The Cisco SM-X Layer 2/3 EtherSwitch Service Modules (Cisco SM-X Layer 2/3 ESM) integrates the Layer 2 and Layer 3 switching features and provide the Cisco 2900 series and Cisco 3900 series ISRs the ability to use the Cisco SM-X Layer 2/3 ESM as an independent Layer 3 switch when running the Cisco IOS software.

The Cisco SM-X Layer 2/3 ESMs also provide a 1-Gbps connection to the multigigabit fabric (MGF) for intermodule communication without burdening your router’s CPU.

The Cisco SM-X Layer 2/3 ESMs are capable of providing up to 30 watts of power per port with the robust Power over Ethernet Plus (PoE+) feature along with IEEE 802.3ae Media Access Control Security (MACSec) port-based, hop-to-hop, encryption, and Cisco TrustSec (CTS) that work on multiple router families.

The Cisco SM-X Layer 2/3 ESM can co-exist with EtherSwitch service modules from previous releases on the host Cisco 2900 and 3900 series ISRs and these modules are capable of interoperability with each other. Support for the maximum number of service modules that can be present on the 2900 and 3900 series ISRs is dictated by the total number of service module slot count on the host router.

The following are the feature histories for the Cisco SM-X Layer 2/3 ESMs:
Contents

- Prerequisites for the Cisco SM-X Layer 2/3 ESMs, page 2
- Information About the Cisco SM-X Layer 2/3 ESMs, page 2
- How to Configure the Cisco SM-X Layer 2/3 ESM on the Router, page 7
- Upgrading the Cisco SM-X Layer 2/3 ESM Software, page 17
- Troubleshooting the Cisco SM-X Layer 2/3 ESM Software, page 24
- Related Documents, page 32

Prerequisites for the Cisco SM-X Layer 2/3 ESMs

- To view the router, Cisco IOS software release, and feature set, enter the `show version` command in privileged EXEC mode.
- To view the Cisco SM-X Layer 2/3 ESM IOS version, enter the `service-module gigabitethernet x/0 status` command in privileged EXEC mode, where X is the slot number.

Information About the Cisco SM-X Layer 2/3 ESMs

This section describes the features and some important concepts about the Cisco SM-X Layer 2/3 ESMs:

- Hardware Overview, page 3
- Software Features, page 3
- Maximum Number of Modules Supported on Each Platform
• Managing Cisco SM-X Layer 2/3 ESM Using Cisco IOS Software, page 6

Note
For a list of Switch IOS feature documentation with information on various supported features on your Cisco SM-X Layer 2/3 ESM, see the Related Documents, page 32

Maximum Number of Modules Supported on Each Platform

Table 2 shows number of modules supported on each Cisco ISR-G2 platform.

Note
The number value in Table 2 indicates the maximum number of Cisco SM-X Layer 2/3 ESMs supported on each router when no other SMs are present on the router.

Hardware Overview

Cisco SM-X Layer 2/3 ESM are modules to which you can connect devices such as Cisco IP phones, Cisco wireless access points, workstations, and other network devices such as servers, routers, and switches.

The Cisco SM-X Layer 2/3 ESMs can be deployed as backbone switches, aggregating 10BASE-T, 100BASE-T, and 1000BASE-T Ethernet traffic from other network devices.

The following Cisco SM-X Layer 2/3 ESMs are available with this release of the hardware:
• SM-X-ES3-16-P—16-port 10/100/1000 Gigabit Ethernet, PoE+, MACSec enabled Service Module, single-wide form factor
• SM-X-ES3-24-P—24-port 10/100/1000 Gigabit Ethernet, PoE+, MACSec enabled Service Module, single-wide form factor
• SM-X-ES3D-48-P—48-port, 10/100/1000 Gigabit Ethernet, 2 SFP Ports, PoE+, MACSec enabled Service Module, double-wide form factor

For complete information about the Cisco SM-X Layer 2/3 ESMs hardware, see the Connecting Cisco SM-X Layer 2/3 ESMs to the Network guide.

Software Features

The following are new features supported in 15.3(3)M release:
Cisco Trust Sec encryption

The Cisco TrustSec security architecture builds secure networks by establishing clouds of trusted network devices. Each device in the cloud is authenticated by its neighbors. Communication on the links between devices in the cloud is secured with a combination of encryption, message integrity checks, and data-path replay protection mechanisms. Cisco TrustSec also uses the device and user identification information acquired during authentication for classifying, or coloring, the packets as they enter the network. This packet classification is maintained by tagging packets on ingress to the Cisco TrustSec network so that they can be properly identified for the purpose of applying security and other policy criteria along the data path. The tag, also called the security group tag (SGT), allows the network to enforce the access control policy by enabling the endpoint device to act upon the SGT to filter traffic. See Configuring Cisco TrustSec Chapter in the Catalyst 3560 Switch Software Configuration Guide, Cisco IOS Release 15.0(2)SE and Later.

IEEE 802.1x Protocol

The IEEE 802.1x standard defines a client-server-based access control and authentication protocol that prevents clients from connecting to a LAN through publicly accessible ports unless they are authenticated. The authentication server authenticates each client connected to a port before making available any services offered by the router or the LAN.

Until the client is authenticated, IEEE 802.1x access control allows only Extensible Authentication Protocol over LAN (EAPOL), Cisco Discovery Protocol (CDP), and Spanning Tree Protocol (STP) traffic through the port to which the client is connected. After authentication, normal traffic can pass through the port. See Configuring IEEE 802.1x Port-Based Authentication Chapter in the Catalyst 3560 Switch Software Configuration Guide, Cisco IOS Release 15.0(2)SE and Later for information on configuring this feature.

Licensing and Software Activation

The Cisco SM-X Layer 2/3 ESM utilizes the Cisco licensing software activation mechanism for different levels of technology software packages. This mechanism is referred to as technology package licensing and leverages the universal technology package based licensing solution. A universal image containing all levels of a software package is loaded on your Cisco SM-X Layer 2/3 ESM.

During startup, the Cisco SM-X Layer 2/3 ESM determines the highest level of license and loads the corresponding software features.

The Cisco SM-X Layer 2/3 ESM has a right to use (RTU) license, also known as honor-based license. The RTU license on Cisco SM-X Layer 2/3 ESM supports the following three feature sets:

- LAN Base: Enterprise access Layer 2 switching features
- IP Base: Enterprise access Layer 3 switching features
- IP Services: Advanced Layer 3 switching (IPv4 and IPv6) features.
You can deploy a specific feature package by applying corresponding software activation licenses. See *Upgrading your License Using Right-To-Use Features* for more information on licensing and software activation.

**MACsec Encryption**

Media Access Control Security (MACsec) encryption is the IEEE 802.1AE standard for authenticating and encrypting packets between two MACsec-capable devices. MACsec encryption is defined in 802.1AE to provide MAC-layer encryption over wired networks by using out-of-band methods for encryption keying. The MACsec Key Agreement (MKA) Protocol provides the required session keys and manages the required encryption keys. MKA and MACsec are implemented after successful authentication using the 802.1x Extensible Authentication Protocol (EAP) framework. Only host facing links (links between network access devices and endpoint devices such as a PC or IP phone) can be secured using MACsec.

The Cisco SM-X Layer 2/3 ESM supports 802.1AE encryption with MACsec Key Agreement (MKA) on downlink ports for encryption between the module and host devices. The module also supports MACsec link layer switch-to-switch security by using Cisco TrustSec Network Device Admission Control (NDAC) and the Security Association Protocol (SAP) key exchange. Link layer security can include both packet authentication between switches and MACsec encryption between switches (encryption is optional). See *Configuring MACsec Encryption* Chapter in the *Catalyst 3560 Switch Software Configuration Guide, Cisco IOS Release 15.0(2)SE and Later* for information on configuring this feature.

**Power over Ethernet (Plus) Features**

The Cisco SM-X Layer 2/3 ESM is capable of providing power to connected Cisco pre-standard and IEEE 802.3af-compliant powered devices (PD) from Power over Ethernet (PoE)-capable ports when the switch detects that there is no power on the circuit.

The ESM supports IEEE 802.3at (PoE+), that increases the available power for PDs from 15.4W to 30 W per port. For more information, see the *Power over Ethernet Ports*. The PoE plus feature supports the cisco discovery protocol (CDP) with power consumption reporting and allows the PDs to notify the amount of power consumed. The PoE plus feature also supports the link layer discovery protocol (LLDP)

**Cisco Intelligent Power Management**

The PDs and the switch negotiate through power-negotiation CDP messages for an agreed power-consumption level. The negotiation allows a high-power Cisco PDs to operate at its highest power mode. The PoE plus feature enable automatic detection and power budgeting; the switch maintains a power budget, monitors, and tracks requests for power, and grants power only when it is available. See the *Configuring the External PoE Service Module Power Supply Mode* section in the *Catalyst 3560 Switch Software Configuration Guide, Cisco IOS Release 15.0(2)SE and Later*.

**Power Policing (Sensing)**

The power policing or power sensing feature allows you to monitor the real-time power consumption. On a per-PoE port basis, the switch senses the total power consumption, polices the power usage, and reports the power usage. For more information on this feature, see *Power Monitoring and Power Policing* section in the *Catalyst 3560 Switch Software Configuration Guide, Cisco IOS Release 15.0(2)SE and Later*.
Smart Install Support

The Cisco SM-X Layer 2/3 ESM supports the Smart Install feature. The Smart Install is a plug-and-play configuration and image-management feature that provides zero-touch deployment for new switches. You can ship a switch to a location, place it in the network and power it on with no configuration required on the device.

A network using Smart Install includes a group of networking devices, known as clients, that are served by a common Layer 3 switch or router that acts as a director. In a Smart Install network, you can use the Zero-Touch Installation process to install new access layer switches into the network without any assistance from the network administrator. The Smart Install Configuration Guide provides detailed information on configuring and using this feature.

Managing Cisco SM-X Layer 2/3 ESM Using Cisco IOS Software

This sections contains the following topics with information on configuring and managing the Cisco SM-X Layer 2/3 ESM on Cisco ISR-G2 using the Cisco IOS software:

- Using OIR to Manage the Cisco SM-X Layer 2/3 ESM, page 6
- Managing Backplane Switch Ports, page 6
- Internal Port Mapping, page 7

Using OIR to Manage the Cisco SM-X Layer 2/3 ESM

The online insertion and removal (OIR) feature allows you to insert or remove your Cisco SM-X Layer 2/3 ESM from a router. The Cisco SM-X Layer 2/3 ESM must be gracefully powered down before removing it from the router using the managed OIR or soft OIR feature. The managed OIR feature allows you to stop the power supply to your module using the `hw-module sm` command and remove a module from one of the subslots while other active modules remain installed on the router.

**Note**

If you are not planning to immediately replace a module after performing OIR, ensure that you install a blank filter plate in the subslot.

The `oir-stop` option allows you to gracefully deactivate a module and the module is rebooted when the `oir-start` option of the command is executed. The reload option will stop or deactivate a specified module and restart it. See the Shutting Down, Resetting, and Reloading the Cisco SM-X Layer 2/3 ESM for more information.

**Note**

The managed OIR feature is only supported on Cisco 3900 Series ISR.

Managing Backplane Switch Ports

When there are no legacy switch modules such as the HWIC-4ESW module in the router, a 2nd GE interface `gigabitethernet slot/1` is created for the SM. This is a Layer-2 switch interface and used to manage the inter module connectivity with other SM in the system via the backplane MGF. You can use the switchport CLIs to manage the L2 switch properties (e.g. access mode, trunk mode, native vlan etc.) for this interface. See the “Maximum Number of Modules Supported on Each Platform” section on page 3 to view a list of modules supported on each platform.
Internal Port Mapping

The Figure 1 below displays the internal port mapping for the Cisco SM-X Layer 2/3 ESM for the Cisco ISR G2. The variable “x” indicates the slot number where the Cisco SM-X-ES3-24-P, Cisco SM-X-ES3-16-P, and the SM-X-ES3D-48-P SKUs of the module are inserted on Cisco 3945 ISR G2.

![Port Mapping for Cisco SM-X Layer 2/3 ESM on Cisco ISR G2](image)

How to Configure the Cisco SM-X Layer 2/3 ESM on the Router

This section contains the following procedures:

- Accessing the CLI Through a Console Connection or Through Telnet, page 7 (required)
- Configuring the Cisco SM-X Layer 2/3 ESM in the Router, page 8
- Module-to-Module Communication, page 23
- Monitoring Real-Time Power Consumption (power sensing), page 15
- Shutting Down, Resetting, and Reloading the Cisco SM-X Layer 2/3 ESM, page 14
- Understanding Interface Types on the Cisco SM-X Layer 2/3 ESMs, page 8 (optional)

Accessing the CLI Through a Console Connection or Through Telnet

Before you can access the Cisco SM-X Layer 2/3 ESM CLI, you must connect to the host router through the router console or through Telnet. Once you are connected to the router, you must configure an IP address on the Gigabit Ethernet interface connected to the Cisco SM-X Layer 2/3 ESM. Open a session to the Cisco SM-X Layer 2/3 ESM using the `service-module gigabitethernet x/0 session` command in privileged EXEC mode on the router.

You can use one of these methods to establish a connection to the Cisco SM-X Layer 2/3 ESM:
How to Configure the Cisco SM-X Layer 2/3 ESM on the Router

Connect to the router console using Telnet or Secure Shell (SSH) and open a session to the switch using the **service-module gigabitethernet x/0 session** command in privileged EXEC mode on the router.

**Note** When connecting to the router through the console using Telnet or SSH from a client station, you must have IP connectivity from the station to the switch.

**Note** The default baud rate of the console connection is 9600.

Use any Telnet TCP/IP or encrypted SSH package from a remote management station. The internal interface must have network connectivity with the Telnet or SSH client, and the internal interface must have an enable secret password configured. After you connect through the CLI, a Telnet session, or an SSH session, the user EXEC prompt appears on the management station.

The Cisco SM-X Layer 2/3 ESM or switch supports up to 5 simultaneous secure SSH sessions and up to 16 simultaneous Telnet sessions. Changes made by one Telnet user are reflected in all other Telnet sessions.

You can use the following configuration examples to establish a connection:

- To configure an IP address and subnet mask for Gigabit Ethernet interface (gigabitethernet 1/0) on the router, use the following command:

  ```
  Router(config)#interface gigabitethernet 1/0
  Router(config-if)#ip address 10.1.1.111 255.255.255.252
  Router(config-if)#no shutdown
  ```

- To open a session from the router to the Cisco SM-X Layer 2/3 ESM, use the following command:

  ```
  Router#service-module gigabitethernet1/0 session
  ```

### Understanding Interface Types on the Cisco SM-X Layer 2/3 ESMs

This section describes the different types of interfaces supported by the Cisco SM-X Layer 2/3 ESM with references to chapters that contain more detailed information about configuring these interface types.

The Cisco SM-X Layer 2/3 ESM supports the following interface types:

- Gigabit Ethernet interfaces
- VLAN switched virtual interface (SVI)

### Configuring the Cisco SM-X Layer 2/3 ESM in the Router

This section describes how to perform the initial configuration on the router with a Cisco SM-X Layer 2/3 ESM installed. This section also describes the initial configuration on the Cisco SM-X Layer 2/3 ESM itself. Once an IP address has been configured on the Gigabit Ethernet interface on the router (representing the Cisco SM-X Layer 2/3 ESM), you can open a console session to the Cisco SM-X Layer 2/3 ESM and configure its Gigabit Ethernet interface for Layer 2 or Layer 3 features.

Once the Cisco SM-X Layer 2/3 ESM interface has been configured and you boot up the service module image, you can switch back and forth between the router and the service module.
During auto boot loader operation, you are not presented with the boot loader command-line prompt. You gain access to the boot loader command line if the switch is set to boot manually or, if a corrupted Cisco IOS image is loaded. You can also access the boot loader if you have lost or forgotten the switch password.

Note

Step 9 and 10 are not required in releases prior to Release 15.5(03)M06.

SUMMARY STEPS

1. dir flash:
2. boot flash:image-name
3. enable
4. show running interface
5. configure terminal
6. interface gigabitethernet slot/port
7. ip address ip address/subnet mask
8. no shutdown
9. line tty line number
10. transport input all
11. end
12. service-module interface slot/port session
13. enable
14. show ip interface brief
15. control+shift+6 x
16. disconnect
17. service-module gigabitethernet slot/port status
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> dir flash:</td>
<td>Displays a list of all files and directories in router flash memory.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>rommon&gt; dir flash:</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2** boot flash:image-name | Boots the router image that supports the Cisco SM-X Layer 2/3 ESM.        |
| **Example:**                 |                                                                          |
| rommon> boot flash:c3900-universalk9-mz | Enter no when prompted to enter the initial configuration dialog and then press Enter. |

| **Step 3** enable          | Enters privileged EXEC mode.                                             |
| **Example:**               |                                                                          |
| Router> enable             |                                                                          |

| **Step 4** show running interface | Displays the running interface of the router, which should have a Gigabit Ethernet interface representing the Cisco SM-X Layer 2/3 ESM. |
| **Example:**                  |                                                                          |
| Router# show running interface gigabitethernet1/0 |                                                                          |

| **Step 5** configure terminal | Enters global configuration mode.                                          |
| **Example:**                  |                                                                          |
| Router# configure terminal    |                                                                          |

| **Step 6** interface gigabitethernet slot/port | Enters interface configuration mode and specifies an interface for configuration. |
| **Example:**                               |                                                                          |
| Router(config)# interface gigabitethernet1/0 |                                                                          |

| **Step 7** ip address ip address/subnet mask | Configures an IP address and subnet mask on this Gigabit Ethernet interface. |
| **Example:**                                |                                                                          |
| Router(config-if)# ip address 20.0.0.1 255.255.255.0 |                                                                          |

| **Step 8** no shutdown | Enables the service module port.                                       |
| **Example:**           |                                                                          |
| Router(config-if)# no shutdown |                                                                          |
## How to Configure the Cisco SM-X Layer 2/3 ESM on the Router

Switch#
Shutting Down, Resetting, and Reloading the Cisco SM-X Layer 2/3 ESM

This section describes how to shut down, reset, and reload a Cisco SM-X Layer 2/3 ESM after it has been installed.

**SUMMARY STEPS**

1. `service-module gigabitethernet slot/port shutdown`
2. `service-module gigabitethernet slot/port reset`
3. `service-module gigabitethernet slot/port reload`

**Note**
The argument `slot` indicates the number of the router chassis slot for the service module. The argument `unit` indicates the number of the daughter card on the service module. For Cisco SM-X Layer 2/3 ESMs, always use 0.

**DETAILED STEPS**

**Command or Action**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 <code>service-module gigabitethernet slot/port shutdown</code></td>
<td>Performs a graceful halt of the Cisco SM-X Layer 2/3 ESM operating system. Use the <code>service-module reset</code> command to power up the service module again.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router# <code>service-module gigabitethernet1/0 shutdown</code></td>
<td>Note Use the <code>hw-module slot / port oir-stop</code> command when removing or replacing a hot-swappable Cisco SM-X Layer 2/3 ESM during online insertion and removal (OIR).</td>
</tr>
<tr>
<td>Step 2 <code>service-module gigabitethernet slot/port reset</code></td>
<td>Performs a hardware reset of the Cisco SM-X Layer 2/3 ESM.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router# <code>service-module gigabitethernet1/0 reset</code></td>
<td></td>
</tr>
<tr>
<td>Step 3 <code>service-module gigabitethernet slot/port reload</code></td>
<td>Performs a graceful halt and reload of the Cisco SM-X Layer 2/3 ESM operating system. The configuration of the switch is saved before reload.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router# <code>service-module gigabitethernet1/0 reload</code></td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

This section provides the following examples:

- Sample Output for the `service-module gigabitethernet shutdown` Command, page 14
- Sample Output for the `service-module gigabitethernet reset` Command, page 15
- Sample Output for the `service-module gigabitethernet reload` Command, page 15

**Sample Output for the `service-module gigabitethernet shutdown` Command**

The following example shows what appears when you enter the `service-module gigabitethernet slot/port shutdown` command:

`Router# service-module gigabitethernet1/0 shutdown`
Shutdown is used for Online removal of Service Module.
Do you want to proceed with shutdown?[confirm]
Use service-module reset command to recover from shutdown.

**Note**
At the confirmation prompt, press **Enter** to confirm the action or **n** to cancel.

**Sample Output for the service-module gigabitethernet reset Command**
The following example shows what appears when you enter the `service-module gigabitethernet slot/port reset` command:

```
Router# service-module g3/0 reset
Use reset only to recover from shutdown or failed state
Warning: May lose data on the NVRAM, nonvolatile file system or unsaved configuration!
Do you want to reset?[confirm]
```

**Note**
At the confirmation prompt, press **Enter** to confirm the action or **n** to cancel.

**Sample Output for the service-module gigabitethernet reload Command**
The following example shows what appears when you enter the `service-module gigabitethernet slot/port reload` command:

```
Router# service-module gigabitethernet1/0 reload
Do you want to proceed with reload?[confirm]
```

**Note**
At the confirmation prompt, press **Enter** to confirm the action or **n** to cancel.

---

**Monitoring Real-Time Power Consumption (power sensing)**

Cisco SM-X Layer 2/3 ESMs’ hardware allows the ESM to accurately monitor the real-time power consumption on each port by measuring the port current as well as the voltage while the powered devices such as IP phones and wireless access points are powered up.

If a powered device is misbehaving by consuming more power than the actual configured value, you can take an appropriate ‘action’ by enabling the power policing or sensing feature on a port using the `power inline (config-if)` command. The ‘action’ is either “logging a warning message” (also knows as lax policing) or shutting down a misbehaving port (strict policing). The ESM constantly monitors the power drawn by the powered devices and takes appropriate action on misbehaving ports. You can monitor the power drawn by the powered devices through `show power inline` CLI.

You can monitor the power drawn at the router level through `show power inline` command on the Cisco ISR-G2 routers. To monitor port-level power consumption use the `show power inline` command on the Cisco SM-X Layer 2/3 ESM in Exec mode.

When power policing is enabled on a port, you can pick a cutoff power value of “x” watts per port and choose an ‘action’ to be taken on the misbehaving ports. Power policing is disabled by default on all ports.

**Note**
You must take the cable loss into consideration when configuring the power monitoring or power policing value for a given port of the switch. There might be some cable loss while configuring power cutoff value at the PSE. The switch can only police the power drawn at the PSE RJ45 port and not the actual power consumed by the powered device.
Restrictions

- Because the switch can only monitor the power drawn at the PSE RJ45 port and not what the PD actually consumes, you must plan for the worst case cable loss when configuring the power cutoff value.
- When power drawn by the power devices exceeds the maximum limit after a period of 1 second or more, the system considers the ports as, “misbehaving ports” and shuts down the power supply.

SUMMARY STEPS

1. `interface gigabitethernet 0/x`
2. `power inline max max-wattage`
3. `power inline police action action`
4. `exit`

Detailed Steps

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enters privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>Switch&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>Switch# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> <code>interface gigabitethernet 0/x</code></td>
<td>Enter interface configuration mode and places you at the GigabitEthernet 0/24 interface.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>Switch(config)# interface gigabitethernet 0/24</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> <code>power inline max max-wattage</code></td>
<td>Specifies the cut off power value for a port.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>Switch(config-if)# power inline max 4000</code></td>
<td>- <strong>max max-wattage</strong>—Limits the power allowed on the port. The range is 4000 to 30000 mW. If no value is specified, the maximum is allowed.</td>
</tr>
<tr>
<td><strong>Step 5</strong> <code>power inline police action action</code></td>
<td>Enables the ESM to generate a syslog message while still providing power to the device.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>Switch(config-if)# power inline police action action</code></td>
<td>- <strong>action action</strong>—Specifies an action. For example, a log message or a warning message to avoid flooding of event log or even shutting down the port.</td>
</tr>
<tr>
<td><strong>Step 6</strong> <code>exit</code></td>
<td>Exits the interface configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>Switch(config-if)# exit</code></td>
<td></td>
</tr>
</tbody>
</table>

Example
Upgrading the Cisco SM-X Layer 2/3 ESM Software

You can copy the switch image to the ESM flash by following one of the two methods listed below:

- Establish connectivity from your ESM’s front panel port to the TFTP server where the desired switch Cisco.com image is stored
- Copy the switch image (available on Cisco.com) to the router’s flash and copy this image to ESM flash through TFTP.

Copying Switch Image Directly to ESM flash Through TFTP Server

This section describes how to copy a switch image directly to the ESM flash through the TFTP server.
## SUMMARY STEPS

1. enable
2. configure terminal
3. interface gigabitethernet 0/x
4. no switchport
5. ip address ip address/subnet mask
6. no shutdown
7. end
8. show run interface gigabitethernet 0/x
9. ping tftp-server-ip-address
10. dir flash:
11. copy tftp: flash:

## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enters privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch&gt; enable</td>
<td></td>

<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> interface gigabitethernet 0/x</td>
<td>Enter interface configuration mode and places you at the GigabitEthernet 0/24 interface.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch(config)# interface gigabitethernet 0/24</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> no switchport</td>
<td>Enables the routed port.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch(config-if)# no switchport</td>
<td></td>
</tr>
<tr>
<td><strong>Note</strong> The no switchport command is only available on the SM-X Layer3 ESMs.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> ip address ip address/subnet mask 192.1.10.200 255.255.255.240</td>
<td>Sets a primary or secondary IP address for this interface.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch(config-if)# ip address 192.1.10.200 255.255.255.240</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> no shutdown</td>
<td>Enables the port that is connected to the TFTP server.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch(config-if)# no shutdown</td>
<td></td>
</tr>
</tbody>
</table>
**Examples**

This section provides the following examples:

**Sample Output for the show run interface gigabitethernet Command**

The following example shows what appears when you enter the `show run interface gigabitethernet` command:

```
Switch# show run interface gigabitethernet 0/24
Building configuration...
Current configuration : 87 bytes
!
interface GigabitEthernet0/24
no switchport
ip address 172.16.1.100 255.255.255.0
end
```

**Sample Output for the ping tftpserver Command**

The following example shows what appears when you enter the `ping ip address` command:

```
Switch# ping 172.16.1.100
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 172.16.1.100, timeout is 2 seconds:
!!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/2/9 ms
```

Copy the image from the tftp server to the switch flash using standard tftp copy procedure.
Sample Output for the show flash: Command

The following example shows what appears when you enter the `dir flash:` command:

```
Switch# dir flash:

Directory of flash:/

2 -rwx 2998 Mar 3 1993 19:26:15 +00:00 express_setup.debug

88735744 bytes total (67715072 bytes free)
Switch#
```

Sample Output for the copy tftp: flash: Command

The following example shows what appears when you enter the `copy tftp: flash:` command:

```
Switch# copy tftp: flash:

Address or name of remote host []? 172.16.1.100
Source filename []? ciscouser/c3560e-universalk9-mz
Destination filename [c3560e-universalk9-mz]? 
Accessing tftp://172.16.1.100/ciscouser/c3560e-universalk9-mz...
Loading ciscouser/c3560e-universalk9-mz from 172.16.1.100 (via GigabitEthernet0/1): !!!!!!

[OK - 20291584 bytes]

20291584 bytes copied in 113.170 secs (179302 bytes/sec)
Switch#
```
Copying Switch Image to ESM Flash Through Host Router

This section describes how to copy the switch image to the ESM flash through the host router.

Summary Steps

1. copy tftp: flash:
2. config terminal
3. tftp-server flash: switch-image
4. interface gigabitethernet slot/port
5. ip address ip address/subnet mask
6. no shutdown
7. end
8. service-module gigabitethernet slot/port session
9. config terminal
10. interface gigabitethernet slot/port
11. ip address ip address/subnet mask
12. copy tftp: flash:
### Detailed Steps

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Copies an image from a TFTP server to flash memory.</td>
</tr>
<tr>
<td><code>copy tftp: flash:</code></td>
<td></td>

<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><code>config terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch#config terminal</td>
</tr>
<tr>
<td><strong>Step 10</strong></td>
<td>Enters interface configuration mode and specifies an interface for configuration.</td>
</tr>
<tr>
<td><code>interface gigabitethernet 0/26</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config)#interface gigabitether 0/26</td>
</tr>
</tbody>
</table>
Module-to-Module Communication

Cisco SM-X Layer 2/3 ESM can directly communicate with any module connected to the backplane switch of the router bypassing the router host CPU, thus, increasing the CPU performance and reducing the CPU processing. The additional GE connection with the router backplane switch designated as GigabitEthernet X/1 port where X is the slot number. This port can be access port or a trunk port.

Example:
Following is an example of the configuration assuming a 16 port module is configured in slot 1 and a 24 port module in slot 2:

Configuration on the router:
```bash
interface gigabitethernet 1/1
  switchport access vlan 10
!
interface gigabitethernet 2/1
  switchport access vlan 10
```

Configuration on the 16 port SM-X module in slot 1:
```bash
interface gigabitethernet 0/17
  switchport access vlan 10
!
```

Configuration on the 24 port SM-X module in slot 2:
```bash
interface gigabitethernet 0/25
  switchport access vlan 10
```

You can apply the trunk port configurations if the port needs to be a trunk port.
Troubleshooting the Cisco SM-X Layer 2/3 ESM Software

This section describes how to troubleshoot the Cisco SM-X Layer 2/3 ESM:

- Recovering from a Corrupted Software Image Using Recovery Image, page 24
- Recovering from a Lost or Forgotten Password, page 25
- Recovering from a Lost or Forgotten Password When Password Recovery Is Disabled, page 27

Recovering from a Corrupted Software Image Using Recovery Image

This section describes how to recover from a corrupted software image by using a recovery image.

The router should have the switch image in the router flash memory or have network connectivity to the TFTP server.

The Cisco SM-X Layer 2/3 EtherSwitch Service Module software can get corrupted when downloading a wrong file during the software upgrade process and when the image is invalid or even when there is no image available.

The load_recovery CLI allows you to recover from a corrupted software image, an invalid image or no image on the flash of the module.

The load_recovery command boots the ESM with an IOS image (recovery image). Once the ESM is booted, desired Cisco.com switch image can be copied to the ESM flash through TFTP from the router’s flash or through the ESM front panel switch ports.

Copying a Cisco.com switch image to the ESM flash through ESM front panel switch ports only works when there is a connectivity established to the TFTP servers from the front panel ports of your ESM.

The router should have the ESM image in the router flash memory or the ESM should have network connectivity to TFTP server through its front panel ports.

We recommend that you continue all network operations using the new image and not the recovery image.

To start the load recovery process, issue the load_recovery command in bootloader prompt. After you issue the load_recovery command, the following message appears:

```
switch: load_recovery
Loading "rs:/c3560e-universalk9-mz.recovery_04302013"...Verifying image
rs:/c3560e-universalk9-mz.recovery_04302013

Image passed digital signature verification

File "rs:/c3560e-universalk9-mz.recovery_04302013" uncompressed and installed, entry point: 0x3000
executing...
```

Restricted Rights Legend

Use, duplication, or disclosure by the Government is subject to restrictions as set forth in subparagraph (c) of the Commercial Computer Software - Restricted Rights clause at FAR sec. 52.227-19 and subparagraph (c) (1) (ii) of the Rights in Technical Data and Computer Software clause at DFARS sec. 252.227-7013.
Recovering from a Lost or Forgotten Password

This section shows how to recover from a lost or forgotten password.

The default configuration for the Cisco SM-X Layer 2/3 ESM allows an end user to recover from a lost password by entering a new password.

During auto boot loader operation, you are not presented with the boot loader command-line prompt. You gain access to the boot loader command line if the switch is set to manually boot or, if an error occurs, the operating system (a corrupted Cisco IOS image) is loaded. You can also access the boot loader if you have lost or forgotten the switch password.

Note

The default configuration for Cisco SM-X Layer 2/3 ESMs allows an end user to recover from a lost password. The password recovery disable feature allows the system administrator to protect access to the switch password by disabling part of this functionality and allowing the user to interrupt the boot process only by agreeing to set the system back to the default configuration. With password recovery disabled, the user can still interrupt the boot process and change the password, but the configuration file (config.text) and the VLAN database file (vlan.dat) are deleted.

Prerequisites

This recovery procedure requires you to have physical access to the service module.

SUMMARY STEPS

1. service-module interface slot/port password-reset
2. flash_init
3. rename
4. boot
5. copy flash:
6. configure terminal
7. enable secret password
8. exit
9. copy running-configuration startup-configuration
10. reload

Now you can upgrade to a new switch image, see the Upgrading the Cisco SM-X Layer 2/3 ESM Software, page 17.
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables password recovery.</td>
</tr>
<tr>
<td><code>service-module interface slot/port password-reset</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router# service-module gigabitethernet1/0 password-reset</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Initializes the flash memory file system.</td>
</tr>
<tr>
<td><code>flash_init</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>switch: flash_init</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Renames the configuration file to config.text.old.</td>
</tr>
<tr>
<td><code>rename</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>switch: rename flash:config.text flash:config.text.old</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Use the boot command to boot up an external process.</td>
</tr>
<tr>
<td><code>boot [-x] [-v] [device:][imagename]</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>switch: boot</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Copies the configuration file into memory.</td>
</tr>
<tr>
<td><code>copy flash:</code></td>
<td></td>
</tr>

<td></td>
</tr>
<tr>
<td>Switch# copy flash:config.text system:running-config</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>Sets the password.</td>
</tr>
<tr>
<td><code>enable secret password</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# enable secret 5 $1$LiBw$0Xc1wyT.PXPkuhPwgyhV10</td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>Returns you to privileged EXEC mode.</td>
</tr>
<tr>
<td><code>exit</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# exit</td>
<td></td>
</tr>
</tbody>
</table>
Recovering from a Lost or Forgotten Password When Password Recovery Is Disabled

When password recovery is disabled, access to the boot loader prompt through the password-recovery mechanism is disallowed even though the password-recovery mechanism has been triggered. If you agree to let the system be reset to the default system configuration, access to the boot loader prompt is then allowed, and you can set the environment variables.

SUMMARY STEPS

1. `service-module interface slot/port password-reset`
2. `service-module interface slot/port session`
3. `dir flash:`
4. `boot`
5. `enable`
6. `configure terminal`
7. `enable secret password`
8. `exit`
9. `copy running-configuration startup-configuration`
10. `reload`
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> service-module interface slot/port password-reset</td>
<td>Resets the password on the router.</td>
</tr>
</tbody>
</table>

**Example:**
```
Router# service-module gigabitethernet1/0 password-reset
```

**Step 2** service-module interface slot/port session | Connects to the service module and opens a service module session. |

**Example:**
```
Router# service-module gigabitethernet 1/0 session
```

- Entering **no** leaves the current configuration file intact, so you can rename it.
- Entering **yes** deletes the configuration file.

**Note** This configuration can only be done if the `service-module session` command is entered within 50 seconds after entering the `service-module password-reset` command.

**Step 3** dir flash: | Displays a list of all files and directories in flash memory on the service module. |

**Example:**
```
switch: dir flash:
```

**Step 4** boot | Boots the system. |

**Example:**
```
switch: boot
```

**Step 5** enable | Enters privileged EXEC mode from the service module prompt. |

**Example:**
```
Switch> enable
```

**Step 6** configure terminal | Enters global configuration mode. |

**Example:**
```
Switch# configure terminal
```

**Step 7** enable secret password | Changes the password. |

**Example:**
```
Switch(config)# enable secret 5 81SliBwQXc1wY.PXKuhFwqyHVI0
```

- The secret password can be from 1 to 25 alphanumeric characters.
- It can start with a number.
- It is case sensitive.
- It allows spaces but ignores leading spaces.

**Step 8** exit | Returns you to privileged EXEC mode. |

**Example:**
```
Switch(config)# exit
```
### Step 9: copy running-configuration startup-configuration

**Example:**
```
Switch# copy running-config startup-config
```

Copies the configuration from the running configuration file to the switch startup configuration file.

- This procedure is likely to leave your Cisco SM-X Layer 2/3 ESM virtual interface in a shut down state.
- You can see which interface is in this state by entering the `show running-configuration` privileged EXEC command.
- To reenable the interface, enter the `interface vlan vlan-id` global configuration command, and specify the VLAN ID of the shut down interface. With the Cisco SM-X Layer 2/3 ESM in interface configuration mode, enter the `no shutdown` command.

### Step 10: reload

**Example:**
```
Switch# reload
```

Reloads the switch.

**Note** This does not set the environment variables if the switch is set to auto boot.
Example

Sample Output for Recovering from a Lost or Forgotten Password When Password Recovery is Disabled

Switch#conf t
Switch(config)#no service password-recovery
Switch(config)#end

...done Initializing Flash.
The password-recovery mechanism has been triggered, but is currently disabled. Access to the boot loader prompt through the password-recovery mechanism is disallowed at this point. However, if you agree to let the system be reset back to the default system configuration, access to the boot loader prompt can still be allowed.

Would you like to reset the system back to the default configuration (y/n)? y

The system has been interrupted, and the config file has been deleted. The following command will finish loading the operating system software:

   boot

switch: boot
Loading "flash:c3560e-universalk9-mz"...Verifying image flash:c3560e-universalk9-mz

<omitted non relevant boot logs>

--- System Configuration Dialog ---

Enable secret warning
-------------------------------
In order to access the device manager, an enable secret is required
If you enter the initial configuration dialog, you will be prompted for the enable secret
If you choose not to enter the initial configuration dialog, or if you exit setup without setting the enable secret,
please set an enable secret using the following CLI in configuration mode:
   enable secret 0 <cleartext password>
-------------------------------
Would you like to enter the initial configuration dialog? [yes/no]: % Please answer 'yes' or 'no'.
Would you like to enter the initial configuration dialog? [yes/no]: no
