Preface

This preface describes the objectives, audience, organization, and conventions of this guide and describes related documents that have additional information.

Objective

This guide provides an overview of the software features and explains how to perform the configuration steps for the Cisco IR800 Integrated Services Routers.

Audience

This guide is intended for people who have a high level of technical ability, although they may not have experience with Cisco software.

Conventions

This section describes the conventions used in this guide.

Note

Means reader take note. Notes contain helpful suggestions or references to additional information and material.

Caution

This symbol means reader be careful. In this situation, you might do something that could result in equipment damage or loss of data.

Tip

Means the following information will help you solve a problem. The tip information might not be troubleshooting or even an action, but could be useful information.

Searching Cisco Documents

To search an HTML document using a web browser, press Ctrl-F (Windows) or Cmd-F (Apple). In most browsers, the option to search whole words only, invoke case sensitivity, or search forward and backward is also available.

To search a PDF document in Adobe Reader, use the basic Find toolbar (Ctrl-F) or the Full Reader Search window (Shift-Ctrl-F). Use the Find toolbar to find words or phrases within a specific document. Use the Full Reader Search window to search multiple PDF files simultaneously and to change case sensitivity and other options. Adobe Reader’s online help has more information about how to search PDF documents.
Obtaining Documentation and Submitting a Service Request

For information on obtaining documentation, submitting a service request, and gathering additional information, see the monthly What’s New in Cisco Product Documentation, which also lists all new and revised Cisco technical documentation, at:

Subscribe to the What’s New in Cisco Product Documentation as a Really Simple Syndication (RSS) feed and set content to be delivered directly to your desktop using a reader application. The RSS feeds are a free service and Cisco currently supports RSS Version 2.0.
Product Overview

This chapter provides an overview of the features available for the Cisco IR800 Integrated Services Routers (ISRs).

- General Description, on page 1
- Hardware Overview, on page 2
- Software Overview, on page 19
- Hardware Differences Between IR809, IR829, and C819HG, on page 21
- Antenna Recommendations, on page 22
- Features Supported in Different IOS Releases, on page 23
- Related Documentation, on page 26

General Description

The 800 Series Industrial Integrated Services Routers are compact, ruggedized, Cisco IOS Software routers. They offer support for integrated 4G LTE wireless WAN (both 809 and 829 models) and wireless LAN capabilities (829 model only). The IR829 offers an Internal WLAN Access Point which runs on-board the router. The AP803 runs its own IOS software independently from the IR829 IOS, and requires configuring. The AP803 works as a standalone access point or with a wireless controller.

They offer:

- Easily and rapidly deployable
- Highly available, highly secure, and reliable
- Designed for machine-to-machine (M2M) communication and for mobile vehicle communication in harsh environmental conditions
- Designed to withstand hostile environments, tolerating a wide temperature range

These industrialized routers deliver enterprise-class features, including highly secure data, voice, and video communications to stationary and mobile network nodes across wired and wireless links. They can deliver enterprise-grade, wireline-like functionality.

The routers also support Cisco IOx Software, providing an open, extensible environment for hosting additional operating systems and applications directly at the network edge. They can enhance other Cisco IoT System products across multiple industries, including transportation, manufacturing, electrical utilities, and others.
For a complete listing of the routers capabilities, see the Cisco 829 Industrial Integrated Services Routers Product Information.

Hardware Overview

This section covers the overview of the IR809 and IR829.

IR829 Product Overview

Figure 1: Cisco IR829 Integrated Services Router, on page 2 shows the IR829.

Note

See the respective Hardware Installation Guides for detailed description of the LEDs.

Reset Button

The reset button resets the router configuration to the default configuration set by the factory. To restore the router configuration to the default configuration set by the factory, use a standard size #1 paper clip with wire gauge 0.033 inch or smaller and simultaneously press the reset button while applying power to the router.

Note

On the IR829, the rear cover must be removed to expose the reset switch.

Starting with release 15.6(1)T, the IR809 and IR829 have changed the way the reset button works. The IR800 series platforms now perform in the same manner as the C819. The high level description of the functionality works like this:

- Press and hold the reset button while powering up the router
- During warm reboot this button has no impact on performance
- Simply pressing the button at any time does not reset the router
- The router will not react to the reset button if it is pressed after power-up because the button needs to be pushed before turning ON/inserting power – to make sure that the condition is detected.
- The push-button cannot be used to boot a IOS image from network. The golden image has to be on flash: only

---

**Note**

For the location of the reset button, see the appropriate IR809 or IR829 Hardware Installation Guide.

Perform the following steps to use the reset button:

**Procedure**

**Step 1** Unplug power.
**Step 2** Press the reset button on the router.
**Step 3** Power up the system while holding down the reset button.
**Step 4** Check the “boot system” setting configuration in the default configuration file (prior to saving it to startup-config), and verify that it points to an existing IOS image on the flash: partition. Note: If that particular IOS image is not present, the device will drop in rommon-2 mode and you will need to manually boot an IOS image from there.
**Step 5** Copy your desired default config file to the startup-config.
**Step 6** Reload the router. Do NOT enter Yes if prompted whether you want to save the running-config to startup-config.

**Example**

An example of the log activity after a reboot follows:

```
IR800# show log
*Nov 30 19:31:04.925:%LINEPROTO-5-UPDOWN: Line protocol on Interface GigabitEthernet0, changed state to down
*Nov 30 19:31:11.527:%LINK-3-UPDOWN: Interface Async0, changed state to up
*Nov 30 19:31:11.595:%SYS-5-RESTART: System restarted --
```

Cisco IOS Software, ir800 Software (ir800-UNIVERSALK9-M), Version 15.6(1)T, RELEASE SOFTWARE (fc1)
What to do next

To simplify the boot process, the IR800 routers do not support the ROMMON configuration register and the associated CLI commands. The IR800 either boots the pre-configured images, or stops at the ROMMON prompt for user intervention. In the event of a boot failure, see Chapter 3, “Setup Command Facility” for additional information.

Booting a Default IOS Image and Default Configuration - Method 1

The IR800 differs from traditional IOS routers when booting a default IOS image and a default configuration. These steps apply on a device running 15.6(1)T or later.

Method 1:

Procedure

Step 1
Save a copy of your IR800 IOS image with the .default extension on flash. For example: ios-image.default.

Step 2
Save a copy of your IR800 Hypervisor image with the .default extension on bootstrap. For example: hypervisor-image.default.

Step 3
Save your desired default configuration file with the .cfg extension on flash. For example: config.cfg.

Step 4
Reset your IR800 router by powering it down, then press and hold the RESET button while powering up the device.

The IR800 router will automatically boot hypervisor-image.default, then ios-image.default, and load the config.cfg.

Step 5
Make sure there exists only one IOS image with a .default extension, only one configuration file with the .cfg extension on the flash, and only one hypervisor image with the .default extension on bootstrap.

Booting a Default IOS Image and Default Configuration - Method 2

If you do not have a config.cfg on flash, it will boot with the Cisco default configuration (aka: empty) startup-config.

Method 2:

Procedure

Step 1
Check the “boot system” setting configuration in the default configuration file (prior to saving it to startup-config), and verify that it points to an existing IOS image on the flash: partition.

Note
If that particular IOS image is not present, the device will drop in rommon-2 mode and you will need to manually boot an IOS image from there.

Step 2
Copy your desired default config file to the startup-config.
**Step 3**  
Reload the router. Do NOT enter Yes if prompted whether you want to save the running-config to startup-config.

---

**What to do next**

An example of the log activity after a reboot follows:

```
IR800# show log
*Nov 30 19:31:04.925: %LINEPROTO-5-UPDOWN: Line protocol on Interface GigabitEthernet0, changed state to down
*Nov 30 19:31:11.527: %LINK-3-UPDOWN: Interface Async0, changed state to up
*Nov 30 19:31:11.595: %SYS-5-RESTART: System restarted --
Cisco IOS Software, ir800 Software (ir800-UNIVERSALK9-M), Version 15.6(1)T, RELEASE SOFTWARE (fc1)
```

**Configuration Register**

**To configure the register:**

```
IR800# conf t
Enter configuration commands, one per line. End with CNTL/Z.
IR800(config)# config-register 0x?
<0x0-0xFFFF>
IR800(config)# config-register 0x102
IR800(config)#
```

```
Jul 26 22:10:22.790: Bootstrap Emulator called with code 62
Jul 26 22:10:22.790: Bootstrap Emulator called with code 61
```

**To display the register:**

```
IR800# sh ver
....
....
```

```
Configuration register is 0x2101 (will be 0x102 at next reload)
```

The Format for the configuration registers is 0x____ (4 bytes)

For example:

0x102, 0x2102, 0x2142, 0x142, 0x101, 0x2101

The Configuration Register 1st byte table shows the configuration register 1st byte values and descriptions.

**Table 1: Configuration Register 1st byte**

<table>
<thead>
<tr>

<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 or 2</td>
<td>Doesn’t make any difference, behavior is decided by next 3 bytes.</td>
</tr>
</tbody>
</table>
Auto-recovery of Corrupt Filesystems

On rare occasions, the router could get stuck in ROMMON to flash and bootstrap file system corruption caused by hard reloads. Hard reloads can be a consequence of fluctuating voltage or very low current. The file system (in flash: or bootstrap:) is completely inaccessible at this point.

Starting with this release (15.8(3)M), on the IR8x9 platforms, software will automatically recover the router if one or more filesystems are corrupt. This feature is enabled once the user executes bundle install, write memory, reload.

For example:

```
IR800#bundle install flash:ir800-universalk9-bundle.SSA.158-3.0m.M
Installing bundle image: /ir800-universalk9-bundle.SSA.158-3.0m.M......
........................
updating Hypervisor image...
Sending file modes: C0444 25196401 ir800-hv.srp.SPA.3.0.55
SRP md5 verification passed!
updating IOS image...
Sending file modes: C0644 64486377 ir800-universalk9-mz.SSA.158-3.0m.M
IOS md5 verification passed!
Done!
Performing image backup .........Done!
```

During the bundle installation, the user will observe the message "Backup partition successful'. Once the bundle install is complete, the user can also verify if backup is successful using `show platform bundle'.

For example:

```
IR800#show platform bundle
Installed
Backup Success
```

This backup partition is taken from the Guest-OS data partition on the IR809, IR829, IR829GW, IR829B products.

The IR829M products mSATA SSD partition is unaffected.

If a previous user was already using up this extra partition in old software, the new software will NOT proceed with creating a backup partition. This ensures the user data is always intact. If the user wants to trigger a backup, ~300Mb needs to be cleaned up from Guest-OS /dev/sdb. In some routers, Guest-OS /dev/sdb may appear to have ~250Mb lesser, and some ~330Mb. This is due to the two different versions of eMMC on the IR8x9s, and there is no software cli to provide eMMC part number to distinguish.

Files Backed Up to the New Backup Partition

- IOS image
- Hypervisor image
- Guest-OS image (if IOX Recovery is enabled using `conf t then iox recovery-enable')
- Standard Files:
  - Entire eem folder
  - The entire managed folder, except managed/images
  - All pnp* files (all PnP related files)
• vlan.dat
• Archive folder

• Field Network Director specific files:
  • express-setup-config
  • before-registration-config
  • before-tunnel-config

• Sample file labeled additional_backup_file (This file is to ensure if a user wants to customize low sized (50 kbytes or less) configuration file copy, they can save it in this name and it will be backed up.

**Files NOT Backed Up to the New Backup Partition**

• Duplicates of software images in managed/images
• User generated files, folders and configurations
• FW of 4G modems
• IOx application data

**Notes:**

The backup partition is limited in space and only for basic device recovery, and to load startup-config [as SPI Flash: is intact]. In this manner, remote device reachability is back up again. Remaining files need to be restored again by end user.

If a user running old software would like to increase their current Guest-OS disk space, it is recommended to take a data backup, and execute the following command taking up larger disk space. Starting at IOS release 156(3)M3 and greater, the default disk space allocated to Guest-OS is Option 1 from the example below. For previous releases default used to be Option 6 from the example below.

```plaintext
IR800#guest-os 1 disk-repartition ?
1 disk1: 500MB vs disk2: 1800MB
2 disk1: 700MB vs disk2: 1600MB
3 disk1: 900MB vs disk2: 1400MB
4 disk1: 1100MB vs disk2: 1200MB
5 disk1: 1300MB vs disk2: 1000MB
6 disk1: 1500MB vs disk2: 800MB
7 disk1: 1700MB vs disk2: 600MB
```

**Note:** Actual storage available for applications will be less than the value chosen for all profiles. The disk2 partition displayed in the 15.8(3)M release has to account for 300MB less space. For example: option1, disk2 is 1500MB not 1800MB. In future releases, this will be corrected.

Once an auto-recovery is complete, the user will observe a small file in flash called fs_recovered.ios. It will contain the timestamp of the last recovery. This file is indication that backup was successful, and that there was indeed a corruption of the filesystem. This file is not persistent on soft reload of the router.

Alternatively, the user can also backup using:

```plaintext
IR800#hypervisor backup_images
```
WARNING - If you are running this command for the first time, it might delete all application data in IOx. This operation cannot be undone. Continue? [yes/no]: y
Performing image backup........ Done

This will ensure the latest sync of vlan.dat, pnp and managed configs.

The first time the command is executed, it will forcibly create the backup. If an IOx user was using up the 300Mb required for backup partition creation from an older IOS release, then it will be carved into backup and the user will loose data. The user can opt for 'no' and perform a manual backup of that data before proceeding with hypervisor backup_images command.

Plug and Play Agent (PnP) support over 4G/Ethernet

An option was added to the bundle install command:

bundle install <bundle_image_name> rom-autoboot

When this option is specified, the IOS system image to boot will NOT be written into the running-config. Instead, it will be set into the rommon BOOT variable (BOOT=<system_image>) ONLY.

After bundle install <bundle_image_name> rom-autoboot and write erase commands, when the device reloads it will automatically boot the IOS image saved in rommon BOOT. This also ensures the device does not have any startup configuration when it boots up so it will allow PNP to start up.

PNP can be started either using Ethernet or cellular 4G. If connected to both, Ethernet will take precedence over Cellular 4G.

PNP using Ethernet can be done in three different ways:

1. Specifying OPTION 43 on DHCP ROUTER
   
   Example: option 43 ascii 5A1D:B2;K4;I<APIC-EM_IP_ADDRESS>;J80

2. Specifying DNS on DHCP ROUTER
   
   Example: domain-name test.com
   
   #conf t
   
   #ip host pnpserver.test.com <APIC-EM address>

3. Specifying CCO’s address by configuring devicehelper.cisco.com on DHCP ROUTER
   
   #conf t
   
   #ip host devicehelper.cisco.com <CCO_address>

PNP using 4G cellular can be done by configuring the device information (Serial number, PID and controller profile-APIC-EM) on CCO.

Once PNP is completed, issue a write mem command to save the configuration. PNP pushes the configuration but does not save it. The configuration must be saved after PNP is successfully completed.

To verify if PNP is completed or not, verify with the sh run command. At the bottom of the command output, there should be a pnp profile and the APIC EM address. This means the device was redirected to APIC-EM and the initial PNP was successfully done. Now once the configuration file is pushed from APIC-EM, verify this using the sh pnp task command and verify the Config-Upgrade Task should have Result: Success.

Note

The device should not be interrupted until PNP is completed. If the device is interrupted, PNP will stop. If at any point something goes wrong, reload the router without saving the configuration and PNP will start once again. Once PNP is completed it is necessary to save the configuration by issuing the write mem command.

Additional Resources for Cisco Plug and Play can be found at the following links:

**Plug and Play (PnP) Support on the IR829 LAN**

*Feature applies to the IR829 product series only*

Starting with this release, PnP will be supported over LAN ports (G1 to G4). In previous releases, PnP was supported only over WAN port and 4G LTE.

Similar to WAN port, PnP over LAN Interfaces can be triggered by configuring either DHCP, DNS or CCO details on DHCP/DNS server. Since all the LAN interfaces default to Vlan1, when the router boots up in factory default mode, it acquires an IP address from either DHCP or DNS server through Vlan1. This is how PnP is initiated. Once the initial PnP discovery is successful and the router is discovered on the PnP Server (for example: any Network Management System such as Field Network Director, APIC-EM, DNAC to name a few), it will be in an unclaimed state. From here, the user can ‘claim’ the device and push required configurations from the PnP server to the router.

**Note:** Image upgrade from the PnP server is currently not supported.

PnP using Ethernet can be done in three different ways:

1. **Specifying OPTION 43 on DHCP router**

   ```
   ip dhcp pool IOT_address
   network 192.168.1.0 255.255.255.0
   default-router 192.168.1.1
   option 43 ascii 5A1D;B2;K4;I172.23.165.116;J80
   ntp master
   ```

2. **Specifying DNS on DHCP router**

   ```
   ip dhcp pool IOT_DNS
   network 192.168.2.0 255.255.255.0
   default-router 192.168.2.1
   ```
3. Specifying CCO’s address by configuring devicehelper.cisco.com on DHCP router

```
ip dhcp pool IOT_dhcp
network 192.168.3.0 255.255.255.0
default-router 192.168.3.1
dns-server 192.168.3.1
ip host devicehelper.cisco.com 64.101.32.10
ip host time-pnp.cisco.com 192.168.3.1
ntp master
```

**Note:** Once PnP is completed, issue a `write mem` command to save the configuration. PnP pushes the configuration but does not save it. The configuration must be saved after PnP is successfully completed.

To verify if PnP is completed or not, verify with the `show run` command. At the bottom of the command output, there should be a PnP profile and the PnP controller IP address. This means the device was redirected to the PnP server and the PnP discovery was successfully done. Once the configuration file is pushed from the PnP server, verify this using the `show pnp task` command and verify the Config-Upgrade Task should show Result: Success.

You can further debug and verify the entire PnP process using the commands `show pnp summary`, `show pnp trace` and `show pnp tech-support`.

**Note:** The device should not be interrupted until PnP is completed. If the device is interrupted, PnP will stop. If at any point something goes wrong, reload the router without saving the configuration and PnP will start once again. Once PnP is completed it is necessary to save the configuration by issuing the `write mem` command.

```
IR800#show running-config | begin pnp profile
pnp profile pnp_redirection_profile
transport https ipv4 128.107.248.237 port 443
end
IR800#show pnp task

```
Password Recovery

Use the following procedure in the event you have lost the router password.

Procedure

Step 1 Copy a ".cfg" configuration file in the router flash memory without any "username", "password", or "AAA" statements.

Example:

IR800# copy usb:default-config flash:default-config.cfg
Destination filename [default-config.cfg]?

In the router flash memory you must have only one ".cfg" at a time. If there are two or more the system will be confused resulting in unexpected behavior.

Step 2 Make a copy of the "startup-config" file in the router flash memory without an extension.

Example:

IR800# copy startup-config flash:startup-config
Destination filename [startup-config.cfg]?

Step 3 Power-off the router. Press the "Reset Button" and power-on the router, holding the button for 30sec. The router should boot with the new ".cfg" file.

Step 4 Copy the "startup-config" file over the "running-config".

Example:

IR800# copy flash:startup-config running-config
Destination filename [startup-config.cfg]?

Step 5 Change only the passwords necessary for your configuration. You can remove individual passwords by using the no in front of each statement. For example, entering the no enable secret command removes the enable secret password.

Step 6 Save the configuration changes.

Example:

IR800# write
building configuration...

Software Overview

The IR800 series offers a rich IOS feature set. This section provides a brief overview of these features.

Note

Features may be dependent of platform and releases
<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Cellular Connectivity**       | • 4G LTE, 3.7G, 3.5G, or 3G Cellular WAN link  
  • External, dual 4G antennas with main and receive diversity for maximum signal strength connectivity  
  • Dual subscriber identity module (SIM) capability  
  • Auto-Sim  
  • MPDN  
  • Assisted GPS [for specific modems]  
  • Dual-SIM  
  • Dual-LTE (on dual LTE SKUs only)  
  • Concurrent connections to two cellular networks for high reliability, enhanced data throughputs for mission critical services.     |
| **Wi-Fi (829 only)**            | • Dual radio 802.11n concurrent 2.4 GHz and 5.0 GHz with embedded 2X3 MIMO  
  • Up to 300 Mbps data rate per radio                                                                                               |
| **Cisco IOx Application Support** | Provides an open, extensible environment for hosting OS and applications at the network edge.  
  Application Hosting on Guest Operation System.                                                                                   |
| **Security**                    | Advanced security features that support:  
  • Access control  
  • Data confidentiality and data privacy  
  • Threat detection and mitigation  
  • Device and platform integrity                                                                                                        |
| **Cisco IOT Field Network Director** | Available as the optional Cisco Industrial Operations Kit. This is a software platform that manages a multiservice network and security infrastructure for IoT applications such as transportation, smart grid, services, distribution automation and substation automation. |
| **Cisco IOS Mobile IP Features** | • Mobile IP offers transparent roaming for mobile networks, establishing a transparent Internet connection regardless of location or movement. This enables mission-critical applications to stay connected even when roaming between networks.  
  • Assigned IP addresses to the home network are maintained in private or public networks.                                           |
<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Cisco IOS Mobile Network Features</strong></td>
<td>Allows an entire subnet or mobile network to maintain connectivity to the home network while roaming.</td>
</tr>
</tbody>
</table>
| **QoS Features** | • Provides traffic precedence to delay-sensitive or prioritized applications.  
• Facilitates low-latency routing of delay-sensitive industrial applications. |
| **Management and Manageability** | • Network managers can remotely manage and monitor networks with SNMP, Telnet, or HTTP/HTTPS/SSH, and locally through a console port.  
• Support for extensive 3G and 4G LTE-based MIBs allows for centralized management of remote devices and gives network managers visibility into and control over the network configuration at the remote site.  
• Network managers can reset to a predesignated golden image, as well as configure an 829 through Cisco IOS Software or through an external reset button.  
• Network managers can upgrade 3G, 3.5G, 3.7G, and 4G LTE firmware and router configurations remotely.  
The tight integration with Cisco IOS Software enables router to self-monitor the LTE WAN link and automatically recover from a radio link failure. |
| **Cisco IOS Software Requirement** | • Cisco IOS Software feature set: Universal Cisco IOS Software  
• Cisco IOS Software Release - 15.5(3)M, or later, and modem firmware - 5.5.58, or later. (several features require later IOS releases) |

**Hardware Differences Between IR809, IR829, and C819HG**

The IR809s are very compact cellular (3G and 4G/LTE) industrial routers for remote deployment in various industries. They enable reliable and secure cellular connectivity for remote asset monitoring and machine-to-machine (M2M) solutions such as distribution automation, pipeline monitoring, and roadside infrastructure monitoring.

The IR829s are highly ruggedized compact cellular (3G and 4G LTE with GPS and dual SIM) and WLAN (2.4/5GHz) industrial routers supporting for scalable, reliable, and secure management of fleet vehicles and mass transit applications.

The 819HG-LTE-MNA-K9: Multimode Cisco LTE 2.0 for carriers that operate LTE 700 MHz (band 17), 1900 MHz (band 2 PCS), 850 MHz (band 5), 700 MHz (band 13), 1900 MHz (band 25 extended PCS) networks; or 1700/2100 MHz (band 4 AWS) networks; backward-compatible with UMTS and HSPA+: 850 MHz (band 5), 900 MHz (band 8), 1900 MHz (band 2 PCS), and 1700/2100 MHz (band 4 AWS), with EVDO Rev A/CDMA 1x BC0, BC1, BC10.

## Antenna Recommendations

Neither the IR809 or IR829 is shipped with antennas. These antennas must be ordered separately. The IR829 must be installed with 2 antennas (Main & Aux) to guarantee the best performance level. Using a single
antenna may impact the downlink performance by a minimum 3dB, and can be much greater (10-20dB) due to multipath fading (destructive interference between direct and reflected radio waves).

In case of 3G UMTS, a solo antenna would not be able to switch to the diversity port.

With the IR829, it must be guaranteed >15dB isolation between the WiFi and LTE antennas at all frequencies of 4G LTE and WiFi operation, for minimum impact to performance. This is ideally 20-25dB.

The Sierra Wireless MC73xx modem series supports MIMO on LTE. WCDMA UMTS HSPA DC-HSPA+ is diversity only, without MIMO.

Poorly installed MIMO antennas, such that the two (or more in case of 3x3, 4x4 MIMO) antennas have a strong correlation coefficient. This may cause the two streams to interfere with each other (otherwise known as lack of diversity), since the system has trouble separating the two. The multi-element antennas (5-in-1, 3-in-1, 2-in-1) have good diversity.

For detailed information about Cisco Antennas, please refer to the following guides:

Cisco Industrial Routers Antenna Guide:

Connected Grid Antennas Installation Guide:

Cisco Aironet Antennas and Accessories Reference Guide

Features Supported in Different IOS Releases

The IR800 series was originally released with IOS software version 15.5(3)M. The following lists the software releases with the features added.

**15.5(3)M (initial release)**
- Software based Crypto

**15.5(3)Mx**
- Hardware based Crypto

**15.6(1)T**
- IR809 Input alarm port, including SNMP Trap support
- SLIP & PPP serial encapsulation on serial interfaces
- Reset button behavior changed to match other 800 series

For detailed information about Cisco Antennas, please refer to the following guides:

Cisco Industrial Routers Antenna Guide:

Connected Grid Antennas Installation Guide:

Cisco Aironet Antennas and Accessories Reference Guide
- IOX phase 2 CAF, 64 bits Linux, IR800-IOXVM image
- Guest OS Serial port access

15.6(2)T
- Ignition power management on the IR829
- Performance improvements on IR800s

15.6(3)M
- Boot time reduction
- Copper SFP support on the IR829
- Serial Baud Rate configuration support
- USB EHCI emulation to GOS Support
- Memory allocation optimization between VDS, IOS and GOS

15.6(3)M0a
- Support added for the Sierra Wireless MC7430 series modems on the IR829.

15.6(3)M1
- 4G LTE IPv6 Support
- Accelerometer and Gyroscope Support
- IOXVM Storage Partition Enhancement
- IOXVM Graceful Shutdown
- Sierra Wireless MC7430 modem support on the IR809.

15.6(3)M1b
- 4G LTE IPv6 Support
- Accelerometer and Gyroscope Support
- IOXVM Storage Partition Enhancement
- IOXVM Graceful Shutdown
• Support for New Modems and Dual Modems.

15.6(3)M2

• 100Mbs SFP Support on the IR829
• Bridge Virtual Interface Support for IR800 Guest-OS
• New Features for LTE Modems
  • Assisted-GPS support on IR800 MC73xx modems
  • Multi-PDN support on IR800 MC73xx and MC74xx modems
  • 2000B MTU support on cellular interface for MC73xx modems

15.6(3)M3

• Bug Fixes Only

15.7(3)M

• IOx Radius authentication
• IOx IPv6 Networking Option
• Cellular Backoff

15.7(3)M1

• Guest OS persistent logging through reload
• Guest OS file system corruption detection and recovery
• Plug and Play Agent (PnP) support over 4G/Ethernet
• AutoSim and Firmware Based Switching
• Battery Back Up (BBU) Support

15.7(3)M2

• Virtual LPWA support for LoRaWAN
• IOS APIs to Enable Native IOx Applications
• Support for mSATA Module
15.8(3)M
• Plug and Play (PnP) Support on the IR829 LAN Interfaces
• Auto-Negotiation Support for the IR829 Gigabit-Ethernet 0 Interface
• Ignition Undervoltage Threshold in Double Decimal
• Auto-recovery of Corrupt Filesystems
• Radio Frequency Band Select
• Modem Low Power Mode
• Enhancement to Modem Crash Action
• Displaying the Wear Leveling Data for the mSATA SSD on the IR829
• Improvements in IOS and Guest-OS Clock Time Synchronization

15.8(3)M1
• GPS NMEA Multiple Stream
• Display digital signature and software authenticity-related information for a specific image file from image header
• Client Information Signaling Protocol (CISP)
• Dot1x Supplicant Support on the L2 interface on the IR829
• LLDP (Link Layer Discovery Protocol) Support for 3rd party PoE devices on the IR829

15.8(3)M2
• IR809 and IR829: MIB support for Gyroscope and Accelerometer
• IR829M: MIB support for mSATA Wear Ratio and Usage
• IR809 and IR829: PNP Image Upgrade from FND

Cisco IR800 Integrated Services Router Software Configuration Guide
Sequence 2

Problems that may occur during ROMMON-1 are:

- Hypervisor was uninstalled, but not re-installed
- **BOOT_HV** variable missing

Resolution would be to `boot ir800-hv.srp.SPA.<version>`

**Note**
USB memory stick or PEN drive can be used as storage at ROMMON-1, i.e. copying HPV and IOS files.

EULA_ACCEPTED=TRUE
```
In the NVRAM status shown above, the default BOOT_IOS_SEQUENCE value is 4. Starting with IOS version 15.7(3)M2, the value has increased to 20.

Setup Command Facility

The setup command facility guides you through the configuration process by prompting you for the specific information that is needed to configure your system. Use the setup command facility to configure a hostname for the router, to set passwords, and to configure an interface for communication with the management network.

To use the setup command facility, you must set up a console connection with the router and enter the privileged EXEC mode.

To configure the initial router settings by using the setup command facility, follow these steps:

Procedure

Step 1
Set up a console connection to your router, and enter privileged EXEC mode.

Step 2
In privileged EXEC mode, at the prompt, enter setup.

Example:

IR800# setup

The following message is displayed:

Example:

--- System Configuration Dialog ---
Would you like to enter the initial configuration dialog? [yes/no]:

You are now in the setup command facility.

The prompts in the setup command facility vary, depending on your router model, on the installed interface modules, and on the software image. The following steps and the user entries (in bold) are shown as examples only.

Note If you make a mistake while using the setup command facility, you can exit and run the setup command facility again. Press Ctrl-C and enter the setup command at the privileged EXEC mode prompt (Router#). To proceed using the setup command facility, enter yes.

Example:

Would you like to enter the initial configuration dialog? yes

Step 3
When the following messages appear, enter yes to enter basic management setup.
Example:

At any point you may enter a question mark '?' for help. Use ctrl-c to abort configuration dialog at any prompt. Default settings are in square brackets '[]'. Basic management setup configures only enough connectivity for management of the system, extended setup will ask you to configure each interface on the system.

Would you like to enter basic management setup? [yes/no]: yes

Step 4  Enter a hostname for the router (this example uses Router).

Example:

Configuring global parameters:
Enter host name [Router]: Router

Step 5  Enter an enable secret password. This password is encrypted (more secure) and cannot be seen when viewing the configuration.

Example:

The enable secret is a password used to protect access to privileged EXEC and configuration modes. This password, after entered, becomes encrypted in the configuration.
Enter enable secret: xxxxxx

Step 6  Enter an enable password that is different from the enable secret password. This password is not encrypted (less secure) and can be seen when viewing the configuration.

Example:

The enable password is used when you do not specify an enable secret password, with some older software versions, and some boot images.
Enter enable password: xxxxxx

Step 7  Enter the virtual terminal password, which prevents unauthenticated access to the router through ports other than the console port.

Example:

The virtual terminal password is used to protect access to the router over a network interface.
Enter virtual terminal password: xxxxxx

Step 8  Respond to the following prompts as appropriate for your network:

Example:

Configure SNMP Network Management? [yes]:
  Community string [public]:

A summary of the available interfaces is displayed. The following is an example summary and may not reflect your configuration:

Example:

Current interface summary
Any interface listed with OK? value "NO" does not have a valid configuration
Step 9  Choose one of the available interfaces for connecting the router to the management network.

Example:

Enter interface name used to connect to the management network from the above interface summary: GigabitEthernet0

Step 10  Respond to the following prompts as appropriate for your network:

Example:

Configuring interface GigabitEthernet0:
Configure IP on this interface? [yes]: yes
Use the 100 Base-TX (RJ-45) connector? [yes]: yes
Operate in full-duplex mode? [no]: yes
Configure IP on this interface? [yes]: yes
IP address for this interface: 172.16.2.3
Subnet mask for this interface [255.255.0.0]: 255.255.0.0
Class B network is 172.16.0.0, 26 subnet bits; mask is /16

The configuration is displayed:

Example:

The following configuration command script was created:
hostname Router
enable secret 5 $1$D5P6$PYx41/lQIASK.HcSbfO5q1
enable password xxxxxx
line vty 0 4
password xxxxxx
snmp-server community public
!
no ip routing
!
interface GigabitEthernet0
no shutdown
speed 100
duplex auto
ip address 172.16.2.3 255.255.0.0
!

Step 11  Respond to the following prompts. Enter 2 to save the initial configuration.

Example:

[0] Go to the IOS command prompt without saving this config.
[1] Return back to the setup without saving this config.
[2] Save this configuration to nvram and exit.
Enter your selection [2]: 2
Building configuration...
Use the enabled mode 'configure' command to modify this configuration.
Press RETURN to get started! RETURN
Step 12 Verify the initial configuration. See the Verifying the Initial Configuration, on page 36 for verification procedures.

What to do next

After the initial configuration file is created, you can use the Cisco IOS CLI to perform additional configuration.

Verifying the Initial Configuration

To verify that the new interfaces are operating correctly, perform the following tests:

- To verify that the interfaces and line protocol are in the correct state—up or down—enter the `show interfaces` command.
- To display a summary status of the interfaces configured for IP, enter the `show ip interface brief` command.
- To verify that you configured the correct hostname and password, enter the `show configuration` command.

After you complete and verify the initial configuration, you can configure your Cisco router for specific functions.

Note

The QoS Input Service Policy can only be configured on the WAN interface, not on the SVI interface.

Note

To ensure product security, even though the use of Hypervisor is not discussed in this guide, a proper password should be set. Only IOS priv15 users will be able to configure the password. The commands are shown as follows:

```plaintext
Router:(config)#iox hypervisor password ?
  0   Specifies an UNENCRYPTED password will follow
  7   Specifies a HIDDEN password will follow
  LINE The UNENCRYPTED (cleartext) password
```

LEDs

The Cisco IR800 has LEDs that are discussed in the Hardware Configuration Guide for each model. There is also a command that will show you the status of the LEDs if you are not near the device. Use the show platform led command with options to view the different output.

Note

The following examples are from the IR829. The IR809 differs slightly.
### Single Modem

IR829# **show platform led**

System LED: amber, blinking
IR829#
IR829#show platform led system
System LED: amber, blinking
Summary of the LED status providers:
The system LED is physically labeled SYS on IR809 and PWR on IR829. However, the software logic for the system LED status works in the same way for both IR809 and IR829.

By definition, amber blinking means the system has an error, but has network connectivity. For most of the time, this amber blinking condition is seen because one or more of the Ethernet ports on your IR829 is in administrative un-shut state, but there’s no actual link (e.g. cable disconnected or peer port is down etc.)

To make the status show solid green, ensure that the link on each administrative un-shut port connects a device that is up, or you can put all disconnected ports in administrative shut state.

IR800# show platform led system
System LED: amber, blinking

<td>critical</td>
<td>OK</td>
</tr>
</tbody>
</table>
There may be a lag time between the LED indication on the router and what the show led commands return.

Software Bundle Installation

The Cisco IR800 ships with the latest software available with the configuration that was ordered. There should be no reason to have to upgrade unless a failure occurs, or you wish to install a new bundle to benefit from new features. Should the need arise, the following steps will assist in performing a bundle installation.

The bundle install will fail if “ip ssh source-interface” is configured. Make sure that none of the interfaces have ssh running on them before performing the installation.

Displaing Digital Signature and Software Authenticity

Feature is new for release 15.8(3)M1 and applies to the IR8x9

Updates have been made to CLI commands due to unsupported file format errors:

- show software authenticity file <IOS image/SRP image/bundle image/GOS image>
- verify <IOS image/SRP image/bundle image/GOS image>

These commands would return the error:

```
IR800#show software authenticity file flash:ir800-universalk9-mz.SSA
%Error processing flash:ir800-universalk9-mz.SSA: Unsupported file format
```

With this feature enhancement, users will now be able to run these CLIs to display and verify digital signature and software authenticity information for these types of signed files present in flash: partition only (IOS image, Hypervisor image, bundle image and Guest-OS image) supported on the IR8x9

show software authenticity file command

Command Syntax:
```
show software authenticity file flash:<bundle image> | <ios image> | <srp image> | <gos image>
```

Description:
Displays digital signature and software authenticity-related information for a specific image file from image header.
### Field | Description
--- | ---
File Name | Name of the file
Image Type | States the type of image
Signer Information |  
Common Name | CiscoSystems
Organizational Unit | Gemini-Balboa
Organizational Name | CiscoSystems
Certificate Serial Number | Number assigned to the certificate
Hash Algorithm | Type of algorithm used for hashing
Signature Algorithm | Type of algorithm used to sign this image
Key Version | The version of the key used to generate the signature

For additional information on this command, please see:

**Expected output example:**

```
Router# show software authenticity file ?
flash: Image to be authenticated
nvram: Image to be authenticated

Router# show software authenticity file flash: ir800-universalk9-mz.SSA
File Name : flash:ir800-universalk9-mz.SSA
Image type : Special
Signer Information
Common Name : CiscoSystems
Organization Unit : Gemini-Balboa
Organization Name : CiscoSystems
Certificate Serial Number : 563ACCAA
Hash Algorithm : SHA512
Signature Algorithm : 2048-bit RSA
Key Version : A

Note: It may take several minutes for the command to perform the image authentication.
```

### verify command

**Syntax:**

```
verify flash:<bundle image> | <ios image> | <srp image> | <gos image>
```

**Description:**

Verify the digital signature for specific image.
Bundle Installation Steps

Overview:

1. Download the bundle to flash memory from a TFTP server.
2. Install the bundle from the Command Line Interface.
3. Save the configuration, and reload the router to use the new image.
4. Download the 4G firmware upgrade.

Example:

Procedure

Step 1
Copy the bundle from a TFTP server to your router.

Example:

IR800#copy tftp flash

Address or name of remote host [192.168.254.254]? your ip address here
Source filename [path to file/ir800-universalk9-bundle.SSA.156-2.10.62.GB]? <enter>
Destination filename [ir800-universalk9-bundle.SSA.156-2.10.62.GB]? <enter>
Accessing tftp://192.168.254.254/tachen/ir800-universalk9-bundle.SSA.156-2.10.62.GB ...

*Jun 25 18:28:45.685: %ARP-4-NULL_SRC_MAC: NULL MAC address from 172.16.0.1 on wlo0!---------------------------------------------------------------
[OK - 161162048 bytes]
161162048 bytes copied in 466.054 secs (345801 bytes/sec)

Step 2
The bundle download is complete, and now needs to be installed. Perform the bundle install flash: < bundle iOS image name > command.

Note    The Bundle and Hypervisor installation will fail if SSH is not properly configured.
Example:

IR800#bundle install flash:ir800-universalk9-bundle.SSA.156-2.10.62.GB
Installing bundle image:
/ir800-universalk9-bundle.SSA.156-2.10.62.GB.......................................................
upgrading Hypervisor image...
Sending file modes: C0444 25160429 ir800-hv.srp.SPA.2.6.9
  SRP md5 verification passed!
upgrading IOS image...
Sending file modes: C0644 63827874 ir800-universalk9-mz.SSA.156-2.10.62.GB
  IOS md5 verification passed!
Done!
IR800#
*Nov 16 18:54:39.456: %SYS-5-CONFIG_I: Configured from console by bundle install command

Step 3  Once the bundle installation has completed, verify with the show platform bundle installed command.

Step 4  (Optional) View which version of Hypervisor you are running.

Example:

IR800# show platform hypervisor
version: 2.5.5.2

Step 5  Verify the boot system parameter before reloading the router.

Step 6  Save the configuration and reload the router.

Example:

IR800# reload
Do you want to reload the internal AP ? [yes/no]: yes
System configuration has been modified. Save? [yes/no]: yes
Building configuration...
[OK]
Proceed with reload? [confirm] <enter>

Step 7  Download the 4G firmware or AP image. Instructions for uploading firmware are located here:
Search for “Upgrading the Modem Firmware”.

---

### Additional Software Bundle Installation Options

The bundle install command has additional options.

<table>
<thead>
<tr>
<th>Command Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>exclude</td>
<td>Used to one of the components of the bundle. Example: Install only hypervisor and IOS from the bundle. IR800#bundle install flash:bundle_image exclude GOS</td>
</tr>
</tbody>
</table>
Power Over Ethernet (PoE)

The IR829 has an optional PoE accessory (IR800-IL-POE). When installed, it supplies a maximum of 30.8W shared between the 4 GE LAN ports (GI1-GI4). The Power can be distributed among the ports in the following manner:

- If one port supports PoE+ (30W), then the other ports have no PoE.
- If 2 ports support PoE (15.4 W), then the other ports have no PoE.
- All 4 ports can support 7.7 W per port.

Note

The router cannot be upgraded for PoE in the field.

IOS supports bi-directional inline power negotiations with Cisco devices through the use of CDP. Cisco Power Devices (PDs) may signal increase or decrease in their demand for power through CDP. Decrease in demand will result in returning unused power to the pool of available power. Increase in demand will be accommodated, subject to the available unused power and the port power limit (and 802.3at classification where applicable).
If the PDs do not support CDP, the inline power allocation is based on the classification if they are 802.3at devices or 15.4W if not 802.3at compliant.

Command Examples

```
IR829(config)#interface gi2
IR829(config-if)#power inline auto
    Automatically detect and power inline devices
never
    Never apply inline power
port
    Configure Port Power Level
IR829(config-if)#power inline port max
    Maximum power configured on this interface
<4000-30800> milli-watts
```

```
IR829#show power inline

PowerSupply SlotNum. Maximum Allocated Status
----------- -------- ------- --------- ------
EXT-PS 0 30.800 30.000 PS GOOD

Interface Config Device Powered PowerAllocated State
--------- ------ ------ ------- -------------- -----
Gi1 auto IEEE-4 On 30.000 Watts PHONE
Gi2 auto Unknown Off 0.000 Watts UNKNOWN
Gi3 auto Unknown Off 0.000 Watts UNKNOWN
Gi4 never Unknown Off 0.000 Watts NO_POWER
```

LLDP (Link Layer Discovery Protocol) Support for 3rd party PoE devices

This feature applies to the IR829 only.

Previously, the IR829 supported PoE allocation/negotiation only for the PD (Powered Devices) which communicate using CDP (Cisco Discovery Protocol). With this release, support is added for Link Layer Discovery Protocol.

LLDP is a vendor-neutral CDP like neighbor discovery protocol that is used by network devices to advertise information about themselves to other devices on the network. LLDP supports a set of attributes that it uses to discover neighbor devices. These attributes contain type, length, and value descriptions and are referred to as TLVs. LLDP supported devices can use TLVs to receive and send information to their neighbors.

Details such as configuration information, device capabilities, and device identity can be advertised using this protocol. LLDP for Media Endpoint Devices (LLDP-MED) is an extension to LLDP that operates between endpoint devices such as IP phones and network devices such as switches. LLDP-MED specifically provides support for voice over IP (VoIP) applications and provides additional TLVs for capabilities discovery, network policy, power over Ethernet (PoE), inventory management, and location information. LLDP-MED contains power management TLV which allows PD (power device) to request power. Power TLV defines the format for power request.

Once power is applied to the port, LLDP-MED (Power TLV) is used to determine the actual power requirement of PDs and the system power budget is adjusted accordingly. The router processes the request and either grants or denies power based on the current power budget. If the request is granted, then the router simply updates the power budget. If the request is denied, the router turns OFF power to the port, generates a syslog message, and updates the power budget and LEDs.

If LLDP-MED is disabled or if the PD does not support the LLDP-MED power TLV, then the initial allocation value is used throughout the duration of the connection. No new CLIs are added and the following commands can be used to troubleshoot.
show power inline interface [detail]

Used in exec mode, this command shows inline power settings and status per interface or all respectively.

IR800>show power inline

**Serial Port Configuration**

**Before you begin**

Serial Port configuration on the IR800 series depends on having proper cabling to start with. Before you configure the serial port of the IR809 or IR829, make sure to read the serial port section of the IR829 Hardware Installation Guide: https://www.cisco.com/c/en/us/td/docs/routers/access/800/829/hardware/install/guide/829hwinst/pview.html#85723

---

**Note**

The serial port can be used either by IOS, or through an IOx application.

To specify an asynchronous serial interface and enter interface configuration mode, use one of the following commands in global configuration mode.

```
interface async?
```

To configure the serial port:

**Procedure**

Perform the steps in the following example.
**Configuring Accelerometer and Gyroscope**

Ensure that your router is running IOS version 15.6(3)M1 or above.

Accelerometer and Gyroscope functionality tracks the speed and angular movement of the device. Two configuration CLIs and one show CLI are available:

```
IR829(config)#[no] gyroscope-reading enable
```

Once this is enabled, gyroscope reading will start by the frequency currently set. Prior to IOS release 15.7(3)M1, the format of the command was:

```
IR829 (config)#gyroscope-reading frequency ?
1/min Reading 1 times per minute
1/sec Reading 1 time per second
10/min Reading 10 times per minute
```

From IOS release 15.7(3)M1 going forward, the format has been modified to:

```
IR829 (config)#gyroscope-reading frequency ?
one/min Reading 1 times per minute
one/sec Reading 1 time per second (default value)
ten/min Reading 10 times per minute
```

After upgrading to IOS release 15.7(3)M1, the router will have to be reconfigured.

Default frequency is 1/sec. If this is configured, it would overwrite default frequency and any later reading would be according to the newly set frequency.

```
IR829 #show platform gyroscope-data
Starting Entry = 0, next_entry = 1003, start time = , wrap_around = 0
Date Time G-X G-Y G-Z XL-X XL-Y XL-Z
2016:09:19 18:25:09.28 2152.50 -253.75 1496.25 -7.564 27.267 1030.168
2016:09:19 18:26:08.83 402.50 -647.50 1295.00 -8.113 43.493 1030.436
2016:09:19 18:27:08.90 -1706.25 -1058.75 1295.00 -6.771 41.724 1017.419
2016:09:19 18:28:08.85 253.75 -498.75 1452.50 -4.819 31.110 1030.168
```

This CLI would only show data if "gyroscope-reading" is enabled. All readings since start (unless wrap-around occurs, which means table is full), would be shown in the order from the most recent to the oldest.
Each entry shows G-X, Y, Z (3D gyroscope data) in mdps (Milli Degrees Per Second) and XL-X, Y, Z (3D accelerometer data) in unit mg (milli g forces) where g is \(\approx 9.81\) m/s\(^2\).

**Note**

Configurations would be in running-config and would stay over reload if saved.

A new MIB/OID is available to support the following SNMP operations:

- SNMP walk: snmpwalk is used to fetch all values of a sub tree under the MIB table or value of particular OID.
- SNMP get: snmpget is used to fetch the value of a particular OID.

The entity OID value is iso.3.6.1.4.1.9.12.3.1.8.230.

The `show platform gyroscope` command gives information about this MIB.

## Auto-Negotiation Support for Gigabit-Ethernet 0 on the IR829

The IR829 product series (with a 1000Base-T SFP) only supported a fixed speed of 1000Mbps. To enable multiple speed support Cisco introduced auto-negotiation as the default speed on Gigabit-Ethernet 0.

It is highly recommended to use auto-negotiation on both sides of the network for best performance results. Once auto-negotiation is initiated, the device (PHY) determines whether or not the remote device has auto-negotiation capability. If so, the device and the remote device negotiate the speed and duplex with which to operate. If the remote device does not have auto-negotiation capability, the device uses the parallel detect function to determine the speed of the remote device for 100BASE-TX and 10BASE T modes. If the link is established based on the parallel detect function, then it is required to establish the link at half duplex mode only. Refer to IEEE 802.3 clauses 28 and 40 for a full description of auto-negotiation.

**Note**: Auto-Negotiation is enabled by default. There is no CLI configuration.

## Where To Go From Here

There are a wide variety of configuration options available on the Cisco IR800. This guide provides information on the most common options. Use the following resources for additional information:

- **Cisco 800 Series Industrial Integrated Services Routers**
- **Cisco Firmware Upgrade Guide for Cellular Modems**
- **Cisco 4G LTE Software Installation Guide**
- **Cisco 3G and 4G Serviceability Enhancement User Guide**
CHAPTER 3

Cellular Interface Modules

This chapter provides configuration details for the cellular interface modules used in the IR800 series routers. It is important to understand the architecture of the IR800 series and the relationship between Modems, SIMs, Interface and Controller. The following table helps to illustrate these relationships.

<table>
<thead>
<tr>
<th>Router</th>
<th>Controller</th>
<th>SIM Slot</th>
<th>Modem Slot</th>

This chapter contains the following sections:

- Cellular Interface, on page 52
- Radio Frequency Band Select, on page 65
- Low Power Mode, on page 66
- Enhancement to Modem Crash Action, on page 66
- IR800 Cellular Technology Selection, on page 67
- GPS, on page 70
- Troubleshooting the Cellular Interface, on page 73

### Cellular Interface

The Cisco IR800 series Industrial routers use the Sierra Wireless MC73XX and MC74XX series modems supporting MIMO on LTE. WCDMA UMTS HSPA DC-HSPA+ is diversity only, without MIMO.

Installation of the SIM card(s) and antennas is covered in the respective Hardware Installation Guides under the Cisco 800 Series Industrial Integrated Services Routers page:

The software download page can be found here:

The Firmware Upgrade Guide for Cellular Modems can be found here:

Cisco 4G LTE Software Installation Guide
After installing the SIM card(s) and antennas, check the cellular hardware, radio, network and SIM (Unlock SIM card if necessary).

4G LTE Dual SIM

Dual Subscriber Identity Module (SIM) provides reliability and multihoming capabilities over LTE and HSPA-based networks. With two LTE modems, the IR829 enables concurrent connectivity to two cellular networks for high reliability, enhanced data throughputs, load balancing and differentiated services.

**Note**

Dual SIM active/backup mode is supported only on single LTE models of the IR829.

The following features are provided:

- The two SIMs operate in active/backup mode on the single LTE models of the IR829, and active/active mode with each of the two SIMs assigned to a specific cellular radio on the dual LTE models. Both mobile provider networks must be supported by the given IR829 SKU, and it must be in an applicable region.
- By default, SIM slot 0 is the primary, and SIM slot1 is the backup. Behavior may be changed using the `lte sim primary` command.
- Profiles for each SIM are assigned by using the `lte sim profile` command. Each SIM has an associated Internet profile and an IMS profile in the CLI.
- Dual-SIM behavior is managed under Cellular 0 CLI configuration.
- The fail over occurs when there is no signal from the current carrier, and generally happens depending on the fail over timer value that is set. The default value is 5 minutes. The range is from 0-7 minutes.
- Dual active LTE radios providing Multi-carrier support for active and backup use cases. Newer cellular modems have been added (MC74xx) with FDD/TDD LTE on LA and EA 829 models.

**Note**

The 7455 modems do not support dual SIM capabilities.

AutoSim and Firmware Based Switching

The advantages of the AutoSim feature are:

- Ease of Ordering Carrier Specific SKUs
- Quicker failover times in dual-sim deployments
- Ease of switchover from other service providers to Telstra network

Auto-SIM is supported in Sierra wireless firmware Version 02.20.03. A new CLI is added in the cellular controller to enable/disable Auto-SIM. The modem in Auto-SIM mode selects the right carrier firmware after a SIM slot switch and an automatic modem reset. Auto-SIM is supported on the MC7455, MC7430, EM7430,
and EM7455 modems. During bootup, if the Auto-SIM configuration on the modem doesn’t match to the IOS configuration, the corresponding Auto-SIM or manual mode is pushed to the modem.

After an Auto-SIM configuration change, the modem is automatically reset; the default is “auto-sim” enabled.

Enable Auto-SIM:

```
router(config)#controller cellular <slot>
router(config-controller)#lte firmware auto-sim #default is auto-sim enabled
```

**Note**

After enabling auto-sim, wait for 5 minutes until the radio comes up. Once the radio is up, issue a modem power-cycle and wait for 3 minutes for the radio to come up again. Modem Power-Cycle is mandatory for auto-sim configuration to take effect.

Disable Auto-SIM:

```
router(config)#controller cellular <slot>
router(config-controller)#no lte firmware auto-sim
```

**Note**

After disabling auto-sim, wait for 5 minutes until the radio comes up. Once the radio is up, issue a modem power-cycle and wait for 3 minutes for the radio to come up again. Modem Power-Cycle is mandatory for auto-sim configuration to take effect.

If Auto-SIM is disabled and the modem is in manual mode, select a carrier with a new exec CLI:

```
cellular lte firmware-activate <firmware-index>
```

The following CLI example shows the firmware-index of the carrier in the modem:

```
router#show cellular <slot> firmware
```

For additional information, see the following guide: https://www.cisco.com/c/en/us/td/docs/routers/access/interfaces/NIM/software/configuration/guide/4GLTENIM_SW.html

### Dual Radio Configuration and Single Radio Configuration

The following examples are of an IR800 cellular configuration using dual modems. A single modem example will look much the same, without the `Cellular1/0` and `Cellular1/1` entries.

```
DUAL-Modem> enable
DUAL-Modem# show ip int brief
Interface   IP-Address  OK? Method Status          Protocol
GigabitEthernet0   unassigned  YES NVRAM administratively down down
GigabitEthernet1   unassigned  YES unset    down            down
GigabitEthernet2   unassigned  YES unset    down            down
GigabitEthernet3   unassigned  YES unset    down            down

Creating a Cellular Profile for Verizon.

DUAL-Modem# cellular 0/0 lte profile create 3 we01.VZWSTATIC
Warning: You are attempting to modify a currently ACTIVE data profile.

This is not recommended and may affect the connection state
PDP Type = IPv4v6
Access Point Name (APN) = we01.VZWSTATIC
Authentication = NONE
Profile 3 already exists with above parameters. Do you want to overwrite? [confirm] <return>
Profile 3 will be overwritten with the following values:
PDP type = IPv4
APN = we01.VZWSTATIC
Authentication = NONE
Are you sure? [confirm] <return>
Profile 3 written to modem
DUAL-Modem#

Enter configuration commands, one per line. End with CNTL/Z.
DUAL-Modem(config)# controller cellular 0
DUAL-Modem(config-controller)# lte sim data-profile 3 attach-profile 1
DUAL-Modem(config-controller)#
DUAL-Modem# conf t
Creating a Cellular Profile for AT&T

DUAL-Modem# cellular 1/0 lte profil create 1 m2m.com.attz
Warning: You are attempting to modify a currently ACTIVE data profile.

This is not recommended and may affect the connection state
PDP Type = IPv4
Access Point Name (APN) = m2m.com.attz
Authentication = NONE
Profile 1 already exists with above parameters. Do you want to overwrite? [confirm] <return>
Profile 1 will be overwritten with the following values:
PDP type = IPv4
APN = m2m.com.attz
Authentication = NONE
Are you sure? [confirm] <return>
Profile 1 written to modem
DUAL-Modem#
DUAL-Modem# conf t
Enter configuration commands, one per line. End with CNTL/Z.
DUAL-Modem(config)# controller cellular 1
DUAL-Modem(config-controller)#
DUAL-Modem(config-controller)# lte sim data-profile 1 attach-profile 1

Note: Please issue a modem reset for the modified attach-profile to take effect.
DUAL-Modem(config-controller)# end
DUAL-Modem#

Controller Cellular 0 and NAT Configuration

Controller Cellular 0 is configured with default parameters. If a profile different from Profile 1 is set-up, it must be attached to controller cellular 0.

If the SIM in slot #1 must be used as primary, it is done under controller cellular 0

Procedure

Step 1  Show the controller cellular 0
Example:

IR800# show run | begin controller
controller Cellular 0
lte sim data-profile 1 attach-profile 1 slot 0 !
Value set-up for configuration example
lte sim max-retry 0
lte failovertimer 0
lte modem link-recovery rssi onset-threshold -110
lte modem link-recovery monitor-timer 20
lte modem link-recovery wait-timer 10
lte modem link-recovery debounce-count 6
!

Step 2 If the cellular interface obtains an IPv4 private address, NAT should be configured.

Example:

IR800# conf term
Enter configuration commands, one per line. End with CNTL/Z.
IR800(config)# inter cellular 0
IR800(config-if)# ip nat outside
IR800(config)# inter vlan 4
IR800(config-if)# ip nat inside
IR800(config)# access-list 10 permit 10.20.20.0 0.0.0.255
!
IPv4 subnet to be NATed
IR800(config)# ip nat inside source list 10 interface Cellular0 overload
!
NAT interface association

Step 3 Once the Cellular configuration is done, ping a well-known IP address to test the connectivity.

Example:

IR800# ping 8.8.8.8
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 8.8.8.8, timeout is 2 seconds:
!!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 340/472/740 ms
IR800#

Step 4 Attached Cellular 0 profile must become “active” and “connection” shows IP address and traffic.

Example:

IR800# show cellular 0 profile
Profile 1 = ACTIVE* **
--------
PDP Type = IPv4
PDP address = 10.60.159.255
Access Point Name (APN) = LTE
Authentication = None
Primary DNS address = 212.27.40.240
Secondary DNS address = 212.27.40.241
* - Default profile
** - LTE attach profile
Configured default profile for active SIM 0 is profile 1.
IR800# show cellular 0 connection
Profile 1, Packet Session Status = ACTIVE
Cellular0:
What to do next

Use the show interface cellular 0 command to display the negotiated IP address if operational.

IR800# show interfaces cellular 0
Cellular0 is up, line protocol is up
Hardware is 4G WWAN Modem - Global (Europe & Australia) Multimode LTE/DC-HSPA+/HSPA+/HSPA/U

Internet address is 10.123.161.59/32
MTU 1500 bytes, BW 384 Kbit/sec, DLY 100000 usec,
reliability 255/255, txload 1/255, rxload 1/255
Encapsulation SLIP, loopback not set
Keepalive not supported
Last input 00:22:41, output never, output hang never
Last clearing of "show interface" counters never
Input queue: 0/75/0/0 (size/max/drops/flushes); Total output drops: 0
Queueing strategy: fifo
Output queue: 0/10 (size/max)
5 minute input rate 0 bits/sec, 0 packets/sec
5 minute output rate 0 bits/sec, 0 packets/sec
 12 packets input, 1128 bytes, 0 no buffer
Received 0 broadcasts (0 IF multicasts)
 0 runts, 0 giants, 0 throttles
 0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored, 0 abort
 51 packets output, 3364 bytes, 0 underruns
 0 output errors, 0 collisions, 0 interface resets
 0 unknown protocol drops
 0 output buffer failures, 0 output buffers swapped out
 0 carrier transitions
DCD=up DSR=up DTR=up RTS=up CTS=up
IR800#

If the negotiated IP address is not operational:

IR800# show interfaces cellular 0
Cellular0 is up (spoofing), line protocol is up (spoofing)
Hardware is 4G WWAN Modem - Global (Europe & Australia) Multimode LTE/DC-HSPA+/HSPA+/HSPA/U

Internet address will be assigned dynamically by the network

Other Useful Commands

IR800# show cell 0 hardware
Modem Firmware Version = SW19X15C_05.05.58.00
Modem Firmware built = 2015/03/04 21:30:23
Hardware Version = 1.0
Device Model ID: MC7304
Package Identifier ID: 1102029_9903299_MC7304_05.05.58.00_00_Cisco_005.010_000
International Mobile Subscriber Identity (IMSI) = 208150103324395
International Mobile Equipment Identity (IMEI) = 352761060206340
Integrated Circuit Card ID (ICCID) = 8933150112100222053
Mobile Subscriber Integrated Services Digital Network-Number (MSISDN) = 33695764790
Current Modem Temperature = 47 deg C
PRI SKU ID = 9903299, PRI version = 05.10, Carrier = 1

IR800# show cell 0 security
Active SIM = 0
SIM slot #0 active
SIM switchover attempts = 0
Card Holder Verification (CHV1) = Disabled
SIM Status = OK
SIM User Operation Required = None
Number of CHV1 Retries remaining = 3

IR800# cellular 0 lte sim unlock XXXX
! 
XXXX = PIN code

IR800# show cell 0 radio
Radio power mode = ON
Channel Number = 3037
Current Band = Unknown
Current RSSI(RSCP) = -99 dBm
Current ECIO = -10 dBm
Radio Access Technology(RAT) Preference = AUTO
Radio Access Technology(RAT) Selected = UMTS (UMTS/WCDMA)

IR800# show cell 0 network
Current Service Status = Normal
Current Service = Packet switched
Current Roaming Status = Home
Network Selection Mode = Automatic
Network = LTE
Mobile Country Code (MCC) = 208
Mobile Network Code (MNC) = 15
Packet switch domain (PS) state = Attached
Location Area Code (LAC) = 3910
Cell ID = 222094374

IR800# show cell 0 all

Note: The output to the show cell 0 all command is extensive, and omitted from this guide for brevity.

Accessing 4G Modem AT Commands

Note: A password must be added to the line configuration for security.

Get the line number associated to Cellular 0:

IR800# show line
Tty Line Typ Tx/Rx A Modem Roty AccO AccI Uses Noise Overruns In
I 3 3 TTY - - - - - 1 0 4/0 Ce0
Use one of the IR800 IP address along with 2000 + line number (2003)

IR800# 10.15.15.1 2003
Trying 10.15.15.1, 2003 ... Open

Execute the 4G modem AT commands, for example AT!GSTATUS?:

```
AT!GSTATUS?
!GSTATUS:

**Checking 4G Modem Firmware through AT Commands**

To check the IR800 4G modem firmware, execute the 4G modem AT commands after connecting to the modem. The following example is for an IR809G-LTE-GA-K9 loaded with FW-MC7304-LTE-GB Global firmware.

```
Note
On the IR809, the PRI SKU ID= 9903299 is not representative of the GB firmware.
```

```

Radio Frequency Band Select

This new feature allows the user to configure and lock down the modem to a specific RF band, or set of bands. The preference can be set to be equal to, or a sub-set of the capability supported by the modem/carrier combination.

The following examples show the controller configuration commands:

```
router# conf t
Enter configuration commands, one per line. End with CNTL/Z.
router(config)#controller cell interface number

router(config-controller)#lte modem ?
band-select Modem band select
dm-log Modem DM logging configuration
fota-poll-timer Set poll timer for AVMS to do Firmware upgrade over the air
link-recovery Cellular Link Recovery
mtu Modem mtu
nas-log Modem NAS logging configuration

router(config-controller)#lte modem band-select ?
all-lte-only Choose all LTE bands only
all-nonlte-only Choose all non-LTE bands only
band-indices Specify the lte and non-lte band indices

router(config-controller)#lte modem band-select band-indices ?
WORD Band index(es) in string format "<band index#>, <band index#>, ...".
(supported band indices are listed under 'show cellular radio band'.)

router(config-controller)#lte modem band-select band-indices "2 4 5" ?
slot primary SIM slot

router(config-controller)#lte modem band-select band-indices "2 4 5" slot ?
<0-1> Slot number

router(config-controller)#lte modem band-select band-indices "2 4 5" slot 0

router#show run | sec controller
controller Cellular 0
lte sim max-retry 0
lte failover timer 4
lte modem dm-log rotation
lte modem link-recovery disable
lte modem band-select band-indices "2,4,5" slot 0

The following examples show the controller show commands:

```
router#show cellular interface number radio ?

band Show Radio band settings
history Show Radio history in graph format
| Output modifiers
<cr> <cr>

router#show cellular interface number radio band
```
LTE bands supported by modem:
- Bands 2 4 5 12.

LTE band Preference settings for the active sim(slot 0):
- Bands 2 4 5 12.

Non-LTE bands supported by modem:

Index:
- 88  WCDMA US PCS 1900 band
- 90  WCDMA US 1700 band
- 91  WCDMA US 850 band

Non-LTE band Preference settings for the active sim(slot 0):

Index:
- 88  WCDMA US PCS 1900 band
- 90  WCDMA US 1700 band
- 91  WCDMA US 850 band

IR807# show run | sec controller
controller Cellular 0
no lte gps enable
lte modem crash-action boot-and-hold
lte modem fota-poll-timer 15
lte modem mtu 1700
lte modem link-recovery disable
IR800#

Low Power Mode

This feature provides the reason for the modem going into a low power mode if the situation ever occurs. It uses the device power control information provided by the modem. A new CLI has been implemented `show cellular <interface> radio details`.

router# show cellular <interface number> radio

Radio power mode = OFF, Reason = User Request
Channel Number = 0
Current Band = Unknown
Current RSSI = -128 dBm
Current ECIO = -2 dBm
Radio Access Technology(RAT) Preference = AUTO
Radio Access Technology(RAT) Selected = AUTO

router# show cellular <interface number> radio details

Radio turned off under cellular controller configuration.

Note: In the above `show cellular <interface number> radio` output, the Radio power mode shows OFF because the user has turned the radio off by choice. In all other cases, when the radio goes to Low Power mode, you will see the display Radio power mode = low power.

Enhancement to Modem Crash Action

If the modem corresponding to the cellular interface crashes, the modem will reset itself and come back up. However, in order to debug the cause of the crash, a full crash dump can be captured on the modem. The steps to capture the crashdump are outlined in:
A new CLI has been added to set the crash action on the modem upon a crash. The CLI is `lte modem crash-action`?. The device can be set to either reset, or to boot and hold.

The following example shows the new functionality of the configuration CLI:

```
Router(config-controller)#lte modem crash-action ?
   boot-and-hold → Remain in crash state
   reset → reset the modem on crash
```

This CLI will set the flag to either 1 or 0 for reset and boot and hold respectively. This is the same as AT command `at!eoption= 0 / 1`

The following example shows the new functionality of the exec CLI:

```
router#show cellular <your interface> logs modem-crash-action
Current modem crash action: Reset
```

This CLI will show the current state the modem is set to. This is the same as AT command `at!eoption=?`

---

**IR800 Cellular Technology Selection**

The cellular interface supports a seamless hand off between LTE and 3G networks when the LTE cell becomes weak in certain spots and vice versa. But it may also be disable to lock the cellular interface in a given technology, for example. LTE.

The cellular interface supports 3G and 2.5G technologies. The IOS CLI can be used to select a particular technology that is most desirable in your local zone.

Use the cellular 0 lte technology command:

```
IR829# cellular 0 lte technology ?
   Blue values available on Global SKU
   auto Automatic LTE Technology Selection
   cdma-1xrtt CDMA 1xRTT
   cdma-evdco CDMA EVDO Rev A
   cdma-hybrid HYBRID CDMA

   gsm  GSM
   lte  LTE
   umts UMTS
```

The default technology type selection is **auto**, and it is recommended to be used at all times. Although **gsm** and **umts** are part of the selection, the modem firmware does not support them on gsm/umts network. They will be used as **lte** selection on a Verizon network.
Show the completed configuration: (output edited for brevity)

The IR800 series can be configured to enable real-time location tracking of remote assets and geo-fence when used with IOT Field Network Director. Field Network Director receives GPS data directly from IOS, not NMEA.

Key Points:

- GPS must be configured under `controller cellular 0`.
- GPS can be assigned to Cellular AUX antenna.
- GPS data can be seen locally, or data stream can be forwarded to applications, i.e. RUBAN.

On the IR829 dual-LTE model, GPS can only be configured on cellular 0/0.

For information about the GPS LED indications and locations of the GPS connectors, see IR829 Product Overview and IR809 Product Overview.

To configure GPS on the IR800 series, refer to the following examples.

```
IR829# conf term
IR829(config)#controller cellular 0
IR829(config-controller)#lte gps ?
   enable enable GPS feature
   mode   select GPS mode
   nmea   enable NMEA data
IR829(config-controller)#lte gps mode standalone

IR829(config-controller)#lte gps nmea ip
IR829#show cellular 0 gps

Satellite #26, elevation 0, azimuth 0, SNR 0
Satellite #29, elevation 0, azimuth 0, SNR 0
IR829#

You can also configure IOS so that GPS can be streamed to another destination (port or address).

For example:

IR829#conf t
Enter configuration commands, one per line. End with CNTL/Z.
IR829(config)#controller cellular 0
IR829(config-controller)#lte gps nmea ?
   ip  NMEA over IP interface
   serial NMEA over serial interface
IR829(config-controller)#lte gps nmea ip ?
   udp  UDP Transport
<cr>
IR829(config-controller)#lte gps nmea ip udp?
   A.B.C.D Source address
IR829(config-controller)#lte gps nmea ip udp 10.3.4.5?
   A.B.C.D Destination address
IR829(config-controller)#lte gps nmea ip udp 10.1.1.1 10.3.4.5?
   <0-65535> Destination port
IR829(config-controller)#lte gps nmea ip udp 10.1.1.1 10.3.4.5 3456
Cellular Modem in HWIC slot 0/0 is still in reset, we recommend to re-execute this cmd after 60 seconds
IR829(config-controller)#

The Command Line Interface for the gyroscope feature has been changed in IOS Release 15-7-3M1 in order to be compatible with the CCP Express NMS. The old CLI format was:

IR829(config)#gyroscope-reading frequency ?
   1/min  Reading 1 times per minute
   1/sec  Reading 1 time per second (default value)
   10/min Reading 10 times per minute

From this release going forward, the format has been modified to:

IR829(config)#gyroscope-reading frequency ?
   one/min Reading 1 times per minute
   one/sec Reading 1 time per second (default value)
   ten/min Reading 10 times per minute

After upgrading to this release, the router will have to be reconfigured.
GPS NMEA Multiple Stream

Feature is new for release 15.8(3)M1 and applies to the IR809 and IR829.

Previous versions of IOS only allowed for a GPS NMEA Stream for one device. This release has support for up to 6 devices at one time. The existing CLI `lte gps nmea ip udp <src ip> <dest ip> <dest portno>` under controller configuration has been enhanced.

Setting up the Configuration

To Enable GPS NMEA Multiple Stream:

Router# config t
Router(config)# controller cellular
<Cellular Interface Number>
Router(config-controller)# lte gps nmea ip udp
<src ip> <dest ip> <dest port> stream <1-6>

To Disable GPS NMEA Multiple Stream:

Router(config-controller)# no lte gps nmea ip udp
<src ip> <dest ip> <dest port> stream <1-6>

Examples for Enabling/Disabling GPS NMEA Multiple Stream

Enable Example:

Router#(config-controller)# lte gps nmea ip udp 10.0.0.1 10.0.0.11 2020 ? stream GPS NMEA multiple stream support
Router#(config-controller)# lte gps nmea ip udp 10.0.0.1 10.0.0.11 2020 ? <1-6> Stream Number
Router#(config-controller)# lte gps nmea ip udp 10.0.0.1 10.0.0.11 2020 stream 6

Disable Example:

Router#(config-controller)# no lte gps nmea ip udp 10.0.0.1 10.0.0.11 2020 stream 6

GPS Multiple NMEA Stream Information

Use the show controller and show run configuration CLIs:

**Sample Output**

Router# sh cont cel 0 | inc NMEA
NMEA Stream no: 1 Configured
NMEA Stream no: 2 Configured
NMEA Stream no: 3 Not Configured
NMEA Stream no: 4 Configured
NMEA Stream no: 5 Configured
NMEA Stream no: 6 Not Configured
Router# sh run | inc cont
controller Cellular 0
lte gps nmea ip udp 10.10.0.1 10.10.0.10 2067 stream 1
lte gps nmea ip udp 20.20.0.1 20.25.0.20 2047 stream 2
lte gps nmea ip udp 20.27.0.1 20.27.0.20 2047 stream 4
lte gps nmea ip udp 20.20.0.1 20.20.0.20 2023 stream 5

Warning Messages

If the destination ip address and port number already exists:

Router#sh run | sec cont
controller Cellular 0
lte gps mode standalone
lte gps nmea ip udp 10.10.0.1 10.10.0.10 2067 stream 1
Router(config-controller)#lte gps nmea ip udp 10.10.0.1 10.10.0.10 2067 stream 5
Destination ip address 10.10.0.10 and destination port number 2067 is already exists for the stream no:1.

Please use different destination ip address and port number.

If the stream number already exists:

Router#sh run | sec cont
controller Cellular 0
lte gps mode standalone
lte gps nmea ip udp 10.10.0.1 10.10.0.10 2067 stream 1
Router(config-controller)#lte gps nmea ip udp 20.20.0.1 20.20.0.10 2057 stream 1
Stream number 1 is already active.

Please remove stream number configuration before creating it with different destination ip address and port number.

Troubleshooting the Cellular Interface

These procedures are to capture information to share with support in order to assist them in helping to troubleshoot an issue with the cellular interface. In order to capture logs, DM logs must be enabled. Refer to the following: https://www.cisco.com/c/en/us/td/docs/routers/access/800/819/user/guide/3G4G-enhancements-userguide.html#pgfId-1063363

The following are steps to capture Linux logs for the cellular interface.

Procedure

**Step 1** Set up the fetch command.

**Example:**

```bash
# conf t
# service internal
# exit
# vds fetch-log
```

These steps will generate a directory on flash:vds-log.

**Step 2** Capture the logs.
Example:

IR800# vds fetch-log
  fetch: 4gmodem.log
    Sending file modes: C0644 510 4gmodem.log
  fetch: auth.log
    Sending file modes: C0640 162330 auth.log
  fetch: auth.log.1
    Sending file modes: C0640 262215 auth.log.1
  fetch: auth.log.2.gz
    Sending file modes: C0640 11297 auth.log.2.gz
  fetch: auth.log.3.gz
    Sending file modes: C0640 11296 auth.log.3.gz
  fetch: cwan_modem0.log
    Sending file modes: C0644 3875716 cwan_modem0.log
  fetch: cwan_modem1.log
    Sending file modes: C0644 791629 cwan_modem1.log
  fetch: daemon.log
    Sending file modes: C0640 1404 daemon.log
  fetch: dmesg
    Sending file modes: C0644 13740 dmesg
  fetch: dmesg.0
    Sending file modes: C0644 0 dmesg.0
  fetch: ios_cs_verify.log
    Sending file modes: C0644 1091 ios_cs_verify.log
  fetch: ios_vds_com.log
    Sending file modes: C0644 219169 ios_vds_com.log
  fetch: ios_vds_com.log.1
    Sending file modes: C0644 262207 ios_vds_com.log.1
  fetch: ios_vds_com.log.2.gz
    Sending file modes: C0644 7859 ios_vds_com.log.2.gz
  fetch: ios_vds_com.log.3.gz
    Sending file modes: C0644 7894 ios_vds_com.log.3.gz
  fetch: kern.log
    Sending file modes: C0644 38608 kern.log
  fetch: messages
    Sending file modes: C0640 174064 messages
  fetch: messages.1
    Sending file modes: C0640 262364 messages.1
  fetch: messages.2.gz
    Sending file modes: C0640 18434 messages.2.gz
  fetch: messages.3.gz
    Sending file modes: C0640 25027 messages.3.gz
  fetch: udev
    Sending file modes: C0644 124266 udev
  fetch: vdscli-acpid.log
    Send

Step 3  Stop the logging after 10 minutes.
Step 4  View the flash directory, and you will see the vds-log directory.

Example:

IR800# dir flash:
Directory of flash:/
  16 -rw- 660  Nov 11 2016 19:25:20 +00:00  vlan.dat
  1 -rw-  0  Jan  1 2014 16:27:44 +00:00  7455_02.18.02_00.Verizon_002.022_000
 17 -rw- 160368465 Nov 11 2016 19:35:30 +00:00  ir800-universalk9-bundle.SPA.156-3.M0a
 18 -rw- 63753008 Nov 11 2016 19:45:34 +00:00  ir800-universalk9-mz.SPA.156-3.M0a
 19 -rw- 64381598 Nov 11 2016 19:50:24 +00:00  74XX_02.20.03.00.cwe
Step 5

The flash/vds-log directory contains the log files captured.

Example:

```
24 -rw- 510 Nov 16 2016 19:06:44 +00:00 4gmodem.log
25 -rw- 162330 Nov 16 2016 19:06:54 +00:00 auth.log
26 -rw- 262215 Nov 16 2016 19:07:04 +00:00 auth.log.1
27 -rw- 11297 Nov 16 2016 19:07:16 +00:00 auth.log.2.gz
28 -rw- 11296 Nov 16 2016 19:07:24 +00:00 auth.log.3.gz
29 -rw- 3875716 Nov 16 2016 19:07:42 +00:00 cwan_modem0.log
30 -rw- 791629 Nov 16 2016 19:07:54 +00:00 cwan_modem1.log
31 -rw- 1404 Nov 16 2016 19:08:04 +00:00 daemon.log
32 -rw- 13740 Nov 16 2016 19:08:14 +00:00 dmesg
33 -rw- 0 Nov 16 2016 19:08:24 +00:00 dmesg.0
34 -rw- 1091 Nov 16 2016 19:08:32 +00:00 ios_cs_verify.log

CHAPTER 4

IR829 AP803 Access Point Module

This chapter provides background on the Internal WLAN Access Point which runs on-board the IR829 router. The AP803 runs its own IOS software independently from the IR829 IOS, and requires configuring. The AP803 works as a standalone access point or with a wireless controller.

- Hardware Overview, on page 77
- Software Overview, on page 78
- IOS Internal Interfaces, on page 78
- IR829 IOS – AP803 Console Access, on page 79
- IR829 Service Module, on page 80
- AP803 Embedded Web Manager, on page 81
- Upgrading the Firmware on the AP803, on page 82

Hardware Overview

Highlights of the Access Point are:

- Atheros QCA9550 SoC + AR9592 radio
- 256MB DDR2 RAM + 128MB NAND Flash + 1MB Boot flash and configuration/calibration storage
- Dual simultaneous 2.4GHz and 5Ghz 802.11 radios
  - Supports 2 x 2 802.11a/n MIMO and 2 x 2 802.11b/g/n MIMO
  - Packet aggregation: A-MPDU (Tx/Rx), A-MSDU (Tx/Rx)
  - 802.11 dynamic frequency selection (DFS)
  - Cyclic shift diversity (CSD) support
  - 20- and 40-MHz channels
  - 802.11 dynamic frequency selection (DFS) – is applicable to IR829 AP803 and is available in IOS release 8.1MR2
Software Overview

This Embedded AP supports a default Autonomous mode and a Unified mode. Both the Autonomous and Unified images are pre-loaded from Cisco on the access point’s flash memory.

The image name describes what each image is for. w7 is Autonomous Image, while w8 is the Unified mode (LWAP) Image. For example:

- Autonomous image – ap1g3-k9w7-tar.153-3.JBB1.tar
- Unified mode (LWAP) image – ap1g3-k9w8-tar.153-3.JBB1.tar

To select the Autonomous or Unified image use the IOS CLI:

IR829(config)#service-module wlan-ap 0 bootimage autonomous
IR829(config)#service-module wlan-ap 0 bootimage unified

Note

The initial release for the IR829 with the AP803 access point is 8.1 MR1 - 15.3(3)JBB1 - Cisco Wireless Release 8.1.111.0.

IOS Internal Interfaces

The IR829 and AP803 are connected through IOS internal interfaces. Refer to the following graphic as a conceptual guide.
**AP803 IOS Gigabit Ethernet0 Interface**

This interface is internally connected to the IR829 WLAN-GigabitEthernet0 switch-port. The Access Point GE0 interface is always up. Neither the Access Point GE0 or the IR829 WLAN-GigabitEthernet0 switch-port interfaces can be shutdown. This is in order to prevent traffic disruption to the internal Access Point.

---

**Note**

Access Point GE0 can NOT be configured by network operators. It always operates in 1000M/full-duplex mode.

---

**AP803 IOS – BVI 1 (in autonomous mode only)**

This is the management interface which bridges the Dot11 radio0, Dot11 radio1 and GE0 interfaces.

**IR829 IOS WLAN-GigabitEthernet0**

This interface connects internally to the Access Point’s GE0 interface and carries all data packets between the Access Point and the Router. The default configuration for WLAN-GigabitEthernet0 is in switch-port access mode, with native VLAN 1 (Layer-3 interface). You can configure the switch-port in trunk mode as well.

**IR 829 IOS wlan-ap 0**

This is the interface representing the embedded Access Point on the Router. It requires an IP address and is used only to reverse telnet into the Access Point console. This interface does not carry any data packets between the Router and the Access Point.

---

**IR829 IOS – AP803 Console Access**

Connecting to the console of the AP803 allows for monitoring Warning and informational messages. You can configure wlan-ap 0 so that a dedicated IP address is not needed, and wlan-ap 0 can share its IP address with another interface. Use the following steps:

**Configuring**

```
# conf term
IR829(config)# inter wlan-ap 0
The wlan-ap 0 interface is used for managing the embedded AP.
Please use the "service-module wlan-ap 0 session" command to console into the embedded AP
IR829(config-if)# ip address 10.1.1.1 255.255.255.255
IR829# service-module wlan-ap 0 session
Trying 10.1.1.1, 2004 ... Open
User Access Verification
Username: cisco
Password: <password>
ap>ena
Password: <password>
ap#
```
Connecting

IR829# service-module wlan-ap 0 session
Trying 10.1.1.1, 2004 ... Open
User Access Verification
Username: cisco
Password: <password>
ap> ena
Password: <password>
ap#

Monitoring

IR829# service-module wlan-ap 0 status
Service Module is Cisco wlan-ap0
Service Module supports session via TTY line 4
Service Module is in Steady state
Service Module reset on error is disabled
Service Module heartbeat-reset is enabled
Getting status from the Service Module, please wait..
   Image path = flash:ap1g3-k9w7-mx.wnbu_bt.201505140911/ap1g3-k9w7-mx.wnbu_bt.201505140911
   System uptime = 0 days, 5 hours, 43 minutes, 7 seconds

Disconnecting

Key in the following sequence:

ctrl-^ X

This suspends the console and returns you to the command line.

IR829#

Next use one of the following two options:

Router> disconnect
-or

Router > service-module wlan-ap 0 session clear
(confirm)
(OK)

IR829 Service Module

The AP803 Access Point is managed by the IR829 Service Module Monitor. It communicates with the AP803 through layer-2 RBCP (Router Blade Configuration Protocol). The AP803 is managed through the service-module wlan-ap 0 CLI.

IR829# service-module wlan-ap 0 ?
   heartbeat-reset  Enable/disable Heartbeat failure to reset Service Module
   reload          Reload service module
   reset           Hardware reset of Service Module
session | Service module session
statistics | Service Module Statistics
status | Service Module Information
upgrade | Service Module Upgrade

IR829# service-module wlan-ap 0 reset ?
bootloader | Reset service-module to bootloader !
Reset to boot loader prompt
default-config | Reset service-module to default-config !
Reset to default configuration
- flash:cpconfig-ap803.cfg to flash:config.txt,
Only valid for Autonomous mode
<cr> !
Reset Access Point only

IR829# conf term
!
to configure Access Point boot image type

IR829(config)# service-module wlan-ap 0 bootimage ?
autonomous | Set AP boot image to autonomous
unified | Set AP boot image to unified

**AP803 Embedded Web Manager**

The IR829 AP803 has an embedded web manager. To access the web manager, open your browser to the IP address of the AP803 BV1 interface. For example:

![AP803 Embedded Web Manager](image)

The feature set for the AP803 is aligned with the Cisco Aironet 1532. More information can be found at:

Cisco Aironet 1530 Series
Upgrade the Firmware on the AP803

The AP803 image is not included in the IR829 IOS bundle. The AP803 image must be installed separately after obtaining the new AP803 release from Cisco.com.

1. Log onto the AP803.

2. Install the new AP803 image using the archive command. Alternately, this can be accomplished through the embedded web interface.

   • archive download-sw ! Software download.
   • /overwrite ! Overwrites the software image in Flash with the downloaded image.
   • /reload ! Reloads the system after downloading the image unless the configuration has been changed and not saved.

The ftp protocol to download the image is:
ftp://username:password@ipaddress/directory/file

For example:

IR829# service-module wlan-ap 0 session

Trying 10.1.1.1, 2004 ... Open

ap# archive download-sw /over /reload
ftp://username:password@192.168.0.90/Temp/ap1g3-k9w7-tar.153-3.JBB1.tar

Cisco IR800 Integrated Services Router Software Configuration Guide
CHAPTER 5

Configuring Virtual-LPWA

This chapter describes the details of configuring virtual-LPWA (VLPWA) interface on the IR800 series for the configuration of the Cisco LoRaWAN Gateway.

This chapter contains the following sections:

- Configuring Virtual-LPWA Interface on the IR800 Series, on page 83
- Configuring SNMP TRAP for Modem Notifications, on page 88
- Configuring VLPWA Interface and Associated Cisco LoRaWAN Gateway, on page 90
- Configuring Cisco LoRaWAN Gateway Password, on page 91
- Configuring Console Access, on page 92
- Configuring Clock for the Cisco LoRaWAN Gateway, on page 92
- Configuring Cisco LoRaWAN Gateway Timezone, on page 93
- Configuring IPSec on the Cisco LoRaWAN Gateway, on page 94
- Configuring SCEP on the Cisco LoRaWAN Gateway, on page 94
- Configuring Security Protection, on page 96
- Managing the Cisco LoRaWAN Gateway, on page 97
- Monitoring the LoRaWAN Gateway, on page 101
- Debugging the LoRaWAN Gateway, on page 105

Configuring Virtual-LPWA Interface on the IR800 Series

The Cisco LoRaWAN Gateway is connected to IR800 series via an Ethernet cable with PoE+ to work as a LoRaWAN gateway. By creating a VLPWA interface on the IR800 series, you can:

- Manage hardware and software of the Cisco LoRaWAN Gateway.
- Send and receive VLPWA protocol modem message to monitor the status of the Cisco LoRaWAN Gateway.
- Send SNMP traps to the IoT Field Network Director (IoT FND).

Note

Cisco IOS Release 15.6(3)M or later is required for the IR800 series to manage the Cisco LoRaWAN Gateway.
You need to install the Actility Thingpark LRR software as the LoRa forwarder firmware, which is loaded through the Cisco IOS software, for the Cisco LoRaWAN Gateway to work.

You can find other documentation for the Cisco LoRaWAN Gateway at:

This chapter provides information of configuring virtual interface mode (virtual-lpwa) of the LoRaWAN gateway. For detailed information about standalone mode configuration, see Cisco Wireless Gateway for LoRaWAN Software Configuration Guide.

### Configuring Ethernet Interface and Creating VLPWA Interface

When you configure IP address for the Ethernet interface or Vlan interface, the IP address allocated must be aligned with the prefix configured for the DHCP pool allocated to the LoRaWAN interface.

The Cisco LoRaWAN Gateway communicates through IOS, therefore a private IPv4 address is assigned with NAT being configured.

### Configuring IR809 for One Cisco LoRaWAN Gateway

Beginning in privileged EXEC mode, follow these steps to configure the Ethernet interface on IR809, and create the VLPWA interface for one Cisco LoRaWAN Gateway.

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> interface gigabitEthernet ID</td>
<td>Configures the Gigabit Ethernet (GE) port.</td>
</tr>
<tr>
<td><strong>Step 3</strong> ip address address mask</td>
<td>Configures the GE interface IP address. Note The IP address should be the default router address in its associated DHCP pool.</td>
</tr>
<tr>
<td><strong>Step 4</strong> ip nat inside</td>
<td>Identifies the interface as the NAT inside interface.</td>
</tr>
<tr>
<td><strong>Step 5</strong> ip virtual-reassembly in</td>
<td>Enables virtual fragment reassembly (VFR) on the interface.</td>
</tr>
<tr>
<td><strong>Step 6</strong> exit</td>
<td>Exits to global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 7</strong> interface Virtual-LPWA vlpwa-id</td>
<td>Creates VLPWA interface.</td>
</tr>
</tbody>
</table>
### Configuring IR809 for Multiple Cisco LoRaWAN Gateways

Beginning in privileged EXEC mode, follow these steps to configure the Ethernet interface on IR809 and create the VLPWA interface for multiple Cisco LoRaWAN Gateways.

#### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>interface gigabitEthernet ID</td>
<td>Configures the Gigabit Ethernet (GE) port.</td>
</tr>
<tr>
<td>Step 3</td>
<td>no shutdown</td>
<td>Enables the interface.</td>
</tr>
<tr>
<td>Step 4</td>
<td>exit</td>
<td>Exits to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5</td>
<td>interface gigabitEthernet ID.subID</td>
<td>Configures sub-interface on the GE port.</td>
</tr>
<tr>
<td>Step 6</td>
<td>encapsulation dot1Q vlan-id native</td>
<td>Configures IEEE802.1Q encapsulation of traffic on a interface.</td>
</tr>
</tbody>
</table>
| Step 7 | ip address address mask | Configures the GE interface IP address.  
**Note** The IP address should be the default router address in its associated DHCP pool. |
| Step 8 | ip nat inside | Identifies the interface as the NAT inside interface. |
| Step 9 | ip virtual-reassembly in | Enables virtual fragment reassembly (VFR) on the interface. |
| Step 10 | exit | Exits to global configuration mode. |
| Step 11 | interface Virtual-LPWA vlpwa-id | Creates VLPWA interface.  
**Note** The value of vlpwa-id should be the same as the option 43 hex number which is specified in DHCP pool. See the DHCP section. |
| Step 12 | end | Exits to privileged EXEC mode. |
Configuring IR829

Each LoRaWAN gateway or virtual-lpwa must be isolated in a dedicated VLAN. If you put it in a VLAN shared with other devices, it may cause the virtual-lpwa interface not being operational.

Beginning in privileged EXEC mode, follow these steps to configure the Ethernet interface on IR829 and create the VLPWA interface.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1            | configure terminal
| Purpose           | Enters global configuration mode. |
| Step 2            | interface vlan vlan-id
| Note              | The VLAN ID can be different from the vlpwa ID. |
| Step 3            | ip address address mask
| Note              | IP address should be default router address in its associated DHCP pool. |
| Step 4            | exit
| Purpose           | Exits to global configuration mode. |
| Step 5            | interface gigabitEthernet ID
| Purpose           | Configures the Gigabit Ethernet port. |
| Step 6            | switchport mode access
| Purpose           | Sets trunking mode to ACCESS on the given port. |
| Step 7            | switchport access vlan ID
| Purpose           | Sets VLAN when interface is in access mode. |
| Step 8            | exit
| Purpose           | Exits to global configuration mode. |
| Step 9            | interface Virtual-LPWA vlpwa-id
| Note              | The value of vlpwa-id should be the same as the option 43 hex number which is specified in DHCP pool. See the DHCP section. |
| Step 10           | end
| Purpose           | Exits to privileged EXEC mode. |
| Step 11           | write memory
| Purpose           | Saves the configurations. |
# Configuring DHCP Pool for the Cisco LoRaWAN Gateway

The Cisco LoRaWAN Gateway connects to the IR800 series through the Ethernet interface. The communication between Cisco LoRaWAN Gateway firmware and IOS is conducted over IP. Therefore, an IP address must be assigned to the Cisco LoRaWAN Gateway through an IOS local DHCP server pool.

If you connect multiple Cisco LoRaWAN Gateways to a single IR800 router, each interface must have its own DHCP pool.

On the IR800 series, beginning in privileged EXEC mode, follow these steps to configure DHCP pool.

### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>ip dhcp pool pool-name</td>
<td>Creates a DHCP server address pool and enters DHCP pool configuration mode.</td>
</tr>
<tr>
<td>Note</td>
<td>If you have changed the parameters of the DHCP server, you must perform a refresh using the no service dhcp interface-type number command and service dhcp interface-type number command.</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>network network-number mask</td>
<td>Specifies the subnet network number and mask of the DHCP address pool. Make sure to allow only one dhcp address releasable to modem.</td>
</tr>
<tr>
<td>Step 4</td>
<td>default-router address</td>
<td>Specifies the IP address of the default router for a DHCP client. The default router address will be assigned to the associated VLAN interface afterwards.</td>
</tr>
<tr>
<td>Step 5</td>
<td>option 43 hex client-ID</td>
<td>Enables vendor specific option 43 and assign the associated Cisco LoRaWAN Gateway client ID number as the hex value.</td>
</tr>
<tr>
<td>Step 6</td>
<td>dns-server address</td>
<td>Defines DNS services.</td>
</tr>
<tr>
<td>Step 7</td>
<td>exit</td>
<td>Exits to global configuration mode.</td>
</tr>
<tr>
<td>Step 8</td>
<td>ip dhcp excluded-address address</td>
<td>Masks all redundant addresses including the default router in DHCP pool.</td>
</tr>
<tr>
<td>Step 9</td>
<td>end</td>
<td>Exits to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 10</td>
<td>write memory</td>
<td>Saves the configurations.</td>
</tr>
</tbody>
</table>

### Example

The following is an example of configuring DHCP pool on IR809:
IR809#configure terminal
IR809(config)#ip dhcp pool modempool
IR809(config)#network 192.168.1.0 255.255.255.248
IR809(config)#default-router 192.168.1.1
IR809(config)#option 43 hex 01
IR809(config)#dns-server 192.168.1.1
IR809(config)#exit
IR809(config)#
IR809(config)#ip dhcp excluded-address 192.168.1.1
IR809(config)#ip dhcp excluded-address 192.168.1.3 192.168.1.6
IR809(config)#exit
IR809#

The following is an example on IR809 using the sub-interface method:

ip dhcp excluded-address 192.168.1.1
ip dhcp excluded-address 192.168.1.3 192.168.1.6
!
ip dhcp pool modempool1
    network 192.168.1.0 255.255.255.248
    default-router 192.168.1.1
    option 43 hex 01
!
interface Virtual-LPWA1
!
interface GigabitEthernet1.101
    encapsulation dot1Q 101 native
    ip address 192.168.1.1 255.255.255.248
    ip nat inside
    ip virtual-reassembly in
!
end

The following is an example on IR829 using the VLAN method:

ip dhcp excluded-address 192.168.1.1
ip dhcp excluded-address 192.168.1.3 192.168.1.6
!
ip dhcp pool modempool1
    network 192.168.1.0 255.255.255.248
    default-router 192.168.1.1
    option 43 hex 01
!
interface Virtual-LPWA1
!
interface GigabitEthernet1
    switchport access vlan 101
!
interface Vlan101
    ip address 192.168.1.1 255.255.255.248
!
end

Configuring SNMP TRAP for Modem Notifications

On the IR800 series, beginning in privileged EXEC mode, follow these steps to enable SNMP TRAP notifications for virtual-Lpwa interface and its associated Cisco LoRaWAN Gateway.
### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> snmp-server enable traps vlpwa</td>
<td>Enables virtual LPWA traps to monitor modem status changing.</td>
</tr>
<tr>
<td><strong>Step 3</strong> snmp-server enable traps snmp linkup linkdown</td>
<td>Enables linkUp and linkDown traps to monitor modem heartbeat.</td>
</tr>
<tr>
<td><strong>Step 4</strong> end</td>
<td>Exits to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 5</strong> write memory</td>
<td>Saves the configurations.</td>
</tr>
</tbody>
</table>

### What to do next

The Modem feature status notifications and OIDs are listed in the following table:

<table>
<thead>
<tr>
<th>Notification</th>
<th>OID</th>
</tr>
</thead>
<tbody>
<tr>
<td>modem door open/close</td>
<td>{1,3,6,1,4,1,9,9,830,0,1};</td>
</tr>
<tr>
<td>modem exceeds maximum temperature threshold</td>
<td>{1,3,6,1,4,1,9,9,830,0,2};</td>
</tr>
<tr>
<td>modem temperature returns to normal from overheat</td>
<td>{1,3,6,1,4,1,9,9,830,0,3};</td>
</tr>
<tr>
<td>modem falls below minimum temperature threshold</td>
<td>{1,3,6,1,4,1,9,9,830,0,4};</td>
</tr>
<tr>
<td>modem temperature returns to normal from undercooling</td>
<td>{1,3,6,1,4,1,9,9,830,0,5};</td>
</tr>
<tr>
<td>modem FPGA upgrade starts</td>
<td>{1,3,6,1,4,1,9,9,830,0,6};</td>
</tr>
<tr>
<td>modem exceeds maximum CPU threshold</td>
<td>{1,3,6,1,4,1,9,9,830,0,7};</td>
</tr>
<tr>
<td>modem CPU usage returns to normal</td>
<td>{1,3,6,1,4,1,9,9,830,0,8};</td>
</tr>
<tr>
<td>modem exceeds maximum memory threshold</td>
<td>{1,3,6,1,4,1,9,9,830,0,9};</td>
</tr>
<tr>
<td>modem memory usage returns to normal</td>
<td>{1,3,6,1,4,1,9,9,830,0,10};</td>
</tr>
<tr>
<td>modem exceeds maximum storage threshold</td>
<td>{1,3,6,1,4,1,9,9,830,0,11};</td>
</tr>
<tr>
<td>modem storage usage returns to normal</td>
<td>{1,3,6,1,4,1,9,9,830,0,12};</td>
</tr>
</tbody>
</table>

When the SNMP linkUp and linkDown traps are enabled, the modem device status could be monitored. The modem device status notifications are listed below:

<table>
<thead>
<tr>
<th>modem power on/off</th>
<th>interface gigabitEthernet_ID linkUp/linkDown</th>
</tr>
</thead>
<tbody>
<tr>
<td>modem agent heartbeat</td>
<td>interface virtual-lpwa_ID linkUp/linkDown</td>
</tr>
</tbody>
</table>
### Configuring VLPWA Interface and Associated Cisco LoRaWAN Gateway

On the IR800 series, beginning in privileged EXEC mode, follow these steps to configure one or multiple VLPWA interfaces and associated Cisco LoRaWAN Gateways.

> **Note**
The following set-up refers to the Thingpark LoRa Forwarder software. When configuring the virtual-lpwa interface with other 3rd party network server, refer to the 3rd party vendor documentation.

### Configuring IR809 for One Cisco LoRaWAN Gateway

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>interface Virtual-LPWA vlpwa-id</td>
<td>Enters the vlpwa interface which is to be configured.</td>
</tr>
<tr>
<td>Step 3</td>
<td>lpwa modem environment var1 [var2]</td>
<td>Specify the environment variables as the configuration for the LoRaWAN modem.</td>
</tr>
</tbody>
</table>

> **Note** There are one or two environment variables to be configured.

| Step 4 | lpwa packet-forwarder firmware [flash: | Configures the packet-forwarder firmware (only Actility LRR is supported) which will be installed on the LoRaWAN modem from the IR800 series. |
|--------| nvram:] firmware-name auto-install [if-not-installed | For the values of **auto-install** method: |
|        | unconditional ] | • if-not-installed — Automatically install if there is no firmware already installed on modem. |
|        |             | • unconditional — Automatically install this firmware unconditionally. |
| Step 5 | lpwa packet-forwarder public-key[flash: | Configures the packet-forwarder public-key which will be installed on the LoRaWAN modem from the IR800 series. |
|        | nvram:] public-key file | |
| Step 6 | end | Exits to privileged EXEC mode. |
| Step 7 | write memory | Saves the configurations. |
Example
The following is an example of configuring VLPWA interface on IR809:

```
interface Virtual-LPWA1
no ip address
lpwa packet-forwarder public-key flash:lrr-opk.pubkey
lpwa modem environment PKTFWD_ROOT /tmp/mdm/pktfwd/firmware
lpwa modem environment LXC_STORE_PATH /tmp/mdm/pktfwd/firmware/usr/etc/lrr
lpwa modem password root $1$0822455D0A16
lpwa modem ntp server ip fr.pool.ntp.org
lpwa modem timezone Europe/Paris
```

Configuring Cisco LoRaWAN Gateway Password

On the IR800 series, beginning in privileged EXEC mode, follow these steps to configure password for the Cisco LoRaWAN Gateway.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> interface Virtual-LPWA vlpwa-id</td>
<td>Enters the vlpwa interface which is to be configured.</td>
</tr>
<tr>
<td><strong>Step 3</strong> lpwa modem password var1 [var2]</td>
<td>Specifies the password variables as the configuration for the LoRaWAN modem. The default account is root. Note There are one or two environment variables to be configured. But currently only the root account is supported.</td>
</tr>
<tr>
<td><strong>Step 4</strong> lpwa modem password root [var2]</td>
<td>Configures the password of the root account for LoRaWAN modem. The default password is NULL. The unencrypted (clear text) secret has the minimum length of 4 characters, and the maximum length of 25 characters.</td>
</tr>
<tr>
<td><strong>Step 5</strong> end</td>
<td>Exits to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 6</strong> write memory</td>
<td>Saves the configurations.</td>
</tr>
</tbody>
</table>
Configuring Console Access

### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td><code>interface Virtual-LPWA vlpwa-id</code></td>
<td>Enters the vlpwa interface which is to be configured.</td>
</tr>
<tr>
<td>Step 3</td>
<td><code>lpwa modem console disable</code></td>
<td>Disables the console access.</td>
</tr>
<tr>
<td>Step 4</td>
<td><code>end</code></td>
<td>Exits to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5</td>
<td><code>write memory</code></td>
<td>Saves the configurations.</td>
</tr>
</tbody>
</table>

#### Configuring Clock for the Cisco LoRaWAN Gateway

The modem clock can use either NTP or the GPS as its source. The default source is NTP.

#### Configuring NTP Server for the Cisco LoRaWAN Gateway

On the IR800 series, beginning in privileged EXEC mode, follow these steps to configure the NTP server for the Cisco LoRaWAN Gateway.

### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td><code>interface Virtual-LPWA vlpwa-id</code></td>
<td>Enters the vlpwa interface which is to be configured.</td>
</tr>
<tr>
<td>Step 3</td>
<td><code>lpwa modem ntp server ip [var1]</code></td>
<td>Specifies the NTP server variables as the configuration for the LoRaWAN modem. For the hostname of peer, refer to <a href="http://www.pool.ntp.org">http://www.pool.ntp.org</a>.</td>
</tr>
</tbody>
</table>

**Example:**

`lpwa modem ntp server ip 0.asia.pool.ntp.org`

Step 4 | `lpwa modem ntp serveraddress [var2]` | Configures the IP address of peer.                                      |

**Example:**

`lpwa modem ntp server address 192.168.1.1`
## Configuring GPS as the Clock Source

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface Virtual-LPWA vlpwa-id</td>
<td>Enters the vlpwa interface which is to be configured.</td>
</tr>
<tr>
<td>Step 3 lpwa modem clock gpstime</td>
<td>Use the GPS as the modem clock source.</td>
</tr>
<tr>
<td>Step 4 end</td>
<td>Exits to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5 write memory</td>
<td>Saves the configurations.</td>
</tr>
</tbody>
</table>

## Configuring Cisco LoRaWAN Gateway Timezone

On the IR800 series, beginning in privileged EXEC mode, follow these steps to configure the timezone for the Cisco LoRaWAN Gateway.

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface Virtual-LPWA vlpwa-id</td>
<td>Enters the vlpwa interface which is to be configured.</td>
</tr>
<tr>
<td>Step 3 lpwa modem timezone [timezone]</td>
<td>Specifies the timezone variables as the configuration for the LoRaWAN modem. The value is based on the IANA Timezone database. Please check the /usr/share/zoneinfo/ folder in your PC host. timezone — Name of time zone, for example, Asia/Shanghai. Example: lpwa modem timezone Asia/Shanghai</td>
</tr>
<tr>
<td>Step 4 end</td>
<td>Exits to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
## Configuring IPSec on the Cisco LoRaWAN Gateway

In virtual-lpwa mode, IPsec is set to protect the communications between the LoRaWAN gateway and the IR800 router.

On the IR800 series, beginning in privileged EXEC mode, follow these steps to configure IPsec for the Cisco LoRaWAN Gateway.

### Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 3</td>
<td>interface Virtual-LPWA vlpwa-id</td>
<td>Enters the vlpwa interface which is to be configured.</td>
</tr>
<tr>
<td>Step 4</td>
<td>lpwa modem ipsec enable</td>
<td>Enables IPsec. By default, IPsec is disabled.</td>
</tr>
<tr>
<td>Step 4</td>
<td>lpwa modem isakmp &lt;xauth-user&gt; &lt;xauth-pw&gt; &lt;peer-ip&gt; group &lt;name&gt; &lt;psk-key&gt; &lt;lifetime&gt;</td>
<td>Specifies the XAUTH credential’s username, password, and the IP address of the right participant’s interface. Matches this information to the IKEID group with group name, pre-shared key for remote peer, and lifetime in seconds.</td>
</tr>
<tr>
<td>Step 5</td>
<td>end</td>
<td>Exits to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 6</td>
<td>write memory</td>
<td>Saves the configurations.</td>
</tr>
</tbody>
</table>

### What to do next

Only PSK (IKEv1) and RSA (IKEv2) are supported.

## Configuring SCEP on the Cisco LoRaWAN Gateway

On the IR800 series, beginning in privileged EXEC mode, use these commands to configure Simple Certificate Enrollment Protocol (SCEP) on the Cisco LoRaWAN Gateway.
**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> interface Virtual-LPWA vlpwa-id</td>
<td>Enters the vlpwa interface which is to be configured.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Configure SCEP by using a configuration file or profile method. Choose one of the following:</td>
</tr>
<tr>
<td></td>
<td>• lpwa modem scep [flash:</td>
</tr>
<tr>
<td></td>
<td>• lpwa modem scep [profile]</td>
</tr>
<tr>
<td></td>
<td>• To configure by file, enter the SCEP configuration file. This file must be provided with the following formatted:</td>
</tr>
<tr>
<td></td>
<td>url &lt;SCEP server URL used for enrollment&gt;</td>
</tr>
<tr>
<td></td>
<td>country &lt;2 letter country name&gt;</td>
</tr>
<tr>
<td></td>
<td>province &lt;Province/State&gt;</td>
</tr>
<tr>
<td></td>
<td>locality &lt;Location&gt;</td>
</tr>
<tr>
<td></td>
<td>organization &lt;Organization&gt;</td>
</tr>
<tr>
<td></td>
<td>unit &lt;Organization Unit&gt;</td>
</tr>
<tr>
<td></td>
<td>common-name &lt;Common Name&gt;</td>
</tr>
<tr>
<td></td>
<td>type &lt;SCEP server type: NDES&gt;</td>
</tr>
<tr>
<td></td>
<td>persistent &lt;Store certificates in modem; default is false&gt;</td>
</tr>
<tr>
<td></td>
<td>key-length &lt;Length of keys; 1024, 2048 (default) or 4096&gt;</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td>lpwa modem scep flash:scep_conf</td>
</tr>
<tr>
<td></td>
<td>SCEP Configuration File Example:</td>
</tr>
<tr>
<td></td>
<td>url</td>
</tr>
<tr>
<td></td>
<td><a href="http://172.19.234.54:80/certsrv/mscep/mscep.dll">http://172.19.234.54:80/certsrv/mscep/mscep.dll</a></td>
</tr>
<tr>
<td></td>
<td>country CN</td>
</tr>
<tr>
<td></td>
<td>province Nanning</td>
</tr>
<tr>
<td></td>
<td>locality Nanning</td>
</tr>
<tr>
<td></td>
<td>organization Cisco</td>
</tr>
<tr>
<td></td>
<td>unit iot</td>
</tr>
<tr>
<td></td>
<td>common-name cisco-iot</td>
</tr>
<tr>
<td></td>
<td>type ndes</td>
</tr>
<tr>
<td></td>
<td>persistent false</td>
</tr>
<tr>
<td></td>
<td>key-length 1024</td>
</tr>
<tr>
<td></td>
<td>• To configure the parameters individually, use the profile method.</td>
</tr>
<tr>
<td></td>
<td>IR800(config-if)#lpwa modem scep profile</td>
</tr>
<tr>
<td></td>
<td>IR800(config-if-vlpwa-scep)#?</td>
</tr>
<tr>
<td></td>
<td>Enter parameters for scep. country, locality, name, org, province, unit &amp; url must all be present.</td>
</tr>
<tr>
<td></td>
<td>country Country server located in default</td>
</tr>
<tr>
<td></td>
<td>defaults Set a command to its defaults</td>
</tr>
<tr>
<td></td>
<td>exit Exit from</td>
</tr>
<tr>
<td></td>
<td>if-vlpwa-scep sub mode</td>
</tr>
<tr>
<td></td>
<td>keylen Specify key length 1024, 2048 or 4096</td>
</tr>
<tr>
<td></td>
<td>locality Locality of server</td>
</tr>
</tbody>
</table>
Configuring Security Protection

On the IR800 series, beginning in privileged EXEC mode, use these commands to configure security protection for the Cisco LoRaWAN Gateway.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> interface Virtual-LPWA vlpwa-id</td>
<td>Enters the vlpwa interface which is to be configured.</td>
</tr>
</tbody>
</table>

**What to do next**

Without SCEP, the IPSec is done with pre-shared key. With SCEP, IPSec is done with RSA or certificates

Only PSK (IKEv1) and RSA (IKEv2) are supported.

The profile CLI block will only take effect when all parameters are configured. Incomplete parameter set will not be sent to the IXM. Make sure that all parameters in the profile are configured.

Note

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the certificate</td>
</tr>
<tr>
<td>no</td>
<td>Negate a command or set its defaults</td>
</tr>
<tr>
<td>organization</td>
<td>Organization of the server</td>
</tr>
<tr>
<td>persistent</td>
<td>Specify persistency of the key</td>
</tr>
<tr>
<td>province</td>
<td>State or Province</td>
</tr>
<tr>
<td>type</td>
<td>Specify type</td>
</tr>
<tr>
<td>unit</td>
<td>Business unit within server organization</td>
</tr>
<tr>
<td>url</td>
<td>Specify url</td>
</tr>
</tbody>
</table>
### Purpose

**Command or Action**

<table>
<thead>
<tr>
<th>Step 3</th>
<th>lpwa modem authentication mandatory enable</th>
</tr>
</thead>
<tbody>
<tr>
<td>Purpose</td>
<td>Enables mandatory security level in the modem, which is disabled by default. When enabled, IR800 will shut down the corresponding vlan or subinterface for ACT2 authentication failure or version mismatch to prevent further attacking. When disabled, the IR800 will only send notifications to IoT FND when the same situations happen, without shutting down vlan or subinterface.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 4</th>
<th>lpwa modem authentication timeout &lt;subinterface/vlan name&gt; &lt;subinterface/vlan number&gt; time &lt;time&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>Purpose</td>
<td>Specifies a timeout protection for a suspended vlpwa interface (one with no traffic up from corresponding vlan or subinterface). You need to set the subinterface or vlan manually with a time (in minute) threshold. If the mandatory security level is also enabled, the corresponding vlan or subinterface will be shut down after the time threshold. If the mandatory security level is disabled, only a notification will be sent to IoT FND.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 5</th>
<th>end</th>
</tr>
</thead>
<tbody>
<tr>
<td>Purpose</td>
<td>Exits to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 6</th>
<th>write memory</th>
</tr>
</thead>
<tbody>
<tr>
<td>Purpose</td>
<td>Saves the configurations.</td>
</tr>
</tbody>
</table>

## Managing the Cisco LoRaWAN Gateway

On the IR800 series, beginning in privileged EXEC mode, use these commands to manage the Cisco LoRaWAN Gateway.

### Note

Virtual -lpwa vlpwa-id packet-forwarder install and uninstall at exec level is not supported

### Command

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **virtual-lpwa unit-number modem upload pfx <url> password <password>** | Upload files to the LoRaWAN modem:  
  • **normal**—Upload a normal file to the modem.  
  • **pfx**—Upload certification files in pfx format to the modem. Specify the password if any. Specify "N" for no password. |
| **virtual-lpwa vlpwa-id [modem | packet-forwarder]** | Management for the LoRaWAN modem virtual-LPWA interface:  
  • **modem**—Manage the modem clock.  
  • **packet-forwarder**—Manage the packet forwarder. |
### Command 

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| `virtual-lpwa vlpwa-id modem [cacert | clock | delete | install | reboot | upload]` | Management for the LoRaWAN modem:  
  - `cacert`—Clean the certificates stored in the modem.  
  - `clock`—Manage the modem clock.  
  - `delete`—Delete uploaded file(s) on the modem.  
  - `install`—Install the modem firmware.  
  - `reboot`—Reboot the modem hardware.  
  - `upload`—Upload a file to the modem. |
| `virtual-lpwa vlpwa-id packet-forwarder [restart | start | stop]` | Management for the LoRaWAN modem packet-forwarder:  
  - `restart`—Restart packet-forwarder.  
  - `start`—Start packet-forwarder.  
  - `stop`—Stop packet-forwarder. |
| `virtual-lpwa vlpwa-id modem clock set hh:mm:ss {dd Mon yyyy}` | Management of the clock for the LoRaWAN modem:  
  - `hh:mm:ss`—Current time.  
  - `dd Mon yyyy`—Day, month, and year.  
  **Example:**  
  `virtual-lpwa vlpwa-id modem clock set 20:30:30 31 Mar 2016` |

### Examples

The following is an example of setting the clock for the Cisco LoRaWAN Gateway:

```
IR829# virtual-lpwa 10 modem clock set 12:02:40 15 Apr 2016
Name: Virtual-LPWA 10
```

The following is an example of rebooting the Cisco LoRaWAN Gateway:

```
IR829# virtual-lpwa 10 modem reboot
Name: Virtual-LPWA 10
Modem reboot initiated.
```

The following is an example of restarting packet-forwarder:

```
IR829# virtual-lpwa 10 packet-forwarder restart
Name: Virtual-LPWA 10
Restarted
```
LoRaWAN Modem Firmware Upgrade

There are three methods to upgrade the LoRaWAN modem firmware image:

- **Normal**—It takes over 5 minutes to install the image.
- **TFTP server**—It takes over 3 minutes to install the image.
- **External TFTP server**—It takes more time than the other two methods, considering the unexpected network accessibility of a user-customized TFTP server.

Use the `virtual-lpwa 1 modem install firmware` command to upgrade the Cisco LoRaWAN Gateway firmware. The following upgrade options are available:

- `external-tftp-factory`—Install the firmware from external tftp, and wipe user data on the LoRaWAN modem.
- `external-tftp-normal`—Install the firmware from external tftp, and keep user data on the LoRaWAN modem.
- `factory`—Install the firmware, and wipe the user data on the LoRaWAN modem.
- `normal`—Install the firmware, and keep the user data on the LoRaWAN modem.
- `tftp-factory`—Upload the firmware image via tftp, install the firmware, and wipe user data on the LoRaWAN modem.
- `tftp-normal`—Upload the firmware image via tftp, install the firmware, and keep user data on the LoRaWAN modem.

**Example**

- **Normal install**:

  IR809# virtual-lpwa 1 modem install firmware normal flash:ixm_mdm_i_k9-1.0.tar.gz
  Name: Virtual-LPWA 1
  Modem image installed successfully
  The modem will reboot in 10 s.
  IR809#

- **TFTP install**:

  IR809(config)#tftp-server flash:ixm_mdm_i_k9-1.0.tar.gz
  IR809# virtual-lpwa 1 modem install firmware tftp-normal flash:ixm_mdm_i_k9-1.0.tar.gz
  Name: Virtual-LPWA 1
  Modem image installed successfully
  The modem will reboot in 10 s.
  IR809#

- **External TFTP install (for which you need to manually enter the file URL)**:

  IR809(config)#tftp-server flash:ixm_mdm_i_k9-1.0.tar.gz
  IR809# virtual-lpwa 1 modem install firmware external-tftp-normal
  10.10.10.10:ixm_mdm_i_k9-1.0.tar.gz
  Name: Virtual-LPWA 1
  Modem image installed successfully
The modem will reboot in 10 s.
IR809#

Installing U-boot

To install u-boot with the firmware image or by itself, use the following command:

```
IR829# install firmware factory flash:ixm_mdm_i_k9-1.0.06.tar.gz
only-uboot
uboot
only-uboot install uboot only
uboot install uboot together
<cr>
```

If you execute the comand without any u-boot parameters, only the firmware image will be installed.

LoRaWAN Gateway FPGA Upgrade

Every released Cisco LoRaWAN Gateway firmware image includes the FPGA image for RF board. When the image is installed successfully, the Cisco LoRaWAN Gateway will auto-reboot and start to upgrade the FPGA when bring up.

The FPGA upgrade needs about 20 minutes to be finished. During this time, LRR can’t work until the upgrade is completed. The FPGA upgrade will only happen if the version differs.

You can check the status of the FPGA upgrade using the `show virtual-lpwa 1 modem info` command or `show virtual-lpwa 1 modem status` command.

Example

```
IR800# show virtual-lpwa 1 modem info
Name : Virtual-LPWA 1
ModemImageVer : 1.0
BootloaderVer : 20160708_cisco
ModemAgentVer : 1.02
SerialNumber : FOC20133FK0
PID : IXM-LORA-800-H-V2
UTCTime : 00:02:56.492 UTC Sat Aug 06 2016
IPv4Address : 10.20.20.4
IPv6Address : none
FPGAVersion : ! Blank when FPGA is upgrading
TimeZone : CEST
LocalTime : Sat Aug  6 02:02:56 CEST 2016
ACT2 Authentication : PASS

IR800# show virtual-lpwa 1 modem status
Name : Virtual-LPWA 1
Status : Running
Uptime : 0:04:11.050000
Door : DoorClose
Upgrade Status : Ready fpga upgrading —14.2%

IR800# show virtual-lpwa 1 modem info | begin IPv6
IPv6Address : none
FPGAVersion : 48 ! Correct FPGA version is displayed when upgrade is complete
TimeZone : CEST
```
Uploading a File to the LoRaWAN Gateway

Customized files from the LRR package, for example, lrr.ini or custom.ini (AES key for geo-location), can be loaded from IOS if necessary by using the `virtual-lpwa 1 modem upload flash:filename` command.

Example

```
IR829# virtual-lpwa 1 modem upload flash:lgwx8_us920.ini
Name : Virtual-LPWA 1
Uploaded successfully
```

The environment variables should be defined correctly using the following commands:

```
IR809# configure terminal
IR809(config)#interface virtual-LPWA 1
IR809(config-if)#lpwa modem environment PKTFWD_ROOT /tmp/mdm/pktfwd/firmware/
IR809(config-if)#lpwa modem environment LXC_STORE_PATH /tmp/mdm/pktfwd/firmware/usr/etc/lrr
IR809(config-if)#exit
```

After proper installation of the LRR package, the output of the command shows the directory that contains customized files:

```
IR829# show virtual-lpwa 1 modem uploads
Name : Virtual-LPWA 1
Current folder: '/mnt/container/rootfs/tmp/mdm/pktfwd/firmware/usr/etc/lrr'
_parameters.sh
_system.sh
autoreboot_last
channels.ini
custom.ini
lgw.ini
lrr.ini
sysconfig_done
```

```
IR829# show virtual-lpwa 1 modem uploads detail
Name : Virtual-LPWA 1
Current folder: '/mnt/container/rootfs/tmp/mdm/pktfwd/firmware/usr/etc/lrr'
total 32
-rw-r--r-- 1 root root 143 Aug 11 20:26 _parameters.sh
-rw-r--r-- 1 root root 20 Aug 11 20:26 _system.sh
-rw-r--r-- 1 root root 0 Aug 16 09:33 autoreboot_last
-rw-rw-r-- 1 sshd sshd 2000 Aug 5 16:15 channels.ini
-rw-rw-r-- 1 sshd sshd 275 Aug 5 15:35 custom.ini
-rw-rw-r-- 1 sshd sshd 1576 Aug 5 16:18 lgw.ini
-rwxrwxr-x 1 sshd sshd 8017 Aug 24 13:53 lrr.ini
-rw-r--r-- 1 root root 29 Aug 11 20:26 sysconfig_done
```

Monitoring the LoRaWAN Gateway

On the IR800 series, beginning in privileged EXEC mode, use these commands to monitor the Cisco LoRaWAN Gateway.
### Command

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show virtual-lpwa vlpwa-id</code></td>
<td>Displays the information of the LoRaWAN modem:</td>
</tr>
<tr>
<td>`modem[gps</td>
<td>info</td>
</tr>
<tr>
<td></td>
<td>• <code>info</code>—Displays modem information.</td>
</tr>
<tr>
<td></td>
<td>• <code>ipsec</code>—Displays modem IPsec status and detailed information.</td>
</tr>
<tr>
<td></td>
<td>• <code>led</code>—Displays modem LED information.</td>
</tr>
<tr>
<td></td>
<td>• <code>log</code>—Displays modem logs.</td>
</tr>
<tr>
<td></td>
<td>• <code>statistics</code>—Displays modem statistics.</td>
</tr>
<tr>
<td></td>
<td>• <code>status</code>—Displays modem status.</td>
</tr>
<tr>
<td></td>
<td>• <code>uploads</code>—Lists uploaded files.</td>
</tr>
<tr>
<td><code>show virtual-lpwa vlpwa-id</code></td>
<td>Displays the information of the LoRaWAN modem packet-forwarder software:</td>
</tr>
<tr>
<td></td>
<td>• <code>log</code>—Displays packet-forwarder logs.</td>
</tr>
<tr>
<td></td>
<td>• <code>status</code>—Displays packet-forwarder status.</td>
</tr>
</tbody>
</table>

### Examples

The following is a sample output of the `show virtual-lpwa 4 modem info` command, which displays the modem information:

```
IR829# show virtual-lpwa 4 modem info
Name : Virtual-LPWA 4
ModemImageVer : 1.0.20
BootloaderVer : 20160830_cisco
ModemAgentVer : 1.02

```
Temperature: 44.5 C

The following is a sample output of the `show virtual-lpwa 10 modem status` command, which displays the modem status information:

```
IR829# show virtual-lpwa 10 modem status
Name: Virtual-LPWA 10
Status: Running
Uptime: 13:40:37.500000
Door: DoorClose
Upgrade Status: Ready
```

The following is a sample output of the `show virtual-lpwa 1 packet-forwarder info` command, which displays the packet-forwarder information, and the LRRID which is required when registering a LoRaWAN interface on Actility Thingpark LoRaWAN network server:

```
IR829# show virtual-lpwa 1 packet-forwarder info
Name : Virtual-LPWA 1
PublicKeyStatus : Installed
FirmwareStatus : Installed
PacketFwdVersion : 1.8.15
LRRID : 68ba477e
PartnerID : 0001
```

The following is a sample output of the `show virtual-lpwa 10 packet-forwarder status` command, which displays the packet-forwarder status:

```
IR829# show virtual-lpwa 10 packet-forwarder status
Name: Virtual-LPWA 10
Status: Running
```

The following is a sample output of the `show virtual-lpwa 10 packet-forwarder log list` command, which displays the packet-forwarder log list:

```
IR829# show virtual-lpwa 10 packet-forwarder log list
Name: Virtual-LPWA 10
------------------------------------------
lrr.ini lrr.ini information
config Get the detail config
radio Radio status
trace LRR Trace log
```

The following is a sample output of the `show virtual-lpwa 10 packet-forwarder log name trace` command, which displays the packet-forwarder log name trace:

```
IR829# show virtual-lpwa 10 packet-forwarder log name trace
Name: Virtual-LPWA 10
------------------------------------------
05:51:35.464 (6196) [../xlap.c:726] TCP Disconnected on RTU(0x7e7b0,lrc7.thingpark.com,2404) fd=7 conn=-1 'connection closed (eot)'
05:51:35.464 (6196) [../main.c:2299] LAP LRC DISC (2648)
05:51:35.465 (6196) [../xlap.c:553] Lap reset partial on RTU(0x7e7b0,lrc7.thingpark.com,2404) outq=0 ackq=3
05:51:37.405 (6196) [../xlap.c:1139] connect accepted on RTU(0x7e7b0,lrc7.thingpark.com,2404)
```

Cisco IR800 Integrated Services Router Software Configuration Guide
Monitoring LED Status

Use the `show virtual-lpwa 1 modem led` command to display LED status of the Cisco LoRaWAN Gateway. For the LED definitions, see the *Cisco LoRaWAN Gateway Hardware Installation Guide*.

The following is a sample output of the `show virtual-lpwa 1 modem led` command:

```bash
IR829# show virtual-lpwa 1 modem led
Name : Virtual-LPWA 1
LED1 : GREEN ON, Solid
LED2 : OFF !Future use
```

Checking Connectivity

To check the connectivity between the Cisco LoRaWAN Gateway and Thingpark Network Server after the LRR software is installed, you must check the IP NAT translations, to make sure the TCP connection over port 2404 is established.

```bash
IR829# show ip nat translation
Pro Inside global Inside local Outside local Outside global
icmp 192.168.0.2:3348 10.16.16.3:3348 217.69.25.85:3348 217.69.25.85:3348

IR829#
```

Connection with port 2404 indicates a successful communication between the LoRaWAN interface and the LoRaWAN network server.

---

**Note**

Make sure that port 2404 is open on the firewall if the gateway is installed on a secured network. It also requires DNS resolution for the name of the LoRaWAN network server, in case DNS is filtered on the firewall.

---

Debugging the LoRaWAN Gateway

On the IR800 series, beginning in privileged EXEC mode, use these commands to debug the Cisco LoRaWAN Gateway.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>debug vlpwa all</code></td>
<td>Enables all vlpwa debug messages.</td>
</tr>
<tr>
<td><code>undebug vlpwa all</code></td>
<td>Disables all vlpwa debug messages.</td>
</tr>
</tbody>
</table>

---
### Command

```
debug vlpwa [decode | detail | errors | memory | raw | registry | session | timers | trace]
```

### Purpose

Enables the following vlpwa debug messages:

- **decode**—Decoded packet information.
- **detail**—Detailed trace information.
- **errors**—Errors.
- **memory**—Memory information.
- **raw**—Raw packet information.
- **registry**—Registry information.
- **session**—Session information.
- **timers**—Timers information.
- **trace**—Trace information.
CHAPTER 6

Alarms

This chapter provides instructions for configuring the alarms on the IR809. The IR829 does not have an alarm port.

- Finding Feature Information, on page 107
- Information About Alarms, on page 107
- Alarm Port, on page 107
- Alarm Conditions, on page 108
- Configuration Examples, on page 109

Finding Feature Information

Your software release may not support all the features documented in this chapter. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to:

An account on Cisco.com is not required.

Information About Alarms

If the conditions present on the IR809 do not match the set parameters, the IR809 software triggers an alarm or a system message. By default, the IR809 software sends the system messages to a system message logging facility, or a syslog facility. You can also configure the IR809 to send Simple Network Management Protocol (SNMP) traps to an SNMP server.

Alarm Port

The Cisco IR800 has alarm ports as shown in Cisco IR809 Front Panel. Additional details and instructions about connecting the alarm ports are found in the IR809 Hardware Configuration Guide and the Getting Started and Product Document of Compliance for the Cisco IR809 Integrated Services Router.
Alarm Conditions

There are two conditions that generate an alarm:

- If the alarm is connected to a door switch or an enclosure and detects a door opening.
  - This is an external alarm and requires wiring. See the IR809 Hardware Installation Guide.

- When the internal temperature is too high.
  - This is an internal alarm, no wiring required.

Note

Prior to IOS 15.6(1)T, the default thresholds were set too low: minor alarm if exceeding 60°C, or major alarm if exceeding 75°C or too low of a cold temperature threshold, less than -25°C. After IOS 15.6(1)T, the default values were changed to 84°C (Minor) and 93°C (Major).

When either condition is met, the alarm LED turns red, and a syslog message and SNMP trap are triggered if configured.

SNMP Traps

SNMP is an application-layer protocol that provides a message format for communication between managers and agents. The SNMP system consists of an SNMP manager, an SNMP agent, and a management information base (MIB).

The `snmp-server enable traps` command can be changed so that the user can send alarm traps to an SNMP server. You can use alarm profiles to set environmental or port status alarm conditions to send SNMP alarm traps.

Syslog Messages

You can use alarm profiles to send system messages to a syslog server.

Configuration Commands

You can set the alarm severity to critical, major, minor, or none. The severity is included in the alarm message when the alarm is triggered.

To configure and show alarms on the IR809, use the Command Line Interface (CLI).

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>alarm contact contact-number description string</td>
<td>(Optional) Configures a description for the alarm contact number.</td>
</tr>
<tr>
<td></td>
<td>- The <code>contact-number</code> value is from 1 to 4.</td>
</tr>
<tr>
<td></td>
<td>- The description string is up to 80 alphanumeric characters in length and is included in any generated system messages.</td>
</tr>
</tbody>
</table>
Purpose
Configure the trigger and severity for an alarm contact number or for all contact numbers.

- Enter a contact number (1 to 4) or specify that you are configuring all alarms.
- For severity, enter critical, major, minor or none. If you do not configure a severity, the default is minor.
- For trigger, enter open or closed. If you do not configure a trigger, the alarm is triggered when the circuit is closed.

Command | Purpose
--- | ---
**alarm contact** *(contact-number | all)* *(severity critical | major | minor | none) | (trigger closed | open)* | Configures the trigger and severity for an alarm contact number or for all contact numbers.

| end | Returns to privileged EXEC mode.
| show env alarm-contact | Shows the configured alarm contacts.
| copy running-config startup-config | (Optional) Saves your entries in the configuration file.

### Configuration Examples

#### Configure an alarm.

```
IR809#conf term
Enter configuration commands, one per line. End with CNTL/Z.

IR809(config)#alarm-contact 1 description
Your Descriptive Text Here

IR809(config)#alarm-contact 1 severity critical

IR809(config)#alarm-contact 1 trigger closed

IR809#
```

#### To show the alarm status:

```
IR809#show environment alarm-contact
! No Alarm Present
ALARM CONTACT
  Status: Not Asserted
  Description: Test Input Alarm
  Severity: Critical
  Trigger: Closed
```

#### Example of an alarm being generated:

```
IR809# !
*Nov 27 14:54:52.573: %IR800_ALARM_CONTACT-0-EXTERNAL_ALARM_CONTACT_ASSERT: External alarm asserted, Severity: Critical
```
To show the alarm status during an event:

```
IR809# show environment alarm-contact
ALARM CONTACT
  Status: Asserted
  Description: Test Input Alarm
  Severity: Critical
  Trigger: Closed
```

Example of an alarm being cleared:

```
IR809# !
*Nov 27 14:55:02.573: %IR800_ALARM_CONTACT-0-EXTERNAL_ALARM_CONTACT_CLEAR: External alarm cleared
IR809#
```

**Note**
With IOS version 15.6(1)T, the `show platform led` command does not provide the ALM led status.

**Enabling SNMP Traps**

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2 snmp-server enable traps alarms</td>
<td>Enables the switch to send SNMP traps.</td>
</tr>
<tr>
<td>Step 3 end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4 show alarm settings</td>
<td>Verifies the configuration.</td>
</tr>
<tr>
<td>Step 5 copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

**MIBs**

To locate and download MIBs using Cisco IOS software, use the Cisco MIB Locator found at the following URL and choose a platform under the Cisco Access Products menu:

http://tools.cisco.com/ITDIT/MIBS/servlet/index
Chapter 7

Guest Operating System (Guest OS) Installation and Configuration

This chapter details Guest Operating System (Guest OS) installation for the Cisco IR800.

- Guest Operating System Overview, on page 111
- Prerequisites, on page 112
- Guidelines and Limitations, on page 113
- Default Settings, on page 113
- Installation and Upgrade, on page 114
- Improvements in IOS and Guest-OS Clock Time Synchronization, on page 114
- Configuring Cisco IOS, on page 115
- Configuring Guest OS, on page 118
- Configuring Network Address Translation (NAT), on page 122
- Troubleshooting, on page 127
- Related Documentation, on page 128

Guest Operating System Overview

The IR800 supports a Hypervisor architecture to support user-specified operating systems within an independent Virtual Machine (VM).

When you install the IR800 IOS software bundle (image) on the router, the image automatically installs the supported Guest OS (Cisco IOS and Linux OS) instance(s). You can use the Linux Guest OS running on a VM on the IR800 to run applications.

The following example shows connectivity of Guest OS and Cisco IOS. A virtual interface managed by Cisco IOS provides network connectivity to Guest OS. Cisco IOS forwards traffic from Guest OS through regular IP forwarding mechanisms.
In this example, A is the interface being used on the router and B is the interface on the Linux OS.
For the Cisco IR809, A is Gigabit Ethernet 2 and B is Eth 0.
For the Cisco IR829, A is Gigabit Ethernet 5 and B is Eth 0
Additionally, the Virtual Machine Linux has a virtual console, and two virtual serial ports.

**Prerequisites**

Router must be running Cisco IOS 15.6(2)T or higher.

---

**Note**
The IOXVM image delivered in the IOS bundle may not be the most recent. Check Cisco.com for the latest version at:
http://software.cisco.com/download/cart.html?imageGuid=F51FECDC2E4FE5814715000B44317E5500EB47C5&i=rs
Guidelines and Limitations

Per CDET CSCvh65331, running excessive traffic from an external host to the Guest OS on the IR800 can cause a system hang. Removing the traffic will recover the console access. Apply qos policies to rate-limit traffic to ensure IOS CPU <65%.

- The bundled Guest OS delivered with the latest IOS version, and is based on Yocto Linux Project Reference Distro, with basic services enabled:
  - IPv4/IPv6
  - DHCP
  - NTP
  - AAA (Radius)
  - Python
  - Basic debugging tools (tcpdump, top, etc)
  - bash

- Serial relay for Guest OS control of the Serial Interface
  - Async 0 and Async 1 respectively reserve line 1/5 and 1/6 to relay serial data to the corresponding Guest OS /dev/ttyS1 and /dev/ttyS2

Prior to 15.6(3)M, Serial Interface parameters needed to be set through IOS. 15.6(3)M allows setting the parameters directly from the Guest OS, through standard Linux commands.

- You must configure Cisco IOS to provide Guest OS connectivity.

There is an IOXVM image more recent than IOS bundle, (IOXVM 1.0.4) available on Cisco.com

Default Settings

The bundled Linux Guest OS:

- Uses DHCP to acquire the IPv4 address.
- Does not have a default root password.
- Uses IPv6 stateless auto-configuration to get an IPv6 address.
Without an IPv6 address set on both GXX and ETH0, the Guest OS will never get displayed as registered under show iox host list detail. GXX is defined as G15 on the IR829 and G12 on the IR809.

**Installation and Upgrade**

By default, IR800s ship with a software bundle that includes the latest versions of all of the required images such as Cisco IOS, Guest OS, and Hypervisor.

**Note**

Before performing a bundle installation, shutdown the Guest OS. Performing a bundle installation on a device with an active Guest OS may result in it not functioning upon reboot.

Use the following procedure to upgrade your router to the latest software bundle. It can take several minutes for the router to upgrade and install all of the images (Hypervisor, Cisco IOS, and Guest OS).

**DETAILED STEPS**

**Procedure**

**Step 1**

Copy the bundle image to the IR800 IOS flash partition using scp or sftp.

Example bundle name: `ir800-universalk9-bundle.SPA.<VERSION>`

**Step 2**

Enter the following commands at the IR800 prompt:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>bundle install flash: &lt;bundle name&gt;.CG</code></td>
<td>Installs the specified bundle.</td>
</tr>
<tr>
<td><code>copy running-config startup-config</code></td>
<td>Saves the current running configuration.</td>
</tr>
<tr>
<td><code>reload</code></td>
<td>Reloads the router.</td>
</tr>
</tbody>
</table>

**Improvements in IOS and Guest-OS Clock Time Synchronization**

In Cisco IOS releases prior to 15.8(3)M, the Guest-OS clock would synchronize with the IOS clock every 30 seconds. Now with IOS 15.8(3)M and beyond, the synchronize time is 1 second. No user configuration is required to initiate Guest-OS clock synchronization or to modify the clock settings.

IOS can be configured to synchronize to an external NTP server and the Guest-OS will sync with IOS. Additionally, the Guest-OS hardware clock time (hwclock) will be in sync with the Guest-OS (IOx) system time.
The following example shows the Guest-OS system clock and Guest-OS hwclock outputs taken at the same time:

**IOS clock time:**

```
IR800#show clock
08:11:18.498 UTC Mon May 7 2018
```

**Guest-OS(IOX) system time and hardware time**

```
IR800-GOS-1:~# date
Mon May 7 08:11:18 UTC 2018
IR800-GOS-1:~# hwclock
Mon May 7 08:11:18 2018 0.000000 seconds
```

## Configuring Cisco IOS

This section describes how to configure the Cisco IOS VM to provide network connectivity to the Guest OS VM.

Guest OS connects to the network through a virtual Network Interface Card (VNIC) provided by the Hypervisor. Network attributes such as IP address, Default gateway, DNS server (as shown in the Configuring DHCP Pool, on page 116 section) on the interface are statically configured or configured for DHCP to dynamically obtain IP addresses. Guest OS network connectivity is only through Cisco IOS, using the virtual network interface provided by the Hypervisor. Network attributes such as IP address, can be configured statically or dynamically, and are obtained from Cisco IOS using DHCP requests. The bundled Linux Guest OS is configured to use DHCP.

This section outlines the task to configure a Cisco IOS DHCP pool to provision the Linux Guest OS with an IP address, and an external Ethernet interface in Cisco IOS to allow the Guest OS network connectivity.

This section includes the following topics:

### Configuring the IR800 Ethernet Interface

You must enable one of the external Ethernet interfaces on the IR800 to provide network connectivity. For details on interface configuration refer to the Cisco 800 Series Integrated Services Routers Software Configuration Guide:

---

**Note**

The QoS Input Service Policy can only be configured on the WAN interface, not on the SVI interface.

---

**Note**

The IR809 uses Gigabit Ethernet 2, and the IR829 uses Gigabit Ethernet 5.
IPv6 Gigabit Ethernet

On Guest OS, IPv6 is enabled by default. The following example configuration uses IPv6 on Guest OS, where Guest OS is automatically assigned an IPv6 address on the Cisco IOS interface GigabitEthernet 5.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipv6 unicast-routing</td>
<td>Enables unicast routing.</td>
</tr>
<tr>
<td>ipv6 cef</td>
<td>Enables cef.</td>
</tr>
<tr>
<td>interface GigabitEthernet 5</td>
<td>Set the internal virtual interface that connects to the Linux Guest OS.</td>
</tr>
<tr>
<td>ipv6 address autoconfig</td>
<td>Sets the IPv6 address.</td>
</tr>
<tr>
<td>ipv6 enable</td>
<td>Enables IPv6.</td>
</tr>
</tbody>
</table>

Enabling IPv4 Gigabit Ethernet

Note
Configuring an IPv4 address on a Gigabit port is not a required part of configuring the Guest OS. However, IOS interfaces must be set to enable external devices to communicate with the Guest-OS through IOS.

To enable an external Gigabit Ethernet IPv4 interface on the IR800 to provide network connectivity, enter the following commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>config terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>interface gig 0</td>
<td>Configures an IPv4 address on Gigabit Ethernet interface 0, and enters interface configuration mode.</td>
</tr>
<tr>
<td>ip address 10.1.2.1 255.255.255.0</td>
<td>Sets the IP address and subnet mask for Gigabit Ethernet interface 0.</td>
</tr>
<tr>
<td>no shutdown</td>
<td>Enables the Gigabit Ethernet interface.</td>
</tr>
</tbody>
</table>

Configuring DHCP Pool

To configure a local DHCP pool, enter the following commands, one per line:

Note
The subnet used for the local DHCP pool must be reachable externally. If you cannot allocate the whole subnet to Guest OS, use a NAT-based configuration. See Configuring Network Address Translation (NAT), on page 122.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>config terminal</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>
### Configuring Guest OS GigabitEthernet on Cisco IOS

The Guest OS Ethernet port (eth0) connects to a GigabitEthernet interface on Cisco IOS. The IR829 uses GigabitEthernet 5, and the IR809 uses GigabitEthernet 2.

To configure the GigabitEthernet interface with the default gateway address of the DHCP pool, enter the following commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip dhcp pool gospool</td>
<td>Names the local DHCP pool.</td>
</tr>
<tr>
<td>network 10.1.2.0 255.255.255.0</td>
<td>Sets the network address.</td>
</tr>
<tr>
<td>default-router 10.1.2.1</td>
<td>Sets the router address.</td>
</tr>
<tr>
<td>domain-name utility.com</td>
<td>Sets the subnet address.</td>
</tr>
<tr>
<td>dns-server 10.1.1.1</td>
<td>Sets the DNS server address.</td>
</tr>
<tr>
<td>lease 5</td>
<td>Sets the duration of the IP address lease to five days.</td>
</tr>
</tbody>
</table>

---

IPv6 must always be enabled on the GigabitEthernet interface.

---

The IR809 uses Gigabit Ethernet 2, and the IR829 uses Gigabit Ethernet 5.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface GigabitEthernet 5</td>
<td>Sets the internal virtual interface that connects to the Linux Guest OS.</td>
</tr>
<tr>
<td>ipv6 enable</td>
<td>Enables IPv6.</td>
</tr>
<tr>
<td>ipv6 address autoconfig</td>
<td>Sets the IPv6 address.</td>
</tr>
<tr>
<td>ipv4 address 10.1.2.1 255.255.255.0</td>
<td>Sets the IPv4 address.</td>
</tr>
<tr>
<td>no shutdown</td>
<td>Enables the Ethernet interface, changing its state from administratively down to administratively up.</td>
</tr>
</tbody>
</table>

---

### Enabling Virtual Guest OS Console

For heightened security, the Guest OS console is disabled by default. To enable the Guest OS console, enter the following commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>config terminal</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>
PurposeCommand

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>line 1/4</td>
<td>Specifies line 1/4 for configuration and enters line configuration collection mode.</td>
</tr>
<tr>
<td>transport input all</td>
<td>Defines which protocols to use to connect to a specific line of the router.</td>
</tr>
</tbody>
</table>

**Configuring Guest OS**

This section describes how to set the root password for Guest OS and enable SSH access. By default, SSH is disabled in Guest OS. This section describes the steps to reverse-Telnet into Guest OS, and enable SSH access.

**Starting Guest OS**

By default, Guest OS starts after installation. To manually start the Guest OS, enter the following commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show iox host list detail</td>
<td>Displays OS: RUNNING if Guest OS is already running.</td>
</tr>
<tr>
<td>guest-os 1 start</td>
<td>Starts Guest OS.</td>
</tr>
</tbody>
</table>

During start up, Guest OS sends a DHCP request and is assigned an IP address from the local DHCP pool and an IPv6 address through IPv6 stateless auto-configuration. Guest OS is then configured with a hostname and sync time from IOS.

**Note**

It can take a few minutes for the Guest OS to start.

**Setting the Root Password**

Guest OS does not have a default root password. To set a root password, at the GOS prompt enter the following command.

**Note**

You must set a root password before turning on SSH access.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>[GOS] # passwd</td>
<td>Runs the following UNIX password script. Enter your desired password at the prompt.</td>
</tr>
</tbody>
</table>

**EXAMPLE**

Changing password for user root.
New UNIX password:
Retype new UNIX password:
passwd: all authentication tokens updated successfully.

[GOS]#

An alternate method for changing the root password from the IOS CLI is shown in the following example:

IR800# iox host exec "resetpw cisco" IR800-GOS-1

Password reset successfully.

You can set uboot password as an environment variable using the following commands:

IR829(config-if)# lpwa modem environment PKTFWD_ROOT /tmp/mdm/pktfwd/firmware
IR829(config-if)# lpwa modem environment LXC_STORE_PATH /tmp/mdm/pktfwd/firmware/usr/etc/lrr
IR829(config-if)# lpwa modem environment UBOOT_PW cisco1234
IR829(config-if)# exit

Note

The UBOOT_PW is optional and the length should be 8~30 if set.

---

**Guest OS persistent logging through reload**

Log files related to the Guest OS file system are stored on the /var/log directory of IOx. This is a volatile location because they may be lost when the IOS or IOx receives a reload command. For this reason, the caf.log, daemon.log, tpmc.log and syslog files from /var/log are now moved to a persistent storage location under /software/downloads (i.e. /dev/sdb filesystem) and the data in it will be restored upon multiple reloads. On reinstallation, the files under /software/downloads will be removed.

The command is persistent across IOS reloads unless a new GOS image is loaded or a bundle install to the new GOS image.

Additional CLIs are available for persistent logging:

- To enable persistent logging from IOS use following command:
  
  IR800# iox host exec enable_persistent_logging <GOS>

- To enable persistent logging from IOS use following command:
  
  IR800# iox host exec disable_persistent_logging <GOS>

- To enable persistent logging from Guest-OS use following command:
  
  IR800-GOS:/etc/scripts# ./enable_persistent_logging

- To disable persistent logging from Guest-OS use following command:
  
  IR800-GOS:/etc/scripts# ./disable_persistent_logging
Guest OS file system corruption detection and recovery

The Guest OS running on the IR800 series have had a higher likelihood for file system corruptions after an abrupt power failure. Upon Guest OS start or restart, a mandatory FSCK is performed on the rootfs and the datafs in order to attempt file system recovery.

This feature can be enabled or disabled using the config command `iox recovery-enable <timeout>`, where timeout specifies the TPMS timer timeout value in minutes. If unspecified, the default value is 5 and maximum is 15. If no registration request is received from TPMC before the timer expires, the Guest OS will be reinstalled. By default, the feature is disabled so that the customers who do not use Guest OS will not run into a situation where the Guest OS is reinstalled because networking is not configured correctly for Guest OS. The command is persistent across IOS reloads.

**IOXVM Graceful Shutdown**

On the IR800 router, the Guest OS will now perform a graceful shutdown before a reload of the device. Previously, the GOS would not go through the shutdown command, which sometimes would result in unexpected behavior.

**Logrotate of IR8x9 Guest-OS logs**

The logrotate feature has been uniformly implemented across all logs in the Guest-OS /var/log path. If persistent-logging is enabled, the specific logs will be saved on /software/downloads and logrotate is implemented on those as well. By default, log-rotate takes effect every day at 7:30am.

**IOx Radius authentication**

This feature allows for enabling the AAA login to IOx applications. There are different options:

- If your device shows no aaa new-model in the configuration, it will use local authentication.
- If your device shows aaa new-model in the configuration, there are two different methods of authentication.
  - If your device shows no iox aaa authentication in the configuration, it will use the default authentication list, for example: "aaa authentication login default..."
  - If your device shows iox aaa authentication WORD in the configuration, it will use the newly created list/group you specify.
  - To create a login authentication group/list, use aaa authentication login WORD. Then specify the name to use for IOX authentication using iox aaa authentication WORD For example

There is a condition in authentication that may cause some confusion. The following provides more details:

**Scenario:** When a user enables a separate AAA Radius server to authenticate and authorize Guest-OS, instead of using local login.

**Observation:** In such a scenario, when a privilege 15 user logs into the Guest-OS console port 2070 from within IOS, the first login request is for the IOS username/password. The second login prompt is for the AAA Radius credential specific to Guest-OS.

**Note**

Users will need to configure the aaa iox username in IOS.
IOXVM Storage Partition Enhancement

This enhancement to the IR800 series is to provide more flexibility to provide a customizable disk partitioning. With a smaller partition for system files, the user can put larger applications in the remaining partition.

A new CLI is introduced for this purpose:

IR829# guest-os 1
  disk-repartition Guest OS disk repartition
  image Guest OS bootable image
  restart Restart Guest OS
  start Start Guest OS
  stop Stop Guest OS

IR829# guest-os 1 disk-repartition
  <30-90> Percentage Guest OS system partition takes

The user can input a number between 30 and 90 which would be rounded up to multiples of 5.

For example, typing in 30 means the system partition would take 30% of total space.

IOS communicates with VDS, which will actually perform disk repartition for GOS. After the action is completed by VDS, VDS will send a notification message back to IOS to indicate the status of operation.

After the disk repartitioning, the user will need to reinstall the GOS.

IR829# guest-os 1 disk-repartition 1
WARNING - Running this command will delete all application data in IOx. This operation cannot be undone. Continue? [no]: yes
Guest OS disk repartitioning with option 1.......................... Done!

After the repartition is successful, you should see the following syslog message:

%IR800_GOS_DISK_REP-6-SUCCESS_GOS_OPERATION: Successfully performed DISK REPARTITION operation for GOS.

After the disk is repartitioned, the GOS needs to be reinstalled by one of two methods:

IR800# bundle install flash:ir800-universalk9-bundle.SSA.156-3.M1 exclude HV-IOS
-or
IR800# guest-os install flash:ir800-ref-gos.img.1.40.gz

Finally, manually restart the GOS.

IR800# guest-os 1 start

If you have an IR809 or IR829 that was originally configured with an IOS version before 15.6(3)M1, then the GOS was partitioned in a different manner than later releases. For example:

- If the router was initially booted up (first time power up) with an image older than 15.6(3)M1b, then the GOS is partitioned the old way with: disk1 (1530 MB) and the rest is disk2 (800 MB)

- If the router was initially booted up (first time power up) with an image at 15.6(3)M1b or newer, then the GOS is initially partitioned with profile 1: disk 1 (500MB) and the rest is disk2 (1800 MB)
In either case, once the router is running 15.6(3)M1b or newer, you can use the following CLI to repartition it with different options:

IR800# guest-os 1 disk-repartition ?
1 disk1: 500MB vs disk2: 1800MB
2 disk1: 700MB vs disk2: 1600MB
3 disk1: 900MB vs disk2: 1400MB
4 disk1: 1100MB vs disk2: 1200MB
5 disk1: 1300MB vs disk2: 1000MB
6 disk1: 1500MB vs disk2: 800MB
7 disk1: 1700MB vs disk2: 600MB

(Note: Actual storage available for apps will be less than the value chosen for disk2 for all profiles.)

**Configuring Network Address Translation (NAT)**

The following example configuration uses NAT for Guest OS network connectivity, where:

- 10.1.1.0 is the externally reachable subnet.
- 10.1.1.131 is the external IP address made available for Guest OS access.
- 192.168.1.0 is the private subnet created for Guest OS to Cisco IOS connectivity. This is not directly reachable outside the IR800.
- The IP address acquired by Guest OS through IOS local DHCP pool is 192.168.1.2. This address can be obtained using `show iox host list details` command from IOS.

This example shows outgoing communications. For incoming communications, proper port mapping will be required.

```plaintext
ip dhcp pool gospool
  network 192.168.1.0 255.255.255.0
  default-router 192.168.1.1
  domain-name utility.com
  dns-server 10.1.1.1
  lease 5
interface gig 5
  ip nat inside
  ip address 192.168.1.1 255.255.255.0
  ipv6 enable
  no shutdown
interface gig 0
  ip nat outside
  ip address 10.1.1.5 255.255.255.0
  no shutdown
  ip nat inside source static 192.168.1.2 10.1.1.131
! End of configuration
```

IR800#sh ip nat trans
Pro Inside global Inside local Outside local Outside global
--- 10.1.1.131 192.168.1.2 --- --- ---
For more information about NAT, please see the Configuring Network Address Translation: Getting Started Guide.

**IR800 Guest-OS USB Access from IOS**

IR800 IOS releases don’t support an external USB storage directly accessible from IOS. However, it is possible to mount an external USB storage on the IR800 Guest-OS, then use it from IOS through SCP

---

**Note**

If a USB is hot swapped or plugged in while the system is operating, it will need to be reloaded. Otherwise the system will not recognize it and it may not be accessible.

---

Plug an external USB storage, wait for its recognition.

Edit “/etc/fstab” to add the new sdc1 drive, then mount it.

```
root@IR800-GOS-1:# vi /etc/fstab
```

```
Rootfs / auto defaults 1 1
Proc /proc proc defaults 0 0
devpts /dev/pts devpts mode=0620,gid=5 0 0
usbdevfs /proc/bus/usb usbdevfs noauto 0 0
tmpfs /var/volatile tmpfs defaults 0 0
tmpfs /media/ram tmpfs defaults 0 0
/dev/sdc1 /mnt/sdc1 auto defaults 0 0
```

**Example of no USB storage recognized**

```
root@IR800-GOS-1:~# ls /dev/sd*
/dev/sda /dev/sda1 /dev/sdb
```

**Example of USB storage recognized**

```
root@IR800-GOS-1:~# ls /dev/sd*
/dev/sda /dev/sda1 /dev/sdb /dev/sdc /dev/sdc1
root@IR800-GOS-1:~# fdisk -l /dev/sdc
```

```
Disk /dev/sdc: 1.993 MB, 199342976 bytes, 3893248 sectors
Units = sectors of 1 * 512 = 512 bytes
Sector size (logical/physical): 512 bytes / 512 bytes
I/O size (minimum/optional): 512 bytes / 512 bytes
Disk identifier: 0x00000000
Device Boot Start   End    Blocks   Id  System
/dev/sdc1 2          3893247 1946623  b  W95 FAT32
```

**Mount the drive**

```
root@IR800-GOS-1:/etc# mount -a
```

**Check that the drive is correctly seen**

```
root@IR800-GOS-1:/etc# df -H /dev/sdc1
```
Create a symbolic link in order to get the device directory (or subdirectory if created) associated to the SSH login

```
root@IR800-GOS-1:~# ln -s /mnt/sdc1 ~/testUSB
```

Show a long listing of the testUSB directory which displays the symbolic link

```
root@IR800-GOS-1:~# ls -l testUSB
lrwxrwxrwx 1 root root 9 Oct 13 18:00 testUSB -> /mnt/sdc1
```

Now you can use the “test” directory to transfer files from and to the IR800 IOS.

**IR800 IOS SCP From/To Guest-OS USB Storage**

Now that the USB device is available to the Guest OS, you can copy files to and from it.

```
IR800#copy
ir800-universalk9-mz.SPA.155-3.M0a scp://10.15.15.2/testUSB/ir800-universalk9-mz.SPA.155-3.M0a
```

```
Source username [IR800]? root
Destination filename [testUSB/ir800-universalk9-mz.SPA.155-3.M0a]? testUSB
Password: *
Writing testUSB/ir800-universalk9-mz.SPA.155-3.M0a
62083137 bytes copied in 51.640 secs (1202230 bytes/sec)
```

```
IR800#copy scp://10.15.15.2/testUSB/hosts flash:
```

```
Source username [IR800]? root
Destination filename [hosts]? hosts
Password: *
Sending file modes: C0755 44 hosts
44 bytes copied in 13.930 secs (3 bytes/sec)
```

**New for IOS 15.6(1)T**

Guest OS enhancements include:

- Cisco distribution is based on Yocto Project 1.8 Reference Distro, with basic services enabled:
  
  - IPv4/IPv6
  - DHCP
  - NTP
  - AAA (Radius)
  - Python 2.7
  - Basic debugging tools (tcpdump, top, etc)
• Serial relay for Guest OS control of the Serial Interface
  • Async 0 and Async 1 respectively reserve line 1/5 and 1/6 to relay serial data to the corresponding
    Guest OS /dev/ttyS1 and /dev/ttyS2

**New for IOS 15.6(3)M**

**USB Support**

Previous to 15.6(3)M, the USB devices, which are connected to external USB port could be emulated on the
Guest OS through OHCI mode only. With this feature Hypervisor will be enhanced to support EHCI emulation
to Guest OS.

**Serial Device Configuration**

Previously, the Guest OS could not configure the physical serial port on the device. The serial port configuration
(e.g. baud rate change) of the serial port needed to be done in IOS.

With 15.6(3)M, hypervisor and IOS are enhanced so that if the Guest OS changes the virtual serial port
configuration, it notifies IOS, and IOS applies the configuration to the physical serial port.

Command line changes consist of the following:

• A new option is appended to allow the baudrate, databits, stopbits and parity propagation from Guest
  OS. If "propagation" is present, the control parameters will be passed from Guest OS to IOS physical
  port. Otherwise it functions as before.

• The serial port control parameters included in the propagation are: baudrate, databits, stopbits and parity.

  relay line <linex> <liney> [propagation]

**Serial Relay Configuration**

IR800(config)#conf term
Enter configuration commands, one per line. End with CNTL/Z.
IR800(config)#inter asyn 0
IR800(config-if)# encap relay-line
IR800(config-if)# end
IR800(config)# line 1
IR800(config-line)# transport input all
IR800(config-line)# relay line 1 1/5 propagation
IR800(config)# show line 1/5
Guest OS output for /dev/tty

GOS is installed through the IOX bundle install process and can be started/stopped and upgraded from IOS CLI

Verification for digitally-signed GOS image distributed via Cisco DevNet must be installed using the guest-os
image install command only.
Memory Allocation Optimization

Improvements have been made in the memory allocation optimization between VDS, IOS and GOS on the IR800. Previously, the 2GB RAM was allocated as follows:

- VDS: 512MB
- IOS: 512MB
- Guest OS: 725MB
- Remainder: used by hypervisor (e.g. device share memory)

Now with optimization, the VDS memory was reduced to give at least 1GB to the Guest OS.

New for IOS 15.7(3)M

Guest OS enhancements include:

- IOx Radius authentication
  This feature allows for enabling the AAA login to IOx applications
- IOx IPv6 Networking Option
  IOx interfaces on IOS now support IPv6 addressing. See the IOx documentation for further information. https://developer.cisco.com/docs/iox/
- Guest OS persistent logging through reload
  Log files related to the Guest OS file system are stored on the /var/log directory of IOx. This is a volatile location because they may be lost when the IOS or IOx receives a reload command. For this reason, the caf.log, daemon.log, tpmc.log and syslog files from /var/log are now moved to a persistent storage location under /software/downloads (i.e. /dev/sdb filesystem) and the data in it will be restored upon multiple reloads. On reinstallation, the files under /software/downloads will be removed.
- Guest OS file system corruption detection and recovery
  The Guest OS running on the IR800 series have had a higher likelihood for file system corruptions after an abrupt power failure. Now, upon Guest OS start or restart, a mandatory FSCK is performed on the rootfs and the datafs in order to attempt file system recovery.
- IOS APIs to Enable Native IOx Applications

Note

The IOx Host Device Management service package needs to be installed for this feature to work.

A new configuration command, `hdm-enable`, has been added in this release to enable the Host Device Management service.

```
ir829-01(config)#iox ?
  aaa       IOx AAA options
  client    Configure iox client
  hdm-enable Enable IOX Host Device Management (HDM) service
  hypervisor Configure hypervisor policy
  recovery-enable Set Guest OS image recovery
```
For more information on IOx, please visit:

## Troubleshooting

To determine common causes of configuration failure, enter the following commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Guest OS Commands:</strong></td>
<td></td>
</tr>
<tr>
<td>ifconfig eth0</td>
<td>Checks if Guest OS is assigned an IP address. The following is example output:</td>
</tr>
<tr>
<td></td>
<td><code>eth0  Link encap:Ethernet  HWaddr 02:00:03:f1:cd:05</code></td>
</tr>
<tr>
<td></td>
<td><code>inet addr:10.1.2.2  Bcast:0.0.0.0  Mask:255.255.255.248</code></td>
</tr>
<tr>
<td></td>
<td><code>UP  BROADCAST  RUNNING  MULTICAST  MTU:1500  Metric:1</code></td>
</tr>
<tr>
<td></td>
<td><code>RX packets:2  errors:0  dropped:0  overruns:0  frame:0</code></td>
</tr>
<tr>
<td></td>
<td><code>TX packets:5  errors:0  dropped:0  overruns:0  carrier:0</code></td>
</tr>
<tr>
<td></td>
<td><code>collisions:0  txqueuelen:1000</code></td>
</tr>
<tr>
<td></td>
<td><code>RX bytes:684 (684.0 B)  TX bytes:894 (894.0 B)</code></td>
</tr>
</tbody>
</table>
| netstat -r | Displays the Guest OS route table. The following is example output:
|             | `Kernel IP routing table` |
|             | `Destination Gateway Genmask Flags MSS Window Irtt Iface` |
|             | default 10.1.2.1 0.0.0.0 UG 0 0 0 eth0 |
|             | `10.1.2.0 * 255.255.255.0 U 0 0 0 eth0` |
|             | `[GOS]#` |
| **IOS Commands:** | |
| show ip arp | Verifies that Cisco IOS learned Guest OS ARP mapping. The following is example output: |
|             | `Protocol Address Age (min) Hardware Addr Type Interface` |
|             | Internet 10.1.1.1 = 0022.bdef.c562 ARPA GigabitEthernet0 |
|             | Internet 10.1.2.1 = 0022.bdef.c569 ARPA GigabitEthernet2 |
|             | Internet 10.1.2.2 112 0022.bdef.c56d ARPA GigabitEthernet2 |
|             | IR800# |
| show ipv6 neighbor | Verifies that Cisco IOS learned Guest OS IPv6 neighbor address. The following is example output: |
|             | `IPv6 Address   Age Link-layer Addr State Interface` |
|             | FE80:1FF:FE90:8B05 0 0200:0190:8b05 REACH Gi2 |
| show platform guest-os | Guest-OS started |

IPv6 configuration manual
CHAPTER 8

WAN Monitoring

This chapter describes the WAN Monitoring software, WANMon, as implemented in Cisco IOS deployments. WANMon monitors the backhaul and initiates recovery actions on link failure.

- Information About WANMon, on page 131
- Prerequisites, on page 132
- Guidelines and Limitations, on page 132
- Configuring WANMon, on page 133
- Verifying WANMon Configuration, on page 134
- Configuration Examples, on page 135
- Related Documentation, on page 136

Information About WANMon

WANMon is a flexible solution to address the WAN link recovery requirements for the following products and interfaces:

- Physical networks: 4G LTE
- Virtual links: Non-crypto map based IPSec tunnels (either legacy or FlexVPN); that is, any IPSec tunnel you configure as an interface.

You enable WANMon to monitor your WAN links and initiate link recovery actions on receipt of link failure triggers.

Built-in Recovery Actions

The following are the three levels of built-in recovery processes specific to the link type:

<table>
<thead>
<tr>
<th>Link Type</th>
<th>Recovery Actions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Level 0 (Immediate)</td>
<td>Level 1 (Active)</td>
</tr>
<tr>
<td>4G LTE</td>
<td>Clear interface, and then shut/no-shut</td>
</tr>
<tr>
<td>Ethernet</td>
<td>Clear interface, and then shut/no-shut</td>
</tr>
</tbody>
</table>
Each level has two time-based thresholds based on which built-in recovery actions are taken. The following are the default settings for each level:

- **threshold** is the wait time in minutes after receipt of a link failure trigger to initiate the recovery action as set in the specified level.

- **mintime** is the frequency to perform the recovery action if the link remains down.

The built-in values are:

<table>
<thead>
<tr>
<th>Level</th>
<th>threshold</th>
<th>mintime</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Level 0</td>
<td>10 min</td>
<td>10 min</td>
<td>Triggers Level 0 actions 10 minutes after the link went down. Repeat no more than every 10 minutes.</td>
</tr>
<tr>
<td>Level 1</td>
<td>60 min</td>
<td>60 min</td>
<td>Triggers Level 1 actions 10 minutes after the link went down. Repeat no more than every 60 minutes.</td>
</tr>
<tr>
<td>Level 2</td>
<td>480 min</td>
<td>60 min</td>
<td>Triggers Level 2 actions 480 minutes after the link went down. Repeat no more than every 60 minutes.</td>
</tr>
</tbody>
</table>

If threshold values are specified as 0, no recovery actions are taken for that level. You can use this to avoid system reload (the built-in Level 2 recovery action) on receipt of a link failure trigger where other WAN links may be operational.

### Prerequisites

Ensure that the WANMon module is available. The WANMon module is included in the IOS image as the `tm_wanmon.tcl` policy file.

### Guidelines and Limitations

- WANMon automatically performs IP address checking (no user configuration) as required for the link type:
  - For cellular interfaces, WANMon performs IP address checking only for external dialer configurations, not for dial-on-demand configurations.
  - For 4G LTE interfaces, WANMon always performs IP address checking.
  - For all other interfaces, WANMon never performs IP address checking.
• WANMon indirectly triggers user-specified actions by generating an application event that link resetter applets monitor.
• If your network is live, ensure that you understand the potential impact of any command.

## Configuring WANMon

You can enable WANMon on the router and assign WANMon support to specific interfaces. Optionally, you can override the built-in recovery actions, define custom recovery links, and define an event manager environment policy to set the track object value and disable IP address checking. WANMon is disabled by default.

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Procedure</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>event manager policy tm_wanmon.tcl authorization bypass</code></td>
<td>Enables the WANMon link recovery module. Use <strong>authorization bypass</strong> to avoid authorization for CLIs invoked by this policy.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>event manager environment wanmon_if_list&lt;instance&gt; {interface name [ipsla&lt;instance&gt;]}</code></td>
<td>Configures WANMon for the interfaces in your WAN, and indicates that this is an interface configuration command.</td>
</tr>
<tr>
<td></td>
<td>Note</td>
<td>Any environment variable with the prefix wanmon_if_list constitutes an interface configuration. Multiple interfaces are allowed by specifying an instance. Be sure to specify the full interface name (for example, <code>cellular3/1</code>). You can set the IP SLA icmp-echo trigger, if desired. Multiple IP SLA triggers are allowed by specifying an instance.</td>
</tr>
<tr>
<td></td>
<td>Note</td>
<td>WANMon only looks at the status of the SLA ID. Even though <code>icmp-echo</code> is most common, if needed any other type of SLA probe (for example, <code>udp-echo</code>) can be used instead.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>event manager environment wanmon_if_list: {interface name {recovery Level0 {Level1 Level2}}}</code></td>
<td>(Optional) Overrides the built-in thresholds.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><code>publish-event sub-system 798 type 2000 arg1 &lt;interface name&gt; arg2 &lt;level&gt;</code></td>
<td>(Optional) Configures custom recovery actions using link resetter applets.</td>
</tr>
</tbody>
</table>
### Purpose

The full interfacename (for example, cellular3/1).

### Step 5

```
{stub <track-stub-id>}
```

(Optional) Allows an event manager environment policy to set the track object value. WANMon can set a track-stub-object value to reflect the link state so that an external applet can track the stub object.

### Step 6

```
event manager environment wanmon_if_list
{<interface name> {checkip <instance>}}
```

(Optional) Disables IP address checking.

### What to do next

#### EXAMPLES

```
event manager policy tm_wanmon.tcl authorization bypass
```

The following examples are Event Manager commands to configure cellular and Ethernet interfaces:

```
event manager environment wanmon_if_list1 {cellular3/1 {ipsla 1}}
event manager environment wanmon_if_list2 {eth2/2 {ipsla 2}}
```

This example sets custom recovery thresholds:

```
event manager environment wanmon_if_list {cellular3/1 {recovery 20 {90 75} 600}}
```

where:

- The Level 0 threshold is set to 20 minutes after the link failure trigger. Level 0 recovery actions are performed for the cellular interface. Repeats indefinitely, no more than every 10 minutes (default).
- Level 1 threshold is set to 90 minutes. Level 1 recovery actions are performed for the cellular interface. Repeats no more frequently than every 75 minutes.
- The Level 2 threshold is set to 600 minutes (10 hours).

The following sets the track-stub-object value to 21:

```
conf t
track 21 stub-object
event manager environment wanmon_if_list {cellular3/1 {ipsla 1} {stub 21}}
```

### Verifying WANMon Configuration

Use the following steps to verify your WANMon configuration.
DETAILED STEPS

Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>show event manager policy registered</td>
<td>Displays the WAN monitoring policy.</td>
</tr>
<tr>
<td>Step 2</td>
<td>show event manager environment</td>
<td>Displays the interface environment variables set during interface configuration.</td>
</tr>
</tbody>
</table>

What to do next

EXAMPLE

show event manager policy registered
1 script system multiple Off Thu Jan 16 18:44:29 2014 tm_wanmon.tcl
show event manager environment
1 wanmon_if_list {cell3/1 {ipsla 1}}

Configuration Examples

The following examples are provided:

WANMon Cellular Interface Configuration Example

```bash
track 1 ip sla 1
ip sla 1
icmp-echo 172.27.166.250
timeout 6000
frequency 300
ip sla schedule 1 life forever start-time now
event manager environment wanmon_if_list {cellular3/1 {ipsla 1}}
event manager policy tm_wanmon.tcl authorization bypass
```

Multiple WAN Link Monitoring Example

```bash
track 1 ip sla 1
track 21 stub-object
ip sla 1
icmp-echo 172.27.166.250
timeout 6000
frequency 300
ip sla schedule 1 life forever start-time now
track 2 ip sla 2
track 22 stub-object
ip sla 2
icmp-echo 10.27.16.25
timeout 6000
frequency 300
ip sla schedule 2 life forever start-time now
event manager environment wanmon_if_list1 {cellular3/1 {ipsla 1} {stub 21}}
event manager policy tm_wanmon.tcl authorization bypass
```
Related Documentation

Configuring WAN Backhaul Redundancy
Ignition Power Management

This chapter provides a description and instructions for configuration of the Ignition Power Management feature of the IR829 router. It also keeps the IR829 up and running while the vehicle is stopped. Therefore, users do not have to wait for routers to reload each time the vehicle is stopped. Ignition Power Management prevents the router from draining the charge of the battery on automotive applications.

When the engine is running, it generates energy and recharges the battery. When the ignition is turned off, the IR829 can remain operational for a pre-determined period of time. This time period is programmable between 60 to 7200 seconds (2 hours) using the IOS ignition off-timer command.

- Features of Ignition Power Management, on page 137
- Command Line Interface (CLI), on page 138
- Command Examples, on page 141
- Default Values, on page 142

Features of Ignition Power Management

The system software (IOS) tries to prevent the discharge of the battery with the following:

- Turning the router off if the vehicle has the ignition off for a period of time (programmable).
- Turning the router off if the battery voltage drops to a certain level (programmable).
- Attempting to protect the router by turning the router off if the battery voltage rises above a certain level (fixed amount of time).

The system software (IOS) logs the following events to the system log:

- When the user turns on or off the ignition management feature with CLI
- When the ignition is turned on or off
- When the ignition-off timer expires and the system goes off
- When the user enables or disables the feature through the CLI
- Tentatively logs the under-voltage and over-voltage events
Command Line Interface (CLI)

The Ignition Power Management feature of the IR800 series uses a command line interface.

Configuration CLI

The following commands are used to configure the feature.

Enable or Disable ignition power management:

```
ignition enable
[no] ignition enable
```

Ignition off timer value. After the ignition is turned off the router will stay operational for this amount of time, then it shuts down if the ignition is still off:

```
ignition off-timer <value>
```

Under-voltage threshold. If the input voltage drops to levels below this threshold, it will cause the router to shut down.

```
ignition undervoltage threshold <value>
```

Status CLI

Starting with release 15.8(3)M, the Ignition Undervoltage Threshold will display in in double decimal. There is a new cli that can be used `ignition undervoltage threshold <Volt> <mV if any>`.

The following command is used to show the status of the feature.

```
show ignition
```

The following is the expected output:

```
IR800#show ignition

Status:
  Ignition management: Disabled
  Input voltage:  0.0 V
  Ignition status:  Power on
  Shutdown timer:  0.0 s to off [will begin power down at ~100 sec]
Thresholds:
  Undervoltage:  9.000 V
  Overvoltage:  32.0 V
  Undervoltage timer:  120.0 s
  Overvoltage timer:  1.0 s
  Ignition-Off timer:  900.0 s

Set the undervoltage threshold:

```
IR800(config)#ignition undervoltage threshold ?
<9-24>  Threshold to shut the system off; value in volts

IR800(config)#ignition undervoltage threshold 10 ?
<0-999>  Enter millivolt (mV), if any
```
The old default Undervoltage value for the IR829 was set to 9 volts. Devices shipped with 15.7(3)M1 and beyond, will have Undervoltage default setting as 11.0V. However, for power-up, a minimum 11.9V [undervoltage threshold + 8%] is required. This is to account for any momentary hysteresis and frequent router power toggles in short duration.

Devices upgraded from older releases to 15.7(3)M1 or higher, this value will not change from 9.0 to 11.0V by itself. It can modified from the IOS command line as follows:

IR800#conf t
IR800#ignition undervoltage threshold 11
IR800#exit

Troubleshooting CLI

A set of CLIs are available for debugging purposes.

To turn the debug off, prepend a no prefix to the CLI command.

The commands are:

Enable debugging error conditions in the ignition management:
debug ignition errors

Enable debugging operating events in the ignition management

debug ignition events

Enable debugging state transitions in the ignition management software:

debug ignition states
IR800#debug ignition states

IR800#
*Mar 11 18:59:20.001: %IGNITION-5-IGN_DEBUG_SET: Ignition Management debugging states is turned on
*Mar 11 18:59:39.679: %IGNITION-5-IGN_TURNED_ON_OFF: The ignition is turned OFF
*Mar 11 18:59:47.065: %IGNITION: Ignition mgmt FSM: IGNITION_MGMT_STATE_PWR_ON
*Mar 11 18:59:49.527: %IGNITION-5-IGN_TURNED_ON_OFF: The ignition is turned ON

Enable all debugging conditions at once:

debug ignition all
IR800#debug all
IR800(config)#

*Mar 11 19:01:06.737: %IGNITION-5-IGN_DEBUG_SET: Ignition Management debugging all is turned on
Enter configuration commands, one per line. End with CNTL/Z.
IR800(config)# igni
IR800(config)# ignition tim
IR800(config)# ignition of
IR800(config)# ignition off-timer 800
IR800(config)#
*Mar 11 19:01:20.357: %IGNITION: handling off-time CLI
*Mar 11 19:01:23.115: %IGNITION: event set off timerdo show ignition Status:
  Ignition management: Enabled
  Input voltage: 12.2 V
  Ignition status: Power on
  Shutdown timer: 0.0 s to off
Thresholds:
  Undervoltage: 9.0 V
  Overvoltage: 32.0 V
  Undervoltage timer: 60.0 s
  Overvoltage timer: 0.5 s
  Ignition-Off timer: 800.0 s

Turn off debugging:

IR800(config)#no igni
IR800(config)#no igni
IR800(config)#no ignition of
IR800(config)#no ignition off-timer ?
<cr>
All debugging commands are cleared through a reboot of the device.

Another troubleshooting command is `show ignition register`. This displays existing register information:

```
IR800# show ignition register
```

```
*Nov 13 20:59:32.525: %SYS-5-CONFIG_I: Configured from console by console

```

---

## Command Examples

The following examples illustrate the CLI commands and the associated output expected.

<table>
<thead>
<tr>
<th>Command Examples</th>
<th>Expected Output</th>
</tr>
</thead>
</table>
| Out of box configuration with no ignition management configured. | IR800# show ignition
Status:
  Ignition management: Disabled
  Input voltage: 11.8 V
  Ignition status: Power on
  Shutdown timer: 0.0 s to off
Thresholds:
  Undervoltage: 9.0 V
  Overvoltage: 32.0 V
  Undervoltage timer: 60.0 s
  Overvoltage timer: 0.5 s
  Ignition-Off timer: 900.0 s |
Command Examples

Configure the device for ignition off timer of 60, and ignition under-voltage threshold of 12.2.

1. Turn vehicle ignition switch off.
2. ignition off-timer 60
3. ignition undervoltage threshold 12
4. ignition enable

Expected Output

IR800#show ignition

Status:
Ignition management: Enabled
Input voltage: 11.8 V
Ignition status: Timing ignition off shut down

Shut down timer: 53.0 s to off

Thresholds:
Undervoltage: 12.0 V
Overvoltage: 32.0 V
Undervoltage timer: 0.5 s
Overvoltage timer: 60.0 s

Default Values

The following default settings apply to Ignition Power Management:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Default Value</th>
<th>User Modifiable?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ignition Power Management Feature</td>
<td>Disabled</td>
<td>Yes</td>
</tr>
<tr>
<td>Ignition off timer</td>
<td>720 seconds</td>
<td>Yes</td>
</tr>
<tr>
<td>Under-Voltage threshold</td>
<td>9 Volts (up to IOS15.7(3)M)</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>11 Volts (IOS15.7(3)M1 and beyond)</td>
<td></td>
</tr>
<tr>
<td>Under-Voltage timer</td>
<td>60 seconds (up to IOS15.7(3)M)</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>120 seconds (IOS15.7(3)M1 and beyond)</td>
<td></td>
</tr>
<tr>
<td>Over-Voltage threshold</td>
<td>32 Volts</td>
<td>No</td>
</tr>
<tr>
<td>Over-Voltage timer</td>
<td>1.0 seconds</td>
<td>No</td>
</tr>
</tbody>
</table>

Note

If the device is upgraded from an IOS version below 15.7(3)M to 15.7(3)M1 or above, the threshold will not automatically change. You must manually configure “ignition under-voltage” to 11V.
Licensing and Security

This chapter provides details on the security licensing for the IR800 series. The IOS feature set is aligned with the IOT 15.x M/T release strategy. They are:

- S800IUK9-15503M – Cisco IR800 Series UNIVERSAL
- S800INPEK9-15503M – Cisco IR800 Series UNIVERSAL – NO PAYLOAD ENCRYPTION

The Software License PIDs are shown in the following table.

<table>
<thead>
<tr>
<th>Software PID</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SL-IR800-IPB-K9</td>
<td>Cisco 800 Series Industrial Routers IP Base License</td>

<td>Cisco 1530 Series Unified &amp; Autonomous 8.1 SW</td>
<td>IR829 AP803 WI-FI</td>
</tr>
</tbody>
</table>

- Licensing, on page 143
- Hardware Crypto Support, on page 144

Licensing

Licenses are installed at manufacturing. If the securityk9 technology-package is not installed, the crypto related functions will not work. See additional information under Hardware Crypto Support, on page 144

To enable the RightToUse license, perform the following:
1. Accept the EULA.
2. Enable the technology-package.
3. Reload the IR800.

**Licensing CLI**

```
IR800# show version

  platform: VPN hardware accelerator
crypto lib version: 22.0.0
mSATA SSD as Additional Storage

This section contains the following topics:

- mSATA Overview, on page 147
- IR829M SKUs, on page 147
- Using the mSATA SSD, on page 148
- Displaying the Wear Leveling Data for the mSATA SSD, on page 149
- IR829M: MIB support for mSATA Wear Ratio and Usage, on page 149
- IR829M OIDs, on page 151

mSATA Overview

Previously, IR829 IOx/Guest-OS legacy systems on which end users can host applications, came with a disk storage of 4GB to store user data. Functionality has been added to the IR829 product line with new SKUs allowing for an mSATA SSD to add 50 GB or 100 GB of available storage.

The pluggable mSATA cards are NOT hot-swappable, the device must be powered down to install or remove it. The cards are installed in the mSATA slot (formerly known as Limited Modularity slot). Additional details are available in the Cisco IR829 Industrial Integrated Services Router Hardware Installation Guide. https://www.cisco.com/c/en/us/td/docs/routers/access/800/829/hardware/install/guide/829hwinst.html

Note

The mSATA SSD is accessible only from IOx, not IOS. For IOx CLI operation, see the command set available in the following section of the Software Configuration Guide: https://www.cisco.com/c/en/us/td/docs/routers/access/800/829/software/configuration/guide/b_IR800config/b_guestos.html

Note

As with any IR800 platform, for IOx, use the Fog Director or Local Manager to install applications and access the new mSATA disk storage provided on IR829M PIDs.

IR829M SKUs

The IR829M SKUs provide the following capabilities:
• Integrated Storage and Compute for IOx Edge application
• 100GB / 50GB industrial grade mSATA SSD integrated storage for IR829
• Integrated PoE to power up to four IP devices such as IP cameras
• Single & Dual LTE WAN redundancy with high reliability
• Dual Band WiFi connectivity
• Advanced routing based on signal strength, cellular technology, etc.
• Ignition Power Management to reduce downtime
• GPS for location-based services Accelerometer and Gyroscope for vehicle/driver safety

Integrated storage has Industrial, Automotive, Railway, Marine and Military certifications

The IR829 SKUs are available in the following product IDs:
• IR829M-2LTE-EA-*K9 (Dual LTE)
  • Dual LTE IR829 with mSATA SSD connector and POE
  • US, Canada and Europe
• IR829M-LTE-EA-*K9 (Single LTE)
  • Single LTE IR829 with mSATA SSD connector and POE US, Canada and Europe

Using the mSATA SSD

Functionality-wise, there are no configuration and troubleshooting differences to the end-user in IOS or IOx, with or without mSATA. The system simply recognizes the additional storage. There are some CLI commands that will show information that pertains to the mSATA storage. Examples are show inventory, and show platform msata.

IR829# show inventory
NAME: "IR829M-2LTE-EA-EK9", DESCR: "IR829M-2LTE-EA-EK9 chassis"
PID: IR829M-2LTE-EA-EK9, VID: V01, SN: FGL214591HB
NAME: "IR800-IL-POE", DESCR: "POE module"
PID: IR800-IL-POE, VID: V01, SN: FOC21452WHT
NAME: "mSATA module", DESCR: "mSATA module 100G"
PID: IR-SSD=mSATA=100G, VID: V00, SN:
NAME: "Modem in slot 0 on Cellular1/0", DESCR: "Sierra Wireless MC7455 4G-EA"
PID: MC7455, VID: 1.0, SN: 352009080067148
NAME: "1000BASE-T SFP", DESCR: "1000BASE-T SFP"
PID: GLC-TE, VID: G3, SN: AVC193822W4
NAME: "Modem in slot 1 on Cellular0/0", DESCR: "Sierra Wireless MC7455 4G-EA"
PID: MC7455, VID: 1.0, SN: 352009080067155

In the above example, note that the IR829 PID changed to IR829M if the mSATA is available. The mSATA PID states if it is a 50GB or 100GB module. The same information is displayed using the show diag command as well.

IR829# show platform msata
SSD Lifetime:
  Lifetime Remaining: 99% -> 99% of the net disk read/write lifetime is remaining
Memory:
Displaying the Wear Leveling Data for the mSATA SSD

Feature applies to the IR829M

IOx Local Manager/ Fog Director can now display the wear leveling data for the mSATA SSD on the IR829M products.

In the IOx Local Manager, it is observed by selecting System > Storage.

From the IOS command line, you can monitor the lifetime using the show platform msata command.

The following example shows a 50G mSATA controller.

```
Router# show platform msata
SSD Lifetime:
  Lifetime Remaining: 99%
Memory:
  Size: 50G.
  Used: 49G
  Available: 932M
  Usage: 99%

After a router reload, it will take a few minutes (approximately 5) before this data will be populated again.

When the SSD lifetime reduces to 15%, 10% and 5% of the lifetime limit, errors start getting reported in syslog.

For example:

*Jan 30 19:03:00.257: %IOX-4-IOX_SSD_LIFETIME_WARN: SSD Lifetime remaining in module:15
```

IR829M: MIB support for mSATA Wear Ratio and Usage

mSATA functionality was added to the IR829 product line to add extra storage in the 15.8.3M release. The PID IR829M has mSATA support available in the device inventory detail. The following table shows the IR829M SKU with the OID:
### Table 6: mSATA OIDs

<table>
<thead>
<tr>
<th>SKU</th>
<th>OID</th>
</tr>
</thead>
<tbody>
<tr>
<td>IR829M-2LTE-EA-BK9</td>
<td>1.3.6.1.4.1.9.1.2610</td>
</tr>
<tr>
<td>IR829M-2LTE-EA-AK9</td>
<td>1.3.6.1.4.1.9.1.2610</td>
</tr>
<tr>
<td>IR829M-2LTE-EA-EK9</td>
<td>1.3.6.1.4.1.9.1.2610</td>
</tr>
<tr>
<td>IR829M-LTE-EA-AK9</td>
<td>1.3.6.1.4.1.9.1.2673</td>
</tr>
<tr>
<td>IR829M-LTE-EA-BK9</td>
<td>1.3.6.1.4.1.9.1.2673</td>
</tr>
<tr>
<td>IR829M-LTE-EA-EK9</td>
<td>1.3.6.1.4.1.9.1.2673</td>
</tr>
<tr>
<td>IR829M-LTE-LA-ZK9</td>
<td>1.3.6.1.4.1.9.1.2609</td>
</tr>
</tbody>
</table>

As part of this enhancement, SNMP support has been added for the following mSATA parameters on the IR829M:

- lifetime remaining (wear leveling)
- memory usage for the mSATA SSD

As part of this enhancement, further SNMP support has been added. There is a new OID name cevMsataWlIR829 in the existing MIB CISCO-ENTITY-VENDORTYPE-OID-MIB.my under the cevModuleCommonCards functional group.

For example:

```
cevMsataWlIR829 OBJECT IDENTIFIER ::= {cevModuleCommonCards 689} -- mSATA wear ratio and usage for IR829.
```

The entity OID value is iso.3.6.1.4.1.9.12.3.1.9.2.689

The `show platform msata` command gives information about this MIB.

### Example: Actual OID and output of SNMP get/walk on OID

```
例: 实际的OID和通过SNMP get/walk获取的OID输出

<OID> = STRING: "Lifetime Remaining: 99%, Usage: 30%"
```

### Feature Details

The following conditions must be met before performing SNMP requests on the IR829M:

- An active mSATA module must be in the IR829M router.
- Verify this using the `show platform msata` CLI.

### Feature Assumptions

- This feature is supported on the IR829M only.
- After a router reload it will take approximately 5 minutes before mSATA data will be populated again.
  Only SNMP get is allowed on OID cevMsataWlIR829 and is marked as read-only. Setting its value will not be allowed.
• Configurations to enable SNMP on IR800 are necessary for fetching MIB value.

IR829M OIDs

There are some new SNMP OIDs created for the new IR829M SKUs

Table 7: SNMP OIDs

mSATA SSD as Additional Storage

IR829M OIDs
CHAPTER 12

Client Information Signaling Protocol (CISP)

This section contains the following topics:

- Client Information Signaling Protocol (CISP), on page 153

Client Information Signaling Protocol (CISP)

Feature is new for release 15.8(3)M1 and applies to the IR829 only.

CISP is a generic protocol used by Network Edge Authentication Topology (NEAT) scenario in order to propagate client MAC addresses and VLAN information between supplicant and authenticator. CISP was already available in Cisco IOS, but is new to the IR829 platform. Complete details on this feature are available here:

Figure 14: Cisp in NEAT, on page 153 illustrates how the CISP feature works in NEAT in a simple scenario.

Figure 14: Cisp in NEAT

CISP Commands

The following commands have been added to the IR829:

- cisp enable
- show cisp [client]/[interface]/[registrations]/[summary]
- debug cisp [all]/[errors]/[events]/[packets]/[sync]
Details on the commands follow:

**cisp enable**

Used to enable the CISP protocol on Authenticator as well as on Supplicants. In config mode CISP enable cli globally enable the CISP protocol on L2 interface.

```
IR800(config)# cisp enable
```

**show cisp commands**

- In exec mode, **show cisp client** displays all the information for authorized host mac address and VLAN details.

```
IR800# show cisp clients
Authenticator Client Table:
---------------------------------  
MAC Address  VLAN Interface     
---------------------------------  
001b.0d55.21c1  200 Fa0/6        
001b.0d55.21c0  1 Fa0/6
```

- In exec mode, **show cisp registrations** displays all the details of Interface(s) with CISP registered user(s).

```
IR800# show cisp registrations
Interface(s) with CISP registered user(s):
------------------------------------------  
Fa0/6
Auth Mgr (Authenticator
```

- In exec mode, **show cisp interface <>** displays information whether the device is supplicant or authenticator, version details, and peer mode.

```
IR800# show cisp interface gigabitEthernet 1
CISP Status for interface Gi1
------------------------------  
Version: (not negotiated)    
Mode: Authenticator          
Peer Mode:                   
Auth State: Idle
```

**CISP Prerequisites**

- 802.1x Authentication is already supported on IR829.
- No support for CISP has been added to the IR809 platform, or for L3 ports on the IR829.
- Before CISP is enabled, the 802.1x authentication must be completed as both supplicant and authenticator.

**Flow Diagrams**

**Trigger of CISP Packets**

- On Successful authentication response from authenticator, it will start registration with Authenticator CISP.
- Once End host is authorized or unauthorized, it will update (Add / Delete) to the authenticator CISP.
• If Access links or trunk uplink goes up or down, it will clear off the local CISP Client. Table and the Authenticator CISP will clear its Client Table.
• If there is New MAC is learned or aged out, CISP will update on both sides.
• If there is no response to CISP request frames, it will retransmit the CISP frames.
• Authentication Switch ACKs CISP frame after completing desired action.

Host Disconnect/Power down/Logoff

• NEAT (Supplicant and Authenticator) utilizes the CISP protocol that securely transports authenticated hosts MAC addresses from a downstream Supplicant device to an upstream Authenticator device. CISP must be enabled on both ends.
• On a successful authentication response from the authenticator, it will start registration with Authenticator CISP. Once the authenticator authenticates the supplicant’s registration packet transfer between the supplicant and the authenticator. The following are examples of the CISP packet transfer after enable the debug cisp all:

Oct 15 13:51:36.707: CISP-RXPAK (Fa0/6): Code: REQUEST ID:0x22 Length: 0x001C Type: REGISTRATION
Oct 15 13:51:36.707: CISP-TXPAK (Fa0/6): Code: RESPONSE ID:0x22 Length:0x001C Type: REGISTRATION

Once the End host is authorized or unauthorized, it will update (Add / Delete) to the authenticator CISP. The following shows an example:

Oct 15 13:51:36.724: CISP-RXPAK (Fa0/6): Code: REQUEST ID:0x23 Length:0x003A Type: ADD_CLIENT
Oct 15 13:51:36.724: CISP-EVENT (Fa0/6): Adding client 001b.0d55.21c1 (vlan: 200) to authenticator list
Dot1x Supplicant Support on the L2 interface

This section contains the following topics:

- Dot1x Supplicant Support on the L2 interface, on page 157

Dot1x Supplicant Support on the L2 interface

Feature is new for release 15.8(3)M1 and applies to the IR829 only

IEEE 802.1X authentication enables the access point to gain access to a secured wired network. You can enable the access point as an 802.1X supplicant (client) on the wired network. A user name and password that are encrypted using the MD5 (IR8x9 platform supports only md5 method) algorithm can be configured to allow the access point to authenticate using 802.1X. Figure 15: Supplicant Topology, on page 157 illustrates the Supplicant Topology.

Figure 15: Supplicant Topology

Supplicant CLI Commands

IR800-suppliant(config-eap-profile)#?
  Eap profile configuration commands:
  description    Provide a description for the EAP profile
  exit           Exit EAP profiles configuration submode
  method         Add an allowed method
  no             Negate a command or set its defaults
IR800-suppliant(config-eap-profile)#method ?
  md5       EAP-MD5 method allowed

Refer to Figure 16: Workflow, on page 158 for the workflow.
Workflow details

- On networks that use IEEE 802.1X port-based network access control, a supplicant cannot gain access to the network until the 802.1X authenticator grants access. If your network uses 802.1X, you must configure 802.1X authentication information on the WAP device, so that it can supply it to the authenticator.
- Supplicant starts with EAPOL start request to the Authenticator
- In Supplicant Request Authenticator send EAP request to supplicant.
- Supplicant sends the EAP response (W/MD5 Credentials) to Authenticator
- Authenticator sends the relay request to AAA via radius to Authenticate the supplicants
- If the supplicant entry is already defined there, Radius sends accept to the Authenticator and the Supplicant port gets authorized by the authenticator
- Now the supplicant works as Authenticator for the host connected to it. The same flow happens when the host connects to the Supplicant.

Sample Configuration to Support DOT1x Supplicant on the IR829

Note: More details can be found here:

! Enable supplicant switch to authenticate devices connected
dot1x system-auth-control

! Forces the switch to send only multicast EAPOL packets when it receives either unicast or multicast packets, which allows NEAT to work on the supplicant switch in all host modes.
dot1x supplicant force-multicast
! configure EAP mode used by supplicant switch to authenticate itself to authenticator
switch eap profile EAP_PRO
  method md5

! Configure credentials use by supplicant switch during that authentication.
dot1x credentials CRED_PRO
  username bsnsswitch
  password 0 Cisco123

The connection of the supplicant to the authenticator is already configured to be a trunk port (in contrast to access port configuration on the authenticator). At this stage, this is expected; configuration will dynamically change when the ISE returns the correct attribute.

interface FastEthernet0/6
switchport trunk encapsulation dot1q
switchport mode trunk
dot1x pae supplicant
dot1x credentials CRED_PRO
dot1x supplicant eap profile EAP_PRO

Note: For support of Dot1x in IR829 dot1x code is added in IR829 for L2 interface.

IR800-suppliant# show dot1x interface gigabitEthernet 1 details
Dot1x Info for GigabitEthernet1
-----------------------------------
PAE = SUPPLICANT
StartPeriod = 30
AuthPeriod = 30
HeldPeriod = 60
MaxStart = 3
Credentials profile = CRED_PRO
EAP profile = EAP_PRO
Dot1x Supplicant Client List
-----------------------------------
Authenticator = 80e0.1d66.2ce1
  Supp SM State = AUTHENTICATED
  Supp Bend SM State = IDLE
Port Status = AUTHORIZED

Note: Dot1x supplicant on L3 interfaces is not supported.
Sample Configuration to Support DOT1x Supplicant on the IR829
Network Management Solutions

This chapter provides details and links to the various methods of managing the IR800 series.

Network Management Solutions (NMS) that are available for the IR800 series consist of the following:

- Cisco IoT Field Network Director (formerly referred to as CG-NMS), on page 161
- IR809 and IR829: PNP Image Upgrade from FND, on page 163
- Cisco Configuration Professional Express, on page 165
- Cisco Kinetic, on page 165
- Cisco Prime Infrastructure, on page 166
- Davra RuBAN, on page 166
- Cisco IoT Fog Director, on page 166

Cisco IoT Field Network Director (formerly referred to as CG-NMS)

The IR800s are supported with IOT Field Network Director which offers a single platform to manage a complete FAN solution, Raw Socket sessions management, and monitoring.
Some of the key features are:

- Geographic Information System (GIS) map-based, visualization, monitoring, troubleshooting, and alarm notifications
- Group-based configuration management for FAN routers (CGR1000, IR8x9, 819H, IR5x9 and CG-Mesh endpoints
- Rule-engine infrastructure for customizable threshold-based alarm processing and event generation
- Secure network infrastructure (inventory, rollback configuration, work order) of IR809 and IR829
- Zero Touch Provisioning - Automatically provision IR800 and head-end routers with configuration
• Collect metrics and events from FAN Routers, Head-end routers, and CG-mesh endpoints, and store them in a database. Cellular metrics and statistics for cost optimization
• Network status monitoring and diagnosis for issues. Location tracking (historical and geo-fence)
• Update firmware on groups of IR809 and IR829. IR829 AP803 (Autonomous mode only)
• North-bound integration API for transparent integration with utility head-end and operational systems, for example Outage Reporting System
• Raw Socket management and monitoring

Detailed information about the IoT Field Network Director is found at the homepage:

**IR809 and IR829: PNP Image Upgrade from FND**

When a Cisco IR8x9 is powered on for the first time, the PnP agent process running on the IOS wakes up in the absence of the startup config and attempts to discover the address of the PnP server. The PnP agent uses methods like DHCP and DNS to acquire the desired IP address of the PnP server. Upon successfully acquiring the IP address, the PnP agent initiates a long lived, bidirectional layer 3 connection with the server, and waits for a message from the server. The PnP server application sends messages to the agent requesting for information and services to be performed on the device. The PnP server application sends the required configurations and optionally IOS image to the device.

The Cisco Plug and Play Connect cloud service works with your Smart Account and the Cisco Network Plug and Play solution to provide automatic plug and play server discovery when other methods such as DHCP or DNS are not available.

For more information go to the Plug and Play Connect webpage.

**Image Installation**

Image Installation service enables a PnP-enabled device to perform an image upgrade upon receiving a request from the PnP Server. The following operations are performed in sequence to successfully load the device with the new image:

1. PnP Server (FND) initiates the upgrade.
2. PnP Device will check the version of the image to be upgraded, and determine if it is a later version than the one the device is booted up with.
3. PnP Device will make a request for copying the image.
4. PnP Device will get the image and its details from PNP agent.
5. Configure the device to load the new image on next reload.
6. Reload the device.

*Figure 17: PnP Message Flow, on page 164* illustrates the message flow for a standalone device
The PnP Agent on the device receives a request from the PnP Server, parses the XML payload, and identifies the request as an Image Upgrade request. It then creates an Image Install process, which identifies the request as a Standalone Image Install request.

Based on the fields populated, PnP Image Install will perform the following operations:

- Copy the image from the file server to a local disk. All the information about the file server, Image location, and destination is populated.
- Once the Image is copied, it needs to be configured to load next time the device reloads. For this operation, the 'boot system' CLI is configured in the startup-config.
- The device now sends a message to the PnP Server that it is undergoing a reload.

**Feature Assumptions**

- This feature is support on the IR809 and IR829 starting from Field Network Director version 4.2.
- Updated PID exists in the PnP Server for new platforms. For end-to-end PnP solution to work, the PnP-server needs to be updated for the specific PID of each new platform.
- The feature supports image upgrade for only bundle image on the IR8x9 platform.
- Upgrade starts upon a request from PnP Server Application.
- No new PnP CLIs will be added as part of this enhancement.
Cisco Configuration Professional Express

Cisco Configuration Professional Express is an embedded, device-management tool that enables bootstrap configuration and provisioning of an IR800 Series Router.

CCP Express provides you two options to bring up a brand new router. You can use the Quick Setup Wizard to perform the basic configuration tasks and Advanced Setup option for detailed configuration options. For a brand new router, Quick setup wizard is the preferred option.

*Caution:* If you log into an IR800 Series device as a one-time user with the cisco/cisco username and password, you must create another user through the UI or command line. Otherwise, the one-time user session is deleted, and your configurations are not saved. For more information, refer to the Cisco Configuration Professional Express Quick Start Guide at:[https://www.cisco.com/c/en/us/td/docs/routers/access/800/829/software/cisco_configuration_professional_express/v3_5/guides/quickstart/CiscoCPExpress-IR-3-5-qsg.html](https://www.cisco.com/c/en/us/td/docs/routers/access/800/829/software/cisco_configuration_professional_express/v3_5/guides/quickstart/CiscoCPExpress-IR-3-5-qsg.html)

For Cisco CP Express to be fully functional, you will need Cisco IOS Software Release 15.6.(3)M2. Cisco CP Express is supported on these browsers:

- Mozilla Firefox 25 or later
- Google Chrome 30 or later
- Microsoft Internet Explorer 11 or later
- Safari 9.1
- Microsoft Edge Version 38

Cisco Kinetic

Cisco Kinetic is a new class of software platform – an IoT data fabric – designed to address the challenges of a distributed environment.

Cisco Kinetic is a system of software running on distributed nodes of edge, data center and cloud. This system of software will:

- Get gateways up and running and configured
- Extract data securely and transform it into a usable format for your applications
- Set policies about which data goes where
- Execute those policies or rules – based on business logic you (the customer) have been able to set on different layers
- Provide visualization tools and dashboards with intuitive UI
- Securely move data to the right applications at the right time, based on your policies and rules
There is wealth of information available for Cisco Kinetic at: https://salesconnect.cisco.com/c/r/salesconnect/index.html#/program/PAGE-10238

Cisco Prime Infrastructure

Cisco Prime Infrastructure provides a single platform to manage an infrastructure with a broad range of static Cisco devices. It is available on the IR829 with Cisco Prime Infrastructure release 2.2 and Device Pack 7.

For detailed information on the Cisco Prime Infrastructure, refer to the following:

Readme for Device Pack 7 for Cisco Prime Infrastructure 2.2
Readme for Device Pack 4 for Cisco Prime Infrastructure 3.0

Note
Only Inventory and Configuration Archive are supported for the IR829.

Davra RuBAN

Single platform for telematics and network management. See the following for more information:

- Cisco Connected Fleet
- Digital Solutions for Cisco Connected Mass Transit
- Cisco Connected Roadways Drives Safety, Efficiency, Mobility, and Sustainability
- Quickstart guide to setting up the RuBAN Bus

Cisco IoT Fog Director

The Cisco IoT Fog Director brings together the IOx Application Management Module, the ability to Understand your IOx resources, and IOx Application Rollout.

About Cisco IOx

Cisco IOx is an application enablement platform that provides uniform and consistent hosting capabilities for various types of applications, or applications, across various Cisco platforms. This platform brings together Cisco IOS, the industry-leading networking operating system, and Linux, the leading open source platform. Linux-based applications can run on Cisco devices in the Cisco IOx framework, so using this platform, you can bring custom applications and interfaces to the network.

With Cisco IOx, developers can create a wide variety of IoT applications, such as data aggregation system and control systems.
About Cisco Fog Director

Cisco Fog Director allows administrators to manage, administer, monitor, and troubleshoot Cisco IOx applications and devices. It provides a web-based user interface from which you can perform activities that include the following:

- Install and uninstall applications
- Start and stop applications
- Upgrade applications
- View the status of applications
- Backup and restore applications data
- Monitor applications and devices and collect statistics
- Create and obtain debug logs for troubleshooting

Detailed information about the Cisco Fog Director is found at the home page:

OID and Inventory

To find out information about your model, use the show inventory oid command:

**IR829**

IR829# show inventory oid
NAME: "IR829GW-LTE-GA-EK9", DESCR: "IR829GW-LTE-GA-EK9 chassis, Hw Serial#: FGL194520VZ, Hw Revision: 2.0"
PID: IR829GW-LTE-GA-EK9, VID: V01, SN: FGL194520VZ
OID: 1.3.6.1.4.1.9.12.3.1.3.1582
NAME: "Modem 0 on Cellular0", DESCR: "Sierra Wireless MC7304 4G-GA"
