thead>
<tr>
<th>LED</th>
<th>Color</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>SYS PWR</td>
<td>Green</td>
<td>Router has successfully booted up and the software is functional. Slow, steady blinking when system is booting or in the ROM monitor.</td>
</tr>
<tr>
<td>SYS ACT</td>
<td>Green</td>
<td>Blinking when packets are transmitted or received on any WAN or LAN interface, or when monitoring system activity.</td>
</tr>
<tr>
<td>CF</td>
<td>Blinking green</td>
<td>Flash memory is busy. Do not remove the CompactFlash memory card when this light is on.</td>
</tr>
</tbody>
</table>

Verifying the LED Indicators on the 1861 Integrated Services Router

Verify that you have correctly installed the router by checking the LEDs shown in Figure 7-1.
Verifying the Hardware Configuration

Verify the router hardware configuration by using the following commands:

- **show version**—Displays the system hardware version, the installed software version, the names and sources of configuration files, the boot images, and the amount of installed DRAM and flash memory.
- **show diag**—Lists and displays diagnostic information about the installed controllers and interface processors. Typical examples are interface cards (VWICs, WICs, HWICs), and advanced integration modules (AIMs).

Initial Configuration of the Router

This section covers the following topics:

- Initial Configuration, page 7-5
- Verifying the Initial Configuration, page 7-6
- Completing the Configuration, page 7-6

Initial Configuration

You can configure your router by using one of the following tools:
Cisco Router and Security Device Manager

If the Cisco Router and Security Device Manager (SDM) has been installed on your router, the following messages appear at the end of the startup sequence:

```
yourname con0 is now available
```

Press RETURN to get started.

For instructions on configuring your router by using SDM, see the Cisco Router and Security Device Manager (SDM) Quick Start Guide. To use SDM, you can download the latest version of SDM and instructions for installing it on your router:

http://www.cisco.com/pcgi-bin/tablebuild.pl/sdm

To obtain the SDM quick start guide, SDM release notes, and other SDM documentation, go to www.cisco.com/go/sdm.

Verifying the Initial Configuration

Verify that the new interfaces are operating correctly by performing the following tests:

- Enter the `show interfaces` command to verify that the interfaces are operating correctly and that the interfaces and line protocol are in the correct state—up or down.
- Enter the `show ip interface brief` command to display a summary status of the interfaces configured for IP.
- Enter the `show configuration` command to verify that you configured the correct hostname and password.

When you have completed and verified the initial configuration, your Cisco router is ready to be configured for specific functions. See the “Completing the Configuration” section on page 7-6 for information about locating documentation for advanced configuration procedures.

Completing the Configuration

When you have completed and verified the initial configuration, your Cisco router is ready to be configured for specific functions. For advanced configuration procedures, use either SDM or the CLI.

For configuration procedures using SDM, see Cisco Router and Security Device Manager (SDM) Quick Start Guide.

For configuration procedures using the CLI, see Cisco 1800 Series Router Software Configuration. The software configuration documents include information about the following topics:

- Basic software configuration
Powering up the Cisco 1861 Integrated Services Router

To power up the Cisco 1861 Integrated Services Router, perform the following steps:

**Step 1**  Verify that the AC power cord is connected to the power supply.

**Step 2**  Power up the power supply and the Cisco 1861 ISR, by connecting the power cord plug to a grounded AC outlet.

**Note**  There is no external Power On/Off switch on the power supply.

**Step 3**  Verify the LED indicators on the front panel of the Cisco 1861 Integrated Services Router, as required. See Figure 7-1.

Software Components of the Cisco 1861 Integrated Services Router

The Cisco 1861 Integrated Services Router is shipped with a factory-installed software configuration for a basic IP telephony system that enables phone users to make and receive calls using the preconfigured numbers on their IP phones within minutes after connecting the Cisco 1861 Integrated Services Router to the Ethernet and their IP phones to the platform. Table 7-2 summarizes the software components of the Cisco 1861 Integrated Services Router.

<table>
<thead>
<tr>
<th>Software Component</th>
<th>Description</th>
<th>Benefits</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco Unified Communications Manager Express (Cisco Unified CME)</td>
<td>Entry-level call processing system that provides a wide range of IP telephony features for small to medium-sized business customers and autonomous small enterprise branch offices.</td>
<td>All files and configurations for IP phones are stored internally on the Cisco 1861 Integrated Services Router for a cost-effective, highly reliable, IP communications solution.</td>
</tr>
<tr>
<td>Cisco Unity Express</td>
<td>Provides voice mail and automated attendant services specifically designed for the small and medium-sized branch office environment.</td>
<td>Users can easily and conveniently manage their voice messages and greetings with intuitive telephone prompts and a straightforward web-based GUI that allows simple administration</td>
</tr>
</tbody>
</table>

</tbody>
</table>
If you encounter problems with your Cisco 1800 series integrated services router (ISR) (modular), the information in this chapter can help you isolate problems in the router or eliminate the router as the source of the problem.

This chapter contains the following sections:

- **Problem Solving**, page 8-1
- **Reading LEDs**, page 8-4
- **System Messages**, page 8-5
- **Recovering a Lost Password**, page 8-6
- **More Troubleshooting Help**, page 8-6

To troubleshoot interface cards, see *Overview of Cisco Interface Cards for Cisco Access Routers*.

If you cannot locate the source of the problem, contact a Cisco customer service representative for information on how to proceed. For technical support information, see the “Obtaining Documentation and Submitting a Service Request” section on page 1-15. Before you call, have the following information ready:

- Chassis type and serial number
- Maintenance agreement or warranty information
- Type of software and version number
- Date you received the router
- Brief description of the problem
- Brief explanation of the steps you have taken to isolate the problem

### Problem Solving

The key to problem solving is to isolate the problem to a specific subsystem by comparing what the router is doing to what it should be doing.

The LEDs on the router aid you in determining router performance and operation. The LEDs are described in the “Reading LEDs” section on page 8-4.
When solving problems, consider the following router subsystems:

- Power and cooling systems—External power source, power cable, router power supply, circuit breaker, and router fan. Also check for inadequate ventilation or air circulation.
- Interface cards—LEDs on the interface cards help identify a failure.
- Cables—External cables that connect the router to the network.

**Troubleshooting the Power and Cooling Systems**

Both the system LED and the fans can help you troubleshoot a power problem. Check the following items to help isolate the problem:

**Normal Indications**

With the power switch on, the normal indications are:

- SYS PWR LED on green and continuous
- Fan operating

**Fault Indications**

Check the following symptoms to locate or eliminate faults in the power and cooling systems:

- With the power switch on, is the SYS PWR LED on?
  - If the LED is green and continuous, the router is receiving power and is functional.
  - If the LED is off, check the power source and power cable.
- With the power switch on and the SYS PWR LED on and green, does the fan operate?
  - If no, check the fan.
  - If yes, the power system is functioning.
- With the power switch on and the SYS PWR LED off, does the fan operate?
  - If yes, the router is receiving power. The fan is connected directly to the DC outputs of the power supply.
  - If no, check the power source and power cable.
- Does the router shut down after being on a short time?
  - Check for an environmentally induced shutdown. See the next section, “Environmental Reporting Features, page 8-3.”
  - Check the environmental site requirements in the “General Site Requirements” section on page 3-3.
  - Check for a power supply failure by inspecting the SYS PWR LED on the front panel. If it is green, the power supply is functional.
- Router partially boots, but LEDs do not go on.
  - Check for a power supply failure by inspecting the SYS PWR LED on the front panel of the router. If the SYS PWR LED is blinking or continuously green, the power supply is functional.
  - If the SYS PWR LED is not on, see “Cisco One-Year Limited Hardware Warranty Terms” section on page 1-14.
Environmental Reporting Features

If the router is operating at an abnormally high temperature, consider the following causes:

- Fan failure
- Air conditioner failure in the room
- Air blockage to cooling vents

Take steps to correct the problem. See the “Site Environment” section on page 3-4.

Troubleshooting Cables, Connections, and Interface Cards

Network problems can be caused by cables, cable connections, or interface cards, or by external devices such as a modem, transceiver, hub, wall jack, WAN interface, or terminal. Check for the following symptoms to help isolate the problem.

- Card is not recognized by the router.
  - Make sure that the card is firmly seated in its slot.
  - Check the LEDs on the card. Each card has its own set of LEDs.
  - Make sure that you have a version of Cisco IOS software that supports the card.

- Card is recognized, but interface ports do not initialize.
  - Make sure that the card is firmly seated in its slot.
  - Check external cable connections.
  - Make sure that you have a version of Cisco IOS software that supports the card. Check the software requirements for the affected card, which can be found in the configuration note for the card.

- Router does not boot properly, or constantly or intermittently reboots.
  - Make sure that the card is firmly seated in its slot.
  - Check the router chassis or software.

- Router boots, but the console screen is frozen.
  - Check the external console connection.
  - Verify that the parameters for your terminal are set as follows:
    (a) The same data rate as configured for the router (9600 baud is the default)
    (b) 8 data bits
    (c) 1 stop bit
    (d) No parity generated or checked

- Router powers on and boots only when a particular card is removed.
  - Check the card. See the “Cisco One-Year Limited Hardware Warranty Terms” section on page 1-14 and the “Obtaining Documentation and Submitting a Service Request” section on page 15 of the “Introduction to Cisco 1800 Series Routers (Modular) Hardware Documentation” document for warranty and customer service contact information.

- Router powers on and boots only when a particular cable is disconnected.
There may be a problem with the card or cable. See the “Cisco One-Year Limited Hardware Warranty Terms” and the “Obtaining Documentation and Submitting a Service Request” sections of the “Introduction to Cisco 1800 Series Routers (Modular) Hardware Documentation” document for warranty and customer service contact information.

Reading LEDs

The LEDs on the router enable you to determine router performance and operation. The System Power (SYS PWR) LED and the System Activity (SYS ACT) LED are on the front panel; all the other LEDs are on the back panel.

Table 8-1  LED Indicators on Cisco 1800 Series Routers

<table>
<thead>
<tr>
<th>LED Indicator</th>

</tr>
</tbody>
</table>
Recovering a Lost Password

The terminal should display one of the following prompts:

* `Router>` (indicates the user EXEC command mode)

or

* `Router#` (indicates the privileged EXEC command mode)

The Cisco IOS software checks the system condition once every 30 seconds. If a condition still exists, the error message is displayed again; if the error condition has cleared, a recovery message is displayed. Table 8-2 describes some of the most common system error and recovery messages.

**Table 8-2  System Messages**

</tr>
</tbody>
</table>

Recovering a Lost Password

You can recover a lost enable password, but an enable secret password is encrypted and is not recoverable. If you lose an enable secret password that is configured on your router, you can replace it with a new enable secret password.

For password recovery and replacement procedures, see the *Password Recovery Procedures*.

More Troubleshooting Help

For online troubleshooting help, go to the TAC Case Collection Tool and Troubleshooting Assistant. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click Cancel at the login dialog box and follow the instructions that appear.
CHAPTER 9

Installing Interface Cards in Cisco 1800 Series Routers (Modular)

Cisco Interface Cards Installation Guide

The Cisco Interface Cards Installation Guide contains the procedures for installing the various types of interface cards in external chassis slots. Interface cards supported by the Cisco 1800 series integrated services routers (modular) include the following types:

- Voice-WAN interface cards (VWICs)—data only on the Cisco 1841 router
- WAN interface cards (WICs)
- High-speed WAN interface cards (HWICs)

You can view the Cisco Interface Cards Installation Guide on Cisco.com.

Related Product Documentation

The following documentation is related to your product. This document was not shipped with your product, but you can access it on Cisco.com.

- Cisco Network Modules and Interface Cards Regulatory Compliance and Safety Information

Installing WICs, VWICs, and HWICs

This section describes how to install WICs, VWICs, and HWICs into Cisco 1800 series routers.

Caution

Do not connect a WAN cable to an interface card until you have completed its installation procedure.

The Cisco 1841 router has two interface card slots. Each slot can accommodate a Cisco WIC, VWIC (data only mode), or a single-wide high-speed WIC (HWIC).

Note

Cisco double-wide HWICs are not supported in the Cisco 1841 router.
To install a card in a Cisco 1841 router, follow these steps:

**Step 1** Make sure that the router is turned off and is disconnected from power.

**Caution**

Power must be removed from the system prior to installing or removing interface cards to avoid damaging them. When interface cards are pushed into or pulled out of a router that is powered up, there is a strong possibility that they could be damaged electrically and would no longer function.

**Step 2** Loosen the thumbscrews on the interface card blank faceplate on the back panel, as shown in Figure 9-1. You should be able to loosen the screws using your fingers; however, if the screws are very tight, you might need to use a Phillips screwdriver.

**Figure 9-1  Removing an Interface Card Blank Faceplate**

![Figure 9-1 Removing an Interface Card Blank Faceplate](image)

1 Blank faceplate

**Step 3** Remove the blank faceplate that covers the card slot.

**Step 4** Hold the interface card by the edges on either side of the card front panel, and line up the card edges with the guides inside the card slot, as shown in Figure 9-2.

**Figure 9-2  Inserting an Interface Card into the Router**

![Figure 9-2 Inserting an Interface Card into the Router](image)

1 Card guides  
2 Interface card
Step 5  Insert the card in the slot, and gently push it into the router until the front panel of the card is flush with the back panel of the router.

Step 6  Tighten the screws.
CHAPTER 10

Installing and Replacing CompactFlash Memory Cards on Cisco 1800 Series Routers (Modular)

This chapter describes installing and replacing CompactFlash memory cards in Cisco 1800 series integrated services routers (ISR) (modular). You can perform these procedures when the router has been installed in its working location with all power and interface cables connected. This chapter contains the following sections:

- Preventing Electrostatic Discharge Damage, page 10-1
- Replacing CompactFlash Memory Cards, page 10-1

Preventing Electrostatic Discharge Damage

CompactFlash memory cards are sensitive to electrostatic discharge (ESD) damage. ESD damage, which can occur when electronic cards or components are handled improperly, results in intermittent or complete failures.

To prevent ESD damage, follow these guidelines:

- Always use an ESD wrist or ankle strap and ensure that it makes good skin contact.
- Connect the equipment end of the strap to an unfinished chassis surface.
- Place a removed CompactFlash memory card on an antistatic surface or in a static shielding bag. If the card will be returned to the factory, immediately place it in a static shielding bag.
- Avoid contact between the card and clothing. The wrist strap protects the card from ESD voltages on the body only; ESD voltages on clothing can still cause damage.
- Do not remove the wrist strap until the installation is complete.

Caution

For safety, periodically check the resistance value of the antistatic strap. The measurement should be between 1 and 10 megohms (Mohms).

Replacing CompactFlash Memory Cards

This section describes how to remove and install CompactFlash memory cards.
Removing a CompactFlash Memory Card

To remove a CompactFlash memory card from an external slot, follow these steps:

⚠️ **Caution**
If the CF LED is on or blinking, do not remove the CompactFlash memory card. The router could crash, or the flash memory contents could be corrupted.

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Press the ejector button next to the CompactFlash memory card. The ejector button moves outward so that it projects from the panel.</td>
</tr>
<tr>
<td>2</td>
<td>Press the ejector button again to unseat the card.</td>
</tr>
<tr>
<td>3</td>
<td>Carefully pull the card out of the slot.</td>
</tr>
<tr>
<td>4</td>
<td>Place the removed CompactFlash memory card on an antistatic surface or in a static shielding bag.</td>
</tr>
<tr>
<td>5</td>
<td>Push the ejector button in until it clicks.</td>
</tr>
</tbody>
</table>

⚠️ **Caution**
To prevent damage to the ejector mechanism, the ejector button must remain fully seated when not being used to eject a CompactFlash memory card.

Installing a CompactFlash Memory Card

To install a CompactFlash memory card, follow these steps:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Make sure that the ejector button is fully seated so that it does not project from the panel.</td>
</tr>
<tr>
<td>📝 <strong>Note</strong></td>
<td>If the ejector button projects from the panel, push it in until it clicks.</td>
</tr>
<tr>
<td>2</td>
<td>With the label facing up, insert the connector end of the CompactFlash memory card into the slot until the card is seated in the connector. The card is keyed so that it cannot be inserted incorrectly.</td>
</tr>
<tr>
<td>📝 <strong>Note</strong></td>
<td>If the ejector button projects from the panel after you insert the CompactFlash memory card, remove the card, press the ejector button until it clicks, and reinsert the card.</td>
</tr>
</tbody>
</table>

⚠️ **Caution**
To prevent damage to the ejector mechanism, the ejector button must remain fully seated when not being used to eject a CompactFlash memory card.

Using the Compact Flash Guard

The Compact Flash guard (CF-guard) provides protection for the compact flash memory slot.
Note

A small flat-head screwdriver is required to attach the CF-guard.

To install the CF-guard, follow these steps:

---

**Step 1** Unpack the CF-guard.

**Step 2** Slip the CF-guard flap into the notch in the CompactFlash memory slot.

**Step 3** Screw the CF-guard into the screw hole.
Installing and Upgrading Internal Modules in Cisco 1800 Series Routers (Modular)

This chapter describes how to install or upgrade modules that are located internally within the Cisco 1800 series integrated services routers (modular): memory modules and advanced integration modules (AIMs). You need to remove the cover from the router to install or remove any of these items. The chapter contains the following sections:

- Safety Warnings, page 11-1
- Modules Internal to the Cisco 1841 Router, page 11-2

Note
To see translations of the warnings that appear in this publication, see the Regulatory Compliance and Safety Information for Cisco 1840 Routers.

Safety Warnings

⚠️ Warning
Before working on a system that has an on/off switch, turn OFF the power and unplug the power cord. Statement 1

⚠️ Warning
Before working on equipment that is connected to power lines, remove jewelry (including rings, necklaces, and watches). Metal objects will heat up when connected to power and ground and can cause serious burns or weld the metal object to the terminals. Statement 43

⚠️ Warning
During this procedure, wear grounding wrist straps to avoid ESD damage to the card. Do not directly touch the backplane with your hand or any metal tool, or you could shock yourself. Statement 94

⚠️ Warning
Do not work on the system or connect or disconnect cables during periods of lightning activity. Statement 1001

⚠️ Warning
Read the installation instructions before you connect the system to its power source. Statement 1004
Warning
Hazardous network voltages are present in WAN ports regardless of whether power to the router is OFF or ON. To avoid electric shock, use caution when working near WAN ports. When detaching cables, detach the end away from the router first. Statement 1026

Modules Internal to the Cisco 1841 Router

This section tells how to install a small outline dual in-line memory module (SODIMM) and an advanced integration module (AIM) in the Cisco 1841 router. It contains the following subsections:

- Opening the Chassis, page 11-2
- Locating Modules, page 11-4
- Installing a SODIMM, page 11-5
- Installing an AIM, page 11-6
- Closing the Chassis, page 11-11

All the module replacement procedures in this section require removal of the chassis cover. Before you perform any of the module replacement procedures, disconnect the power and remove the cover as described in the “Opening the Chassis” section on page 11-2. After you complete the module replacement procedures, install the chassis cover as described in the “Closing the Chassis” section on page 11-11.

Opening the Chassis

To open the chassis, follow these steps. A number 1 Phillips screw driver is required.

Step 1 Make sure that the router is turned off and is disconnected from AC power.
Step 2 Turn the router upside down, and rest the top of the router on a flat surface.
Step 3 Use the Phillips screwdriver to remove the screw that holds the top and bottom of the chassis together, as shown in Figure 11-1.
Step 4  Insert a flat-head screwdriver into the slots at the screwdriver pry points and rotate the screwdriver 90 degrees to disengage the top cover from the chassis. See Figure 11-2.

Step 5  Turn the router back to its original position (top up).

Step 6  Gently slide the top of the router (which is facing up toward you) away and up from the bottom of the router (which is resting on the flat surface). See Figure 11-3.
Step 7  Place the router bottom on an antistatic mat, and begin installing memory.

Locating Modules

Figure 11-4 shows where the connector for the SODIMM or the AIM is located on the Cisco 1841 motherboard.
Installing a SODIMM

You can install a SODIMM to increase the amount of DRAM in the router.

To install a SODIMM on the router motherboard, follow these steps:

**Step 1** Locate the SODIMM socket on the motherboard.

**Step 2** Remove any existing SODIMM by gently pulling the spring-loaded clips on the end of the socket far enough to clear the SODIMM, and gently pulling the SODIMM up and away from the socket. See Figure 11-5.
Step 3  
Insert the SODIMM into the SODIMM socket, as shown in Figure 11-6.

Step 4  
Firmly press the SODIMM into the socket until the spring-loaded clips on the socket snap over the end of the SODIMM.

Installing an AIM

The Cisco 1841 router has the capability to support a single AIM module. To install an AIM, follow the procedure given here.
Caution
When you install an AIM, always wear an ESD-preventive wrist strap, and ensure that it makes good contact with your skin. Connect the equipment end of the wrist strap to the metal part of the chassis.

Caution
Handle AIMs by the edges only. AIMs are ESD-sensitive components and can be damaged by mishandling.

Accessory Kit to Use

Some AIMs are provided with multiple accessory kits that contain different configurations of mounting hardware. Mounting hardware for the Cisco 1841 router consists of two machine thread metal standoffs, two machine thread metal screws, and one plastic standoff.

To install an AIM2-CUE-K9 or an AIM2-APPRE-104-K9, use the snap-fit blue standoff, the two hex standoffs, and the two M2.5 screws found in mounting kit 69-1870-01. You can discard the remaining parts.

For all other AIM module installations, use the hardware found in mounting kit 69-1316-01.

Installation Procedure

To install the AIM, perform the following steps. You need a number 2 Phillips screwdriver or flat-head screwdriver to complete this procedure.

Step 1
Find the metal standoff attachment locations on the system board near the AIM connector, indicated by a star pattern, as shown in Figure 11-7.
Step 2  Install the two metal standoffs from the accessory kit into the system board in the metal standoff attachment locations, as shown in Figure 11-9. Use a 1/4-inch nut driver to tighten the standoffs. Locations for AIM standoffs are denoted by a star pattern around the standoff mounting holes.

Caution  Make sure that the standoffs are installed straight. Tighten them gently but firmly. The shoulder must be seated tightly against the system board.

Step 3  Insert the plastic standoff (Figure 11-8) from the accessory kit into the hole in the system board. See Figure 11-9. Press the standoff firmly into the system board to be sure that it is locked to the board.

Note  The plastic standoff snaps into the system board. Be sure to insert the locking end of the standoff into the system board. The locking end is the shortest end of the standoff. Figure 11-8 identifies the locking end of the plastic standoff used with AIMs.

Note  For most AIMs, the plastic snap-in standoff is white. For the AIM2-CUE-K9 and the AIM2-APPRE-104-K9, the plastic standoff is blue and has a slightly larger snap-in feature to accommodate the PCB which is thicker.
Step 4 Insert the connector on the AIM into the AIM connector on the system board. See Figure 11-9.

Note Be sure to press firmly on the AIM until the board seats onto the connector. The plastic standoff must snap into the hole in the AIM board. See Figure 11-9.

Step 5 Insert the screws from the accessory kit through the AIM into the metal standoffs. See Figure 11-9. Carefully tighten the screws with a Phillips screwdriver.
Step 6  Check that the AIM is installed correctly on the system board. See Figure 11-10.
Applying the AIM Label

The AIM label for the chassis might be in the AIM mounting kit, or it might be attached to the label on the AIM card. To apply the chassis label, follow these steps:

**Step 1**  If the chassis label is attached to the label on the AIM card, carefully tear off the chassis label at the perforation. If the chassis label is in the AIM mounting kit, remove the label from the kit bag.

**Step 2**  Peel the chassis label from its backing.

**Step 3**  If there is a suitable space, apply the chassis label to the back of the chassis. If no suitable space is available on the back of the chassis, apply the label to the top cover at the back edge. The label must be visible with the chassis installed.

*Note*  Do not apply the AIM label for the chassis to a blank cover plate; to any removable network module or interface card; or over any holes, screws, chassis vents, or existing labels.

Closing the Chassis

To close the chassis, follow these steps:

**Step 1**  Rotate the cover down onto the chassis. Slide the cover back onto the bottom of the chassis. See Figure 11-11.

**Step 2**  Push firmly to close.

**Step 3**  Turn the router upside-down.
Step 4 Use a number 1 Phillips—screwdriver to reinstall the screw that holds the cover to the chassis. See Figure 11-1.
