PART 1

Getting Started

CHAPTER 1
Basic Router Configuration 1-1
Viewing the Default Configuration 1-2
Information Needed for Customizing the Default Parameters 1-2
Interface Port Labels 1-3
Configuring Basic Parameters 1-3
  Configure Global Parameters 1-4
  Configure Fast Ethernet LAN Interfaces 1-4
  Configure WAN Interfaces 1-4
    Configure the Fast Ethernet WAN Interface 1-5
    Configure the ATM WAN Interface 1-5
  Configure the Wireless Interface 1-6
Configuring a Loopback Interface 1-6
  Configuration Example 1-7
  Verifying Your Configuration 1-7
Configuring Command-Line Access to the Router 1-8
  Configuration Example 1-9
Configuring Static Routes 1-10
  Configuration Example 1-10
  Verifying Your Configuration 1-10
Configuring Dynamic Routes 1-11
  Configuring RIP 1-11
    Configuration Example 1-12
    Verifying Your Configuration 1-12
PART 2 Configuring Your Router for Ethernet and DSL Access

CHAPTER 2 Sample Network Deployments 2-1

CHAPTER 3 Configuring PPP over Ethernet with NAT 3-1
  Configure the Virtual Private Dialup Network Group Number 3-2
  Configure the Fast Ethernet WAN Interfaces 3-3
  Configure the Dialer Interface 3-4
  Configure Network Address Translation 3-5
  Configuration Example 3-8
  Verifying Your Configuration 3-8

CHAPTER 4 Configuring PPP over ATM with NAT 4-1
  Configure the Dialer Interface 4-2
  Configure the ATM WAN Interface 4-5
  Configure DSL Signaling Protocol 4-6
    Configuring ADSL 4-6
    Verify the Configuration 4-7
  Configure Network Address Translation 4-7
  Configuration Example 4-9
  Verifying Your Configuration 4-10

CHAPTER 5 Configuring a LAN with DHCP and VLANs 5-1
  Configure DHCP 5-2
    Configuration Example 5-4
    Verify Your DHCP Configuration 5-4
  Configure VLANs 5-5
    Assign a Switch Port to a VLAN 5-6
    Verify Your VLAN Configuration 5-6

CHAPTER 6 Configuring a VPN Using Easy VPN and an IPsec Tunnel 6-1
  Configure the IKE Policy 6-3
  Configure Group Policy Information 6-4
  Apply Mode Configuration to the Crypto Map 6-5
  Enable Policy Lookup 6-6
  Configure IPsec Transforms and Protocols 6-6
  Configure the IPsec Crypto Method and Parameters 6-7
Apply the Crypto Map to the Physical Interface 6-8
Create an Easy VPN Remote Configuration 6-9
Verifying Your Easy VPN Configuration 6-10
Configuration Example 6-10

CHAPTER 7 Configuring VPNs Using an IPsec Tunnel and Generic Routing Encapsulation 7-1
Configure a VPN 7-2
   Configure the IKE Policy 7-3
   Configure Group Policy Information 7-4
   Enable Policy Lookup 7-5
   Configure IPsec Transforms and Protocols 7-5
   Configure the IPsec Crypto Method and Parameters 7-6
   Apply the Crypto Map to the Physical Interface 7-7
Configure a GRE Tunnel 7-8
Configuration Example 7-9

CHAPTER 8 Configuring a Simple Firewall 8-1
Configure Access Lists 8-3
Configure Inspection Rules 8-4
Apply Access Lists and Inspection Rules to Interfaces 8-4
Configuration Example 8-5

CHAPTER 9 Configuring a Wireless LAN Connection 9-1
Configure the Root Radio Station 9-2
Configure Bridging on VLANs 9-4
Configure Radio Station Subinterfaces 9-5
Configuration Example 9-6

PART 3 Configuring Additional Features and Troubleshooting

CHAPTER 10 Additional Configuration Options 10-1

CHAPTER 11 Configuring Security Features 11-1
   Authentication, Authorization, and Accounting 11-1
   Configuring AutoSecure 11-2
   Configuring Access Lists 11-2
      Access Groups 11-3
Contents

Guidelines for Creating Access Groups 11-3
Configuring a CBAC Firewall 11-3
Configuring Cisco IOS Firewall IDS 11-4
Configuring VPNs 11-4

Chapter 12  
Troubleshooting 12-1
Getting Started 12-1
Before Contacting Cisco or Your Reseller 12-1
ADSL Troubleshooting 12-2
ATM Troubleshooting Commands 12-2
  ping atm interface Command 12-2
  show interface Command 12-3
  show atm interface Command 12-5
  debug atm Commands 12-5
    Guidelines for Using Debug Commands 12-5
    debug atm errors Command 12-6
    debug atm events Command 12-6
    debug atm packet Command 12-7
Software Upgrade Methods 12-8
Recovering a Lost Password 12-9
  Change the Configuration Register 12-9
  Reset the Router 12-10
  Reset the Password and Save Your Changes 12-11
  Reset the Configuration Register Value 12-11

Preface

This preface describes the objectives, audience, organization, and conventions of this guide, and describes related documents that have additional information. It contains the following sections:

- Objective, page ix
- Audience, page ix
- Organization, page x
- Conventions, page xi
- Related Documentation, page xvi
- Obtaining Documentation and Submitting a Service Request, page xvii

Objective

This guide provides an overview and explains how to install and connect the wireless and nonwireless Cisco Secure Router 520 Series routers.

For warranty, service, and support information, see the “Cisco One-Year Limited Hardware Warranty Terms” section in the Readme First for Cisco Secure Router 520 Series document that was shipped with your router.

Audience

This guide is intended for network administrators whose backgrounds vary from having little or no experience in configuring routers to having a high level of experience.
# Organization

This guide is organized into the following chapters and appendix.

## Part 1: Getting Started

<table>
<thead>
<tr>
<th>Chapter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chapter 1, “Basic Router Configuration”</td>
<td>Describes how to configure basic router features and interfaces.</td>
</tr>
</tbody>
</table>

## Part 2: Configuring Your Router for Ethernet and DSL Access

<table>
<thead>
<tr>
<th>Chapter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chapter 2, “Sample Network Deployments”</td>
<td>Provides a road map for Part 2.</td>
</tr>
<tr>
<td>Chapter 3, “Configuring PPP over Ethernet with NAT”</td>
<td>Provides instructions on how to configure PPPoE with Network Address Translation (NAT) on your Cisco router.</td>
</tr>
<tr>
<td>Chapter 4, “Configuring PPP over ATM with NAT”</td>
<td>Provides instructions on how to configure PPPoA with Network Address Translation (NAT) on your Cisco router.</td>
</tr>
<tr>
<td>Chapter 5, “Configuring a LAN with DHCP and VLANs”</td>
<td>Provides instructions on how to configure your Cisco router with multiple VLANs and to have it act as a DHCP server.</td>
</tr>
<tr>
<td>Chapter 6, “Configuring a VPN Using Easy VPN and an IPsec Tunnel”</td>
<td>Provides instructions on how to configure a virtual private network (VPN) with a secure IP tunnel using the Cisco Easy VPN.</td>
</tr>
<tr>
<td>Chapter 7, “Configuring VPNs Using an IPsec Tunnel and Generic Routing Encapsulation”</td>
<td>Provides instructions on how to configure a VPN with a secure IP tunnel and generic routing encapsulation (GRE).</td>
</tr>
<tr>
<td>Chapter 8, “Configuring a Simple Firewall”</td>
<td>Provides instructions on how to configure a basic firewall on your Cisco router.</td>
</tr>
<tr>
<td>Chapter 9, “Configuring a Wireless LAN Connection”</td>
<td>Provides instructions on how to configure a wireless LAN connection on your Cisco router.</td>
</tr>
</tbody>
</table>

## Part 3: Configuring Additional Features and Troubleshooting

<table>
<thead>
<tr>
<th>Chapter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chapter 10, “Additional Configuration Options”</td>
<td>Provides a road map for Part 3.</td>
</tr>
<tr>
<td>Chapter 11, “Configuring Security Features”</td>
<td>Explains basic configuration of Cisco IOS security features, including firewall and VPN configuration.</td>
</tr>
<tr>
<td>Chapter 12, “Troubleshooting”</td>
<td>Provides information on identifying and solving problems with the ADSL line and the telephone interface. Also explains how to recover a lost software password.</td>
</tr>
</tbody>
</table>

## Part 4: Reference Information

<table>
<thead>
<tr>
<th>Appendix</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Appendix A, “Cisco IOS Software Basic Skills”</td>
<td>Explains what you need to know about Cisco IOS software before you begin to configure it.</td>
</tr>
<tr>
<td>Appendix B, “Concepts”</td>
<td>Provides general concept explanations of features.</td>
</tr>
</tbody>
</table>
Conventions

This section describes the conventions used in this guide.

**Note**

Means *reader take note*. Notes contain helpful suggestions or references to additional information and material.

**Caution**

This symbol means *reader be careful*. In this situation, you might do something that could result in equipment damage or loss of data.

**Warning**

**IMPORTANT SAFETY INSTRUCTIONS**

This warning symbol means danger. You are in a situation that could cause bodily injury. Before you work on any equipment, be aware of the hazards involved with electrical circuitry and be familiar with standard practices for preventing accidents. Use the statement number provided at the end of each warning to locate its translation in the translated safety warnings that accompanied this device. Statement 1071

**SAVE THESE INSTRUCTIONS**

**BELANGRIJKE VEILIGHEIDSINSTRUCTIES**

Dit waarschuwingssymbool betekent gevaar. U verkeert in een situatie die lichamelijk letsel kan veroorzaken. Voordat u aan enige apparatuur gaat werken, dient u zich bewust te zijn van de bij elektrische schakelingen betrokken risico’s en dient u op de hoogte te zijn van de standaard praktijken om ongelukken te voorkomen. Gebruik het nummer van de verklaring onderaan de waarschuwing als u een vertaling van de waarschuwing die bij het apparaat wordt geleverd, wilt raadplegen.

**BEWAAR DEZE INSTRUCTIES**

**TÄRKEITÄ TURVALLISUUSOHJEITA**

Tämä varoitusmerkki merkitsee vaaraa. Tilanne voi aiheuttaa ruumiillisia vammoja. Ennen kuin käsittelet laitteistoa, huomioi sähköpiirien käsittelemiseen liittyvät riskit ja tutustu onnettomuksien yleisiin ehkäisytapoihin. Turvallisuusvaroitusten käänökset löytyvät laitteiden mukana toimitettujen käännettyjen turvallisuusvaroitusten joukosta varoitusten lopussa näkyvien lausuntonumeroiden avulla.

**SÄILYTÄ NÄMÄ OHJEET**

Avvertenza IMPORTANTI ISTRUZIONI SULLA SICUREZZA

Questo simbolo di avvertenza indica un pericolo. La situazione potrebbe causare infortuni alle persone. Prima di intervenire su qualsiasi apparecchiatura, occorre essere al corrente dei pericoli relativi ai circuiti elettrici e conoscere le procedure standard per la prevenzione di incidenti. Utilizzare il numero di istruzione presente alla fine di ciascuna avvertenza per individuare le traduzioni delle avvertenze riportate in questo documento.

CONSERVARE QUESTE ISTRUZIONI

Advarsel VIKTIGE SIKKERHETSINSTRUKSJONER

Dette advarselsymbolet betyr fare. Du er i en situasjon som kan føre til skade på person. Før du begynner å arbeide med noe av utstyret, må du være oppmerksom på farene forbundet med elektriske kretser, og kjenne til standardprosedyrer for å forhindre ulykker. Bruk nummeret i slutten av hver advarsel for å finne oversettelsen i de oversatte sikkerhetsadvarslene som fulgte med denne enheten.

TA VARE PÅ DISSE INSTRUKSJONENE

Aviso INSTRUÇÕES IMPORTANTES DE SEGURANÇA

Este símbolo de aviso significa perigo. Você está em uma situação que poderá ser causadora de lesões corporais. Antes de iniciar a utilização de qualquer equipamento, tenha conhecimento dos perigos envolvidos no manuseio de circuitos elétricos e familiarize-se com as práticas habituais de prevenção de acidentes. Utilize o número da instrução fornecido ao final de cada aviso para localizar sua tradução nos avisos de segurança traduzidos que acompanham este dispositivo.

GUARDE ESTAS INSTRUÇÕES
¡Advertencia! INSTRUCCIONES IMPORTANTES DE SEGURIDAD

Este símbolo de aviso indica peligro. Existe riesgo para su integridad física. Antes de manipular cualquier equipo, considere los riesgos de la corriente eléctrica y familiarícese con los procedimientos estándar de prevención de accidentes. Al final de cada advertencia encontrará el número que le ayudará a encontrar el texto traducido en el apartado de traducciones que acompaña a este dispositivo.

GUARDE ESTAS INSTRUCCIONES

Warning! VIKTIGA SÄKERHETSANVISNINGAR

SPARA DESSA ANVISNINGAR

Fontos biztonsági előírások

Ez a figyelmezetlet jel veszélyre utal. Sérülésveszélyt rejt a helyzetben van. Mielőtt bármelyik berendezésen munkát végezte, legyen figyelemmel az elektromos áramkörök okozta kockázatokra, és ismerkedjen meg a szokásos balesetvédelmi eljárásokkal. A kiadóban szerepelő figyelmezetletek fordítása a készülékhez mellékelt biztonsági figyelmezetletek között található; a fordítás az egyes figyelmezetletek végén látható szám alapján kereshető meg.

ORIZZE MEG EZEKET AZ UTASÍTÁSOKAT!

Важные инструкции по соблюдению техники безопасности

Этот символ предупреждения обозначает опасность. То есть имеется место ситуация, в которой следует опасаться телесных повреждений. Перед эксплуатацией оборудования выясните, каким опасностям может подвергаться пользователь при использовании электрических цепей, и ознакомьтесь с правилами техники безопасности для предотвращения возможных несчастных случаев. Воспользуйтесь номером заявления, приведенным в конце каждого предупреждения, чтобы найти его переведенный вариант в переводе предупреждений по безопасности, прилагаемом к данному устройству.

СОХРАНИТЕ ЭТИ ИНСТРУКЦИИ

警告 重要的安全性说明

此警告符号代表危险。您正处于可能受到严重伤害的工作环境中。在您使用设备开始工作之前，必须充分意识到触电的危险，并熟练掌握防止事故发生的标准工作程序。请根据每项警告结尾提供的声明号码来找到此设备的安全性警告说明的翻译文本。

请保存这些安全性说明

The Cisco Secure Router 520 Series product is shipped with a minimal set of printed documentation. Additional product documentation is available on Cisco.com.

In addition to the Cisco Secure Router 520 Series Software Configuration Guide (this document), the Cisco Secure Router 520 Series documentation set includes the following documents.

The following documentation is shipped with the product:

- For warranty, service, and support information, see the Readme First for Cisco Secure Router 520 Series document.
- Cisco Regulatory Compliance and Safety Information Roadmap

The following Cisco Secure Router 520 Series product documentation is available on Cisco.com:

- Cisco Secure Router 520 Series Hardware Installation Guide
- Regulatory Compliance and Safety Information for Cisco Secure Router 500 Series
Obtaining Documentation and Submitting a Service Request

For information on obtaining documentation, submitting a service request, and gathering additional information, see the monthly What's New in Cisco Product Documentation, which also lists all new and revised Cisco technical documentation, at:

Subscribe to the What's New in Cisco Product Documentation as a Really Simple Syndication (RSS) feed and set content to be delivered directly to your desktop using a reader application. The RSS feeds are a free service and Cisco currently supports RSS version 2.0.
PART 1

Getting Started
Basic Router Configuration

The Cisco Secure Router 520 Series routers are designed for small businesses with up to 50 users and teleworkers who want secure connectivity to corporate LANs and to the Internet. These routers provide advanced security features that include secure Virtual Private Network (VPN) access and comprehensive threat defense with Cisco IOS Firewall, Intrusion Prevention Solution (IPS), and URL filtering. The Cisco Secure Router 520 Series routers also provide dynamic routing and advanced quality of service (QoS) features.

The Cisco Secure Router 520 Series routers complement the Cisco Unified Communications 500 Series router and the Cisco Smart Business Communications System (SBCS) portfolio. As part of the SBCS portfolio, the Cisco Secure Router 520 Series routers deliver a common user experience through integration with the Cisco Configuration Assistant, Cisco Smart Assist, Cisco Monitor Manager, and Cisco Monitor Director.

This chapter provides procedures for configuring the basic parameters of your Cisco router, including global parameter settings, routing protocols, interfaces, and command-line access using the CLI. It also describes the default configuration at startup.

Individual router models may not support every feature described throughout this guide. Features not supported by a particular router are indicated whenever possible.

This chapter contains the following sections:

- Viewing the Default Configuration
- Information Needed for Customizing the Default Parameters
- Interface Port Labels
- Configuring Basic Parameters
- Configuring Static Routes
- Configuring Dynamic Routes

Each section includes a configuration example and verification steps, as available.

For complete information on how to access global configuration mode, see the “Entering Global Configuration Mode” section in Appendix A, “Cisco IOS Basic Skills.” For more information on the commands used in the following tables, see the Cisco IOS Release 12.3 documentation set.
Viewing the Default Configuration

When the router first boots up, some basic configuration has already been performed. All of the LAN and WAN interfaces have been created, console and VTY ports are configured, and the inside interface for Network Address Translation has been assigned.

To view the default configuration, follow these steps:

**Step 1**  Use the default username cisco and the default password cisco to enter the privileged EXEC mode.

**Step 2**  Use the `show running-config` command to view the initial configuration.

Information Needed for Customizing the Default Parameters

You need to gather some or all of the following information, depending on your planned network scenario, prior to configuring your network.

- If you are setting up an Internet connection, gather the following information:
  - Point-to-Point Protocol (PPP) client name that is assigned as your login name
  - PPP authentication type: Challenge Handshake Authentication Protocol (CHAP) or Password Authentication Protocol (PAP)
  - PPP password to access your Internet service provider (ISP) account
  - DNS server IP address and default gateways
- If you are setting up a connection to a corporate network, you and the network administrator must generate and share the following information for the WAN interfaces of the routers:
  - PPP authentication type: CHAP or PAP
  - PPP client name to access the router
  - PPP password to access the router
- If you are setting up IP routing:
  - Generate the addressing scheme for your IP network.
  - Determine the IP routing parameter information, including IP address, and ATM permanent virtual circuits (PVCs). These PVC parameters are typically virtual path identifier (VPI), virtual circuit identifier (VCI), and traffic shaping parameters.
  - Determine the number of PVCs that your service provider has given you, along with their VPIs and VCIs.
  - For each PVC determine the type of AAL5 encapsulation supported. It can be one of the following:
    - AAL5SNAP—This can be either routed RFC 1483 or bridged RFC 1483. For routed RFC 1483, the service provider must provide you with a static IP address. For bridged RFC 1483, you may use DHCP to obtain your IP address, or you may obtain a static IP address from your service provider.
    - AAL5MUX PPP—With this type of encapsulation, you need to determine the PPP-related configuration items.
  - If you plan to connect over an ADSL line:
Order the appropriate line from your public telephone service provider. Ensure that the ADSL signaling type is DMT (also called ANSI T1.413) or DMT Issue 2.

Once you have collected the appropriate information, you can perform a full configuration on your router, beginning with the tasks in the “Configuring Basic Parameters” section.

## Interface Port Labels

Table 1-1 lists the interfaces supported for each router and their associated port labels on the equipment.

### Table 1-1  Supported Interfaces and Associated Port Labels by Router

<table>
<thead>
<tr>
<th>Router</th>
<th>Interface</th>
<th>Port Label</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco Secure Router 520</td>
<td>Fast Ethernet LAN</td>
<td>FE0–FE3</td>
</tr>
<tr>
<td>Ethernet-to-Ethernet routers</td>
<td>Fast Ethernet WAN</td>

</tr>
<tr>
<td></td>
<td>Wireless LAN</td>
<td>None (antenna is not labeled)</td>
</tr>
<tr>
<td>Cisco Secure Router 520</td>
<td>Fast Ethernet LAN</td>
<td>LAN (top), FE0–FE3 (bottom)</td>
</tr>
<tr>
<td>ADSL-over-POTS routers</td>
<td>ATM WAN</td>
<td>ADSLoPOTS</td>
</tr>
<tr>
<td></td>
<td>Wireless LAN</td>
<td>None (antenna is not labeled)</td>
</tr>
<tr>
<td>Cisco Secure Router 520</td>
<td>Fast Ethernet LAN</td>
<td>LAN (top), FE0–FE3 (bottom)</td>
</tr>
<tr>
<td>ADSL-over-ISDN routers</td>
<td>ATM WAN</td>
<td>ADSLoISDN</td>
</tr>
<tr>
<td></td>
<td>Wireless LAN</td>
<td>None (antenna is not labeled)</td>
</tr>
</tbody>
</table>

## Configuring Basic Parameters

To configure the router, perform one or more of these tasks:

- **Configure Global Parameters**
- **Configure Fast Ethernet LAN Interfaces**
- **Configure WAN Interfaces**
- **Configuring a Loopback Interface**
- **Configuring Command-Line Access to the Router**

A configuration example is presented with each task to show the network configuration following completion of that task.
Configure Global Parameters

Perform these steps to configure selected global parameters for your router:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>configure terminal</strong></td>
</tr>
<tr>
<td></td>
<td>Enters global configuration mode, when using the console port.</td>
</tr>
<tr>
<td></td>
<td>If you are connecting to the router using a remote terminal, use the</td>
</tr>
<tr>
<td></td>
<td>following:</td>
</tr>
<tr>
<td></td>
<td><code>telnet router name or address</code></td>
</tr>
<tr>
<td></td>
<td>Login: <code>login id</code></td>
</tr>
<tr>
<td></td>
<td>Password: <code>*******</code></td>
</tr>
<tr>
<td></td>
<td><code>Router&gt; enable</code></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>Router&gt; enable</code></td>
</tr>
<tr>
<td></td>
<td><code>Router# configure terminal</code></td>
</tr>
<tr>
<td></td>
<td><code>Router(config)#</code></td>
</tr>
<tr>
<td></td>
<td><code>Example:</code></td>
</tr>
<tr>
<td></td>
<td><code>Router(config)#</code></td>
</tr>
<tr>
<td></td>
<td><code>hostname name</code></td>
</tr>
<tr>
<td></td>
<td>Specifies the name for the router.</td>
</tr>
<tr>
<td></td>
<td><code>Example:</code></td>
</tr>
<tr>
<td></td>
<td><code>Router(config)#</code></td>
</tr>
<tr>
<td></td>
<td><code>hostname Router</code></td>
</tr>
<tr>

For complete information on the global parameter commands, see the Cisco IOS Release 12.3 documentation set.

Configure Fast Ethernet LAN Interfaces

The Fast Ethernet LAN interfaces on your router are automatically configured as part of the default VLAN and as such, they are not configured with individual addresses. Access is afforded through the VLAN. You may assign the interfaces to other VLANs if desired. For more information about creating VLANs, see Chapter 5, “Configuring a LAN with DHCP and VLANs.”

Configure WAN Interfaces

The Cisco Secure Router 520 Ethernet-to-Ethernet routers have one Fast Ethernet interface for WAN connection. The Cisco Secure Router 520 ADSL-over-POTS and Cisco Secure Router 520 ADSL-over-ISDN routers have one ATM interface for WAN connection.
Configure Basic Parameters

Based on the router you have, configure the WAN interface(s) by using one of the following procedures:

- Configure the Fast Ethernet WAN Interface
- Configure the ATM WAN Interface

Configure the Fast Ethernet WAN Interface

This procedure applies only to the Cisco Secure Router 520 Ethernet-to-Ethernet routers. Perform these steps to configure the Fast Ethernet interface, beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>interface type number</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Enters the configuration mode for a Fast Ethernet WAN interface on the router.</td>
</tr>
<tr>
<td>Router(config)# interface fastethernet 4</td>
<td></td>
</tr>
<tr>
<td>Router(config-if)#</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>ip address ip-address mask</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Sets the IP address and subnet mask for the specified Fast Ethernet interface.</td>
</tr>
<tr>
<td>Router(config-if)# ip address 192.1.12.2 255.255.255.0</td>
<td></td>
</tr>
<tr>
<td>Router(config-if)#</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>no shutdown</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Enables the Ethernet interface, changing its state from administratively down to administratively up.</td>
</tr>
<tr>
<td>Router(config-if)# no shutdown</td>
<td></td>
</tr>
<tr>
<td>Router(config-if)#</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><strong>exit</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Exits configuration mode for the Fast Ethernet interface and returns to global configuration mode.</td>
</tr>
<tr>
<td>Router(config-if)# exit</td>
<td></td>
</tr>
<tr>
<td>Router(config)#</td>
<td></td>
</tr>
</tbody>
</table>

Configure the ATM WAN Interface

This procedure applies only to the Cisco Secure Router 520 ADSL-over-POTS and Cisco Secure Router 520 ADSL-over-ISDN routers.
Perform these steps to configure the ATM interface, beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>interface type number</strong></td>
</tr>
<tr>
<td>Example:</td>
<td>Router(config)# interface atm0</td>
</tr>
<tr>
<td></td>
<td>Router(config-if)#</td>
</tr>
<tr>
<td></td>
<td>Identifies and enters the configuration mode for an ATM interface.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>ip address ip-address mask</strong></td>
</tr>
<tr>
<td>Example:</td>
<td>Router(config-if)# ip address 200.200.100.1 255.255.255.0</td>
</tr>
<tr>
<td></td>
<td>Router(config-if)#</td>
</tr>
<tr>
<td></td>
<td>Sets the IP address and subnet mask for the ATM interface.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>no shutdown</strong></td>
</tr>
<tr>
<td>Example:</td>
<td>Router(config-if)# no shutdown</td>
</tr>
<tr>
<td></td>
<td>Router(config-if)#</td>
</tr>
<tr>
<td></td>
<td>Enables the ATM 0 interface.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><strong>exit</strong></td>
</tr>
<tr>
<td>Example:</td>
<td>Router(config-if)# exit</td>
</tr>
<tr>
<td></td>
<td>Router(config)#</td>
</tr>
<tr>
<td></td>
<td>Exits configuration mode for the ATM interface and returns to global configuration mode.</td>
</tr>
</tbody>
</table>

**Configure the Wireless Interface**

The wireless interface enables connection to the router through a wireless LAN connection. For more information about configuring a wireless connection, see Chapter 9, “Configuring a Wireless LAN Connection,” and the *Cisco Access Router Wireless Configuration Guide*.

**Configuring a Loopback Interface**

The loopback interface acts as a placeholder for the static IP address and provides default routing information.

For complete information on the loopback commands, see the Cisco IOS Release 12.3 documentation set.
Perform these steps to configure a loopback interface, beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> interface type number</td>
<td>Enters configuration mode for the loopback interface.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config)# interface Loopback 0</td>
<td></td>
</tr>
<tr>
<td>Router(config-if)#</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> ip address ip-address mask</td>
<td>Sets the IP address and subnet mask for the loopback interface.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config-if)# ip address 10.108.1.1 255.255.255.0</td>
<td></td>
</tr>
<tr>
<td>Router(config-if)#</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> exit</td>
<td>Exits configuration mode for the loopback interface and returns to global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config-if)# exit</td>
<td></td>
</tr>
<tr>
<td>Router(config)#</td>
<td></td>
</tr>
</tbody>
</table>

### Configuration Example

The loopback interface in this sample configuration is used to support Network Address Translation (NAT) on the virtual-template interface. This configuration example shows the loopback interface configured on the Fast Ethernet interface with an IP address of 200.200.100.1/24, which acts as a static IP address. The loopback interface points back to virtual-template1, which has a negotiated IP address.

```<example code here>```

### Verifying Your Configuration

To verify that you have properly configured the loopback interface, enter the `show interface loopback` command. You should see verification output similar to the following example.

```<example output here>```
Chapter 1      Basic Router Configuration

Configuring Basic Parameters

Last clearing of "show interface" counters never
Queueing strategy: fifo
Output queue 0/0, 0 drops; input queue 0/75, 0 drops
5 minute input rate 0 bits/sec, 0 packets/sec
5 minute output rate 0 bits/sec, 0 packets/sec
 0 packets input, 0 bytes, 0 no buffer
  Received 0 broadcasts, 0 runts, 0 giants, 0 throttles
  0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored, 0 abort
  0 packets output, 0 bytes, 0 underruns
  0 output errors, 0 collisions, 0 interface resets
  0 output buffer failures, 0 output buffers swapped out

Another way to verify the loopback interface is to ping it:
Router# ping 200.200.100.1
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 200.200.100.1, timeout is 2 seconds:
!!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/2/4 ms

Configuring Command-Line Access to the Router

Perform these steps to configure parameters to control access to the router, beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td>line [aux</td>
<td>console</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><strong>Example:</strong></td>
</tr>
<tr>
<td>Router(config)# line console 0</td>
<td>Router(config-line)#</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td>password password</td>
<td>Specifies a unique password for the console terminal line.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><strong>Example:</strong></td>
</tr>
<tr>
<td>Router(config-line)# password 5dr4Hepw3</td>
<td>Router(config-line)#</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td>login</td>
<td>Enables password checking at terminal session login.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><strong>Example:</strong></td>
</tr>
<tr>
<td>Router(config-line)# login</td>
<td>Router(config-line)#</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td>exec-timeout minutes [seconds]</td>
<td>Sets the interval that the EXEC command interpreter waits until user input is detected. The default is 10 minutes. Optionally, add seconds to the interval value. This example shows a timeout of 5 minutes and 30 seconds. Entering a timeout of 0 0 specifies never to time out.</td>
</tr>
</tbody>
</table>
### Command Purpose

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>exit</td>
<td>Exits line configuration mode, and returns to global configuration mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router(config-line)# exit</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router (config)#</td>
<td></td>
</tr>
<tr>
<td>6</td>
<td>line [aux</td>
<td>console</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router(config)# line vty 0 4</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router(config-line)#</td>
<td></td>
</tr>
<tr>
<td>7</td>
<td>password password</td>
<td>Specifies a unique password for the virtual terminal line.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router(config-line)# password aldf2ad1</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router(config-line)#</td>
<td></td>
</tr>
<tr>
<td>8</td>
<td>login</td>
<td>Enables password checking at the virtual terminal session login.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router(config-line)# login</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router(config-line)#</td>
<td></td>
</tr>
<tr>
<td>9</td>
<td>end</td>
<td>Exits line configuration mode, and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router(config-line)# end</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router#</td>
<td></td>
</tr>
</tbody>
</table>

For complete information about the command line commands, see the Cisco IOS Release 12.3 documentation set.

### Configuration Example

The following configuration shows the command-line access commands. You do not need to input the commands marked “default.” These commands appear automatically in the configuration file generated when you use the `show running-config` command.

```
!
line con 0
exec-timeout 10 0
password 4youreyesonly
login
transport input none (default)
stopbits 1 (default)
line vty 0 4
password secret
login
!
```
Configuring Static Routes

Static routes provide fixed routing paths through the network. They are manually configured on the router. If the network topology changes, the static route must be updated with a new route. Static routes are private routes unless they are redistributed by a routing protocol. Configuring static routes on the Cisco Secure Router 520 Series router is optional.

Perform these steps to configure static routes, beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>ip route prefix mask {ip-address</td>
</tr>
<tr>
<td>Example:</td>
<td>Specifies the static route for the IP packets. For details about this command and additional parameters that can be set, see the Cisco IOS IP Command Reference, Volume 2 of 4: Routing Protocols.</td>
</tr>
<tr>
<td>Router(config)# ip route 192.168.0.0 255.255.0.0 10.10.10.2</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 2</th>
<th>end</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Exits router configuration mode, and enters privileged EXEC mode.</td>
</tr>
<tr>
<td>Router(config)# end</td>
<td></td>
</tr>
</tbody>
</table>

For complete information on the static routing commands, see the Cisco IOS Release 12.3 documentation set. For more general information on static routing, see Appendix B, “Concepts.”

Configuration Example

In the following configuration example, the static route sends out all IP packets with a destination IP address of 192.168.1.0 and a subnet mask of 255.255.255.0 on the Fast Ethernet interface to another device with an IP address of 10.10.10.2. Specifically, the packets are sent to the configured PVC.

You do not need to enter the commands marked “(default).” These commands appear automatically in the configuration file generated when you use the show running-config command.

```
! ip classless (default)
ip route 192.168.1.0 255.255.255.0 10.10.10.2
!```

Verifying Your Configuration

To verify that you have properly configured static routing, enter the show ip route command and look for static routes signified by the “S.”

You should see verification output similar to the following example.

```
Router# show ip route
Codes: C - connected, S - static, R - RIP, M - mobile, B - BGP
       D - EIGRP, EX - EIGRP external,
       i - IS-IS, su - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2
```

Verifying Your Configuration
Configuring Dynamic Routes

In dynamic routing, the network protocol adjusts the path automatically, based on network traffic or topology. Changes in dynamic routes are shared with other routers in the network.

The Cisco routers can use IP routing protocols, such as Routing Information Protocol (RIP), to learn routes dynamically. You can configure either of these routing protocols on your router.

Configuring RIP

Perform these steps to configure the RIP routing protocol on the router, beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Task</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>router rip</td>
<td>Enters router configuration mode, and enables RIP on the router.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router(config)# router rip</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router(config-router)#</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>version {1</td>
<td>2}</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router(config-router)# version 2</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router(config-router)#</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>network ip-address</td>
<td>Specifies a list of networks on which RIP is to be applied, using the address of the network of directly connected networks.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router(config-router)# network 192.168.1.1</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router(config-router)# network 10.10.7.1</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router(config-router)#</td>
<td></td>
</tr>
</tbody>
</table>
Chapter 1      Basic Router Configuration

Configuring Dynamic Routes

For complete information on the dynamic routing commands, see the Cisco IOS Release 12.3 documentation set. For more general information on RIP, see Appendix B, “Concepts.”

Configuration Example

The following configuration example shows RIP version 2 enabled in IP network 10.0.0.0 and 192.168.1.0.

Execute the `show running-config` command from privileged EXEC mode to see this configuration.

```
Step 4
no auto-summary

Example:
Router(config-router)# no auto-summary
Router(config-router)#
```

Disables automatic summarization of subnet routes into network-level routes. This allows subprefix routing information to pass across classful network boundaries.

```
Step 5
disable

Example:
Router(config-router)# disable
Router
```

Exits router configuration mode, and enters privileged EXEC mode.

Verifying Your Configuration

To verify that you have properly configured RIP, enter the `show ip route` command and look for RIP routes signified by “R.” You should see verification output like the example shown below.

```
Verifying Your Configuration

Example:
Router# show ip route
Codes: C - connected, S - static, R - RIP, M - mobile, B - BGP
D - EIGRP, EX - EIGRP external,
I - IS-IS, Su - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2
ia - IS-IS inter area, * - candidate default, U - per-user static route
O - ODR, P - periodic downloaded static route

Gateway of last resort is not set

10.0.0.0/24 is subnetted, 1 subnets
C 10.108.1.0 is directly connected, Loopback0
R 3.0.0.0/24 [120/1] via 2.2.2.1, 00:00:02, Ethernet0/0
```

For complete information on the dynamic routing commands, see the Cisco IOS Release 12.3 documentation set. For more general information on RIP, see Appendix B, “Concepts.”
PART 2

Configuring Your Router for Ethernet and DSL Access
Sample Network Deployments

This part of the software configuration guide presents a variety of possible Ethernet and Digital Subscriber Line (DSL)—based network configurations using the Cisco Secure Router 520 Series router. Each scenario is described with a network topology, a step-by-step procedure that is used to implement the network configuration, and a configuration example that shows the results of the configuration. The Cisco Secure Router 520 Ethernet-to-Ethernet routers can be used in the Ethernet-based scenarios and the Cisco Secure Router 520 ADSL-over-POTS and Cisco Secure Router 520 ADSL-over-ISDN routers can be used in the DSL-based scenarios.

The first network scenario provides a simple network configuration: point-to-point protocol (PPP) over the WAN interface with Network Address Translation (NAT). Each successive scenario builds on the previous scenario by configuring another key feature.

The scenarios do not address all of the possible network needs; instead, they provide models on which you can pattern your network. You can choose not to use features presented in the examples, or you can add or substitute features that better suit your needs.

To verify that a specific feature is compatible with your router, you can use the Software Advisor tool. You can access this tool at www.cisco.com > Technical Support & Documentation > Tools & Resources with your Cisco username and password.

For Ethernet-Based Network Deployments
Use the following configuration examples to assist you in configuring your router for Ethernet-based networks.

- Chapter 3, “Configuring PPP over Ethernet with NAT”
- Chapter 5, “Configuring a LAN with DHCP and VLANs”
- Chapter 6, “Configuring a VPN Using Easy VPN and an IPsec Tunnel”
- Chapter 7, “Configuring VPNs Using an IPsec Tunnel and Generic Routing Encapsulation”
- Chapter 8, “Configuring a Simple Firewall”

For DSL-Based Network Deployments
Use the following configuration examples to assist you in configuring your router for DSL-based networks.

- Chapter 4, “Configuring PPP over ATM with NAT”
- Chapter 5, “Configuring a LAN with DHCP and VLANs”
- Chapter 6, “Configuring a VPN Using Easy VPN and an IPsec Tunnel”
• Chapter 7, “Configuring VPNs Using an IPsec Tunnel and Generic Routing Encapsulation”
• Chapter 8, “Configuring a Simple Firewall”
Configuring PPP over Ethernet with NAT

The Cisco Secure Router 520 Ethernet-to-Ethernet routers support Point-to-Point Protocol over Ethernet (PPPoE) clients and network address translation (NAT).

Multiple PCs can be connected to the LAN behind the router. Before the traffic from these PCs is sent to the PPPoE session, it can be encrypted, filtered, and so forth. Figure 3-1 shows a typical deployment scenario with a PPPoE client and NAT configured on the Cisco router.

**Figure 3-1** PPP over Ethernet with NAT

1. Multiple networked devices—Desktops, laptop PCs, switches
2. Fast Ethernet LAN interface (inside interface for NAT)
3. PPPoE client—Cisco Secure Router 520 Ethernet-to-Ethernet router
4. Point at which NAT occurs
5. Fast Ethernet WAN interface (outside interface for NAT)
6. Cable modem or other server (for example, a Cisco 6400 server) that is connected to the Internet
7. PPPoE session between the client and a PPPoE server
PPPoe

The PPPoE Client feature on the router provides PPPoE client support on Ethernet interfaces. A dialer interface must be used for cloning virtual access. Multiple PPPoE client sessions can be configured on an Ethernet interface, but each session must use a separate dialer interface and a separate dialer pool.

A PPPoE session is initiated on the client side by the Cisco Secure Router 520 Ethernet-to-Ethernet routers. An established PPPoE client session can be terminated in one of two ways:

- By entering the `clear vpdn tunnel pppoe` command. The PPPoE client session terminates, and the PPPoE client immediately tries to reestablish the session. This also occurs if the session has a timeout.
- By entering the `no pppoe-client dial-pool number` command to clear the session. The PPPoE client does not attempt to reestablish the session.

NAT

NAT (represented as the dashed line at the edge of the Cisco router) signifies two addressing domains and the inside source address. The source list defines how the packet travels through the network.

Configuration Tasks

Perform the following tasks to configure this network scenario:

- Configure the Virtual Private Dialup Network Group Number
- Configure the Fast Ethernet WAN Interfaces
- Configure the Dialer Interface
- Configure Network Address Translation

An example showing the results of these configuration tasks is shown in the “Configuration Example” section on page 3-8.

Configure the Virtual Private Dialup Network Group Number

Configuring a virtual private dialup network (VPDN) enables multiple clients to communicate through the router by way of a single IP address.

Complete the following steps to configure a VPDN, starting from the global configuration mode. See the “Configure Global Parameters” section on page 1-4 for details about entering this mode.

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>vpdn enable</td>
<td>Enables VPDN on the router.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router(config)# vpdn enable</td>
<td></td>
</tr>
<tr>
<td>Router(config)#</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>vpdn-group name</td>
<td>Creates and associates a VPDN group with a customer or VPDN profile.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router(config)# vpdn-group 1</td>
<td></td>
</tr>
<tr>
<td>Router(config-vpdn)#</td>
<td></td>
</tr>
</tbody>
</table>
Chapter 3 Configuring PPP over Ethernet with NAT

Configure the Fast Ethernet WAN Interfaces

In this scenario, the PPPoE client (your Cisco router) communicates over a 10/100 Mbps-Ethernet interface on both the inside and the outside.

Perform these steps to configure the Fast Ethernet WAN interfaces, starting in global configuration mode:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 3</strong> request-dialin</td>
<td>Creates a request-dialin VPDN subgroup, indicating the dialing direction, and initiates the tunnel.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config-vpdn)# request-dialin Router(config-vpdn-req-in)#</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 4** protocol {l2tp | pppoe} | Specifies the type of sessions the VPDN subgroup can establish. |
| **Example:** Router(config-vpdn-req-in)# protocol pppoe Router(config-vpdn-req-in)# |

| **Step 5** exit | Exits request-dialin VPDN group configuration. |
| **Example:** Router(config-vpdn-req-in)# exit Router(config-vpdn)# |

| **Step 6** exit | Exits VPDN configuration, returning to global configuration mode. |
| **Example:** Router(config-vpdn)# exit Router(config)# |

---

Configure the Fast Ethernet WAN Interfaces

In this scenario, the PPPoE client (your Cisco router) communicates over a 10/100 Mbps-Ethernet interface on both the inside and the outside.

Perform these steps to configure the Fast Ethernet WAN interfaces, starting in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> interface type number</td>
<td>Enters interface configuration mode for a Fast Ethernet WAN interface.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config)# interface fastethernet 4 Router(config-if)#</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2** pppoe-client dial-pool-number number | Configures the PPPoE client and specifies the dialer interface to use for cloning. |
| **Example:** Router(config-if)# pppoe-client dial-pool-number 1 Router(config-if)# |
Configure the Dialer Interface

The dialer interface indicates how to handle traffic from the clients, including, for example, default routing information, the encapsulation protocol, and the dialer pool to use. The dialer interface is also used for cloning virtual access. Multiple PPPoE client sessions can be configured on a Fast Ethernet interface, but each session must use a separate dialer interface and a separate dialer pool.

Complete the following steps to configure a dialer interface for one of the Fast Ethernet LAN interfaces on the router, starting in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>interface dialer dialer-rotary-group-number</strong></td>
</tr>
</tbody>
</table>
| **Example:** | | Router(config)# interface dialer 0  
Router(config-if)# |
| **Step 2** | **ip address negotiated** | Specifies that the IP address for the interface is obtained through PPP/IPCP (IP Control Protocol) address negotiation. |
| **Example:** | | Router(config-if)# ip address negotiated  
Router(config-if)# |
| **Step 3** | **ip mtu bytes** | Sets the size of the IP maximum transmission unit (MTU). The default minimum is 128 bytes. The maximum for Ethernet is 1492 bytes. |
| **Example:** | | Router(config-if)# ip mtu 1492  
Router(config-if)# |
| **Step 4** | **encapsulation encapsulation-type** | Sets the encapsulation type to PPP for the data packets being transmitted and received. |
| **Example:** | | Router(config-if)# encapsulation ppp  
Router(config-if)# |
Configure Network Address Translation

Network Address Translation (NAT) translates packets from addresses that match a standard access list, using global addresses allocated by the dialer interface. Packets that enter the router through the inside interface, packets sourced from the router, or both are checked against the access list for possible address translation. You can configure NAT for either static or dynamic address translations.
Perform these steps to configure the outside Fast Ethernet WAN interface with dynamic NAT, beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>`ip nat pool name start-ip end-ip [netmask netmask</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>`ip nat inside source [list access-list-number] [interface type number</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>interface type number</code>&lt;br&gt;Example: <code>&lt;br&gt;Router(config)# interface vlan 1&lt;br&gt;Router(config-if)#</code>&lt;br&gt;Enters configuration mode for the VLAN (on which the Fast Ethernet LAN interfaces [FE0–FE3] reside) to be the inside interface for NAT.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>`ip nat [inside</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><code>no shutdown</code>&lt;br&gt;Example: <code>&lt;br&gt;Router(config-if)# no shutdown&lt;br&gt;Router(config-if)#</code>&lt;br&gt;Enables the configuration changes just made to the Ethernet interface.</td>
</tr>
</tbody>
</table>
### Step 6
**Command:**
```
exit
```
**Example:**
```
Router(config-if)# exit
Router(config)#
```
**Purpose:**
Exits configuration mode for the Fast Ethernet interface.

### Step 7
**Command:**
```
interface type number
```
**Example:**
```
Router(config)# interface fastethernet 4
Router(config-if)#
```
**Purpose:**
Enters configuration mode for the Fast Ethernet WAN interface (FE4) to be the outside interface for NAT.

### Step 8
**Command:**
```
ip nat {inside | outside}
```
**Example:**
```
Router(config-if)# ip nat outside
Router(config-if)#
```
**Purpose:**
Identifies the specified WAN interface as the NAT outside interface.
For details about this command and additional parameters that can be set, as well as information about enabling static translation, see the Cisco IOS IP Command Reference, Volume 1 of 4: Addressing and Services.

### Step 9
**Command:**
```
no shutdown
```
**Example:**
```
Router(config-if)# no shutdown
Router(config-if)#
```
**Purpose:**
Enables the configuration changes just made to the Ethernet interface.

### Step 10
**Command:**
```
exit
```
**Example:**
```
Router(config-if)# exit
Router(config)#
```
**Purpose:**
Exits configuration mode for the Fast Ethernet interface.

### Step 11
**Command:**
```
access-list access-list-number {deny | permit} source [source-wildcard]
```
**Example:**
```
Router(config)# access-list 1 permit 192.168.1.0 0.0.0.255
```
**Purpose:**
Defines a standard access list indicating which addresses need translation.
**Note**
All other addresses are implicitly denied.

---

**Note**
If you want to use NAT with a virtual-template interface, you must configure a loopback interface. See Chapter 1, “Basic Router Configuration,” for information on configuring a loopback interface.

For complete information on the NAT commands, see the Cisco IOS Release 12.3 documentation set. For more general information on NAT concepts, see Appendix B, “Concepts.”
Configuration Example

The following configuration example shows a portion of the configuration file for the PPPoE scenario described in this chapter.

The VLAN interface has an IP address of 192.168.1.1 with a subnet mask of 255.255.255.0. NAT is configured for inside and outside.

**Note**
Since the VLAN interface is on LAN, we have used a private IP address.

**Note**
Commands marked by “(default)” are generated automatically when you run the `show running-config` command.

```
!
vpdn enable
vpdn-group 1
request-dialin
protocol pppoe
!
interface vlan 1
ip address 192.168.1.1 255.255.255.0
no ip directed-broadcast (default)
ip nat inside
!
interface FastEthernet 4
ip address 192.1.12.2 255.255.255.0
no ip directed-broadcast (default)
ip nat outside
!
interface dialer 1
ip address negotiated
ppp authentication chap
dialer pool 1
dialer-group 1
!
dialer-list 1 protocol ip permit
ip nat inside source list 1 interface dialer 0 overload
ip classless (default)
ip route 10.10.25.2 0.255.255.255 dialer 0
!
```

Verifying Your Configuration

Use the `show ip nat statistics` command in privileged EXEC mode to verify the PPPoE with NAT configuration. You should see verification output similar to the following example:

```
Router# show ip nat statistics
Total active translations: 0 (0 static, 0 dynamic; 0 extended)
Outside interfaces:
    FastEthernet4
Inside interfaces:
    Vlan1
    Hits: 0  Misses: 0
    CEF Translated packets: 0, CEF Punted packets: 0
    Expired translations: 0
```
Dynamic mappings:
-- Inside Source
[Id: 1] access-list 1 interface Dialer0 refcount 0
Queued Packets: 0
Configuring PPP over ATM with NAT

The Cisco Secure Router 520 ADSL-over-POTS and Cisco Secure Router 520 ADSL-over-ISDN routers support Point-to-Point Protocol over Asynchronous Transfer Mode (PPPoA) clients and network address translation (NAT).

Multiple PCs can be connected to the LAN behind the router. Before traffic from the PCs is sent to the PPPoA session, it can be encrypted, filtered, and so forth. PPP over ATM provides a network solution with simplified address handling and straight user verification, as with a dial network. Figure 4-1 shows a typical deployment scenario with a PPPoA client and NAT configured on the Cisco router. This scenario uses a single static IP address for the ATM connection.

Figure 4-1  PPP over ATM with NAT

1 Small business with multiple networked devices—desktops, laptop PCs, switches
2 Fast Ethernet LAN interface (inside interface for NAT, 192.168.1.1/24)
3 PPPoA Client—Cisco Secure Router 520 ADSL-over-POTS or Cisco Secure Router 520 ADSL-over-ISDN router
4 Point at which NAT occurs
5 ATM WAN interface (outside interface for NAT)
6 PPPoA session between the client and a PPPoA server at the ISP
In this scenario, the small business or remote user on the Fast Ethernet LAN can connect to an Internet service provider (ISP) using the following protocols on the WAN connection:

- Asymmetric digital subscriber line (ADSL) over plain old telephone service (POTS) using the Cisco Secure Router 520 ADSL-over-POTS routers
- ADSL over integrated services digital network (ISDN) using the Cisco Secure Router 520 ADSL-over-ISDN routers

The Fast Ethernet interface carries the data packet through the LAN and off-loads it to the PPP connection on the ATM interface. The ATM traffic is encapsulated and sent over the ADSL or ISDN lines. The dialer interface is used to connect to the ISP.

**PPPoA**

The PPPoA Client feature on the router provides PPPoA client support on ATM interfaces. A dialer interface must be used for cloning virtual access. Multiple PPPoA client sessions can be configured on an ATM interface, but each session must use a separate dialer interface and a separate dialer pool.

A PPPoA session is initiated on the client side by the Cisco Secure Router 520 Series router.

**NAT**

NAT (represented as the dashed line at the edge of the Cisco router) signifies two addressing domains and the inside source address. The source list defines how the packet travels through the network.

**Configuration Tasks**

Perform the following tasks to configure this network scenario:

- Configure the Dialer Interface
- Configure the ATM WAN Interface
- Configure DSL Signaling Protocol
- Configure Network Address Translation

An example showing the results of these configuration tasks is shown in the “Configuration Example” section on page 4-9.

**Configure the Dialer Interface**

The dialer interface indicates how to handle traffic from the clients, including, for example, default routing information, the encapsulation protocol, and the dialer pool to use. It is also used for cloning virtual access. Multiple PPPoA client sessions can be configured on an ATM interface, but each session must use a separate dialer interface and a separate dialer pool.
Perform these steps to configure a dialer interface for the ATM interface on the router, starting in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>interface dialer dialer-rotary-group-number</strong>&lt;br&gt;Example:&lt;br&gt;Router(config)# interface dialer 0&lt;br&gt;Router(config-if)#</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>ip address negotiated</strong>&lt;br&gt;Example:&lt;br&gt;Router(config-if)# ip address negotiated&lt;br&gt;Router(config-if)#</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>ip mtu bytes</strong>&lt;br&gt;Example:&lt;br&gt;Router(config-if)# ip mtu 1492&lt;br&gt;Router(config-if)#</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><strong>encapsulation encapsulation-type</strong>&lt;br&gt;Example:&lt;br&gt;Router(config-if)# encapsulation ppp&lt;br&gt;Router(config-if)#</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><strong>ppp authentication {protocol1 [protocol2...]}</strong>&lt;br&gt;Example:&lt;br&gt;Router(config-if)# ppp authentication chap&lt;br&gt;Router(config-if)#</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td><strong>dialer pool number</strong>&lt;br&gt;Example:&lt;br&gt;Router(config-if)# dialer pool 1&lt;br&gt;Router(config-if)#</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td><strong>dialer-group group-number</strong>&lt;br&gt;Example:&lt;br&gt;Router(config-if)# dialer-group 1&lt;br&gt;Router(config-if)#</td>
</tr>
</tbody>
</table>
# Configure the Dialer Interface

## Chapter 4  Configuring PPP over ATM with NAT

### Command Purpose

<table>
<thead>
<tr>
<th>Step 8</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 8</strong></td>
<td><strong>exit</strong></td>
<td>Exits the dialer 0 interface configuration.</td>
</tr>
</tbody>
</table>

**Example:**

```plaintext
Router(config-if)# exit
Router(config)#
```

<table>
<thead>
<tr>
<th>Step 9</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 9</strong></td>
<td><strong>dialer-list</strong> <em>dialer-group</em> <em>protocol</em> <em>protocol-name</em> {permit</td>
<td>deny</td>
</tr>
</tbody>
</table>

**Example:**

```plaintext
Router(config)# dialer-list 1 protocol ip permit
Router(config)#
```

<table>
<thead>
<tr>
<th>Step 10</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 10</strong></td>
<td><strong>ip route</strong> <em>prefix</em> <em>mask</em> {interface-type interface-number}</td>
<td>Sets the IP route for the default gateway for the dialer 0 interface. For details about this command and additional parameters that can be set, see the <em>Cisco IOS IP Command Reference, Volume 1 of 4: Routing Protocols</em>.</td>
</tr>
</tbody>
</table>

**Example:**

```plaintext
Router(config)# ip route 10.10.25.0 255.255.255.0 dialer 0
Router(config)#
```

Repeat these steps for any additional dialer interfaces or dialer pools needed.
Configure the ATM WAN Interface

Perform these steps to configure the ATM interface, beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>Command</strong></td>
</tr>
<tr>
<td></td>
<td>interface type number</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
</tr>
<tr>
<td></td>
<td>Router(config)# interface atm 0</td>
</tr>
<tr>
<td></td>
<td>Router(config-if)#</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>This interface was initially configured during basic router configuration. See the “Configure WAN Interfaces” section on page 1-4.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>Command</strong></td>
</tr>
<tr>
<td></td>
<td>pvc vpi/vci</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
</tr>
<tr>
<td></td>
<td>Router(config-if)# pvc 8/35</td>
</tr>
<tr>
<td></td>
<td>Router(config-if-atm-vc)#</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>When a PVC is defined, AAL5SNAP encapsulation is defined by default. Use the encapsulation command to change this, as shown in Step 3. The VPI and VCI arguments cannot be simultaneously specified as zero; if one is 0, the other cannot be 0.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>For details about this command and additional parameters that can be set, see the Cisco IOS Wide-Area Networking Command Reference.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>Command</strong></td>
</tr>
<tr>
<td></td>
<td>encapsulation {aal5auto</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
</tr>
<tr>
<td></td>
<td>Router(config-if-atm-vc)# encapsulation aal5mux ppp dialer</td>
</tr>
<tr>
<td></td>
<td>Router(config-if-atm-vc)#</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>For details about this command and additional parameters that can be set, see the Cisco IOS Wide-Area Networking Command Reference.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><strong>Command</strong></td>
</tr>
<tr>
<td></td>
<td>dialer pool-member number</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
</tr>
<tr>
<td></td>
<td>Router(config-if-atm-vc)# dialer pool-member 1</td>
</tr>
<tr>
<td></td>
<td>Router(config-if-atm-vc)#</td>
</tr>
</tbody>
</table>
Configure DSL Signaling Protocol

DSL signaling must be configured on the ATM interface for connection to your ISP. The Cisco Secure Router 520 ADSL-over-POTS routers support ADSL signaling over POTS and the Cisco Secure Router 520 ADSL-over-ISDN routers support ADSL signaling over ISDN. To configure the DSL signaling protocol, see the “Configuring ADSL” section on page 4-6.

Configuring ADSL

The default configuration for ADSL signaling is shown in Table 4-1.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
<th>Default Value</th>
</tr>
</thead>
</table>
| Operating mode | Specifies the operating mode of the digital subscriber line (DSL) for an ATM interface.  
|                | • ADSL over POTS—ANSI or ITU full rate, or automatic selection.  
|                | • ADSL over ISDN—ITU full rate, ETSI, or automatic selection.             | Auto          |
| Loss of margin | Specifies the number of times a loss of margin may occur.                  | —             |
| Training log   | Toggles between enabling the training log and disabling the training log.   | Disabled      |

If you wish to change any of these settings, use one of the following commands in global configuration mode:

- dsl operating-mode (from the ATM interface configuration mode)
- dsl lom integer
- dsl enable-training-log

See the Cisco IOS Wide-Area Networking Command Reference for details of these commands.
### Verify the Configuration

You can verify that the configuration is set the way you want by using the `show dsl interface atm` command from privileged EXEC mode.

### Configure Network Address Translation

Network Address Translation (NAT) translates packets from addresses that match a standard access list, using global addresses allocated by the dialer interface. Packets that enter the router through the inside interface, packets sourced from the router, or both are checked against the access list for possible address translation. You can configure NAT for either static or dynamic address translations.

Perform these steps to configure the outside ATM WAN interface with dynamic NAT, beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>**ip nat pool name start-ip end-ip {netmask netmask</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>ip nat inside source {list access-list-number}</strong>&lt;br&gt;{interface type number</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>interface type number</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Router(config)# <code>interface vlan 1</code>&lt;br&gt;Router(config-if)#</td>
</tr>
</tbody>
</table>
### Configure Network Address Translation

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>`ip nat {inside</td>
<td>outside}`</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Router(config-if)# ip nat inside</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Router(config-if)#</code></td>
<td></td>
</tr>
<tr>
<td>5</td>
<td><code>no shutdown</code></td>
<td>Enables the configuration changes just made to the Ethernet interface.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Router(config-if)# no shutdown</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Router(config-if)#</code></td>
<td></td>
</tr>
<tr>
<td>6</td>
<td><code>exit</code></td>
<td>Exits configuration mode for the Fast Ethernet interface.</td>
</tr>
<tr>
<td></td>

</tbody>
</table>
Chapter 4 Configuring PPP over ATM with NAT

Configuration Example

Step 10

Command
exit

Example:
Router(config-if)# exit
Router(config)#

Purpose
Exits configuration mode for the ATM interface.

Step 11

Command
access-list access-list-number {deny | permit} source [source-wildcard]

Example:
Router(config)# access-list 1 permit 192.168.1.0 0.0.0.255

Purpose
Defines a standard access list permitting addresses that need translation.

Note
All other addresses are implicitly denied.

Note
If you want to use NAT with a virtual-template interface, you must configure a loopback interface. See Chapter 1, “Basic Router Configuration,” for information on configuring the loopback interface.

For complete information on NAT commands, see the Cisco IOS Release 12.3 documentation set. For more general information on NAT concepts, see Appendix B, “Concepts.”

Configuration Example

The following configuration example shows a portion of the configuration file for a client in the PPPoA scenario described in this chapter.

The VLAN interface has an IP address of 192.168.1.1 with a subnet mask of 255.255.255.0. NAT is configured for inside and outside.

Note
Commands marked by “(default)” are generated automatically when you run the show running-config command.

```bash
! interface Vlan1
    ip address 192.168.1.1 255.255.255.0
    ip nat inside
    ip virtual-reassembly (default)
! interface ATM0
    no ip address
    ip nat outside
    ip virtual-reassembly
    no atm ilmi-keepalive
    pvc 8/35
    encapsulation aal5mux ppp dialer
dialer pool-member 1
!  dsl operating-mode auto
! interface Dialer0
    ip address negotiated
```
Configuration Example

```
ip mtu 1492
encapsulation ppp
dialer pool 1
  dialer-group 1
  ppp authentication chap
!
ip classless (default)
!
ip nat pool pool1 192.168.1.0 192.168.2.0 netmask 0.0.0.255
ip nat inside source list 1 interface Dialer0 overload
!
access-list 1 permit 192.168.1.0 0.0.0.255
dialer-list 1 protocol ip permit

ip route 10.10.25.2 0.255.255.255 dialer 0
```

Verifying Your Configuration

Use the `show ip nat statistics` command in privileged EXEC mode to verify the PPPoA client with NAT configuration. You should see verification output similar to the following example:

```
Router# show ip nat statistics
Total active translations: 0 (0 static, 0 dynamic; 0 extended)
Outside interfaces:
  ATM0
Inside interfaces:
  Vlan1
Hits: 0  Misses: 0
CEF Translated packets: 0, CEF Punted packets: 0
Expired translations: 0
Dynamic mappings:
  -- Inside Source
    [Id: 1] access-list 1 interface Dialer0 refcount 0
Queued Packets: 0
```
Configuring a LAN with DHCP and VLANs

The Cisco Secure Router 520 Series routers support clients on both physical LANs and virtual LANs (VLANs). The routers can use the Dynamic Host Configuration Protocol (DHCP) to enable automatic assignment of IP configurations for nodes on these networks.

Figure 5-1 shows a typical deployment scenario with two physical LANs connected by the router and two VLANs.

Figure 5-1  Physical and Virtual LANs with DHCP Configured on the Cisco Router

1 Fast Ethernet LAN (with multiple networked devices)
2 Router and DHCP server—Cisco Secure Router 520 Series router—connected to the Internet
3 VLAN 1
4 VLAN 2

DHCP

DHCP, which is described in RFC 2131, uses a client/server router for address allocation. As an administrator, you can configure your Cisco Secure Router 520 Series router to act as a DHCP server, providing IP address assignment and other TCP/IP-oriented configuration information to your workstations. DHCP frees you from having to manually assign an IP address to each client.

When you configure a DHCP server, you must configure the server properties, policies, and DHCP options.
Whenever you change server properties, you must reload the server with the configuration data from the Network Registrar database.

### VLANs
The Cisco Secure Router 520 Series routers support four Fast Ethernet ports on which you can configure VLANs.

VLANs enable networks to be segmented and formed into logical groups of users, regardless of the user’s physical location or LAN connection.

### Configuration Tasks
Perform the following tasks to configure this network scenario:

- Configure DHCP
- Configure VLANs

The procedures in this chapter assume you have already configured basic router features as well as PPPoE or PPPoA with NAT. If you have not performed these configurations tasks, see Chapter 1, “Basic Router Configuration,” Chapter 3, “Configuring PPP over Ethernet with NAT,” and Chapter 4, “Configuring PPP over ATM with NAT” as appropriate for your router.

### Configure DHCP

Perform these steps to configure your router for DHCP operation, beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>ip domain name name</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Router(config)# ip domain name smallbiz.com&lt;br&gt;Router(config)#</td>
</tr>
</tbody>
</table>
| **Step 2** | **ip name-server server-address1**
[server-address2...server-address6]<br>**Example:**<br>Router(config)# ip name-server 192.168.11.12<br>Router(config)# | Specifies the address of one or more Domain Name System (DNS) servers to use for name and address resolution. |
| **Step 3** | **ip dhcp excluded-address low-address**
[high-address]<br>**Example:**<br>Router(config)# ip dhcp excluded-address 192.168.9.0 | Specifies IP addresses that the DHCP server should not assign to DHCP clients. In this example, we are excluding the router address. |
## Configure DHCP

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td><code>ip dhcp pool name</code></td>
<td>Creates a DHCP address pool on the router and enters DHCP pool configuration mode. The <code>name</code> argument can be a string or an integer.</td>

<td><strong>Example:</strong></td>
</tr>
<tr>
<td></td>
<td><code>Router(dhcp-config)# exit</code></td>
<td><code>Router(config)#</code></td>
</tr>
</tbody>
</table>
Configuration Example

The following configuration example shows a portion of the configuration file for the DHCP configuration described in this chapter.

```
ip dhcp excluded-address 192.168.9.0
!
ip dhcp pool dpool1
    import all
    network 10.10.0.0 255.255.255.0
default-router 10.10.10.10
dns-server 192.168.35.2
domain-name cisco.com
!
ip domain name smallbiz.com
ip name-server 192.168.11.12
```

Verify Your DHCP Configuration

Use the following commands to view your DHCP configuration.

- `show ip dhcp import`—Displays the optional parameters imported into the DHCP server database.
- `show ip dhcp pool`—Displays information about the DHCP address pools.
- `show ip dhcp server statistics`—Displays the DHCP server statistics, such as the number of address pools, bindings, and so forth.

```
Router# show ip dhcp import
Address Pool Name: dpool1

Router# show ip dhcp pool
Pool dpool1:
    Utilization mark (high/low) : 100 / 0
    Subnet size (first/next)   : 0 / 0
    Total addresses           : 254
    Leased addresses          : 0
    Pending event             : none
    1 subnet is currently in the pool:

# Configure VLANs

Perform these steps to configure VLANs on your router, beginning in privileged EXEC mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>Command</strong></td>
</tr>
<tr>
<td>vlan database</td>
<td>Enters VLAN configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router# vlan database</td>
<td></td>
</tr>
<tr>
<td>Router(vlan)#</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>Command</strong></td>
</tr>
<tr>
<td>vlan vlan-id [media type] [name vlan-name]</td>
<td>Adds VLANs, with identifiers ranging from 2 to 1001. For details about this command and additional parameters that can be set, see the <em>Cisco IOS Switching Services Command Reference</em>.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(vlan)# vlan 2 media ethernet name VLAN0002</td>
<td></td>
</tr>
<tr>
<td>VLAN 2 added:</td>
<td></td>
</tr>
<tr>
<td>Name: VLAN0002</td>
<td></td>
</tr>
<tr>
<td>Media type: ETHERNET</td>
<td></td>
</tr>
<tr>
<td>Router(vlan)# vlan 3 media ethernet name red-vlan</td>
<td></td>
</tr>
<tr>
<td>VLAN 3 added:</td>
<td></td>
</tr>
<tr>
<td>Name: red-vlan</td>
<td></td>
</tr>
<tr>
<td>Media type: ETHERNET</td>
<td></td>
</tr>
<tr>
<td>Router(vlan)#</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>Command</strong></td>
</tr>
<tr>
<td>exit</td>
<td>Updates the VLAN database, propagates it throughout the administrative domain, and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(vlan)# exit</td>
<td></td>
</tr>
<tr>
<td>Router#</td>
<td></td>
</tr>
</tbody>
</table>
Assign a Switch Port to a VLAN

Perform these steps to assign a switch port to a VLAN, beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>interface switch port id</code></td>
<td>Specifies the switch port that you want to assign to the VLAN.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config)# interface FastEthernet 2</td>
<td>Router(config-if)#</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>switchport access vlan vlan-id</code></td>
<td>Assigns a port to the VLAN.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config-if)# switchport access vlan 2</td>
<td>Router(config-if)#</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td><code>end</code></td>
<td>Exits interface mode and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config-if)# end</td>
<td>Router#</td>
</tr>
</tbody>
</table>

Verify Your VLAN Configuration

Use the following commands to view your VLAN configuration.

- `show`—Entered from VLAN database mode. Displays summary configuration information for all configured VLANs.
- `show vlan-switch`—Entered from privileged EXEC mode. Displays detailed configuration information for all configured VLANs.

```
Router# vlan database
Router(vlan)# show

VLAN ISL Id: 1

The Cisco Secure Router 520 Series routers support the creation of Virtual Private Networks (VPNs). Cisco routers and other broadband devices provide high-performance connections to the Internet, but many applications also require the security of VPN connections which perform a high level of authentication and which encrypt the data between two particular endpoints.

Two types of VPNs are supported—site-to-site and remote access. Site-to-site VPNs are used to connect branch offices to corporate offices, for example. Remote access VPNs are used by remote clients to log in to a corporate network.

The example in this chapter illustrates the configuration of a remote access VPN that uses the Cisco Easy VPN and an IPsec tunnel to configure and secure the connection between the remote client and the corporate network. Figure 6-1 shows a typical deployment scenario.

**Figure 6-1  Remote Access VPN Using IPsec Tunnel**

Cisco Easy VPN

The Cisco Easy VPN client feature eliminates much of the tedious configuration work by implementing the Cisco Unity Client protocol. This protocol allows most VPN parameters, such as internal IP addresses, internal subnet masks, DHCP server addresses, WINS server addresses, and split-tunneling flags, to be defined at a VPN server, such as a Cisco Adaptive Security Appliance (ASA) Series concentrator that is acting as an IPsec server.

An Easy VPN server–enabled device can terminate VPN tunnels initiated by mobile and remote workers who are running Cisco Easy VPN Remote software on PCs. Easy VPN server–enabled devices allow remote routers to act as Easy VPN Remote nodes.

The Cisco Easy VPN client feature can be configured in one of two modes—client mode or network extension mode. Client mode is the default configuration and allows only devices at the client site to access resources at the central site. Resources at the client site are unavailable to the central site.

Network extension mode allows users at the central site (where the Cisco ASA Series concentrator is located) to access network resources on the client site.

After the IPsec server has been configured, a VPN connection can be created with minimal configuration on an IPsec client, such as a supported Cisco Secure Router 520 Series router. When the IPsec client initiates the VPN tunnel connection, the IPsec server pushes the IPsec policies to the IPsec client and creates the corresponding VPN tunnel connection.

---

**Note**

The Cisco Easy VPN client feature supports configuration of only one destination peer. If your application requires creation of multiple VPN tunnels, you must manually configure the IPsec VPN and Network Address Translation/Peer Address Translation (NAT/PAT) parameters on both the client and the server.

---

**Configuration Tasks**

Perform the following tasks to configure your router for this network scenario:

- Configure the IKE Policy
- Configure Group Policy Information
- Apply Mode Configuration to the Crypto Map
- Enable Policy Lookup
- Configure IPsec Transforms and Protocols
- Configure the IPsec Crypto Method and Parameters
- Apply the Crypto Map to the Physical Interface
- Create an Easy VPN Remote Configuration

An example showing the results of these configuration tasks is provided in the “Configuration Example” section on page 6-10.
Configure the IKE Policy

Perform these steps to configure the Internet Key Exchange (IKE) policy, beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> crypto isakmp policy <em>priority</em></td>
<td>Creates an IKE policy that is used during IKE negotiation. The priority is a number from 1 to 10000, with 1 being the highest. Also enters the Internet Security Association Key and Management Protocol (ISAKMP) policy configuration mode.</td>
</tr>
</tbody>
</table>
| Example: 
  Router(config)# crypto isakmp policy 1
  Router(config-isakmp)# | |
| **Step 2** encryption {des | 3des | aes | aes 192 | aes 256} | Specifies the encryption algorithm used in the IKE policy. The example specifies 168-bit data encryption standard (DES). |
| Example: 
  Router(config-isakmp)# encryption 3des
  Router(config-isakmp)# | |
| **Step 3** hash {md5 | sha} | Specifies the hash algorithm used in the IKE policy. The example specifies the Message Digest 5 (MD5) algorithm. The default is Secure Hash standard (SHA-1). |
| Example: 
  Router(config-isakmp)# hash md5
  Router(config-isakmp)# | |
| **Step 4** authentication {rsa-sig | rsa-enclr | pre-share} | Specifies the authentication method used in the IKE policy. The example specifies a pre-shared key. |
| Example: 
  Router(config-isakmp)# authentication pre-share
  Router(config-isakmp)# |
Configure Group Policy Information

Perform these steps to configure the group policy, beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
  crypto isakmp client configuration group (group-name | Creates an IKE policy group containing attributes to be downloaded to the remote client. Also enters the Internet Security Association Key and Management Protocol (ISAKMP) group policy configuration mode.

  | default) |

  Example:
  
  Router(config)# crypto isakmp client configuration group rtr-remote
  
  | **Step 2**
  | key name | Specifies the IKE pre-shared key for the group policy. |

  Example:
  
  Router(config-isakmp-group)# key secret-password

  | **Step 3**
  | dns primary-server | Specifies the primary Domain Name System (DNS) server for the group. |

  Example:
  
  Router(config-isakmp-group)# dns 10.50.10.1

  | Note | You may also want to specify Windows Internet Naming Service (WINS) servers for the group by using the wins command. |
Apply Mode Configuration to the Crypto Map

Perform these steps to apply mode configuration to the crypto map, beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>crypto map map-name isakmp authorization list list-name</td>
<td>Applies mode configuration to the crypto map and enables key lookup (IKE queries) for the group policy from an authentication, authorization, and accounting (AAA) server.</td>
</tr>
<tr>
<td>crypto map tag client configuration address [initiate</td>
<td>respond]</td>
</tr>
</tbody>
</table>

**Step 4**

```
Command or Action: domain name

Example:
Router(config-isakmp-group)# domain company.com
Router(config-isakmp-group)#
```

Specifies group domain membership.

**Step 5**

```
Command or Action: exit

Example:
Router(config-isakmp-group)# exit
Router(config)#
```

Exits IKE group policy configuration mode, and enters global configuration mode.

**Step 6**

```
Command or Action: ip local pool {default | poolname} [low-ip-address [high-ip-address]]

Example:
Router(config)# ip local pool dynpool 30.30.30.20 30.30.30.30
Router(config)#
```

Specifies a local address pool for the group. For details about this command and additional parameters that can be set, see the **Cisco IOS Dial Technologies Command Reference**.
Enable Policy Lookup

Perform these steps to enable policy lookup through AAA, beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>aaa new-model</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>Router(config)# aaa new-model</code></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>**aaa authentication login {default</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>Router(config)# aaa authentication login rtr-remote local</code></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>**aaa authorization {network</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>Router(config)# aaa authorization network rtr-remote local</code></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>**username name {nopassword</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>Router(config)# username Cisco password 0 Cisco</code></td>
</tr>
</tbody>
</table>

Configure IPsec Transforms and Protocols

A transform set represents a certain combination of security protocols and algorithms. During IKE negotiation, the peers agree to use a particular transform set for protecting data flow.

During IKE negotiations, the peers search in multiple transform sets for a transform that is the same at both peers. When such a transform set is found, it is selected and applied to the protected traffic as a part of both peers’ configurations.
Perform these steps to specify the IPsec transform set and protocols, beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>crypto ipsec transform-set transform-set-name [transform2] [transform3] [transform4]</code></td>
<td>Defines a transform set—an acceptable combination of IPsec security protocols and algorithms. See the <em>Cisco IOS Security Command Reference</em> for detail about the valid transforms and combinations.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Router(config)# crypto ipsec transform-set vpn1 esp-3des esp-sha-hmac</code></td>
<td></td>
</tr>
<tr>
<td><code>Router(config-crypto-trans)#</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Specifies global lifetime values used when IPsec security associations are negotiated. See the <em>Cisco IOS Security Command Reference</em> for details.</td>
</tr>
<tr>
<td>`crypto ipsec security-association lifetime [seconds seconds</td>
<td>kilobytes kilobytes]`</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Router(config-crypto-trans)# crypto ipsec security-association lifetime seconds 86400</code></td>
<td></td>
</tr>
<tr>
<td><code>Router(config)#</code></td>
<td></td>
</tr>
</tbody>
</table>

**Note**

With manually established security associations, there is no negotiation with the peer, and both sides must specify the same transform set.

## Configure the IPsec Crypto Method and Parameters

A dynamic crypto map policy processes negotiation requests for new security associations from remote IPsec peers, even if the router does not know all the crypto map parameters (for example, IP address). Perform these steps to configure the IPsec crypto method, beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>crypto dynamic-map dynamic-map-name dynamic-seq-num</code></td>
<td>Creates a dynamic crypto map entry and enters crypto map configuration mode. See the <em>Cisco IOS Security Command Reference</em> for more detail about this command.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Router(config)# crypto dynamic-map dynmap 1</code></td>
<td></td>
</tr>
<tr>
<td><code>Router(config-crypto-map)#</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Specifies which transform sets can be used with the crypto map entry.</td>
</tr>
<tr>
<td><code>set transform-set transform-set-name [transform-set-name2...transform-set-name6]</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Router(config-crypto-map)# set transform-set vpn1</code></td>
<td></td>
</tr>
<tr>
<td><code>Router(config-crypto-map)#</code></td>
<td></td>
</tr>
</tbody>
</table>
Apply the Crypto Map to the Physical Interface

The crypto maps must be applied to each interface through which IP Security (IPsec) traffic flows. Applying the crypto map to the physical interface instructs the router to evaluate all the traffic against the security associations database. With the default configurations, the router provides secure connectivity by encrypting the traffic sent between remote sites. However, the public interface still allows the rest of the traffic to pass and provides connectivity to the Internet.

Perform these steps to apply a crypto map to an interface, beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>interface type number</td>
<td>Enters the interface configuration mode for the interface to which you want the crypto map applied.</td>
</tr>
<tr>
<td>2</td>
<td>reverse-route</td>
<td>Creates source proxy information for the crypto map entry. See the Cisco IOS Security Command Reference for details.</td>
</tr>
<tr>
<td>3</td>
<td>exit</td>
<td>Returns to global configuration mode.</td>
</tr>
<tr>
<td>4</td>
<td>crypto map map-name seq-num [ipsec-isakmp] [dynamic dynamic-map-name] [discover] [profile profile-name]</td>
<td>Creates a crypto map profile.</td>
</tr>
</tbody>
</table>

Example:

```plaintext
Router(config)# interface fastethernet 4
Router(config-if)#
```
Create an Easy VPN Remote Configuration

The router acting as the IPsec remote router must create an Easy VPN remote configuration and assign it to the outgoing interface.

Perform these steps to create the remote configuration, beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> crypto ipsec client ezvpn name</td>
<td>Creates a Cisco Easy VPN remote configuration, and enters Cisco Easy VPN remote configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config)# crypto ipsec client ezvpn ezvpnclient Router(config-crypto-ezvpn)#</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> group group-name key group-key</td>
<td>Specifies the IPsec group and IPsec key value for the VPN connection.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config-crypto-ezvpn)# group ezvpnclient key secret-password Router(config-crypto-ezvpn)#</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> peer {ipaddress</td>
<td>hostname}</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config-crypto-ezvpn)# peer 192.168.100.1 Router(config-crypto-ezvpn)#</td>
<td><strong>Note</strong> A hostname can be specified only when the router has a DNS server available for hostname resolution.</td>
</tr>
<tr>
<td><strong>Step 4</strong> mode {client</td>
<td>network-extension</td>
</tr>
<tr>
<td><strong>Example:</strong> Router(config-crypto-ezvpn)# mode client Router(config-crypto-ezvpn)#</td>
<td></td>
</tr>
</tbody>
</table>
### Verifying Your Easy VPN Configuration

```
router# show crypto ipsec client ezvpn
```

Tunnel name :ezvpnclient
Inside interface list: vlan 1
Outside interface: fastethernet 4
Current State: IPSEC_ACTIVE
Last Event: SOCKET_UP
Address: 8.0.0.5
Mask: 255.255.255.255
Default Domain: cisco.com

### Configuration Example

The following configuration example shows a portion of the configuration file for the VPN and IPsec tunnel described in this chapter.

```
!aaa new-model

Configuring VPNs Using an IPsec Tunnel and Generic Routing Encapsulation

The Cisco Secure Router 520 Series routers support the creation of virtual private networks (VPNs). Cisco routers and other broadband devices provide high-performance connections to the Internet, but many applications also require the security of VPN connections which perform a high level of authentication and which encrypt the data between two particular endpoints.

Two types of VPNs are supported—site-to-site and remote access. Site-to-site VPNs are used to connect branch offices to corporate offices, for example. Remote access VPNs are used by remote clients to log in to a corporate network.

The example in this chapter illustrates the configuration of a site-to-site VPN that uses IPsec and the generic routing encapsulation (GRE) protocol to secure the connection between the branch office and the corporate network. Figure 7-1 shows a typical deployment scenario.

**Figure 7-1  Site-to-Site VPN Using an IPsec Tunnel and GRE**

1. Branch office containing multiple LANs and VLANs
2. Fast Ethernet LAN interface—With address 192.168.0.0/16 (also the inside interface for NAT)
3. VPN client—Cisco Secure Router 520 Series routers
4. Fast Ethernet or ATM interface—With address 200.1.1.1 (also the outside interface for NAT)
5. LAN interface—Connects to the Internet; with outside interface address of 210.110.101.1
6. VPN client—Another router, which controls access to the corporate network
7. LAN interface—Connects to the corporate network, with inside interface address of 10.1.1.1
8. Corporate office network
9. IPsec tunnel with GRE
Configure a VPN

GRE Tunnels
GRE tunnels are typically used to establish a VPN between the Cisco router and a remote device that controls access to a private network, such as a corporate network. Traffic forwarded through the GRE tunnel is encapsulated and routed out onto the physical interface of the router. When a GRE interface is used, the Cisco router and the router that controls access to the corporate network can support dynamic IP routing protocols to exchange routing updates over the tunnel, and to enable IP multicast traffic. Supported IP routing protocols include Routing Information Protocol (RIP) and Intermediate System-to-Intermediate System (IS-IS).

Note
When IP Security (IPsec) is used with GRE, the access list for encrypting traffic does not list the desired end network and applications, but instead refers to the permitted source and destination of the GRE tunnel in the outbound direction. All packets forwarded to the GRE tunnel are encrypted if no further access control lists (ACLs) are applied to the tunnel interface.

VPNs
VPN configuration information must be configured on both endpoints; for example, on your Cisco router and at the remote user, or on your Cisco router and on another router. You must specify parameters, such as internal IP addresses, internal subnet masks, DHCP server addresses, and Network Address Translation (NAT).

Configuration Tasks
Perform the following tasks to configure this network scenario:

- Configure a VPN
- Configure a GRE Tunnel

A configuration example showing the results of these configuration tasks is provided in the “Configuration Example” section on page 7-9.

Note
The procedures in this chapter assume that you have already configured basic router features as well as PPPoE or PPPoA with NAT, DHCP, and VLANs. If you have not performed these configurations tasks, see Chapter 1, “Basic Router Configuration,” Chapter 3, “Configuring PPP over Ethernet with NAT,” Chapter 4, “Configuring PPP over ATM with NAT,” and Chapter 5, “Configuring a LAN with DHCP and VLANs,” as appropriate for your router.

Configure a VPN

Perform the following tasks to configure a VPN over an IPsec tunnel:

- Configure the IKE Policy
- Configure Group Policy Information
- Enable Policy Lookup
- Configure IPsec Transforms and Protocols
- Configure the IPsec Crypto Method and Parameters
- Apply the Crypto Map to the Physical Interface
## Configure the IKE Policy

Perform these steps to configure the Internet Key Exchange (IKE) policy, beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><code>crypto isakmp policy priority</code></td>
<td>Creates an IKE policy that is used during IKE negotiation. The priority is a number from 1 to 10000, with 1 being the highest. Also enters Internet Security Association and Key Management Protocol (ISAKMP) policy configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>`encryption {des</td>
<td>3des</td>
</tr>
<tr>
<td>3</td>
<td>`hash {md5</td>
<td>sha}`</td>
</tr>
<tr>
<td>4</td>
<td>`authentication {rsa-sig</td>
<td>rsa-encr</td>
</tr>
<tr>
<td>5</td>
<td>`group {1</td>
<td>2</td>
</tr>
<tr>
<td>6</td>
<td><code>lifetime seconds</code></td>
<td>Specifies the lifetime, 60–86400 seconds, for an IKE security association (SA).</td>
</tr>
<tr>
<td>7</td>
<td><code>exit</code></td>
<td>Exits IKE policy configuration mode, and enters global configuration mode.</td>
</tr>
</tbody>
</table>
## Configure Group Policy Information

Perform these steps to configure the group policy, beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>crypto isakmp client configuration group {group-name</td>
<td>default}</td>
</tr>
<tr>
<td></td>
<td>Example: Router(config)# crypto isakmp client configuration group rtr-remote Router(config-isakmp-group)#</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>key name</td>
<td>Specifies the IKE pre-shared key for the group policy.</td>
</tr>
<tr>
<td></td>
<td>Example: Router(config-isakmp-group)# key secret-password Router(config-isakmp-group)#</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>dns primary-server</td>
<td>Specifies the primary Domain Name Service (DNS) server for the group. <strong>Note</strong> You may also want to specify Windows Internet Naming Service (WINS) servers for the group by using the wins command.</td>
</tr>
<tr>
<td></td>
<td>Example: Router(config-isakmp-group)# dns 10.50.10.1 Router(config-isakmp-group)#</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>domain name</td>
<td>Specifies group domain membership.</td>
</tr>
<tr>
<td></td>
<td>Example: Router(config-isakmp-group)# domain company.com Router(config-isakmp-group)#</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>exit</td>
<td>Exits IKE group policy configuration mode, and enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example: Router(config-isakmp-group)# exit Router(config)#</td>
<td></td>
</tr>
<tr>
<td>6</td>
<td>ip local pool {default</td>
<td>poolname} [low-ip-address [high-ip-address]]</td>
</tr>
<tr>
<td></td>
<td>Example: Router(config)# ip local pool dynpool 30.30.30.20 30.30.30.30 Router(config)#</td>
<td></td>
</tr>
</tbody>
</table>
Enable Policy Lookup

Perform these steps to enable policy lookup through AAA, beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> aaa new-model</td>
<td>Enables the AAA access control model.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>aaa new-model</code></td>
<td></td>
</tr>
<tr>
<td><code>Router(config)# aaa new-model</code></td>
<td></td>
</tr>
<tr>
<td><code>Router(config)#</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> aaa authentication login {default</td>
<td>list-name} method1 [method2...]</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>This example uses a local authentication database. You could also use a RADIUS server for this. See the <em>Cisco IOS Security Configuration Guide</em> and the <em>Cisco IOS Security Command Reference</em> for details.</td>
</tr>
<tr>
<td><code>aaa authentication login</code></td>
<td></td>
</tr>
<tr>
<td><code>rtr-remote local</code></td>
<td></td>
</tr>
<tr>
<td><code>Router(config)#</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> aaa authorization {network</td>
<td>exec</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>This example uses a local authorization database. You could also use a RADIUS server for this. See the <em>Cisco IOS Security Configuration Guide</em> and the <em>Cisco IOS Security Command Reference</em> for details.</td>
</tr>
<tr>
<td><code>aaa authorization</code></td>
<td></td>
</tr>
<tr>
<td><code>network</code></td>
<td></td>
</tr>
<tr>
<td><code>rtr-remote local</code></td>
<td></td>
</tr>
<tr>
<td><code>Router(config)#</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> username name {nopassword</td>
<td>password password</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>This example implements a username of <em>cisco</em> with an encrypted password of <em>cisco</em>.</td>
</tr>
<tr>
<td><code>username</code></td>
<td></td>
</tr>
<tr>
<td><code>cisco</code></td>
<td></td>
</tr>
<tr>
<td><code>Router(config)#</code></td>
<td></td>
</tr>
</tbody>
</table>

Configure IPsec Transforms and Protocols

A transform set represents a certain combination of security protocols and algorithms. During IKE negotiation, the peers agree to use a particular transform set for protecting data flow.

During IKE negotiations, the peers search in multiple transform sets for a transform that is the same at both peers. When such a transform set is found, it is selected and applied to the protected traffic as a part of both peers’ configurations.
Configure a VPN

Perform these steps to specify the IPsec transform set and protocols, beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>crypto ipsec transform-set transform-set-name</code></td>
<td>Defines a transform set—An acceptable combination of IPsec security protocols and algorithms.</td>
</tr>
<tr>
<td><code>crypto ipsec security-association lifetime</code></td>
<td>Specifies global lifetime values used when negotiating IPsec security associations.</td>
</tr>
</tbody>
</table>

Example:
```
Router(config)# crypto ipsec transform-set vpn1 esp-3des esp-sha-hmac
```

**Command or Action**
```
crypto dynamic-map dynamic-map-name
```

**Purpose**

Creates a dynamic crypto map entry, and enters crypto map configuration mode.

Example:
```
Router(config)# crypto dynamic-map dynmap 1
```

**Step 2**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>set transform-set transform-set-name</code></td>
<td>Specifies which transform sets can be used with the crypto map entry.</td>
</tr>
</tbody>
</table>

Example:
```
Router(config-crypto-map)# set transform-set vpn1
```

**Note**

With manually established security associations, there is no negotiation with the peer, and both sides must specify the same transform set.

Configure the IPsec Crypto Method and Parameters

A dynamic crypto map policy processes negotiation requests for new security associations from remote IPsec peers, even if the router does not know all the crypto map parameters (for example, IP address).

Perform these steps to configure the IPsec crypto method, beginning in global configuration mode:

**Command or Action**
```
crypto ipsec transform-set transform-set-name
```

**Purpose**

Defines a transform set—An acceptable combination of IPsec security protocols and algorithms.

See the Cisco IOS Security Command Reference for detail about the valid transforms and combinations.

Example:
```
Router(config)# crypto ipsec transform-set vpn1 esp-3des esp-sha-hmac
```

**Step 2**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>crypto ipsec security-association lifetime</code></td>
<td>Specifies global lifetime values used when negotiating IPsec security associations.</td>
</tr>
<tr>
<td><code>crypto dynamic-map</code></td>
<td>Creates a dynamic crypto map entry, and enters crypto map configuration mode.</td>
</tr>
</tbody>
</table>

Example:
```
Router(config)# crypto dynamic-map dynmap 1
```

**Note**

See the Cisco IOS Security Command Reference for more detail about this command.

Example:
```
Router(config-crypto-map)# set transform-set vpn1
```

**Note**

See the Cisco IOS Security Command Reference for more detail about this command.
Chapter 7  Configuring VPNs Using an IPsec Tunnel and Generic Routing Encapsulation

### Configure a VPN

#### Apply the Crypto Map to the Physical Interface

The crypto maps must be applied to each interface through which IPsec traffic flows. Applying the crypto map to the physical interface instructs the router to evaluate all the traffic against the security associations database. With the default configurations, the router provides secure connectivity by encrypting the traffic sent between remote sites. However, the public interface still allows the rest of the traffic to pass and provides connectivity to the Internet.

Perform these steps to apply a crypto map to an interface, beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Enters interface configuration mode for the interface to which you want to apply the crypto map.</td>
</tr>
<tr>
<td>interface type number</td>
<td>Creates a crypto map profile.</td>
</tr>
<tr>
<td>crypto map map-name seq-num [ipsec-isakmp] [dynamic dynamic-map-name] [discover] [profile profile-name]</td>
<td>Enters interface configuration mode for the interface to which you want to apply the crypto map.</td>
</tr>
</tbody>
</table>
## Configure a GRE Tunnel

Perform these steps to configure a GRE tunnel, beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> interface type number</td>
<td>Creates a tunnel interface and enters interface configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router(config)# interface tunnel 1</td>
<td></td>
</tr>
<tr>
<td>Router(config-if)#</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> ip address ip-address subnet mask</td>
<td>Assigns an address to the tunnel.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router(config-if)# ip address 10.62.1.193 255.255.255.255</td>
<td></td>
</tr>
<tr>
<td>Router(config-if)#</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> tunnel source interface-type number</td>
<td>Specifies the source endpoint of the router for the GRE tunnel.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router(config-if)# tunnel source fastethernet 0</td>
<td></td>
</tr>
<tr>
<td>Router(config-if)#</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> tunnel destination default-gateway-ip-address</td>
<td>Specifies the destination endpoint of the router for the GRE tunnel.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router(config-if)# tunnel destination 192.168.101.1</td>
<td></td>
</tr>
<tr>
<td>Router(config-if)#</td>
<td></td>
</tr>
</tbody>
</table>
Chapter 7      Configuring VPNs Using an IPsec Tunnel and Generic Routing Encapsulation

Configuration Example

The following configuration example shows a portion of the configuration file for a VPN using a GRE tunnel scenario described in the preceding sections.

```
! aaa new-model
!
! aaa authentication login rtr-remote local
aaa authorization network rtr-remote local
aaa session-id common
!
username cisco password 0 cisco
!
interface tunnel 1
    ip address 10.62.1.193 255.255.255.252
```
tunnel source fastethernet 0

tunnel destination interface 192.168.101.1

ip route 20.20.20.0 255.255.255.0 tunnel 1

crypto isakmp policy 1

ip classless
ip route 0.0.0.0 0.0.0.0 210.110.101.1
no ip http server
!
!
! acl 102 associated addresses used for NAT.
access-list 102 permit ip 10.1.1.0 0.0.0.255 any
! acl 103 defines traffic allowed from the peer for the IPsec tunnel.
access-list 103 permit udp host 200.1.1.1 any eq isakmp
access-list 103 permit udp host 200.1.1.1 eq isakmp any
access-list 103 permit esp host 200.1.1.1 any
! Allow ICMP for debugging but should be disabled because of security implications.
access-list 103 permit icmp any any
access-list 103 deny ip any any ! Prevents Internet-initiated traffic inbound.
! acl 105 matches addresses for the IPsec tunnel to or from the corporate network.
access-list 105 permit ip 10.1.1.0 0.0.0.255 192.168.0.0 0.0.255.255
no cdp run
Configuring a Simple Firewall

The Cisco Secure Router 520 Series routers support network traffic filtering by means of access lists. The routers also support packet inspection and dynamic temporary access lists by means of Context-Based Access Control (CBAC).

Basic traffic filtering is limited to configured access list implementations that examine packets at the network layer or, at most, the transport layer, permitting or denying the passage of each packet through the firewall. However, the use of inspection rules in CBAC allows the creation and use of dynamic temporary access lists. These dynamic lists allow temporary openings in the configured access lists at firewall interfaces. These openings are created when traffic for a specified user session exits the internal network through the firewall. The openings allow returning traffic for the specified session (that would normally be blocked) back through the firewall.

See the Cisco IOS Security Configuration Guide, Release 12.3, for more detailed information on traffic filtering and firewalls.
Figure 8-1 shows a network deployment using PPPoE or PPPoA with NAT and a firewall.

**Figure 8-1  Router with Firewall Configured**

In the configuration example that follows, the firewall is applied to the outside WAN interface (FE4) and protects the Fast Ethernet LAN on FE0 by filtering and inspecting all traffic entering the router on the Fast Ethernet WAN interface FE4. Note that in this example, the network traffic originating from the corporate network, network address 10.1.1.0, is considered safe traffic and is not filtered.

### Configuration Tasks

Perform the following tasks to configure this network scenario:

- **Configure Access Lists**
- **Configure Inspection Rules**
- **Apply Access Lists and Inspection Rules to Interfaces**

A configuration example that shows the results of these configuration tasks is provided in the “Configuration Example” section on page 8-5.
Configure Access Lists

Perform these steps to create access lists for use by the firewall, beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
- `access-list access-list-number {deny | permit}
  protocol source source-wildcard [operator [port]]
  destination`

  **Example:**
  Router(config)# access-list 103 deny ip any any
  Router(config)# access-list 103 permit host 200.1.1.1 eq isakmp any
  Router(config)#

  Creates an access list which prevents Internet-initiated traffic from reaching the local (inside) network of the router, and which compares source and destination ports.

  See the Cisco IOS IP Command Reference, Volume 1 of 4: Addressing and Services for details about this command.

| **Step 2**
- `access-list access-list-number {deny | permit}
  protocol source source-wildcard destination destination-wildcard`

  **Example:**
  Router(config)# access-list 105 permit ip 10.1.1.0 0.0.0.255 192.168.0.0 0.0.255.255
  Router(config)#

  Creates an access list that allows network traffic to pass freely between the corporate network and the local networks through the configured VPN tunnel.
Configure Inspection Rules

Perform these steps to configure firewall inspection rules for all TCP and UDP traffic, as well as specific application protocols as defined by the security policy, beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> ip inspect name inspection-name protocol</td>
<td>Defines an inspection rule for a particular protocol.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router(config)# ip inspect name firewall tcp</td>
<td></td>
</tr>
<tr>
<td>Router(config)#</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> ip inspect name inspection-name protocol</td>
<td>Repeat this command for each inspection rule that you wish to use.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router(config)# ip inspect name firewall rtsp</td>
<td></td>
</tr>
<tr>
<td>Router(config)# ip inspect name firewall h323</td>
<td></td>
</tr>
<tr>
<td>Router(config)# ip inspect name firewall netshow</td>
<td></td>
</tr>
<tr>
<td>Router(config)# ip inspect name firewall netshow</td>
<td></td>
</tr>
<tr>
<td>Router(config)# ip inspect name firewall sqlnet</td>
<td></td>
</tr>
<tr>
<td>Router(config)#</td>
<td></td>
</tr>
</tbody>
</table>

Apply Access Lists and Inspection Rules to Interfaces

Perform these steps to apply the ACLs and inspection rules to the network interfaces, beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> interface type number</td>
<td>Enters interface configuration mode for the inside network interface on your router.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router(config)# interface vlan 1</td>
<td></td>
</tr>
<tr>
<td>Router(config-if)#</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> ip inspect inspection-name {in</td>
<td>out}</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router(config-if)# ip inspect firewall in</td>
<td></td>
</tr>
<tr>
<td>Router(config-if)#</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> exit</td>
<td>Returns to global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router(config-if)# exit</td>
<td></td>
</tr>
<tr>
<td>Router(config)#</td>
<td></td>
</tr>
</tbody>
</table>
A telecommuter is granted secure access to a corporate network, using IPsec tunneling. Security to the home network is accomplished through firewall inspection. The protocols that are allowed are all TCP, UDP, RTSP, H.323, NetShow, FTP, and SQLNet. There are no servers on the home network; therefore, no traffic is allowed that is initiated from outside. IPsec tunneling secures the connection from the home LAN to the corporate network.

Like the Internet Firewall Policy, HTTP need not be specified because Java blocking is not necessary. Specifying TCP inspection allows for single-channel protocols such as Telnet and HTTP. UDP is specified for DNS.

The following configuration example shows a portion of the configuration file for the simple firewall scenario described in the preceding sections.

```
!
! Firewall inspection is set up for all TCP and UDP traffic as well as
! specific application protocols as defined by the security policy.
ip inspect name firewall tcp
ip inspect name firewall udp
ip inspect name firewall rtsp
ip inspect name firewall h323
ip inspect name firewall netshow
ip inspect name firewall ftp
ip inspect name firewall sqlnet
!
interface vlan 1! This is the internal home network.
ip inspect firewall in ! Inspection examines outbound traffic.
  no cdp enable
!
interface fastethernet 4! FE4 is the outside or Internet-exposed interface.
! acl 103 permits IPsec traffic from the corp. router
! as well as denies Internet-initiated traffic inbound.
ip access-group 103 in
```
Configuration Example

    ip nat outside
    no cdp enable

    ! acl 103 defines traffic allowed from the peer for the IPsec tunnel.
    access-list 103 permit udp host 200.1.1.1 any eq isakmp
    access-list 103 permit udp host 200.1.1.1 eq isakmp any
    access-list 103 permit esp host 200.1.1.1 any
    ! Allow ICMP for debugging but should be disabled because of security implications.
    access-list 103 permit icmp any any
    access-list 103 deny ip any any ! Prevents Internet-initiated traffic inbound.
    ! acl 105 matches addresses for the ipsec tunnel to or from the corporate network.
    access-list 105 permit ip 10.1.1.0 0.0.0.255 192.168.0.0 0.0.255.255
    no cdp run

Configuring a Wireless LAN Connection

The Cisco Secure Router 520 Series routers support a secure, affordable, and easy-to-use wireless LAN solution that combines mobility and flexibility with the enterprise-class features required by networking professionals. With a management system based on Cisco IOS software, the Cisco routers act as access points, and are Wi-Fi certified, IEEE 802.11a/b/g-compliant wireless LAN transceivers.

You can configure and monitor the routers using the command-line interface (CLI), the browser-based management system, or Simple Network Management Protocol (SNMP). This chapter describes how to configure the router using the CLI. Use the `interface dot11radio` global configuration CLI command to place the device into radio configuration mode.

See the Cisco Access Router Wireless Configuration Guide for more detailed information about configuring these Cisco routers in a wireless LAN application.

Figure 9-1 shows a wireless network deployment.

Figure 9-1 Wireless Connection to the Cisco Router

| 1 | Wireless LAN (with multiple networked devices) |
| 2 | Cisco Secure Router 520 Series router connected to the Internet |
| 3 | VLAN 1 |
| 4 | VLAN 2 |

In the configuration example that follows, a remote user is accessing the Cisco Secure Router 520 Series router using a wireless connection. Each remote user has his own VLAN.
Configure the Root Radio Station

Perform these steps to create and configure the root radio station for your wireless LAN, beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
  * interface name number*                 | Enters interface configuration mode for the radio interface.           |
  
  **Example:**
  
  Router(config)# interface dot11radio 0
  Router(config-if)#

| **Step 2**
  * broadcast-key [vlan vlan-id] change seconds* | Specifies the time interval, in seconds, between rotations of the broadcast encryption key used for clients. |
  
  **Example:**
  
  Router(config-if)# broadcast-key vlan 1 change 45
  Router(config-if)#

**Note**

Client devices using static Wired Equivalent Privacy (WEP) cannot use the access point when you enable broadcast key rotation—only wireless client devices using 802.1x authentication (such as Light Extensible Authentication Protocol [LEAP], Extensible Authentication Protocol–Transport Layer Security [EAP-TLS], or Protected Extensible Authentication Protocol [PEAP]) can use the access point.

**Note**

This command is not supported on bridges.

See the *Cisco IOS Commands for Access Points and Bridges* for more details.
## Command Purpose

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td><strong>encryption method algorithm key</strong></td>
<td>Specifies the encryption method, algorithm, and key used to access the wireless interface. The example uses the VLAN with optional encryption method of data ciphers.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Router(config-if)# encryption vlan 1 mode ciphers tkip</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Router(config-if)#</code></td>
<td></td>
</tr>
<tr>
<td>4</td>
<td><strong>ssid name</strong></td>
<td>Creates a Service Set ID (SSID), the public name of a wireless network.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td>Note: All of the wireless devices on a WLAN must employ the same SSID to communicate with each other.</td>
</tr>
<tr>
<td></td>
<td><code>Router(config-if)# ssid cisco</code></td>
<td></td>
</tr>
<tr>

</tbody>
</table>
Configure Bridging on VLANs

Perform these steps to configure integrated routing and bridging on VLANs, beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>`bridge [number</td>
<td>crb</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Router(config)# bridge irb</code></td>
<td></td>
</tr>
<tr>
<td><code>Router(config)#</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>interface name number</code></td>
<td>Enters interface configuration mode. We want to set up bridging on the VLANs, so the example enters the VLAN interface configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>

Configure Radio Station Subinterfaces

Perform these steps to configure subinterfaces for each root station, beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1  
interface type number | Enters subinterface configuration mode for the root station interface. |
| Example:  
Router(config)# interface dot11radio 0.1  
Router(config-subif)# | |
| Step 2  
description string | Provides a description of the subinterface for the administrative user. |
| Example:  
Router(config-subif)# description Cisco open  
Router(config-subif)# | |
Configuration Example

The following configuration example shows a portion of the configuration file for the wireless LAN scenario described in the preceding sections.

```plaintext
! bridge irb
! interface Dot11Radio0
  no ip address
  ! broadcast-key vlan 1 change 45
!```

Repeat these steps to configure more subinterfaces, as needed.

### Command Example

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>

PART 3

Configuring Additional Features and Troubleshooting
Additional Configuration Options

This part of the software configuration guide describes additional configuration options and troubleshooting tips for the Cisco Secure Router 520 Series routers.

The configuration options described in this part include:

- Chapter 11, “Configuring Security Features”
- Chapter 12, “Troubleshooting”

The descriptions contained in these chapters do not describe all of your configuration or troubleshooting needs. See the appropriate Cisco IOS configuration guides and command references for additional details.

Note

To verify that a specific feature is compatible with your router, you can use the Software Advisor tool. You can access this tool at www.cisco.com > Technical Support & Documentation > Tools & Resources with your Cisco username and password.
Configuring Security Features

This chapter gives an overview of authentication, authorization, and accounting (AAA), the primary Cisco framework for implementing selected security features that can be configured on the Cisco Secure Router 520 Series routers.

Note
Individual router models may not support every feature described throughout this guide. Features not supported by a particular router are indicated whenever possible.

This chapter contains the following sections:
- Authentication, Authorization, and Accounting
- Configuring AutoSecure
- Configuring Access Lists
- Configuring a CBAC Firewall
- Configuring Cisco IOS Firewall IDS
- Configuring VPNs

Each section includes a configuration example and verification steps, where available.

Authentication, Authorization, and Accounting

AAA network security services provide the primary framework through which you set up access control on your router. Authentication provides the method of identifying users, including login and password dialog, challenge and response, messaging support, and, depending on the security protocol you choose, encryption. Authorization provides the method for remote access control, including one-time authorization or authorization for each service, per-user account list and profile, user group support, and support of IP, Internetwork Packet Exchange (IPX), AppleTalk Remote Access (ARA), and Telnet.

Accounting provides the method for collecting and sending security server information used for billing, auditing, and reporting, such as user identities, start and stop times, executed commands (such as PPP), number of packets, and number of bytes.

AAA uses protocols such as RADIUS, TACACS+, or Kerberos to administer its security functions. If your router is acting as a network access server, AAA is the means through which you establish communication between your network access server and your RADIUS, TACACS+, or Kerberos security server.
For information about configuring AAA services and supported security protocols, see the following sections of the Cisco IOS Security Configuration Guide:

- Configuring Authentication
- Configuring Authorization
- Configuring Accounting
- Configuring RADIUS
- Configuring TACACS+
- Configuring Kerberos

## Configuring AutoSecure

The AutoSecure feature disables common IP services that can be exploited for network attacks and enables IP services and features that can aid in the defense of a network when under attack. These IP services are all disabled and enabled simultaneously with a single command, greatly simplifying security configuration on your router. For a complete description of the AutoSecure feature, see the AutoSecure feature document.

## Configuring Access Lists

Access lists (ACLs) permit or deny network traffic over an interface based on source IP address, destination IP address, or protocol. Access lists are configured as standard or extended. A standard access list either permits or denies passage of packets from a designated source. An extended access list allows designation of both the destination and the source, and it allows designation of individual protocols to be permitted or denied passage. An access list is a series of commands with a common tag to bind them together. The tag is either a number or a name. Table 11-1 lists the commands used to configure access lists.

<table>
<thead>
<tr>
<th>Table 11-1</th>
<th>Access List Configuration Commands</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ACL Type</strong></td>
<td><strong>Configuration Commands</strong></td>
</tr>
<tr>
<td><strong>Numbered</strong></td>
<td></td>
</tr>
<tr>
<td>Standard</td>
<td>access-list {1-99} {permit</td>
</tr>
<tr>
<td>Extended</td>
<td>access-list {100-199} {permit</td>
</tr>
<tr>
<td><strong>Named</strong></td>
<td></td>
</tr>
<tr>
<td>Standard</td>
<td>ip access-list standard name followed by deny {source</td>
</tr>
<tr>
<td>Extended</td>
<td>ip access-list extended name followed by {permit</td>
</tr>
</tbody>
</table>
Access Groups

A sequence of access list definitions bound together with a common name or number is called an access group. An access group is enabled for an interface during interface configuration with the following command:

\[ \text{ip access-group} \{ \text{access-list-number} \mid \text{access-list-name} \} \{ \text{in} \mid \text{out} \} \]

where \text{in} \mid \text{out} refers to the direction of travel of the packets being filtered.

Guidelines for Creating Access Groups

Use the following guidelines when creating access groups.

- The order of access list definitions is significant. A packet is compared against the first access list in the sequence. If there is no match (that is, if neither a permit nor a deny occurs), the packet is compared with the next access list, and so on.
- All parameters must match the access list before the packet is permitted or denied.
- There is an implicit “deny all” at the end of all sequences.

For more complete information on creating access lists, see the “Access Control Lists: Overview and Guidelines” section of the Cisco IOS Release 12.3 Security Configuration Guide.

Configuring a CBAC Firewall

Context-Based Access Control (CBAC) lets you configure a stateful firewall where packets are inspected internally and the state of network connections is monitored. This is superior to static access lists, because access lists can only permit or deny traffic based on individual packets, not streams of packets. Also, because CBAC inspects the packets, decisions to permit or deny traffic can be made by examining application layer data, something static access lists cannot do.

To configure a CBAC firewall, specify which protocols to examine by using the following command in interface configuration mode:

\[ \text{ip inspect name} \text{inspection-name protocol} \text{timeout} \text{seconds} \]

When inspection detects that the specified protocol is passing through the firewall, a dynamic access list is created to allow the passage of return traffic. The \text{timeout} parameter specifies the length of time the dynamic access list remains active without return traffic passing through the router. When the timeout value is reached, the dynamic access list is removed, and subsequent packets (possibly valid ones) are not permitted.

Use the same inspection name in multiple statements to group them into one set of rules. This set of rules can be activated elsewhere in the configuration by using the \text{ip inspect inspection-name in} \mid \text{out} command when you configure an interface at the firewall.

See Chapter 8, “Configuring a Simple Firewall,” for a sample configuration. For additional information about configuring a CBAC firewall, see the “Configuring Context-Based Access Control” section of the Cisco IOS Release 12.3 Security Configuration Guide.
Configuring Cisco IOS Firewall IDS

Cisco IOS Firewall Intrusion Detection System (IDS) technology enhances perimeter firewall protection by taking appropriate action on packets and flows that violate the security policy or represent malicious network activity.

Cisco IOS Firewall IDS identifies 59 of the most common attacks using “signatures” to detect patterns of misuse in network traffic. It acts as an in-line intrusion detection sensor, watching packets and sessions as they flow through the router, scanning each to match any of the IDS signatures. When it detects suspicious activity, it responds before network security can be compromised, logs the event, and, depending on configuration, sends an alarm, drops suspicious packets, or resets the TCP connection.

For additional information about configuring Cisco IOS Firewall IDS, see the “Configuring Cisco IOS Firewall Intrusion Detection System” section of the Cisco IOS Release 12.3 Security Configuration Guide.

Configuring VPNs

A virtual private network (VPN) connection provides a secure connection between two networks over a public network such as the Internet. Cisco Secure Router 520 Series routers support site-to-site VPNs using IP security (IPsec) tunnels and generic routing encapsulation (GRE). Permanent VPN connections between two peers, or dynamic VPNs using EZVPN which create and tear down VPN connections as needed, can be configured. Chapter 6, “Configuring a VPN Using Easy VPN and an IPsec Tunnel,” and Chapter 7, “Configuring VPNs Using an IPsec Tunnel and Generic Routing Encapsulation,” show examples of how to configure your router with these features. For more information about IPsec and GRE configuration, see the “Configuring IPsec Network Security” chapter of the Cisco IOS Release 12.3 Security Configuration Guide.

For information about additional VPN configurations supported by Cisco Secure Router 520 Series routers, see the EZVPN Server feature document. Cisco Secure Router 520 Series routers can be configured to act as EZVPN servers, letting authorized EZVPN clients establish dynamic VPN tunnels to the connected network.
Troubleshooting

Use the information in this chapter to help isolate problems you might encounter or to rule out the router as the source of a problem. This chapter contains the following sections:

- Getting Started
- Before Contacting Cisco or Your Reseller
- ADSL Troubleshooting
- ATM Troubleshooting Commands
- Software Upgrade Methods
- Recovering a Lost Password

Getting Started

Before troubleshooting a software problem, you must connect a terminal or PC to the router using the light-blue console port. With a connected terminal or PC, you can view status messages from the router and enter commands to troubleshoot a problem.

You can also remotely access the interface (Ethernet, ADSL, or telephone) by using Telnet. The Telnet option assumes that the interface is up and running.

Before Contacting Cisco or Your Reseller

If you cannot locate the source of a problem, contact your local reseller for advice. Before you call, you should have the following information ready:

- Chassis type and serial number
- Maintenance agreement or warranty information
- Type of software and version number
- Date you received the hardware
- Brief description of the problem
- Brief description of the steps you have taken to isolate the problem
ADSL Troubleshooting

If you experience trouble with the ADSL connection, verify the following:

- The ADSL line is connected and is using pins 3 and 4. For more information on the ADSL connection, see the hardware guide for your router.
- The ADSL CD LED is on. If it is not on, the router may not be connected to the DSL access multiplexer (DSLAM). For more information on the ADSL LEDs, see the hardware installation guide specific for your router.
- The correct Asynchronous Transfer Mode (ATM) virtual path identifier/virtual circuit identifier (VPI/VCI) is being used.
- The DSLAM supports discrete multi-tone (DMT) Issue 2.
- The ADSL cable that you connect to the Cisco router must be 10BASE-T Category 5, unshielded twisted-pair (UTP) cable. Using regular telephone cable can introduce line errors.

ATM Troubleshooting Commands

Use the following commands to troubleshoot your ATM interface.

- ping atm interface Command
- show interface Command
- show atm interface Command
- debug atm Commands

ping atm interface Command

Use the ping atm interface command to determine whether a particular PVC is in use. The PVC does not need to be configured on the router to use this command. Example 12-1 shows the use of this command to determine whether PVC 8/35 is in use.

Example 12-1  Determining If a PVC Is in Use

Router# ping atm interface atm 0 8 35 seg-loopback
Type escape sequence to abort.
Sending 5, 53-byte segment OAM echoes, timeout is 2 seconds:
!!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 148/148/148 ms

This command sends five OAM F5 loopback packets to the DSLAM (segment OAM packets). If the PVC is configured at the DSLAM, the ping is successful.

To test whether the PVC is being used at the aggregator, enter the following command:

Router# ping atm interface atm 0 8 35 end-loopback
Type escape sequence to abort.
Sending 5, 53-byte end-to-end OAM echoes, timeout is 2 seconds:
!!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 400/401/404 ms
This command sends end-to-end OAM F5 packets, which are echoed back by the aggregator.

**show interface Command**

Use the `show interface` command to display the status of all physical ports (Ethernet and ATM) and logical interfaces on the router. Table 12-1 describes messages in the command output.

**Example 12-2 Viewing Status of Selected Interfaces**

Router# `show interface atm 0`
ATM0 is up, line protocol is up
  Hardware is PQUICC_SAR (with Alcatel ADSL Module)
  Internet address is 14.0.0.16/8
  MTU 1500 bytes, sub MTU 1500, BW 640 Kbit, DLY 80 usec,
      reliability 40/255, txload 1/255, rxload 1/255
  Encapsulation ATM, loopback not set
  Keepalive not supported
  Encapsulation(s):AAL5, PVC mode
  10 maximum active VCs, 1 current VCCs
  VC idle disconnect time:300 seconds
  Last input 01:16:31, output 01:16:31, output hang never
  Last clearing of "show interface" counters never
  Input queue:0/75/0 (size/max/drops); Total output drops:0
  Queueing strategy:Per VC Queuing
  5 minute input rate 0 bits/sec, 0 packets/sec
  5 minute output rate 0 bits/sec, 0 packets/sec
  512 packets input, 59780 bytes, 0 no buffer
  Received 0 broadcasts, 0 runts, 0 giants, 0 throttles
  0 input errors, 1024 CRC, 0 frame, 0 overrun, 0 ignored, 0 abort
  426 packets output, 46282 bytes, 0 underruns
  0 output errors, 0 collisions, 2 interface resets
  0 output buffer failures, 0 output buffers swapped out

Router# `show interface fastethernet 0`
Ethernet0 is up, line protocol is up
  Hardware is PQUICC Ethernet, address is 0000.Oc13.a4db (bia0010.9181.1281)
  Internet address is 170.1.4.101/24
  MTU 1500 bytes, BW 10000 Kbit, DLY 1000 usec,
      reliability 255/255., txload 1/255, rxload 1/255
  Encapsulation ARPA, loopback not set
  Keepalive set (10 sec)

Router# `show interface dialer 1`
Dialer 1 is up, line protocol is up
  Hardware is Dialer interface
  Internet address is 1.1.1.1/24
  MTU 1500 bytes, BW 100000 Kbit, DLY 10000 usec, reliability
      255/255., txload 1/255, rxload 1/255
  Encapsulation PPP, loopback not set
  Keepalive set (10 sec)
  DTR is pulsed for 5 seconds on reset
  LCP Closed
Table 12-1 describes possible command output for the `show interface` command.

### Table 12-1  show interface Command Output Description

<table>
<thead>
<tr>
<th>Output</th>
<th>Cause</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>For ATM Interfaces</strong></td>
<td></td>
</tr>
<tr>
<td>ATM 0 is up, line protocol is up</td>
<td>The ATM line is up and operating correctly.</td>
</tr>
</tbody>
</table>
| ATM 0 is down, line protocol is down | • The ATM interface has been disabled with the `shutdown` command.  
or  
• The ATM line is down, possibly because the ADSL cable is disconnected or because the wrong type of cable is connected to the ATM port. |
| ATM 0.n is up, line protocol is up | The specified ATM subinterface is up and operating correctly. |
| ATM 0.n is administratively down, line protocol is down | The specified ATM subinterface has been disabled with the `shutdown` command. |
| ATM 0.n is down, line protocol is down | The specified ATM subinterface is down, possibly because the ATM line has been disconnected (by the service provider). |
| **For Fast Ethernet Interfaces** | |
| Fast Ethernet n is up, line protocol is up | The specified Fast Ethernet interface is connected to the network and operating correctly. |
| Fast Ethernet n is up, line protocol is down | The specified Fast Ethernet interface has been correctly configured and enabled, but the Ethernet cable might be disconnected from the LAN. |
| Fast Ethernet n is administratively down, line protocol is down | The specified Fast Ethernet interface has been disabled with the `shutdown` command, and the interface is disconnected. |
| **For Dialer Interfaces** | |
| Dialer n is up, line protocol is up | The specified dialer interface is up and operating correctly. |
| Dialer n is down, line protocol is down | • This is a standard message and may not indicate anything is actually wrong with the configuration.  
or  
• If you are having problems with the specified dialer interface, this can mean it is not operating, possibly because the interface has been brought down with the `shutdown` command, or the ADSL cable is disconnected. |
show atm interface Command

To display ATM-specific information about an ATM interface, use the `show atm interface atm 0` command from privileged EXEC mode, as shown in Example 12-3.

Example 12-3  Viewing Information About an ATM Interface

```
Router# show atm interface atm 0
Interface ATM0:
  AAL enabled: AAL5, Maximum VCs:11, Current VCCs:0
  Maximum Transmit Channels:0
  Max. Datagram Size:1528
  PLIM Type:INVALID - 640Kbps, Framing is INVALID,
  DS3 lbo:short, TX clocking:LINE
  0 input, 0 output, 0 IN fast, 0 OUT fast
  Avail bw = 640
  Config. is ACTIVE
```

Table 12-2 describes some of the fields shown in the command output.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ATM interface</td>
<td>Interface number. Always 0 for the Cisco Secure Router 520 Series router.</td>
</tr>
<tr>
<td>AAL enabled</td>
<td>Type of AAL enabled. The Cisco Secure Router 520 Series routers support AAL5.</td>
</tr>
<tr>
<td>Maximum VCs</td>
<td>Maximum number of virtual connections this interface supports.</td>
</tr>
<tr>
<td>Current VCCs</td>
<td>Number of active virtual channel connections (VCCs).</td>
</tr>
<tr>
<td>Maximum Transmit Channels</td>
<td>Maximum number of transmit channels.</td>
</tr>
<tr>
<td>Max Datagram Size</td>
<td>Configured maximum number of bytes in the largest datagram.</td>
</tr>
<tr>
<td>PLIM Type</td>
<td>Physical layer interface module (PLIM) type.</td>
</tr>
</tbody>
</table>

debug atm Commands

Use the `debug` commands to troubleshoot configuration problems that you might be having on your network. The `debug` commands provide extensive, informative displays to help you interpret any possible problems.

Guidelines for Using Debug Commands

Read the following guidelines before using debug commands to ensure appropriate results.

- All debug commands are entered in privileged EXEC mode.
- To view debugging messages on a console, enter the `logging console debugging` command.
- Most `debug` commands take no arguments.
Chapter 12      Troubleshooting

ATM Troubleshooting Commands

- To disable debugging, enter the **undebug all** command.
- To use **debug** commands during a Telnet session on your router, enter the **terminal monitor** command.

⚠️ **Caution**

Debugging is assigned a high priority in your router CPU process, and it can render your router unusable. For this reason, use **debug** commands only to troubleshoot specific problems. The best time to use debug commands is during periods of low network traffic so that other activity on the network is not adversely affected.

You can find additional information and documentation about the **debug** commands in the *Cisco IOS Debug Command Reference*.

**debug atm errors Command**

Use the **debug atm errors** command to display ATM errors. The **no** form of this command disables debugging output. **Example 12-4** shows a sample output.

**Example 12-4  Viewing ATM Errors**

```
Router# debug atm errors
ATM errors debugging is on
Router#
01:32:02:ATM(ATM0.2):VC(3) Bad SAP received 4500
01:32:04:ATM(ATM0.2):VC(3) Bad SAP received 4500
01:32:06:ATM(ATM0.2):VC(3) Bad SAP received 4500
01:32:08:ATM(ATM0.2):VC(3) Bad SAP received 4500
01:32:10:ATM(ATM0.2):VC(3) Bad SAP received 4500
```

**debug atm events Command**

Use the **debug atm events** command to display events that occur on the ATM interface processor and to diagnose problems in an ATM network. This command provides an overall picture of the stability of the network. The **no** form of this command disables debugging output.

If the interface is successfully communicating with the Digital Subscriber Line Access Multiplexer (DSLAM) at the telephone company, the modem state is 0x10. If the interface is not communicating with the DSLAM, the modem state is 0x8. **Example 12-5** shows an ADSL line that is up and training successfully. **Example 12-6** shows an ADSL line that is not communicating correctly. Note that the modem state does not transition to 0x10.

**Example 12-5  Viewing ATM Interface Processor Events—Success**

```
Router# debug atm events
Router#
00:02:57: DSL: Send ADSL_OPEN command.
00:02:57: DSL: Using subfunction 0xA
00:02:57: DSL: Using subfunction 0xA
00:02:57: DSL: Sent command 0x5
00:02:57: DSL: Received response: 0x26
00:02:57: DSL: Unexpected response 0x26
00:02:57: DSL: Send ADSL_OPEN command.
00:02:57: DSL: Using subfunction 0xA
00:02:57: DSL: Using subfunction 0xA
00:02:57: DSL: Sent command 0x5
```
Example 12-6  Viewing ATM Interface Processor Events—Failure

Router# debug atm events
Router#
00:02:57: DSL: Send ADSL_OPEN command.
00:02:57: DSL: Using subfunction 0xA
00:02:57: DSL: Using subfunction 0xA
00:02:57: DSL: Sent command 0x5
00:02:57: DSL: Received response: 0x26
00:02:57: DSL: Unexpected response 0x26
00:02:57: DSL: Send ADSL_OPEN command.
00:02:57: DSL: Using subfunction 0xA
00:02:57: DSL: Using subfunction 0xA
00:02:57: DSL: Sent command 0x5
00:03:00: DSL: 1: Modem state = 0x8
00:03:00: DSL: 1: Modem state = 0x8
00:03:00: DSL: 1: Modem state = 0x8
00:03:00: DSL: 1: Modem state = 0x8
00:03:00: DSL: 1: Modem state = 0x8
00:03:00: DSL: 1: Modem state = 0x8

**debug atm packet Command**

Use the **debug atm packet** command to display all process-level ATM packets for both outbound and inbound packets. The output reports information online when a packet is received or a transmission is attempted. The **no** form of this command disables debugging output.

⚠️ **Caution**

Because the **debug atm packet** command generates a significant amount of output for every packet processed, use it only when network traffic is low, so that other system activities are not adversely affected.

The command syntax is:

**debug atm packet [interface atm number [vcd vcd-number][vc vpi/vci number]]**

**no debug atm packet [interface atm number [vcd vcd-number][vc vpi/vci number]]**

where the keywords are defined as follows:

**interface atm number** (Optional) ATM interface or subinterface number.

**vcd vcd-number** (Optional) Number of the virtual circuit designator (VCD).

**vc vpi/vci number** VPI/VCI value of the ATM PVC.
Example 12-7 shows sample output for the `debug atm packet` command.

**Example 12-7 Viewing ATM Packet Processing**

```
Router# debug atm packet
Router# 01:23:48:ATM0(O):

**Software Upgrade Methods**

Several methods are available for upgrading software on the Cisco Secure Router 520 Series routers, including:

- Copy the new software image to flash memory over the LAN or WAN while the existing Cisco IOS software image is operating.
- Copy the new software image to flash memory over the LAN while the boot image (ROM monitor) is operating.
- Copy the new software image over the console port while in ROM monitor mode.
- From ROM monitor mode, boot the router from a software image that is loaded on a TFTP server. To use this method, the TFTP server must be on the same LAN as the router.
Recovering a Lost Password

To recover a lost enable or lost enable-secret password:

1. Change the Configuration Register
2. Reset the Router
3. Reset the Password and Save Your Changes (for lost enable secret passwords only)
4. Reset the Configuration Register Value

Note

Recovering a lost password is only possible when you are connected to the router through the console port. These procedures cannot be performed through a Telnet session.

Tip

See the “Hot Tips” section on Cisco.com for additional information on replacing enable secret passwords.

Change the Configuration Register

To change a configuration register, follow these steps:

Step 1
Connect an ASCII terminal or a PC running a terminal emulation program to the CONSOLE port on the rear panel of the router.

Step 2
Configure the terminal to operate at 9600 baud, 8 data bits, no parity, and 1 stop bit.

Step 3
At the privileged EXEC prompt (router_name #), enter the show version command to display the existing configuration register value (shown in bold at the bottom of this output example):

Router# show version
Cisco IOS Software, SR520 Software (SR520-ADVIPSERVICESK9-M), Experimental Version 12.4(20070608:212108) [rhsu2k-p121 190]

Recovering a Lost Password

Cisco SR520W-ADSL (MPC8272) processor (revision 0x100) with 118784K/12288K bytes of memory.

Processor board ID FOC09171CB7
MPC8272 CPU Rev: Part Number 0xC, Mask Number 0x10
4 FastEthernet interfaces
1 ATM interface
1 802.11 Radio
128K bytes of non-volatile configuration memory.
20480K bytes of processor board System flash (Intel Strataflash)

Configuration register is 0x0

Step 4 Record the setting of the configuration register.

Step 5 To enable the break setting (indicated by the value of bit 8 in the configuration register), enter the
config-register 0x01 command from privileged EXEC mode.

- Break enabled—Bit 8 is set to 0.
- Break disabled (default setting)—Bit 8 is set to 1.

---

Reset the Router

To reset the router, follow these steps:

Step 1 If break is enabled, go to Step 2. If break is disabled, turn the router off (O), wait 5 seconds, and turn it
on (I) again. Within 60 seconds, press the Break key. The terminal displays the ROM monitor prompt. Go to
Step 3.

Note Some terminal keyboards have a key labeled Break. If your keyboard does not have a Break key,
see the documentation that came with the terminal for instructions on how to send a break.

Step 2 Press break. The terminal displays the following prompt:

rommon 2>

Step 3 Enter confreg 0x2142 to reset the configuration register:

rommon 2> confreg 0x2142

Step 4 Initialize the router by entering the reset command:

rommon 2> reset

The router cycles its power, and the configuration register is set to 0x2142. The router uses the boot ROM
system image, indicated by the system configuration dialog:

--- System Configuration Dialog ---

Step 5 Enter no in response to the prompts until the following message is displayed:

Press RETURN to get started!

Step 6 Press Return. The following prompt appears:

Router>
Step 7 Enter the **enable** command to enter enable mode. Configuration changes can be made only in enable mode:

```
Router> enable
```

The prompt changes to the privileged EXEC prompt:

```
Router#
```

Step 8 Enter the **show startup-config** command to display an enable password in the configuration file:

```
Router# show startup-config
```

If you are recovering an enable password, do not perform the steps in the following “**Reset the Password and Save Your Changes**” section. Instead, complete the password recovery process by performing the steps in the “**Reset the Configuration Register Value**” section.

If you are recovering an enable secret password, it is not displayed in the **show startup-config** command output. Complete the password recovery process by performing the steps in the following “**Reset the Password and Save Your Changes**” section.

---

**Reset the Password and Save Your Changes**

To reset your password and save the changes, follow these steps:

---

**Step 1** Enter the **configure terminal** command to enter global configuration mode:

```
Router# configure terminal
```

**Step 2** Enter the **enable secret** command to reset the enable secret password in the router:

```
Router(config)# enable secret password
```

**Step 3** Enter **exit** to exit global configuration mode:

```
Router(config)# exit
```

**Step 4** Save your configuration changes:

```
Router# copy running-config startup-config
```

---

**Reset the Configuration Register Value**

To reset the configuration register value after you have recovered or reconfigured a password, follow these steps:

---

**Step 1** Enter the **configure terminal** command to enter global configuration mode:

```
Router# configure terminal
```

**Step 2** Enter the **configure register** command and the original configuration register value that you recorded.

```
Router(config)# config-reg value
```
Step 3  Enter `exit` to exit configuration mode:

```plaintext
Router(config)# exit
```

**Note**  To return to the configuration being used before you recovered the lost enable password, do not save the configuration changes before rebooting the router.

Step 4  Reboot the router, and enter the recovered password.
P A R T  4

Reference Information
Cisco IOS Software Basic Skills

Understanding how to use Cisco IOS software can save you time when you are configuring your router. If you need a refresher, take a few minutes to read this appendix.

This appendix contains the following sections:

- Configuring the Router from a PC
- Understanding Command Modes
- Getting Help
- Enable Secret Passwords and Enable Passwords
- Entering Global Configuration Mode
- Using Commands
- Saving Configuration Changes
- Summary
- Where to Go Next

If you are already familiar with Cisco IOS software, go to one of the following chapters:

- Chapter 1, “Basic Router Configuration”
- Chapter 2, “Sample Network Deployments”
- One of the configuration topic chapters described in Chapter 10, “Additional Configuration Options.”

Configuring the Router from a PC

You can configure your router from a PC connected through the console port using *terminal emulation* software. The PC uses this software to send commands to your router. Table A-1 lists some common types of this software, which are based on the type of PC you are using.

<table>
<thead>
<tr>
<th>PC Operating System</th>
<th>Software</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows 95, Windows 98, Windows 2000,</td>
<td>HyperTerm (included with Windows software),</td>
</tr>
<tr>
<td>Windows NT, Windows XP</td>
<td>ProComm Plus</td>
</tr>
</tbody>
</table>

Table A-1  Terminal Emulation Software
Understanding Command Modes

This section describes the Cisco IOS command mode structure. Each command mode supports specific Cisco IOS commands. For example, you can use the `interface type number` command only from global configuration mode.

The following Cisco IOS command modes are hierarchical. When you begin a router session, you are in user EXEC mode.

- User EXEC
- Privileged EXEC
- Global configuration

Table A-2 lists the command modes that are used in this guide, how to access each mode, the prompt you see in that mode, and how to exit to a mode or enter the next mode. Because each mode configures different router elements, you might need to enter and exit modes frequently. You can see a list of available commands for a particular mode by entering a question mark (?) at the prompt. For a description of each command, including syntax, see the Cisco IOS Release 12.3 documentation set.
### Table A-2  Command Modes Summary

<table>
<thead>
<tr>
<th>Mode</th>
<th>Access Method</th>
<th>Prompt</th>
<th>Exit and Entrance Method</th>
<th>About This Mode</th>
</tr>
</thead>
</table>
| User EXEC             | Begin a session with your router.                  | Router>     | To exit a router session, enter the **logout** command.                                    | Use this mode for these tasks:  
  - Change terminal settings.  
  - Perform basic tests.  
  - Display system information. |
| Privileged EXEC       | Enter the **enable** command from user EXEC mode.  | Router#     | • To exit to user EXEC mode, enter the **disable** command.  
  • To enter global configuration mode, enter the **configure** command.                                                                                           | Use this mode for these tasks:  
  - Configure your router operating parameters.  
  - Perform the verification steps shown in this guide.  
  To prevent unauthorized changes to your router configuration, access to this mode should be protected with a password as described in “Enable Secret Passwords and Enable Passwords” later in this chapter. |
| Global configuration  | Enter the **configure** command from privileged EXEC mode. | Router (config)# | • To exit to privileged EXEC mode, enter the **exit** or **end** command, or press Ctrl-Z.  
  • To enter interface configuration mode, enter the **interface** command.  
  • To enter interface configuration mode, specify a subinterface with the **interface** command.                                                                 | Use this mode to configure parameters that apply to your router as a whole.  
  Also, you can access the following modes, which are described later in this table:  
  - Interface configuration  
  - Router configuration  
  - Line configuration |
| Interface configuration| Enter the **interface** command (with a specific interface, such as **interface atm 0**) from global configuration mode. | Router (config-if)# | • To exit to global configuration mode, enter the **exit** command.  
  • To exit to privileged EXEC mode, enter the **end** command, or press Ctrl-Z.  
  • To enter subinterface configuration mode, specify a subinterface with the **interface** command.                                                                 | Use this mode to configure parameters for the router Ethernet and serial interfaces or subinterfaces. |

Table A-2  Command Modes Summary (continued)

<table>
<thead>
<tr>
<th>Mode</th>
<th>Access Method</th>
<th>Prompt</th>
<th>Exit and Entrance Method</th>
<th>About This Mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router configuration</td>
<td>Enter one of the router commands followed by the appropriate keyword, for example router rip, from global configuration mode.</td>
<td>Router (config-router)#</td>
<td>• To exit to global configuration mode, enter the exit command.</td>
<td>Use this mode to configure an IP routing protocol.</td>
</tr>
<tr>
<td>Line configuration</td>
<td>Enter the line command with the desired line number and optional line type, for example, line 0, from global configuration mode.</td>
<td>Router (config-line)#</td>
<td>• To exit to global configuration mode, enter the exit command.</td>
<td>Use this mode to configure parameters for the terminal line.</td>
</tr>
</tbody>
</table>

Getting Help

You can use the question mark (?) and arrow keys to help you enter commands.

For a list of available commands at that command mode, enter a question mark:

Router> ?
access-enable  Create a temporary access-list entry
access-profile Apply user-profile to interface
clear          Reset functions
...

To complete a command, enter a few known characters followed by a question mark (with no space):

Router> s?
  * s=show set show slip systat

For a list of command variables, enter the command followed by a space and a question mark:

Router> show ?
...
clock          Display the system clock
dialer         Dialer parameters and statistics
exception      exception information
...

To redisplay a command you previously entered, press the Up Arrow key. You can continue to press the Up Arrow key for more commands.

Enable Secret Passwords and Enable Passwords

By default, the router ships without password protection. Because many privileged EXEC commands are used to set operating parameters, you should password-protect these commands to prevent unauthorized use.
You can use two commands to do this:

- **enable secret password**—A very secure, encrypted password
- **enable password**—A less secure, unencrypted local password

Both the `enable` and `enable secret` passwords control access to various privilege levels (0 to 15). The `enable` password is intended for local use and is thus unencrypted. The `enable secret` password is intended for network use; that is, in environments where the password crosses the network or is stored on a TFTP server. You must enter an `enable secret` or `enable` password with a privilege level of 1 to gain access to privileged EXEC mode commands.

For maximum security, the passwords should be different. If you enter the same password for both during the setup process, your router accepts the passwords, but warns you that they should be different.

An `enable secret` password can contain from 1 to 25 uppercase and lowercase alphanumeric characters. An `enable` password can contain any number of uppercase and lowercase alphanumeric characters. In both cases, a number cannot be the first character. Spaces are also valid password characters; for example, *two words* is a valid password. Leading spaces are ignored; trailing spaces are recognized.

---

## Entering Global Configuration Mode

To make any configuration changes to your router, you must be in global configuration mode. This section describes how to enter global configuration mode while using a terminal or PC that is connected to your router console port.

To enter global configuration mode, follow these steps:

---

**Step 1**

After your router boots up, enter the `enable` or `enable secret` command:

```
Router> enable
```

**Step 2**

If you have configured your router with an enable password, enter it when you are prompted.

The enable password does not appear on the screen when you enter it. This example shows how to enter privileged EXEC mode:

```
Password: enable_password
Router#
```

Privileged EXEC mode is indicated by the `#` in the prompt. You can now make changes to your router configuration.

**Step 3**

Enter the `configure terminal` command to enter global configuration mode:

```
Router# configure terminal
Router(config)#
```

You can now make changes to your router configuration.

---

## Using Commands

This section provides some tips about entering Cisco IOS commands at the command-line interface (CLI).
Abbreviating Commands

You only have to enter enough characters for the router to recognize the command as unique. This example shows how to enter the `show version` command:

```
Router # sh v
```

Undoing Commands

If you want to disable a feature or undo a command you entered, you can enter the keyword `no` before most commands; for example, `no ip routing`.

Command-Line Error Messages

Table A-3 lists some error messages that you might encounter while using the CLI to configure your router.

<table>
<thead>
<tr>
<th>Error Message</th>
<th>Meaning</th>
<th>How to Get Help</th>
</tr>
</thead>
<tbody>
<tr>
<td>% Ambiguous command: &quot;show con&quot;</td>
<td>You did not enter enough characters for your router to recognize the command.</td>
<td>Reenter the command, followed by a question mark (?) with no space between the command and the question mark. The possible keywords that you can enter with the command are displayed.</td>
</tr>
<tr>
<td>% Incomplete command.</td>
<td>You did not enter all of the keywords or values required by this command.</td>
<td>Reenter the command, followed by a question mark (?) with no space between the command and the question mark. The possible keywords that you can enter with the command are displayed.</td>
</tr>
<tr>
<td>% Invalid input detected at '^' marker.</td>
<td>You entered the command incorrectly. The error occurred where the caret mark (^) appears.</td>
<td>Enter a question mark (?) to display all of the commands that are available in this particular command mode.</td>
</tr>
</tbody>
</table>

Saving Configuration Changes

You need to enter the `copy running-config startup-config` command to save your configuration changes to nonvolatile RAM (NVRAM) so that they are not lost if there is a system reload or power outage. This example shows how to use this command to save your changes:

```
Router# copy running-config startup-config
Destination filename [startup-config]?
```
Press **Return** to accept the default destination filename `startup-config`, or enter your desired destination filename and press **Return**.

It might take a minute or two to save the configuration to NVRAM. After the configuration has been saved, the following message appears:

```
Building configuration...
Router#
```

### Summary

Now that you have reviewed some Cisco IOS software basics, you can begin to configure your router. Remember:

- You can use the question mark (?) and arrow keys to help you enter commands.
- Each command mode restricts you to a set of commands. If you are having difficulty entering a command, check the prompt, and then enter the question mark (?) for a list of available commands. You might be in the wrong command mode or using the wrong syntax.
- If you want to disable a feature, enter the keyword `no` before the command; for example, **no ip routing**.
- Save your configuration changes to NVRAM so that they are not lost if there is a system reload or power outage.

### Where to Go Next

To configure your router, go to Chapter 1, “Basic Router Configuration,” and Chapter 2, “Sample Network Deployments.”
Where to Go Next
This appendix contains conceptual information that may be useful to Internet service providers or network administrators when they configure Cisco routers. To review some typical network scenarios, see Chapter 2, “Sample Network Deployments.” For information on additional details or configuration topics, see Chapter 10, “Additional Configuration Options.”

The following topics are included in this appendix:

- ADSL
- Network Protocols
- Routing Protocol Options
- PPP Authentication Protocols
- TACACS+
- Network Interfaces
- NAT
- Easy IP (Phase 1)
- Easy IP (Phase 2)
- QoS
- Access Lists

**ADSL**

ADSL is a technology that allows both data and voice to be transmitted over the same line. It is a packet-based network technology that allows high-speed transmission over twisted-pair copper wire on the local loop (“last mile”) between a network service provider (NSP) central office and the customer site, or on local loops created within either a building or a campus.

The benefit of ADSL over a serial or dialup line is that it is always on and always connected, increasing bandwidth and lowering the costs compared with a dialup or leased line. ADSL technology is asymmetric in that it allows more bandwidth from an NSP central office to the customer site than from the customer site to the central office. This asymmetry, combined with always-on access (which eliminates call setup), makes ADSL ideal for Internet and intranet surfing, video on demand, and remote LAN access.
Network Protocols

Network protocols enable the network to pass data from its source to a specific destination over LAN or WAN links. Routing address tables are included in the network protocols to provide the best path for moving the data through the network.

IP

The best-known Transmission Control Protocol/Internet Protocol (TCP/IP) at the internetwork layer is IP, which provides the basic packet delivery service for all TCP/IP networks. In addition to the physical node addresses, the IP protocol implements a system of logical host addresses called IP addresses. The IP addresses are used by the internetwork and higher layers to identify devices and to perform internetwork routing. The Address Resolution Protocol (ARP) enables IP to identify the physical address that matches a given IP address.

IP is used by all protocols in the layers above and below it to deliver data, which means that all TCP/IP data flows through IP when it is sent and received regardless of its final destination.

IP is a connectionless protocol, which means that IP does not exchange control information (called a *handshake*) to establish an end-to-end connection before transmitting data. In contrast, a connection-oriented protocol exchanges control information with the remote computer to verify that it is ready to receive data before sending it. When the handshaking is successful, the computers have established a connection. IP relies on protocols in other layers to establish the connection if connection-oriented services are required.

Internet Packet Exchange (IPX) exchanges routing information using Routing Information Protocol (RIP), a dynamic distance-vector routing protocol. RIP is described in more detail in the following subsections.

Routing Protocol Options

Routing protocols include Routing Information Protocol (RIP).

RIP

RIP is an associated protocol for IP, and is widely used for routing protocol traffic over the Internet. RIP is a distance-vector routing protocol, which means that it uses distance (hop count) as its metric for route selection. *Hop count* is the number of routers that a packet must traverse to reach its destination. For example, if a particular route has a hop count of 2, then a packet must traverse two routers to reach its destination.

By default, RIP routing updates are broadcast every 30 seconds. You can reconfigure the interval at which the routing updates are broadcast. You can also configure triggered extensions to RIP so that routing updates are sent only when the routing database is updated. For more information on triggered extensions to RIP, see the Cisco IOS Release 12.3 documentation set.
PPP Authentication Protocols

The Point-to-Point Protocol (PPP) encapsulates network layer protocol information over point-to-point links.

PPP originally emerged as an encapsulation protocol for transporting IP traffic over point-to-point links. PPP also established a standard for the assignment and management of IP addresses, asynchronous (start/stop) and bit-oriented synchronous encapsulation, network protocol multiplexing, link configuration, link quality testing, error detection, and option negotiation for such capabilities as network-layer address negotiation and data-compression negotiation. PPP supports these functions by providing an extensible Link Control Protocol (LCP) and a family of Network Control Protocols (NCPs) to negotiate optional configuration parameters and facilities.

The current implementation of PPP supports two security authentication protocols to authenticate a PPP session:

- Password Authentication Protocol (PAP)
- Challenge Handshake Authentication Protocol (CHAP)

PPP with PAP or CHAP authentication is often used to inform the central site which remote routers are connected to it.

PAP

PAP uses a two-way handshake to verify the passwords between routers. To illustrate how PAP works, imagine a network topology in which a remote office Cisco router is connected to a corporate office Cisco router. After the PPP link is established, the remote office router repeatedly sends a configured username and password until the corporate office router accepts the authentication.

PAP has the following characteristics:

- The password portion of the authentication is sent across the link in clear text (not scrambled or encrypted).
- PAP provides no protection from playback or repeated trial-and-error attacks.
- The remote office router controls the frequency and timing of the authentication attempts.

CHAP

CHAP uses a three-way handshake to verify passwords. To illustrate how CHAP works, imagine a network topology in which a remote office Cisco router is connected to a corporate office Cisco router.

After the PPP link is established, the corporate office router sends a challenge message to the remote office router. The remote office router responds with a variable value. The corporate office router checks the response against its own calculation of the value. If the values match, the corporate office router accepts the authentication. The authentication process can be repeated any time after the link is established.

CHAP has the following characteristics:

- The authentication process uses a variable challenge value rather than a password.
- CHAP protects against playback attack through the use of the variable challenge value, which is unique and unpredictable. Repeated challenges limit the time of exposure to any single attack.
- The corporate office router controls the frequency and timing of the authentication attempts.
Note

We recommend using CHAP because it is the more secure of the two protocols.

TACACS+

Cisco Secure Router 520 Series routers support the Terminal Access Controller Access Control System Plus (TACACS+) protocol through Telnet. TACACS+ is a Cisco proprietary authentication protocol that provides remote access authentication and related network security services, such as event logging. User passwords are administered in a central database rather than in individual routers. TACACS+ also provides support for separate modular authentication, authorization, and accounting (AAA) facilities that are configured at individual routers.

Network Interfaces

This section describes the network interface protocols that Cisco Secure Router 520 Series routers support. The following network interface protocols are supported:

- Ethernet
- ATM for DSL

Ethernet

Ethernet is a baseband LAN protocol that transports data and voice packets to the WAN interface using carrier sense multiple access collision detect (CSMA/CD). The term is now often used to refer to all CSMA/CD LANs. Ethernet was designed to serve in networks with sporadic, occasionally heavy traffic requirements, and the IEEE 802.3 specification was developed in 1980 based on the original Ethernet technology.

Under the Ethernet CSMA/CD media-access process, any host on a CSMA/CD LAN can access the network at any time. Before sending data, CSMA/CD hosts listen for traffic on the network. A host wanting to send data waits until it detects no traffic before it transmits. Ethernet allows any host on the network to transmit whenever the network is quiet. A collision occurs when two hosts listen for traffic, hear none, and then transmit simultaneously. In this situation, both transmissions are damaged, and the hosts must retransmit at some later time. Algorithms determine when the colliding hosts should retransmit.

ATM for DSL

Asynchronous Transfer Mode (ATM) is a high-speed multiplexing and switching protocol that supports multiple traffic types, including voice, data, video, and imaging.

ATM is composed of fixed-length cells that switch and multiplex all information for the network. An ATM connection is simply used to transfer bits of information to a destination router or host. The ATM network is considered a LAN with high bandwidth availability. Unlike a LAN, which is connectionless, ATM requires certain features to provide a LAN environment to the users.

Each ATM node must establish a separate connection to every node in the ATM network that it needs to communicate with. All such connections are established through a permanent virtual circuit (PVC).
PVC

A PVC is a connection between remote hosts and routers. A PVC is established for each ATM end node with which the router communicates. The characteristics of the PVC that are established when it is created are set by the ATM adaptation layer (AAL) and the encapsulation type. An AAL defines the conversion of user information into cells. An AAL segments upper-layer information into cells at the transmitter and reassembles the cells at the receiver.

Cisco routers support the AAL5 format, which provides a streamlined data transport service that functions with less overhead and affords better error detection and correction capabilities than AAL3/4. AAL5 is typically associated with variable bit rate (VBR) traffic and unspecified bit rate (UBR) traffic.

ATM encapsulation is the wrapping of data in a particular protocol header. The type of router that you are connecting to determines the type of ATM PVC encapsulation.

The routers support the following encapsulation types for ATM PVCs:

- LLC/SNAP (RFC 1483)
- VC-MUX (RFC 1483)
- PPP (RFC 2364)

Each PVC is considered a complete and separate link to a destination node. Users can encapsulate data as needed across the connection. The ATM network disregards the contents of the data. The only requirement is that data be sent to the ATM subsystem of the router in a manner that follows the specific AAL format.

Dialer Interface

A dialer interface assigns PPP features (such as authentication and IP address assignment method) to a PVC. Dialer interfaces are used when configuring PPP over ATM.

Dialer interfaces can be configured independently of any physical interface and applied dynamically as needed.

NAT

Network Address Translation (NAT) provides a mechanism for a privately addressed network to access registered networks, such as the Internet, without requiring a registered subnet address. This mechanism eliminates the need for host renumbering and allows the same IP address range to be used in multiple intranets.

NAT is configured on the router at the border of an inside network (a network that uses nonregistered IP addresses) and an outside network (a network that uses a globally unique IP address; in this case, the Internet). NAT translates the inside local addresses (the nonregistered IP addresses assigned to hosts on the inside network) into globally unique IP addresses before sending packets to the outside network.

With NAT, the inside network continues to use its existing private or obsolete addresses. These addresses are converted into legal addresses before packets are forwarded onto the outside network. The translation function is compatible with standard routing; the feature is required only on the router connecting the inside network to the outside domain.
Translations can be static or dynamic. A static address translation establishes a one-to-one mapping between the inside network and the outside domain. Dynamic address translations are defined by describing the local addresses to be translated and the pool of addresses from which to allocate outside addresses. Allocation occurs in numeric order, and multiple pools of contiguous address blocks can be defined.

NAT eliminates the need to readdress all hosts that require external access, saving time and money. It also conserves addresses through application port-level multiplexing. With NAT, internal hosts can share a single registered IP address for all external communications. In this type of configuration, relatively few external addresses are required to support many internal hosts, thus conserving IP addresses.

Because the addressing scheme on the inside network may conflict with registered addresses already assigned within the Internet, NAT can support a separate address pool for overlapping networks and translate as appropriate.

Easy IP (Phase 1)

The Easy IP (Phase 1) feature combines Network Address Translation (NAT) and PPP/Internet Protocol Control Protocol (IPCP). This feature enables a Cisco router to automatically negotiate its own registered WAN interface IP address from a central server and to enable all remote hosts to access the Internet using this single registered IP address. Because Easy IP (Phase 1) uses existing port-level multiplexed NAT functionality within Cisco IOS software, IP addresses on the remote LAN are invisible to the Internet.

The Easy IP (Phase 1) feature combines NAT and PPP/IPCP. With NAT, the router translates the nonregistered IP addresses used by the LAN devices into the globally unique IP address used by the dialer interface. The ability of multiple LAN devices to use the same globally unique IP address is known as overloading. NAT is configured on the router at the border of an inside network (a network that uses nonregistered IP addresses) and an outside network (a network that uses a globally unique IP address; in this case, the Internet).

With PPP/IPCP, Cisco routers automatically negotiate a globally unique (registered) IP address for the dialer interface from the ISP router.

Easy IP (Phase 2)

The Easy IP (Phase 2) feature combines Dynamic Host Configuration Protocol (DHCP) server and relay. DHCP is a client-server protocol that enables devices on an IP network (the DHCP clients) to request configuration information from a DHCP server. DHCP allocates network addresses from a central pool on an as-needed basis. DHCP is useful for assigning IP addresses to hosts connected to the network temporarily or for sharing a limited pool of IP addresses among a group of hosts that do not need permanent IP addresses.

DHCP frees you from having to assign an IP address to each client manually. DHCP configures the router to forward UDP broadcasts, including IP address requests, from DHCP clients. DHCP allows for increased automation and fewer network administration problems by:

- Eliminating the need for the manual configuration of individual computers, printers, and shared file systems
- Preventing the simultaneous use of the same IP address by two clients
- Allowing configuration from a central site
QoS

This section describes Quality of Service (QoS) parameters, including the following:

- **IP Precedence**
- **PPP Fragmentation and Interleaving**
- **CBWFQ**
- **RSVP**
- **Low Latency Queuing**

QoS refers to the capability of a network to provide better service to selected network traffic over various technologies, including ATM, Ethernet and IEEE 802.1 networks, and IP-routed networks that may use any or all of these underlying technologies. Primary goals of QoS include dedicated bandwidth, controlled jitter and latency (required by some real-time and interactive traffic), and improved loss characteristics. QoS technologies provide the elemental building blocks for future business applications in campus, WAN, and service provider networks.

QoS must be configured throughout your network, not just on your router running VoIP, to improve voice network performance. Not all QoS techniques are appropriate for all network routers. Edge routers and backbone routers in your network do not necessarily perform the same operations; the QoS tasks they perform might differ as well. To configure your IP network for real-time voice traffic, you need to consider the functions of both edge and backbone routers in your network.

QoS software enables complex networks to control and predictably service a variety of networked applications and traffic types. Almost any network can take advantage of QoS for optimum efficiency, whether it is a small corporate network, an Internet service provider, or an enterprise network.

**IP Precedence**

You can partition traffic in up to six classes of service using IP Precedence (two others are reserved for internal network use). The queuing technologies throughout the network can then use this signal to expedite handling.

Features such as policy-based routing and committed access rate (CAR) can be used to set precedence based on extended access-list classification. This allows considerable flexibility for precedence assignment, including assignment by application or user, by destination and source subnet, and so on. Typically this functionality is deployed as close to the edge of the network (or administrative domain) as possible, so that each subsequent network element can provide service based on the determined policy.

IP Precedence can also be set in the host or network client with the signaling used optionally. IP Precedence enables service classes to be established using existing network queuing mechanisms (such as class-based weighted fair queuing [CBWFQ]) with no changes to existing applications or complicated network requirements.

**PPP Fragmentation and Interleaving**

With multiclass multilink PPP interleaving, large packets can be multilink-encapsulated and fragmented into smaller packets to satisfy the delay requirements of real-time voice traffic; small real-time packets, which are not multilink encapsulated, are transmitted between fragments of the large packets. The interleaving feature also provides a special transmit queue for the smaller, delay-sensitive packets, enabling them to be transmitted earlier than other flows. Interleaving provides the delay bounds for delay-sensitive voice packets on a slow link that is used for other best-effort traffic.
In general, multilink PPP with interleaving is used in conjunction with CBWFQ and RSVP or IP Precedence to ensure voice packet delivery. Use multilink PPP with interleaving and CBWFQ to define how data is managed; use Resource Reservation Protocol (RSVP) or IP Precedence to give priority to voice packets.

CBWFQ

In general, class-based weighted fair queuing (CBWFQ) is used in conjunction with multilink PPP and interleaving and RSVP or IP Precedence to ensure voice packet delivery. CBWFQ is used with multilink PPP to define how data is managed; RSVP or IP Precedence is used to give priority to voice packets.

There are two levels of queuing: ATM queues and Cisco IOS queues. CBWFQ is applied to Cisco IOS queues. A first-in-first-out (FIFO) Cisco IOS queue is automatically created when a PVC is created. If you use CBWFQ to create classes and attach them to a PVC, a queue is created for each class.

CBWFQ ensures that queues have sufficient bandwidth and that traffic gets predictable service. Low-volume traffic streams are preferred; high-volume traffic streams share the remaining capacity, obtaining equal or proportional bandwidth.

RSVP

RSVP enables routers to reserve enough bandwidth on an interface to ensure reliability and quality performance. RSVP allows end systems to request a particular QoS from the network. Real-time voice traffic requires network consistency. Without consistent QoS, real-time traffic can experience jitter, insufficient bandwidth, delay variations, or information loss. RSVP works in conjunction with current queuing mechanisms. It is up to the interface queuing mechanism (such as CBWFQ) to implement the reservation.

RSVP works well on PPP, HDLC, and similar serial-line interfaces. It does not work well on multi-access LANs. RSVP can be equated to a dynamic access list for packet flows.

You should configure RSVP to ensure QoS if the following conditions describe your network:

- Small-scale voice network implementation
- Links slower than 2 Mbps
- Links with high utilization
- Need for the best possible voice quality

Low Latency Queuing

Low latency queuing (LLQ) provides a low-latency strict priority transmit queue for real-time traffic. Strict priority queuing allows delay-sensitive data to be dequeued and sent first (before packets in other queues are dequeued), giving delay-sensitive data preferential treatment over other traffic.
Access Lists

With basic standard and static extended access lists, you can approximate session filtering by using the established keyword with the `permit` command. The established keyword filters TCP packets based on whether the ACK or RST bits are set. (Set ACK or RST bits indicate that the packet is not the first in the session and the packet therefore belongs to an established session.) This filter criterion would be part of an access list applied permanently to an interface.
The ROM monitor firmware runs when the router is powered up or reset. The firmware helps to initialize the processor hardware and boot the operating system software. You can use the ROM monitor to perform certain configuration tasks, such as recovering a lost password or downloading software over the console port. If there is no Cisco IOS software image loaded on the router, the ROM monitor runs the router.

This appendix contains the following sections:
- Entering the ROM Monitor
- ROM Monitor Commands
- Command Descriptions
- Disaster Recovery with TFTP Download
- Configuration Register
- Console Download
- Debug Commands
- Exiting the ROM Monitor

## Entering the ROM Monitor

To use the ROM monitor, you must be using a terminal or PC that is connected to the router over the console port.

Perform these steps to configure the router to boot up in ROM monitor mode the next time it is rebooted:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enters privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 3 config-reg 0x0</td>
<td>Resets the configuration register.</td>
</tr>
</tbody>
</table>
Timesaver

Break (system interrupt) is always enabled for 60 seconds after the router reboots, regardless of whether it is set to on or off in the configuration register. During this 60-second window, you can break to the ROM monitor prompt by pressing the Break key.

ROM Monitor Commands

Enter ? or help at the ROM monitor prompt to display a list of available commands and options, as follows:

```
rommon 1 > ?
alias set and display aliases command
boot boot up an external process
break set/show/clear the breakpoint
confreg configuration register utility
cont continue executing a downloaded image
context display the context of a loaded image
cookie display contents of cookie PROM in hex
copy Copy a file-copy [-b <buffer_size>] <src_file> <dst_file>
delete Delete file(s)-delete <filenames ...>
dir List files in directories-dir <directory>
dis display instruction stream
dnld serial download a program module
format Format a filesystem-format <filesystem>
frame print out a selected stack frame
fsck Check filesystem consistency-fsck <filesystem>
help monitor builtin command help
history monitor command history
meminfo main memory information
mkdir Create dir(s)-mkdir <dirnames ...>
more Concatenate (type) file(s)-cat <filenames ...>
rename Rename a file-rename <old_name> <new_name>
repeat repeat a monitor command
reset system reset
rmdir Remove a directory
set display the monitor variables
stack produce a stack trace
sync write monitor environment to NVRAM
sysret print out info from last system return
tftpdnld tftp image download
unalias unset an alias
unset unset a monitor variable
xmodem x/ymodem image download
```
Commands are case sensitive. You can halt any command by pressing the Break key on a terminal. If you are using a PC, most terminal emulation programs halt a command when you press the Ctrl and the Break keys at the same time. If you are using another type of terminal emulator or terminal emulation software, see the documentation for that product for information on how to send a Break command.

## Command Descriptions

Table C-1 describes the most commonly used ROM monitor commands.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>help or ?</td>
<td>Displays a summary of all available ROM monitor commands.</td>
</tr>
</tbody>
</table>
| -? | Displays information about command syntax; for example:  
  `rommon 16 > dis -?
  usage : dis [addr] [length]`
  The output for this command is slightly different for the `xmodem` download command:  
  `rommon 11 > xmodem -?
  xmodem: illegal option -- ?
  usage: xmodem [-cyrxu] <destination filename>
  -c CRC-16
  -y ymodem-batch protocol
  -r copy image to dram for launch
  -x do not launch on download completion
  -u upgrade ROMMON, System will reboot after upgrade`
| reset or i | Resets and initializes the router, similar to a power up. |
| dir device: | Lists the files on the named device; for example, flash memory files:  
  `rommon 4 > dir flash:
  Directory of flash:/
  2 -rwx 10283208 <date> c870-advsecurityk9-mz
  9064448 bytes available (10289152 bytes used)`
| boot commands | For more information about the ROM monitor boot commands, see the *Cisco IOS Configuration Fundamentals and Network Management Guide*. |
| b | Boots the first image in flash memory. |
| b flash: [filename] | Attempts to boot the image directly from the first partition of flash memory. If you do not enter a filename, this command will boot this first image in flash memory. |

## Disaster Recovery with TFTP Download

The standard way to load new software on your router is to use the `copy tftp flash` privileged EXEC command from the Cisco IOS software command-line interface (CLI). However, if the router is unable to boot Cisco IOS software, you can load new software while in ROM monitor mode.

This section describes how to load a Cisco IOS software image from a remote TFTP server to the router flash memory. Use the `tftpdnld` command only for disaster recovery, because it erases all existing data in flash memory before downloading a new software image to the router.
**TFTP Download Command Variables**

This section describes the system variables that can be set in ROM monitor mode and that are used during the TFTP download process. There are both required variables and optional variables.

*Note*  The commands described in this section are case sensitive and must be entered exactly as shown.

### Required Variables

These variables must be set with these commands before you use the `tftpdnld` command:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP address of the router.</td>
<td><code>IP_ADDRESS= ip_address</code></td>
</tr>
<tr>
<td>Subnet mask of the router.</td>
<td><code>IP_SUBNET_MASK= ip_address</code></td>
</tr>
<tr>
<td>IP address of the default gateway of the router.</td>
<td><code>DEFAULT_GATEWAY= ip_address</code></td>
</tr>
<tr>
<td>IP address of the TFTP server from which the software will be downloaded.</td>
<td><code>TFTP_SERVER= ip_address</code></td>
</tr>
<tr>
<td>Name of the file that will be downloaded to the router.</td>
<td><code>TFTP_FILE= filename</code></td>
</tr>
</tbody>
</table>

### Optional Variables

These variables can be set with these commands before using the `tftpdnld` command:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configures how the router displays file download progress. 0—No progress is displayed. 1—Exclamation points (!!!) are displayed to indicate file download progress. This is the default setting. 2—Detailed progress is displayed during the file download process; for example:</td>
<td><code>TFTP_VERBOSE= setting</code></td>
</tr>
</tbody>
</table>
| • Initializing interface.  
• Interface link state up.  
• ARPing for 1.4.0.1  
• ARP reply for 1.4.0.1 received. MAC address 00:00:0c:07:ac:01 |  |
Using the TFTP Download Command

Perform these steps in ROM monitor mode to download a file through TFTP:

**Step 1** Use the appropriate commands to enter all the required variables and any optional variables described in preceding sections.

**Step 2** Enter the `tftpdnld` command as follows:

```
rommon 1 > tftpdnld
```

You will see output similar to the following:

```
IP_ADDRESS: 10.3.6.7
IP_SUBNET_MASK: 255.255.0.0
DEFAULT_GATEWAY: 10.3.0.1
TFTP_SERVER: 192.168.254.254
TFTP_FILE: sr520-adipservicesk9-mz
Do you wish to continue? y/n: [n]:
```

**Step 3** If you are sure that you want to continue, enter `y` in response to the question in the output:

```
Do you wish to continue? y/n: [n]:y
```

The router begins to download the new file.

If you mistakenly entered yes, you can enter `Ctrl-C` or `Break` to stop the transfer before the flash memory is erased.

Configuration Register

The virtual configuration register is in nonvolatile RAM (NVRAM) and has the same functionality as other Cisco routers. You can view or modify the virtual configuration register from either the ROM monitor or the operating system software. Within the ROM monitor, you can change the configuration register by entering the register value in hexadecimal format, or by allowing the ROM monitor to prompt you for the setting of each bit.

- **TFTP_RETRY_COUNT**
  - `retry_times`
  - Number of times the router attempts ARP and TFTP download. The default is 7.

- **TFTP_TIMEOUT**
  - `time`
  - Length of time, in seconds, before the download process times out. The default is 2,400 seconds (40 minutes).

- **TFTP_CHECKSUM**
  - `setting`
  - Whether or not the router performs a checksum test on the downloaded image:
    - 1—Checksum test is performed.
    - 0—No checksum test is performed.
Changing the Configuration Register Manually

To change the virtual configuration register from the ROM monitor manually, enter the `confreg` command followed by the new value of the register in hexadecimal format, as shown in the following example:

```
rommon 1 > confreg 0x2101
```

You must reset or power cycle for new config to take effect

```
rommon 2 >
```

The value is always interpreted as hexadecimal. The new virtual configuration register value is written into NVRAM but does not take effect until you reset or reboot the router.

Changing the Configuration Register Using Prompts

Entering the `confreg` command without an argument displays the contents of the virtual configuration register and a prompt to alter the contents by describing the meaning of each bit.

In either case, the new virtual configuration register value is written into NVRAM but does not take effect until you reset or reboot the router.

The following display shows an example of entering the `confreg` command:

```
rommon 7> confreg

Configuration Summary
enabled are:
console baud: 9600
boot: the ROM Monitor

do you wish to change the configuration? y/n [n]: y
enable "diagnostic mode"? y/n [n]: y
enable "use net in IP broadcast address"? y/n [n]:
enable "load rom after netboot fails"? y/n [n]:
enable "use all zero broadcast"? y/n [n]:
enable "break/abort has effect"? y/n [n]:
enable "ignore system config info"? y/n [n]:
change console baud rate? y/n [n]: y
enter rate: 0 = 9600, 1 = 4800, 2 = 1200, 3 = 2400 [0]: 0
change the boot characteristics? y/n [n]: y
enter to boot:
0 = ROM Monitor
1 = the boot helper image
2-15 = boot system
[0]: 0

Configuration Summary
enabled are:
diagnostic mode
console baud: 9600
boot: the ROM Monitor

do you wish to change the configuration? y/n [n]:
```

You must reset or power cycle for new config to take effect.
Console Download

You can use console download, a ROM monitor function, to download either a software image or a configuration file over the router console port. After download, the file is either saved to the mini-flash memory module or to main memory for execution (image files only).

Use console download when you do not have access to a TFTP server.

**Note** If you want to download a software image or a configuration file to the router over the console port, you must use the ROM monitor `dnld` command.

**Note** If you are using a PC to download a Cisco IOS image over the router console port at 115,200 bps, ensure that the PC serial port is using a 16550 universal asynchronous transmitter/receiver (UART). If the PC serial port is not using a 16550 UART, we recommend using a speed of 38,400 bps or less when downloading a Cisco IOS image over the console port.

Command Description

The following are the syntax and descriptions for the `xmodem` console download command:

```
xmodem [-cyrx] destination_file_name
```

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-c</td>
<td>Optional. Performs the download using 16-bit cyclic redundancy check (CRC-16) error checking to validate packets. Default is 8-bit CRC.</td>
</tr>
</tbody>
</table>
| -y     | Optional. Sets the router to perform the download using Ymodem protocol. The default is Xmodem protocol. The protocols differ as follows:  
  - Xmodem supports a 128-block transfer size. Ymodem supports a 1024-block transfer size.  
  - Ymodem uses CRC-16 error checking to validate each packet. Depending on the device that the software is being downloaded from, this function might not be supported by Xmodem. |
| -r     | Optional. Image is loaded into DRAM for execution. The default is to load the image into flash memory. |
| -x     | Optional. Image is loaded into DRAM without being executed. |

`destination_file_name` Name of the system image file or the system configuration file. In order for the router to recognize it, the name of the configuration file must be `router_config`.

Follow these steps to run Xmodem:

**Step 1** Move the image file to the local drive where Xmodem will execute.

**Step 2** Enter the `xmodem` command.
Error Reporting

Because the ROM monitor console download uses the console to perform the data transfer, when an error occurs during a data transfer, error messages are only displayed on the console once the data transfer is terminated.

If you have changed the baud rate from the default rate, the error message is followed by a message telling you to restore the terminal to the baud rate specified in the configuration register.

Debug Commands

Most ROM monitor debugging commands are functional only when Cisco IOS software has crashed or is halted. If you enter a debugging command and Cisco IOS crash information is not available, you see the following error message:

"xxx: kernel context state is invalid, can not proceed."

The following are ROM monitor debugging commands:

- **stack** or **k**—Produces a stack trace; for example:

  ```
  rommon 6> stack
  Stack trace:
  PC = 0x801111b0
  Frame 00: FP = 0x80005ea8    PC = 0x801111b0
  Frame 01: FP = 0x80005eb4    PC = 0x80113694
  Frame 02: FP = 0x80005f74    PC = 0x8010eb44
  Frame 03: FP = 0x80005f9c    PC = 0x80008118
  Frame 04: FP = 0x80005fac    PC = 0x80008064
  Frame 05: FP = 0x80005fc4    PC = 0xff005d70
  ```

- **context**—Displays processor context; for example:

  ```
  rommon 7> context
  CPU context of the most recent exception:
  PC  = 0x801111b0  MSR = 0x00009032  CR  = 0x53000035  LR    = 0x80113694
  CTR = 0x801065e4  XER = 0xa0006d36  DAR = 0xffffffff  DSISR = 0xffffffff
  DEC = 0xffffffff  TBU = 0xffffffff  TBL = 0xffffffff  IMMR  = 0xffffffff
  R0  = 0x00000000  R1  = 0x80005ea8  R2  = 0xffffffff  R3    = 0x00000000
  R4  = 0x8fab0d76  R5  = 0x80657d00  R6  = 0x80570000  R7    = 0x80570000
  R8  = 0x00000000  R9  = 0x80570000  R10 = 0x0000954c  R11   = 0x00000000
  R12 = 0x00000080  R13 = 0xffffffff  R14 = 0xffffffff  R15   = 0xffffffff
  R16 = 0xffffffff  R17 = 0xffffffff  R18 = 0xffffffff  R19   = 0xffffffff
  R20 = 0xffffffff  R21 = 0xffffffff  R22 = 0xffffffff  R23   = 0xffffffff
  R24 = 0xffffffff  R25 = 0xffffffff  R26 = 0xffffffff  R27   = 0xffffffff
  R28 = 0xffffffff  R29 = 0xffffffff  R30 = 0xffffffff  R31   = 0xffffffff
  ```

- **frame**—Displays an individual stack frame.

- **sysret**—Displays return information from the last booted system image. This information includes the reason for terminating the image, a stack dump of up to eight frames, and, if an exception is involved, the address where the exception occurred; for example:

  ```
  rommon 8> sysret
  System Return Info:
  count: 19,  reason: user break
  pc:0x801111b0,  error address: 0x801111b0
  Stack Trace:
  FP: 0x80005ea8, PC: 0x801111b0
  FP: 0x80005eb4, PC: 0x80113694
  FP: 0x80005f74, PC: 0x8010eb44
  ```
Exiting the ROM Monitor

You must set the configuration register to a value from 0x2 to 0xF for the router to boot a Cisco IOS image from flash memory upon startup or reloading.

The following example shows how to reset the configuration register and cause the router to boot a Cisco IOS image stored in flash memory:

```
rommon 1 > confreg 0x2101
```

You must reset or power cycle for new config to take effect:

```
rommon 2 > boot
```

The router will boot the Cisco IOS image in flash memory. The configuration register will change to 0x2101 the next time the router is reset or power cycled.
Common Port Assignments

Table D-1 lists currently assigned Transmission Control Protocol (TCP) port numbers. To the extent possible, the User Datagram Protocol (UDP) uses the same numbers.

<table>
<thead>
<tr>

group policy, configuring  6-4, 7-4

H
handshake
   defined  B-2
   three-way  B-3
   two-way  B-3
help command  C-3
help with commands  A-4

I
i command  C-3
IKE policy, configuring  6-3, 7-3
inspection rules
   applying to interfaces  8-4
   configuring  8-4
interface configuration mode  A-3
interface port labels (table)  1-3
interleaving, PPP  B-7
Internet connection, setting up  1-2
IP, overview  B-2
IPCP  B-6
IP Precedence
   with CBWFQ  B-8
   overview  B-7
IP routing, setting up  1-2
IPsec tunnel
   configuration example  6-10, 7-9
   configuring  6-1, 7-1
crypto method  6-7, 7-6
transforms and protocols  6-6, 7-5

K
k command  C-8

L
LAN with DHCP and VLANs, configuring  5-1 to 5-8
LCP  B-3
LFQ  B-8
line configuration mode  A-4
Link Control Protocol
   See LCP
LLC  B-5
loopback interface, configuring 1-6 to 1-8
low latency queuing
  See LFQ

M
meminfo command C-9
metrics
  RIP B-2
mode configuration, applying to crypto map 6-5
modes
  See command modes

N
NAT
  configuration example 3-8, 4-9
  configuring with PPPoA 4-7
  configuring with PPPoE 3-1, 3-5
  overview B-5 to B-6
  See also Easy IP (Phase 1)
NCP B-3
network address translation
  See NAT
network configuration, preparing for 1-2
Network Control Protocols
  See NCP
network protocols B-2
network scenarios
  See configuration examples
nonvolatile RAM
  See NVRAM
NVRAM, saving changes to A-6

O
overloading, defined B-6

P
packets, ATM, displaying 12-7
PAP B-3
parameters, setting up global 1-4
Password Authentication Protocol
  See PAP
password protection A-4
passwords
  recovery 12-9 to 12-12
  resetting 12-11
  setting A-4
permanent virtual circuit
  See PVC
permit command B-9
ping atm interface command 12-2
Point-to-Point Protocol
  See PPP
policy-based routing B-7
policy lookup, enabling 6-6, 7-4, 7-5
port assignments, common D-1 to D-2
port labels for interfaces 1-3
port numbers currently assigned D-1 to D-2
PPP
  authentication protocols B-3
  fragmentation B-7
  interleaving B-7
  overview B-3
PPP/Internet Protocol Control Protocol
  See IPCP
PPPoA, configuration example 4-9
PPPoE
  client 3-1
  configuration example 3-8
  configuring 3-1
  verifying your configuration 3-8
prerequisites, for configuration 1-2
privileged EXEC commands, accessing A-5
privileged EXEC mode A-2, A-3
protocols

PVC
  encapsulation types B-5
  overview B-5

Q
  QoS parameters B-7 to B-8
  queues, ATM B-8

R
  radio station subinterfaces, configuring 9-5
  remote access VPN 6-1
  reset command C-3
  resetting
    configuration register value 12-11
    passwords 12-11
    router 12-10 to 12-11
  RIP
    configuring 1-11
    overview B-2
  ROM monitor
    commands C-2 to C-3
    debug commands C-8, C-9
    entering C-1
    exiting C-9
  root radio station, configuring 9-2
  router configuration mode A-4
  Routing Information Protocol
    See RIP
    routing protocol overview B-2 to ??
  RST bits B-9
  RSVP B-8

S
  saving configuration changes 12-11, A-6
  scenarios, network
    See configuration examples
  security authentication protocols B-3
  security features, configuring
    A11 to 11-4
  settings
    router default A-2
    standard VT-100 emulation A-2
  show atm interface command 12-5
  show dsl interface atm command 4-7
  show interface command 12-3
  site-to-site VPN 7-1
  software, upgrading methods 12-8
  static routes
    configuration 1-10
    configuration example 1-10
    configuring 1-10
    sysret command C-8

T
  TACACS+ B-4
  TCP/IP-oriented configuration 5-1
  TCP port numbers D-1 to D-2
  terminal emulation software A-1
  tftpdownload command C-3, C-5
  TFTPD download C-3 to C-5
    See also console download
  transform set, configuring 6-6
  translation
    See NAT
  triggered extensions to RIP B-2
troubleshooting commands, ATM 12-2 to 12-8

U

UDP port numbers  D-1 to D-2
undoing commands  A-6
upgrading software, methods for 12-8
User Datagram Protocol
  See UDP
user EXEC mode  A-2, A-3

V

variables, command listing  A-4
VC  B-5
verify
  DHCP server configuration  5-4
  Easy VPN configuration  6-10
  PPPoE with NAT configuration  3-8
  VLAN configuration  5-6
viewing default configuration  1-2
virtual configuration register  C-5
virtual private dialup network group number, configuring 3-2
VLANs
  configuring  5-1
  verify configuration  5-6
VPDN group number, configuring  3-2
VPNs
  configuration example  6-10
  configuration tasks  6-2, 7-2
  configuring  6-1, 7-1, 11-4

W

WAN interface, configuring  1-4, 3-3
wireless LAN configuration example  9-6

xmodem command  C-7
