Configuring Backup Data Lines and Remote Management

This chapter describes configuring backup data lines and remote management in the following sections:

- Configuring Backup Interfaces, page 6-1
- Configuring Cellular Dial-on-Demand Routing Backup, page 6-3
- Configuring Dial Backup and Remote Management Through the Console Port, page 6-8.

The Cisco 819 Integrated Services Router (ISR) supports backup data connectivity with a backup data line that enables them to mitigate WAN downtime.

Cisco 819 ISRs also support remote management functions through the auxiliary port on any Cisco 819 series ISRs.

On the Cisco 819 ISRs, the console port and the auxiliary port are on the same physical RJ-45 port. Therefore, the two ports cannot be activated simultaneously. You must use the command-line interface (CLI) to enable the desired function.

### Configuring Backup Interfaces

When the router receives an indication that the primary interface is down, the backup interface becomes enabled. After the primary connection has been restored for a specified period, the backup interface is disabled.

Even if the backup interface comes out of standby mode, the router does not enable the backup interface unless the router receives the traffic specified for that backup interface.

Table 6-1 shows the backup interfaces available for each Cisco 819 ISR, along with their port designations. Basic configurations for these interfaces are given in the “Configuring WAN Interfaces” section on page 5-9.

<table>
<thead>
<tr>
<th>Router Model Number</th>
<th>3G</th>
</tr>
</thead>
<tbody>
<tr>
<td>819</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Table 6-1 Model Number and Data Line Backup Capabilities
To configure your router with a backup interface, perform these steps, beginning in global configuration mode:

**SUMMARY STEPS**

1. `interface type number`
2. `backup interface interface-type interface-number`
3. `exit`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**

```
interface type number
```

*Example:*

```
Router(config)# interface xxx 0
Router(config-if)#
```

Enters interface configuration mode for the interface for which you want to configure backup. This can be a serial interface, ISDN interface, or asynchronous interface.

| **Step 2**

```
backup interface interface-type interface-number
```

*Example:*

```
Router(config-if)# backup interface serial 0
Router(config-if)#
```

Assigns an interface as the secondary or backup interface. This can be a serial interface or asynchronous interface. For example, a serial 1 interface could be configured to back up a serial 0 interface. The example shows a serial interface configured as the backup interface for the ATM 0 interface.

| **Step 3**

```
exit
```

*Example:*

```
Router(config-if)# exit
Router(config)#
```

Exits the configuration interface mode.
Chapter 6  Configuring Backup Data Lines and Remote Management

Configuring Cellular Dial-on-Demand Routing Backup

To monitor the primary connection and initiate the backup connection over the cellular interface when needed, the router can use one of the following methods:

- **Backup Interface**—The backup interface that stays in standby mode until the primary interface line protocol is detected as down and then is brought up. See the “Configuring Backup Interfaces” section on page 6-1.
- **Dialer Watch**—Dialer watch is a backup feature that integrates dial backup with routing capabilities. See the “Configuring DDR Backup Using Dialer Watch” section on page 6-3.
- **Floating Static Route**—The route through the backup interface has an administrative distance that is greater than the administrative distance of the primary connection route and therefore would not be in the routing table until the primary interface goes down. When the primary interface goes down, the floating static route is used. See the “Configuring DDR Backup Using Floating Static Route” section on page 6-5

**Note**
You cannot configure a backup interface for the cellular interface and any other asynchronous serial interface.

Configuring DDR Backup Using Dialer Watch

To initiate dialer watch, you must configure the interface to perform dial-on-demand routing (DDR) and backup. Use traditional DDR configuration commands, such as dialer maps, for DDR capabilities. To enable dialer watch on the backup interface and create a dialer list, use the following commands in interface configuration mode.

**SUMMARY STEPS**

1. `configure terminal`
2. `interface type number`
3. `dialer watch group group-number`
4. `dialer watch-list group-number ip ip-address address-mask`
5. `dialer-list <dialer-group> protocol <protocol name> { permit | deny | list <access list number> | access-group }
6. `ip access-list <access list number> permit <ip source address>`
7. `interface cellular 0`
8. `dialer string <string>`
### DETAILED STEPS

<tr>
<td><code>interface cellular 0</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router (config)# interface cellular 0</td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>CDMA only. Specifies the dialer script (defined using the <code>chat script</code> command). GSM only. Maps a dialer list to the dialer interface.</td>
</tr>
<tr>
<td><code>dialer string &lt;string&gt;</code></td>
<td></td>
</tr>
<tr>
<td>or <code>dialer group &lt;dialer group number&gt;</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router (config-if)# dialer string cdma *** cdma ***</td>
<td></td>
</tr>
<tr>
<td>or Router (config-if)# dialer group 2 *** gsm ***</td>
<td></td>
</tr>
</tbody>
</table>
Configuring DDR Backup Using Floating Static Route

To configure a floating static default route on the secondary interface, use the following commands, beginning in the global configuration mode.

Note
Make sure you have ip classless enabled on your router.

SUMMARY STEPS

1. `configure terminal`
2. `ip route network-number network-mask {ip-address | interface} [administrative distance] [name name]`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 <code>configure terminal</code></td>
<td>Enters global configuration mode from the terminal.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router# configure terminal</td>
</tr>
<tr>
<td>Step 2 `ip route network-number network-mask {ip-address</td>
<td>interface} [administrative distance] [name name]`</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router (config)# ip route 0.0.0.0 Dialer 2 track 234</td>
</tr>
</tbody>
</table>

Cellular Wireless Modem as Backup with NAT and IPsec Configuration

The following example shows how to configure the 3G wireless modem as backup with NAT and IPsec on either GSM or CDMA networks.

Note
The receive and transmit speeds cannot be configured. The actual throughput depends on the cellular network service.

Configuring Dial Backup and Remote Management Through the Console Port

When customer premises equipment, such as a Cisco 819 ISR, is connected to an ISP, an IP address is dynamically assigned to the router or the IP address may be assigned by the router peer through the centrally managed function. The dial backup feature can be added to provide a failover route in case the primary line fails. The Cisco 819 ISRs can use the auxiliary port for dial backup and remote management.
Figure 6-1 shows the network configuration used for remote management access and for providing backup to the primary WAN line.

Figure 6-1  Dial Backup and Remote Management Through the Auxiliary Port

<tr>
<td>3</td>
<td>PC</td>
<td>C</td>
</tr>
</tbody>
</table>
To configure dial backup and remote management for these routers, perform these steps, beginning in global configuration mode:

**SUMMARY STEPS**

1. `ip name-server server-address`
2. `ip dhcp pool name`
3. `exit`
4. `chat-script script-name expect-send`
5. `interface type number`
6. `exit`
7. `interface type number`
8. `dialer watch-group group-number`
9. `exit`
10. `ip nat inside source {list access-list-number}{interface type number | pool name} [overload]`
11. `ip route prefix mask {ip-address | interface-type interface-number [ip-address]}`
12. `access-list access-list-number {deny | permit} source [source-wildcard]`
13. `dialerwatch-list group-number {ip ip-address address-mask | delay route-check initial seconds}`
14. `line [aux | console | tty | vty] line-number [ending-line-number]`
15. `modem enable`
16. `exit`
17. `line [aux | console | tty | vty] line-number [ending-line-number]`
18. `flowcontrol {none | software [lock] [in | out] | hardware [in | out]}`
### Detailed Steps

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | ip name-server server-address | Enters your ISP DNS IP address.  
**Tip** You may add multiple server addresses if available. |
| **Example** | Router(config)#ip name-server 192.168.28.12  
Router(config)# |  |
| **Step 2** | ip dhcp pool name           | Creates a DHCP address pool on the router and enters DHCP pool configuration mode. The name argument can be a string or an integer.  
- Configure the DHCP address pool. For sample commands that you can use in DHCP pool configuration mode, see the “Example” section on page 6-13. |
| **Example** | Router(config)#ip dhcp pool 1  
Router(config-dhcp)# |  |
| **Step 3** | exit                        | Exits config-dhcp mode and enters global configuration mode. |
| **Example** | Router(config-dhcp)#exit  
Router(config)# |  |
| **Step 4** | chat-script script-name expect-send | Configures a chat script used in dial-on-demand routing (DDR) to give commands for dialing a modem and for logging in to remote systems. The defined script is used to place a call over a modem connected to the PSTN. |
| **Example** | Router(config)# chat-script Dialout ABORT  
ERROR ABORT BUSY "" ""AT" OR "ATDT 555102  
T" TIMEOUT 45 CONNECT \c  
Router(config)# |  |
| **Step 5** | interface type number       | Creates and enters configuration mode for the asynchronous interface.  
Configure the asynchronous interface. For sample commands that you can use in asynchronous interface configuration mode, see the “Example” section on page 6-13. |
| **Example** | Router(config)# interface Async 1  
Router(config-if)# |  |
| **Step 6** | exit                        | Enters global configuration mode. |
| **Example** | Router(config-if)# exit  
Router(config)# |  |
| **Step 7** | interface type number       | Creates and enters configuration mode for the dialer interface. |
| **Example** | Router(config)# interface Dialer 3  
Router(config-if)# |  |
