Preface

This section describes the intended audience, scope, and organization of the Cisco 815 Integrated Services Router Hardware Installation Guide and defines the conventions used to convey instructions and information.

Audience and Scope

This guide is for users who have some experience in installing and maintaining networking hardware. Cisco 815 integrated services router users should be familiar with the terminology and concepts of local Ethernet and wide-area networking.

This guide describes the functional and physical features of the Cisco 815 integrated services router and provides installation procedures, troubleshooting information, technical specifications, and cable and connector guidelines and specifications.

Organization

This guide is organized as follows:

- Chapter 1, “Overview,” describes the router features, LEDs, and connectors.
- Chapter 2, “Installation,” describes how to install the router by connecting cables and power, and tells how to install WAN interface cards (WICs).
Preface

Chapter 3, “Troubleshooting,” describes some problems that you might experience with the router and how to solve these problems.

Appendix A, “Technical Specifications,” lists the physical characteristics, environmental requirements, and power specifications for the router.

Appendix B, “Cabling Specifications,” provides the cables and cabling guidelines for the router.

Appendix C, “Installing and Upgrading Memory and Virtual Private Network Modules,” describes how to install or upgrade memory modules in your router.

Reporting Security Problems in Cisco Products

Cisco is committed to delivering secure products. We test our products internally before we release them, and we strive to correct all vulnerabilities quickly. If you think that you have identified a vulnerability in a Cisco product, contact PSIRT:

- For Emergencies only—security-alert@cisco.com
  
  An emergency is either a condition in which a system is under active attack or a condition for which a severe and urgent security vulnerability should be reported. All other conditions are considered nonemergencies.

- For Nonemergencies—psirt@cisco.com

In an emergency, you can also reach PSIRT by telephone:

- 1 877 228-7302

Tip

We encourage you to use Pretty Good Privacy (PGP) or a compatible product (for example, GnuPG) to encrypt any sensitive information that you send to Cisco. PSIRT can work with information that has been encrypted with PGP versions 2.x through 9.x.

Never use a revoked or an expired encryption key. The correct public key to use in your correspondence with PSIRT is the one linked in the Contact Summary section of the Security Vulnerability Policy page at this URL:

The link on this page has the current PGP key ID in use.

If you do not have or use PGP, contact PSIRT at the aforementioned e-mail addresses or phone numbers before sending any sensitive material to find other means of encrypting the data.
Obtaining Technical Assistance

Cisco Technical Support provides 24-hour-a-day award-winning technical assistance. The Cisco Technical Support & Documentation website on Cisco.com features extensive online support resources. In addition, if you have a valid Cisco service contract, Cisco Technical Assistance Center (TAC) engineers provide telephone support. If you do not have a valid Cisco service contract, contact your reseller.

Cisco Technical Support & Documentation Website

The Cisco Technical Support & Documentation website provides online documents and tools for troubleshooting and resolving technical issues with Cisco products and technologies. The website is available 24 hours a day, at this URL:

Access to all tools on the Cisco Technical Support & Documentation website requires a Cisco.com user ID and password. If you have a valid service contract but do not have a user ID or password, you can register at this URL:

Cisco Product Identification Tool

Use the Cisco Product Identification (CPI) tool to locate your product serial number before submitting a web or phone request for service. You can access the CPI tool from the Cisco Technical Support & Documentation website by clicking the Tools & Resources link under Documentation & Tools. Choose Cisco Product Identification Tool from the Alphabetical Index drop-down list, or click the Cisco Product Identification Tool link under Alerts & RMAs. The CPI tool offers three search options: by product ID or model name; by tree view; or for certain products, by copying and pasting show command output. Search results show an illustration of your product with the serial number label location highlighted. Locate the serial number label on your product and record the information before placing a service call.
Submitting a Service Request

Using the online TAC Service Request Tool is the fastest way to open S3 and S4 service requests. (S3 and S4 service requests are those in which your network is minimally impaired or for which you require product information.) After you describe your situation, the TAC Service Request Tool provides recommended solutions. If your issue is not resolved using the recommended resources, your service request is assigned to a Cisco engineer. The TAC Service Request Tool is located at this URL:

http://www.cisco.com/techsupport/servicerequest

For S1 or S2 service requests, or if you do not have Internet access, contact the Cisco TAC by telephone. (S1 or S2 service requests are those in which your production network is down or severely degraded.) Cisco engineers are assigned immediately to S1 and S2 service requests to help keep your business operations running smoothly.

To open a service request by telephone, use one of the following numbers:
- Asia-Pacific: +61 2 8446 7411 (Australia: 1 800 805 227)
- EMEA: +32 2 704 55 55
- USA: 1 800 553-2447

For a complete list of Cisco TAC contacts, go to this URL:

http://www.cisco.com/techsupport/contacts

Definitions of Service Request Severity

To ensure that all service requests are reported in a standard format, Cisco has established severity definitions.

Severity 1 (S1)—An existing network is down, or there is a critical impact to your business operations. You and Cisco will commit all necessary resources around the clock to resolve the situation.

Severity 2 (S2)—Operation of an existing network is severely degraded, or significant aspects of your business operations are negatively affected by inadequate performance of Cisco products. You and Cisco will commit full-time resources during normal business hours to resolve the situation.
Severity 3 (S3)—Operational performance of the network is impaired, while most business operations remain functional. You and Cisco will commit resources during normal business hours to restore service to satisfactory levels.

Severity 4 (S4)—You require information or assistance with Cisco product capabilities, installation, or configuration. There is little or no effect on your business operations.

This section describes the types of memory stored in the router and how to find out how much of each type of memory is stored in the router.

For instruction on how to upgrade memory in the router, see Appendix C, “Installing and Upgrading Memory and Virtual Private Network Modules.”

Types of Memory

The Cisco 815 integrated services router has the following types of memory:

- Dynamic random-access memory (DRAM)—This is the main storage memory for the router. DRAM is also called working storage. It contains the dynamic configuration information. The DRAM in the Cisco 815 integrated services router stores a working copy of the Cisco IOS software, dynamic configuration information, and routing table information.

- Nonvolatile random-access memory (NVRAM)—This type of memory contains a backup copy of the router configuration. If the power is lost or the router is turned off, this backup copy enables the router to return to operation without reconfiguration.

- Flash memory—This special kind of erasable, programmable memory contains a copy of the Cisco IOS software. The flash memory structure can store multiple copies of the Cisco IOS software. You can load a new level of the operating system in every router in your network and then, when convenient, upgrade the whole network to the new level.

Amounts of Memory

The Cisco 815 integrated services router supports a maximum of 32 MB of flash memory and 128 MB of DRAM. Use the `show version` command to see how much DRAM, NVRAM, and flash memory is stored in your router. The following example of output for the `show version` command shows the amount of memory in this router:

Installation

This chapter provides procedures for installing the Cisco 815 integrated services router and includes the following sections:

- Before Installing the Router
- Connecting the Router to Your Local Network
- Connecting Power to the Router
- Verifying Your Installation
- Optional Installation Procedures

Before Installing the Router

The Cisco 815 integrated services router is shipped ready for desktop mounting. Before you connect it to the power and network, simply set the router on a desktop, shelf, or other flat surface.

Be sure to read the safety information in the Regulatory Compliance and Safety Information for Cisco 800 Series and SOHO Series Routers document online.

⚠️ Warning

Read the installation instructions before you connect the system to its power source.
Connecting the Router to Your Local Network

Warning Before working on equipment that is connected to power lines, remove jewelry (including rings, necklaces, and watches). Metal objects will heat up when connected to power and ground and can cause serious burns or weld the metal object to the terminals. (To see translated versions of this warning, refer to the Regulatory Compliance and Safety Information for Cisco 800 Series and SOHO Series Routers document that came with the router.)

Warning Do not work on the system or connect or disconnect cables during periods of lightning activity.

Caution Do not place anything on top of the router that weighs more than 10 pounds (4.5 kg). Excessive weight on top of the router could damage the chassis.

Caution There are no field-replaceable parts inside the router. Do not open the router enclosure to replace parts.

Caution To prevent damage to the chassis, never attempt to lift or tilt the chassis by the plastic panel on the front. Always hold the chassis by the metal body.

Connecting the Router to Your Local Network

The Cisco 815 integrated services router is connected to your local Ethernet network through the yellow 10/100 Ethernet port. You must provide the following items for this connection:

- A straight-through, RJ-45-to-RJ-45, Ethernet cable
- A 10/100-Mbps Ethernet hub or switch
Caution
Do not connect a WAN cable to the card until you have completed the installation procedure.

Note
For details about specific WAN interface cards (WICs), connecting the card to the WAN line, and configuring the interface with Cisco IOS software, see the Cisco Interface Cards Hardware Installation Guide.

Warning
The ports labeled 10/100 ETHERNET and CONSOLE are safety extra-low voltage (SELV) circuits. SELV circuits should only be connected to other SELV circuits. Because BRI circuits are treated like telephone-network voltage, avoid connecting the SELV circuits to the telephone network voltage (TNV) circuits. (To see translated versions of this warning, refer to the Regulatory Compliance and Safety Information for Cisco 800 Series and SOHO Series Routers document that came with the router.)

Follow these steps to connect the router to the local network:

Step 1
Connect one end of the cable to the yellow Ethernet port (labeled 10/100 ETHERNET) on the back panel of the router, as shown in Figure 2-1.
Step 2  Connect the other end of the cable to a network port on the hub or switch.

1  10/100 Ethernet port on the Cisco 815 integrated services router

2  Straight-through Ethernet cable

3  Ethernet hub or switch
Connecting Power to the Router

Read the following warnings before connecting the router to power.

⚠️ **Warning**  
The power supply is designed to work with TN power systems.

⚠️ **Warning**  
This equipment is intended to be grounded. Ensure that the host is connected to earth ground during normal use.

Follow these steps to connect power to the router and to turn on the router:

**Step 1**  
Connect the attached power-supply cord to the power socket (labeled +5, +12, -12 VDC) on the router back panel, as shown in Figure 2-2.

---

**Figure 2-2  Connecting the Power Supply**

Chapter 2      Installation

Verifying Your Installation

Step 2  Connect one end of the separate power cord to the socket on the power supply.
Step 3  Connect the other end of the separate power cord to a power outlet.
Step 4  Press the router power switch to ON (I).
Step 5  Confirm that the router has power by checking that the PWR LED on the front panel is on.

Verifying Your Installation

You can verify that you have correctly installed the router by checking the following LEDs:

- PWR (front panel)—On when power is being supplied to the router.
- OK (front panel)—On when the router software is loaded and functional. Blinking indicates that the router is performing a power-on self-test (POST).
- WIC0/WIC1 OK (back panel)—On when the WIC is correctly installed in the corresponding WIC slot.
- ETH ACT (front panel)—Blinking when there is network traffic on the local 10/100 Ethernet LAN.
- WIC0 ACT or WIC1 ACT (front panel)—Varies, depending on the WIC installed. See Table 1-4 in Chapter 1, “Overview.”
- LINK (back panel)—On when the router is correctly connected to the local Ethernet LAN through the 10/100 ETHERNET port.
- MOD OK (back panel)—On when the VPN hardware encryption module is installed and recognized by the Cisco IOS software.
Optional Installation Procedures

This section describes some installation procedures that you might or might not use, depending on your site and on how you are configuring the router. This section describes the following procedures:

- Connecting a PC
- Connecting a Modem
- Stacking the Router
- Unstacking the Router

Connecting a PC

If you want to use the Cisco IOS command-line interface to configure the router, you must connect the router console port to a terminal or PC. The cable and adapter required for this connection are included with the router.

If you want to use a PC to configure the router, you need to make sure that the PC has some type of terminal emulation software installed. The software should be configured with the following parameters: 9600 baud, 8 data bits, no parity bits, 1 stop bit.

Follow these steps to connect the router to a terminal or PC:

Step 1  Connect the blue console cable to the blue console port on the back of the router, as shown in Figure 2-3.

**Step 2** Connect the DB-9 end of the console cable to the console port (also called the *serial port*) on your PC. If this adapter does not fit your PC console port, you must provide an adapter that fits.
Connecting a Modem

When a modem is connected to the auxiliary port, a remote user can dial in to the router and configure it. You can use the console cable provided in the accessory kit.

Follow these steps to connect a modem to the router, using the console cable:

**Step 1**
Connect the RJ-45 end of the cable to the black AUX port on the back of the router, as shown in Figure 2-4.

Optional Installation Procedures

Step 2  Connect the DB-9 end of the cable to the DB-9 end of the DB-9-to-DB-25 adapter.
Step 3  Connect the DB-25 end of the adapter to the modem.

Stacking the Router

You can stack one Cisco 815 integrated services router in a four-device stack, along with other Cisco products designed for stacking with the router. Using a stacking clip and fastener, you can stack each device directly on top of another device.

Note  The Cisco 815 integrated services router is not shipped with the stacking equipment described in this section; however, the equipment is included with all other Cisco products that are designed to be stacked.

Other Cisco products designed to be stacked with the router comes with a stacking clip and a fastener for keeping the multiple devices together in a stack. Before you stack the devices, assemble the clip and fastener as shown in Figure 2-5.
After assembling the clip and fastener, follow these steps to stack the router with another device:

**Step 1** Place the clip on top of the lower device, as shown in Figure 2-6. Slide the clip forward so that the front tabs slide into the vent slots. Make sure that the back hooks fit over the edge of the lower device.
Figure 2-6  Stacking the Router (Back View)

Step 2  Position the router onto the clip so that the back hooks fit over the edge of the router.

Step 3  Position the plastic fastener into the slot on the bottom of the router.

Step 4  Snap the router onto the clip by pushing it down.
Unstacking the Router

Follow these steps to unstack the router from another device:

**Step 1**  Press up on the tab over the center of the lower device to release the clip from the vent, as shown in Figure 2-7.

**Figure 2-7   Unstacking the Router**

**Step 2**  Slide the clip and router toward you.

**Step 3**  Use both hands to lift the router and the stacking clip off the lower device. Afterward, remove the clip from the bottom of the router.
Troubleshooting

Use the information in this chapter to help isolate problems you might encounter with the Cisco 815 integrated services router or to rule out the router as the source of the problem.

This appendix contains the following sections:

- Contacting Your Cisco Reseller
- Recovering a Lost Password
- Problem Solving

Contacting Your Cisco Reseller

If you cannot locate the source of a problem, contact your local reseller for advice. Before you call, you should have the following information ready:

- Chassis type and serial number
- Maintenance agreement or warranty information
- Type and version number of the Cisco IOS software that is installed on your router
- Date that you received the router
- Brief description of the problem
- Brief description of the steps you have taken to isolate the problem
- Output from the `show tech-support` command
Recovering a Lost Password

This section describes how to recover a lost enable password and how to enter a new enable secret password.

Password recovery consists of the following major processes:

- **Determining the Configuration Register Value**
  With this process, you determine the configuration of the router, so that you may restore the configuration after the password is recovered.

- **Resetting the Router**
  With this process, you reconfigure the router to its initial startup configuration. You then display the enable password, if one is used.

- **Resetting the Password**
  If you are using an enable secret password, you enter a new password with this process. You then restore the router to its previous configuration.

- **Resetting the Configuration Register Value**
  If you are using an enable password, you use this process to restore the router to its previous configuration.

---

**Note**
See the “Hot Tips” section on Cisco.com for additional information on replacing enable secret passwords.

---

**Determining the Configuration Register Value**

Follow these steps to determine the configuration register value:

**Step 1**
Connect an ASCII terminal or a PC that is running a terminal-emulation program to the console port on the router. See the “Connecting a PC” section in Chapter 2, “Installation.”

**Step 2**
Configure the terminal to operate at 9600 baud, 8 data bits, no parity, 1 stop bit and no flow control.

**Step 3**
Reboot the router by pressing the power switch to the off (0) position and then to the on (1) position.
Step 4  At the user EXEC prompt (Router#), enter the **show version** command to display the existing configuration register value (shown at the end of this example output):

```

Step 5  Record the setting of the configuration register.

Step 6  Record the break setting, as given by bit 8 of the configuration register.

- Break enabled—Bit 8 is set to 0.
- Break disabled (default setting)—Bit 8 is set to 1.
Resetting the Router

Follow these steps to reset the router:

Step 1
Do one of the following:
- If break is enabled, go to Step 2.
- If break is disabled, turn off the router, wait 5 seconds, and turn it on again. Within 60 seconds, press the Break key. The terminal displays the ROM monitor prompt. Go to Step 3.

Note Some terminal keyboards have a key labeled Break. If your keyboard does not have a Break key, refer to the documentation that came with the terminal for instructions on how to send a break. To send a break in Windows HyperTerminal, press Ctrl-Break.

Step 2
Send a break. The terminal displays the following prompt:

rommon 2>

Step 3
Enter confreg 0x142 to reset the configuration register:

rommon 2> confreg 0x142

Step 4
Initialize the router by entering the reset command:

rommon 2> reset

The router resets, and the configuration register is set to 0x142. The router boots the system image in flash memory and displays the following:

--- System Configuration Dialog ---

Step 5
Enter no in response to the prompts until the following message is displayed:

Press RETURN to get started!

Step 6
Press Return. The following prompt appears:

Router>
Step 7 Enter the `enable` command to enter privileged EXEC mode. Configuration changes can be made only in this mode.

```
Router> enable
```

The prompt changes to the privileged EXEC prompt:
```
Router#
```

Step 8 Enter the `show startup-config` command to display an enable password in the configuration file:

```
Router# show startup-config
```

If you are using an enable password, it will appear in the startup configuration. Write down the password and keep the record secure.

If you are using an enable secret password, there will be no enable password in the startup configuration.

Step 9 Enter the `copy startup-config running-config` command to return to your startup configuration:

```
Router# copy startup-config running-config
```

If you are recovering an enable password, skip the next section, “Resetting the Password,” and complete the password recovery process by performing the steps in the “Resetting the Configuration Register Value” section.

If you are resetting an enable secret password, you will not see it displayed in the `show startup-config` command output. Complete the password recovery process by performing the steps in the “Resetting the Password” section, which follows.
Chapter 3  Troubleshooting

Recovering a Lost Password

Resetting the Password

Follow these steps to reset an enable secret password and restore the configuration of the router:

Step 1  Enter the `configure terminal` command to enter configuration mode:

`Router# configure terminal`

Step 2  Enter the `enable secret` command to reset the enable secret password in the router:

`Router(config)# enable secret <password>`

Step 3  Enter the `config-register` command and the original configuration register value that you recorded in Step 5 in the “Determining the Configuration Register Value” section on page 3-2.

Step 4  Press Ctrl-Z to exit configuration mode.

`Router(config)# Ctrl-Z`

Step 5  Save your configuration changes:

`Router# copy running-config startup-config`

Step 6  Reboot the router, and enter the enable secret password.

Resetting the Configuration Register Value

Follow these steps to restore the configuration of the router after you have recovered an enable password:

Step 1  Enter the `configure terminal` command to enter configuration mode:

`Router# configure terminal`

Step 2  Enter the `config-register` command and the original configuration register value that you recorded in Step 5 in the “Determining the Configuration Register Value” section on page 3-2.
Problem Solving

The key to problem solving is to isolate the problem to a specific subsystem by comparing what the router is doing to what it should be doing.

In problem solving, consider the following subsystems of the router:

- **WICs**—Refer to the LEDs on the cards and the LEDs on the router front panel to help identify a failure. For more information on WAN interface cards (WICs), refer to the *Cisco Interface Cards Hardware Installation Guide*.

- **Cables**—Check all the external cables that connect the router to the network.

- **Power system**—Check the external power source, power cable, router power supply, and circuit breaker. Check for inadequate ventilation or air circulation that might cause overheating.

OK LED Diagnostics

Use the front panel OK LED to determine any problems with the router. When the router first boots up, it performs a power-on self-test (POST). If the router detects a problem during the POST, the OK LED blinks in different patterns (described in Table 3-1), depending on the problem. A pattern consists of a specific number of blinks that is repeated until the router is turned off. If the router experiences any of these problems, contact your Cisco reseller.

Step 3 Press Ctrl-Z to exit configuration mode:

Router(config)# Ctrl-Z

Step 4 Reboot the router, and enter the recovered enable password.
Use the `show diag` command to help determine problems with a card. Table 3-2 lists problems that could occur with WAN interface cards (WICs) and the possible causes of these problems.

# Troubleshooting the Power System

If the router external power supply fails, you should return it to your Cisco reseller. Table 3-3 lists symptoms and possible causes of power problems.

<table>
<thead>
<tr>

| The router shuts down after being on a short time. | • Make sure that the area in which the router is installed meets the environmental site requirements in Appendix A, “Technical Specifications,” in this guide.  
• If the front panel PWR LED is not on, the power supply has failed. |
| The router attempts to boot, but all LEDs remain off. | The power supply has failed. |

Cabling Specifications

This appendix describes cables and cabling guidelines for the Cisco 815 integrated services router and contains the following sections:

- Ethernet Cables
- Ethernet Network Cabling Guidelines
- Console Cable and Adapter

Note

For information about cables used with Cisco WAN interface cards (WICs), refer to the *Cisco Interface Cards Hardware Installation Guide*.

Ethernet Cables

This section describes the Ethernet cables that are used to connect the router to your local Ethernet network. A 10/100BASE-TX router, such as the Cisco 815 integrated services router, requires Category 5 unshielded twisted-pair (UTP) or shielded twisted-pair (STP) cable. Table B-1 gives the pinouts for an Ethernet cable.

Console Cable and Adapter

A console cable is provided with your router. Use this cable to connect the router to a PC or terminal. The router comes with a DB-9-to-DB-25 adapter that may be used for connecting the router to a modem, using the console cable.

Table B-3 describes the wiring for the console port and the console cable. This table also includes pinouts for the DB-9-to-DB-25 adapter.

Installing and Upgrading Memory and Virtual Private Network Modules

This chapter tells how to install or upgrade memory and how to install a Virtual Private Network (VPN) module in your Cisco 815 integrated services router and includes the following sections:

- Safety Warnings
- Opening the Chassis
- Locating Modules
- Installing and Removing a DIMM
- Installing a VPN Module
- Closing the Chassis

Safety Warnings

⚠️ Warning

During this procedure, wear grounding wrist straps to avoid ESD damage to the router. Do not directly touch the backplane with your hand or any metal tool, or you could shock yourself.

⚠️ Warning

Before working on a system that has an on/off switch, turn OFF the power and unplug the power cord.
Opening the Chassis

In order to upgrade the Cisco 815 integrated services router memory, you must open the chassis. Opening the chassis requires a number one Phillips screwdriver. Follow these steps to open the chassis:

**Step 1** Make sure the router is turned off and is disconnected from the power supply.

**Step 2** Turn the router upside down, and rest the top of the router on a flat surface.

**Step 3** Use the number one Phillips screwdriver to remove the four screws that fasten the top and bottom of the chassis together, as shown in Figure C-1.
Step 4  Holding the router assembly together, turn the router back to its original position.

Step 5  Gently remove the top of the router (which is facing up toward you) up and away from the bottom of the router (which is resting on the flat surface).

At this point, you might have to disconnect the fan, which is inside the top of the router chassis, from the motherboard, by disconnecting the fan cable from the connector (labeled FAN) on the motherboard.

Step 6  Place the router bottom on an antistatic mat, and begin installing memory.
Locating Modules

Figure C-2 shows where to find the slots for a dual in-line memory module (DIMM) and a VPN module on the router motherboard.

Installing and Removing a DIMM

You can install a DIMM to increase the amount of dynamic random-access memory (DRAM) in the router.
DIMMs have a polarization notch on the mating edge to prevent incorrect insertion. Figure C-3 shows the polarization notch on a DRAM DIMM.

**Figure C-3 DIMM Polarization Notch**

Removing a DIMM

Follow these steps to remove a DIMM on the router motherboard:

**Step 1**
Pull the latches away from the DIMM at both ends. This lifts the DIMM slightly. Lift the DIMM completely out of the connector. See Figure C-4.

**Figure C-4 Removing a DIMM**

1. Release the latches
2. Remove the DIMM
**Appendix C Installing and Upgrading Memory and Virtual Private Network Modules**

**Installing and Removing a DIMM**

**Step 2** Place the DIMM in an antistatic bag to protect it from ESD damage.

---

**Installing a DIMM**

---

**Caution** Do not insert DIMMs into the same connector more than 25 times. Overuse can damage the connector.

To install a DIMM, follow these steps:

**Step 1** Make sure that both latches on the DIMM connector are open.

**Step 2** Orient the DIMM so that the polarization notch lines up with the key in the connector. See Figure C-5.

**Step 3** Carefully insert the DIMM into the connector.

**Step 4** Carefully and firmly press the DIMM into the connector until both latches rotate to the closed position against the DIMM.

---

**Figure C-5 Installing a DIMM**

1. Insert the DIMM
2. Latches rotate to closed position
Installing a VPN Module

Caution

To support the VPN module on the Cisco 815 integrated services router, the router must have Cisco advanced IP services IOS software and 128 MB of DRAM installed.

Follow these steps to install a VPN module:

Step 1
Install the two standoffs on the module, as shown in Figure C-6.
Appendix C  Installing and Upgrading Memory and Virtual Private Network Modules

Installing a VPN Module

Step 2  Locate the VPN module slot, and insert the VPN module, as shown in Figure C-7.

Figure C-7  VPN Module Location

Step 3  Pushing down as indicated in Figure C-8, plug the VPN module into the slot.

Figure C-8  Seating the VPN Module
Step 4  To secure the VPN board connection in the socket, you must attach a retention clip.

a. The retention clip for the Cisco 815 integrated services router slides over the VPN module where it connects to the socket and clips to the side of the router motherboard. The horizontal tab slides underneath the WIC 0 socket, as shown in Figure C-9.

b. Align the post in the middle of the clip with the hole in the center of the socket side of the VPN card as shown in Figure C-10.
c. Attach the retention clip to the motherboard, as shown in Figure C-11.
Figure C-11  Attaching the Retention Clip to the Motherboard

Pull the snap over the edge of the board.
Step 5  Turn the motherboard over, so that it is resting on its top. Use a Phillips screwdriver to attach the standoffs to the motherboard by using the screws provided, as shown in Figure C-12.

*Figure C-12  Securing the Standoff to the Router Motherboard*
Closing the Chassis

After installing memory or a VPN module on the motherboard, attach the router cover by following these steps:

**Step 1** If you disconnected the fan from the motherboard in the “Opening the Chassis” procedure, reconnect the fan cable to the connector labeled FAN on the motherboard.

**Step 2** Locate the posts that protrude from the inside of the chassis cover, and locate the corresponding openings on the chassis bottom.

**Step 3** Line up the posts with the corresponding openings, as shown in Figure C-8, and carefully slide the posts into the openings, taking care not to damage the router motherboard with the posts.
Step 4 Using a number one Phillips screwdriver, replace the screws that you removed when you opened the chassis. (See Figure C-1.)
