Preface

From Release 6.1.2 onwards, Cisco introduces support for the 64-bit Linux-based IOS XR operating system. Extensive feature parity is maintained between the 32-bit and 64-bit environments. Unless explicitly marked otherwise, the contents of this document are applicable for both the environments. For more details on Cisco IOS XR 64 bit, refer to the Release Notes for Cisco ASR 9000 Series Routers, Release 6.1.2 document.

This guide describes the System Management configuration details for Cisco IOS XR software. This chapter contains details on the changes made to this document.

• Changes to This Document, on page xvii
• Communications, Services, and Additional Information, on page xvii

Changes to This Document

This table lists the changes made to this document since it was first released.

Configuring Profiles

Your router caters to different market segments on the service provider edge space. Your router is capable of supporting a wide range of market segments and features, but to make the software more efficient, you must configure the appropriate profiles to achieve the results you require.

- Different customers have different network architectures, and this puts different scale demands on the router. By configuring the scale profile, you can configure your router to accommodate your needs.

- The software supports a wide range of features. To optimize performance, each feature profile enables a subset of the total available features for a release. You must configure the appropriate profile to enable the features that you require.

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.9.1</td>
<td>The scale profile was introduced</td>
</tr>
</tbody>
</table>
| Release 4.0.1 | The scale profile configuration was moved to admin mode.  
                | The feature profile was introduced.                |

This model contains the following topics:
- Restrictions of Scale Profiles, on page 3
- Information About Profiles, on page 4
- Configure iTCAM profile, on page 5
- How to Configure Profiles, on page 7
- Additional References, on page 12

Restrictions of Scale Profiles

Video monitoring is not supported with the L3XL scale profile.
Information About Profiles

Information About Scale Profiles

A scale profile is a user-configurable setting that tunes the router to perform more efficiently depending on how the router is being used. You should configure a scale profile before deploying the router to production use.

Your router can be used for different market segments on the service provider edge space. Because different customers have different network architectures, which can place different scale demands on the router, it is important to configure the scale profile so that your router works as efficiently as possible within the architecture that you are using.

Possible scenarios that are taken into account by the scale profile are:

- Use of the router as a Layer 2 transport device, thus requiring the support of high Layer 2 scale numbers.
- Use of the router primarily as a Layer 3 box that provides Layer 3 virtual private network (VPN) services, thus requiring the support of a high number of Layer 3 routes.

There are three scale profiles available on your router:

- The **default scale profile** that supports deployments that require large Layer 2 MAC tables (up to 512,000 entries) and a relatively small number of Layer 3 routes (less than 512,000).
- The **Layer 3 scale profile** that supports deployments that require more Layer 3 routes (up to 1 million) and smaller Layer 2 MAC tables (less than 128,000 entries).
- The **Layer 3 XL scale profile** that supports deployments that require a very large number of Layer 3 routes (up to 1.3 million) and minimal Layer 2 functionality. Note that the support for up to 1.3 million routes is split into IPv4 scaled support and IPv4/IPv6 scaled support. You can configure up to 1.3 million IPv4 routes, or up to 1 million IPv4 routes with 128,000 IPv6 routes. The layer 3 XL scale profile does not support video monitoring.

You can increase the memory available for BGP by configuring the Layer 3 XL profile on the Cisco ASR9000 Series Router using the `hw-module profile scale l3xl` command. However, this reduces the memory available for some other processes. To activate the new profile, you need to manually reboot the system.

The memory for BGP and the other processes can be verified by using the following commands before and after the configuration:

- `show processes memory detail`
- `show bgp process performance-statistics | include RLIMIT`: This command is available only from Cisco IOS-XR release 6.1.x onwards.

Information About Feature Profiles

To allow sufficient computation capabilities within the router, the available features within the Cisco IOS XR software image are bundled. A feature profile determines which bundle of features is available for you to use.
Although you can always configure a feature, if the feature is not supported by the active feature profile, you cannot use it.

There are two feature profiles available on your router:

- The default profile that supports all Cisco IOS XR software features except for IEEE 802.1ah provider backbone bridge (PBB).
- The Layer 2 profile that supports all Cisco IOS XR software features including IEEE 802.1ah PBB, but does not support IPv6, reverse-path forwarding (RPF) or netflow.

If the feature profile that you have configured on your router does not support a feature that you have configured, warning messages are displayed on the console, and the feature does not work. A configured feature profile takes affect only after you reload all the line cards on the router.

### Relationship Between Scale and Feature Profiles

Although you are not limited in your selection of scale and feature profiles in relation to each other, Cisco recommends using the scale and feature profiles together as indicated here:

<table>
<thead>
<tr>
<th>Layer 2 Feature Profile</th>
<th>Default Feature Profile</th>
</tr>
</thead>
<tbody>
<tr>
<td>PBB</td>
<td>Up to 512 K Layer 3 CEF(^1) scale</td>
</tr>
<tr>
<td>Not recommended</td>
<td>Up to 1.0 M Layer 3 CEF scale</td>
</tr>
<tr>
<td>Not recommended</td>
<td>Less than 128 K MAC entries</td>
</tr>
<tr>
<td>Not recommended</td>
<td>Up to 1.3 M Layer 3 CEF scale</td>
</tr>
</tbody>
</table>

\(^1\) Cisco Express Forwarding
\(^2\) provider backbone bridge

Other pairs are not recommended. Note that the Layer 3 XL scale profile does not support video monitoring.

### Configure iTCAM profile

Both A99-12X100GE and A99-4X100GE line cards have an internal TCAM of 5MB. You can recarve internal TCAM partition at a Global Configuration level to increase entries on the L2 table and V6 table. Recarving of the TCAM partition helps in the optimal and efficient utilisation of the available memory.

<table>
<thead>
<tr>
<th>Recarving iTCAM profile</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Limits</td>
</tr>
<tr>
<td>1K entries for L2</td>
</tr>
<tr>
<td>24K limit for V4 entries</td>
</tr>
<tr>
<td>1.75K limit for V6 entries</td>
</tr>
<tr>
<td>Recarving Limits</td>
</tr>
<tr>
<td>4K entries for L2 table</td>
</tr>
<tr>
<td>Adjusted as required for V4 table</td>
</tr>
<tr>
<td>3.25L entries for V6 table</td>
</tr>
</tbody>
</table>
Restrictions

- This configuration is supported only on A99-12X100GE and A99-4X100GE line cards.
- For 32-bit IOS-XR, perform this configuration in the Admin Configuration mode.
- For 64-bit IOS-XR perform this configuration in the Global Configuration mode.
- Unless you reload the line cards after the configuration of iTCAM profile on the linecards, the configuration does not take effect.

Configuration Example

To configure iTCAM profile of linecards, use the following steps:

1. Enter the Administration Configuration mode.
2. Configure iTCAM profile of line cards as to-profile-se1 to recarve TCAM partition of line cards and change the entries to accommodate more L2 or V6 entries in the L2 table and V6 table.

   If you configure the iTCAM profile as to-default, it enables default TCAM entries present in the linecards.

3. Reload the A99-12X100GE and A99-4X100GE line card line cards in the chassis.

Configuration

/* Enter the Administration Configuration mode and configure iTCAM profile on an interface for line cards as to-profile-se1 or to-default. */
Router(admin-config)# hw-module profile itcam to-profile-se1 location 0/0/CPU0
Sun Mar  3 07:44:23.066 UTC
In order to activate this new internal tcam partition profile, you must manually reload the line card.
Router(admin-config)# commit
/* Reload the entire router or all the line cards in the chassis. */

Verification

To verify the increase in the limits of L2 and V6 entries in the L2 table and V6 table for line cards on an interface, use the show prm server tcam summary all all detail location command. In the output, you can see that L2 entries have increased to 4K in the L2 table, V4 entries have reduced to 1.5K in the V4 table, and V6 entries have increased to 3.5K in the V6 table.

Router# show prm server tcam summary all all detail np3 location 0/0/CPU0
Wed Mar 13 21:37:43.743 UTC

Node: 0/0/CPU0:
----------------------------------------------------------------
TCAM summary for NP3:

TCAM Logical Table: TCAM_LT_L2 (1)
  Partition ID: 0, valid entries: 2, free entries: 22
  Partition ID: 1, valid entries: 0, free entries: 24
  Partition ID: 2, valid entries: 0, free entries: 24
  Partition ID: 3, valid entries: 0, free entries: 2012.
Configure Profiles

Configuring the Scale Profile

Before you deploy your router, you should configure the scale profile to make the system most efficient for your specific network architecture.

Before you begin

In general, the route switch processor (RSP) with 6 GB of memory is capable of loading 1.3 million IPv4 routes. For large scale routes like 4 million, 12 GB of memory is required.

The RSP440 supports 1.3 million IPv4 routes with the default memory.
The scale profile should be configured in the administration configuration. If you previously configured the L3 scale profile in the global configuration, the following limitations apply:

- If the scale profile is set only in the global configuration, the setting takes affect.
- Scale profile settings in the administration configuration override scale profile settings in the global configuration.
- Cisco recommends that you configure all scale profile settings in the administration configuration and remove the global configuration settings. For more information, refer to Removing the Scale Profile from the Global Configuration, on page 11.

### SUMMARY STEPS

1. admin
2. configure
3. hw-module profile scale {default | l3 | l3xl}
4. commit
5. reload location all
6. show running-config
7. show hw-module profile

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> admin</td>
<td>Enters administration EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>admin</td>
<td></td>
</tr>
<tr>
<td>RP/0/RSP0/CPU0:router# admin</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2** configure | Enters administration configuration mode. |
| **Example:**         |         |
| configure            |         |
| RP/0/RSP0/CPU0:router(config)# configure |         |

| **Step 3** hw-module profile scale {default | l3 | l3xl} | Specifies the scale profile for the router. |
| **Example:**         |         |
| hw-module profile    |         |
| scale l3xl           |         |
| RP/0/RSP0/CPU0:router(config)# hw-module profile scale l3xl |         |
| Sun Nov 14 10:04:27.109 PST |         |
| In order to activate this new memory resource profile, you must manually reboot the system. |         |
| • default—efficient for deployments that require large Layer 2 MAC tables (up to 512,000 entries) and a relatively small number of Layer 3 routes (less than 512,000). |         |
| • l3—efficient for deployments that require more Layer 3 routes (up to 1 million) and smaller Layer 2 MAC tables (less than 128,000 entries). |         |
| • l3xl—efficient for deployments that require a very large number of Layer 3 routes (up to 1.3 million) and minimal Layer 2 functionality. Note that the support |         |
### Configuring the Feature Profile

Before deploying your router you should determine that the feature profile is consistent with the features that you need to use. If it is not, use this task to configure a different profile.

**SUMMARY STEPS**

1. admin
2. configure
3. hw-module profile feature {default | l2}
4. commit
5. reload location {all | node-id}
6. show running-config
7. show hw-module profile feature

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> admin</td>
<td>Enters administration EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>RP/0/RSP0/CPU0:router# admin</td>
<td></td>
</tr>
</tbody>
</table>
### Configuring the Feature Profile

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2 configure</td>
<td>Enters administration configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RSP0/CPU0:router(admin)# configure</td>
</tr>
<tr>
<td>Step 3 hw-module profile feature {default | l2}</td>
<td>Specifies the feature profile for the router.</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RSP0/CPU0:router(config)# hw-module profile feature l2</td>
</tr>
<tr>
<td></td>
<td>Wed Dec 8 08:29:54.053 PST</td>
</tr>
<tr>
<td></td>
<td>L2 feature profile does NOT support the following features: IPv6, RPF, Netflow.</td>
</tr>
<tr>
<td></td>
<td>In order to activate this new memory resource profile, you must manually reboot the line cards.</td>
</tr>
<tr>
<td>Step 4 commit</td>
<td></td>
</tr>
<tr>
<td>Step 5 reload location {all | node-id}</td>
<td>Reloads a line card. Before the feature profile configuration becomes effective, you must reload all line cards in the router. Use the <code>reload location node-id</code> command for each line card separately.</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RSP0/CPU0:router(config)# reload location 0/0/cpu0</td>
</tr>
<tr>
<td>Step 6 show running-config</td>
<td>Displays the configured feature profile.</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RSP0/CPU0:router(config)# show running-config hw-module profile feature</td>
</tr>
<tr>
<td>Step 7 show hw-module profile feature</td>
<td>Displays the active feature profile. If the active profile is different from the configured profile, the line cards have not been reloaded as required for the feature profile configuration to take place.</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RSP0/CPU0:router# show hw-module profile feature all</td>
</tr>
</tbody>
</table>

---

**What to do next**

If you see warning messages to the console indicating that the active feature profile does not match the configured profile, you must reload the affected line card so that the configured profile matches the active profile.

```
LC/0/1/CPU0:Nov 5 02:50:42.732 : prm_server[236]: Configured 'hw-module profile feature l2' does not match active 'hw-module profile feature default'. You must reload this line card in order to activate the configured profile on this card or you must change the configured profile.
```

If you see warning messages to the console indicating that some features do not match the feature profile, you should either change the feature profile configuration, or remove the non-supported features.
Removing the Scale Profile from the Global Configuration

If a scale profile is configured in the global configuration, you should duplicate the configuration in the administration configuration, and remove the global configuration as described here.

Note
If you do not move the scale profile setting to the administration configuration, the configuration in global configuration mode takes affect.

If the scale profile is configured in both the global configuration and administration configuration, the setting in the administration configuration takes precedence.

SUMMARY STEPS

1. `show running-config | file new-config-file`
2. Remove the line with the command `hw-module profile scale` from the file created in the previous step.
3. `configure`
4. `load new-config-file`
5. `commit replace`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>`show running-config</td>
<td>file new-config-file`</td>
</tr>
<tr>
<td></td>
<td>Example: RP/0/RSP0/CPU0:router# show running-config</td>
<td>file new-config-file</td>
</tr>
<tr>
<td>Step 2</td>
<td>Remove the line with the command <code>hw-module profile scale</code> from the file created in the previous step.</td>
<td>Takes out the profile command that is configured in the global configuration.</td>
</tr>
<tr>
<td>Step 3</td>
<td><code>configure</code></td>
<td></td>

CHAPTER 3

Configuring Manageability

This module describes the configuration required to enable the Extensible Markup Language (XML) agent services. The XML Parser Infrastructure provides parsing and generation of XML documents with Document Object Model (DOM), Simple Application Programming Interface (API) for XML (SAX), and Document Type Definition (DTD) validation capabilities:

- DOM allows customers to programmatically create, manipulate, and generate XML documents.
- SAX supports user-defined functions for XML tags.
- DTD allows for validation of defined document types.

Table 5: Feature History for Configuring Manageability on Cisco IOS XR Software

- How to Configure Manageability, on page 14
- Configuration Examples for Manageability, on page 15
- Additional References, on page 15

Information About XML Manageability

The Cisco IOS XR Extensible Markup Language (XML) API provides a programmable interface to the router for use by external management applications. This interface provides a mechanism for router configuration and monitoring utilizing XML formatted request and response streams. The XML interface is built on top of the Management Data API (MDA), which provides a mechanism for Cisco IOS XR components to publish their data models through MDA schema definition files.
Cisco IOS XR software provides the ability to access the router via XML using a dedicated TCP connection, Secure Socket Layer (SSL), or a specific VPN routing and forwarding (VRF) instance.

## How to Configure Manageability

### Configuring the XML Agent

#### SUMMARY STEPS

1. xml agent [ssl]
2. iteration on size iteration-size
3. session timeout timeout
4. throttle {memory size | process-rate tags}
5. vrf {default | vrf-name} [access-list access-list-name]

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables Extensible Markup Language (XML) requests over a dedicated TCP connection and enters XML agent configuration mode. Use the ssl keyword to enable XML requests over Secure Socket Layer (SSL).</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RSP0/CPU0:router#xml agent</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Configures the iteration size for large XML agent responses in KBytes. The default is 48.</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RSP0/CPU0:router#iteration on size 500</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Configures an idle timeout for the XML agent in minutes. By default, there is no timeout.</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RSP0/CPU0:router#session timeout 5</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Configures the XML agent processing capabilities.</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RSP0/CPU0:router#throttle memory 300</td>
</tr>
</tbody>
</table>

- Specify the throttle memory size in Mbytes per session. Values can range from 100 to 600. The default is 300.
- Specify the process-rate as the number of tags that the XML agent can process per second. Values can range from 1000 to 30000. By default the process rate is not throttled. |
| **Step 5** | Configures the dedicated agent or SSL agent to receive and send messages via the specified VPN routing and forwarding (VRF) instance. |
| Example: | RP/0/RSP0/CPU0:router#vrf vrf-name [access-list access-list-name] |
Configuration Examples for Manageability

Enabling VRF on an XML Agent: Examples

The following example illustrates how to configure the dedicated XML agent to receive and send messages via VRF1, VRF2 and the default VRF:

RP/0/RSP0/CPU0:router# xml agent
RP/0/RSP0/CPU0:router(config)# vrf VRF1
RP/0/RSP0/CPU0:router(config)# vrf VRF2

The following example illustrates how to remove access to VRF2 from the dedicated agent:

RP/0/RSP0/CPU0:router# xml agent
RP/0/RSP0/CPU0:router(config)# no vrf VRF2

The following example shows how to configure the XML SSL agent to receive and send messages through VRF1, VRF2 and the default VRF:

RP/0/RSP0/CPU0:router# xml agent ssl
RP/0/RSP0/CPU0:router(config)# vrf VRF1
RP/0/RSP0/CPU0:router(config)# vrf VRF2

The following example removes access for VRF2 from the dedicated XML agent:

RP/0/RSP0/CPU0:router# xml agent ssl
RP/0/RSP0/CPU0:router(config)# no vrf VRF2

Configuring Physical and Virtual Terminals

Line templates define standard attribute settings for incoming and outgoing transport over physical and virtual terminal lines (vtys). Vty pools are used to apply template settings to ranges of vtys.

Before creating or modifying the vty pools, enable the telnet server using the `telnet server` command in Global Configuration mode. See *IP Addresses and Services Configuration Guide for Cisco ASR 9000 Series Routers* and *IP Addresses and Services Command Reference for Cisco ASR 9000 Series Routers* for more information.

This module describes the new and revised tasks you need to implement physical and virtual terminals on your Cisco IOS XR network.

For more information about physical and virtual terminals on the Cisco IOS XR software and complete descriptions of the terminal services commands listed in this module, see Related Documents, on page 26. To locate documentation for other commands that might appear in the course of running a configuration task, search online in *Cisco ASR 9000 Series Aggregation Services Router Commands Master List*.

Prerequisites for Implementing Physical and Virtual Terminals

You must be in a user group associated with a task group that includes the proper task IDs. The command reference guides include the task IDs required for each command. If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Information About Implementing Physical and Virtual Terminals

To implement physical and virtual terminals, you need to understand the concepts in this section.

Line Templates

The following line templates are available in the Cisco IOS XR software.

- Default line template—The default line template that applies to a physical and virtual terminal lines.
- Console line template—The line template that applies to the console line.
- User-defined line templates—User-defined line templates that can be applied to a range of virtual terminal lines.

Line Template Configuration Mode

Changes to line template attributes are made in line template configuration mode. To enter line template configuration mode, issue the `line` command from Global Configuration mode, specifying the template to be modified. These line templates can be configured with the `line` command:

- console—console template
- default—default template
- template—user-defined template

After you specify a template with the `line` command, the router enters line template configuration mode where you can set the terminal attributes for the specified line. This example shows how to specify the attributes for the console:

```
RP/0/RSP0/CPU0:router(config)# line console
RP/0/RSP0/CPU0:router(config-line)#
```

From line template configuration mode, use the online help feature ( ? ) to view all available options. Some useful options include:

- absolute-timeout—Specifies a timeout value for line disconnection.
- escape-character—Changes the line escape character.
- exec-timeout—Specifies the EXEC timeout.
- length—Sets the number of lines displayed on the screen.
• session-limit—Specifies the allowable number of outgoing connections.
• session-timeout—Specifies an interval for closing the connection if there is no input traffic.
• timestamp—Displays the timestamp before each command.
• width—Specifies the width of the display terminal.

Line Template Guidelines

The following guidelines apply to modifying the console template and to configuring a user-defined template:

• Modify the templates for the physical terminal lines on the router (the console port) from line template configuration mode. Use the `line console` command from Global Configuration mode to enter line template configuration mode for the console template.
• Modify the template for virtual lines by configuring a user-defined template with the `line template-name` command, configuring the terminal attributes for the user-defined template from line template configuration, and applying the template to a range of virtual terminal lines using the `vty pool` command.

Attributes not defined in the console template, or any virtual template, are taken from the default template.

The default settings for the default template are described for all commands in line template configuration mode in the *Terminal Services Commands on the Cisco ASR 9000 Series Router* module in *System Management Command Reference for Cisco ASR 9000 Series Routers*.

**Note**

Before creating or modifying the vty pools, enable the telnet server using the `telnet server` command in Global Configuration mode. See *IP Addresses and Services Configuration Guide for Cisco ASR 9000 Series Routers* and *IP Addresses and Services Command Reference for Cisco ASR 9000 Series Routers* for more information.

Terminal Identification

The physical terminal lines for the console port is identified by its location, expressed in the format of `rack/slot/module`, on the active or standby route processor (RP) where the respective console port resides. For virtual terminals, physical location is not applicable; the Cisco IOS XR software assigns a vty identifier to vtys according to the order in which the vty connection has been established.

vty Pools

Each virtual line is a member of a pool of connections using a common line template configuration. Multiple vty pools may exist, each containing a defined number of vtys as configured in the vty pool. The Cisco IOS XR software supports the following vty pools by default:

• Default vty pool—The default vty pool consists of five vtys (vtys 0 through 4) that each reference the default line template.

• Default fault manager pool—The default fault manager pool consists of six vtys (vtys 100 through 105) that each reference the default line template.
In addition to the default vty pool and default fault manager pool, you can also configure a user-defined vty pool that can reference the default template or a user-defined template.

When configuring vty pools, follow these guidelines:

- The vty range for the default vty pool must start at vty 0 and must contain a minimum of five vtys.
- The vty range from 0 through 99 can reference the default vty pool.
- The vty range from 5 through 99 can reference a user-defined vty pool.
- The vty range from 100 is reserved for the fault manager vty pool.
- The vty range for fault manager vty pools must start at vty 100 and must contain a minimum of six vtys.
- A vty can be a member of only one vty pool. A vty pool configuration will fail if the vty pool includes a vty that is already in another pool.
- If you attempt to remove an active vty from the active vty pool when configuring a vty pool, the configuration for that vty pool will fail.

How to Implement Physical and Virtual Terminals on Cisco IOS XR Software

Modifying Templates

This task explains how to modify the terminal attributes for the console and default line templates. The terminal attributes that you set will modify the template settings for the specified template.

**SUMMARY STEPS**

1. `configure`
2. `line {console | default}`
3. Configure the terminal attribute settings for the specified template using the commands in line template configuration mode.
4. Use one of the following commands:
   - `end`
   - `commit`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>`line {console</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Enters line template configuration mode for the specified line template.</td>
</tr>
<tr>
<td><code>RP/0/RSP0/CPU0:router(config)# line console</code></td>
<td>• <code>console</code> — Enters line template configuration mode for the console template.</td>
</tr>
<tr>
<td>or</td>
<td>• <code>default</code> — Enters line template configuration mode for the default line template.</td>
</tr>
<tr>
<td><code>RP/0/RSP0/CPU0:router(config)# line default</code></td>
<td></td>
</tr>
</tbody>
</table>
Creating and Modifying vty Pools

This task explains how to create and modify vty pools. You can omit Step 3, on page 22 to Step 5, on page 22 if you are configuring the default line template to reference a vty pool.

SUMMARY STEPS

1. configure
2. telnet {ipv4 | ipv6} server max-servers limit
3. line template template-name
4. Configure the terminal attribute settings for the specified line template using the commands in line template configuration mode.
5. exit
6. vty-pool {default | pool-name | eem} first-vty last-vty [line-template {default | template-name}]
7. commit
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> telnet {ipv4</td>
<td>ipv6} server max-servers limit</td>
</tr>
<tr>
<td><strong>Example:</strong> RP/0/RSP0/CPU0:router(config)# telnet ipv4 server max-servers 10</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> line template template-name</td>
<td>Enters line template configuration mode for a user-defined template.</td>
</tr>
<tr>
<td><strong>Example:</strong> RP/0/RSP0/CPU0:router(config)# line template 1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> Configure the terminal attribute settings for the specified line template using the commands in line template configuration mode.</td>
<td>—</td>
</tr>
<tr>
<td><strong>Step 5</strong> exit</td>
<td>Exits line template configuration mode and returns the router to global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> RP/0/RSP0/CPU0:router(config-line)# exit</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> vty-pool {default</td>
<td>pool-name</td>
</tr>
<tr>
<td><strong>Example:</strong> RP/0/RSP0/CPU0:router(config)# vty-pool default 0 5 line-template default</td>
<td></td>
</tr>
<tr>
<td>or</td>
<td></td>
</tr>
<tr>
<td>RP/0/RSP0/CPU0:router(config)# vty-pool pool1 5 50 line-template template1</td>
<td></td>
</tr>
<tr>
<td>or</td>
<td></td>
</tr>
<tr>
<td>RP/0/RSP0/CPU0:router(config)# vty-pool eem 100 105 line-template template1</td>
<td></td>
</tr>
</tbody>
</table>

- If you do not specify a line template with the `line-template` keyword, a vty pool defaults to the default line template.

- **default** —Configures the default vty pool.
  - The default vty pool must start at vty 0 and must contain a minimum of five vtys (vty 0 through 4).
  - You can resize the default vty pool by increasing the range of vtys that compose the default vty pool.

- **pool-name** —Creates a user-defined vty pool.
  - A user-defined pool must start at least at vty 5, depending on whether the default vty pool has been resized.
  - If the range of vtys for the default vty pool has been resized, use the first range value free from the default line template. For example, if the range of vtys for the default vty pool has been configured to include 10 vtys (vty 0 through 9),
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>eem</td>
<td>Configures the embedded event manager pool.</td>
</tr>
<tr>
<td></td>
<td>• The default embedded event manager vty pool must start at vty 100 and must contain a minimum of six vtys (vty 100 through 105).</td>
</tr>
<tr>
<td>line-template</td>
<td>Configures the vty pool to reference a user-defined template.</td>
</tr>
</tbody>
</table>

Step 7 commit

Monitoring Terminals and Terminal Sessions

This task explains how to monitor terminals and terminal sessions using the `show` EXEC commands available for physical and terminal lines.

![Note]

The commands can be entered in any order.

**SUMMARY STEPS**

1. (Optional) `show line [aux location node-id | console location node-id | vty number]`
2. (Optional) `show terminal`
3. (Optional) `show users`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Displays the terminal parameters of terminal lines.</td>
</tr>
<tr>
<td>(Optional) `show line [aux location node-id</td>
<td>console location node-id</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>RP/0/RSP0/CPU0:router# show line</td>
<td></td>
</tr>
</tbody>
</table>

- Specifying the `show line aux location node-id` EXEC command displays the terminal parameters of the auxiliary line.
- Specifying the `show line console location node-id` EXEC command displays the terminal parameters of the console.

- For the `location node-id` keyword and argument, enter the location of the Route Processor (RP) on which the respective auxiliary or console port resides.
- The `node-id` argument is expressed in the format of `rack/slot/module`. 

System Management Configuration Guide for Cisco ASR 9000 Series Routers, IOS XR Release 6.2.x
### Craft Panel Interface

The Craft Panel is an easily-accessible and user-friendly interface which assists the field operator in troubleshooting the router. It consists of a LCD display and three LEDs. The LEDs indicate minor, major and critical alarms.

For more details of the Craft Panel Interface, refer the Hardware and System set-up guides.

### Configuration Examples for Implementing Physical and Virtual Terminals

#### Modifying the Console Template: Example

This configuration example shows how to modify the terminal attribute settings for the console line template:

```
line console
  exec-timeout 0 0
  escape-character 0x5a
  session-limit 10
  disconnect-character 0x59
  session-timeout 100
  transport input telnet
  transport output telnet
```

In this configuration example, the following terminal attributes are applied to the console line template:

- The EXEC time out for terminal sessions is set to 0 minutes, 0 seconds. Setting the EXEC timeout to 0 minutes and 0 seconds disables the EXEC timeout function; thus, the EXEC session for the terminal session will never time out.
• The escape character is set to the 0x5a hexadecimal value (the 0x5a hexadecimal value translates into the “Z” character).
• The session limit for outgoing terminal sessions is set to 10 connections.
• The disconnect character is set to 0x59 hexadecimal value (the 0x59 hexadecimal character translates into the “Y” character).
• The session time out for outgoing terminal sessions is set to 100 minutes (1 hour and 40 minutes).
• The allowed transport protocol for incoming terminal sessions is Telnet.
• The allowed transport protocol for outgoing terminal sessions is Telnet.

To verify that the terminal attributes for the console line template have been applied to the console, use the show line command:

```
RP/0/RSP0/CPU0:router# show line console location 0/0/CPU0
```

```
Tty  Speed  Modem  Uses  Noise Overruns  Acc I/O
* con0/0/CPU0  9600 - - - 0/0 -/-
```

Line con0_0_CPU0, Location "Unknown", Type "Unknown"
Length: 24 lines, Width: 80 columns
Baud rate (TX/RX) is 9600, 1 parity, 2 stopbits, 8 databits
Template: console
Config:
Allowed transports are telnet.

**Modifying the Default Template: Example**

This configuration example shows how to override the terminal settings for the default line template:

```
line default
  exec-timeout 0 0
  width 512
  length 512
```

In this example, the following terminal attributes override the default line template default terminal attribute settings:

• The EXEC timeout for terminal sessions is set to 0 minutes and 0 seconds. Setting the EXEC timeout to 0 minutes and 0 seconds disables the EXEC timeout function; thus, the EXEC session for the terminal session will never time out (the default EXEC timeout for the default line template is 10 minutes).
• The width of the terminal screen for the terminals referencing the default template is set to 512 characters (the default width for the default line template is 80 characters).
• The length, the number of lines that will display at one time on the terminal referencing the default template, is set to 512 lines (the default length for the default line template is 24 lines).

**Configuring a User-Defined Template to Reference the Default vty Pool: Example**

This configuration example shows how to configure a user-defined line template (named test in this example) for vtys and to configure the line template test to reference the default vty pool:

```
line template test
  exec-timeout 100 0
```
Configuring a User-Defined Template to Reference a User-Defined vty Pool: Example

This configuration example shows how to configure a user-defined line template (named test2 in this example) for vtys and to configure the line template test to reference a user-defined vty pool (named pool1 in this example):

```
line template test2
  exec-timeout 0 0
  session-limit 10
  session-timeout 100
  transport input all
  transport output all
  exit
vty-pool pool1 5 50 line-template test2
```

Configuring a User-Defined Template to Reference the Fault Manager vty Pool: Example

This configuration example shows how to configure a user-defined line template (named test3 in this example) for vtys and to configure the line template test to reference the fault manager vty pool:

```
line template test3
  width 110
  length 100
  session-timeout 100
  exit
vty-pool eem 100 106 line-template test3
```

Configuring Simple Network Management Protocol

Simple Network Management Protocol (SNMP) is an application-layer protocol that provides a message format for communication between SNMP managers and agents. SNMP provides a standardized framework and a common language used for the monitoring and management of devices in a network.

This module describes the new and revised tasks you need to implement SNMP on your Cisco IOS XR network.

For detailed conceptual information about SNMP on the Cisco IOS XR software and complete descriptions of the SNMP commands listed in this module, see Related Documents, on page 52. For information on specific MIBs, refer to Cisco ASR 9000 Series Aggregation Services Routers MIB Specifications Guide. To locate documentation for other commands that might appear in the course of performing a configuration task, search online in Cisco ASR 9000 Series Aggregation Services Router Commands Master List.

Prerequisites for Implementing SNMP

You must be in a user group associated with a task group that includes the proper task IDs. The command reference guides include the task IDs required for each command. If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Restrictions for SNMP Use on Cisco IOS XR Software

SNMP outputs are only 32-bits wide and therefore cannot display any information greater than $2^{32}$. $2^{32}$ is equal to 4.29 Gigabits. Note that a 10 Gigabit interface is greater than this and so if you are trying to display speed information regarding the interface, you might see concatenated results.

Information About Implementing SNMP

To implement SNMP, you need to understand the concepts described in this section.

SNMP Functional Overview

The SNMP framework consists of three parts:

- SNMP manager
- SNMP agent
- Management Information Base (MIB)

SNMP Manager

The SNMP manager is the system used to control and monitor the activities of network hosts using SNMP. The most common managing system is called a network management system (NMS). The term NMS can be applied to either a dedicated device used for network management, or the applications used on such a device. A variety of network management applications are available for use with SNMP. These features range from simple command-line applications to feature-rich graphical user interfaces (such as the CiscoWorks 2000 line of products).

SNMP Agent

The SNMP agent is the software component within the managed device that maintains the data for the device and reports these data, as needed, to managing systems. The agent and MIB reside on the router. To enable the SNMP agent, you must define the relationship between the manager and the agent.

MIB

The Management Information Base (MIB) is a virtual information storage area for network management information, which consists of collections of managed objects. Within the MIB there are collections of related objects, defined in MIB modules. MIB modules are written in the SNMP MIB module language, as defined in STD 58, RFC 2578, RFC 2579, and RFC 2580. Note that individual MIB modules are also referred to as MIBs; for example, the Interfaces Group MIB (IF-MIB) is a MIB module within the MIB on your system.
The SNMP agent contains MIB variables whose values the SNMP manager can request or change through Get or Set operations. A manager can get a value from an agent or store a value into that agent. The agent gathers data from the MIB, the repository for information about device parameters and network data. The agent can also respond to manager requests to get or set data.

This figure illustrates the communications relationship between the SNMP manager and agent. A manager can send the agent requests to get and set MIB values. The agent can respond to these requests. Independent of this interaction, the agent can send unsolicited notifications (traps) to the manager to notify the manager of network conditions.

Figure 1: Communication Between an SNMP Agent and Manager

Related Topics
Addional References, on page 52

SNMP Notifications

A key feature of SNMP is the ability to generate notifications from an SNMP agent. These notifications do not require that requests be sent from the SNMP manager. On Cisco IOS XR software, unsolicited (asynchronous) notifications can be generated only as traps. Traps are messages alerting the SNMP manager to a condition on the network. Notifications can indicate improper user authentication, restarts, the closing of a connection, loss of connection to a neighbor router, or other significant events.

Traps are less reliable than informs because the receiver does not send any acknowledgment when it receives a trap. The sender cannot determine if the trap was received. An SNMP manager that receives an inform request acknowledges the message with an SNMP response protocol data unit (PDU). If the manager does not receive an inform request, it does not send a response. If the sender never receives a response, the inform request can be sent again. Thus, informs are more likely to reach their intended destination.

However, traps are often preferred because informs consume more resources in the router and in the network. Unlike a trap, which is discarded as soon as it is sent, an inform request must be held in memory until a response is received or the request times out. Also, traps are sent only once, and an inform may be retried several times. The retries increase traffic and contribute to a higher overhead on the network. Thus, traps and inform requests provide a trade-off between reliability and resources.

Figure 2: Trap Received by the SNMP Manager

In this illustration, the agent router sends a trap to the SNMP manager. Although the manager receives the trap, it does not send any acknowledgment to the agent. The agent has no way of knowing that the trap reached its destination.
SNMP Versions

Cisco IOS XR software supports the following versions of SNMP:

- Simple Network Management Protocol Version 1 (SNMPv1)
- Simple Network Management Protocol Version 2c (SNMPv2c)
- Simple Network Management Protocol Version 3 (SNMPv3)

Both SNMPv1 and SNMPv2c use a community-based form of security. The community of managers able to access the agent MIB is defined by an IP address access control list and password.

SNMPv2c support includes a bulk retrieval mechanism and more detailed error message reporting to management stations. The bulk retrieval mechanism supports the retrieval of tables and large quantities of information, minimizing the number of round-trips required. The SNMPv2c improved error handling support includes expanded error codes that distinguish different kinds of error conditions; these conditions are reported through a single error code in SNMPv1. Error return codes now report the error type. Three kinds of exceptions are also reported: no such object exceptions, no such instance exceptions, and end of MIB view exceptions.

SNMPv3 is a security model. A security model is an authentication strategy that is set up for a user and the group in which the user resides. A security level is the permitted level of security within a security model. A combination of a security model and a security level will determine which security mechanism is employed when an SNMP packet is handled. See Table 9: SNMP Security Models and Levels, on page 33 for a list of security levels available in SNMPv3. The SNMPv3 feature supports RFCs 3411 to 3418.

You must configure the SNMP agent to use the version of SNMP supported by the management station. An agent can communicate with multiple managers; for this reason, you can configure the Cisco IOS-XR software to support communications with one management station using the SNMPv1 protocol, one using the SNMPv2c protocol, and another using SNMPv3.

Comparison of SNMPv1, v2c, and v3

SNMP v1, v2c, and v3 all support the following operations:
• get-request—Retrieves a value from a specific variable.

• get-next-request—Retrieves the value following the named variable; this operation is often used to retrieve variables from within a table. With this operation, an SNMP manager does not need to know the exact variable name. The SNMP manager searches sequentially to find the needed variable from within the MIB.

• get-response—Operation that replies to a get-request, get-next-request, and set-request sent by an NMS.

• set-request—Operation that stores a value in a specific variable.

• trap—Unsolicited message sent by an SNMP agent to an SNMP manager when some event has occurred.

The below table identifies other key SNMP features supported by the SNMP v1, v2c, and v3.

Security Models and Levels for SNMPv1, v2, v3

The security level determines if an SNMP message needs to be protected from disclosure and if the message needs to be authenticated. The various security levels that exist within a security model are as follows:

• noAuthNoPriv—Security level that does not provide authentication or encryption.

• authNoPriv—Security level that provides authentication but does not provide encryption.

• authPriv—Security level that provides both authentication and encryption.

Three security models are available: SNMPv1, SNMPv2c, and SNMPv3. The security model combined with the security level determine the security mechanism applied when the SNMP message is processed.

The below table identifies what the combinations of security models and levels mean.

Table 9: SNMP Security Models and Levels

### SNMPv3 Benefits

SNMPv3 provides secure access to devices by providing authentication, encryption and access control. These added security benefits secure SNMP against the following security threats:

- Masquerade—The threat that an SNMP user may assume the identity of another SNMP user to perform management operations for which that SNMP user does not have authorization.
- Message stream modification—The threat that messages may be maliciously reordered, delayed, or replayed (to an extent that is greater than can occur through the natural operation of a subnetwork service) to cause SNMP to perform unauthorized management operations.
- Disclosure—The threat that exchanges between SNMP engines could be eavesdropped. Protecting against this threat may be required as a matter of local policy.

In addition, SNMPv3 provides access control over protocol operations on SNMP managed objects.

### Notes

3 Hash-Based Message Authentication Code  
4 Message Digest 5  
5 Secure Hash Algorithm  
6 Data Encryption Standard  
7 Cipher Block Chaining  
8 Triple Data Encryption Standard  
9 Advanced Encryption Standard

Use of 3DES and AES encryption standards requires that the security package (k9sec) be installed. For information on installing software packages, see *Upgrading and Managing Cisco IOS XR Software*.
SNMPv3 Costs

SNMPv3 authentication and encryption contribute to a slight increase in the response time when SNMP operations on MIB objects are performed. This cost is far outweighed by the security advantages provided by SNMPv3.

This table shows the order of response time (from least to greatest) for the various security model and security level combinations.

User-Based Security Model

SNMPv3 User-Based Security Model (USM) refers to SNMP message-level security and offers the following services:

- Message integrity—Ensures that messages have not been altered or destroyed in an unauthorized manner and that data sequences have not been altered to an extent greater than can occur nonmaliciously.
- Message origin authentication—Ensures that the claimed identity of the user on whose behalf received data was originated is confirmed.
- Message confidentiality—Ensures that information is not made available or disclosed to unauthorized individuals, entities, or processes.

SNMPv3 authorizes management operations only by configured users and encrypts SNMP messages. USM uses two authentication protocols:

- HMAC-MD5-96 authentication protocol
- HMAC-SHA-96 authentication protocol

USM uses Cipher Block Chaining (CBC)-DES (DES-56) as the privacy protocol for message encryption.

View-Based Access Control Model

The View-Based Access Control Model (VACM) enables SNMP users to control access to SNMP managed objects by supplying read, write, or notify access to SNMP objects. It prevents access to objects restricted by views. These access policies can be set when user groups are configured with the `snmp-server group` command.

MIB Views

For security reasons, it is often valuable to be able to restrict the access rights of some groups to only a subset of the management information within the management domain. To provide this capability, access to a
Access Policy

Access policy determines the access rights of a group. The three types of access rights are as follows:

- read-view access—The set of object instances authorized for the group when objects are read.
- write-view access—The set of object instances authorized for the group when objects are written.
- notify-view access—The set of object instances authorized for the group when objects are sent in a notification.

IP Precedence and DSCP Support for SNMP

SNMP IP Precedence and differentiated services code point (DSCP) support delivers QoS specifically for SNMP traffic. You can change the priority setting so that SNMP traffic generated in a router is assigned a specific QoS class. The IP Precedence or IP DSCP code point value is used to determine how packets are handled in weighted random early detection (WRED).

After the IP Precedence or DSCP is set for the SNMP traffic generated in a router, different QoS classes cannot be assigned to different types of SNMP traffic in that router.

The IP Precedence value is the first three bits in the type of service (ToS) byte of an IP header. The IP DSCP code point value is the first six bits of the differentiate services (DiffServ Field) byte. You can configure up to eight different IP Precedence markings or 64 different IP DSCP markings.

Session MIB support on subscriber sessions

SNMP monitoring requires information about subscribers of all types. The CISCO-SUBSCRIBER-SESSION-MIB is defined to model per-subscriber data as well as aggregate subscriber (PPPoE) data. It is required to support notifications (traps) for aggregate session counts crossing configured thresholds. Generic MIB Data Collector Manager (DCM) support for CISCO-SUBSCRIBER-SESSION-MIB, helps faster data collection and also better handling of parallel data.

SNMP Notifications

A key feature of SNMP is the ability to generate notifications from an SNMP agent. These notifications do not require that requests be sent from the SNMP manager. On Cisco IOS XR software, unsolicited (asynchronous) notifications can be generated only as traps. Traps are messages alerting the SNMP manager to a condition on the network. Notifications can indicate improper user authentication, restarts, the closing of a connection, loss of connection to a neighbor router, or other significant events.

Note

Inform requests (inform operations) are supported in Cisco IOS XR software from release 4.1 onwards. For more information see, http://www.cisco.com/c/en/us/td/docs/routers/asr9000/software/asr9k_r5-3/sysman/command/reference/b-sysman-cr53xasr/b-sysman-cr53xasr_chapter_010010.html#wp2863682680

Traps are less reliable than informs because the receiver does not send any acknowledgment when it receives a trap. The sender cannot determine if the trap was received. An SNMP manager that receives an inform request acknowledges the message with an SNMP response protocol data unit (PDU). If the manager does
not receive an inform request, it does not send a response. If the sender never receives a response, the inform request can be sent again. Thus, informs are more likely to reach their intended destination.

However, traps are often preferred because informs consume more resources in the router and in the network. Unlike a trap, which is discarded as soon as it is sent, an inform request must be held in memory until a response is received or the request times out. Also, traps are sent only once, and an inform may be retried several times. The retries increase traffic and contribute to a higher overhead on the network. Thus, traps and inform requests provide a trade-off between reliability and resources.

*Figure 4: Trap Received by the SNMP Manager*

In this illustration, the agent router sends a trap to the SNMP manager. Although the manager receives the trap, it does not send any acknowledgment to the agent. The agent has no way of knowing that the trap reached its destination.

*Figure 5: Trap Not Received by the SNMP Manager*

In this illustration, the agent sends a trap to the manager, but the trap does not reach the manager. Because the agent has no way of knowing that the trap did not reach its destination, the trap is not sent again. The manager never receives the trap.

**Session Types**

The supported session types are:

- PPPoE
- IP SUB PKT
- IP SUB DHCP

**How to Implement SNMP on Cisco IOS XR Software**

This section describes how to implement SNMP.

The `snmp-server` commands enable SNMP on Management Ethernet interfaces by default. For information on how to enable SNMP server support on other inband interfaces, see the *Implementing Management Plane...*
**Configuring SNMPv3**

This task explains how to configure SNMPv3 for network management and monitoring.

- **Note**: No specific command enables SNMPv3; the first `snmp-server` global configuration command (config), that you issue enables SNMPv3. Therefore, the sequence in which you issue the `snmp-server` commands for this task does not matter.

### SUMMARY STEPS

1. `configure`
2. `snmp-server view view-name oid-tree {included | excluded}`
3. `snmp-server group name {v1 | v2c | v3 {auth | noauth | priv}} [read view] [write view] [notify view] [access-list-name]`
4. `snmp-server user username groupname {v1 | v2c | v3 {auth {md5 | sha} {clear | encrypted} priv-password [priv des56 {clear | encrypted} priv-password]} [access-list-name]`
5. `commit`

### DETAILED STEPS

</tbody>
</table>

**Purpose**

Only one remote host can be assigned to the same username for SNMP version 3. If you configure the same username with different remote hosts, only the last username and remote host combination will be accepted and will be seen in the **show running** configuration. In the case of multiple SNMP managers, multiple unique usernames are required.

### Configuring SNMP Trap Notifications

This task explains how to configure the router to send SNMP trap notifications.

---

**Note**

You can omit Step 3, on page 38 if you have already completed the steps documented under the **Configuring SNMPv3**, on page 38 task.

### SUMMARY STEPS

1. configure
2. snmp-server group name {v1 | v2c | v3 {auth | noauth | priv}} [read view] [write view] [notify view] [access-list-name]
3. snmp-server user username groupname {v1 | v2c | v3 {auth | md5 | sha} {clear | encrypted} auth-password priv des56 {clear | encrypted} priv-password| [access-list-name]
4. snmp-server host address [traps] [version {1 | 2c | 3 {auth | noauth | priv}}] community-string [udp-port port] [notification-type]
5. snmp-server traps [notification-type]
6. commit
7. (Optional) show snmp host

### Defining the Maximum SNMP Agent Packet Size

This task shows how to configure the largest SNMP packet size permitted when the SNMP server is receiving a request or generating a reply.

**Note**  
The sequence in which you issue the `snmp-server` commands for this task does not matter.

### Summary Steps

1. `configure`
2. (Optional) `snmp-server packetsize byte-count`
3. `commit`

### Detailed Steps

<table>
<thead>
<tr>

System Management Configuration Guide for Cisco ASR 9000 Series Routers, IOS XR Release 6.2.x
Changing Notification Operation Values

After SNMP notifications have been enabled, you can specify a value other than the default for the source interface, message queue length, or retransmission interval.

This task explains how to specify a source interface for trap notifications, the message queue length for each host, and the retransmission interval.

**Note**
The sequence in which you issue the `snmp-server` commands for this task does not matter.

### SUMMARY STEPS

1. configure
2. (Optional) `snmp-server trap-source type interface-path-id`
3. (Optional) `snmp-server queue-length length`
4. (Optional) `snmp-server trap-timeout seconds`
5. `commit`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> (Optional) <code>snmp-server trap-source type interface-path-id</code></td>
<td>Specifies a source interface for trap notifications.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>RP/0/RSP0/CPU0:router(config)# snmp-server trap-source POS 0/0/1/0</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> (Optional) <code>snmp-server queue-length length</code></td>
<td>Establishes the message queue length for each notification.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>RP/0/RSP0/CPU0:router(config)# snmp-server queue-length 20</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> (Optional) <code>snmp-server trap-timeout seconds</code></td>
<td>Defines how often to resend notifications on the retransmission queue.</td>

<td>RP/0/RSP0/CPU0:router(config)# snmp-server packetsize 1024</td>
<td></td>
</tr>
</tbody>
</table>
Setting IP Precedence and DSCP Values

This task describes how to configure IP Precedence or IP DSCP for SNMP traffic.

**Before you begin**

SNMP must be configured.

**SUMMARY STEPS**

1. configure
2. Use one of the following commands:
   - `snmp-server ipv4 precedence value`
   - `snmp-server ipv4 dscp value`
3. commit

**DETAILED STEPS**

**Configuring MIB Data to be Persistent**

Many SNMP MIB definitions define arbitrary 32-bit indices for their object tables. MIB implementations often do a mapping from the MIB indices to some internal data structure that is keyed by some other set of data. In these MIB tables the data contained in the table are often other identifiers of the element being modelled. For example, in the ENTITY-MIB, entries in the entPhysicalTable are indexed by the 31-bit value, entPhysicalIndex, but the entities could also be identified by the entPhysicalName or a combination of the other objects in the table.

Because of the size of some MIB tables, significant processing is required to discover all the mappings from the 32-bit MIB indices to the other data which the network management station identifies the entry. For this...
reason, it may be necessary for some MIB indices to be persistent across process restarts, switchovers, or device reloads. The ENTITY-MIB entPhysicalTable and CISCO-CLASS-BASED-QOS-MIB are two such MIBs that often require index values to be persistent.

Also, because of query response times and CPU utilization during CISCO-CLASS-BASED-QOS-MIB statistics queries, it is desirable to cache service policy statistics.

**SUMMARY STEPS**

1. (Optional) `snmp-server entityindex persist`
2. (Optional) `snmp-server mibs cbqosmib persist`
3. (Optional) `snmp-server cbqosmib cache refresh time time`
4. (Optional) `snmp-server cbqosmib cache service-policy count count`
5. `snmp-server ifindex persist`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> (Optional) <code>snmp-server entityindex persist</code></td>
<td>Enables the persistent storage of ENTITY-MIB data.</td>
</tr>
<tr>
<td>Example: <code>RP/0/RSP0/CPU0:router(config)# snmp-server entityindex persist</code></td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2** (Optional) `snmp-server mibs cbqosmib persist` | Enables persistent storage of the CISCO-CLASS-BASED-QOS-MIB data. |
| Example: `RP/0/RSP0/CPU0:router(config)# snmp-server mibs cbqosmib persist` | 

| **Step 3** (Optional) `snmp-server cbqosmib cache refresh time time` | Enables QoS MIB caching with a specified cache refresh time. |
| Example: `RP/0/RSP0/CPU0:router(config)# snmp-server mibs cbqosmib cache refresh time 45` | 

| **Step 4** (Optional) `snmp-server cbqosmib cache service-policy count count` | Enables QoS MIB caching with a limited number of service policies to cache. |
| Example: `RP/0/RSP0/CPU0:router(config)# snmp-server mibs cbqosmib cache service-policy count 50` | 

| **Step 5** `snmp-server ifindex persist` | Enables ifIndex persistence globally on all Simple Network Management Protocol (SNMP) interfaces. |
| Example: `RP/0/RSP0/CPU0:router(config)# snmp-server ifindex persist` | 

**System Management Configuration Guide for Cisco ASR 9000 Series Routers, IOS XR Release 6.2.x**
Configuring LinkUp and LinkDown Traps for a Subset of Interfaces

By specifying a regular expression to represent the interfaces for which you are interested in setting traps, you can enable or disable linkUp and linkDown traps for a large number of interfaces simultaneously.

Before you begin
SNMP must be configured.

SUMMARY STEPS

1. configure
2. snmp-server interface subset subset-number regular-expression expression
3. notification linkupdown disable
4. commit
5. (Optional) show snmp interface notification subset subset-number
6. (Optional) show snmp interface notification regular-expression expression
7. (Optional) show snmp interface notification type interface-path-id

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure</td>
<td>Enters snmp-server interface mode for the interfaces identified by the regular expression.</td>
</tr>
<tr>
<td>2</td>
<td>snmp-server interface subset subset-number regular-expression expression</td>
<td>The subset-number argument identifies the set of interfaces, and also assigns a priority to the subset in the event that an interface is included in more than one subset. Lower interface subset numbers have higher priority and their configuration takes precedence over interface subsets with higher numbers. The expression argument must be entered surrounded by double quotes. Refer to the Understanding Regular Expressions, Special Characters, and Patterns module in Cisco ASR 9000 Series Aggregation Services Router Getting Started Guide for more information regarding regular expressions.</td>
</tr>
<tr>
<td>3</td>
<td>notification linkupdown disable</td>
<td>Disables linkUp and linkDown traps for all interfaces being configured. To enable previously disabled interfaces, use the no form of this command.</td>
</tr>
<tr>
<td>4</td>
<td>commit</td>
<td>Displays the linkUp and linkDown notification status for all interfaces identified by the subset priority.</td>
</tr>
<tr>
<td>5</td>
<td>(Optional) show snmp interface notification subset subset-number</td>
<td></td>
</tr>
</tbody>
</table>
Purpose
Command or Action
RP/0/RSP0/CPU0:router# show snmp interface notification subset 10

Step 6 (Optional) show snmp interface notification regular-expression expression
Example:
RP/0/RSP0/CPU0:router# show snmp interface notification
regular-expression "^Gig[a-zA-Z]+[0-9/]\.

Step 7 (Optional) show snmp interface notification type interface-path-id
Example:
RP/0/RSP0/CPU0:router# show snmp interface notification
tengige 0/4/0/3.10

Configuration Examples for Implementing SNMP

Configuring SNMPv3: Examples

Setting an Engine ID
This example shows how to set the identification of the local SNMP engine:

```
snmp-server engineID local 00:00:00:09:00:00:a1:61:6c:20:61
```

Note
After the engine ID has been configured, the SNMP agent restarts.

Verifying the Identification of the Local SNMP Engines
This example shows how to verify the identification of the local SNMP engine:

```
config
   show snmp engineid

SNMP engineID 00000009000000a1ffffffff
```
Creating a View

There are two ways to create a view:

- You can include the object identifier (OID) of an ASN.1 subtree of a MIB family from a view by using the included keyword of the `snmp-server view` command.
- You can exclude the OID subtree of the ASN.1 subtree of a MIB family from a view by using the excluded keyword of the `snmp-server view` command.

This example shows how to create a view that includes the sysName (1.3.6.1.2.1.1.5) object:

```config
snmp-server view SNMP_VIEW1 1.3.6.1.2.1.1.5 included
```

This example shows how to create a view that includes all the OIDs of a system group:

```config
snmp-server view SNMP_VIEW1 1.3.6.1.2.1.1 included
```

This example shows how to create a view that includes all the OIDs under the system group except the sysName object (1.3.6.1.2.1.1.5), which has been excluded:

```config
snmp-server view SNMP_VIEW1 1.3.6.1.2.1.1 included
snmp-server view SNMP_VIEW1 1.3.6.1.2.1.1.5 excluded
```

Verifying Configured Views

This example shows how to display information about the configured views:

```
RP/0/RSP0/CPU0:router# show snmp view
v1default 1.3.6.1 - included nonVolatile active
SNMP_VIEW1 1.3.6.1.2.1.1 - included nonVolatile active
SNMP_VIEW1 1.3.6.1.2.1.1.5 - excluded nonVolatile active
```

Creating Groups

If you do not explicitly specify a notify, read, or write view, the Cisco IOS XR software uses the v1 default (1.3.6.1). This example shows how to create a group that utilizes the default view:

```
RP/0/RSP0/CPU0:router(config)# snmp-server group group-name v3 auth
```

The following configuration example shows how to create a group that has read access to all the OIDs in the system except the sysUpTime object (1.3.6.1.2.1.1.3), which has been excluded from the view applied to the group, but write access only to the sysName object (1.3.6.1.2.1.1.5):

```
!"
Verifying Groups

This example shows how to verify the attributes of configured groups:

RP/0/RSP0/CPU0:router# show snmp group

<table>
<thead>
<tr>
<th>Groupname</th>
<th>Security Model</th>
<th>Read View</th>
<th>Write View</th>
</tr>
</thead>
<tbody>
<tr>
<td>group_name1</td>
<td>usm</td>
<td>view_name1</td>
<td>view_name2</td>
</tr>
<tr>
<td>notifyview:</td>
<td>v1default</td>
<td>row status:</td>
<td>nonVolatile</td>
</tr>
</tbody>
</table>

Creating and Verifying Users

Given the following SNMPv3 view and SNMPv3 group configuration:

```
!  snmp-server view view_name 1.3.6.1.2.1.1 included
  snmp-server group group_name v3 noauth read view_name write view_name
!
```

This example shows how to create a noAuthNoPriv user with read and write view access to a system group:

```
config
  snmp-server user noauthuser group_name v3
```

**Note**

The user must belong to a noauth group before a noAuthNoPriv user can be created.

Only one remote host can be assigned to the same username for SNMP version 3. If you configure the same username with different remote hosts, only the last username and remote host combination will be accepted and will be seen in the show running configuration. In the case of multiple SNMP managers, multiple unique usernames are required.

This example shows the same username case which only the last configuration will be accepted:

```
config
  snmp-server user username nervectrgrp remote 10.69.236.146 udp-port 162 v3 auth sha <password> priv aes 128 <password>
  snmp-server user username nervectrgrp remote 10.214.127.2 udp-port 162 v3 auth sha <password> priv aes 128 <password>
  snmp-server user username nervectrgrp remote 10.69.236.147 udp-port 162 v3 auth sha <password> priv aes 128 <password>
RP/0/RSP0/CPU0:router# show run snmp-server user
  snmp-server user username nervectrgrp remote 10.69.236.146 udp-port 162 v3 auth sha
```

```
```
encrypted <password> priv aes 128 encrypted <password>

This example shows all 3 hosts for username1, username2, and username3 will be accepted.

:  

snmp-server user username1 nervectrgrp remote 10.69.236.146 udp-port 162 v3 auth sha <password> priv aes 128 <password>

snmp-server user username2 nervectrgrp remote 10.214.127.2 udp-port 162 v3 auth sha <password> priv aes 128 <password>

snmp-server user username3 nervectrgrp remote 10.69.236.147 udp-port 162 v3 auth sha <password> priv aes 128 <password>

This example shows how to verify the attributes that apply to the SNMP user:

RP/0/RSP0/CPU0:router# show run snmp-server user

snmp-server user batmanusr1 nervectrgrp remote 10.69.236.146 udp-port 162 v3 auth sha encrypted <password> priv aes 128 encrypted <password>

snmp-server user batmanusr2 nervectrgrp remote 10.214.127.2 udp-port 162 v3 auth sha encrypted <password> priv aes 128 encrypted <password>

snmp-server user batmanusr3 nervectrgrp remote 10.69.236.147 udp-port 162 v3 auth sha encrypted <password> priv aes 128 encrypted <password>

This example shows how to create a user with authentication (including encryption), read, and write view access to a system group:

config
snmp-server user userv3authprivSNMP_GROUP1 v3 auth md5 password123 priv aes 128 password123

Given the following SNMPv3 view and SNMPv3 group configuration:

!

snmp-server view SNMP_VIEW1 1.3.6.1.2.1.1 included
snmp-server group SNMP_GROUP1 v3 auth notify SNMP_VIEW1 read SNMP_VIEW1 write SNMP_VIEW1
!

This example shows how to create authNoPriv user with read and write view access to a system group:

RP/0/RSP0/CPU0:router(config)# snmp-server user authuser group_name v3 auth md5 clear auth_passwd
Because the group is configured at a security level of Auth, the user must be configured as “auth” at a minimum to access this group (“priv” users could also access this group). The authNoPriv user configured in this group, authuser, must supply an authentication password to access the view. In the example, auth_passwd is set as the authentication password string. Note that `clear` keyword is specified before the auth_passwd password string. The `clear` keyword indicates that the password string being supplied is unencrypted.

This example shows how to verify the attributes that apply to SNMP user:

```bash
RP/0/RSP0/CPU0:router# show snmp user
User name: authuser
Engine ID: localSnmpID
storage-type: nonvolatile active
```

Given the following SNMPv3 view and SNMPv3 group configuration:

```bash
! 
snmp view view_name 1.3.6.1.2.1.1 included
snmp group group_name v3 priv read view_name write view_name
!
```

This example shows how to create an authPriv user with read and write view access to a system group:

```bash
config
  snmp-server user privuser group_name v3 auth md5 clear auth_passwd priv des56 clear priv_passwd
```

Because the group has a security level of Priv, the user must be configured as a “priv” user to access this group. In this example, the user, privuser, must supply both an authentication password and privacy password to access the OIDs in the view.

This example shows how to verify the attributes that apply to the SNMP user:

```bash
RP/0/RSP0/CPU0:router# show snmp user
User name: privuser
Engine ID: localSnmpID
storage-type: nonvolatile active
```

### Configuring Trap Notifications: Example

The following example configures an SNMP agent to send out different types of traps. The configuration includes a v2c user, a noAuthNoPriv user, anaauthNoPriv user, and an AuthPriv user.
The default User Datagram Protocol (UDP) port is 161. If you do not specify a UDP port with the `udp-port` keyword and `port` argument, then the configured SNMP trap notifications are sent to port 161.

```
!snmp-server host 10.50.32.170 version 2c public udp-port 2345
snmp-server host 10.50.32.170 version 3 auth userV3auth udp-port 2345
snmp-server host 10.50.32.170 version 3 priv userV3priv udp-port 2345
snmp-server user userv2c groupv2c v2c
snmp-server user userV3auth groupV3auth v3 auth md5 encrypted 140F0A13
snmp-server user userV3priv groupV3priv v3 auth md5 encrypted 021E1C43 priv des56 encrypted 1110001C
snmp-server user userV3noauth groupV3noauth v3 LROwner
snmp-server view view_name 1.3 included
snmp-server community public RW
snmp-server group groupv2c v2c read view_name
snmp-server group groupV3auth v3 auth read view_name
snmp-server group groupV3priv v3 priv read view_name
snmp-server group groupV3noauth v3 noauth read view_name
```

This example shows how to verify the configuration SNMP trap notification recipients host, the recipients of SNMP trap notifications. The output displays the following information:

- IP address of the configured notification host
- UDP port where SNMP notification messages are sent
- Type of trap configured
- Security level of the configured user
- Security model configured

```
config
show snmp host

Notification host: 10.50.32.170 udp-port: 2345 type: trap
user: userV3auth security model: v3 auth

Notification host: 10.50.32.170 udp-port: 2345 type: trap
user: userV3noauth security model: v3 noauth

Notification host: 10.50.32.170 udp-port: 2345 type: trap
user: userV3priv security model: v3 priv

Notification host: 10.50.32.170 udp-port: 2345 type: trap
user: userv2c security model: v2c
```

**Setting an IP Precedence Value for SNMP Traffic: Example**

The following example shows how to set the SNMP IP Precedence value to 7:

```
configure
```
Setting an IP DSCP Value for SNMP Traffic: Example

The following example shows how to set the IP DSCP value of SNMP traffic to 45:

```
configure
    snmp-server ipv4 dscp 45
exit

Uncommitted changes found, commit them before exiting(yes/no/cancel)? [cancel]: y
```

CHAPTER 6

Configuring Object Tracking

This module describes the configuration of object tracking on your Cisco IOS XR network. For complete descriptions of the commands listed in this module, see Related Documents, on page 63. To locate documentation for other commands that might appear in the course of performing a configuration task, search online in Cisco ASR 9000 Series Aggregation Services Router Commands Master List.

</tr>
</tbody>
</table>

This module contains the following topics:

- Prerequisites for Implementing Object Tracking, on page 55
- Information About Object Tracking, on page 55
- How to Implement Object Tracking, on page 56
- Configuration Examples for Configuring Object Tracking, on page 62
- Additional References, on page 62

Prerequisites for Implementing Object Tracking

You must be in a user group associated with a task group that includes the proper task IDs. The command reference guides include the task IDs required for each command. If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Information About Object Tracking

Object tracking is a mechanism for tracking an object to take any client action on another object as configured by the client. The object on which the client action is performed may not have any relationship to the tracked objects. The client actions are performed based on changes to the properties of the object being tracked.

You can identify each tracked object by a unique name that is specified by the track command in the configuration mode.
The tracking process periodically polls the tracked object and reports any changes to its state. The state of the tracked objects can be up or down. The polling occurs either immediately or after a delay of a configured period.

You can also track multiple objects by a list. You can use a flexible method for combining objects with Boolean logic. This functionality includes:

- **Boolean AND function**—When a tracked list has been assigned a Boolean AND function, each object that is defined within a subset must be in an "up" state. This condition enables the tracked object to be in the "up" state.

- **Boolean OR function**—When the tracked list has been assigned a Boolean OR function, at least one object that is defined within a subset must also be in an "up" state. This condition enables the tracked object to be in the "up" state.

### How to Implement Object Tracking

This section describes the various object tracking procedures.

### Tracking the Line Protocol State of an Interface

Perform this task in global configuration mode to track the line protocol state of an interface.

A tracked object is considered up when a line protocol of the interface is up.

After configuring the tracked object, you may associate the interface whose state should be tracked and specify the number of seconds to wait before the tracking object polls the interface for its state.

#### SUMMARY STEPS

1. configure
2. track track-name
3. type line-protocol state
4. interface type interface-path-id
5. exit
6. (Optional) delay {up seconds | down seconds}
7. Use one of the following commands:
   - end
   - commit

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure</td>

*Example:*
```
RP/0/RSP0/CPU0:router(config-track-line-prot)# exit
```

<table>
<thead>
<tr>
<th>Step 6</th>
<th><strong>Command or Action</strong></th>
<th><strong>Purpose</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>**(Optional) delay { up seconds</td>
<td>down seconds }**</td>
<td>Schedules the delay that can occur between tracking whether the object is up or down.</td>
</tr>
</tbody>
</table>

*Example:*
```
RP/0/RSP0/CPU0:router(config-track)# delay up 10
```

<table>
<thead>
<tr>
<th>Step 7</th>
<th><strong>Command or Action</strong></th>
<th><strong>Purpose</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Use one of the following commands:</td>
<td>Saves configuration changes.</td>
<td></td>
</tr>
</tbody>
</table>

*Example:*
```
RP/0/RSP0/CPU0:router(config-track)# end
```

`or`
```
RP/0/RSP0/CPU0:router(config-track)# commit
```

*When you issue the **end** command, the system prompts you to commit changes:*
```
Uncommitted changes found, commit them before exiting(yes/no/cancel)? [cancel]:
```

*Entering **yes** saves configuration changes to the running configuration file, exits the configuration session, and returns the router to EXEC mode.*

*Entering **no** exits the configuration session and returns the router to EXEC mode without committing the configuration changes.*

*Entering **cancel** leaves the router in the current configuration session without exiting or committing the configuration changes.*
### Tracking IP Route Reachability

When a host or a network goes down on a remote site, routing protocols notify the router and the routing table is updated accordingly. The routing process is configured to notify the tracking process when the route state changes due to a routing update.

A tracked object is considered up when a routing table entry exists for the route and the route is accessible.

#### SUMMARY STEPS

1. configure
2. track track-name
3. type route reachability
4. Use one of the following commands:
   - vrf vrf-table-name
   - route ipv4 IP-prefix/mask
5. exit
6. (Optional) delay {up seconds | down seconds}
7. commit

#### DETAILED STEPS

<table>
<thead>
<tr>

<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure</td>
<td>Enters track configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> track track-name</td>
<td>Configures the routing process to notify the tracking process when the state of the route changes due to a routing update.</td>
</tr>
<tr>
<td>Example: RP/0/RSP0/CPU0:router(config)# track track1</td>
<td>• track-name—Specifies a name for the object to be tracked.</td>
</tr>
<tr>
<td><strong>Step 3</strong> type route reachability</td>
<td>Configures the type of IP route to be tracked, which can consist of either of the following, depending on your router type:</td>
</tr>
<tr>
<td>Example: RP/0/RSP0/CPU0:router(config-track)# type route reachability vrf internet</td>
<td>• vrf-table-name—A VRF table name.</td>
</tr>
<tr>
<td><strong>Step 4</strong> Use one of the following commands:</td>
<td>• IP-prefix/mask—An IP prefix consisting of the network and subnet mask (for example, 10.56.8.10/16).</td>
</tr>
<tr>
<td>• vrf vrf-table-name</td>
<td></td>
</tr>
</tbody>
</table>
Building a Track Based on a List of Objects

Perform this task in the global configuration mode to create a tracked list of objects (which, in this case, are lists of interfaces or prefixes) using a Boolean expression to determine the state of the list.

A tracked list contains one or more objects. The Boolean expression enables two types of calculations by using either AND or OR operators. For example, when tracking two interfaces, using the AND operator, up means that both interfaces are up, and down means that either interface is down.

An object must exist before it can be added to a tracked list.

The NOT operator is specified for one or more objects and negates the state of the object.

After configuring the tracked object, you must associate the interface whose state should be tracked and you may optionally specify the number of seconds to wait before the tracking object polls the interface for its state.

**SUMMARY STEPS**

1. configure
2. track track-name
3. type list boolean { and | or }
4. object object-name [ not ]
5. exit
6. (Optional) delay { up seconds | down seconds }
7. Use one of the following commands:
   • end
# Building a Track Based on a List of Objects

## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> track  track-name</td>
<td>Enters track configuration mode.</td>
</tr>
</tbody>
</table>
| **Example:**  
  RP/0/RSP0/CPU0:router(config)# track track1 |  
  • **track-name**—Specifies a name for the object to be tracked. |
| **Step 3** type  list  boolean  { and | or } | Configures a Boolean list object and enters track list configuration mode. |
| **Example:**  
  RP/0/RSP0/CPU0:router(config-track-list)# type list  
  boolean and |  
  • **boolean**—Specifies that the state of the tracked list is based on a Boolean calculation.  
  • **and**—Specifies that the list is up if all objects are up, or down if one or more objects are down. For example, when tracking two interfaces, up means that both interfaces are up, and down means that either interface is down.  
  • **or**—Specifies that the list is up if at least one object is up. For example, when tracking two interfaces, up means that either interface is up, and down means that both interfaces are down. |
| **Step 4** object  object-name  [ not ] | Specifies the object to be tracked by the list |
| **Example:**  
  RP/0/RSP0/CPU0:router(config-track-list)# object  
  3 not |  
  • **object-name**—Name of the object to track.  
  • **not**—Negates the state of the object. |
| **Step 5** exit | Exits the track line protocol configuration mode. |
| **Example:**  
  RP/0/RSP0/CPU0:router(config-track-line-prot)# exit | |
| **Step 6** (Optional) delay  { up  seconds | down  seconds } | Schedules the delay that can occur between tracking whether the object is up or down. |
| **Example:**  
  RP/0/RSP0/CPU0:router(config-track)# delay up 10 | |
| **Step 7** Use one of the following commands:  
  • end  
  • commit | Saves configuration changes. |
| **Example:**  
  RP/0/RSP0/CPU0:router(config-track)# end |  
  • When you issue the **end** command, the system prompts you to commit changes:  
  **Uncommitted changes found, commit them before exiting(yes/no/cancel)?**  
  [cancel]; |
### Purpose

Command or Action | Purpose
--- | ---
RP/0/RSP0/CPU0:router(config-track)# commit | • Entering `yes` saves configuration changes to the running configuration file, exits the configuration session, and returns the router to EXEC mode.

|  | • Entering `no` exits the configuration session and returns the router to EXEC mode without committing the configuration changes.

|  | • Entering `cancel` leaves the router in the current configuration session without exiting or committing the configuration changes.

|  | • Use the `commit` command to save the configuration changes to the running configuration file and remain within the configuration session.

### Tracking IPSLA Reachability

Use this task to enable the tracking of the return code of IP service level agreement (SLA) operations.

#### SUMMARY STEPS

1. `configure`
2. `track track-name`
3. `type rtr ipsla-no reachability`
4. `commit`

System Management Configuration Guide for Cisco ASR 9000 Series Routers, IOS XR Release 6.2.x
Configuring IPSLA Tracking: Example

This example shows the configuration of IPSLA tracking:

```
RP/0/RSP0/CPU0:router(config)# track track1
RP/0/RSP0/CPU0:router(config-track)# type rtr 1 reachability
RP/0/RSP0/CPU0:router(config-track)# delay up 5
RP/0/RSP0/CPU0:router(config-track)# delay down 10
```

Configuration Examples for Configuring Object Tracking

Configuring IPSLA Tracking: Example

This example shows the configuration of IPSLA tracking, including the ACL and IPSLA configuration:

ACL configuration:

```
RP/0/RSP0/CPU0:router(config)# ipv4 access-list abf-track
RP/0/RSP0/CPU0:router(config-ipv4-acl)# 10 permit any any nexthop track track1 1.2.3.4
```

Object tracking configuration:

```
RP/0/RSP0/CPU0:router(config)# track track1
RP/0/RSP0/CPU0:router(config-track)# type rtr 1 reachability
RP/0/RSP0/CPU0:router(config-track)# delay up 5
RP/0/RSP0/CPU0:router(config-track)# delay down 10
```

IPSLA configuration:

```
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# operation 1
RP/0/RSP0/CPU0:router(config-ipsla-op)# type icmp echo
RP/0/RSP0/CPU0:router(config-ipsla-icmp-echo)# source address 2.3.4.5
RP/0/RSP0/CPU0:router(config-ipsla-icmp-echo)# destination address 1.2.3.4
RP/0/RSP0/CPU0:router(config-ipsla-icmp-echo)# frequency 60
RP/0/RSP0/CPU0:router(config-ipsla-icmp-echo)# exit
RP/0/RSP0/CPU0:router(config-ipsla-op)# exit
RP/0/RSP0/CPU0:router(config-ipsla)# schedule operation 1
RP/0/RSP0/CPU0:router(config-ipsla-sched)# start-time now
RP/0/RSP0/CPU0:router(config-ipsla-sched)# life forever
```

Configuring Cisco Discovery Protocol

Cisco Discovery Protocol (CDP) is a media- and protocol-independent protocol that runs on all Cisco-manufactured equipment including routers, bridges, access and communication servers, and switches. Using CDP, you can view information about all the Cisco devices that are directly attached to the device.

This module describes the new and revised tasks you need to implement CDP on your Cisco IOS XR network.

For more information about CDP on the Cisco IOS XR software and complete descriptions of the CDP commands listed in this module, refer to Related Documents, on page 73. To locate documentation for other commands that might appear in the course of running a configuration task, search online in Cisco ASR 9000 Series Aggregation Services Router Commands Master List.

</tr>
</tbody>
</table>

This module contains the following topics:

- Prerequisites for Implementing CDP, on page 65
- Information About Implementing CDP, on page 66
- How to Implement CDP on Cisco IOS XR Software, on page 67
- Configuration Examples for Implementing CDP, on page 72
- Additional References, on page 72

Prerequisites for Implementing CDP

You must be in a user group associated with a task group that includes the proper task IDs. The command reference guides include the task IDs required for each command. If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.
Information About Implementing CDP

CDP is primarily used to obtain protocol addresses of neighboring devices and discover the platform of those devices. CDP can also be used to display information about the interfaces your router uses. CDP is media- and protocol-independent, and runs on all equipment manufactured by Cisco, including routers, bridges, access servers, and switches.

Use of SNMP with the CDP MIB allows network management applications to learn the device type and the SNMP agent address of neighboring devices and to send SNMP queries to those devices. CDP uses the CISCO-CDP-MIB.

CDP runs on all media that support Subnetwork Access Protocol (SNAP), including LAN, Frame Relay, and ATM physical media. CDP runs over the data link layer only. Therefore, two systems that support different network-layer protocols can learn about each other.

Each device configured for CDP sends periodic messages, known as advertisements, to a multicast address. Each device advertises at least one address at which it can receive SNMP messages. The advertisements also contain time-to-live, or hold-time, information, which indicates the length of time a receiving device holds CDP information before discarding it. Each device also listens to the periodic CDP messages sent by others to learn about neighboring devices and determine when their interfaces to the media go up or down.

CDP Version-2 (CDPv2) is the most recent release of the protocol and provides more intelligent device tracking features. These features include a reporting mechanism that allows for more rapid error tracking, thereby reducing costly downtime. Reported error messages can be sent to the console or to a logging server, and can cover instances of unmatching native VLAN IDs (IEEE 802.1Q) on connecting ports, and unmatching port duplex states between connecting devices.

CDPv2 `show` commands can provide detailed output on VLAN Trunking Protocol (VTP) management domain and duplex modes of neighbor devices, CDP-related counters, and VLAN IDs of connecting ports.

Type-length-value fields (TLVs) are blocks of information embedded in CDP advertisements. Table 13: Type-Length-Value Definitions for CDPv2, on page 66 summarizes the TLV definitions for CDP advertisements.

<table>
<thead>
<tr>
<th>TLV</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device-ID TLV</td>
<td>Identifies the device name in the form of a character string.</td>

### How to Implement CDP on Cisco IOS XR Software

#### Enabling CDP

To enable CDP, you must first enable CDP globally on the router and then enable CDP on a per-interface basis. This task explains how to enable CDP globally on the router and then enable CDP on an interface.

**SUMMARY STEPS**

1. `configure`
2. `cdp`
3. `interface` *type* `interface-path-id`
4. `cdp`
5. `commit`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>configure</code></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>cdp</code></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>RP/0/RSP0/CPU0:router(config)# cdp</code></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>interface</code> <em>type</em> <code>interface-path-id</code></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>RP/0/RSP0/CPU0:router(config)# interface pos 0/0/0/1</code></td>
</tr>
</tbody>
</table>
### Modifying CDP Default Settings

This task explains how to modify the default version, hold-time setting, and timer settings.

**Note**
The commands can be entered in any order.

#### SUMMARY STEPS

1. `configure`
2. `cdp advertise v1`
3. `cdp holdtime seconds`
4. `cdp timer seconds`
5. `commit`
6. (Optional) `show cdp`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure</td>
<td>Configures CDP to use only version 1 (CDPv1) in communicating with neighboring devices.</td>
</tr>
<tr>
<td><strong>Step 2</strong> cdp advertise v1</td>
<td>Enables CDP on an interface.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>By default, when CDP is enabled, the router sends CDPv2 packets. CDP also sends and receives CDPv1 packets if the device with which CDP is interacting does not process CDPv2 packets.</td>
</tr>
<tr>
<td></td>
<td>In this example, the router is configured to send and receive only CDPv1 packets.</td>
</tr>
<tr>
<td><strong>Step 3</strong> cdp holdtime seconds</td>
<td>Specifies the amount of time that the receiving networking device will hold a CDP packet sent from the router before discarding it.</td>
</tr>
<tr>
<td>Example:</td>
<td>By default, when CDP is enabled, the receiving networking device holds a CDP packet for 180 seconds before discarding it.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Configuring Cisco Discovery Protocol

#### Monitoring CDP

This task shows how to monitor CDP.

**Note**
The commands can be entered in any order.

**SUMMARY STEPS**

1. `show cdp entry {* | entry-name} [protocol | version]`
2. `show cdp interface [type interface-path-id | location node-id]`
3. `show cdp neighbors [type interface-path-id | location node-id] [detail]`
4. `show cdp traffic [location node-id]`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> `show cdp entry {*</td>
<td>entry-name} [protocol</td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>RP/0/RSP0/CPU0:router# show cdp entry *</td>
<td>Displays information about the interfaces on which CDP is enabled.</td>
</tr>
<tr>
<td><strong>Step 2</strong> show cdp interface [type interface-path-id</td>
<td>location node-id]</td>
</tr>
<tr>
<td><strong>Step 3</strong> show cdp neighbors [type interface-path-id</td>
<td>location node-id] [detail]</td>
</tr>
<tr>
<td><strong>Step 4</strong> show cdp traffic [location node-id]</td>
<td></td>
</tr>
</tbody>
</table>

### Examples

The following is sample output for the `show cdp neighbors` command:

```
RP/0/RSP0/CPU0:router# show cdp neighbors

Capability Codes: R - Router, T - Trans Bridge, B - Source Route Bridge
                  S - Switch, H - Host, I - IGMP, r - Repeater

Device ID     Local Intrfce    Holdtme Capability  Platform   Port ID
router1       Mg0/0/CPU0/0      177  T S           WS-C2924M Fa0/12
router2       PO0/4/0/0        157  R             12008/GRP Po0/4/0/1
```

The following is sample output for the `show cdp neighbors` command. In this example, the optional `type instance` arguments are used in conjunction with the `detail` optional keyword to display detailed information about a CDP neighbor. The output includes information on both IPv4 and IPv6 addresses.

```
RP/0/RSP0/CPU0:router# show cdp neighbors POS 0/4/0/0 detail

Device ID: uut-user
SysName : uut-user
Entry address(es):
  IPv4 address: 1.1.1.1
  IPv6 address: 1::1
  IPv6 address: 2::2
Platform: cisco 12008/GRP, Capabilities: Router
Interface: POS/4/0/3
Port ID (outgoing port): POS/2/0/3
Holdtime : 177 sec
Version : 
```
The following is sample output for the `show cdp entry` command. In this example, the optional `entry` argument is used to display entry information related to a specific CDP neighbor.

```
RP/0/RSP0/CPU0:router# show cdp entry router2

advertisement version: 2

-------------------------
Device ID: router2
SysName : router2
Entry address(es):
Platform: cisco 12008/GRP, Capabilities: Router
Interface: POS0/4/0/0
Port ID (outgoing port): POS0/4/0/1
Holdtime : 145 sec

Version :
Cisco IOS XR Software, Version 0.48.0[Default]
Copyright (c) 2004 by cisco Systems, Inc.

advertisement version: 2
```

The following is sample output for the `show cdp interface` command. In this example, CDP information related to Packet over SONET/SDH (POS) interface 0/4/0/0 is displayed.

```
RP/0/RSP0/CPU0:router# show cdp interface pos 0/4/0/0

POS0/4/0/0 is Up
Encapsulation HDLC
Sending CDP packets every 60 seconds
Holdtime is 180 seconds
```

The following is sample output for the `show cdp traffic` command:

```
RP/0/RSP0/CPU0:router# show cdp traffic

CDP counters :
Packets output: 194, Input: 99
Hdr syntax: 0, Chksum error: 0, Encaps failed: 0
No memory: 0, Invalid packet: 0, Truncated: 0
CDP version 1 advertisements output: 0, Input: 0
CDP version 2 advertisements output: 194, Input: 99
Unrecognize Hdr version: 0, File open failed: 0
```

The following is sample output for the `show cdp traffic` command. In this example, the optional `location` keyword and `node-id` argument are used to display information about the traffic gathered between devices using CDP from the specified node.

```
RP/0/RSP0/CPU0:router# show cdp traffic location 0/4/cpu0

CDP counters :
Packets output: 16, Input: 13
```
Configuration Examples for Implementing CDP

Enabling CDP: Example

The following example shows how to configure CDP globally and then enable CDP on Packet over SONET/SDH (POS) interface 0/3/0/0:

```
cdp
interface POS0/3/0/0
cdp
```

Modifying Global CDP Settings: Example

The following example shows how to modify global CDP settings. In this example, the timer setting is set to 20 seconds, the hold-time setting is set to 30 seconds, and the version of CDP used to communicate with neighboring devices is set to CDPv1:

```
cdp timer 20
  cdp holdtime 30
  cdp advertise v1
```

The following example shows how to use the `show cdp` command to verify the CDP global settings:

```
RP/0/RSP0/CPU0:router# show cdp

Global CDP information:
  Sending CDP packets every 20 seconds
  Sending a holdtime value of 30 seconds
  Sending CDPv2 advertisements is not enabled
```

CHAPTER 8

Configuring Periodic MIB Data Collection and Transfer

This document describes how to periodically transfer selected MIB data from your router to a specified Network Management System (NMS). The periodic MIB data collection and transfer feature is also known as bulk statistics.

Table 14: Feature History for Periodic MIB Data Collection and Transfer

This module contains the following topics:

- Prerequisites for Periodic MIB Data Collection and Transfer, on page 75
- Information About Periodic MIB Data Collection and Transfer, on page 76
- 4arg, on page 77
- How to Configure Periodic MIB Data Collection and Transfer, on page 77
- Periodic MIB Data Collection and Transfer: Example, on page 84

Prerequisites for Periodic MIB Data Collection and Transfer

To use periodic MIB data collection and transfer, you should be familiar with the Simple Network Management Protocol (SNMP) model of management information. You should also know what MIB information you want to monitor on your network devices, and the OIDs or object names for the MIB objects to be monitored.
Information About Periodic MIB Data Collection and Transfer

SNMP Objects and Instances

A type (or class) of SNMP management information is called an object. A specific instance from a type of management information is called an object instance (or SNMP variable). To configure a bulk statistics collection, you must specify the object types to be monitored using a bulk statistics object list and the specific instances of those objects to be collected using a bulk statistics schema.

MIBs, MIB tables, MIB objects, and object indices can all be specified using a series of numbers called an object identifier (OID). OIDs are used in configuring a bulk statistics collection in both the bulk statistics object lists (for general objects) and in the bulk statistics schemas (for specific object instances).

Bulk Statistics Object Lists

To group the MIB objects to be polled, you need to create one or more object lists. A bulk statistics object list is a user-specified set of MIB objects that share the same MIB index. Object lists are identified using a name that you specify. Named bulk statistics object lists allow the same configuration to be reused in different bulk statistics schemas.

All the objects in an object list must share the same MIB index. However, the objects do not need to be in the same MIB and do not need to belong to the same MIB table. For example, it is possible to group ifInOctets and a CISCO-IF-EXTENSION-MIB object in the same schema, because the containing tables for both objects are indexed by the ifIndex.

Bulk Statistics Schemas

Data selection for the Periodic MIB Data Collection and Transfer Mechanism requires the definition of a schema with the following information:

• Name of an object list.

• Instance (specific instance or series of instances defined using a wild card) that needs to be retrieved for objects in the specified object list.

• How often the specified instances need to be sampled (polling interval). The default polling interval is 5 minutes.

A bulk statistics schema is also identified using a name that you specify. This name is used when configuring the transfer options.

Bulk Statistics Transfer Options

After configuring the data to be collected, a single virtual file (VFile or bulk statistics file) with all collected data is created. This file can be transferred to a network management station using FTP or TFTP. You can specify how often this file should be transferred. The default transfer interval is once every 30 minutes. You can also configure a secondary destination for the file to be used if, for whatever reason, the file cannot be transferred to the primary network management station.
The value of the transfer interval is also the collection period (collection interval) for the local bulk statistics file. After the collection period ends, the bulk statistics file is frozen, and a new local bulk statistics file is created for storing data. The frozen bulk statistics file is then transferred to the specified destination.

By default, the local bulk statistics file is deleted after successful transfer to an network management station.

**Benefits of Periodic MIB Data Collection and Transfer**

Periodic MIB data collection and transfer (bulk statistics feature) allows many of the same functions as the bulk file MIB (CISCO-BULK-FILE-MIB.my), but offers some key advantages. The main advantage is that this feature can be configured through the CLI and does not require an external monitoring application.

Periodic MIB data collection and transfer is mainly targeted for medium to high-end platforms that have sufficient local storage (volatile or permanent) to store bulk statistics files. Locally storing bulk statistics files helps minimize loss of data during temporary network outages.

This feature also has more powerful data selection features than the bulk file MIB; it allows grouping of MIB objects from different tables into data groups (object lists). It also incorporates a more flexible instance selection mechanism, where the application is not restricted to fetching an entire MIB table.

**4arg**

4arg is Cisco’s implementation of Object Size Checking (OSC). OSC is a useful static analysis utility and a critical runtime defense for the detection and prevention of buffer overflows. 4arg captures buffer overflows (at runtime) that are otherwise undetected by code analysis tools and human review. 4arg also carries a reporting and logging component.

4arg refers to a theoretical fourth argument to a string copy function representing the destination buffer size.

**4arg Messages: Example**

An example of a 4arg message:

```
RP/0/RSP0/CPU0:router:Dec 1 12:00:00.802 : foo[123]:
%OS-DATACORRUPTION-1-DATAINCONSISTENCY : copy error : pkg/bin/foo :
(PID=12345) : -Traceback= 4bd43404 4bac7e04 4000c100
```

If you witness a traceback, please report the incident to Cisco TAC as soon as possible. Include the log message exactly as printed in the console.

**How to Configure Periodic MIB Data Collection and Transfer**

**Configuring a Bulk Statistics Object List**

The first step in configuring the Periodic MIB Data Collection and Transfer Mechanism is to configure one or more object lists.
Configuring a Bulk Statistics Schema

The second step in configuring periodic MIB data collection and transfer is to configure one or more schemas.

Before you begin
The bulk statistics object list to be used in the schema must be defined.

SUMMARY STEPS

1. configure
2. snmp-server mib bulkstat schema schema-name
3. object-list list-name
4. Do one of the following:
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td><strong>snmp-server mib bulkstat schema</strong> schema-name</td>
<td>Names the bulk statistics schema and enters bulk statistics schema mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>RP/0/RSP0/CPU0:router(config)# snmp-server mib bulkstat schema intE0</td>
<td></td>
</tr>
<tr>
<td></td>
<td>RP/0/RSP0/CPU0:router(config-bulk-sc)#</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td><strong>object-list</strong> list-name</td>
<td>Specifies the bulk statistics object list to be included in this schema. Specify only one object-list per schema. If multiple object-list commands are executed, the earlier ones are overwritten by newer commands.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>RP/0/RSP0/CPU0:router(config-bulk-sc)# object-list ifMib</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>Do one of the following:</td>
<td>Specifies the instance information for objects in this schema:</td>
</tr>
<tr>
<td></td>
<td>• instance exact {interface interface-id [sub-if]</td>
<td>• The <strong>instance exact</strong> command indicates that the specified instance, when appended to the object list, represents the complete OID.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>oid}</td>
</tr>
<tr>
<td></td>
<td>• instance wild {interface interface-id [sub-if]</td>
<td>• The <strong>instance wild</strong> command indicates that all subindices of the specified OID belong to this schema. The wild keyword allows you to specify a partial, “wild carded” instance.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>oid}</td>
</tr>
<tr>
<td></td>
<td>• instance range start oid end oid</td>
<td>• The <strong>instance range</strong> command indicates a range of instances on which to collect data.</td>
</tr>
<tr>
<td></td>
<td>• instance repetition oid max repeat-number</td>
<td>• The <strong>instance repetition</strong> command indicates data collection to repeat for a certain number of instances of a MIB object.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>RP/0/RSP0/CPU0:router(config-bulk-sc)# instance</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>wild oid 1</td>
</tr>
<tr>
<td></td>
<td>or</td>
<td></td>
</tr>
<tr>
<td></td>
<td>RP/0/RSP0/CPU0:router(config-bulk-sc)# instance</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>exact interface FastEthernet 0/1.25</td>
</tr>
<tr>
<td></td>
<td>or</td>
<td></td>
</tr>
<tr>
<td></td>
<td>RP/0/RSP0/CPU0:router(config-bulk-sc)# instance</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>range start 1 end 2</td>
</tr>
<tr>
<td></td>
<td>or</td>
<td></td>
</tr>
<tr>
<td></td>
<td>RP/0/RSP0/CPU0:router(config-bulk-sc)# instance</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>repetition 1 max 4</td>
</tr>
</tbody>
</table>

**Note** Only one **instance** command can be configured per schema. If multiple **instance** commands are executed, the earlier ones are overwritten by new commands.
Configuring Bulk Statistics Transfer Options

The final step in configuring periodic MIB data collection and transfer is to configure the transfer options. The collected MIB data are kept in a local file-like entity called a VFile (virtual file, referred to as a bulk statistics file in this document). This file can be transferred to a remote network management station at intervals you specify.

Before you begin
The bulk statistics object lists and bulk statistics schemas must be defined before configuring the bulk statistics transfer options.

SUMMARY STEPS
1. configure
2. snmp-server mib bulkstat transfer-id transfer-id
3. buffer-size bytes
4. format {bulkBinary | bulkASCII | schemaASCII}
5. schema schema-name
6. transfer-interval minutes
7. url primary url
8. url secondary url
9. retry number
10. retain minutes
11. enable
12. commit

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>snmp-server mib bulkstat transfer-id transfer-id</td>
<td>Identifies the transfer configuration with a name (transfer-id argument) and enters bulk statistics transfer configuration mode.</td>
</tr>
</tbody>
</table>

Example:

RP/0/RSP0/CPU0:router(config-bulk-sc)＃
configure
snmp-server mib bulkstat transfer-id bulkstat1

What to do next
Configure the bulk statistics transfer options.
### Command or Action

#### Step 3

**buffer-size bytes**

**Example:**

```
RP/0/RSP0/CPU0:router(config-bulk-tr)# buffersize 3072
```

**Purpose**

(Optional) Specifies the maximum size for the bulk statistics data file, in bytes. The valid range is from 1024 to 2147483647 bytes. The default buffer size is 2048 bytes.

**Note**

If the maximum buffer size for a bulk statistics file is reached before the transfer interval time expires, all additional data received is deleted. To correct this behavior, you can decrease the polling frequency, or increase the size of the bulk statistics buffer.

#### Step 4

**format {bulkBinary | bulkASCII | schemaASCII}**

**Example:**

```
RP/0/RSP0/CPU0:router(config-bulk-tr)# format schemaASCII
```

**Purpose**

(Optional) Specifies the format of the bulk statistics data file (VFile). The default is schemaASCII.

**Note**

Transfers can only be performed using schemaASCII (cdcSchemaASCII) format. SchemaASCII is a human-readable format that contains parser-friendly hints for parsing data values.

#### Step 5

**schema schema-name**

**Example:**

```
RP/0/RSP0/CPU0:router(config-bulk-tr)# schema ATM2/0-IFMIB
RP/0/RSP0/CPU0:router(config-bulk-tr)# schema ATM2/0-CAR
RP/0/RSP0/CPU0:router(config-bulk-tr)# schema Ethernet2/1-IFMIB
```

**Purpose**

Specifies the bulk statistics schema to be transferred. Repeat this command as desired. Multiple schemas can be associated with a single transfer configuration; all collected data are placed in a single bulk data file (VFile).

#### Step 6

**transfer-interval minutes**

**Example:**

```
RP/0/RSP0/CPU0:router(config-bulk-tr)# transfer-interval 20
```

**Purpose**

(Optional) Specifies how often the bulk statistics file are transferred, in minutes. The default value is once every 30 minutes. The transfer interval is the same as the collection interval.

#### Step 7

**url primary url**

**Example:**

```
RP/0/RSP0/CPU0:router(config-bulk-tr)# url primary ftp://user:password@host/folder/bulkstat1
```

**Purpose**

Specifies the network management system (host) that the bulk statistics data file is transferred to, and the protocol to use for transfer. The destination is specified as a Uniform Resource Locator (URL). FTP or TFTP can be used for the bulk statistics file transfer.

#### Step 8

**url secondary url**

**Example:**

```
RP/0/RSP0/CPU0:router(config-bulk-tr)# url secondary tftp://10.1.0.1/tftpboot/user/bulkstat1
```

**Purpose**

(Optional) Specifies a backup transfer destination and protocol for use in the event that transfer to the primary location fails. FTP or TFTP can be used for the bulk statistics file transfer.
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 9**         | **retry number**  
Example:  
RP/0/RSP0/CPU0:router(config-bulk-tr)# retry 1  |

(Optional) Specifies the number of transmission retries. The default value is 0 (in other words, no retries). If an attempt to send the bulk statistics file fails, the system can be configured to attempt to send the file again using this command.

One retry includes an attempt first to the primary destination then, if the transmission fails, to the secondary location. For example, if the retry value is 1, an attempt is made first to the primary URL, then to the secondary URL, then to the primary URL again, then to the secondary URL again. The valid range is from 0 to 100.

If all retries fail, the next normal transfer occurs after the configured transfer-interval time.

| **Step 10** | **retain minutes**  
Example:  
RP/0/RSP0/CPU0:router(config-bulk-tr)# retain 60  |

(Optional) Specifies how long the bulk statistics file should be kept in system memory, in minutes, after the completion of the collection interval and a transmission attempt is made. The default value is 0. Zero (0) indicates that the file is deleted immediately after the transfer is attempted. The valid range is from 0 to 20000.

**Note**  
If the retry command is used, you should configure a retain interval larger than 0. The interval between retries is the retain interval divided by the retry number. For example, if **retain 10** and **retry 2** are configured, two retries are attempted once every 5 minutes. Therefore, if retain 0 is configured, no retries are attempted.

| **Step 11** | **enable**  
Example:  
RP/0/RSP0/CPU0:router(config-bulk-tr)# enable  |

begins the bulk statistics data collection and transfer process for this configuration.

- For successful execution of this action, at least one schema with non-zero number of objects must be configured.

- Periodic collection and file transfer begins only if this command is configured. Conversely, the **no enable** command stops the collection process. A subsequent **enable** starts the operations again.

- Each time the collection process is started using the **enable** command, data is collected into a new bulk statistics file. When the **no enable** command is used, the transfer process for any collected data immediately begins (in other words, the existing bulk statistics file is transferred to the specified management station).

| **Step 12** | **commit** |

|
What to do next

If the maximum buffer size for a bulk statistics file is reached before the transfer interval time expires, the transfer operation is still initiated, but any bulk statistics data received after the file was full, and before it was transferred, are deleted. To correct this behavior, you can decrease the polling frequency, or increase the size of the bulk statistics buffer.

If retain 0 is configured, no retries are attempted. This is because the interval between retries is the retain value divided by the retry value. For example, if retain 10 and retry 2 are configured, retries are attempted once every 5 minutes. Therefore, if you configure the retry command, you should also configure an appropriate value for the retain command.

Monitoring Periodic MIB Data Collection and Transfer

SUMMARY STEPS

1. show snmp mib bulkstat transfer transfer-name

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 show snmp mib bulkstat transfer transfer-name   | (Optional) The show command for this feature lists all bulk statistics virtual files (VFiles) on the system that have finished collecting data. (Data files that are not complete are not displayed.) The output lists all of the completed local bulk statistics files, the remaining time left before the bulk statistics file is deleted (remaining retention period), and the state of the bulk statistics file. The “STATE” of the bulk statistics file is one of the following:
  • Queued--Indicates that the data collection for this bulk statistics file is completed (in other words, the transfer interval has been met) and that the bulk statistics file is waiting for transfer to the configured destination(s).
  • Retry--Indicates that one or more transfer attempts have failed and that the file transfer will be attempted again. The number of retry attempts remaining are displayed in parenthesis.
  • Retained--Indicates that the bulk statistics file has either been successfully transmitted or that the configured number of retries have been completed. |
### Periodic MIB Data Collection and Transfer: Example

This example shows how to configure periodic MIB data collection and transfer:

```plaintext
snmp-server mib bulkstat object-list cempo
add cempMemPoolName
add cempMemPoolType
!

snmp-server mib bulkstat schema cempWild
object-list cempo
instance wild oid 8695772
poll-interval 1
!

snmp-server mib bulkstat schema cempRepeat
object-list cempo
instance repetition 8695772.1 max 4294967295
poll-interval 1
!

snmp-server mib bulkstat transfer-id cempt1
enable
schema cempWild
schema cempRepeat
transfer-interval 2
!
```

This example shows sample bulk statistics file content:

```plaintext
Schema-def cempt1.cempWild "%u, %s, %s, %d" Epochtime instanceoid
1.3.6.1.4.1.9.9.221.1.1.1.1.3 1.3.6.1.4.1.9.9.221.1.1.1.1.2

cempt1.cempWild: 1339491515, 8695772.1, processor, 2

cempt1.cempWild: 1339491515, 8695772.2, reserved, 11

cempt1.cempWild: 1339491515, 8695772.3, image, 12

cempt1.cempWild: 1339491575, 8695772.1, processor, 2

cempt1.cempWild: 1339491575, 8695772.2, reserved, 11

cempt1.cempWild: 1339491575, 8695772.3, image, 12

Schema-def cempt1.cempRepeat "%u, %s, %s, %d" Epochtime instanceoid
```

---

**show snmp mib bulkstat transfer Sample Output**

RP/0/RSP0/CPU0:router# show snmp mib bulkstat transfer

Transfer Name : ifmib
Retained files

<table>
<thead>
<tr>
<th>File Name</th>
<th>Time Left (in seconds)</th>
<th>STATE</th>
</tr>
</thead>
<tbody>
<tr>
<td>ifmib_Router_020421_100554683</td>
<td>173</td>
<td>Retry (2 Retry attempt(s) Left)</td>
</tr>
</tbody>
</table>

---

**Periodic MIB Data Collection and Transfer: Example**

This example shows how to configure periodic MIB data collection and transfer:

```plaintext
snmp-server mib bulkstat object-list cempo
add cempMemPoolName
add cempMemPoolType
!

snmp-server mib bulkstat schema cempWild
object-list cempo
instance wild oid 8695772
poll-interval 1
!

snmp-server mib bulkstat schema cempRepeat
object-list cempo
instance repetition 8695772.1 max 4294967295
poll-interval 1
!

snmp-server mib bulkstat transfer-id cempt1
enable
schema cempWild
schema cempRepeat
transfer-interval 2
!
```

This example shows sample bulk statistics file content:

```plaintext
Schema-def cempt1.cempWild "%u, %s, %s, %d" Epochtime instanceoid
1.3.6.1.4.1.9.9.221.1.1.1.1.3 1.3.6.1.4.1.9.9.221.1.1.1.1.2

cempt1.cempWild: 1339491515, 8695772.1, processor, 2

cempt1.cempWild: 1339491515, 8695772.2, reserved, 11

cempt1.cempWild: 1339491515, 8695772.3, image, 12

cempt1.cempWild: 1339491575, 8695772.1, processor, 2

cempt1.cempWild: 1339491575, 8695772.2, reserved, 11

cempt1.cempWild: 1339491575, 8695772.3, image, 12

Schema-def cempt1.cempRepeat "%u, %s, %s, %d" Epochtime instanceoid
```
Configuring Periodic MIB Data Collection and Transfer

Periodic MIB Data Collection and Transfer: Example
Configuring Flexible Command Line Interface

This module describes how to configure and use flexible command line interface (CLI) configuration groups.

| Table 15: Feature History for Configuring Flexible CLI Configuration Groups |
|-------------------|------------------|
| **Release**       | **Modification** |
| Release 4.3.1     | Flexible CLI configuration groups were introduced. |

This module contains these topics:

- Information About Flexible CLI Configuration Groups, on page 87
- Flexible Configuration Restrictions, on page 88
- Configuring a Configuration Group, on page 89
- Verifying the Configuration of Configuration Groups, on page 92
- Apply Groups Priority Inheritance, on page 93
- Regular Expressions in Configuration Groups, on page 94
- Configuration Examples for Flexible CLI Configuration, on page 105

Information About Flexible CLI Configuration Groups

Flexible command line interface (CLI) configuration groups provide the ability to minimize repetitive configurations by defining a series of configuration statements in a configuration group, and then applying this group to multiple hierarchical levels in the router configuration tree.

Flexible CLI configuration groups utilize regular expressions that are checked for a match at multiple submodes of the configuration tree based on where the group is applied within the hierarchy. If a match is found at a configuration submode, the corresponding configuration defined in the group is inherited within the matched submode.

Flexible CLI configuration groups also provide an auto-inheritance feature. Auto-inheritance means that any change done to a CLI configuration group is automatically applied to the configuration in any matched submodes that have an apply-group at that hierarchical level. This allows you to make a configuration change or addition once, and have it applied automatically in multiple locations, depending on where you have applied the flexible CLI configuration group.
Flexible Configuration Restrictions

Note these restrictions while using flexible configuration groups:

- Flexible CLI configuration groups are not supported in administration configurations and corresponding apply-groups are not supported in administration configurations.
- Use of preconfigured interfaces in configuration groups is not supported.
- Downgrading from an image that supports configuration groups to an image that does not support them is not supported.
- Access lists, quality of service and route policy configurations do not support the use of configuration groups. Configurations such as these are not valid:

```conf
group g-not-supported
  ipv4 access-list ...
  !
  ipv6 access-list ...
  !
  ethernet-service access-list ...
  !
  class-map ...
  !
  policy-map ...
  !
  route-policy ...
  !
end-group
```

You can, however, reference such configurations, as shown in this example:

```conf
group g-reference-ok
  router bgp 6500
  neighbor 7::7
  remote-as 65000
  bfd fast-detect
  update-source Loopback300
  graceful-restart disable
  address-family ipv6 unicast
  route-policy test1 in
  route-policy test2 out
  soft-reconfiguration inbound always
  !
  !
  !
  interface Bundle-Ether1005
  bandwidth 10000000
  mtu 9188
  service-policy output input_1
  load-interval 30
  !
end-group
```

- Some regular expressions are not supported within groups. For example, ‘?’ and ‘|’ are not supported within groups. Also some characters such as /d and /w are not supported.
• The choice operator “|” to express multiple match expressions within a regular expression is not supported. For example, these expressions are not supported:

Gig.*|Gig.*\.\.*—To match on either Gigabit Ethernet main interfaces or Gigabit Ethernet sub-interfaces.

Gig.*0/0/0/[1-5]|Gig.*0/0/0/[10-20]—To match on either Gig.*0/0/0/[1-5] or Gig.*0/0/0/[10-20].

'TenGigE.*|POS.*—To match on either TenGigE.* or POS.*.

• Commands that require a node identifier for the location keyword are not supported. For example, this configuration is not supported:

lpts pifib hardware police location 0/0/CPU0

• Overlapping regular expressions within a configuration group for the same configuration are not supported. For example:

```plaintext
group G-INTERFACE
interface 'gig.*a.*'
  mtu 1500
!
interface 'gig.*e.*'
  mtu 2000
!
end-group

interface gigabitethernet0/4/1/0
  apply-group G-INTERFACE
```

This configuration is not permitted because it cannot be determined whether the interface gigabitethernet0/4/1/0 configuration inherits mtu 1500 or mtu 2000. Both expressions in the configuration group match gigabitethernet0/4/1/0.

• Up to eight configuration groups are permitted on one apply-group command.

• Use multi-line configuration style to configure Flexible CLI configuration groups (like group or apply-group commands) by entering each configuration mode in a separate line, one configuration per line. This is important so that the configuration properties are fully inherited and for better readability during troubleshooting.

Example for a correct configuration style is:

```plaintext
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# router isis IGP
RP/0/RSP0/CPU0:router(config-isis)# interface Ten 0/4/0/0
RP/0/RSP0/CPU0:router(config-isis-if)# address-family ipv4 unicast
RP/0/RSP0/CPU0:router (config-isis-if-sf)# metric 123
```

### Configuring a Configuration Group

A configuration group includes a series of configuration statements that can be used in multiple hierarchical levels in the router configuration tree. By using regular expressions in a configuration group, you can create generic commands that can be applied in multiple instances.
Use this task to create and use a configuration group.

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure</td>
</tr>
<tr>
<td>Step 2</td>
<td>group group-name</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RSP0/CPU0:router(config)# group g-interf</td>
</tr>
<tr>
<td></td>
<td>Specifies a name for a configuration group and enters group configuration mode to define the group. The group-name argument can have up to 32 characters and cannot contain any special characters. For information regarding special characters, refer to the Understanding Regular Expressions, Special Characters, and Patterns module in the Cisco ASR 9000 Series Aggregation Services Router Getting Started Guide.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Enter configuration commands, starting from global configuration mode. Use regular expressions for interface names and other variable instances.</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RSP0/CPU0:router(config)# group g-interf RP/0/RSP0/CPU0:router(config-GRP)# interface 'GigabitEthernet.*' RP/0/RSP0/CPU0:router(config-GRP-if)# mtu 1500</td>
</tr>
<tr>
<td></td>
<td>Specifies the configuration statements that you want included in this configuration group.</td>
</tr>
<tr>
<td></td>
<td>For more information regarding the use of regular expressions, see Regular Expressions in Configuration Groups, on page 94. This example is applicable to all Gigabit Ethernet interfaces.</td>
</tr>
<tr>
<td>Step 4</td>
<td>end-group</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RSP0/CPU0:router(config-GRP-if)# end-group</td>
</tr>
<tr>
<td></td>
<td>Completes the configuration of a configuration group and exits to global configuration mode.</td>
</tr>
<tr>
<td>Step 5</td>
<td>apply-group</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RSP0/CPU0:router(config)# interface GigabitEthernet0/2/0/0 RP/0/RSP0/CPU0:router(config-if)# apply-group</td>
</tr>
<tr>
<td></td>
<td>Adds the configuration of the configuration group into the router configuration applicable at the location that the group is applied. Groups can be applied in multiple locations, and their effect depends on the location and context.</td>
</tr>
<tr>
<td></td>
<td>The MTU value from the group g-interf is applied to the interface GigabitEthernet0/2/0/0. If this group is applied in</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>------------------</td>
<td>---------</td>
</tr>
<tr>
<td>g-interf</td>
<td>global configuration mode, the MTU value is inherited by all Gigabit Ethernet interfaces that do not have an MTU value configured.</td>
</tr>
</tbody>
</table>

**Simple Configuration Group: Example**

This example shows how to use configuration groups to add a global configuration to the system:

```
RP/0/RSP0/CPU0:router(config)# group g-logging
RP/0/RSP0/CPU0:router(config-GRP)# logging trap notifications
RP/0/RSP0/CPU0:router(config-GRP)# logging console debugging
RP/0/RSP0/CPU0:router(config-GRP)# logging monitor debugging
RP/0/RSP0/CPU0:router(config-GRP)# logging buffered 10000000
RP/0/RSP0/CPU0:router(config-GRP)# end-group

RP/0/RSP0/CPU0:router(config)# apply-group g-logging
```

When this configuration is committed, all commands contained in the g-logging configuration group are committed.

**Configuration Group Applied to Different Places: Example**

Configuration groups can be applied to different places, and their effect depends on the context within which they are applied. Consider this configuration group:

```
RP/0/RSP0/CPU0:router(config)# group g-interfaces
RP/0/RSP0/CPU0:router(config-GRP)# interface 'FastEthernet.*'
RP/0/RSP0/CPU0:router(config-GRP-if)# mtu 1500
RP/0/RSP0/CPU0:router(config-GRP-if)# exit
RP/0/RSP0/CPU0:router(config-GRP)# interface 'GigabitEthernet.*'
RP/0/RSP0/CPU0:router(config-GRP-if)# mtu 1000
RP/0/RSP0/CPU0:router(config-GRP-if)# exit
RP/0/RSP0/CPU0:router(config-GRP)# interface 'POS.*'
RP/0/RSP0/CPU0:router(config-GRP-if)# mtu 2000
RP/0/RSP0/CPU0:router(config-GRP-if)# end-group
```

This group can be applied to Fast Ethernet, Gigabit Ethernet or POS interfaces, and in each instance the applicable MTU is applied. For instance, in this example, the Gigabit Ethernet interface is configured to have an MTU of 1000:

```
RP/0/RSP0/CPU0:router(config)# interface GigabitEthernet0/2/0/0
RP/0/RSP0/CPU0:router(config-if)# apply-group g-interfaces
RP/0/RSP0/CPU0:router(config-if)# ipv4 address 2.2.2.2 255.255.255.255
```

In this example, the Fast Ethernet interface is configured to have an MTU of 1500:

```
RP/0/RSP0/CPU0:router(config)# interface FastEthernet0/2/0/0
RP/0/RSP0/CPU0:router(config-if)# apply-group g-interfaces
```
### Verifying the Configuration of Configuration Groups

Use this task to verify the router configuration using configuration groups:

#### SUMMARY STEPS

1. `show running-config group [group-name]`
2. `show running-config`
3. `show running-config inheritance`
4. `show running-config interface x/y/z inheritance config-command`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> show running-config group [group-name]</td>
<td>Displays the contents of a specific or all configured configuration groups.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>RP/0/RSP0/CPU0:router# show running-config group</code></td>
<td></td>
</tr>
<tr>
<td>group g-int-ge</td>
<td></td>
</tr>
<tr>
<td>interface 'GigabitEthernet.*'</td>
<td></td>
</tr>
<tr>
<td>mtu 1000</td>
<td></td>
</tr>
<tr>
<td>negotiation auto</td>
<td></td>
</tr>
<tr>
<td>!</td>
<td></td>
</tr>
<tr>
<td>end-group</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> show running-config</td>
<td>Displays the running configuration. Any applied groups are displayed. There is no indication as to whether these configuration groups affect the actual configuration or not. In this example, although the group G-INTERFACE-MTU is applied to POS0/4/1/1, the configured MTU value is 2000 and not 1500. This happens if the command <code>mtu 2000</code> is configured directly on the interface. An actual configuration overrides a configuration group configuration if they are the same.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>RP/0/RSP0/CPU0:router# show running-config</code></td>
<td></td>
</tr>
<tr>
<td>group G-INTERFACE-MTU</td>
<td></td>
</tr>
<tr>
<td>interface 'POS.*'</td>
<td></td>
</tr>
<tr>
<td>mtu 1500</td>
<td></td>
</tr>
<tr>
<td>!</td>
<td></td>
</tr>
<tr>
<td>end-group</td>
<td></td>
</tr>
<tr>
<td>interface POS0/4/1/0</td>
<td></td>
</tr>
<tr>
<td>apply-group G-INTERFACE-MTU</td>
<td></td>
</tr>
<tr>
<td>!</td>
<td></td>
</tr>
<tr>
<td>interface POS0/4/1/1</td>
<td></td>
</tr>
<tr>
<td>apply-group G-INTERFACE-MTU</td>
<td></td>
</tr>
<tr>
<td>mtu 2000</td>
<td></td>
</tr>
<tr>
<td>!</td>
<td></td>
</tr>
</tbody>
</table>
**Purpose**

**Command or Action**

**Step 3**

`show running-config inheritance`  
**Example:**

RP/0/RSP0/CPU0:router# show running-config inheritance  
.
.
group G-INTERFACE-MTU  
  interface 'POS.*'  
  mtu 1500  
  !
eend-group  
.
.
interface POS0/4/1/0  
  ## Inherited from group G-INTERFACE-MTU  
  mtu 1500  
  !
interface POS0/4/1/1  
  mtu 2000  
  !
.
.
**Purpose**

Displays the inherited configuration where ever a configuration group has been applied.

**Step 4**

`show running-config interface x/y/z inheritance config-command`  
**Example:**

RP/0/RSP0/CPU0:router# show running-config interface pos0/4/1/0 inheritance [detail]  
interface POS0/4/1/0  
  ## Inherited from group G-INTERFACE-MTU  
  mtu 1500

**Purpose**

Displays the inherited configuration for a specific configuration command.

---

**Apply Groups Priority Inheritance**

The inheritance is supported according to the priority.

Apply groups priority inheritance helps flexible configuration groups handle common configuration statements between groups. When multiple configuration groups have common configuration statements, the inheritance priority is configuration statements present in inner groups have precedence over configuration statements present in outer groups. Tiebreaker is determined by the system order (lexicographical) of the regular expressions. User defined order of commands are not accepted.

For example, a configuration statement in configuration group ONE has precedence over any other group. A configuration statement in configuration group SEVEN is used only if it is not contained in any other group. Within a configuration group, inheritance priority is lengthiest match.

```
apply-group SIX SEVEN
router ospf 0
  apply-group FOUR FIVE
```
Regular Expressions in Configuration Groups

Regular expressions are used in configuration groups to make them widely applicable. Portable Operating System Interface for UNIX (POSIX) 1003.2 regular expressions are supported in the names of configuration statements. Single quotes must be used to delimit a regular expression.

For general information regarding regular expressions, refer to the Understanding Regular Expressions, Special Characters, and Patterns module in the Cisco ASR 9000 Series Aggregation Services Router Getting Started Guide.

Note

Not all POSIX regular expressions are supported. Refer to Flexible Configuration Restrictions, on page 88 for more information.

Regular Expressions for Interface Identifiers

Configuration groups do not accept exact interface identifiers. You must use a regular expression to identify a group of interfaces that are applicable to the configuration group. The regular expression ‘.*’ is not allowed. You must begin the regular expression for an interface identifier with an unambiguous word, followed by the regular expression. For example, to configure Gigabit Ethernet interfaces, use the regular expression 'GigabitEthernet.*'.

To display a list of available interface types for your router configuration, enter interface ? at the configuration group prompt:

```
RP/0/RSP0/CPU0:router(config-GRP)# interface ?
ATM 'RegExp': ATM Network Interface(s)
BVI 'RegExp': Bridge-Group Virtual Interface
Bundle-Ether 'RegExp': Aggregated Ethernet interface(s)
Bundle-POS 'RegExp': Aggregated POS interface(s)
GigabitEthernet 'RegExp': GigabitEthernet/IEEE 802.3 interface(s)
IMA 'RegExp': ATM Network Interface(s)
Loopback 'RegExp': Loopback interface(s)
```
### Regular Expressions in Configuration Groups

Although you are required to enter only enough characters for the interface type to be unique, it is recommended that you enter the entire phrase. All interface types used in regular expressions are case-sensitive.

To specify a subinterface, prefix the expression with the characters \ (backslash period). For example, use `interface 'GigabitEthernet.*\..*'` to configure all Gigabit Ethernet subinterfaces.

You can specify Layer 2 transport interfaces or point-to-point interfaces as shown in these examples:

```plaintext
group g-l2t
  interface 'Gi.*\..*' l2transport
  .
end-group
```

```plaintext
group g-ptp
  interface 'Gi.*\..*' point-to-point
  .
end-group
```

### Regular Expressions for an OSPF Configuration

Exact router process names and OSPF areas cannot be used. You must use a regular expression to specify a process name or group of OSPF areas. To specify that the OSPF area can be either a scalar value or an IP address, use the regular expression `\.*`, as in this example:

```plaintext
group g-ospf
  router ospf \.*
  area \.*
  mtu-ignore enable
  !
end-group
```

To specify that the OSPF area must be an IP address, use the expression `\..` as in this example:

```plaintext
group g-ospf-ipaddress
  router ospf \.*
  area \.*
  passive enable
  !
end-group
```
To specify that the OSPF area must be a scalar value, use the expression '1.*', as in this example:

```plaintext
group g-ospf-match-number
router ospf '.*'
area '1.*'
passive enable
!
end-group
```

**Regular Expressions for a BGP AS**

Exact BGP AS values cannot be used in configuration groups. Use a regular expression to specify either AS plain format, or AS dot format as in the format X.Y. To match AS plain format instances, use a simple regular expression. To match AS dot format instances, use two regular expressions separated by a dot, as shown in this example:

```plaintext
group g-bgp
router bgp '.*'.**
address-family ipv4 unicast
!
end-group
```

**Regular Expressions for ANCP**

Exact Access Node Control Protocol (ANCP) sender-name identifiers cannot be used in configuration groups. Because the sender name argument can be either an IP address or a MAC address, you must specify in the regular expression which one is being used. Specify an IP address as '.*\..*\..*\..*'; specify a MAC address as '.*\..*\..*'.

**Resolving to a Uniform Type**

Regular expressions must resolve to a uniform type. This is an example of an illegal regular expression:

```plaintext
group g-invalid
interface '.*'
  bundle port-priority 10
  !
interface '.*Ethernet.*'
  bundle port-priority 10
  !
end-group
```

In this example, the `bundle` command is supported for interface type GigabitEthernet but not for interface type 'FastEthernet'. The regular expressions '.*' and '.*Ethernet.*' match both GigabitEthernet and FastEthernet types. Because the `bundle` command is not applicable to both these interface types, they do not resolve to a uniform type and therefore the system does not allow this configuration.

---

**Note**

If the system cannot determine from the regular expression what the configuration should be, the expression is not considered valid.
The regular expression ‘.*’ is not allowed when referring to an interface identifier. You must begin the regular expression for an interface identifier with an unambiguous word, followed by the regular expression. Refer to Regular Expressions for Interface Identifiers in this section for more information.

**Overlapping Regular Expressions**

Regular expressions are used in names of configuration statements within a configuration group. This permits inheritance by the configuration when applied to matching names. Single quotes are used to delimit the regular expression. Overlapping regular expression within a configuration group for the same configuration is permitted.

The example, given below, illustrates the process of creating and applying multiple configuration groups:

```plaintext
RP/0/RSP0/CPU0:router(config)#group FB_flexi_snmp
RP/0/RSP0/CPU0:router(config-GRP)# snmp-server vrf '.*'
RP/0/RSP0/CPU0:router(config-GRP-snmp-vrf)# host 1.1.1.1 traps version 2c group_1
RP/0/RSP0/CPU0:router(config-GRP-snmp-vrf)# host 1.1.1.1 informs version 2c group_1
RP/0/RSP0/CPU0:router(config-GRP-snmp-vrf)# context group_1

RP/0/RSP0/CPU0:router(config-GRP-snmp-vrf)# commit
RP/0/RSP0/CPU0:router(config-GRP-snmp-vrf)#apply-group FB_flexi_snmp
RP/0/RSP0/CPU0:router(config)#snmp-server vrf vrf1
RP/0/RSP0/CPU0:router(config)#snmp-server vrf vrf10
RP/0/RSP0/CPU0:router(config)#snmp-server vrf vrf100
RP/0/RSP0/CPU0:router(config)#commit
RP/0/RSP0/CPU0:router(config)#apply-group FB_flexi_snmp
RP/0/RSP0/CPU0:router(config)#root
RP/0/RSP0/CPU0:router(config)#apply-group FB_flexi_snmp
RP/0/RSP0/CPU0:router(config)#do sh running-config group
   group FB_flexi_snmp
   snmp-server vrf '.*'
   host 1.1.1.1 traps version 2c group_1
   host 1.1.1.1 informs version 2c group_1
   context group_1
end-group
apply-group FB_flexi_snmp
snmp-server vrf vrf1
snmp-server vrf vrf10
snmp-server vrf vrf100
RP/0/0/CPU0:ios#show running-config inheritance detail

 group FB_flexi_snmp
   snmp-server vrf '.*'
   host 1.1.1.1 traps version 2c group_1
   host 1.1.1.1 informs version 2c group_1
   context group_1
```

System Management Configuration Guide for Cisco ASR 9000 Series Routers, IOS XR Release 6.2.x
The example given below demonstrates the regular expression. In this example `snmp-server vrf '.*'` and `snmp-server vrf '([^\w]+)'` are two different regular expressions.

```
end-group
snmp-server vrf vrf1
  ## Inherited from group FB_flexi_snmp
  host 1.1.1.1 traps version 2c group_1
  ## Inherited from group FB_flexi_snmp
  host 1.1.1.1 informs version 2c group_1
  ## Inherited from group FB_flexi_snmp
  context group_1
snmp-server vrf vrf10
  ## Inherited from group FB_flexi_snmp
  host 1.1.1.1 traps version 2c group_1
  ## Inherited from group FB_flexi_snmp
  host 1.1.1.1 informs version 2c group_1
  ## Inherited from group FB_flexi_snmp
  context group_1
snmp-server vrf vrf100
  ## Inherited from group FB_flexi_snmp
  host 1.1.1.1 traps version 2c group_1
  ## Inherited from group FB_flexi_snmp
  host 1.1.1.1 informs version 2c group_1
  ## Inherited from group FB_flexi_snmp
  context group_1

The example given below demonstrates the regular expression. In this example `snmp-server vrf '.*'` and `snmp-server vrf '([^\w]+)'` are two different regular expressions.

```
group FB_flexi_snmp
snmp-server vrf '.*'
  host 1.1.1.1 traps version 2c group_1
  host 1.1.1.1 informs version 2c group_1
  context group_1
snmp-server vrf '([^\w]+)'
  host 2.2.2.2 traps version 2c group_2
  host 2.2.2.2 informs version 2c group_2
  context group_2
end-group

This individual regular expression gets combined to all the three expressions - `snmp-server vrf vrf1`, `snmp-server vrf vrf10` and `snmp-server vrf vrf100` as given below.

```
apply-group FB_flexi_snmp
snmp-server vrf vrf1
snmp-server vrf vrf10
snmp-server vrf vrf100
```
In a configuration group, there can be instances of regular expressions overlap. In such cases, the regular expression with the highest priority is activated and inherited, when applied. It has that regular expression, which comes first in the lexicographic order that has the highest priority.

The following example shows how to use overlapping regular expressions and how the expression with higher priority is applied:

```plaintext
group FB_flexi_snmp
snmp-server vrf '.*'
    host 1.1.1.1 traps version 2c group_1
    host 1.1.1.1 informs version 2c group_1
    context group_1
!

snmp-server vrf '\[\w\]+'
    host 2.2.2.2 traps version 2c group_2
    host 2.2.2.2 informs version 2c group_2
    context group_2
!
end-group
```

The expression shown below has the highest priority:

```plaintext
group FB_flexi_snmp
snmp-server vrf '.*'
    host 1.1.1.1 traps version 2c group_1
    host 1.1.1.1 informs version 2c group_1
    context group_1
```

The examples given above, show two different regular expression `snmp-server vrf '.*'` and `snmp-server vrf '\[\w\]+'`.

The expression below, shows how these two expressions get merged together:

```plaintext
apply-group FB_flexi_snmp
snmp-server vrf vrf1
!
snmp-server vrf vrf10
!
snmp-server vrf vrf100
!
```

Any change in a regular expression with lower priority will not affect the inheritance.
Any changes made to an existing regular expression, which is of less (non-top) priority, it will not have any effect on the inheritance.
snmp-server vrf '\[\w\]+'
host 2.2.2.2 traps version 2c group_2
host 2.2.2.2 informs version 2c group_2
context group_2

The expression with the higher priority gets inherited, as shown below:

group FB_flexi_snmp
snmp-server vrf './*'
host 1.1.1.1 traps version 2c group_1
host 1.1.1.1 informs version 2c group_1
context group_1

Apply Groups Priority Inheritance
Priority governs inheritance.

Note
From the Release 6.3.1 onwards, you are able to enter the Flexible CLI config group definition, apply-group and exclude-group command in any order as long as the entire commit has all the group definitions needed.

Apply groups priority inheritance helps flexible configuration groups to handle common configuration statements between groups. When multiple configuration groups have common configuration statements, the inheritance priority is such that the configuration statements present in inner groups have precedence over those configuration statements present in outer groups. In case of tiebreakers, the priority is assigned in accordance to the lexicographical order of regular expressions. User defined order of commands are not accepted.

For example, a configuration statement in configuration group ONE has precedence over another group. A configuration statement in configuration group SEVEN is used only if it does not exist in any other group. Within a configuration group, inheritance priority is the longest match.

apply-group SIX SEVEN
    router ospf 0
        apply-group FOUR FIVE
            area 0
                apply-group THREE
                    interface GigabitEthernet 0/0/0/0
                        apply-group ONE TWO

The above example shows two scenarios. The inner most group (apply-group ONE TWO) has the highest priority. Case 1

The first scenario shows which group gets the priority. The example states which group is applied between different configuration groups (different groups with nothing in common). While applying group one (ONE TWO), all the seven groups matches the interface interface GigabitEthernet 0/0/0/0- is applied.

Case 2
Here, when all have the same (common) configuration, group one will be active. That is apply-group ONE TWO is active. If group ONE is deleted, then group TWO will be active.

Configuration Examples Using Regular Expressions

Configuration Group with Regular Expression: Example

This example shows the definition of a configuration group for configuring Gigabit Ethernet interfaces with ISIS routing parameters, using regular expressions for the exact interface:

```
RP/0/RSP0/CPU0:router(config)# group g-isis-gige
RP/0/RSP0/CPU0:router(config-GRP)# router isis '.*'
RP/0/RSP0/CPU0:router(config-GRP-isis)# interface 'GigabitEthernet.*'
RP/0/RSP0/CPU0:router(config-GRP-isis-if)# lsp-interval 20
RP/0/RSP0/CPU0:router(config-GRP-isis-if)# hello-interval 40
RP/0/RSP0/CPU0:router(config-GRP-isis-if)# address-family ipv4 unicast
RP/0/RSP0/CPU0:router(config-GRP-isis-if-af)# metric 10
RP/0/RSP0/CPU0:router(config-GRP-isis-if-af)# end-group
RP/0/RSP0/CPU0:router(config)#
```

To illustrate the use of this configuration group, assume that you want to configure these Gigabit Ethernet interfaces with the ISIS routing parameters:

```
router isis green
  interface GigabitEthernet0/0/0/0
    lsp-interval 20
    hello-interval 40
    address-family ipv4 unicast
      metric 10
    !
  !
interface GigabitEthernet0/0/0/1
  lsp-interval 20
  hello-interval 40
  address-family ipv4 unicast
  metric 10
  !
  !
interface GigabitEthernet0/0/0/2
  lsp-interval 20
  hello-interval 40
  address-family ipv4 unicast
  metric 10
  !
  !
interface GigabitEthernet0/0/0/3
  lsp-interval 20
  hello-interval 40
  address-family ipv4 unicast
  metric 10
  !
  !
```

There are three possible ways to use the configuration group to configure these interfaces. The first is by applying the group within the interface configuration, as shown here:
router isis green
interface GigabitEthernet0/0/0/0
  apply-group g-isis-gige
!
interface GigabitEthernet0/0/0/1
  apply-group g-isis-gige
!
interface GigabitEthernet0/0/0/2
  apply-group g-isis-gige
!
interface GigabitEthernet0/0/0/3
  apply-group g-isis-gige
!

In this situation, only the interfaces to which you apply the configuration group inherit the configuration.

The second way to configure these interfaces using the configuration group is to apply the configuration group within the router isis configuration, as shown here:

router isis green
  apply-group g-isis-gige
interface GigabitEthernet0/0/0/0
!
interface GigabitEthernet0/0/0/1
!
interface GigabitEthernet0/0/0/2
!
interface GigabitEthernet0/0/0/3
!

In this way, any other Gigabit Ethernet interfaces that you configure in the ISIS green configuration also inherit these configurations.

The third way to configure these interfaces using the configuration group is to apply the group at the global level as shown here:

apply-group g-isis-gige
router isis green
  apply-group g-isis-gige
interface GigabitEthernet0/0/0/0
!
interface GigabitEthernet0/0/0/1
!
interface GigabitEthernet0/0/0/2
!
interface GigabitEthernet0/0/0/3
!

In this example, the configuration of the group is applied to all Gigabit Ethernet interfaces configured for ISIS.
Local Configuration Has Precedence Over Configuration Group

An explicit configuration takes precedence over a configuration applied from a configuration group. For example, assume that this configuration is running on the router:

```
router ospf 100
    packet-size 1000
! 
```

You configure this configuration group, apply it, and commit it to the configuration.

```
RP/0/RSP0/CPU0:router(config)# group g-ospf
RP/0/RSP0/CPU0:router(config-GRP)# router ospf '.','
RP/0/RSP0/CPU0:router(config-GRP-ospf)# nsf cisco
RP/0/RSP0/CPU0:router(config-GRP-ospf)# packet-size 3000
RP/0/RSP0/CPU0:router(config-GRP-ospf)# end-group

RP/0/RSP0/CPU0:router(config)# apply-group g-ospf
```

The result is effectively this configuration:

```
router ospf 100
    packet-size 1000
    nsf cisco

```

Note that `packet-size 3000` is not inherited from the configuration group because the explicit local configuration has precedence.

Compatible Configuration Is Inherited

The configuration in the configuration group must match the configuration on the router to be inherited. If the configuration does not match, it is not inherited. For example, assume that this configuration is running on the router:

```
router ospf 100
    auto-cost disable
!
```

You configure this configuration and commit it to the configuration.

```
RP/0/RSP0/CPU0:router(config)# group g-ospf
RP/0/RSP0/CPU0:router(config-GRP)# router ospf '.','
RP/0/RSP0/CPU0:router(config-GRP-ospf)# area '.','
RP/0/RSP0/CPU0:router(config-GRP-ospf-ar)# packet-size 2000
RP/0/RSP0/CPU0:router(config-GRP-ospf)# end-group

RP/0/RSP0/CPU0:router(config)# apply-group g-ospf

RP/0/RSP0/CPU0:router(config)# router ospf 200
RP/0/RSP0/CPU0:router(config-ospf)# area 1
```
The result is effectively this configuration:

```console
router ospf 100
  auto-cost disable
router ospf 200
  area 1
  packet-size 2000
```

The packet size is inherited by the ospf 200 configuration, but not by the ospf 100 configuration because the area is not configured.

**Layer 2 Transport Configuration Group: Example**

This example shows how to configure and apply a configuration group with Layer 2 transport subinterfaces:

```console
RP/0/RSP0/CPU0:router(config)# group g-l2trans-if
RP/0/RSP0/CPU0:router(config-GRP)# interface 'TenGigE.*\..*' l2transport
RP/0/RSP0/CPU0:router(config-GRP)# mtu 1514
RP/0/RSP0/CPU0:router(config-GRP)# end-group

RP/0/RSP0/CPU0:router(config)# interface TenGigE0/0/0/0.1 l2transport
RP/0/RSP0/CPU0:router(config-if)# apply-group g-l2trans-if
```

When this configuration is committed, the Ten Gigabit Ethernet interface 0/0/0/0.1 inherits the 1514 MTU value. This is the output displayed from the `show running-config inheritence` command for the Ten Gigabit Ethernet interface:

```console
interface TenGigE0/0/0/0.1 l2transport
  ## Inherited from group g-l2trans-if
  mtu 1514
```

**Configuration Group Precedence: Example**

When similar configuration statements are contained in multiple configuration groups, groups applied in inner configuration modes take precedence over groups applied in outer modes. This example shows two configuration groups that configure different cost values for OSPF:

```console
RP/0/RSP0/CPU0:router(config)# group g-ospf2
RP/0/RSP0/CPU0:router(config-GRP)# router ospf '.*'
RP/0/RSP0/CPU0:router(config-GRP-ospf)# area '.*'
RP/0/RSP0/CPU0:router(config-GRP-ospf-ar)# cost 2
RP/0/RSP0/CPU0:router(config-GRP-ospf-ar)# end-group

RP/0/RSP0/CPU0:router(config)# group g-ospf100
RP/0/RSP0/CPU0:router(config-GRP)# router ospf '.*'
RP/0/RSP0/CPU0:router(config-GRP-ospf)# area '.*'
RP/0/RSP0/CPU0:router(config-GRP-ospf-ar)# cost 100
RP/0/RSP0/CPU0:router(config-GRP-ospf-ar)# end-group
```
If these configuration groups are applied as follows, the cost 2 specified in g-ospf2 is inherited by
OSPF area 0 because the group is applied in a more inner configuration mode. In this case, the
configuration in group g-ospf100 is ignored.

```
RP/0/RSP0/CPU0:router(config)# router ospf 0
RP/0/RSP0/CPU0:router(config-ospf)# apply-group g-ospf100
RP/0/RSP0/CPU0:router(config-ospf)# area 0
RP/0/RSP0/CPU0:router(config-ospf-ar)# apply-group g-ospf2
```

**Changes to Configuration Group are Automatically Inherited: Example**

When you make changes to a configuration group that is committed and applied to your router
configuration, the changes are automatically inherited by the router configuration. For example,
assume that this configuration is committed:

```
group g-interface-mtu
  interface 'POS.*'
    mtu 1500
  !
end-group

interface POS0/4/1/0
  apply-group g-interface-mtu
  !
```

Now you change the configuration group as in this example:

```
RP/0/RSP0/CPU0:router(config)# group g-interface-mtu
RP/0/RSP0/CPU0:router(config-GRP)# interface 'POS.*'
  mtu 2000
RP/0/RSP0/CPU0:router(config-GRP-if)# end-group
```

When this configuration group is committed, the MTU configuration for interface POS0/4/1/0 is
automatically updated to 2000.

**Configuration Examples for Flexible CLI Configuration**

**Basic Flexible CLI Configuration: Example**

This example shows that the Media Access Control (MAC) accounting configuration from the gd21
configuration group is applied to all Gigabit Ethernet interfaces in slot 2, ports 1 to 9.

1. Configure the configuration group that configures MAC accounting:

```
RP/0/RSP0/CPU0:router# show running group gd21

group gd21
  interface 'GigabitEthernet0/0/0/2[1-9]'
  description general interface inheritance check
```
load-interval 30
mac-accounting ingress
mac-accounting egress
!
end-group

2. Check that the corresponding apply-group is configured in global configuration or somewhere in the hierarchy:

```
RP/0/RSP0/CPU0:router# show running | in apply-group gd21
Building configuration...
apply-group gd21
```

3. Check the concise local view of the configuration of some of the interfaces:

```
RP/0/RSP0/CPU0:router# show running interface
interface GigabitEthernet0/0/0/21
!
interface GigabitEthernet0/0/0/22
!
```

4. Verify that the match and inheritance occur on these interfaces:

```
RP/0/RSP0/CPU0:router# show running inheritance interface
interface GigabitEthernet0/0/0/21
## Inherited from group gd21
description general interface inheritance check
## Inherited from group gd21
load-interval 30
## Inherited from group gd21
mac-accounting ingress
## Inherited from group gd21
mac-accounting egress
!
Interface GigabitEthernet0/0/0/22
## Inherited from group gd21
description general interface inheritance check
## Inherited from group gd21
load-interval 30
## Inherited from group gd21
mac-accounting ingress
## Inherited from group gd21
mac-accounting egress
!
```

5. Verify that the inherited configuration actually takes effect:

```
RP/0/RSP0/CPU0:router# show mac gigabitEthernet0/0/0/21
GigabitEthernet0/0/0/21
Input (96 free)
   6c9c.ed35.90fd: 1271 packets, 98426 bytes
   Total: 1271 packets, 98426 bytes
Output (96 free)
   6c9c.ed35.90fd: 774 packets, 63265 bytes
```
Interface MTU Settings for Different Interface Types: Example

This example shows that an MTU value is configured on different interface types.

1. Configure an interface MTU configuration group and apply this group:

   ```
   RP/0/RSP0/CPU0:router# show running group l2tr
   group l2tr
   interface 'GigabitEthernet0/0/0/3.*'
   mtu 1500
   
   interface 'GigabitEthernet0/0/0/9.*'
   mtu 1400
   
   interface 'GigabitEthernet0/0/0/9.*' l2transport
   mtu 1400
   
   end-group
   RP/0/RSP0/CPU0:router# show running | inc apply-group
   Building configuration...
   apply-group l2tr
   ```

2. Check the concise view and the inheritance view of the various interfaces:

   ```
   RP/0/RSP0/CPU0:router# show running interface gigabitEthernet0/0/0/30
   interface GigabitEthernet0/0/0/30
   
   RP/0/RSP0/CPU0:router# show running inheritance interface gigabitEthernet0/0/0/30
   interface GigabitEthernet0/0/0/30
   ## Inherited from group l2tr
   mtu 1500
   
   RP/0/RSP0/CPU0:router# show running interface gigabitEthernet0/0/0/9.800
   interface GigabitEthernet0/0/0/9.800
   encapsulation dot1q 800
   
   RP/0/RSP0/CPU0:router# show running inheritance interface gigabitEthernet0/0/0/9.800
   interface GigabitEthernet0/0/0/9.800
   ## Inherited from group l2tr
   mtu 1400
   encapsulation dot1q800
   
   RP/0/RSP0/CPU0:router# show running interface gigabitEthernet0/0/0/9.250
   ```
interface GigabitEthernet0/0/0/9.250 12transport
    encapsulation dot1q 250
!
RP/0/RSP0/CPU0:router# show running inheritance interface gigabitEthernet0/0/0/800

interface GigabitEthernet0/0/0/9.250 12transport
    encapsulation dot1q250
    ## Inherited from group l2tr
    mtu 1400
!

3. Verify that the correct values from the group do take effect:

RP/0/RSP0/CPU0:router# show interface gigabitEthernet 0/0/0/30

GigabitEthernet0/0/0/30 is down, line protocol is down
    Interface state transitions: 0
    Hardware is GigabitEthernet, address is 0026.9824.ee56 (bia 0026.9824.ee56)
    Internet address is Unknown
    MTU 1500 bytes, BW 1000000 Kbit (Max: 1000000 Kbit)
    reliability 255/255, txload 0/255, rxload 0/255
    Encapsulation ARPA,
    Full-duplex, 1000Mb/s, link type is force-up
    output flow control is off, input flow control is off
    loopback not set,
    Last input never, output never
    Last clearing of "show interface" counters never
    5 minute input rate 0 bits/sec, 0 packets/sec
    5 minute output rate 0 bits/sec, 0 packets/sec
    0 packets input, 0 bytes, 0 total input drops
    0 drops for unrecognized upper-level protocol
    Received 0 broadcast packets, 0 multicast packets
    0 runs, 0 giants, 0 throttles, 0 parity
    0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored, 0 abort
    0 packets output, 0 bytes, 0 total output drops
    Output 0 broadcast packets, 0 multicast packets
    0 output errors, 0 underruns, 0 applique, 0 resets
    0 output buffer failures, 0 output buffers swapped out

RP/0/RSP0/CPU0:router# show interface gigabitEthernet 0/0/0/9.801

GigabitEthernet0/0/0/9.801 is up, line protocol is up
    Interface state transitions: 1
    Hardware is VLAN sub-interface(s), address is 0026.9824.ee41
    Internet address is Unknown
    MTU 1400 bytes, BW 1000000 Kbit (Max: 1000000 Kbit)
    reliability 255/255, txload 0/255, rxload 0/255
    Encapsulation 802.1Q Virtual LAN, VLAN Id 801, loopback not set,
    Last input never, output never
    Last clearing of "show interface" counters never
    5 minute input rate 0 bits/sec, 0 packets/sec
    5 minute output rate 0 bits/sec, 0 packets/sec
    0 packets input, 0 bytes, 0 total input drops
    0 drops for unrecognized upper-level protocol
    Received 0 broadcast packets, 0 multicast packets
    0 packets output, 0 bytes, 0 total output drops
    Output 0 broadcast packets, 0 multicast packets

RP/0/RSP0/CPU0:router# show interface gigabitEthernet 0/0/0/9.250

System Management Configuration Guide for Cisco ASR 9000 Series Routers, IOS XR Release 6.2.x
108
ACL Referencing: Example

This example shows how to reference access-lists on a number of interfaces using configuration groups.

1. Configure the configuration group and apply-group:

   ```
   RP/0/RSP0/CPU0:router# show running group acref
   group acref
   interface 'GigabitEthernet0/0/0/3.*'
     ipv4 access-group adem ingress
     ipv4 access-group adem egress
   !
   end-group
   RP/0/RSP0/CPU0:router# show running | inc apply-group
   Building configuration...
   apply-group isis l2tr isis2 mpp bundle1 acref
   ```

2. Check the concise and inheritance view of the matching configurations:

   ```
   RP/0/RSP0/CPU0:router# show running interface gigabitEthernet 0/0/0/30
   interface GigabitEthernet0/0/0/30
     !
   RP/0/RSP0/CPU0:router# show running inheritance interface GigabitEthernet 0/0/0/30
   interface GigabitEthernet0/0/0/30
     ## Inherited from group l2tr
     mtu 1500
     ## Inherited from group acref
     ipv4 access-group adem ingress
     ## Inherited from group acref
     ipv4 access-group adem egress
     !
   ```
Local Configuration Takes Precedence: Example

This example illustrates that local configurations take precedence when there is a discrepancy between a local configuration and the configuration inherited from a configuration group.

1. Configure a local configuration in a configuration submode with an access list:

```
RP/0/RSP0/CPU0:router# show running interface gigabitEthernet 0/0/0/39
interface GigabitEthernet0/0/0/39
  ipv4 access-group smany ingress
  ipv4 access-group smany egress

RP/0/RSP0/CPU0:router# show running interface gigabitEthernet 0/0/0/38
interface GigabitEthernet0/0/0/38

RP/0/RSP0/CPU0:router# show running ipv4 access-list smany
ipv4 access-list smany
  10 permit ipv4 any any

RP/0/RSP0/CPU0:router# show running ipv4 access-list adem
ipv4 access-list adem
  10 permit ipv4 21.0.0.0 0.255.255.255 host 55.55.55.55
  20 deny ipv4 any any
```

2. Configure and apply the access list group configuration:

```
RP/0/RSP0/CPU0:router# show running group acref

group acref
  interface 'GigabitEthernet0/0/0/3.*'
    ipv4 access-group adem ingress
```
ipv4 access-group adem egress
!
end-group

RP/0/RSP0/CPU0:router# show running | inc apply-group

Building configuration...
apply-group isis l2tr isis2 mpp bundle1 acref

3. Check the concise and inheritance views for the matching interface where the access list reference is configured locally:

RP/0/RSP0/CPU0:router# show running interface gigabitEthernet 0/0/0/39
interface GigabitEthernet0/0/0/39
ipv4 access-group smany ingress
ipv4 access-group smany egress
!

RP/0/RSP0/CPU0:router# show running inheritance interface gigabitEthernet 0/0/0/39
interface GigabitEthernet0/0/0/39
## Inherited from group l2tr
mtu 1500
ipv4 access-group smany ingress
tv4 access-group smany egress
<< no config inherited, local config prioritized
!

RP/0/RSP0/CPU0:router# show running interface gigabitEthernet 0/0/0/38

interface GigabitEthernet0/0/0/38
!

RP/0/RSP0/CPU0:router# show running inheritance interface gigabitEthernet 0/0/0/38
interface GigabitEthernet0/0/0/38
## Inherited from group l2tr
mtu 1500
## Inherited from group acref
ipv4 access-group acref
## Inherited from group acref
ipv4 access-group adem ingress
ipv4 access-group adem egress
!

4. Use a traffic generator to verify that the traffic pattern for interface GigabitEthernet0/0/0/39 gets acted on by the access list in the local configuration (smany) and not according to the inherited referenced access list (adem).

**ISIS Hierarchical Configuration: Example**

This example illustrates inheritance and priority handling with two ISIS groups using an ISIS configuration.

1. Configure the local ISIS configuration:

   RP/0/RSP0/CPU0:router# show running router isis
router isis vink
net 49.0011.2222.2222.2222.00
address-family ipv4 unicast
  mpls traffic-eng level-1-2
  mpls traffic-eng router-id Loopback0
  redistribute connected

interface Bundle-Ether1
  address-family ipv4 unicast

interface Bundle-Ether2

interface Loopback0

interface TenGigE0/2/0/0.3521
  address-family ipv4 unicast

interface TenGigE0/2/0/0.3522
  address-family ipv4 unicast

interface TenGigE0/2/0/0.3523
  address-family ipv4 unicast

interface TenGigE0/2/0/0.3524
  address-family ipv4 unicast

interface TenGigE0/2/0/0.3525
  address-family ipv4 unicast

interface TenGigE0/2/0/0.3526

interface TenGigE0/2/0/0.3527

interface TenGigE0/2/0/0.3528

interface TenGigE0/2/0/0.3529
  address-family ipv4 unicast

2. Configure two ISIS groups and apply these to the configuration:

RP/0/RSP0/CPU0:router# show running group isis

group isis
  router isis '.*'
    address-family ipv4 unicast
      mpls traffic-eng level-1-2
      mpls traffic-eng router-id Loopback0
      redistribute connected
      redistribute ospf 1 level-1-2
    !
    interface 'TenGig.*'
      lsp-interval 40

hello-interval 15
address-family ipv4 unicast
   metric 50
!
interface 'Bundle-Ether.*'
address-family ipv4 unicast
   metric 55
!
!
end-group

RP/0/RSP0/CPU0:router# show running group isis2

group isis2
   router isis '.*'
!
   router isis '(vink)'
      address-family ipv4 unicast
!
   interface '(^Ten)Gig.*'
!
   interface '(^Ten)Gig.*'
      address-family ipv4 unicast
         metric 66
!
!
end-group

RP/0/RSP0/CPU0:router# show running | inc apply-group

Building configuration...

apply-group isis 12tr isis2 mpp bundle1 acref

3. Check the inheritance view of the ISIS configuration:

RP/0/RSP0/CPU0:router# show running inheritance router isis

router isis vink
   net 49.0011.2222.2222.2222.00
   address-family ipv4 unicast
   mpls traffic-eng level-1-2
   mpls traffic-eng router-id Loopback0
   redistribute connected
      ## Inherited from group isis
      redistribute ospf 1 level-1-2
!
   interface Bundle-Ether1
      address-family ipv4 unicast
         ## Inherited from group isis
         metric 55
!
!
   interface Bundle-Ether2
      ## Inherited from group isis
      address-family ipv4 unicast
         ## Inherited from group isis
         metric 55
!
interface Loopback0

interface TenGigE0/2/0/0.3521
  ## Inherited from group isis
  lsp-interval 40
  ## Inherited from group isis
  hello-interval 15
  address-family ipv4 unicast
    ## Inherited from group isis
    metric 50

interface TenGigE0/2/0/0.3522
  ## Inherited from group isis
  lsp-interval 40
  ## Inherited from group isis
  hello-interval 15
  address-family ipv4 unicast
    ## Inherited from group isis
    metric 50

interface TenGigE0/2/0/0.3523
  ## Inherited from group isis
  lsp-interval 40
  ## Inherited from group isis
  hello-interval 15
  address-family ipv4 unicast
    ## Inherited from group isis
    metric 50

interface TenGigE0/2/0/0.3524
  ## Inherited from group isis
  lsp-interval 40
  ## Inherited from group isis
  hello-interval 15
  address-family ipv4 unicast
    ## Inherited from group isis
    metric 50

interface TenGigE0/2/0/0.3525
  ## Inherited from group isis
  lsp-interval 40
  ## Inherited from group isis
  hello-interval 15
  address-family ipv4 unicast
    ## Inherited from group isis
    metric 50

interface TenGigE0/2/0/0.3526
  ## Inherited from group isis
  lsp-interval 40
  ## Inherited from group isis
  hello-interval 15
  address-family ipv4 unicast
    ## Inherited from group isis
    metric 50
interface TenGigE0/2/0/0.3527
## Inherited from group isis
lsp-interval 40
## Inherited from group isis
hello-interval 15
## Inherited from group isis
address-family ipv4 unicast
## Inherited from group isis
metric 50
!
!
interface TenGigE0/2/0/0.3528
## Inherited from group isis
lsp-interval 40
## Inherited from group isis
hello-interval 15
## Inherited from group isis
address-family ipv4 unicast
## Inherited from group isis
metric 50
!
!
interface TenGigE0/2/0/1
## Inherited from group isis
lsp-interval 40
## Inherited from group isis
hello-interval 15
address-family ipv4 unicast
## Inherited from group isis
metric 50
!
!

4. Verify the actual functionality:

RP/0/RSP0/CPU0:router# show isis interface TenGigE0/2/0/0.3528 | inc Metric

Metric (L1/L2): 50/50

**OSPF Hierarchy: Example**

This example illustrates hierarchical inheritance and priority. The configuration that is lower in hierarchy gets the highest priority.

1. Configure a local OSPF configuration:

RP/0/RSP0/CPU0:router# show running router ospf

router ospf 1
   apply-group go-c
   nsr
   router-id 121.121.121.121
   nsf cisco
   redistribute connected
   address-family ipv4 unicast
   area 0
   apply-group go-b
Configure a configuration group and apply it in a configuration submode:

RP/0/RSP0/CPU0:router# show running group go-a

group go-a
  router ospf ".**"
  area ".**"
    interface 'Gig.*'
    cost 200
    
end-group

RP/0/RSP0/CPU0:router# show running group go-b

group go-b
  router ospf ".**"
  area ".**"
    interface 'Gig.*'
    cost 250
    
end-group

RP/0/RSP0/CPU0:router# show running group go-c

group go-c
  router ospf ".**"
  area ".**"
    interface 'Gig.*'

3. Check the inheritance view and verify that the apply-group in the lowest configuration submode gets the highest priority:

```
RP/0/RSP0/CPU0:router# show running inheritance router ospf 1

router ospf 1
nsr
router-id 121.121.121.121
nsf cisco
redistribute connected
address-family ipv4 unicast
area 0
  interface GigabitEthernet0/0/0/0
    ## Inherited from group go-a
    cost 200  << apply-group in lowest submode gets highest priority

  interface GigabitEthernet0/0/0/1
    ## Inherited from group go-b
    cost 250

  interface GigabitEthernet0/0/0/3
    ## Inherited from group go-b
    cost 250

  interface GigabitEthernet0/0/0/4
    ## Inherited from group go-b
    cost 250

  interface GigabitEthernet0/0/0/21
    bfd minimum-interval 100
    bfd fast-detect
    bfd multiplier 3
    ## Inherited from group go-b
    cost 250

  interface TenGigE0/2/0/0.3891

  interface TenGigE0/2/0/0.3892

  interface TenGigE0/2/0/0.3893

  interface TenGigE0/2/0/0.3894
```

4. Check the functionality of the cost inheritance through the groups:

```
RP/0/RSP0/CPU0:router# show ospf 1 interface GigabitEthernet 0/0/0/0

GigabitEthernet0/0/0/0 is up, line protocol is up
  Internet Address 1.0.1.1/30, Area 0
  Process ID 1, Router ID 121.121.121.121, Network Type BROADCAST, Cost: 200
  Transmit Delay is 1 sec, State DR, Priority 1, MTU 1500, MaxPktSz 1500
  Designated Router (ID) 121.121.121.121, Interface address 1.0.1.1
```
Link Bundling Usage: Example

This example shows how to configure interface membership in a bundle link:

1. Configure the configuration groups:

   ```
   RP/0/RSP0/CPU0:router# show running group bundle1
   group bundle1
   interface 'GigabitEthernet0/1/0/1[1-6]' bundle id 1 mode active
   end-group
   RP/0/RSP0/CPU0:router# show running | inc apply-group
   Building configuration...
   apply-group isis l2tr isis2 mpp bundle1
   ```

2. Check the local configuration:

   ```
   RP/0/RSP0/CPU0:router# show running interface gigabitEthernet 0/1/0/11
   interface GigabitEthernet0/1/0/11
   !
   RP/0/RSP0/CPU0:router# show running interface Bundle-Ether1
   interface Bundle-Ether1
   ipv4 address 108.108.1.1 255.255.255.0
   bundle maximum-active links 10
   bundle minimum-active links 5
   !
   ```

3. Check the inheritance configuration view:

   ```
   RP/0/RSP0/CPU0:router# show running inheritance interface GigabitEthernet 0/1/0/11
   interface GigabitEthernet0/1/0/11
   ## Inherited from group bundle1
   ```
bundle id 1 mode active

4. Check that the inheritance configuration took effect:

RP/0/RSP0/CPU0:router# show interface Bundle-Ether1

Bundle-Ether1 is up, line protocol is up
  Interface state transitions: 1
  Hardware is Aggregated Ethernet interface(s), address is 0024.F71F.4BC3
  Internet address is 108.108.1.1/24
  MTU 1514 bytes, BW 6000000 Kbit (Max: 6000000 Kbit)
  reliability 255/255, txload 0/255, rxload 0/255
  Encapsulation ARPA,

Link Bundling Usage: Example
Managing Router Hardware

This chapter describes the command-line interface (CLI) techniques and commands used to manage and configure the hardware components of a router running the Cisco IOS XR software.

For complete descriptions of the commands listed in this module, see Additional References, on page 155. To locate documentation for other commands that might appear in the course of performing a configuration task, search online in Cisco ASR 9000 Series Aggregation Services Router Commands Master List.

Table 16: Feature History for Managing Router Hardware with Cisco IOS XR Software

<table>

<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This feature was introduced.</td>
</tr>
<tr>
<td>Release 3.9.0</td>
<td>No modification.</td>
</tr>
</tbody>
</table>

This module contains the following topics:

- Prerequisites for Managing Router Hardware, on page 121
- Displaying Hardware Status, on page 122
- RSP Redundancy and Switchover, on page 138
- Console Management Port, on page 142
- CPAK, on page 145
- Reloading, Shutting Down, or Power Cycling a Node, on page 147
- Flash Disk Recovery, on page 149
- Using Controller Commands to Manage Hardware Components, on page 150
- Formatting Hard Drives, Flash Drives, and Other Storage Devices, on page 150
- Removing and Replacing Cards, on page 151
- Upgrading the CPU Controller Bits, on page 154
- Configure Single Feed Power Mode, on page 155
- Additional References, on page 155

Prerequisites for Managing Router Hardware

You must be in a user group associated with a task group that includes the proper task IDs. The command reference guides include the task IDs required for each command. If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.
Displaying Hardware Status

This section describes how to display different types of hardware status information.

Displaying SDR Hardware Version Information

To display hardware version information for the components assigned to a secure domain router (SDR), connect to the designated shelf controller (DSC) and enter the `show diag` command in EXEC mode. The displayed information includes the card serial number and the ROMMON software version.

The syntax for the `show diag` command in EXEC mode is:

```
show diag [node-id | details | summary]
```

In the following example, the `show diag` command displays information for all nodes in the SDR:

```
RP/0/RSP0/CP00:router# show diag
Mon Jun 29 00:36:41.576 PST

```
Displaying System Hardware Version Information

To display hardware version information for all or some of the components assigned in a system, connect to the designated shelf controller (DSC) and enter the show diag command in administration EXEC mode. When this command is entered in administration EXEC mode, you can display information on RSPs, line cards, and system components such as the chassis, fan trays, and power supplies.

**Note**
If you enter the show diag command in EXEC mode, the software displays only the hardware assigned to the SDR to which you are connected.

The syntax for the show diag command in administration EXEC mode is:

```
show diag [node-id | chassis | details | fans | memory | power-supply | summary]
```

**Tip**
For information on the software version, use the show version command.

In the following example, the show diag command displays information for all nodes in the system:

```
RP/0/RSP0/CPU0:router(admin)# show diag

Mon Jun 29 01:21:04.571 PST

### Displaying Software and Hardware Information

The `show version` command displays a variety of system information, including the hardware and software versions, router uptime, boot settings (including the configuration register), and active software.

The following is sample output from the `show version` command:

```bash
RP/0/RP0/CPU0:router# show version
Sat Aug 1 22:52:39.089 DST
Cisco IOS XR Software, Version 3.9.0.16I[DT_IMAGE]
Copyright (c) 2009 by Cisco Systems, Inc.
ROM: System Bootstrap, Version 1.1(20090521:183759) [ASR9K ROMMON],
router uptime is 1 day, 2 hours, 34 minutes
System image file is "bootflash:disk0/asr9k-os-mbi-3.9.0.16I/mbiasr9k-rp.vm"
cisco ASR9K Series (MPC8641D) processor with 4194304K bytes of memory.
MPC8641D processor at 1333MHz, Revision 2.2
2 Management Ethernet
12 TenGigE
40 GigabitEthernet
219k bytes of non-volatile configuration memory.
975M bytes of compact flash card.
3394M bytes of hard disk.
1605616k bytes of disk0: (Sector size 512 bytes).
1605616k bytes of disk1: (Sector size 512 bytes).
Configuration register on node 0/RSP0/CPU0 is 0x102
Boot device on node 0/RSP0/CPU0 is disk0:
Package active on node 0/RSP0/CPU0:
asr9k-scfclient, V 3.9.0.16I[DT_IMAGE], Cisco Systems, at disk0:asr9k-scfclient-3.9.0.16I
Built on Thu Jul 30 12:09:40 DST 2009
By sjc-ids-208 in /auto/ioxbuild7/production/3.9.0.16I.DT_IMAGE/asr9k/workspace for c4.2.1-p0
```
Displaying SDR Node IDs and Status

In EXEC mode, the `show platform` command displays information for all nodes assigned to the owner SDR. For each node, this information includes the host card type, the operational state, and the configuration state. To display information on a single node, enter the command with a node ID.

The syntax for the `show platform` command is:

```
show platform [node-id]
```

The following example displays the status for all nodes in the SDR to which you are connected:

```
RP/0/RSP0/CPU0:router# show platform
Mon Aug 3 07:39:01.416 DST
Node Type State Config State
-----------------------------------------------
0/RSP0/CPU0 A9K-RSP-4G(Active) IOS XR RUN PWR,NSSHUT,MON
0/1/CPU0 A9K-40GE-B IOS XR RUN PWR,NSSHUT,MON
0/4/CPU0 A9K-8T/4-B IOS XR RUN PWR,NSSHUT,MON
0/6/CPU0 A9K-4T-B IOS XR RUN PWR,NSSHUT,MON
```

The `node-id` appears in the `rack/slot/module` notation, and the `node-id` components are as follows:

- **rack** — In a single-shelf system the rack number is always “0.”
- **slot** — Number of the physical slot in which the card is installed.
- **module** — Subslot number of a system hardware component.

Table 17: Node ID Components, on page 131 summarizes the `node-id` for each type of card.
Table 17: Node ID Components

<table>
<thead>
<tr>
<th>Card Type (the card to which your are issuing commands)</th>
<th>Rack (always “0”)</th>

</tbody>
</table>

Displaying Router Node IDs and Status

In administration EXEC mode, the `show platform` command displays information for all router nodes. In administration EXEC mode, the command display also includes additional node IDs such as those for fabric cards, alarm modules, and fan controllers. For each node, this information includes the host card type, the operational state, and the configuration state. To display information on a single node, enter the command with a node ID.

The syntax for the `show platform` command is:

```
show platform [node-id]
```

The following example displays the status for all nodes in the system:

```
RP/0/RSP0/CPU0:router(admin)# show platform
Sat Mar 24 05:02:18.569 DST
Node Type State Config State
-----------------------------------------------------------------
0/RSP0/CPU0 A9K-RSP-4G(Active) IOS XR RUN FWR,NSSHUT,MON
0/1/CPU0 A9K-40GE-B IOS XR RUN FWR,NSSHUT,MON
0/4/CPU0 A9K-8T/4-B IOS XR RUN FWR,NSSHUT,MON
0/6/CPU0 A9K-4T-B IOS XR RUN FWR,NSSHUT,MON
```

The `node-id` appears in the `rack/slot/module` notation, and the `node-id` components are as follows:

- **rack** — In a single-shelf system the rack number is always “0.”
- **slot** — Number of the physical slot in which the card is installed.
- **module** — Subslot number of a system hardware component.
Table 17: Node ID Components, on page 131 summarizes the node-id argument for each type of card.

Displaying Router Environment Information

The show environment command displays hardware information for the system, including fan speeds, LED indications, power supply voltage and current information, and temperatures.

The syntax for the show environment command is:

```
show environment [options]
```

You can use the show environment command options to limit the detail in the command display. To view the command options, enter the show environment ? command. The following example shows the full environment status report:

```
RP/0/RSP0/CPU0:router(admin)# show environment
Mon Jun 29 04:32:07.587 PST
Temperature Information

Configuring the Chassis Altitude

To allow your router to adjust the fan speed to compensate for lower cooling capabilities at higher altitudes, you should configure the chassis altitude setting. Use the `environment altitude` command in administration configuration mode. The default setting is 1800 meters.

The syntax for the environment altitude command is:

```
environment altitude altitude rack rack-no
```

---

```
host Major-Alarm Off
host Minor-Alarm Off
host ACO Off

Displaying RP Redundancy Status

The `show redundancy` command displays the redundancy status of the route switch processors (RSPs). This command also displays the boot and switch-over history for the RSPs.

The `show redundancy` operates in EXEC and administration EXEC mode.

In the following example, the `show redundancy` command displays the redundancy status for a redundant RSP pair:

```
RP/0/RSP0/CPU0:router(admin)# show redundancy

Mon Jun 29 04:49:26.098 PST
Redundancy information for node 0/RSP0/CPU0:
==========================================
Node 0/RSP0/CPU0 is in ACTIVE role
Node 0/RSP0/CPU0 has no valid partner

Reload and boot info
---------------------
A9K-RSP-4G reloaded Thu Jun 11 15:20:50 2009: 2 weeks, 3 days, 13 hours, 28 minutes ago
Active node booted Thu Jun 11 15:20:50 2009: 2 weeks, 3 days, 13 hours, 28 minutes ago
Active node reload "Cause: Turboboost completed successfully"
```

Displaying Field-Programmable Device Compatibility

The `show hw-module fpd` command displays field-programmable device (FPD) compatibility for all modules or a specific module.

The syntax for the `show hw-module fpd` command is:

```
show hw-module fpd location {all | node-id}
```

The `show hw-module fpd` operates in EXEC and administration EXEC mode.

The following example shows how to display FPD compatibility for all modules in the router:

```
RP/0/RSP0/CPU0:router# ios#show hw-module fpd
Tue Jan 22 13:56:55.082 UTC
FPD Versions
-----------------------------
Location Card type HWver FPD device ATR Status Running Programd
-----------------------------------------------
0/RP0 NCS-55A2-MOD-S 0.3 MB-MIFPGA CURRENT 0.19 0.19
0/RP0 NCS-55A2-MOD-S 0.3 Bootloader CURRENT 1.10 1.10
0/RP0 NCS-55A2-MOD-S 0.3 CPU-IOFPGA CURRENT 1.18 1.18
0/RP0 NCS-55A2-MOD-S 0.3 MB-IOFPGA CURRENT 0.18 0.18
0/PM0 NC55-1200W-ACFW 1.0 LIT-PriMCU-ACFW NEED UFGD 2.08 2.08
0/PM1 NC55-1200W-ACFW 1.0 LIT-PriMCU-ACFW NEED UFGD 2.08 2.08
RP/0/RP0/CPU0:ios#.
```

Note

After Release 5.3.x, Upg/Dng? will display Yes only for upgrade.

The following example shows the FPD for which upgrade will be skipped.
Displaying Field-Programmable Device Compatibility

```
RP/0/RP0/CPU0:router# show hw-module fpd location all
```

---

**Existing Field Programmable Devices**

<table>
<thead>
<tr>

RSP Redundancy and Switchover

This section describes RSP redundancy and switchover commands and issues.

Establishing RSP Redundancy

Your router has two slots for RSPs: RSP0 and RSP1 (see Figure 6: Redundant Set of RSPs Installed in Slots RSP0 and RSP1 in an 8-Slot Chassis, on page 138). RSP0 is the slot on the left, facing the front of the chassis, and RSP1 is the slot on right. These slots are configured for redundancy by default, and the redundancy cannot be eliminated. To establish RSP redundancy, install RSPs into both slots.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Upg/Dng?</td>
<td>Specifies whether an FPD upgrade or downgrade is required. A downgrade is required in rare cases when the version of the FPD image has a higher major revision than the version of the FPD image in the current Cisco IOS XR software package.</td>
</tr>
</tbody>
</table>
Determining the Active RP in a Redundant Pair

During system startup, one RSP in each redundant pair becomes the active RSP. You can tell which RSP is the active RSP in the following ways:

- The active RSP can be identified by the green Primary LED on the faceplate of the card. The active RSP is indicated when the Primary LED is on. The alphanumeric LED display on the RSP displays ACTV RP.
- The slot of the active RSP is indicated in the CLI prompt. For example:

  RP/0/RSP1/CPU0:router#

In this example, the prompt indicates that you are communicating with the active RSP in slot RSP1. See Cisco ASR 9000 Series Aggregation Services Router Getting Started Guide for a complete description of the CLI prompt.

- Enter the `show redundancy` command in EXEC mode to display a summary of the active and standby RSP status. For example:

  RP/0/RSP0/CPU0:router(admin)# show redundancy

     Mon Jun 29 04:49:26.098 PST
  Redundancy information for node 0/RSP0/CPU0:
  ------------------------------------------
  Node 0/RSP0/CPU0 is in ACTIVE role
  Node 0/RSP0/CPU0 has no valid partner
  Reload and boot info
  ------------------------------------------
  A9K-RSP-4G reloaded Thu Jun 11 15:20:50 2009: 2 weeks, 3 days, 13 hours, 28 minutes ago
  Active node booted Thu Jun 11 15:20:50 2009: 2 weeks, 3 days, 13 hours, 28 minutes ago

  Active node reload "Cause: Turboboot completed successfully"

Role of the Standby RSP

The second RSP to boot in a redundant pair automatically becomes the standby RSP. While the active RSP manages the system and communicates with the user interface, the standby RSP maintains a complete backup of the software and configurations for all cards in the system. If the active RSP fails or goes off line for any reason, the standby RSP immediately takes control of the system.

Summary of Redundancy Commands

RSP redundancy is enabled by default in the Cisco IOS XR software, but you can use the commands described in Table 19: RSP Redundancy Commands, on page 139 to display the redundancy status of the cards or force a manual switchover.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show redundancy</td>
<td>Displays the redundancy status of the RSPs. This command also displays the boot and switchover history for the RSPs.</td>
</tr>
</tbody>
</table>
Command | Description
--- | ---
redundancy switchover | Forces a manual switchover to the standby RSP. This command works only if the standby RSP is installed and in the “ready” state.
show platform | Displays the status for node, including the redundancy status of the RSP cards. In EXEC mode, this command displays status for the nodes assigned to the SDR. In administration EXEC mode, this command displays status for all nodes in the system.

**Automatic Switchover**

Automatic switchover from the active RSP to the standby RSP occurs only if the active RSP encounters a serious system error, such as the loss of a mandatory process or a hardware failure. When an automatic switchover occurs, the RSPs respond as follows:

- If a standby RSP is installed and “ready” for switchover, the standby RSP becomes the active RSP. The original active RSP attempts to reboot.
- If the standby RSP is not in “ready” state, then both RSPs reboot. The first RSP to boot successfully assumes the role of active RSP.

**RSP Redundancy During RSP Reload**

The `reload` command causes the active RSP to reload the Cisco IOS XR software. When an RSP reload occurs, the RSPs respond as follows:

- If a standby RSP is installed and “ready” for switchover, the standby RSP becomes the active RSP. The original active RSP reboots and becomes the standby RSP.
- If the standby RSP is not in the “ready” state, then both RSPs reboot. The first RSP to boot successfully assumes the role of active RSP.

⚠️ **Caution**

You should not use the `reload` command to force an RSP switchover because the result could be a significant loss of router operations. Instead, use the `redundancy switchover` command to fail over to the standby RSP, then use the `hw-module location node-id reload` command to reload the new standby RSP.

**Related Topics**

- [Reloading, Shutting Down, or Power Cycling a Node](#), on page 147

**Manual Switchover**

You can force a manual switchover from the active RSP to the standby RSP using the `redundancy switchover` command.

If a standby RSP is installed and ready for switchover, the standby RSP becomes the active RSP. The original active RSP becomes the standby RSP. In the following example, partial output for a successful redundancy switchover operation is shown:

```plaintext
RP/0/RSP0/CPU0:router# show redundancy
```
This node (0/RSP0/CPU0) is in ACTIVE role
Partner node (0/RSP1/CPU0) is in STANDBY role
Standby node in 0/RSP1/CPU0 is ready

RP/0/RSP0/CPU0:router# redundancy switchover
Updating Commit Database. Please wait... [OK]
Proceed with switchover 0/RSP0/CPU0 -> 0/RSP1/CPU0? [confirm]
Initiating switch-over.
RP/0/RSP0/CPU0:router#

<Your 'TELNET' connection has terminated>

In the preceding example, the Telnet connection is lost when the previously active RP resets. To continue management of the router, you must connect to the newly activated RP as shown in the following example:

User Access Verification
Username: xxxxx
Password: xxxxx
Last switch-over Sat Apr 15 12:26:47 2009: 1 minute ago

RP/0/RSP1/CPU0:router#

If the standby RSP is not in “ready” state, the switchover operation is not allowed. In the following example, partial output for a failed redundancy switchover attempt is shown:

RP/0/RSP0/CPU0:router# show redundancy
Redundancy information for node 0/RP1/CPU0:
-------------------------------------------
Node 0/RSP0/CPU0 is in ACTIVE role
Partner node (0/RSP1/CPU0) is in UNKNOWN role
Reload and boot info
-----------------------------
RP reloaded Wed Mar 29 17:22:08 2009: 2 weeks, 2 days, 19 hours, 14 minutes ago
Active node booted Sat Apr 15 12:27:58 2009: 8 minutes ago
Last switch-over Sat Apr 15 12:35:42 2009: 1 minute ago
There have been 4 switch-overs since reload

RP/0/RSP0/CPU0:router# redundancy switchover
Switchover disallowed: Standby node is not ready.

**Communicating with a Standby RP**

The active RSP automatically synchronizes all system software, settings, and configurations with the standby RSP.

If you connect to the standby RSP through the console port, you can view the status messages for the standby RSP. The standby RSP does not display a CLI prompt, so you cannot manage the standby card while it is in standby mode.
If you connect to the standby RSP through the management Ethernet port, the prompt that appears is for the active RSP, and you can manage the router the same as if you had connected through the management Ethernet port on the active RSP.

**Console Management Port**

The Console Management Port (CMP) feature enables console access to the RSP and RP network devices through an ethernet port on the router using the Secure Shell (SSH).

To enable CMP feature the IPU and ROMMON must be upgraded to the latest version available in the Cisco IOS XR Software Release 5.3.2 through FPD upgrade for IOS XR 32-bit image.

For information about FPD upgrade, see *Cisco ASR 9000 Series Aggregation Services Router System Management Configuration Guide*, chapter Upgrading FPD.

---

**Note**

CMP feature helps troubleshoot the RP and RSP issues when IOS XR CLI is unavailable or when the CPU is inaccessible. On the contrary, using the CMP feature otherwise will result in unpredictable behavior of the router.

The CMP feature enables:

- ROMMON and XR access.
- Connection to route processor console port.
- Connection to route processor auxiliary port (32-bit image) or system admin plane (64-bit image).
- Installation of new software image through SCP (32-bit image) or PXE (64-bit image) without a terminal server connected to the console port.
- CMP password recovery by using the `resetcmp` command on the CMP shell. This clears CMP data (user IDs, passwords, DNS name, hostname, SSH Key) to default settings.

---

**Note**

The default login username is cmp and password is cisco123.

You can download a new Cisco IOS XR image using the `tftp` or `scp` command. You must provide the server IPv6 address and filename when using `scpboot` command. The image is copied from the server directly to the route processor CPU memory. If route processor CPU side is in ROMMON or already in IOS XR, it is reset and held in ROMMON until the image is copied. This image is automatically booted (turbo boot for 32-bit) on the route processor CPU side. The image download options provided by the CMP can only download and boot a complete image. Subsequent image upgrades, pie downloads (32-bit image) must be done through system admin (32-bit image), and using the management ports.

CMP implements zero-configuration networking concepts such as mDNS and DNS-SD to ease the booting of a supervisor (RSP, RP) card. See the section Zero Configuration Networking, on page 145 for information on zero-configuration networking.

For information on CMP shell, see the section CMP Shell, on page 143.
CMP Shell

CMP is accessed using IPv6 SSH. Use the default username/password to login to CMP shell. This table describes the commands available on the CMP shell:

**Table 20: CMP Shell Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>adduser</td>
<td>Adds a new CMP user ID/password.</td>
</tr>
<tr>
<td>aux</td>
<td>Connects to route processor CPU auxiliary port for 32-bit image.</td>
</tr>
<tr>
<td>con</td>
<td>Connects to route processor CPU console port. Although multiple SSH sessions to the CMP shell are allowed, the <code>con</code>, <code>aux</code>, or <code>lc</code> command execution is allowed for only single user at a time.</td>
</tr>
<tr>
<td>copykey</td>
<td>SCP a key.</td>
</tr>
<tr>
<td>deluser</td>
<td>Deletes a user ID. It is recommended that you delete the default username <code>cmp</code> after a new user is created.</td>
</tr>
<tr>
<td>desc_err</td>
<td>Shows description of command error codes.</td>
</tr>
<tr>
<td>debug</td>
<td>Enables CMP console logging functionality.</td>
</tr>
<tr>
<td>dns</td>
<td>Changes DNS name. The initial service advertisement uses the domain name of chassis serial number + RSP/RP slot. This can be changed using the <code>dns</code> command.</td>
</tr>
<tr>
<td>exit</td>
<td>Logs out of CMP.</td>
</tr>
<tr>
<td>fanspeed</td>
<td>Shows information about fan trays in the chassis.</td>
</tr>
<tr>
<td>help</td>
<td>Displays available CMP commands.</td>
</tr>
<tr>
<td>hostname</td>
<td>Changes a host name.</td>
</tr>
<tr>
<td>lc</td>
<td>Connects to a line card console.</td>
</tr>
<tr>
<td>leslotinfo</td>
<td>Shows line card slot ID information.</td>
</tr>
<tr>
<td>passwd</td>
<td>Changes password (minimum 5 and maximum 8 characters).</td>
</tr>
<tr>
<td>power</td>
<td><code>[cycle] [off] [on] &lt;slot&gt;</code> Powers on/off card</td>
</tr>
<tr>
<td>priv</td>
<td>Enters privileged EXEC mode.</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>tftp</td>
<td>TFTP boots Cisco IOS XR image to Route processor CPU memory.</td>
</tr>
<tr>
<td>resetcmp</td>
<td>Clears CMP data (user IDs, passwords, DNS name, hostname and SSH key) to default settings.</td>
</tr>
<tr>
<td>run</td>
<td>Runs diagnostic commands ping/ping6/traceroute/traceroute6 to diagnose basic network connectivity problems.</td>
</tr>
<tr>
<td>scp</td>
<td>SCP boots 32-bit IOS XR image.</td>
</tr>
<tr>
<td>show</td>
<td>Shows all CMP data.</td>
</tr>
<tr>
<td></td>
<td>Displays ip/key/cmp configuration.</td>
</tr>
<tr>
<td>showinv</td>
<td>Shows the physical inventory.</td>
</tr>
<tr>
<td>showtemp</td>
<td>Shows the temperature information.</td>
</tr>
<tr>
<td>slotmap</td>
<td>Displays physical slot and card mapping information.</td>
</tr>
<tr>
<td>sshkeygen</td>
<td>Generates a new SSH key.</td>
</tr>
<tr>
<td>unlock</td>
<td>Removes all system locks.</td>
</tr>
<tr>
<td></td>
<td>From CMP shell only one user is allowed to login to the console port, auxiliary port or LC console, and that user holds the lock and there is no access to other users.</td>
</tr>
<tr>
<td>reset</td>
<td>Enables a router to warm-reboot.</td>
</tr>
</tbody>
</table>

Limitations

Return Material Authorization (RMA) - In the event of a RMA of the supervisor (RSP/RP) card, since the CMP information is tied to the chassis serial number, all the modified information using the CMP shell is reverted back to factory default values. This means that the username/password database would be erased and the default username/password is in effect. The domain name used in service advertisement reverts to the chassis serial number plus slot ID.

These are the limitation of CMP:

- CMP supports only SSH service.
- Only one SSH session has console, auxiliary or system admin port.
- CMP does not support software image upgrade, pie or VM downloads.
- IPv6 link local address is preferred by Avahi application rather than the IPv6 global address.
- There is no authentication performed on users logging into the CMP shell.
- Warm reload causes loss of CMP SSH session only in A9K-RSP880-TR/SE or A99-RP2-TR/SE.
Zero Configuration Networking

CMP configures the network devices using zero-configuration networking model and eliminates the need to have serial terminal servers. The zero-configuration networking enables:

• automatic IP address selection for network device—If a network device does not have an IP address assigned to it, then zero-configuration networking supports DHCP to obtain IPv6 Stateless Address Autoconfiguration (SLAAC), IPv4 and IPv6 addresses. The CMP port when connected to a IPv6 network obtains a link local address and also IPv6 global auto address based on IPv6 SLAAC.

• automatic domain name resolution and distribution of computer host names—The zero-configuration networking implements multicast DNS (mDNS). mDNS allows a network device to select a domain name in the local namespace and then broadcast that name using a special multicast IP address, allowing other devices on the network to connect to it by name instead of by numbered IP address. This eliminates the need to configure a DNS server.

• automatic location of network services through DNS service discovery—The zero-configuration networking enables a network device to use standard DNS queries to discover devices registered on the network that are broadcasting the services that they provide. This eliminates the need to set up a directory server.

These are the zero-configuration networking applications that are supported:

• For Windows and MAC OS—Bonjour
• For Linux OS—Avahi

CPAK

CPAKs are the Cisco's innovation for 100G pluggable optics, which is built with the industry leading smallest form factor, in full compliant with IEEE802.3ae specification for 100GE-SR10, -LR4, and can interoperate with all IEEE 802.3ba compliant CFP-SR10 or CFP-LR4 100G optics.

The key new functionality is that CPAK variants are being constructed that represent 10 x 10GE ports. A single physical port on the linecard needs to instantiate multiple breakout Ethernet interfaces, very much similar to serial interface channelization.

Modes Supported on CPAKs

This table clearly lists the modes supported with the relevant PID:

<table>
<thead>
<tr>
<th>CPAK (PID)</th>
<th>Modes Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>CPAK-100G-SR10</td>
<td>100 GE, 10 GE, 40 GE</td>
</tr>
<tr>
<td>CPAK-100G-LR</td>
<td>100 GE</td>
</tr>
<tr>
<td>CPAK-10X10G-LR</td>
<td>10 GE.</td>
</tr>
</tbody>
</table>

The standard R/S/I/P format is 4-tuple. 5-tuple interfaces are represented as - R/S/I/P/SP. P is the CPAK port and SP indicates the breakout port. A CPAK which is configured as 5 tuple after executing the breakout command can be configured as 0x10G configuration. A CPAK, without the breakout mode can only be
configured as 100G, represents a 4 tuple configuration. The default interface type is HundredGigE. If there is no configuration, then Hundred GigE interface would be created for the CPAK ports.

Configuring Breakout

This task enables the user to configure the breakout option.

**SUMMARY STEPS**

1. configure
2. hw-module location preconfigure location port breakout interface

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure</td>
<td></td>
</tr>
<tr>
<td>Step 2 hw-module location preconfigure location port breakout interface</td>
<td>Configures the breakout option.</td>
</tr>
</tbody>
</table>

**Example:**

RP/0/RSP0/CPU0:router (config) # hw-module location 0/0/CPU0 port 0 breakout 10x TenGigE

**Note**
The optional keyword, `preconfigure` enables the user to preconfigure breakout on an empty slot.

SR10 CPAK can operate in the following modes:
- 1x100GE or 10x10GE. 1x100GE is the default option. 10x10 CPAK can also support 10x10GE.

**Power saving mode**

8x100GE Line card consists of 4 Slices (0,1,2,3). Each slice has two physical ports. Slice-1, 2 and 3 can be configured into power save mode. Power save option is not applicable to Slice-0. Use the `hw-module power saving` command to configure the required slice to power saving mode.

Once a slice is configured in the power saving mode, the interfaces will be deleted and hence all traffic passing through the interfaces will be dropped.

<table>
<thead>
<tr>
<th>Slice</th>
<th>Ports</th>
</tr>
</thead>
<tbody>
<tr>
<td>Slice 1</td>
<td>Ports 2,3</td>
</tr>
<tr>
<td>Slice 2</td>
<td>Ports 4,5</td>
</tr>
<tr>
<td>Slice 3</td>
<td>Ports 6,7</td>
</tr>
</tbody>
</table>

**To configure the power save option**

This task enables the user to configure the power save option.

**SUMMARY STEPS**

1. admin
2. configure
3. hw-module power saving location location slice number

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> admin</td>
<td>Enters administration EXEC mode.</td>
</tr>
<tr>
<td>Step 2 configure</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> hw-module power saving location location slice number</td>
<td>Configures the power saving option for the specified slice. The available options are Slice1, 2, 3.</td>
</tr>
</tbody>
</table>

**Note** Power save option is not applicable for Slice 0.

What to do next

Use the show plat slices command to get the status of the slices.

**Reloading, Shutting Down, or Power Cycling a Node**

Use the commands described in this section to reload the Cisco IOS XR software on the active RSP or on any specified node in the system. This section also describes the commands used to administratively shut down a node and power a node on or off.

Table 22: Commands to Reload, Shut Down, or Power Cycle a Node, on page 147 summarizes the commands described in this section.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hw-module location node-id power disable</td>
<td>This command administratively turns the power off for a node. It is entered in administration configuration mode. The changes do not take effect until you enter the commit command. To power on a node, use the no form of this command.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>This command cannot be used to disable power on the RSP from which the command is entered.</td>
</tr>
<tr>
<td>hw-module location node-id reload</td>
<td>This command works in EXEC mode and reloads the Cisco IOS XR software on a specific node or all nodes. To specify all nodes, enter the all keyword in place of the node-id argument. The node reloads with the current running configuration and active software set for that node.</td>
</tr>
</tbody>
</table>
Reloading the Active RSP

The `reload` command causes the active RSP to reload the Cisco IOS XR software according to the configuration register setting. This setting determines how the active RSP acts when reloaded.

This section contains instructions to reload the Cisco IOS XR software and return to EXEC mode. For instructions to use the `reload` command for entering ROM Monitor bootstrap mode, see *ROM Monitor Configuration Guide for Cisco ASR 9000 Routers*.

⚠️ **Caution**

Because the `reload` command causes the active RSP to go off line and either reload the Cisco IOS XR software or enter ROM Monitor mode, the router experiences a loss of service unless a redundant standby RSP is installed and in “ready” state. To display the status of the standby RSP, use the `show redundancy` command in EXEC mode.

**SUMMARY STEPS**

1. `show redundancy`
2. `admin`
3. `show variables boot`
4. (Optional) `config-register register-value`
5. `admin`
6. `reload`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> show redundancy</td>
<td>Displays the RSP redundancy status.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>RP/0/RSP0/CPU0:router# show redundancy</code></td>
<td>• If a standby RSP is in “ready” redundancy state, the <code>reload</code> command also causes the router to gracefully fail over to the standby RSP.</td>
</tr>
<tr>
<td><strong>Step 2</strong> admin</td>
<td>Enters administration EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>RP/0/RSP0/CPU0:router# admin</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> show variables boot</td>
<td>Displays the configuration register setting.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>RP/0/RSP0/CPU0:router(admin)# show variables boot</code></td>
<td>• Enter this command in administration EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>• For normal operations, the configuration register setting is 0x102 or 0x2102, which causes the active RSP to reload the Cisco IOS XR software.</td>
</tr>
<tr>
<td></td>
<td>• Verify that the configuration register setting is 0x102 or 0x2102. If it is not, complete Step 4, on page 149 to reset the configuration register to 0x102 or 0x2102.</td>
</tr>
</tbody>
</table>
### Flash Disk Recovery

When an RSP is power cycled or experiences an ungraceful reset, the boot disk (PCMCIA flash disk used to boot the card) may experience a file-system corruption. If this occurs, an error message is displayed and the RSP fails to boot. The corrupted flash disk is automatically reformatted and the Cisco IOS XR software is restored from the designated system controller (DSC) for the system.

For example, if a flash disk for an RSP is corrupted, the RP fails to boot and the following error message is displayed:

```
#########################################################
Restricted Rights Legend
Use, duplication, or disclosure by the Government is subject to restrictions as set forth in subparagraph (c) of the Commercial Computer Software - Restricted Rights clause at FAR sec. 52.227-19 and subparagraph (c) (1) (ii) of the Rights in Technical Data and Computer Software clause at DFARS sec. 252.227-7013.

Cisco Systems, Inc.
170 West Tasman Drive
San Jose, California 95134-1706

# Flash Disk Recovery
```
Cisco IOS XR Software for the Cisco XR Cisco ASR 9000 Series Router-mbirp,
Copyright (c) 2009 by Cisco Systems, Inc.
Unable to mount /disk0:, filesystem is corrupted.
Check fsck log at /tmp/chkfs_fd0.log
init: special_commands:wait for disk0: failed

If this occurs, then the flash disk is automatically reformatted and the Cisco IOS XR software is restored to
the flash disk.

Note
If the flash disk is badly damaged and cannot be reformatted, the disk must be replaced.
If the corrupted flash disk is the DSC, then the router fails over to the standby DSC. If no standby DSC is
installed, then the system fails to boot.

Using Controller Commands to Manage Hardware Components

The controller, controllers, and show controllers commands are used to manage and display settings
for various hardware components, including the switch fabric management, Ethernet control plane, and
interface manager. These commands are primarily diagnostic and related to driver-level details. The information
available with these commands varies widely and is hardware specific.

For information on the use of these commands, see Interface and Hardware Component Command Reference
for Cisco ASR 9000 Series Routers.

Formatting Hard Drives, Flash Drives, and Other Storage Devices

To format a storage device on the router, use the format command in EXEC mode.

Caution
Formatting a storage device deletes all data on that device.

The following command syntax is used:

format filesystem: [options]

Table 23: format command Syntax Description, on page 151 describes the format command syntax.
Table 23: format command Syntax Description

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filesystem</td>
<td>Specifies the memory device to format. The supported file systems are:</td>
</tr>
<tr>
<td></td>
<td>- bootflash:</td>
</tr>
<tr>
<td></td>
<td>- compactflash:</td>
</tr>
<tr>
<td></td>
<td>- configflash:</td>
</tr>
<tr>
<td></td>
<td>- harddisk:</td>
</tr>
<tr>
<td></td>
<td>- harddiska:</td>
</tr>
<tr>
<td></td>
<td>- disk0:</td>
</tr>
<tr>
<td></td>
<td>- disk1:</td>
</tr>
<tr>
<td></td>
<td>Enter format ? to see the devices supported on your router.</td>
</tr>
<tr>
<td>options</td>
<td>Enter format filesystem: ? to see the available options.</td>
</tr>
</tbody>
</table>

For more information, see System Management Command Reference for Cisco ASR 9000 Series Routers.

In the following example, the format command is used to format the hard disk:

RP/0/RSP0/CPU0:router# format harddisk:

Removing and Replacing Cards

This section describes card replacement issues and procedures.

Removing Line Cards

Line cards are designed for online insertion and removal (OIR). A line card is a single card that contains all service processing functions and physical line interfaces.

The OIR feature allows you to remove and replace cards without removing power to the card or chassis. Removing a card interrupts all traffic passing through the card, but it does not remove the card configuration.

When you remove a card, the configuration remains for all interfaces, but the interfaces do not appear in the output of the show interfaces command. You can view interface configurations by entering the show running-config command. The following example shows how the configuration appears when a card is removed:

RP/0/RSP0/CPU0:router# show running-config

Building configuration...  
hostname router  
router ospf 3269  
   area 0  
      interface POS0/3/0/0  
      cost 20  
!  
interface preconfigure POS0/3/0/0
In this example, the line card in slot 3 is removed, and the interface configuration for all four interfaces changes to “interface preconfigure.” However, the “router ospf” reference to a slot 3 interface does not change. If you replace a line card with another line card that uses the same media type and port count, the configuration becomes active on the replacement card.

To remove the configuration for a slot after a card is removed, use the no interface preconfigure command to remove all interface configuration statements for that card in the running configuration. In addition, search the configuration for any references to the removed interfaces, such as the “router ospf” reference to slot 3 in the preceding example.

To remove the configuration for a slot when a card is installed, use the no interface command to remove all interface configuration statements for that card in the running configuration. In addition, search the configuration for any references to the removed interfaces.

Each line card supports a specific media type (Packet over SONET/SDH [POS] or Ethernet, for example) and port count. If you replace a line card with one that supports a different media type or port count, you should review the configuration and revise it to support the replacement line card.

### Replacing a Line Card with the Same Media Type and Port Count

When you replace a line card or PLIM with a card that is of the same media type and has the same port count as the replaced card, the guidelines in the Removing Line Cards, on page 151 apply. Because the replacement card is of the same media type and port count, no special procedures are required for card removal and replacement.

### Replacing a Line Card with the Same Media Type and a Different Port Count

When you replace a line card with a card that is of the same media type with a different port count, the guidelines in Removing Line Cards, on page 151 apply.

If the new card has a greater port count than the replaced card, the configuration applies to the corresponding lower port numbers, and the ports that did not exist on the replaced card have no configuration and come up in the shutdown state.

If the new card supports fewer ports, the existing configuration for the corresponding number of ports on the new card set is applied. The previous configuration for the removed ports remains in interface preconfigure state, as shown in the following example:

```
RP/0/RSP0/CPU0:router# show running-config

Building configuration...
```
hostname rtp-gsr1
interface POS0/3/0/0
  ipv4 address 10.10.50.1 255.255.255.0
!
interface preconfigure POS0/3/0/1
  description POS0/3/0/1
  shutdown
!
interface preconfigure POS0/3/0/2
  description POS0/3/0/2
  shutdown
!
interface preconfigure POS0/3/0/3
  description POS0/3/0/3
  shutdown
!

In the preceding example, a four-port card has been replaced with a single-port card. The configuration from port 1 on the four-port card is applied to the single port on the replacement card, and the remaining port configurations change to “interface preconfigure.” To remove the configuration for the missing interfaces, use the `no interface preconfigure` command. In addition, search for and remove any configuration references to the removed interfaces.

Whenever you replace a line card with the same media type and a different port count, review the running configuration in the router and revise the configuration as necessary.

### Replacing a Line Card or PLIM with a Different Media Type

When you replace a line card or PLIM with a card that is of a different media type (for example, if you replace a POS PLIM with an Ethernet PLIM), the guidelines in Removing Line Cards, on page 151 apply. Review the running configuration in the router and revise the configuration as necessary for the new media type.

### Examples: Breakout and Power saving options

The following are the examples for the `power save` and `breakout` options:

#### Power saving mode

Configuring the power saving option:

```conf
admin
  config
    hw-module power saving location 0/0/CPU0 slice 3
  
show platform slices
Line Card  Slice  Config    Status
0/0/CPU0  0      Power on  Completed
         1      Power on  Completed
         2      Power on  Completed
         3      Power saving Completed
```

#### Breakout option

Configuring the breakout option:

```conf
config
  hw-module location 0/0/CPU0 port 0 breakout 10xTenGigE
  
```

show command output indicating the breakout ports:

RP/0/RSP0/CPU0:TD02#show ipv4 interface brief | include Hun
Sun Sep  7 15:59:33.446 PST
HundredGigE0/0/0/0 34.34.34.2 Down Down
HundredGigE0/0/0/1 100.0.1.1 Up Up
HundredGigE0/0/0/2 unassigned Up Up
HundredGigE0/0/0/3 unassigned Up Up
HundredGigE0/0/0/4 unassigned Shutdown Down
HundredGigE0/0/0/5 unassigned Shutdown Down
HundredGigE0/0/0/6 unassigned Shutdown Down
HundredGigE0/0/0/7 unassigned Shutdown Down

RP/0/RSP0/CPU0:router(config)#hw-module location 0/0/CPU0 port 2 breakout 10xTenGigE
RP/0/RSP0/CPU0:router(config)#commit
RP/0/RSP0/CPU0:router#show ipv4 interface brief | include Ten
TenGigE0/0/0/2/0 unassigned Shutdown Down

TenGigE0/0/0/2/4 unassigned Shutdown Down
TenGigE0/0/0/2/5 unassigned Shutdown Down
TenGigE0/0/0/2/6 unassigned Shutdown Down
TenGigE0/0/0/2/7 unassigned Shutdown Down
TenGigE0/0/0/2/8 unassigned Shutdown Down
TenGigE0/0/0/2/9 unassigned Shutdown Down

Upgrading the CPU Controller Bits

Use this procedure to upgrade the CPU controller bits on all nodes that are installed in the router or on a specific node.

SUMMARY STEPS

1. admin
2. upgrade cpuctrlbits {all | location node-id}

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters administration EXEC mode.</td>
</tr>
<tr>
<td>admin</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RSP0/CPU0:router# admin</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Upgrades the CPU controller bits on all nodes in the router. Use the <code>location node-id</code> keyword and argument to upgrade the CPU controller bits on a specific node.</td>
</tr>
<tr>
<td>upgrade cpuctrlbits {all</td>
<td>location node-id}</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RSP0/CPU0:router(admin)# upgrade cpuctrlbits all</td>
</tr>
</tbody>
</table>
Examples

The following example shows how to upgrade the CPU controller bits on all nodes in a router:

RP/0/RSP0/CPU0:router# admin
RP/0/RSP0/CPU0:router@admin)# upgrade cpucrtlbits all

Please do not power cycle, reload the router or reset any nodes until all upgrades are completed.
Please check the syslog to make sure that all nodes are upgraded successfully.
If you need to perform multiple upgrades, please wait for current upgrade to be completed before proceeding to another upgrade. Failure to do so may render the cards under upgrade to be unusable.

Configure Single Feed Power Mode

Cisco ASR 9000 series router supports the operating of one or all power modules. For example, V1 DC, V2 DC, V3 AC and V3 DC.
Ideally, you’re expected to connect all the power modules (or feed) to power supply. If you don’t connect any one feed, the system raises an alarm or error message.
You can configure the single-feed power mode to suppress the error message or an alarm for any missing feeds.

Configuration Example

The following example enables the single power feed mode for the 0/PS2/M0/SP power module:

Router#admin
Router@admin)# config
Router@admin-config)# power single-feed location 0/PS2/M0/SP

Chapter 11

Upgrading and Managing Cisco IOS XR Software

Cisco IOS XR software is divided into software packages so that you can select which features run on your router. This module describes the concepts and tasks necessary to add feature packages, upgrade the active set of packages, roll back to a previously active set of packages, and perform other related package management tasks.

For complete descriptions of the commands listed in this module, see Related Documents, on page 214. To locate documentation for other commands that might appear in the course of performing a configuration task, search online in Cisco ASR 9000 Series Aggregation Services Router Commands Master List.

This module contains the following topics:

- Overview of Cisco IOS XR Software Packages, on page 158
- Information About Package Management, on page 162
- Package Management Procedures, on page 174
- Rolling Back to a Previous Software Set, on page 211
- Additional References, on page 214
Overview of Cisco IOS XR Software Packages

Cisco IOS XR software is divided into software packages so that you can select which features run on your router. Each package contains the components to perform a specific set of router functions, such as routing, security, or modular services card (MSC) support. Bundles are groups of packages that can be downloaded as a set. For example, Cisco IOS XR Unicast Routing Core Bundle (known as mini) provides the main packages for use on every router.

Adding a package to the router does not affect the operation of the router—it only copies the package files to a local storage device on the router, known as the boot device (such as the compact flash drive). To make the package functional on the router, you must activate it for one or more cards.

To upgrade a package, you activate a newer version of the package. When the automatic compatibility checks have been passed, the new version is activated, and the old version is deactivated.

---

**Note**
Activating a software maintenance upgrade (SMU) does not cause any earlier SMUs or the package to which the SMU applies to be automatically deactivated.

---

**Note**
If an interface on a router does not have a configuration and is brought up by performing no-shut operation, then upon router reload, the interface state changes to admin-shutdown automatically.

To downgrade a package, you activate an older version of the package. When the automatic compatibility checks have been passed, the older version is activated, and the newer version is deactivated.

---

**Caution**
Do not perform any install operations when the router is reloading.

---

**Note**
For more information on the features and components included in each package, refer to the release notes.

---

Package Installation Envelopes

Package Installation Envelopes (PIEs) are nonbootable files that contain a single package or a set of packages (called a composite package or bundle). Because the files are nonbootable, they are used to add software package files to a running router.

PIE files have a pie extension. When a PIE file contains software for a specific bug fix, it is called a software maintenance upgrade (SMU).
Files with the `vm` extension are bootable installation files used only to replace all current Cisco IOS XR software. These files are installed from ROM Monitor mode, which causes significant router downtime. Cisco Systems recommends installing or upgrading software packages only using PIE files as described in this document. For more information on `vm` files, see *ROM Monitor Configuration Guide for Cisco ASR 9000 Routers*.

**Summary of Cisco IOS XR Software Packages**

Every router includes a basic set of required packages contained in the Cisco IOS XR Unicast Routing Core Bundle. Additional optional packages can be added and activated on the router to provide specific features.

**Packages in the Cisco IOS XR Unicast Routing Core Bundle**

The packages contained in the Cisco IOS XR Unicast Routing Core Bundle are as follows:

- Operating system (OS) and minimum boot image (MBI)—Kernel, file system, memory management, and other slow changing core components.
- Base—Interface manager, system database, checkpoint services, configuration management, other slow-changing components.
- Routing—RIB, BGP, ISIS, OSPF, EIGRP, RIP, RPL, and other routing protocols.
- Forwarding—FIB, ARP, QoS, ACL, and other components.
- LC—Line card drivers.

The filename for this bundle is: `asr9k-mini.pie-version`.

Refer to the release notes for additional information on the specific features provided by each package.

**Software Maintenance Upgrades**

A software maintenance upgrade (SMU) is a PIE file that contains fixes for a specific defect. A composite SMU is a PIE file that contains SMUs for more than one package. SMUs are added and activated using the same procedures as other PIE files. SMUs are created to respond to immediate issues and do not include new features. Typically, SMUs do not have a large impact on router operations. SMU versions are synchronized to the package major, minor, and maintenance versions they upgrade.

The affect of an SMU depends on its type:

- Process Restart SMU—Causes a process or group of processes to restart on activation.
- Reload SMU—Causes a parallel reload (of RPs and line cards).

SMUs are not an alternative to maintenance releases. They provide quick resolution of immediate issues. All bugs fixed by SMUs are integrated into the maintenance releases. For information on available SMUs, contact Cisco Technical Support, as described in *Obtaining Technical Assistance* in the monthly *What’s New in Cisco Product Documentation*. 
Activating a software maintenance upgrade (SMU) does not cause any earlier SMUs, or the package to which the SMU applies, to be automatically deactivated.

Note

Related Topics

Updating Software Images Without a Router Reload

PIE Filenames and Version Numbers

PIE filenames have two formats: one for composite-package PIEs (bundles) and one for single-package PIEs. A composite-package file is a PIE file that contains multiple packages.

Note

Hyphens in the filename are part of the filename.

Table 25: PIE Filenames, on page 160 shows the filenames for available PIE types.

Table 25: PIE Filenames

<table>
<thead>
<tr>
<th>Software Delivery Type</th>
<th>Filename</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Composite (Bundle) PIE</td>
<td>platform-composite_name.pie-major:minor:maintenance</td>
<td>asr9k-mini.pie-3.7.2</td>
</tr>
<tr>
<td>Single package PIE</td>
<td>platform-package_type.-p.pie-major:minor:maintenance</td>
<td>asr9k-mpls.pie-3.7.2</td>
</tr>
<tr>
<td>Composite SMU</td>
<td>comp-platform-composite_name.ddts.pie</td>
<td>comp-asr9k-001.CSCec98xxx.pie</td>
</tr>
<tr>
<td>Single package SMU</td>
<td>platform-package_type-major:minor:maintenance.ddts.pie</td>
<td>asr9k-base-3.7.2.CS0ei45xxx.pie</td>
</tr>
</tbody>
</table>

Note

A SMU composite name usually is “001”, which means the SMU is the first SMU for that DDTS. In rare cases in which the same DDTS requires multiple composite SMUs, a second composite version number is released as “002”. In the previous example, a second composite SMU “comp-002.CSCec98766” would be created for DDTS CSCec98766.

Filename Component Description

The filename components for all packages are described in Table 26: Composite- and Single-Package Filename Components, on page 160.

## Copying the PIE File to a Local Storage Device or Network Server

To add an optional package or upgrade or downgrade a package, you must copy the appropriate PIE file to a local storage device or to a network file server to which the router has access.

If you need to store PIE files on the router, we recommended storing PIE files on the hard disk. Flash disk0: serves as the boot device for packages that have been added or activated on the system. Flash disk1: is used as a backup for disk0:.

**Tip**

Before copying PIE files to a local storage device, use the `dir` command to check to see if the required PIE files are already on the device.

---

## Information About Package Management

### Summary of Package Management

The general procedure for adding optional packages, upgrading a package or package set, or downgrading packages on the router is as follows:

1. Copy the package file or files to a local storage device or file server.
2. Add the package or packages on the router using the command `install add`.
3. Activate the package or packages on the router using the `install activate` command.
4. Commit the current set of packages using the `install commit` command.

Figure 7: Process to Add, Activate, and Commit Cisco IOS XR Software Packages, on page 163 illustrates key steps in the package management process.
Adding Packages

Use the `install add` command to unpack the package software files from a PIE file and copy them to the boot device (usually disk0:).

- The package software files are added to the boot device of the DSC of the router from either administration EXEC or EXEC mode.

**Note**

The disk that holds the unpacked software files is also known as the *boot device*. By default, flash disk0: is used as the boot device. To use an alternate storage device, such as flash disk1:, see the *Router Recovery with ROM Monitor* module of *ROM Monitor Configuration Guide for Cisco ASR 9000 Routers*. Remember that all RSPs in a system must use the same boot device. If the boot device on the primary RSP is flash disk0:, then the standby RSP must also have a flash disk0:.

**Verifying Package Details**

Before you activate a package on the router, you can verify the type of upgrade that is required for the package and whether the package requires a router reload or not. Use the `show install package pie detail` command in admin mode.

```
RP/0/RSP0/CPU0:router# show install package disk0:asr9k-px-4.x.x.04I.CSCuc66088-0.0.4.i detail
```

```
Mon Nov 19 09:44:24.036 UTC

```
Activating Packages

Software packages remain inactive until activated with the `install activate` command.

After a package has been added to the router, use the `install activate` command to activate the package or SMUs for all valid cards. Information within the package is used to verify compatibility with the target cards and with the other active software. Actual activation is performed only after the package compatibility and application programming interface (API) compatibility checks have been passed.

SDR-specific activation is supported for specific packages and upgrades, such as optional packages and SMUs. Packages that do not support SDR-specific EXEC mode activation can only be activated from administration EXEC mode.

Activating a Package on the Router

To activate a package on your router, use the `install activate` command in either administration EXEC mode or EXEC mode. If used in administration EXEC mode, the `install activate` command also activates the
package on all administration plane nodes and resources, including service processors (SPs), fabric SCs, fan controllers, alarm modules, and power modules.

---

**Note**

To enter administration EXEC mode, you must be logged in to the owner secure domain router (SDR) and have root-system access privileges.

You can also activate a package using the `install activate` command from EXEC mode.

### Activating Multiple Packages or SMUs

To install multiple packages or software maintenance upgrades (SMUs) with a single command, use the `install activate` command and either specify up to 16 packages by repeating `device: package` arguments or use wildcard syntax to specify multiple packages. Some SMUs may require a reload. If the operation requires a node reload, the user is prompted before the installation operation occurs.

**Related Topics**

- SMU Installation Combinations

### Activating All Packages Added in a Specific Operation

To install all packages that were added in a specific `install add` operation, use the `install activate` command with the `id add-id` keyword and argument, specifying the operation ID of the `install add` operation. You can specify up to 16 operations in a single command.

### Adding and Activating a Package with a Single Command

To add and activate a package with a single command, use the `install add` command with the `activate` keyword.

- To add and activate a package, enter the `install add` command with the `activate` keyword from administration EXEC mode.
- To add and activate a package in EXEC mode (where supported), enter the `install add` command with the `activate` keyword.

### Flexible XR Install

The Flexible XR Install feature allows you to upgrade as well as downgrade the software versions, packages and SMUs on the Cisco ASR 9000 Series Aggregation Services Router.

The Flexible XR Install feature automatically downloads all the packages that are required for installation. This is followed by compatibility testing, where the packages are checked for their compatibility with the running software or the software to be upgraded or downgraded. All required packages are extracted from specified repository to achieve SMUs dependencies.

This feature upgrades or downgrades the system using following sources:

- FTP
- TFTP
- Other local disks (for example, local harddisk, usb)
Digitally Signed Images

From Release 6.0.1 onwards, all Cisco IOS XR images are digitally signed to ensure the authenticity of the software. If the ROMMON/BIOS image on the line card is digitally signed, then ensure that the Cisco IOS XR image on the router is also digitally signed, as the ROMMON/BIOS checks the Cisco IOS XR image for a digital signature.

The Cisco IOS XR Release 5.3.x images are not digitally signed. If you are running Cisco IOS XR Release 5.3.x, then ensure that you install the Abraxas based SMU for successful operation of the router with the latest line cards.

The digitally signed images are supported on the following line cards:

- A99-RP2-TR
- A99-RP2-SE
- A9K-RSP880-TR
- A9K-RSP880-SE
- A9K-8X100GE-SE
- A9K-8X100GE-TR
- A9K-4X100GE-SE
- A9K-4X100GE-TR
- A99-8X100GE-SE
- A99-8X100GE-TR
- A9K-MOD400-SE
- A9K-MOD400-TR
- A9K-MOD200-SE
- A9K-MOD200-TR
- A9K-400G-DWDM-TR
- A99-12X100GE

For more information on installing line cards, see Cisco ASR 9000 Series Aggregation Services Routers Ethernet Line Card Installation Guide.

Validation Messages

When image credentials, signature, and other attributes of the signature envelope are matched, the router reboots.

The following message is displayed on successful image validation.

File reception completed.**** check image validation **********BIOS CODE SIGN ENTRY ...Image ASR9K-Tomahawk verified successfully~~~~~~~~~~~~~~~~~~~~~~~~~
Upgrading and Downgrading Packages

If image validation is unsuccessful, the boot process is interrupted, and the router enters the ROMMON CLI mode.

The following message is displayed on unsuccessful image validation.

```
** check image validation **......BIOS CODE SIGN ENTRY ... Image ASR9K-Tomahawk
Verification Failed Invalid signature offset ************************************ ASR9K
image validation failed, cannot boot image, contact tech support
```

Upgrading and Downgrading Packages

To upgrade a package, activate the latest version of the package; the previous version is automatically deactivated. To downgrade a package, activate the previous version of the package; the latest version is automatically deactivated.

Actual activation is performed only after compatibility checks have been passed.

Note

- Activating a software maintenance upgrade (SMU) does not cause previous versions of the SMUs, or the package to which the SMU applies, to be automatically deactivated.

- If you upgrade an ASR 9000 router with low RSP card memory, then the RSP440-TR route-switch processor and Cisco ASR 9000 2nd Generation line card can become inaccessible due to insufficient memory. Power cycling the router may help bring the router back to the up state.

Committing the Active Software Set

When a package is activated on the router, it becomes part of the current running configuration. To make the package activation persistent across reloads, enter the `install commit` command. On startup, the designated shelf controller (DSC) of the secure domain router (SDR) loads the committed software set.

- To commit the active software set from administration EXEC mode, use the `install commit` command with the `sdr Owner` keywords. Alternatively, use the `install commit` command without keywords or arguments.

Note

If the system is restarted before the active software set is saved with the `install commit` command, the previously committed software set is used.

Rolling Back to a Previous Installation Operation

Although the term `commit` sounds final, the Cisco IOS XR software provides the flexibility to roll back the selected package set to previously saved package sets. Each time a package is activated or deactivated, a rollback point is created that defines the package set that is active after the package activation or deactivation. The software also creates a rollback point for the last committed package set. If you find that you prefer a previous package set over the currently active package set, you can use the `install rollback` command to make a previously active package set active again.

Related Topics

Rolling Back to a Previous Software Set, on page 211
Multiple Disks Support during Installations

In installations on platforms where Cisco IOS XR Software is supported, only a single disk is used as an install device; that is, either disk0 or disk1. When multiple packages are installed on a single disk, it results in space constraints. To resolve this space limitation, the disk supported for the install operations has been extended to another disk called the disk1. When installing multiple packages, this feature enables you to choose between disk0 and disk1.

To add packages to a specific disk name, use the `install media` command in the admin configuration mode.

```
RP/0/RSP0/CPU0: router (admin) # install media disk1
```

Restrictions

- Before enabling the addition of disk1 through the `install media` command, the disk mirroring feature should be explicitly disabled. For details regarding disk mirroring, see the Disk Mirroring chapter.

- All single version packages should be installed into one disk; that is, either disk0 or disk1.

- When downgrading to an image that does not support extended disk, the rollback points of the extended disk will not be available on the downgraded image. For example, assume a case where the version1 (V1) image does not support the extended disk functionality and version2 (V2) image supports the functionality. Upgrading from V1(disk0) to V2(disk1), in such a case, makes the rollback points of V1 available on V2. However, when downgrading from V2(disk1) to V1(disk0), the rollback points of V2 will not be available on V1. For more information about the rollback feature and rollback points, see the Upgrading and Managing Software chapter.

Deactivation of fully superseded SMUs

Cisco IOS XR Software will accumulate a set of Software Maintenance Upgrades (SMUs) over time, where an older SMU gets superseded by the latest SMU. For example, if SMU A was initially delivered to you, and subsequently, as a result of a bug resolution, SMU B was delivered, then SMU A becomes the subset of SMU B and SMU A is superseded by SMU B. In this case, SMU A is redundant and can be deactivated to clean up the software package.

**Note**

When an older SMU gets superseded their code is no longer used but it can be used for rollback purposes which consumes the disk space.

When you install a reload SMU which supersedes the existing SMU the router reboots and SMU is placed in the superseded list automatically. If the superseded reload SMU is deactivated and fully supersedes the existing SMU, then router will not reboot when you run the `install deactivate superseded` command and the `install remove inactive` command.

**Note**

Removing the superseded SMUs will increase the disk space and it will not affect the functionality.

To deactivate all the fully superseded SMUs, use the `install deactivate superseded` command in the admin mode.

```
RP/0/RSP0/CPU0: router(admin) # install deactivate superseded
```
To display the details of the SMUs that are superseded, use the `show install superseded` command in the EXEC mode.

```
RP/0/RSP0/CPU0: router # show install superseded
Thu Feb 3 17:37:20.379 UTC
disk0:asr9k-px-4.3.0.CSCud93518-1.0.0 is fully superseded by
disk0:asr9k-px-4.3.0.CSCue23747-1.0.0
```

**Support for the Ignore Package Presence Check Option**

During any software package upgrade in Cisco IOS XR Software, two versions of the packages get stored, both the previous version and the upgraded version. In Route Switch Processor 2 (RSP2), the disk space is insufficient to hold all packages of these two versions. To address this, a new optional keyword, `ignore-pkg-presence-check`, is added to the `install activate` command, which allows upgrading with lesser number of packages. For example, assume a case where version1 (V1) of the software consists of packages A, B, C, and D, and you want to upgrade to the version2 (V2) with only 3 packages (A, B, and C). The `ignore-pkg-presence-check` option allows only packages A, B, and C to be upgraded to V2 and deactivates package D of V1. Thus, an explicit deactivation of package D is not required and the user can add package D of V1 after upgrading to V2.

To upgrade software with lesser number of packages, use the `install activate [ignore-pkg-presence-check]` command in the admin mode.

```
RP/0/RSP0/CPU0: router(admin) # install activate [ignore-pkg-presence-check] V2 packages
```

**Restrictions**

The restrictions for this option are:

- The `ignore-pkg-presence-check` keyword is supported only with the `install activate` command and is not supported with the `install add activate` command.

- When you upgrade using the `ignore-pkg-presence-check` option, the deactivation of packages always happens synchronously, using the synchronous keyword in the `install deactivate` command.

**Upgrading Packages**

To upgrade a package that is currently active on your router, add and activate a newer version of the same package (see Figure 8: Example of a Maintenance Release Package Upgrade, on page 170). The older version of the software package is deactivated automatically. These actions are permitted only after the package compatibility checks and API version compatibility checks have been passed.

Deactivated packages are not removed from the router. To remove inactive package files, use the `install remove` command.

**Caution**

Upgrading or downgrading a software package can cause a process to restart or a new process to start. Use the `test` option to preview the impact of the package activation.
Downgrading Packages

To downgrade a software package, activate an older version on one or more cards for which that package is already active. The newer version of the same software package is deactivated automatically. These actions are performed only after the package compatibility checks and API version compatibility checks have been passed.

Deactivated packages are not removed from the router. To remove inactive package files, use the `install remove` command. See the Related Topics section for links to more information.

Impact of Package Version Changes

Each package version change has a different impact on the operation of the router, depending on the type of package and whether the upgrade is for a major, minor, or maintenance release. The following resources can provide more information on the impact of a package version change:

- See Related Topics for more information on the typical impact for major, minor, and maintenance releases.
- For specific information about the impact of an upgrade, consult the release notes for the package release, and test the impact of the package activation by adding the test option to the `install activate` command.
- The Cisco IOS XR Software Selector tool also contains information on package version compatibility.

Impact of Package Activation and Deactivation

Activation or deactivation of a package can have an immediate impact on the system. The system can be affected in the following ways:

- When a new package is activated, any new CLI commands for the package are added to the router. The router need not be restarted or reloaded.
When a package is deactivated, the commands associated with the features being deactivated are removed from the router. The commands are no longer available to the user.

During a software package deactivation, upgrade, or downgrade, any incompatible configurations are removed from the running configuration of the router, and saved to a file. Messages for incompatible configurations are displayed. Incompatible configurations are those configurations that are not supported by the new version of the software package.

You must address any issues that result from the revised configuration and reapply the configuration, if necessary.

- New processes may be started.
- Running processes may be stopped or restarted.
- All processes in the cards may be restarted. Restarting processes in the cards is equivalent to a soft reset.
- The cards may reload.
- No impact: no processes in the card may be affected.

When activating and deactivating packages, use the **test** option to test the effects of a command without impacting the running system. After the activation or deactivation process completes, enter the **show install log** command to display the process results.

**Tip**

When activating and deactivating packages, use the **test** option to test the effects of a command without impacting the running system. After the activation or deactivation process completes, enter the **show install log** command to display the process results.

**Delaying the Return of the CLI Prompt**

By default, the CLI prompt is returned to the screen before the installation operation is complete, which allows you to enter other commands that are not installation commands. If additional installation requests are attempted before the first operation is complete, they are not run.

To delay the return of the CLI prompt until an installation operation is complete, enter the **install** command with the **synchronous** keyword. For example:

```
install add disk1:/pie-file synchronous
install activate disk0:package synchronous
```

To determine if an **install** command is currently running, enter the **show install request** command.

**Displaying Installation Log Information**

The install log provides information on the history of the installation operations. Each time an installation operation is run, a number is assigned to that operation.

- Use the **show install log** command to display information about both successful and failed installation operations.
- The **show install log** command with no arguments displays a summary of all installation operations. Specify the **request-id** argument to display information specific to an operation. Use the **detail** or **verbose** keywords to display details for specific operation.
- Use the **detail** or **verbose** keywords to display detailed information, including file changes, nodes that could be reloaded, impact to processes, and impact to Dynamic Link Libraries (DLLs).
By default, the install log stores up to 50 entries. Use the `clear install log-history` command to reset the number of entries to any value from 0 to 255.

**Examples**

**Displaying install log Entries: Example**

The following example displays information for the install requests. Use the `verbose` keyword to display detailed information, including files changes, impact to processes, and impact to DLLs.

```
RP/0/RSP0/CPU0:router (admin)# show install log verbose

Install operation 1 started by user 'labuser' at 17:48:51 UTC Sat Jun 03 2009.
install add /disk1:asr9k-diags-p.pie-PD34-06.06.07

Package Management Procedures

Review the concepts about package management before performing the tasks described in this module.

Related Topics
Information About Package Management, on page 162

Activation and Deactivation Prerequisites

These prerequisites must be met for a package to be activated or deactivated:

- You must be in a user group associated with a task group that includes the proper task IDs. The command reference guides include the task IDs required for each command. If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

- Verify that all cards are installed and operating properly. For example, do not activate or deactivate packages while cards are booting, while cards are being upgraded or replaced, or when you anticipate an automatic switchover activity.

- If a ROM Monitor upgrade is required for the software package, the upgrade must be completed before the package is activated. For ROM Monitor upgrade information and procedures, see ROM Monitor Configuration Guide for Cisco ASR 9000 Routers.

- Check the sanity of the configuration file system and recover from any internal inconsistencies by using the cfs check command.

  RP/0/RSP0/CPU0:router# cfs check

  Tue Sep 20 07:22:03.374 DST

  Creating any missing directories in Configuration File system...OK
  Initializing Configuration Version Manager...OK
  Syncing commit database with running configuration...OK

- Clear any inconsistency alarms and remove any failed configurations using the clear configuration inconsistency command.

  An inconsistency alarm is set when there is a failure to restore the configuration; this can occur during router startup, or when a line card or route switch processor (RSP) card is inserted or removed. If an inconsistency alarm is set, a message similar to the one in this example is displayed:

  RP/0/0/CPU0:May 26 11:58:40.662 : cfgmgr-rp[130]: %MGBL-CONFIGCLLI-3
  BATCH_CONFIG_FAIL : 28 config(s) failed during startup. To view
  failed config(s) use the command - "show configuration failed startup"

  When the inconsistency alarm is set, all configuration commit operations fail until the alarm is cleared.
Although more than one version of a software package can be added to a storage device, only one version of a package can be active for any card.

Some packages require the activation or deactivation of other packages.

The package being activated must be compatible with the current active software set.

Package activation from EXEC mode is supported for specific packages and upgrades, such as optional packages and SMUs. Packages that do not support EXEC mode activation can only be activated for the entire router from administration EXEC mode.

Activation is performed only after the package compatibility checks and API version compatibility checks have been passed. If a conflict is found, an on-screen error message is displayed.

While a software package is being activated, other requests are not allowed to run on any of the impacted nodes. Package activation is completed when a message similar to this one appears:

```
Install operation 2 completed successfully at 20:30:29 UTC Mon Nov 14 2005.
```

Each CLI install request is assigned a request ID, which can be used later to review the events.

## Obtaining and Placing Cisco IOS XR Software

This section contains information to locate the available software packages and to transfer them either to a local storage device or to a network server. When this is done, the package or packages can be added and activated on the router.

There are two primary ways to obtain packages in Cisco IOS XR software:

- Request the software from Cisco on a flash disk that you can insert into the removable flash disk slot (usually flash disk1:). Flash disk1: is optional. When it is installed, flash disk1: can be used to store PIE files, which can then be used to add new software to the boot device (usually flash disk0:).
- Download the Cisco IOS XR software packages to a local storage device of the DSC, such as flash disk1:, or to a remote server, such as a tftp or rcp server.

The boot device is the local disk on the DSC where Cisco IOS XR software is added and activated. PIE files should not be stored on this boot device. The default boot device is disk0:. All PIE files should be stored on flash disk1:.

## Transferring Installation Files from a Network File Server to a Local Storage Device

If the Cisco IOS XR software PIE files are located on a remote TFTP, FTP, SFTP, or rcp server, you can copy the files to a local storage device such as disk1:. When the PIE files are located on a local storage device, the software packages can be added and activated on the router from that storage device. Table 27: Download Protocols Supported by Cisco IOS XR Software, on page 176 describes the supported server protocols, and the CLI syntax used copy files from each server type to the local storage device.

---

**Tip**

Cisco IOS XR software PIE files can also be added to the router boot device directly from the remote server.

**Note**

Consult your system administrator for the location and availability of your network server.
Table 27: Download Protocols Supported by Cisco IOS XR Software

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Trivial File Transfer Protocol</td>
<td>TFTP allows files to be transferred from one computer to another over a network, usually without the use of client authentication (for example, username and password). It is a simplified version of FTP.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> Some Cisco IOS XR software images may be larger than 32 MB, and the TFTP services provided by some vendors may not support a file this large. If you do not have access to a TFTP server that supports files larger than 32 MB, download the software image using FTP or rcp.</td>
</tr>
<tr>
<td>File Transfer Protocol</td>
<td>FTP is part of the TCP/IP protocol stack and requires a username and password.</td>
</tr>
<tr>
<td>Remote Copy Protocol</td>
<td>The rcp protocol uses TCP to ensure the reliable delivery of data, and rcp downloads require a usernames.</td>
</tr>
<tr>
<td>SSH File Transfer Protocol</td>
<td>SFTP is part of the SSHv2 feature in the Security package and provides for secure file transfers. For more information, see the System Security Configuration Guide for Cisco ASR 9000 Series Routers.</td>
</tr>
</tbody>
</table>

The router commands listed in Table 28: Commands for Copying Package Files to the Router, on page 176 show how to copy package files to the router using three types of file transfer protocols.

Table 28: Commands for Copying Package Files to the Router

<table>
<thead>
<tr>
<th>Server Type</th>
<th>Command and Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>TFTP</td>
<td>The following command syntax is used:</td>
</tr>
<tr>
<td></td>
<td><code>copy tftp:// hostname_or_ipaddress / directory-path / pie-name disk1:</code></td>
</tr>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td>RP/0/RSP0/CPU0:router# copy tftp://10.1.1.1/images/comp-asr9k-mini.pie disk1:</td>
</tr>
<tr>
<td>FTP</td>
<td>The following command syntax is used:</td>
</tr>
<tr>
<td></td>
<td><code>copy ftp:// username : password@hostname_or_ipaddress / directory-path / pie-name disk1:</code></td>
</tr>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td>RP/0/RSP0/CPU0:router# copy ftp://john:secret@10.1.1.1/images/comp-asr9k-mini.pie disk1:</td>
</tr>
</tbody>
</table>
Command and Examples

The following command syntax is used:

```
copy rcp:// username @ hostname_or_ipaddress / directory-path / pie-name disk1:
```

Example:

```
RP/0/RSP0/CPU0:router# copy rcp://john@10.1.1.1/images/comp-asr9k-mini.pie disk1:
```

Table 29: Command Variables for Copying and Adding Packages from a Network Server

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostname_or_ipaddress</td>
<td>Host name or IP address of the server that stores the source file.</td>
</tr>
<tr>
<td>pie-name</td>
<td>Name of the PIE file (package). See the Overview of Cisco IOS XR Software Packages, on page 158 for descriptions of the available packages.</td>
</tr>
<tr>
<td>username</td>
<td>Required for FTP and rcp only and must be a valid username on the FTP or rcp server.</td>
</tr>
<tr>
<td>password</td>
<td>Required for FTP only. If a password is not provided, the networking device accepts anonymous FTP.</td>
</tr>
<tr>
<td>directory-path</td>
<td>The specified directory should be a directory under the home directory of the user. In the rcp and FTP examples in Table 28: Commands for Copying Package Files to the Router, on page 176, the file being downloaded is in a subdirectory called “images” in the home directory of the user “john.”</td>
</tr>
</tbody>
</table>

Note: For FTP and rcp services, `directory-path` is the directory relative to the `username` home directory. If you want to specify an absolute path for the directory, you must add a “/” following the server address.

When the installation files have been transferred to a network file server or the router, you are ready to activate or upgrade the software.

**Note**

Files with the `.vm` extension are bootable installation files used only to replace all current Cisco IOS XR software. These files are installed from ROM monitor mode and cause significant router downtime. We recommend installing or upgrading software packages using PIE files only, as described in this chapter. See ROM Monitor Configuration Guide for Cisco ASR 9000 Routers for information on installing from .vm files.

Preparing for Software Installation Operations

This section includes instructions to prepare for software installation operations.

**Note**
Activation is performed only after the automatic package compatibility and API version compatibility checks have been passed. If a conflict is found, an on-screen error message is displayed.

**Before you begin**

Before adding or activating Cisco IOS XR software:

- Update the ROM Monitor software, if necessary.
- Determine if a software change is required.
- Verify that the new package is supported on your system. Some software packages require that other packages or package versions be activated, and some packages only support specific cards.
- Review the release notes for important information related to that release and to help determine the package compatibility with your router configuration.
- Verify that the system is stable and prepared for the software changes.

**SUMMARY STEPS**

1. admin
2. show diag
3. Update the ROMMON software if necessary.
4. show install active
5. show install pie-info device:package [brief | detail | verbose]
6. verify packages
7. exit
8. (Optional) show system verify start
9. (Optional) show system verify [detail | report]
10. show clock

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
| admin
| Example:
| RP/0/RSP0/CPU0:router# admin |
| Enters administration EXEC mode. |
| **Step 2**
| show diag
| Example:
<p>| RP/0/RSP0/CPU0:router(admin)# show diag |
| Displays the ROMMON software version for all cards in the system. Verify that the correct ROMMON software version is installed before upgrading a Cisco IOS XR software package. |</p>
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Note</strong></td>
<td>See Related Topics for information regarding the required ROM Monitor (ROMMON) software version.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Update the ROMMON software if necessary. Updates the ROMMON software. For instructions, see ROM Monitor Configuration Guide for Cisco ASR 9000 Routers.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Displays the active software for the owner SDR. Use this command to determine what software should be added, upgraded or downgraded on the router, and to compare to the active software report after installation operations are complete.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>You can also display the active packages for a specific node, and view results in detailed or summary mode. See the Software Package Management Commands on the Cisco ASR 9000 Series Router module of System Management Command Reference for Cisco ASR 9000 Series Routers for more information.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Displays information imbedded in the package. The following keywords provide three levels of information:</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>Always review the release notes for the software package for important information related to that release and to help determine the package compatibility with your router configuration.</td>
</tr>
<tr>
<td>Step 6</td>
<td>Verifies that there are no corrupted software files. The consistency of a previously installed software set is verified against the package file from which it originated. This command can be used as a debugging tool to verify the validity of the files that constitute the packages, to determine if there are any corrupted files. This command also checks for corruptions of installation state files and MBI image files. This command is particularly useful when issued after the activation of a package or upgrading the Cisco IOS XR software to a major release.</td>
</tr>
</tbody>
</table>

### Command Examples

**Step 3**

```
RP/0/RSP0/CPU0:router(admin)# show install active
```

**Step 4**

```
RP/0/RSP0/CPU0:router(admin)# show install active
```

**Step 5**

```
RP/0/RSP0/CPU0:router(admin)# show install pie-info device:package [ brief | detail | verbose ]
```

**Note**

```
RP/0/RSP0/CPU0:router(admin)# install verify packages
```

**Note**

```
RP/0/RSP0/CPU0:router(admin)# install verify packages
```
The install verify packages command can take up to two minutes per package to process.

<table>
<thead>
<tr>

Displaying the Active Software for the Entire System: Example

The following example displays the active packages for the entire system. Use this information to determine if a software change is required:

RP/0/RSP0/CPU0:router (admin)# show install active summary

Mon Jun 22 13:01:46.438 PST
Default Profile:
  SDRs:
  Owner
  Active Packages:
  disk0:comp-asr9k-mini-3.9.0.12I
  disk0:asr9k-fpd-3.9.0.12I
  disk0:asr9k-k9sec-3.9.0.12I
  disk0:asr9k-mcast-3.9.0.12I
  disk0:asr9k-mgb1-3.9.0.12I
  disk0:asr9k-mpls-3.9.0.12I
Displaying Information About the Contents of a PIE File: Example

In the following example, information is displayed about the manageability PIE. This command displays the expiry date of the package, the cards supported by the package, and other details. Use this information to verify the compatibility of the package with your system and other software packages.

Note

A software activation is performed only after the automatic package compatibility and API version compatibility checks have been passed. If a conflict is found, an on-screen error message is displayed.

```bash
RP/0/RSP0/CPU0:router(admin)# show install pie-info disk1:/asr9k-mgbl-p.pie-3.8.0 detail

Contents of pie file '/disk1:/asr9k-mgbl-p.pie-3.8.0':

    Expiry date       : Jan 19, 2007 02:55:56 UTC
    Uncompressed size : 17892613

    asr9k-mgbl-3.8.0
    asr9k-mgbl V3.8.0[00] Manageability Package
    Vendor : Cisco Systems
    Desc : Manageability Package
    Build : Built on Wed May 10 08:04:58 UTC 2006
    Source : By edde-bld1 in /vws/aga/production/3.8.0/asr9k/workspace for c28
    Card(s): RP, DRP, DRPSC

    Restart information:
    Default: parallel impacted processes restart
    Components in package asr9k-mgbl-3.8.0, package asr9k-mgbl:
    manageability-cwi V[r33x/2] Craft Web Interface related binaries ae
    asr9k-feature-ipsla V[r33x/1] IPSLA time stamping feature
    doc-asr9k-mgbl V[r33x/2] Contains the man page documentation for asr9ks
```

Verifying That There Are No Corrupted Software Files: Example

The following sample output verifies the consistency of the currently active software against the file from which it originated:

```bash
RP/0/RSP0/CPU0:router(admin)# install verify packages

Mon Jun 22 13:19:08.590 PST
Install operation 3 '(admin) install verify packages' started by user 'user'
The install operation will continue asynchronously.
RP/0/RSP0/CPU0:router(admin)#Info:
This operation can take up to 2 minutes per package being verified.
Info: Please be patient.

Info: 0/6/CPU0 [LC] [SDR: Owner]
Info: meta-data: [SUCCESS] Verification Successful.
```
Info: Successful.
Info: /install/asr9k-scfclient-3.9.0.12I: [SUCCESS] Verification
Info: Successful.
Info: Verification Summary:
Info: 0/6/CPU0: ERROR. Anomalies found.
Info: 0/1/CPU0: ERROR. Anomalies found.
Info: 0/4/CPU0: ERROR. Anomalies found.

Verifying That the System Clock Is Correct: Example

The following example displays the current system clock setting:

```
RP/0/RSP0/CPU0:router# show clock
02:14:51.474 PST Wed Jan 28 2009
```

Adding and Activating Packages

The procedure in this section describes how to upgrade or add Cisco IOS XR software PIE files that are stored on a local storage device, such as a flash disk, or on a remote TFTP, FTP, SFTP, or rcp server. The PIE software file can include any of the following:

- The Cisco IOS XR Unicast Routing Core Bundle (six packages in one composite PIE file)
- Any of the optional packages (one package per PIE file)
- Software maintenance upgrades (SMUs)

When you need to add and activate two or more of the preceding package types, you should add and activate them in the order listed above.
When adding and activating two or more packages, optional packages can be activated together. Also, if the operation is a reload, multiple packages can be activated together. For example, five reload SMUs can be activated together or the Cisco IOS XR Unicast Routing Core Bundle plus the SMUs and optional packages can be activated together.

For a description of the software management process, see the Related Topics section.

These instructions are also used to downgrade software packages.

By default, installation operations are performed asynchronously: the CLI prompt is returned before the operation is complete, allowing the operator to continue work while the installation is completed in the background. Use the synchronous keyword at the end of install commands to delay the return of the CLI prompt until an installation operation is complete. See the Related Topics section for more information.

**Before you begin**

Before upgrading or adding packages, verify that these prerequisites have been met:

- Verify that the ROMMON version is correct. For instructions on upgrading ROM Monitor, see ROM Monitor Configuration Guide for Cisco ASR 9000 Routers.
- All packages to be upgraded or added are present on a local storage device (for example a flash disk), or a network file server.
- Prerequisites for the activation of packages are met as described in the Prerequisites section.
- Complete the procedures described in the Preparing for Software Installation Operations, on page 178 section.

To use the automatic FPD upgrade feature, the fpd auto-upgrade command must be enabled in administration configuration mode.

**SUMMARY STEPS**

1. Connect to the console port and log in.
2. (Optional) dir flash-disk :
3. admin
4. install add [source source-path | tar] file [activate ]
5. (Optional) show install inactive summary
6. install activate {id add-id | device package} [test] [location node-id] [pause sw-change] [sdr sdr-name] [prompt-level {all | none}] [auto-abort-timer {time | off}]
7. Repeat Step 4, on page 190 through Step 6, on page 191 until all packages are activated.
8. (Optional) show install active summary
9. (Optional) install verify packages
10. (Optional) exit
11. (Optional) show system verify start
12. admin
13. (Optional) install commit
14. Upgrade the field-programmable device (FPD) software, if necessary.

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> Connect to the console port and log in.</td>
<td>Establishes a CLI management session with the SDR. Connect to the console port for the active DSC. For more information on console connections, see Cisco ASR 9000 Series Aggregation Services Router Getting Started Guide.</td>
</tr>
<tr>
<td><strong>Step 2</strong> (Optional) dir flash-disk :</td>
<td>Displays the package files that are available for package upgrades and additions. <strong>Note</strong> Only PIE files can be added and activated using this procedure.</td>
</tr>
<tr>
<td><strong>Example:</strong> dir disk1:</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> Required: admin</td>
<td>Enters administration EXEC mode. <strong>Note</strong> Some show install commands can be entered in EXEC mode on an SDR.</td>
</tr>
<tr>
<td><strong>Example:</strong> admin</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> install add [source source-path</td>
<td>tar] file [activate ]</td>
</tr>
<tr>
<td><strong>Example:</strong> disk1:/asr9k-mgbl-px.pie=6.0.1</td>
<td>• If the source keyword is used, the source-path specifies the directory path that is used for multiple filenames in the same directory. • If the tar keyword is used, all PIE files contained in the tar file are unpacked.</td>
</tr>
<tr>
<td>or</td>
<td>The file argument can take any of these formats:</td>
</tr>
<tr>
<td>or</td>
<td>• device filename</td>
</tr>
<tr>
<td>or</td>
<td>• tftp://hostname_or_ipaddress/directory-path/filename</td>
</tr>
<tr>
<td>or</td>
<td>• ftp://username:password@hostname_or_ipaddress/directory-path/filename</td>
</tr>
<tr>
<td>or</td>
<td>• rcp://username@hostname_or_ipaddress/directory-path/filename</td>
</tr>
<tr>
<td>or</td>
<td>These are descriptions for each of the terms used here:</td>
</tr>
<tr>
<td>or</td>
<td>• device—Name of the local storage device where the PIE file is stored, such as disk1:/</td>
</tr>
<tr>
<td>or</td>
<td>• filename—Name of the PIE file you want to add. If the tar keyword is used, the file argument is the name</td>
</tr>
</tbody>
</table>
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>目的</em></td>
<td>一个或多个 PIE 文件的 tar 文件，或包含 PIE 文件的目录。</td>
</tr>
<tr>
<td>• <em>tftp://</em></td>
<td>从网络服务器使用 Trivial File Transfer 协议解压 PIE 文件。</td>
</tr>
<tr>
<td>• <em>ftp://</em></td>
<td>从网络服务器使用 File Transfer 协议解压 PIE 文件。</td>
</tr>
<tr>
<td>• <em>rcp://</em></td>
<td>从网络服务器使用 Remote Copy 协议解压 PIE 文件。</td>
</tr>
<tr>
<td>• <em>hostname_or_ipaddress</em></td>
<td>网络文件服务器的主机名或 IP 地址。</td>
</tr>
<tr>
<td>• <em>directory-path</em></td>
<td>网络文件服务器路径，指向要添加的 PIE 文件。</td>
</tr>
<tr>
<td>• <em>username</em></td>
<td>具有访问权限的目录中的用户名称。</td>
</tr>
<tr>
<td>• <em>password</em></td>
<td>与具有访问权限的目录的用户名关联的密码。</td>
</tr>
<tr>
<td>• <em>activate</em></td>
<td>自动激活已成功添加的软件包。</td>
</tr>
</tbody>
</table>

**Note**

多个软件包版本可以被添加到存储设备中而不会影响运行配置，但一张卡上只能激活一个版本的软件包。

**Tip**

自动 FPD 升级仅在 FPD pie 与 *install PIE* 一起添加和激活时发生。

---

### Step 5

(Optional) **show install inactive summary**

**Example:**

```bash
RP/0/RSP0/CPU0:router(admin)# show install inactive summary
```

显示路由器上无效的包。验证在前一步中添加的包是否出现在显示中。

### Step 6

**install activate**

**Example:**

```bash
RP/0/RSP0/CPU0:router(admin)# install activate disk0:asr9k-mini-px-4.3.99
```

激活在前一步中添加的包。跳过此步骤（如果此包已通过 *install add* 命令激活）。

**id add-id** — 指定使用 *install add* 命令中添加包的 ID。

**device:package** — 指定包的名称。

**test** — 测试。

**location node-id** — 子卡。

**pause sw-change** — 暂停应用程序更改。

**sdr sdr-name** — 子卡。

**prompt-level {all | none}** — 提示级别。

**auto-abort-timer {time | off}** — 自动中止计时。

**Example:**

```bash
RP/0/RSP0/CPU0:router(admin)# install activate disk0:asr9k-mini-px-4.3.99
```
Adding and Activating Packages

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>of the boot device and inactive package, which can be displayed as described in the previous step.</td>
</tr>
</tbody>
</table>

**Note** Press `?` after a partial package name to display all possible matches available for activation. If there is only one match, press `[TAB]` to fill in the rest of the package name.

- **location node-id**—Activates a package for a specific card (node). To display a list of node IDs for the entire system, enter the `show platform` command in administration EXEC mode. A package cannot be activated on a single node unless some version of the package being activated is already active on all nodes.

**Note** By default, packages are activated for all cards supported by that package.

- **pause sw-change**—Pauses the operation after preparatory checks and before the configuration is locked for the actual activation. This action enables you to hold the operation while you perform configuration changes, and proceed with the activation whenever you choose. This operation is useful, for example, if your workflow involves configuring a router out of the network during software installation and you want to minimize the time that the router is out of the network. Follow onscreen instructions to control the pausing and completion of the operation.

- **prompt-level**—Use a prompt-level of `all` to view all stages of the installation process and to specify whether to continue, or not.

- **auto-abort-timer**—Specifies an abort timer value, in minutes, which when expired loads the last committed loadpath. The default is 60. The timer is enabled by default. After the installation, if the activated software is working correctly, use the `install commit` command to cancel the timer and commit the new loadpath.

**Note** The package being activated must be compatible with the currently active software to operate. When an activation is attempted, the system runs an automatic compatibility check to ensure that the package is compatible with the other active software on the router. The activation is permitted only after all compatibility checks have been passed.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 7</strong></td>
<td>Repeat Step 4, on page 190 through Step 6, on page 191 until all packages are activated. Activates additional packages as required.</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>(Optional) <strong>show install active summary</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;<code>RP/0/RSP0/CPU0:router(admin)# show install active</code>&lt;br&gt;Displays all active packages. Use this display to determine if the correct packages are active:</td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td>(Optional) <strong>install verify packages</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;<code>RP/0/RSP0/CPU0:router(admin)# install verify packages</code>&lt;br&gt;Verifies the consistency of a installed software set with the package file from which it originated. This command can be used as a debugging tool to verify the validity of the files that constitute the packages, to determine whether there are any corrupted files. This command also checks for corruptions of installation state files and MBI image files. This command is particularly useful when issued after the activation of a package or upgrading the Cisco IOS XR software to a major release.&lt;br&gt;<strong>Note</strong> The <strong>install verify packages</strong> command can take up to two minutes for each package to process.</td>
</tr>
<tr>
<td><strong>Step 10</strong></td>
<td>(Optional) <strong>exit</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;<code>RP/0/RSP0/CPU0:router(admin)# exit</code>&lt;br&gt;Exits administration EXEC mode and returns to EXEC mode.&lt;br&gt;Use this command only if you performed the installation operations in administration EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 11</strong></td>
<td>(Optional) <strong>show system verify start</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;<code>RP/0/RSP0/CPU0:router# show system verify start</code>&lt;br&gt;Starts the system status check.</td>
</tr>
<tr>
<td><strong>Step 12</strong></td>
<td><strong>admin</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;<code>RP/0/RSP0/CPU0:router# admin</code>&lt;br&gt;Enters administration EXEC mode.</td>
</tr>
</tbody>
</table>
### Purpose

Commits the current set of packages for an SDR or for all SDRs so that these packages are used if the router is restarted.

- This command can be used from either administration EXEC or EXEC mode.

For more information, see the Related Topics section.

### Command or Action

**Step 13** (Optional) install commit

**Example:**

RP/0/RSP0/CPU0:router# dir disk1:

RP/0/RSP0/CPU0:router(admin)# install commit

### Purpose

Commits the current set of packages for an SDR or for all SDRs so that these packages are used if the router is restarted.

### Step 14

Upgrade the field-programmable device (FPD) software, if necessary.

### Purpose

Whenever a Cisco IOS XR software image that supports SPAs and SIPs is released, a companion SPA or SIP FPD image is bundled with the Cisco IOS XR software release. Generally, the FPD image is not automatically upgraded. You must manually upgrade the FPD image running on the SPA or SIP when you upgrade the Cisco IOS XR software image. FPD versions must be compatible with the Cisco IOS XR software that is running on the router.

**Note** If you have enabled the `fpd auto-upgrade` command and add and activate the FPD PIE together with the software installation PIE, the FPD image is automatically upgraded before the router is rebooted.

For information on FPDs, including instructions to upgrade FPD images, see the Upgrading FPD Cisco IOS XR Software section.

### Examples

#### Adding a Package: Example

The following example shows how to add the contents of a PIE file on disk1: to the boot device. Because the software package is added to the boot device by default, it is not necessary to specify the destination device in the CLI.
From Cisco IOS XR Software Release 6.0.1 and later, you must append a forward slash ('/') to the source location (for example, disk1:/) of the PIE file in the install add command.

```
RP/0/RSP0/CPU0:router(admin)# install add disk1:/asr9k-mpls-px.pie-6.0.1 synchronous
Install operation 4 'install add /disk1:/asr9k-mpls-px.pie-6.0.1 synchronous' started by user 'cisco' at 18:10:18 UTC Sat Apr 08 2009.
Info: The following package is now available to be activated:
Info: disk0:asr9k-mpls-px.pie-6.0.1
Info: Install operation 4 completed successfully at 18:14:11 UTC Sat Apr 08 2009.
```

The following example shows how to add the contents of a PIE file on a TFTP server to the boot device:

```
RP/0/RSP0/CPU0:router(admin)# install add tftp://209.165.201.1/asr9k-mpls.pie synchronous
Install operation 4 '(admin) install add /tftp://209.165.201.1/asr9k-mpls.pie synchronous' started by user 'cisco' at 18:16:18 UTC Thu Jan 03 2009.
Info: The following package is now available to be activated:
Info: disk0:asr9k-mpls-3.7.2
Info: Install operation 4 completed successfully at 18:19:10 UTC Thu Jan 03 2009.
```

**Activating a Package: Example**

The following example shows the activation of the MPLS package. The package is activated on the boot device disk0:

```
RP/0/RSP0/CPU0:router(admin)# install activate disk0: asr9k-mpls-3.7.2 synchronous
Install operation 15 'install activate disk0:asr9k-mpls-3.7.2 synchronous' started by user 'lab' at 19:15:33 UTC Sat Apr 08 2009.
Info: The changes made to software configurations will not be persistent across system reloads. Use the command 'admin install commit' to make changes persistent.
Info: Please verify that the system is consistent following the software change using the following commands:
Info: show system verify
Info: install verify packages
Install operation 5 completed successfully at 19:16:18 UTC Sat Apr 08 2009.
```
Activating a Package by Specifying an Operation ID: Example

The following example shows the activation of the MPLS package using the operation ID of the
install add operation that added the package:

```
RP/0/RSP0/CPU0:router(admin)# install activate id 4
Install operation 5 '(admin) install activate id 4' started by user 'lab' via
CLI at 18:20:17 UTC Thu Jan 03 2009.
Info: This operation will activate the following package:
Info: disk0:asr9k-mpls-3.7.2
Info: Install Method: Parallel Process Restart
The install operation will continue asynchronously.
Info: The changes made to software configurations will not be persistent
Info: across system reloads. Use the command '(admin) install commit' to
Info: make changes persistent.
Info: Please verify that the system is consistent following the software
Info: change using the following commands:
Info: show system verify
Info: install verify packages
Install operation 5 completed successfully at 18:21:30 UTC Thu Jan 03 2009.
```

Adding and Activating a Package from an FTP File Server with One Command: Example

To add and activate a package with a single command, enter the install add command with the
activate keyword. In the following example, the Manageability PIE located on disk1: is verified,
unpacked, and added to the boot device disk0. Because this operation is performed in administration
EXEC mode, the package is activated for all SDRs in the system.

```
RP/0/RSP0/CPU0:router(admin)# install add disk1:/
asr9k-mgbl-px.pie-6.0.1 activate
Install operation 4 'install add /disk1:/asr9k-mgbl-px.pie-6.0.1 activate' started
by user 'cisco' at 07:58:56 UTC Wed Mar 01 2009.
The install operation will continue asynchronously.
:router(admin)# Part 1 of 2 (add software): Started
Info: The following package is now available to be activated:
Info: disk0:asr9k-mgbl-px.pie-6.0.1
Info:
Part 1 of 2 (add software): Completed successfully
Part 2 of 2 (activate software): Started
Info: The changes made to software configurations will not be
persistent across system reloads. Use the command 'admin install
Info: commit' to make changes persistent.
Info: Please verify that the system is consistent following
the software change using the following commands:
Info: show system verify
Info: install verify packages
Part 2 of 2 (activate software): Completed successfully
Part 1 of 2 (add software): Completed successfully
Part 2 of 2 (activate software): Completed successfully
Install operation 4 completed successfully at 08:00:24 UTC Wed Mar 01 2009.
```
Displaying the Active Packages: Example

The following example displays a summary of the active packages on a router. Because this operation is performed in administration EXEC mode, the active packages for all SDRs are displayed.

```
RP/0/RSP0/CPU0:router(admin)# show install active summary
Mon Jun 22 23:41:19.509 PST
Default Profile:
SDRs:
Owner
Active Packages:
disk0:comp-asr9k-mini-3.9.0.12I
disk0:asr9k-fpd-3.9.0.12I
disk0:asr9k-k9sec-3.9.0.12I
disk0:asr9k-mcast-3.9.0.12I
disk0:asr9k-mgbl-3.9.0.12I
disk0:asr9k-mpls-3.9.0.12I
```

Committing the Active Package Set

When a package is activated, it becomes part of the current running configuration. To make the package activation persistent across system-wide reloads, enter the `install commit` command. On startup, DSC of the owner SDR loads this committed software set. If the system is reloaded before the current active software is committed with the `install commit` command, the previously committed software set is used.

If the system is reloaded before the current active software is committed with the `install commit` command, the previously committed software set is used.

Tip

Before committing a package set, verify that the SDR is operating correctly and is forwarding packets as expected.

SUMMARY STEPS

1. admin
2. install commit
3. show install committed [detail | summary | verbose] [location node-id]

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 admin</td>
<td>Enters administration EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>RP/0/RSP0/CPU0:router# admin</td>
<td></td>
</tr>
<tr>
<td>Step 2 Required: install commit</td>
<td>Commits the current set of packages on the router so that these packages are used if the router is restarted.</td>
</tr>
</tbody>
</table>
### Examples

**Committing the Active Package Set: Example**

In the following example, the active software packages are committed on the router:

```
RP/0/RSP0/CPU0:router(admin)# install commit
Install operation 16 'install commit' started by user 'lab' at 19:18:58 UTC Sat Apr 08 2009.
Install operation 16 completed successfully at 19:19:01 UTC Sat Apr 08 2009.
```

**Displaying the Committed Package Versions: Example**

In the following example, the committed packages are shown for the owner SDR:

```
RP/0/RSP0/CPU0:router(admin)# show install committed
Tue Jun 23 05:11:29.968 PST
Secure Domain Router: Owner
Node 0/RSP0/CPU0 [RP] [SDR: Owner]
  Boot Device: disk0:
  Boot Image: /disk0/asr9k-os-mbi-3.9.0.12I/mbiasr9k-rp.vm
  Committed Packages:
    disk0:comp-asr9k-mini-3.9.0.12I
    disk0:asr9k-fpd-3.9.0.12I
    disk0:asr9k-k9sec-3.9.0.12I
    disk0:asr9k-mcast-3.9.0.12I
    disk0:asr9k-mgbl-3.9.0.12I
    disk0:asr9k-mpls-3.9.0.12I

Node 0/1/CPU0 [LC] [SDR: Owner]
  Boot Device: mem:
  Boot Image: /disk0/asr9k-os-mbi-3.9.0.12I/lc/mbiasr9k-lc.vm
  Committed Packages:
    disk0:comp-asr9k-mini-3.9.0.12I
    disk0:asr9k-fpd-3.9.0.12I
    disk0:asr9k-mcast-3.9.0.12I
    disk0:asr9k-mpls-3.9.0.12I
```
Node 0/4/CPU0 [LC] [SDR: Owner]
- Boot Device: mem:
- Boot Image: /disk0/asr9k-os-mbi-3.9.0.12I/lc/mbiasr9k-lc.vm
- Committed Packages:
  - disk0:comp-asr9k-mini-3.9.0.12I
  - disk0:asr9k-fpd-3.9.0.12I
  - disk0:asr9k-mcast-3.9.0.12I
  - disk0:asr9k-mpls-3.9.0.12I

Node 0/6/CPU0 [LC] [SDR: Owner]
- Boot Device: mem:
- Boot Image: /disk0/asr9k-os-mbi-3.9.0.12I/lc/mbiasr9k-lc.vm
- Committed Packages:
  - disk0:comp-asr9k-mini-3.9.0.12I
  - disk0:asr9k-fpd-3.9.0.12I
  - disk0:asr9k-mcast-3.9.0.12I
  - disk0:asr9k-mpls-3.9.0.12I

As with the show install active command, the show install committed command may display a composite package that represents all packages in the Cisco IOS XR Unicast Routing Core Bundle.

**Upgrading to Cisco IOS XR Software Release 4.0**

The main difference between the standard upgrade procedure and the procedure required to upgrade from Release 3.x to 4.x is that the later requires the addition of one additional software package, known as the *upgrade package* (asr9k-upgrade-p.pie).

**Before you begin**

Before performing this procedure, refer to the adding and activating software package procedures described in *System Management Configuration Guide for Cisco ASR 9000 Series Routers*.

**SUMMARY STEPS**

1. admin
2. install add tftp://hostname_or_ipaddress/directory-path/mandatory-bundle-pie
3. install add tftp://hostname_or_ipaddress/directory-path/asr9k-upgrade-p.pie
4. install activate device:mandatory-bundle-pie device:upgrade-package
5. install deactivate device:upgrade-package
6. (Optional) install commit
7. install remove device:upgrade-package

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Required: admin</td>

<td>Purpose</td>
</tr>
<tr>
<td>-------------------------------------------------------</td>
<td>-------------------------------------------------------------------------</td>
</tr>
<tr>
<td>• This command is not required.</td>
<td></td>
</tr>
<tr>
<td><strong>Note</strong> Some <code>show install</code> commands can be entered</td>
<td></td>
</tr>
<tr>
<td>in EXEC mode on an SDR.</td>
<td></td>
</tr>
</tbody>
</table>

**Step 2**  
`install add tftp://hostname_or_ipaddress/directory-path/mandatory-bundle-pie`  
Unpacks the mandatory bundle PIE file from a network server and adds the package file to the boot device of the router.  
**Example:**  
RP/0/RSP0/CPU0:router(admin)# install add tftp://10.1.1.1/auto/tftpboot/usr/400/asr9k-mini-p.pie

**Step 3**  
`install add tftp://hostname_or_ipaddress/directory-path/asr9k-upgrade-p.pie`  
Unpacks the upgrade PIE file from a network server and adds the package file to the boot device of the router.  
**Example:**  
RP/0/RSP0/CPU0:router(admin)# install add tftp://10.1.1.1/auto/tftpboot/usr/400/asr9k-upgrade-p.pie

**Step 4**  
`install activate device:mandatory-bundle-pie device:upgrade-package`  
Activates the package that was added to the router together with the upgrade package.  
**Note** The bundle of mandatory packages and the upgrade bundle are activated together to perform the successful upgrade from release 3.x to 4.x.  
**Example:**  
RP/0/RSP0/CPU0:router(admin)# install activate disk0:asr9k-mini-p-4.0.0 disk0:asr9k-upgrade-p-4.0.0

**Step 5**  
`install deactivate device:upgrade-package`  
Deactivates the upgrade package on the router. For specific information regarding the deactivation and removal of software packages, refer to the general procedure.  
**Example:**  
RP/0/RSP0/CPU0:router(admin)# install deactivate disk0:asr9k-upgrade-p-4.0.0

**Step 6**  
(Optional) `install commit`  
Commits the current set of packages so that these packages are used if the router is restarted. Packages can be removed only if the deactivation operation is committed.  
**Example:**  
RP/0/RSP0/CPU0:router(admin)# install commit

**Step 7**  
Required: `install remove device:upgrade-package`  
Removes the inactive upgrade package.  
**Example:**  
RP/0/RSP0/CPU0:router(admin)# install remove disk0:asr9k-upgrade-p-4.0.0

**Example**  
The following example illustrates the upgrade operation:
RP/0/RSP0/CPU0:router(admin)# install add /tftp://223.255.254.254/auto/tftpboot/users/user/asr9k-mini-p.pie

Deactivating and Removing Cisco IOS XR Software Packages

When a package is deactivated, it is no longer active on the router, but the package files remain on the boot disk. The package files can be reactivated later, or they can be removed from the disk.

A package is deactivated using the following methods:
• When a newer version of a package is activated, the earlier version of the package is automatically deactivated. See Related Topics for more information.

Note
Activating a software maintenance upgrade (SMU) does not cause any earlier SMUs or the package to which the SMU applies to be automatically deactivated.

• When an earlier version of a package is activated, the newer version is deactivated automatically. See Related Topics for more information.
• A specific package is deactivated using the install deactivate command. This command turns off the package features for a card or card type.

Before you begin

The following are the restrictions when deactivating and removing Cisco IOS XR Software packages:
• A package cannot be deleted if it is part of the running or committed software of the SDR.
• A package cannot be deactivated if that package is required by another active package. When a deactivation is attempted, the system runs an automatic check to ensure that the package is not required by other active packages. The deactivation is permitted only after all compatibility checks have been passed.
• Router reloads: If the deactivation requires a router reload, a confirmation prompt appears. Use the install deactivate command with the prompt-level none keywords to automatically ignore any reload confirmation prompts and proceed with the package deactivation. The router reloads if required.
• Node reloads: If a software operation requires a node reload, the configuration register for that node should be set to autoboot. If the config-register for the node is not set to autoboot, then the system automatically changes the setting and the node reloads. A message describing the change is displayed.
• FPD versions must be compatible with the Cisco IOS XR software that is running on the router; if an incompatibility exists between an FPD version and the Cisco IOS XR software, the device with the field-programmable gate array (FPGA) may not operate properly until the incompatibility is resolved. For information on FPDs, including instructions to upgrade FPD images, see the Upgrading FPD Cisco IOS XR Software module of Interface and Hardware Component Configuration Guide for Cisco ASR 9000 Series Routers.

SUMMARY STEPS

1. Connect to the console port and log in.
2. admin
3. install deactivate { id add-id | device : package } [ location node-id ] [ test ] [ pause sw-change ]
4. (Optional) show install inactive summary
5. (Optional) install verify packages
6. exit
7. (Optional) show system verify start
8. (Optional) show system verify [ detail | report ]
9. admin
10. (Optional) install commit
11. (Optional) install remove { id add-id | device : package | inactive } [ test ]
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Connect to the console port and log in.</td>
<td>Establishes a CLI management session with the SDR. Connect to the console port for the active DSC. For more information on console connections, see <em>Cisco ASR 9000 Series Aggregation Services Router Getting Started Guide</em>.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Required: admin&lt;br&gt;<strong>Example:</strong>&lt;br&gt;RP/0/RSP0/CPU0:router# admin</td>
<td>Enters administration EXEC mode. • From administration EXEC mode, you can perform installation operations for the router. To enter administration EXEC mode, you must be logged in to the owner SDR and have root-system access privileges. • This command is not required.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>install deactivate</strong> { id add-id</td>
<td>device:&lt;br&gt;package } [ location node-id ] [ test ] [ pause sw-change ]&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Rp0/Rsp0/Cpu0:router(admin)# install deactivate disk0:asr9k-diags-3.7.2</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
<td></td>
</tr>
<tr>
<td>------------------</td>
<td>---------</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>(Optional) <strong>show install inactive summary</strong> &lt;br&gt;<strong>Example:</strong>&lt;br&gt;RP/0/RSP0/CPU0:router(admin)# show install inactive summary</td>
<td>Displays the inactive packages on the router.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>(Optional) <strong>install verify packages</strong> &lt;br&gt;<strong>Example:</strong>&lt;br&gt;RP/0/RSP0/CPU0:router(admin)# install verify packages</td>
<td>Verifies the consistency of an installed software set with the package file from which it originated. This command can be used as a debugging tool to verify the validity of the files that constitute the packages, to determine if there are any corrupted files. This command also checks for corruptions of installation state files and MBI image files. This command is particularly useful when issued after the activation of a package or upgrading the Cisco IOS XR software to a major release. &lt;br&gt;&lt;br&gt;<strong>Note</strong> The <strong>install verify packages</strong> command can take up to two minutes per package to process.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Required: <strong>exit</strong> &lt;br&gt;<strong>Example:</strong>&lt;br&gt;RP/0/RSP0/CPU0:router(admin)# exit</td>
<td>Exits administration EXEC mode and returns to EXEC mode. &lt;br&gt;Use this command only if you performed the installation operations in administration EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>(Optional) <strong>show system verify start</strong> &lt;br&gt;<strong>Example:</strong>&lt;br&gt;RP/0/RSP0/CPU0:router# show system verify start</td>
<td>Starts the system status check.</td>
</tr>
</tbody>
</table>
| **Step 8**       | (Optional) **show system verify** [ **detail** | **report** ] <br>**Example:**<br>RP/0/RSP0/CPU0:router# show system verify | Displays system status information. A variety of information is displayed including the memory and CPU usage, process status, protocol status, and other status information. Use this information to verify that the system is stable.<br>Enter this command in EXEC mode. <br>* **detail**—Displays additional information at the card and processor level, including actual numbers.
### Command or Action | Purpose
--- | ---
|  | • report—Displays the same information as the default show system verify command
| **Note** | Although most of the output should display the status “OK,” some processes may show other output, such as “Warning.” This does not specifically indicate a problem. Contact your Cisco technical support representative for more information on the output of this command.

**Step 9**

**admin**

Example:

RP/0/RSP0/CPU0:router# admin

Enters administration EXEC mode.

**Step 10**

(Optional) **install commit**

Example:

RP/0/RSP0/CPU0:router(admin)# install commit

Commits the current set of packages so that these packages are used if the router is restarted. Packages can be removed only if the deactivation operation is committed.

**Note**

This command is entered in administration EXEC or EXEC mode.

**Step 11**

(Optional) **install remove** { id add-id | device : package | inactive } [ test ]

Example:

RP/0/RSP0/CPU0:router(admin)# install remove disk0:asr9k-diags-3.8.30

Removes the inactive package.

- Only inactive packages can be removed.
- Packages can be removed only if they are deactivated from all cards in the router.
- The package deactivation must be committed.
- To remove a specific inactive package from a storage device, use the **install remove** command with the device:package arguments.
- To remove all packages that were added in one or more specific **install add** operations, use the id add-id keyword and argument. The operation ID of an **install add** operation is indicated in the syslog displayed during the operation and in the output of the **show install log** command. If you specify packages according to operation ID, all the packages that were added by the specified operation must still be on the router.
- To remove all inactive packages from all nodes in the system, use the **install remove** command with the **inactive** keyword.
- You can use the **install remove** command in either administration EXEC or EXEC mode.

System Management Configuration Guide for Cisco ASR 9000 Series Routers, IOS XR Release 6.2.x
Examples

In the following examples, a package is deactivated from the router. The changes are committed and the inactive package is removed from the router.

Deactivating the Package: Example

RP/0/RSP0/CPU0:router(admin)# install deactivate disk0:asr9k-diags-3.7.2

Install operation 27 'install deactivate disk0:asr9k-diags-3.7.2' started by user 'lab' at 23:29:37 UTC Sat Apr 15 2009.
The install operation will continue asynchronously.
Info: The changes made to software configuration across system reloads. Use the command 'admin install commit' to make changes persistent.
Info: Please verify that the system is consistent following the software change using the following commands:
Info: show system verify
Info: install verify packages
Install operation 27 completed successfully at 23:30:22 UTC Sat Apr 15 2009.

Committing the Active Software Set: Example

RP/0/RSP0/CPU0:router(admin)# install commit

Install operation 29 'install commit' started by user 'lab' at 23:39:21 UTC Sat Apr 15 2009.

Displaying the Inactive Packages: Example

RP/0/RSP0/CPU0:router(admin)# show install inactive summary

Default Profile:
SDRs:
Owner
Inactive Packages:
disk0:asr9k-diags-3.7.2

Removing the Inactive Package from the Router: Example

The following example shows how to remove an inactive package. In this example, the operation is run in test mode. The operation is confirmed and the package is removed.

RP/0/RSP0/CPU0:router(admin)# install remove disk0:asr9k-diags-3.7.2 test

Install operation 30 'install remove disk0:asr9k-diags-3.7.2 test' started by user 'lab' at 23:40:22 UTC Sat Apr 15 2009.
Warning: No changes will occur due to 'test' option being specified. The following is the predicted output for this install command.
Info: This operation will remove the following package:
Rolling Back to a Previous Software Set

Cisco IOS XR software allows you to roll back one or more SDRs to a previous committed or uncommitted software set. Use the `show install rollback` command to view the available rollback points and use the `install rollback to` command to roll back the SDR to a previous software set. You can also use the `install rollback to committed` command to roll back to the most recent committed software set.

Rollback operations can be performed by running the command in administration EXEC or EXEC mode.

Displaying Rollback Points

A rollback point is created every time a software package is activated, deactivated, or committed. Use the `show install rollback` command to display the eligible rollback points.
Displaying the Active Packages Associated with a Rollback Point

To display the active packages associated with a rollback point, use the `show install rollback` command with the `point-id` argument. This command displays the packages that are active if you roll back one or more SDRs to that installation point. For example, the `show install rollback 2` command displays the packages that are active if you roll back to rollback point 2.

```
RP/O/RSP0/CPU0:router (admin)# show install rollback 0
Tue Jun 23 06:25:06.493 PST
ID: 0, Label:
Secure Domain Router: Owner

Node 0/RSP0/CPU0 [RP] [SDR: Owner]
  Boot Device: disk0:
  Boot Image: /disk0/asr9k-os-mbi-3.9.0.12I/mbiasr9k-rp.vm
  Rollback Packages:
    disk0:comp-asr9k-mini-3.9.0.12I

Node 0/1/CPU0 [LC] [SDR: Owner]
  Boot Device: mem:
  Boot Image: /disk0/asr9k-os-mbi-3.9.0.12I/lc/mbiasr9k-lc.vm
  Rollback Packages:
    disk0:comp-asr9k-mini-3.9.0.12I

Node 0/4/CPU0 [LC] [SDR: Owner]
  Boot Device: mem:
  Boot Image: /disk0/asr9k-os-mbi-3.9.0.12I/lc/mbiasr9k-lc.vm
  Rollback Packages:
    disk0:comp-asr9k-mini-3.9.0.12I

Node 0/6/CPU0 [LC] [SDR: Owner]
  Boot Device: mem:
  Boot Image: /disk0/asr9k-os-mbi-3.9.0.12I/lc/mbiasr9k-lc.vm
  Rollback Packages:
    disk0:comp-asr9k-mini-3.9.0.12I
```

You can enter the command in either administration EXEC mode or EXEC mode.
Rolling Back to a Specific Rollback Point

You can roll back to a specific rollback point, including a noncommitted software set:

- If you roll back to the most recent noncommitted rollback point (with the highest number), you do not need to reload the router.
- You can repeat the rollback process one rollback point at a time without reloading if you always choose the most recent rollback point.
- If you choose a rollback point that is older than the most recent point, the impacted nodes reload, interrupting data traffic on those nodes. Before the reload occurs, you are prompted to confirm the install rollback operation.

In the following example, the system is rolled back to noncommitted rollback point 8:

```
RP/0/RSP0/CPU0:router(admin)# install rollback to 8

Install operation 10 'install rollback to 8' started by user 'cisco' at 07:49:26 UTC Mon Nov 14 2009.
The install operation will continue asynchronously.
Info: The changes made to software configurations will not be persistent across system reloads. Use the command 'admin install commit' to make changes persistent.
Info: Please verify that the system is consistent following the software change using the following commands:
Info: show system verify
Info: install verify packages

The currently active software is the same as the committed software.

Install operation 10 completed successfully at 07:51:24 UTC Mon Nov 14 2009.
```

Rolling Back to the Last Committed Package Set

Use the `install rollback to committed` command to roll back to the last committed package set.

In the following example, the owner SDR is rolled back to the last committed package set:

```
RP/0/RSP0/CPU0:router(admin)# install rollback to committed

Install operation 27 'install rollback to committed' started by user 'lab' at 16:41:38 UTC Sat Nov 19 2009.
Info: The rollback to committed software will require a reload of impacted nodes because it is over multiple activation & deactivation operations.
Info: This operation will reload the following node:
Info: 0/RP1/CPU0 (RP) (SDR: Owner)
Info: This operation will reload all RPs in the Owner SDR, and thereby indirectly cause every node in the router to reload.

Proceed with this install operation? [confirm]
```
Updating Commit Database. Please wait...[OK]
Info: The changes made to software configurations will not be persistent
Info: across system reloads. Use the command 'admin install commit' to make
Info: changes persistent.
Info: Please verify that the system is consistent following the software
Info: change using the following commands:
Info:     show system verify
Info:     install verify packages

You can enter the command in either administration EXEC mode or EXEC mode.

In Service Software Upgrade for Cisco IOS XR 64 Bit

This module contains the following topics:

- Overview of ISSU on ASR 9000 with IOS XR 64 Bit, on page 217
- Restrictions and Usage Guidelines, on page 218
- Pre-Installation Tasks, on page 219
- ISSU on ASR 9000 with IOS XR 64 Bit: Single Phase Installation, on page 222
- ISSU on ASR 9000 with IOS XR 64 Bit: Multi Step Installation, on page 226
- Installing Packages Using ISSU: Related Commands, on page 227

Overview of ISSU on ASR 9000 with IOS XR 64 Bit

In-Service Software Upgrade (ISSU) provides the ability to upgrade the IOS XR 64 Bit version on ASR 9000 with minimal disruption on the control plane and forwarding plane. ISSU supports upgrading an image from a lower to a higher version. ISSU supports zero topology loss (ZTL) and causes only a minimal packet loss of less than six seconds.

You can perform ISSU installation in a single step or as multiple phases. You need to perform the pre-installation tasks before executing ISSU. During the pre-installation tasks and ISSU execution, V1 refers to the image currently running on the router and V2 will be the upgraded image.

ISSU execution contains the following phases:

- Prepare phase: The installable files are pre-checked and loaded on the router before activation. This phase is optional.
- Activate phase: The new image (V2) is downloaded to all nodes in the router replacing the old image (V1). This phase can be run in step-by-step phases like Load, Run, and Cleanup or by using a one-shot Activate phase.

**Note**
The Prepare phase is optional and can be skipped because the Load phase prepares the package if Prepare phase was not performed before the Load phase.

- Commit phase: The ISSU installation is complete with V2 on all nodes.
ISSU supports upgrading the System Admin VM and XR VM individually. Using ISSU, the System Admin VM and XR VM can also be upgraded sequentially. The upgrade sequence is System Admin ISSU followed by XR ISSU. Committing the upgrade from XR VM commits both the System Admin and XR software. But, committing the upgrade from System Admin VM commits only the System Admin software.

Note

When RSP1 is the active RP and System Admin VM ISSU is triggered on Cisco ASR 9000 with IOS XR 64 bit, there is an additional VM switch over compared to performing System Admin VM ISSU from RSP0. This is an expected behaviour.

Restrictions and Usage Guidelines

ISSU on ASR 9000 with IOS XR 64 Bit is supported only on few third generation ASR 9000 Series Ethernet line cards, RSPs and RPs.

The third generation of line cards include:

- A9K-8X100G-LB-SE
- A9K-8X100G-LB-TR
- A9K-8X100GE-SE
- A9K-8X100GE-TR
- A9K-4X100GE-SE
- A9K-4X100GE-TR
- A9K-MOD400-SE
- A9K-MOD400-TR
- A9K-MOD200-SE
- A9K-MOD200-TR

The third generation of RSP and RP cards include:

- A9K-RSP880-SE/TR
- A9K-RSP880-LT-SE/TR
- A99-RSP-SE/TR
- A99-RP2-SE/TR

ISSU is not supported on the ASR 9000 Series 24-port and 48-port dual-rate 10GE and 1GE line cards. The line cards include:

- A9K-24X10GE-1G-SE
- A9K-24X10GE-1G-TR
- A9K-48X10GE-1G-SE
- A9K-48X10GE-1G-TR
- A9K-48X10GE-1G-SE
- A9K-48X10GE-1G-TR

ISSU is not supported on the ASR 9000 fourth generation QSFP28 based dense 100GE line cards. The line cards include:

- A9K-16X100GE-TR
- A9K-32X100GE-TR
- A9K-16X100GE-X-SE

ISSU is not supported on the single RP system of ASR 9901.

Pre-Installation Tasks

Pre-Installation Tasks

Before performing ISSU on ASR 9000 with IOS XR 64 Bit, complete the following tasks.

1. Configure NTP in XR VM. Once you configure NTP on XR VM, System Admin VM automatically synchronizes with NTP running on RSP. If NTP server is not available, configure clock on both XR VM and System Admin VM in configuration mode and make sure that your clock is set to the correct location and timezone.

   RP/0/RSP0/CPU0:Router# show ntp associations
   address  ref clock  st  when  poll reach  delay  offset  disp
   *~172.27.131.19 171.68.38.65 2 13 64 77 2.05 -1.174 191.09
   ~172.27.130.34 171.68.38.65 2 35 64 0 0.00 0.000 0.000
   +172.27.130.33 171.68.38.65 2 9 64 77 2.41 10.370 189.47
   * sys_peer, # selected, + candidate, - outlayer, x falseticker, ~ configured

   sysadmin-vm:0_RSP0:Router# show ntp associations
   Wed Oct 31 15:18:59.728 UTC-07:00
   remote  refid  st  t  when  poll reach  delay  offset  jitter
   -----------------------------------------------
   external:
   *rsp0_xr 172.27.131.19 3 u 12 128 347 0.171 0.989 0.456
   rspl_xr .STEP. 16 u - 256 0 0.000 0.000 0.000
   internal:
   *192.0.16.4 172.27.131.19 3 u 12 128 347 0.171 0.989 0.456
   192.0.20.4 .STEP. 16 u - 256 0 0.000 0.000 0.000

2. Ensure that the dual RP and RSP systems are synchronized and they are in active and standby roles respectively using the show redundancy summary command. The line card status should be Final Band or Running.

   RP/0/RSP0/CPU0:Router# show redundancy summary
   Active Node  Standby Node
   ---------  ----------
   0/RSP0/CPU0  0/RSP1/CPU0 (Node Ready, NSR:Ready)
3. Ensure that firmware on linecards, RSP, and RP is upgraded to the latest version. You can upgrade the router cards in a single step by using the `upgrade hw-module location all fpd all` command. Use the `show hw-module location location fpd` command to verify the firmware versions.

```plaintext
RP/0/RSP0/CPU0:Router# upgrade hw-module location all fpd all
```

This example shows verifying the firmware versions for a node.

```plaintext
RP/0/RSP0/CPU0:Router# show hw-module location 0/rsp1 fpd
```

4. Check the disk storage space on both System Admin VM and XR VM and ensure that sufficient disk space is available. Remove files like show-tech, cores, kernel dumps, manually created text, log, debug information and so on.

This example shows verifying the disk storage space for System Admin VM and XR VM on RSP0. You also need to verify the disk space on the standby RSP (RSP1). If required you can verify the disk storage on line cards using the `show media location` command.

```plaintext
RP/0/RSP0/CPU0:Router# show media
```

- rootfs: = root file system (read-only)
- log: = system log files (read-only)
- config: = configuration storage (read-only)
- install: = install repository (read-only)
- a9ksys: = ASR9K system storage (read-only)

5. Populate the repository with RPMs and SMUs. You can pick and install individual RPMs, SMUs, one by one, or make a tarball and install one tarball or break it down with multiple tarballs.

**Note**
You cannot include a tarball within another tarball. However, multiple tarballs can be specified at once.

```
RP/0/RSP0/CPU0:Router# install add source tftp://172.27.131.19/xrimages/e652/asr9k-mini-x64-6.5.2.13I.iso ASR9K-RPMS-65213I.tar
```
```
RP/0/RSP0/CPU0:Router# show install request
The install add operation 4 is 80% complete
```
```
RP/0/RSP0/CPU0:Router# show install repository | i mini
asr9k-mini-x64-6.2.3 <=V1 iso image currently running
asr9k-mini-x64-6.5.2.13I <=V2 iso image to upgrade to
```

6. Check the repository to validate that packages, images, or SMUs are populated properly in the router's repository by using the `show install repository` command. There should be a one to one relationship between V1 and V2 images and SMUs. For example, if you install a SMU on V1, you also need the corresponding V2 version in the repository to execute ISSU.

```
RP/0/RSP0/CPU0:Router# show install repository | i mini
asr9k-mini-x64-6.2.3 <=V1 iso image currently running
asr9k-mini-x64-6.5.2.13I <=V2 iso image to upgrade to
```

7. Extract the ISO image in System Admin VM or XR VM depending on the version of the image.
   - For IOS XR versions prior to 6.5.1: You should extract the ISO image in XR VM as well as in System Admin VM because the system can only use packages in RPM format.
   - For IOS XR version 6.5.1 and onwards: System automatically extracts the system admin package from the ISO file once you mentioned the file name while executing ISSU. You only need to extract the XR package separately.

```
RP/0/RSP0/CPU0:Router# install extract asr9k-mini-x64-6.5.2.13I
Oct 31 20:50:30 Install operation 9 started by root:

ISSU on ASR 9000 with IOS XR 64 Bit: Single Phase Installation

This section shows how to perform ISSU on ASR 9000 with IOS XR 64 Bit in a single step. You can either upgrade the system or install a patch in a single step. The system upgrade is done using an ISO image file, while the patch installation is done using packages and SMUs.

You should perform the following steps before performing this task:

- Copy the package to be installed either on the router's hard disk or on a network server to which the router has access.
- Ensure that dual route processor (RP) system with standby is in "is ready" state.

Preform the following steps to upgrade the system or install a patch in a single step.

Note: Depending on whether you are installing a System Admin package or a XR package, execute these commands in the System Admin EXEC mode or XR EXEC mode respectively.

1. (Optional) Prepare the installable files by using the `install prepare issu package_name` command. During the prepare phase, pre-activation checks are made, and the components of the installable files are loaded on to the router setup.
   - For System Admin VM:
     ```
     sysadmin-vm:0_RSP0# install prepare issu asr9k-xr-<release-version>
     ```
   - For XR VM:
     ```
     RP/0/RSP0/CPU0:router# install prepare issu asr9k-xr-<release-version>
     ```

2. Activate the ISSU installation in XR VM or System Admin VM in a single step by using the `install activate issu` command.
   - For System Admin VM:
     ```
     sysadmin-vm:0_RSP0# install activate issu asr9k-xr-<release-version>
     ```
   - For XR VM:
     ```
     RP/0/RSP0/CPU0:router# install activate issu asr9k-xr-<release-version>
     ```
ISSU operation takes about 30 minutes to complete. If the ISSU operation is not concluded in 40 minutes, the ISSU may timeout or abort.

3. Commit the newly active software by using the `install commit` command.

   For System Admin VM:
   ```
   sysadmin-vm:0_RSP1# install commit
   ```

   For XR VM:
   ```
   RP/0/RSP0/CPU0:router# install commit
   ```

**Examples: Install Packages Using ISSU Single Step Installation on ASR 9000 with IOS XR 64 Bit**

This example shows performing System Admin VM upgrade using ISSU and how to verify the installation using show commands.

```bash

In Service Software Upgrade for Cisco IOS XR 64 Bit
ISSU on ASR 9000 with IOS XR 64 Bit: Single Phase Installation

System Management Configuration Guide for Cisco ASR 9000 Series Routers, IOS XR Release 6.2.x
ISSU on ASR 9000 with IOS XR 64 Bit: Multi Step Installation

This section shows how to perform ISSU on ASR 9000 with IOS XR 64 Bit in multiple steps.

You should perform the following steps before performing the steps in this task:

• Copy the package to be installed either on the router's hard disk or on a network server to which the router has access.

• Ensure that dual route processor (RP) system with standby is in "is ready" state.

Perform the following steps to upgrade the system or install a patch in multiple phases.

Note

Depending on whether you are installing a System Admin package or a XR package, execute these commands in the System Admin EXEC mode or XR EXEC mode respectively.

Note

You should update the System Admin VM first and then update the XR VM. IOS XR 64 bit ISSU will fail if the System Admin VM is not updated first.

1. (Optional) Prepare the installable files by using the `install prepare issu package_name` command. During the prepare phase, pre-activation checks are performed and the components of the installable files are loaded on to the router setup.

   For System Admin VM:
   `sysadmin-vm:0_RSP0# install prepare issu asr9k-xr-<release-version>`

   For XR VM:
   `RP/0/RSP0/CPU0:router# install prepare issu asr9k-xr-<release-version>`

2. Start the load phase by issuing the `install activate issu load` command.

   For System Admin VM:
   `sysadmin-vm:0_RSP0# install activate issu load asr9k-xr-<release-version>`

   For XR VM:
   `RP/0/RSP0/CPU0:router# install activate issu load asr9k-xr-<release-version>`

This step downloads the new image (V2) to all nodes in the router. The new image is checked for compatibility to ensure that the router can be upgraded. At the start of the Load phase, the router configuration mode is locked, and you cannot perform any configuration on the router until ISSU completes...
the phase. At the end of this stage, all standby nodes run V2 and all active nodes (including all line cards) still run the original software images (V1).

3. Starts the run phase by issuing the `install activate issu run` command.
   For System Admin VM:
   ```
   sysadmin-vm:0_RSP0# install activate issu run
   ```
   For XR VM:
   ```
   RP/0/RSP0/CPU0:router# install activate issu run
   ```
   This phase starts version switch from V1 to V2. All the packages that have been prepared are activated to make the package configurations active on the router.

4. Starts the cleanup phase by issuing the `install activate issu cleanup` command.
   For System Admin VM:
   ```
   sysadmin-vm:0_RSP0# install activate issu cleanup
   ```
   For XR VM:
   ```
   RP/0/RSP0/CPU0:router# install activate issu cleanup
   ```
   This phase initiates shutdown of VMs with previous versions after running the activation. The cleanup phase concludes the ISSU process and the new software runs on all nodes in the system.

5. Commit the newly active software by using the `install commit` command.
   For System Admin VM:
   ```
   sysadmin-vm:0_RSP0# install commit
   ```
   For XR VM:
   ```
   RP/0/RSP0/CPU0:router# install commit
   ```

CHAPTER 13

Upgrading Field-Programmable Devices

In general terms, field-programmable devices (FPDs) are hardware devices implemented on router cards that support separate software upgrades. A field-programmable gate array (FPGA) is a type of programmable memory device that exists on most hardware components of the router. The term FPD has been introduced to collectively and generically describe any type of programmable hardware device on SIPs and shared port adapters (SPAs), including FPGAs. Cisco IOS XR software provides the Cisco FPD upgrade feature to manage the upgrade of FPD images on SIPs and SPAs.

This chapter describes the information that you must know to verify image versions and to perform an upgrade for SPA or SIP FPD images when incompatibilities arise.

For complete descriptions of the FPD commands listed in this module, refer to the upcoming sections. To locate documentation for other commands that might appear in the course of performing a configuration task, search online in Cisco ASR 9000 Series Aggregation Services Router Commands Master List.

This module contains the following topics:

- Upgrading Field-Programmable Device, on page 229
- Prerequisites for FPD Image Upgrades, on page 230
- Overview of FPD Image Upgrade Support, on page 230
- FPD upgrade service, on page 231
- How to Upgrade FPD Images, on page 233
- Configuration Examples for FPD Image Upgrade, on page 236
- Troubleshooting Problems with FPD Image Upgrades, on page 241

Upgrading Field-Programmable Device

An FPD is a field programmable logic device which contains non-volatile, re-programmable memory to define its internal wiring and functionality. The contents of this non-volatile memory are called the FPD image or FPD firmware. Over the lifespan of an FPD, FPD firmware images may need upgrades for bug fixes or functionality improvements. These upgrades are performed in the field with minimum system impact.
Prerequisites for FPD Image Upgrades

You must install the FPD pie before you install the SMUs or Service Packs. If you install the SMU or Service Packs before the FPD pie, the FPDs on the line card may not upgrade. In such cases, you must remove the SMUs and Service Packs and reload the router.

Overview of FPD Image Upgrade Support

An FPD image is used to upgrade the software on an FPD.

Whenever an image is released that supports SIPs and SPAs, a companion SIP and SPA FPD image is bundled. Generally, the FPD image is not automatically upgraded. You must manually upgrade the FPD image running on the SPA or SIP when you upgrade the Cisco IOS XR software image.

FPD versions must be compatible with the Cisco IOS XR software that is running on the router; if an incompatibility exists between an FPD version and the Cisco IOS XR software, the device with the FPGA may not operate properly until the incompatibility is resolved. An FPGA incompatibility on a SPA does not necessarily affect the running of the SPA interfaces; an FPD incompatibility on a SIP disables all interfaces for all SPAs in the SIP until the incompatibility is addressed.

Use the `show hw-module fpd` command to determine if an FPD upgrade is required. A value of ‘Yes’ in the Upg/Dng? (upgrade/downgrade) column indicates that an upgrade or downgrade is required.

The NCS 5500 supports upgrades for FPGA devices on its SIPs and SPAs. FPGA and ROMMON software upgrades are part of an FPD image package that corresponds to a Cisco IOS XR software image. SIPs and SPAs support manual upgrades for FPGA devices using the Cisco FPD upgrade feature that is further described in this chapter.

Note: It is mandatory to upgrade all the required FPDs before doing a reload when you are upgrading FPDs on line cards. This is because, partial FPD component upgrades might result in booting errors (in some cases).

Automatic FPD Upgrade

Restriction: Newly inserted or reloaded line cards do not reload automatically after a FPD image automatic upgrade, so you must reload the line card manually to use the new FPD image.

By default, the FPD image is not automatically upgraded. You must manually upgrade the FPD image running on the Field Replaceable Unit (FRU) when you upgrade the Cisco IOS XR software image.

However, if you enable the `fpd auto-upgrade` command in Admin Configuration mode, FPD images are automatically updated when:

- Software upgrade is carried out.
- Line cards are added to an existing router or reloaded.

The following conditions must be met for an Automatic FPD Upgrade to work on a system upgrade:

- FPD package installation envelope (PIE) must be installed on the router.
• FPD PIE must be activated together with the new Cisco IOS XR image.
• The `fpd auto-upgrade` command must be configured in the Admin Configuration mode.

The following conditions must be met for an Automatic FPD Upgrade to work on a FRU Insertion or reload:
• The `fpd auto-upgrade` command must be configured in the Admin Configuration mode.

Note
Although the FPD upgrade is performed during the install operation, there is no install commit performed. Therefore, once the FPD has been upgraded, if the image is rolled back to the original version, the FPD version is not downgraded to the previous version.

Automatic FPD Upgrade is not performed when:
• A non-reload software maintenance upgrade (SMU) or PIE installation is performed, even where the FPD image version changes. Since a non-reload installation is, by definition, not supposed to reload the router, and an FPD upgrade requires a router reload, an Automatic FPD Upgrade is repressed.

Note
In all cases where the automatic FPD upgrade is not performed, you must perform a manual FPD upgrade using the `upgrade hw-module fpd` command.

Note
A message is displayed when router modules cannot get upgraded during automatic FPD upgrade indicating that the FPGA is intentionally skipped during upgrade. To upgrade such FPGAs, you can use the CLI command with a particular location explicitly specified. For example, `upgrade hw-module fpd all location 0/3/1`.

Note
CFP2-DCO Optical modules do not support automatic-FPD upgrade.

**FPD upgrade service**

The main tasks of the FPD upgrade service are:
• FPD image version checking to decide if a specific firmware image needs an upgrade or not.
• Automatic FPD Image Upgrade (if enabled).
• Manual FPD Image Upgrade using the `upgrade hw-module fpd` command.
• Invoke the appropriate device driver with a name of the new image to load.

An FPD image package is used to upgrade FPD images. The `install activate` command is used to place the FPD binary files into the expected location on the boot devices.

**Supported Upgrade Methods**
<table>
<thead>
<tr>
<th>Method</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Manual Upgrade</td>
<td>Upgrade using CLI, force upgrade supported.</td>
</tr>
<tr>
<td>Auto Upgrade</td>
<td>Upgrade using install SMU activation or during image upgrade. User can enable/disable auto upgrade feature.</td>
</tr>
</tbody>
</table>

### Determining Upgrade Requirement

Use the `show hw-module fpd` command to determine if an FPD upgrade is required. Check for NEED UPGD in the Status column.

Use the `show fpd package` command to find out which FPGAs are supported with your current software release and minimum hardware requirements for each module.

### Automatic FPD upgrade

Use the `fpd auto-upgrade enable` command to enable the auto upgrade feature.

The FPD images are upgraded as part of the install activation of the new image. The FPDs are upgraded before the router is reloaded.

During an FPD auto-upgrade, the installed FPD rpm package includes an FPD image with a new version of software that is different than the version of the image running on the hardware. Once the FPDs have been upgraded, even if the base image is rolled backed to the older version, the FPD will not be downgraded to its previous version.

When a reload package is installed with new FPD images, the FPD images are upgraded before the router gets reloaded. This feature is controlled through an fpd auto-upgrade configuration option. The auto-upgrade feature does not address the following:

- FPD Upgrade during initial boot
- FPD Upgrade during new card insertion

### Manual FPD upgrade

Manual FPD upgrade is performed using the `upgrade hw-module fpd` command. All cards or all of FPGA in a card can be upgraded. If reload is required to activate FPD, the upgrade should be complete. All line-cards, fabric cards and RP cards cannot be reloaded during the process of the FPD upgrade.

FPD upgrade is transaction-based:

- Each fpd upgrade cli execution is one transaction
- Only one transaction is allowed at any given time
- One transaction may include one or many FPD upgrade(s)

The `force` option can be used to forcibly upgrade the FPD (regardless of whether it is required or not). It triggers all FPDs to be upgraded or downgraded. The force option can also be used to downgrade or upgrade the FPGAs even after the version check.
In some cases, FPDs can have primary and backup images.

How to Upgrade FPD Images

You must determine if an FPD image upgrade is needed using the `show hw-module fpd` command and perform the upgrade, if needed, under the following circumstances:

- You migrate the software to a later Cisco IOS XR software release.
- You swap SPAs or SIPs from a system running a different Cisco IOS XR software release.
- You insert a new SPA or SIP.

In the event that there is an FPD incompatibility with your card, you may receive an error message. If you upgrade to a newer version of the Cisco IOS XR software and there is an FPD incompatibility, you receive the following message:

```
LC/0/1/CPU0:Dec 23 16:33:47.945 : spa_192_jacket_v2[203]: %PLATFORM-UPGRADE_FPD-4-DOWN_REV : spa fpga2 instance 0 is down-rev (V0.6), upgrade to (V1.0). Use the "upgrade hw-module fpd" CLI in admin mode.
```

If the FPD image on the card is newer then what is required by the currently running Cisco IOS XR software image on the router, you receive the following error message:

```
LC/0/1/CPU0:Dec 23 16:33:47.955 : spa_192_jacket_v2[203]: %PLATFORM-UPGRADE_FPD-4-UP_REV : spa fpga instance 1 is up-rev(V1.10), downgrade to (V0.09) is "OPTIONAL". Use "upgrade hw-module fpd force" CLI in admin mode.
```

You should perform the FPD upgrade procedure if you receive such messages. Cards may not function properly if FPD incompatibilities are not resolved.

The use of the `force` option when performing a FPD upgrade is not recommended except under explicit direction from Cisco engineering or TAC.

Before you begin

- The FPD upgrade procedure is performed while the card is online. At the end of the procedure the card must be reloaded before the FPD upgrade is complete. To automatically reload the card, you can use the `hw-module reload` command during your next maintenance window. The upgrade procedure is not complete until the card is reloaded.

- During the FPD upgrade, you must not do the following:
  - Reload, perform an online insertion and removal (OIR) of a line card (LC), or power down the chassis. Doing so may cause the node to enter an unusable state.
  - Press Ctrl-C if the console appears to hang without any output. Doing so may abort the upgrade.

- If you are not sure whether a card requires an FPD upgrade, you can install the card and use the
show hw-module fpd command to determine if the FPD image on the card is compatible with the currently running Cisco IOS XR software release.

**SUMMARY STEPS**

1. show hw-module fpd location {all | node-id}
2. admin
3. (Optional) show fpd package
4. upgrade hw-module fpd {all | fpga-type} [ force] location {all | node-id}
5. exit
6. (Optional) hw-module {location node-id | subslot subslot-id} reload
7. show platform

<td>RP/0/RSP0/CPU0:router(admin)# upgrade hw-module fpd all location 0/3/1</td>
<td></td>
</tr>
</tbody>
</table>
### Purpose Command or Action

<table>
<thead>
<tr>
<th>Purpose</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>FPD upgrade started.</td>
<td></td>
</tr>
<tr>
<td>FPD upgrade in progress.</td>
<td></td>
</tr>
<tr>
<td>FPD upgrade in progress..</td>
<td></td>
</tr>
<tr>
<td>FPD upgrade sent to location xxxx</td>
<td></td>
</tr>
<tr>
<td>FPD upgrade sent to location yyyy</td>
<td></td>
</tr>
<tr>
<td>FPD upgrade in progress..</td>
<td></td>
</tr>
<tr>
<td>FPD upgrade finished for location xxx</td>
<td></td>
</tr>
<tr>
<td>FPD upgrade in progress..</td>
<td></td>
</tr>
<tr>
<td>FPD upgrade finished for location yyyy</td>
<td></td>
</tr>
<tr>
<td>FPD upgrade completed.</td>
<td></td>
</tr>
</tbody>
</table>

The “FPD upgrade in progress.” message is printed every minute. These logs are information logs, and as such, are displayed if the logging console informational command is configured.

If Ctrl-C is pressed while the FPD upgrade is in progress, the following warning message is displayed:

```
FPD upgrade in progress on some hardware, aborting now is not recommended as it might cause HW programming failure and result in RMA of the hardware.
Do you want to continue? [Confirm(y/n)]
```

If you confirm that you want to abort the FPD upgrade procedure, this message is displayed:

```
FPD upgrade process has been aborted, please check the status of the hardware and reissue the upgrade command if required.
```

**Note** If your card supports multiple FPD images, you can use the `show fpd package` admin command to determine what specific image to upgrade in the `upgrade hw-module fpd` command.

**Note** A message is displayed when router modules cannot get upgraded during upgrade with location all option indicating that the FPGA is intentionally skipped during upgrade. To upgrade such FPGAs, you can use the CLI command with a particular location explicitly specified. For example, `upgrade hw-module fpd all location 0/3/1`.

#### Step 5

**Example:**

```
RP/0/RSP0/CPU0:router(admin)# exit
```
### Purpose

Use the `hw-module subslot reload` command to reload a SPA and the `hw-module location reload` command to reload a SIP or line card.

### Step 6

((Optional) `hw-module {location node-id | subslot subslot-id} reload`  

**Example:**

```
RP/0/RSP0/CPU0:router# hw-module subslot 0/3/1 reload
or
RP/0/RSP0/CPU0:router# hw-module location 0/3/cpu0 reload
```

### Step 7

`show platform`  

**Example:**

```
RP/0/RSP0/CPU0:router# show platform
```

### Configuration Examples for FPD Image Upgrade

The following examples indicates the use of commands associated with the FPD image upgrade procedure.

#### show hw-module fpd Command Output: Example

Use the `show hw-module fpd` to display the current version of FPD images on the SPAs, SIPs and other cards installed on your router.

This command can be used to identify information about FPDs on any card. If you enter the location of a line card that is not a SPA, the output displays information about any programmable devices on that line card.

The following example shows how to display FPD compatibility for all modules in the router:

```
RP/0/RSP0/CPU0:router# show hw-module fpd
Tue Jan 22 13:56:55.082 UTC

show fpd package Command Output: Example

Use the `show fpd package` command in administration EXECAdmin EXEC mode to find out which SPAs and SIPs are supported with your current Cisco IOS XR software release, which FPD image package you need for each SPA or SIP, and what the minimum hardware requirements are for each module. If multiple FPD images are available for your card, they are listed as Subtype fpga2, fpga3, and so on.

The FPD name used in the FPD Description column of the output of the `show fpd package` command includes the last ten characters of DCO-PID. Depending on the slot and port numbers, the FPD name is appended with DCO_0, DCO_1, or DCO_2. For example, the FPD names for CFP2-WDM-D-1HL in port 0 and port 1 are `WDM-D-1HL_DCO_0` and `WDM-D-1HL_DCO_1` respectively.

The following example shows sample output from the `show fpd package` command:

```
show fpd package

<td>FPD software version recommended for the associated module running the current Cisco IOS XR software.</td>
</tr>
<tr>
<td>Min Req SW Vers</td>
<td>Minimum required FPD image software version to operate the card. Version 0.0 indicates that a minimum required image was not programmed into the card.</td>
</tr>
<tr>
<td>Min Req HW Vers</td>
<td>Minimum required hardware version for the associated FPD image. A minimum hardware requirement of version 0.0 indicates that all hardware can support this FPD image version.</td>
</tr>
</tbody>
</table>

**Note**

In the `show fpd package` command output, the “subtype” column shows the FPDs that correspond with each SPA image. To upgrade a specific FPD with the `upgrade hw-module fpd` command, replace the `fpga-type` argument with the appropriate FPD from the “subtype” column, as shown in the following example:

```
RP/0/RSP0/CPU0:router(admin)# upgrade hw-module fpd fpga2 location 0/3/1 reload
```

---

**upgrade hw-module fpd Command Output: Example**

Use the `upgrade hw-module fpd` command to upgrade the FPD image on a SPA, SIP or line card.

```
RP/0/RSP0/CPU0:router# admin
RP/0/RSP0/CPU0:router(admin)# upgrade hw-module fpd fpga location 0/1/cpu0

Mon Jan 12 05:44:37.611 PST
% RELOAD REMINDER: - The upgrade operation of the target module will not interrupt its normal operation. However, for the changes to take effect, the target module will need to be manually reloaded after the upgrade operation. This can be accomplished with the use of "hw-module <target> reload" command.
- If automatic reload operation is desired after the upgrade, please use the "reload" option at the end of the upgrade command.
- The output of "show hw-module fpd location" command will not display correct version information after the upgrade if the target module is not reloaded.
Continue? [confirm] y

Starting the upgrade/download of following FPD:

```
== Current Upg/Dng ==

System Management Configuration Guide for Cisco ASR 9000 Series Routers, IOS XR Release 6.2.x
show platform Command Output: Example

Use the `show platform` command to verify that the SPA is up and running.

Troubleshooting Problems with FPD Image Upgrades

This section contains information to help troubleshoot problems that can occur during the upgrade process.

Power Failure or Removal of a SPA During an FPD Image Upgrade

If the FPD upgrade operation is interrupted by a power failure or the removal of the SPA, it could corrupt the FPD image. This corruption of the FPD image file makes the SPA unusable by the router and the system displays the following messages when it tries to power up the SPA. When it cannot successfully power up the SPA, it places it in the failed state, as shown in the following example:

```
LC/0/3/CPU0:Feb 4 08:23:16.672: spa_192_jacket[188]: %L2-SPA-5-OIR_INSERTED: SPA discovered in bay 0
LC/0/3/CPU0:Feb 4 08:23:23.349: spa_192_jacket[188]: %L2-SPA-5-OIR_ERROR : SPA (0): An error occurred (0x1002), error recovery action: reset SPA
LC/0/3/CPU0:Feb 4 08:23:26.431: spa_192_jacket[188]: %L2-SPA-5-OIR_INSERTED: SPA discovered in bay 0
LC/0/3/CPU0:Feb 4 08:23:32.593: spa_192_jacket[188]: %L2-SPA-5-OIR_ERROR : SPA (0): Too many retries, error recovery stopped
LC/0/3/CPU0:Feb 4 08:23:32.593: spa_192_jacket[188]: %L2-SPA-5-OIR_ERROR : SPA (0): An error occurred (0x1002), error recovery action: hold SPA in reset
```

When a SPA is in the failed state, it may not register itself with the FPD upgrade mechanism. In this case, you do not see the SPA listed when you use the `show hw-module fpd` command. To verify the state of a SPA, use the `show hw-module subslot error` command and the `show hw-module subslot status` command.

Performing a SPA FPD Recovery Upgrade

To recover a SPA from the failed state because of a corrupted FPD image, you must manually shut down the SPA. Use the `hw-module subslot subslot-id shutdown` command in Global Configuration mode to administratively shutdown the SPA. After the SPA is shut down, you can use the `upgrade hw-module fpd` command in administration EXEC mode:
Performing a SIP FPD Recovery Upgrade

If a SIP upgrade fails for whatever reason, do not reload the SIP. Try to perform the upgrade procedure again. You can perform the upgrade procedure multiple times, as long as you do not reload the SIP. The FPD upgrade procedure takes several minutes to complete; do not interrupt the procedure. If you reload the SIP when the FPD image is corrupted, the SIP malfunctions and you must contact Cisco technical support for assistance.

To recover a SIP from the failed state because of a corrupted FPD image, you must contact Cisco technical support.

To recover a SIP from the failed state because of a corrupted FPD image, you must turn off the automatic reset of the SIP card. Use the `hw-module reset auto disable` command in administration configuration mode, as shown in the following example:

```
RP/0/RSP0/CPU0:router(admin-config)# hw-module reset auto disable location 0/1/4
```
CHAPTER 14

Configuring Network Time Protocol

Network Time Protocol (NTP) is a protocol designed to time-synchronize devices within a network. Cisco IOS XR software implements NTPv4. NTPv4 retains backwards compatibility with the older versions of NTP, including NTPv3 and NTPv2 but excluding NTPv1, which has been discontinued due to security vulnerabilities.

This module describes the tasks you need to implement NTP on the Cisco IOS XR software.

For more information about NTP on the Cisco IOS XR software and complete descriptions of the NTP commands listed in this module, see Related Documents, on page 266. To locate documentation for other commands that might appear in the course of running a configuration task, search online in Cisco ASR 9000 Series Aggregation Services Router Commands Master List.

<td>Support was added for NTP server inside VRF interface</td>
</tr>
</tbody>
</table>

This module contains the following topics:

- Prerequisites for Implementing NTP on Cisco IOS XR Software, on page 244
- Information About Implementing NTP, on page 244
- How to Implement NTP, on page 246
- Configuration Examples for Implementing NTP, on page 261
- Configuring NTP server inside VRF interface, on page 264
- Additional References, on page 265
Prerequisites for Implementing NTP on Cisco IOS XR Software

You must be in a user group associated with a task group that includes the proper task IDs. The command reference guides include the task IDs required for each command. If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Information About Implementing NTP

NTP synchronizes timekeeping among a set of distributed time servers and clients. This synchronization allows events to be correlated when system logs are created and other time-specific events occur.

NTP uses the User Datagram Protocol (UDP) as its transport protocol. All NTP communication uses Coordinated Universal Time (UTC). An NTP network usually receives its time from an authoritative time source, such as a radio clock or an atomic clock attached to a time server. NTP distributes this time across the network. NTP is extremely efficient; no more than one packet per minute is necessary to synchronize two machines to within a millisecond of each other.

NTP uses the concept of a “stratum” to describe how many NTP “hops” away a machine is from an authoritative time source. A “stratum 1” time server typically has an authoritative time source (such as a radio or atomic clock, or a GPS time source) directly attached, a “stratum 2” time server receives its time via NTP from a “stratum 1” time server, and so on.

NTP avoids synchronizing to a machine whose time may not be accurate, in two ways. First, NTP never synchronizes to a machine that is not synchronized itself. Second, NTP compares the time reported by several machines and does not synchronize to a machine whose time is significantly different than the others, even if its stratum is lower. This strategy effectively builds a self-organizing tree of NTP servers.

The Cisco implementation of NTP does not support stratum 1 service; in other words, it is not possible to connect to a radio or atomic clock (for some specific platforms, however, you can connect a GPS time-source device). We recommend that time service for your network be derived from the public NTP servers available in the IP Internet.

If the network is isolated from the Internet, the Cisco implementation of NTP allows a machine to be configured so that it acts as though it is synchronized via NTP, when in fact it has determined the time using other means. Other machines can then synchronize to that machine via NTP.

Several manufacturers include NTP software for their host systems, and a publicly available version for systems running UNIX and its various derivatives is also available. This software also allows UNIX-derivative servers to acquire the time directly from an atomic clock, which would subsequently propagate time information along to Cisco routers.

The communications between machines running NTP (known as associations) are usually statically configured; each machine is given the IP address of all machines with which it should form associations. Accurate timekeeping is made possible by exchanging NTP messages between each pair of machines with an association.

The Cisco implementation of NTP supports two ways that a networking device can obtain NTP time information on a network:

- By polling host servers
- By listening to NTP broadcasts
In a LAN environment, NTP can be configured to use IP broadcast messages. As compared to polling, IP broadcast messages reduce configuration complexity, because each machine can simply be configured to send or receive broadcast or multicast messages. However, the accuracy of timekeeping is marginally reduced because the information flow is one-way only.

An NTP broadcast client listens for broadcast messages sent by an NTP broadcast server at a designated IPv4 address. The client synchronizes the local clock using the first received broadcast message.

The time kept on a machine is a critical resource, so we strongly recommend that you use the security features of NTP to avoid the accidental or malicious setting of incorrect time. Two mechanisms are available: an access list-based restriction scheme and an encrypted authentication mechanism.

When multiple sources of time (VINES, hardware clock, manual configuration) are available, NTP is always considered to be more authoritative. NTP time overrides the time set by any other method.

**Preventing Issues due to GPS Week Number Rollover (WNRO)**

- If there are no GPS sources in the NTP source chain or server chain, there is no impact of GPS Week Number Rollover (WNRO).

- GPS WNRO affects only the system clock and not user traffic.

- Contact your GPS manufacturer to fix the GPS source for this condition.

To mitigate impact of GPS sources that are subject to GPS WNRO perform the following optional workarounds:

- If the GPS source has been identified to be a cause of potential disruption on April 6, 2019 (or after), configure ntp master in the Cisco that is device connected to this source, and its clock on the Stratum 1 device to preventively isolate it. This configuration enables the device to present its own clock for synchronization to downstream NTP clients.

**Note**

The usage of ntp master command as mentioned above is only a workaround to this condition. Use this command until the GPS source-related conditions are resolved, and to prevent the distribution of incorrect clock values throughout the network.

- Configure multiple NTP servers (ideally 4, but more than 3) at Stratum 2 level of the network, to enable NTP clients at Stratum 2 level to get clock from more than one Stratum 1 server. This way, WNRO affected Stratum 1 servers are staged to be marked as ‘false ticker’ or ‘outlier’ clock sources as compared to other non-WNRO affected Stratum 1 servers.

**NTP-PTP Interworking**

NTP-PTP interworking provides the ability to use PTP, as well as other valid time of day (TOD) sources such as Data over Cable Service Interface Specification (DOCSIS) Timing Interface (DTI) and global positioning system (GPS), as the time source for the operating system. Prior to the support of NTP-PTP interworking, only backplane time was supported for the operating system time.

NTP-PTP interworking also provides the means to communicate status changes between PTP and NTP processes. It also supports the unambiguous control of the operating system time and backplane time in the event of bootup, switchovers or card and process failures.
Related Topics
Configuring NTP-PTP Interworking, on page 257

How to Implement NTP

Configuring Poll-Based Associations

No specific command enables NTP; the first NTP configuration command that you issue enables NTP.

You can configure the following types of poll-based associations between the router and other devices (which may also be routers):

- Client mode
- Symmetric active mode

The client and the symmetric active modes should be used when NTP is required to provide a high level of time accuracy and reliability.

When a networking device is operating in the client mode, it polls its assigned time serving hosts for the current time. The networking device then picks a host from all the polled time servers to synchronize with. Because the relationship that is established in this case is a client-host relationship, the host does not capture or use any time information sent by the local client device. This mode is most suited for file-server and workstation clients that are not required to provide any form of time synchronization to other local clients.

Use the `server` command to individually specify the time-serving hosts that you want your networking device to consider synchronizing with and to set your networking device to operate in the client mode.

When a networking device is operating in the symmetric active mode, it polls its assigned time-serving hosts for the current time and it responds to polls by its hosts. Because this is a peer-to-peer relationship, the host also retains time-related information about the local networking device that it is communicating with. This mode should be used when there are several mutually redundant servers that are interconnected via diverse network paths. Most stratum 1 and stratum 2 servers on the Internet today adopt this form of network setup.

Use the `peer` command to individually specify the time-serving hosts that you want your networking device to consider synchronizing with and to set your networking device to operate in the symmetric active mode.

When the router polls several other devices for the time, the router selects one device with which to synchronize.

To configure a peer-to-peer association between the router and another device, you must also configure the router as a peer on the other device.

You can configure multiple peers and servers, but you cannot configure a single IP address as both a peer and a server at the same time.

To change the configuration of a specific IP address from peer to server or from server to peer, use the `no` form of the `peer` or `server` command to remove the current configuration before you perform the new configuration. If you do not remove the old configuration before performing the new configuration, the new configuration does not overwrite the old configuration.
SUMMARY STEPS

1. configure
2. ntp
3. server ip-address [version number] [key key-id] [minpoll interval] [maxpoll interval] [source type interface-path-id] [prefer] [burst] [iburst]
4. peer ip-address [version number] [key key-id] [minpoll interval] [maxpoll interval] [source type interface-path-id] [prefer]
5. Use one of the following commands:
   • end
   • commit

Configuring Broadcast-Based NTP Associates

In a broadcast-based NTP association, an NTP server propagates NTP broadcast packets throughout a network. Broadcast clients listen for the NTP broadcast packets propagated by the NTP server and do not engage in any polling.

Broadcast-based NTP associations should be used when time accuracy and reliability requirements are modest and if your network is localized and has a large number of clients (more than 20). Broadcast-based NTP associations also are recommended for use on networks that have limited bandwidth, system memory, or CPU resources. Time accuracy is marginally reduced in broadcast-based NTP associations because information flows only one way.

Use the `broadcast client` command to set your networking device to listen for NTP broadcast packets propagated through a network. For broadcast client mode to work, the broadcast server and its clients must be located on the same subnet. The time server that is transmitting NTP broadcast packets must be enabled on the interface of the given device using the `broadcast` command.

Use the `broadcast` command to set your networking device to send NTP broadcast packets.

**Note**

No specific command enables NTP; the first NTP configuration command that you issue enables NTP.

**SUMMARY STEPS**

1. `configure`
2. `ntp`
3. (Optional) `broadcastdelay microseconds`
4. `interface type interface-path-id`
5. `broadcast client`
6. `broadcast [destination ip-address] [key key-id] [version number]`
7. Use one of the following commands:
   - `end`
### Configuring Broadcast-Based NTP Associates

<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>ntp&lt;br&gt;Example:&lt;br&gt;RP/0/RSP0/CPU0:router(config)# ntp</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>(Optional) broadcastdelay microseconds&lt;br&gt;Example:&lt;br&gt;RP/0/RSP0/CPU0:router(config-ntp)# broadcastdelay 5000</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>interface type interface-path-id&lt;br&gt;Example:&lt;br&gt;RP/0/RSP0/CPU0:router(config-ntp)# interface POS 0/1/0/0</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>broadcast client&lt;br&gt;Example:&lt;br&gt;RP/0/RSP0/CPU0:router(config-ntp-int)# broadcast client</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>broadcast [destination ip-address] [key key-id] [version number]&lt;br&gt;Example:&lt;br&gt;RP/0/RSP0/CPU0:router(config-ntp-int)# broadcast destination 10.50.32.149</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>Use one of the following commands:&lt;br&gt;- end&lt;br&gt;- commit&lt;br&gt;Example:&lt;br&gt;RP/0/RSP0/CPU0:router(config-ntp-int)# end&lt;br&gt;or&lt;br&gt;RP/0/RSP0/CPU0:router(config-ntp-int)# commit</td>
</tr>
</tbody>
</table>

**Purpose**

- Enters NTP configuration mode.
- Adjusts the estimated round-trip delay for NTP broadcasts.
- Enters NTP interface configuration mode.
- Configures the specified interface to receive NTP broadcast packets.
- Configures the specified interface to send NTP broadcast packets.
- Saves configuration changes.

**Note**

- Go to next step to configure the interface to send NTP broadcast packets.
- Go to previous step to configure the interface to receive NTP broadcast packets.

### Configuring NTP Access Groups

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>no</td>
<td>Entering no exits the configuration session and returns the router to EXEC mode without committing the configuration changes.</td>
</tr>
<tr>
<td>cancel</td>
<td>Entering cancel leaves the router in the current configuration session without exiting or committing the configuration changes.</td>
</tr>
<tr>
<td>commit</td>
<td>Use the commit command to save the configuration changes to the running configuration file and remain within the configuration session.</td>
</tr>
</tbody>
</table>

#### Configuring NTP Access Groups

No specific command enables NTP; the first NTP configuration command that you issue enables NTP.

The access list-based restriction scheme allows you to grant or deny certain access privileges to an entire network, a subnet within a network, or a host within a subnet.

The access group options are scanned in the following order, from least restrictive to most restrictive:

1. peer—Allows time requests and NTP control queries and allows the system to synchronize itself to a system whose address passes the access list criteria.
2. serve—Allows time requests and NTP control queries, but does not allow the system to synchronize itself to a system whose address passes the access list criteria.
3. serve-only—Allows only time requests from a system whose address passes the access list criteria.
4. query-only—Allows only NTP control queries from a system whose address passes the access list criteria.

If the source IP address matches the access lists for more than one access type, the first type is granted. If no access groups are specified, all access types are granted to all systems. If any access groups are specified, only the specified access types are granted.

For details on NTP control queries, see RFC 1305 (NTP version 3).

### SUMMARY STEPS

1. configure
2. ntp
3. access-group {peer | query-only | serve | serve-only} access-list-name
4. Use one of the following commands:
   - end
   - commit
### DETAILED STEPS

### Configuring NTP Authentication

This task explains how to configure NTP authentication.

- No specific command enables NTP; the first NTP configuration command that you issue enables NTP.
The encrypted NTP authentication scheme should be used when a reliable form of access control is required. Unlike the access-list-based restriction scheme that is based on IP addresses, the encrypted authentication scheme uses authentication keys and an authentication process to determine if NTP synchronization packets sent by designated peers or servers on a local network are deemed as trusted, before the time information that it carries along is accepted.

The authentication process begins from the moment an NTP packet is created. A message authentication code (MAC) is computed using the MD5 Message Digest Algorithm and the MAC is embedded into an NTP synchronization packet. The NTP synchronization packet together with the embedded MAC and key number are transmitted to the receiving client. If authentication is enabled and the key is trusted, the receiving client computes the MAC in the same way. If the computed MAC matches the embedded MAC, the system is allowed to sync to the server that uses this key in its packets.

After NTP authentication is properly configured, your networking device only synchronizes with and provides synchronization to trusted time sources.

**SUMMARY STEPS**

1. configure
2. ntp
3. authenticate
4. authentication-key *key-number* md5 [clear | encrypted] *key-name*
5. trusted-key *key-number*
6. Use one of the following commands:
   - end
   - commit

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure</td>
<td>Enters NTP configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> ntp</td>
<td>Enables the NTP authentication feature.</td>
</tr>
</tbody>
</table>
| **Example:**

RP/0/RSP0/CPU0:router(config)# ntp |

| **Step 3** authenticate | Defines the authentication keys. |
| **Example:**

RP/0/RSP0/CPU0:router(config-ntp)# authenticate |

| **Step 4** authentication-key *key-number* md5 [clear | encrypted] *key-name* | |
| **Example:**

RP/0/RSP0/CPU0:router(config-ntp)#
authentication-key 42 md5 clear key1 | |

- Each key has a key number, a type, a value, and, optionally, a name. Currently the only key type supported is md5.
<table>
<thead>
<tr>

<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 5</strong></td>
<td><strong>trusted-key key-number</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;RP/0/RSP0/CPU0:router(config-ntp)# trusted-key 42</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Use one of the following commands:&lt;br&gt;• end&lt;br&gt;• commit&lt;br&gt;<strong>Example:</strong>&lt;br&gt;RP/0/RSP0/CPU0:router(config-ntp)# end&lt;br&gt;or&lt;br&gt;RP/0/RSP0/CPU0:router(config-ntp)# commit</td>
</tr>
</tbody>
</table>

Disabling NTP Services on a Specific Interface

NTP services are disabled on all interfaces by default.

NTP is enabled globally when any NTP commands are entered. You can selectively prevent NTP packets from being received through a specific interface by turning off NTP on a given interface.

**SUMMARY STEPS**

1. configure
2. ntp
3. Use one of the following commands:<br>• no interface type interface-path-id<br>• interface type interface-path-id disable
4. Use one of the following commands:<br>• end
### Disabling NTP Services on a Specific Interface

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure</td>
<td>Enters NTP configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> ntp</td>
<td>Disables NTP services on the specified interface.</td>
</tr>
<tr>

<td></td>
</tr>
<tr>
<td>RP/0/RSP0/CPU0:router(config-ntp)# commit</td>
<td></td>
</tr>
</tbody>
</table>

- **commit**
Configuring the Source IP Address for NTP Packets

By default, the source IP address of an NTP packet sent by the router is the address of the interface through which the NTP packet is sent. Use this procedure to set a different source address.

**Note**
No specific command enables NTP; the first NTP configuration command that you issue enables NTP.

**SUMMARY STEPS**

1. `configure`
2. `ntp`
3. `source type interface-path-id`
4. Use one of the following commands:
   - `end`
   - `commit`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>ntp</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>RP/0/RSP0/CPU0:router(config)# ntp</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>source type interface-path-id</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>RP/0/RSP0/CPU0:router(config-ntp)# source POS 0/0/0/1</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Use one of the following commands:</td>
</tr>
<tr>
<td></td>
<td>• end</td>
</tr>
<tr>
<td></td>
<td>• commit</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>RP/0/RSP0/CPU0:router(config-ntp)# end</td>
</tr>
<tr>
<td></td>
<td>RP/0/RSP0/CPU0:router(config-ntp)# commit</td>
</tr>
</tbody>
</table>

This interface is used for the source address for all packets sent to all destinations. If a source address is to be used for a specific association, use the `source` keyword in the `peer` or `server` command shown in Configuring Poll-Based Associations, on page 246.

Saves configuration changes.

- When you issue the `end` command, the system prompts you to commit changes:

  Uncommitted changes found, commit them before exiting(yes/no/cancel)?
  [cancel]:

  - Entering `yes` saves configuration changes to the running configuration file, exits the configuration session, and returns the router to EXEC mode.
### Configuring Network Time Protocol

#### Configuring the System as an Authoritative NTP Server

You can configure the router to act as an authoritative NTP server, even if the system is not synchronized to an outside time source.

**Note**

No specific command enables NTP; the first NTP configuration command that you issue enables NTP.

### SUMMARY STEPS

1. `configure`
2. `ntp`
3. `master stratum`
4. Use one of the following commands:
   - `end`
   - `commit`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><code>configure</code></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 2</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><code>ntp</code></td>
<td>Enters NTP configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>RP/0/RSP0/CPU0:router(config)# ntp</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 3</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><code>master stratum</code></td>
<td>Makes the router an authoritative NTP server.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
<td></td>
</tr>
<tr>
<td>----------------------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------</td>
<td></td>
</tr>
<tr>
<td>RP/0/RSP0/CPU0:router(config-ntp)# master 9</td>
<td>Use the master command with caution. It is very easy to override valid time sources using this command, especially if a low stratum number is configured. Configuring multiple machines in the same network with the master command can cause instability in time keeping if the machines do not agree on the time.</td>
<td></td>
</tr>
</tbody>
</table>

**Step 4**

Use one of the following commands:

- `end`
- `commit`

**Example:**

RP/0/RSP0/CPU0:router(config-ntp)# end

or

RP/0/RSP0/CPU0:router(config-ntp)# commit

Saves configuration changes.

- When you issue the `end` command, the system prompts you to commit changes:

  Uncommitted changes found, commit them before exiting(yes/no/cancel)?
  [cancel]:

    • Entering **yes** saves configuration changes to the running configuration file, exits the configuration session, and returns the router to EXEC mode.

    • Entering **no** exits the configuration session and returns the router to EXEC mode without committing the configuration changes.

    • Entering **cancel** leaves the router in the current configuration session without exiting or committing the configuration changes.

- Use the **commit** command to save the configuration changes to the running configuration file and remain within the configuration session.

**Configuring NTP-PTP Interworking**

Use this task to configure NTP to use PTP as the time source.

**Before you begin**

PTP must be supported and enabled on the router before NTP-PTP interworking can be configured. If PTP is not enabled, you receive an error message similar to the following when you try to commit the configuration:

RP/0/RSP0/CPU0:router(config)# ntp master primary-reference-clock

RP/0/RSP0/CPU0:router(config)# commit

% Failed to commit one or more configuration items. Please issue 'show configuration failed' from this session to view the errors

RP/0/RSP0/CPU0:router(config)# show configuration failed

[:::]  
nntp
master primary-reference-clock
!!% 'ip-ntp' detected the 'fatal' condition 'PTP is not supported on this platform'
end

Refer to the Configuring PTP, on page 413 module for more information.

SUMMARY STEPS

1. configure
2. ntp
3. master primary-reference-clock
4. Use one of the following commands:
   • end
   • commit

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure</td>
<td></td>
</tr>
<tr>
<td>Step 2 ntp</td>
<td>Enters NTP configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>RP/0/RSP0/CP00:router(config)# ntp</td>
<td></td>
</tr>
<tr>
<td>Step 3 master primary-reference-clock</td>
<td>Specifies PTP to be the NTP time source.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>RP/0/RSP0/CP00:router(config-ntp)# master primary-reference-clock</td>
<td></td>
</tr>
<tr>
<td>Step 4 Use one of the following commands:</td>
<td>Saves configuration changes.</td>
</tr>
<tr>
<td>• end</td>
<td>• When you issue the end command, the system prompts you to commit changes:</td>
</tr>
<tr>
<td>• commit</td>
<td>Uncommitted changes found, commit them before exiting(yes/no/cancel)?</td>
</tr>
<tr>
<td>Example:</td>
<td>[cancel]:</td>
</tr>
<tr>
<td>RP/0/RSP0/CP00:router(config-ntp)# end</td>
<td>• Entering yes saves configuration changes to the running configuration file, exits the configuration session, and returns the router to EXEC mode.</td>
</tr>
<tr>
<td>or</td>
<td>• Entering no exits the configuration session and returns the router to EXEC mode without committing the configuration changes.</td>
</tr>
<tr>
<td>RP/0/RSP0/CP00:router(config-ntp)# commit</td>
<td></td>
</tr>
</tbody>
</table>
### Purpose

**Command or Action**

- Entering `cancel` leaves the router in the current configuration session without exiting or committing the configuration changes.
- Use the `commit` command to save the configuration changes to the running configuration file and remain within the configuration session.

### Updating the Hardware Clock

On devices that have hardware clocks (system calendars), you can configure the hardware clock to be periodically updated from the software clock. This is advisable for devices using NTP, because the time and date on the software clock (set using NTP) is more accurate than the hardware clock. The time setting on the hardware clock has the potential to drift slightly over time.

**Note**

No specific command enables NTP; the first NTP configuration command that you issue enables NTP.

### SUMMARY STEPS

1. `configure`
2. `ntp`
3. `update-calendar`
4. Use one of the following commands:
   - `end`
   - `commit`

### DETAILED STEPS

</tbody>
</table>

* master (synced), # master (unsynced), + selected, - candidate, ~ configured

The following is sample output from the `show ntp status` command:

RP/0/RSP0/CPU0:router# show ntp status

Clock is synchronized, stratum 4, reference is 172.19.69.1
nominal freq is 1000.0000 Hz, actual freq is 999.9988 Hz, precision is 2**26
reference time is C54C131B.9EECF6CA (07:26:19.620 UTC Mon Nov 24 2008)
clock offset is 66.3685 msec, root delay is 7.80 msec
root dispersion is 950.04 msec, peer dispersion is 3.38 msec

Configuration Examples for Implementing NTP

Configuring Poll-Based Associations: Example

The following example shows an NTP configuration in which the router’s system clock is configured to form a peer association with the time server host at IP address 192.168.22.33, and to allow the system clock to be synchronized by time server hosts at IP address 10.0.2.1 and 172.19.69.1:

```
ntp
server 10.0.2.1 minpoll 5 maxpoll 7
peer 192.168.22.33

server 172.19.69.1
```

Configuring Broadcast-Based Associations: Example

The following example shows an NTP client configuration in which interface 0/2/0/0 is configured to receive NTP broadcast packets, and the estimated round-trip delay between an NTP client and an NTP broadcast server is set to 2 microseconds:

```
ntp
interface tengige 0/2/0/0
```
The following example shows an NTP server configuration where interface 0/2/0/2 is configured to be a broadcast server:

```
ntp
  interface tengige 0/2/0/2
    broadcast
```

### Configuring NTP Access Groups: Example

The following example shows a NTP access group configuration where the following access group restrictions are applied:

- Peer restrictions are applied to IP addresses that pass the criteria of the access list named peer-acl.
- Serve restrictions are applied to IP addresses that pass the criteria of access list named serve-acl.
- Serve-only restrictions are applied to IP addresses that pass the criteria of the access list named serve-only-acl.
- Query-only restrictions are applied to IP addresses that pass the criteria of the access list named query-only-acl.

```plaintext
ntp
  peer 10.1.1.1
  peer 10.1.1.1
  peer 10.2.2.2
  peer 10.3.3.3
  peer 10.4.4.4
  peer 10.5.5.5
  peer 10.6.6.6
  peer 10.7.7.7
  peer 10.8.8.8
  access-group peer peer-acl
  access-group serve serve-acl
  access-group serve-only serve-only-acl
  access-group query-only query-only-acl
  exit
ipv4 access-list peer-acl
  10 permit ip host 10.1.1.1 any
  20 permit ip host 10.8.8.8 any
  exit
ipv4 access-list serve-acl
  10 permit ip host 10.4.4.4 any
  20 permit ip host 10.5.5.5 any
  exit
ipv4 access-list query-only-acl
  10 permit ip host 10.2.2.2 any
  20 permit ip host 10.3.3.3 any
  exit
ipv4 access-list serve-only-acl
  10 permit ip host 10.6.6.6 any
  20 permit ip host 10.7.7.7 any
  exit
```
**Configuring NTP Authentication: Example**

The following example shows an NTP authentication configuration. In this example, the following is configured:

- NTP authentication is enabled.
- Two authentication keys are configured (key 2 and key 3).
- The router is configured to allow its software clock to be synchronized with the clock of the peer (or vice versa) at IP address 10.3.32.154 using authentication key 2.
- The router is configured to allow its software clock to be synchronized with the clock by the device at IP address 10.32.154.145 using authentication key 3.
- The router is configured to synchronize only to systems providing authentication key 3 in their NTP packets.

```
nmp
  authenticate
  authentication-key 2 md5 encrypted 06120A2D40031D1008124
  authentication-key 3 md5 encrypted 1311121B074110232621
  trusted-key 3
  server 10.3.32.154 key 3
  peer 10.32.154.145 key 2
```

**Disabling NTP on an Interface: Example**

The following example shows an NTP configuration in which 0/2/0/0 interface is disabled:

```
nmp
  interface tengige 0/2/0/0
  disable
  exit
  authenticate
  authentication-key 2 md5 encrypted 06120A2D40031D1008124
  authentication-key 3 md5 encrypted 1311121B074110232621
  authenticate
  trusted-key 3
  server 10.3.32.154 key 3
  peer 10.32.154.145 key 2
```

**Configuring the Source IP Address for NTP Packets: Example**

The following example shows an NTP configuration in which Ethernet management interface 0/0/CPU0/0 is configured as the source address for NTP packets:

```
nmp
  authenticate
  authentication-key 2 md5 encrypted 06120A2D40031D1008124
  authentication-key 3 md5 encrypted 1311121B074110232621
  authenticate
  trusted-key 3
  server 10.3.32.154 key 3
  peer 10.32.154.145 key 2
  source MgmtEth0/0/CPU0/0
```
Configuring the System as an Authoritative NTP Server: Example

The following example shows a NTP configuration in which the router is configured to use its own NTP master clock to synchronize with peers when an external NTP source becomes unavailable:

```
ntp
    master 6
```

Updating the Hardware Clock: Example

The following example shows an NTP configuration in which the router is configured to update its hardware clock from the software clock at periodic intervals:

```
ntp
    server 10.3.32.154
    update-calendar
```

Configuring NTP server inside VRF interface

This task explains how to configure NTP server inside VRF interface.

**Note**

No specific command enables NTP; the first NTP configuration command that you issue enables NTP.

**SUMMARY STEPS**

1. `configure`
2. `ntp`
3. `vrf vrf-name`
4. `source interface-type interface-instance`
5. Use one of the following commands:
   - `end`
   - `commit`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td><code>ntp</code></td>
<td>Enters NTP configuration mode.</td>
</tr>
<tr>
<td></td>
<td><code>Example:</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
<td></td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
<td></td>
</tr>
<tr>
<td>RP/0/RSP0/CPU0:router(config)# ntp</td>
<td>Specify name of a VRF (VPN- routing and forwarding) instance to configure.</td>
<td></td>
</tr>
</tbody>
</table>

**Step 3**  
**vrf vrf-name**  
**Example:**  
RP/0/RSP0/CPU0:router(config)# ntp vrf Customer_A  

Configures an interface from which the IP source address is taken. This allows IOS-XR to respond to NTP queries on VRF interfaces, in this case the source is BVI.  

**Note**  
This interface is used for the source address for all packets sent to all destinations. If a source address is to be used for a specific association, use the `source` keyword in the `peer` or `server` command shown in Configuring Poll-Based Associations, on page 246.

| Step 4 | source interface-type interface-instance  
**Example:**  
RP/0/RSP0/CPU0:router(config)# ntp vrf Customer_A source bvi 70 | Saves configuration changes. |

**Step 5**  
Use one of the following commands:  
- `end`  
- `commit`  
**Example:**  
RP/0/RSP0/CPU0:router(config-ntp)# end  
or  
RP/0/RSP0/CPU0:router(config-ntp)# commit  

- When you issue the `end` command, the system prompts you to commit changes:  

```
Uncommitted changes found, commit them before exiting(yes/no/cancel)? [cancel]:
```

- Entering `yes` saves configuration changes to the running configuration file, exits the configuration session, and returns the router to EXEC mode.  
- Entering `no` exits the configuration session and returns the router to EXEC mode without committing the configuration changes.  
- Entering `cancel` leaves the router in the current configuration session without exiting or committing the configuration changes.  

- Use the `commit` command to save the configuration changes to the running configuration file and remain within the configuration session.

- Enabling NETCONF over SSH, on page 273
- Additional Reference, on page 275

### The Network Configuration Protocol

The Network Configuration Protocol (Netconf) provides mechanisms to install, manipulate, and delete the configuration of network devices. It uses an Extensible Markup Language (XML)-based data encoding for the configuration data as well as the protocol messages. Yang is a data modeling language used with Netconf.

Netconf uses a simple RPC-based (Remote Procedure Call) mechanism to facilitate communication between a client and a server. The client can be a script or application typically running as part of a network manager. The server is typically a network device.

The configuration of features need not be done the traditional way (using CLIs), the client application (controller) reads the Yang model and communicates with the Netconf server (IOS XR) accordingly.
Netconf Sessions and Operations

A Netconf session is the logical connection between a network configuration application and a network device. A device should be capable of supporting multiple sessions and at least one Netconf session.

Characteristics of a Netconf session:

- Netconf is connection-oriented - SSH is the underlying transport.
- The Netconf client establishes session with the server.
- Netconf sessions are established with the hello message. Features and capabilities are announced.
- Sessions can be terminated using the close or kill messages.

Basic Netconf operations:

- Get configuration <get-config>
- Get all information <get>
- Edit configuration <edit-config>
- Copy configuration <copy-config>

Note: <copy-config> does not support source attribute with “data store” at present.

- <lock>, <unlock>
- <kill-session>
- <close-session>
- Commit configuration <commit>

The Yang data model

Each feature has a defined Yang Model which is synthesized from the schemas. A model is published in a tree format and includes:

- Top level nodes and their subtrees
- Subtrees that augment nodes in other yang models

Example: The aaa Yang model
module: Cisco-IOS-XR-aaa-lib-cfg
  +--rw aaa
    +--rw accountings
      | +--rw accounting* [type listname]
      |    | +--rw type xr:Cisco-ios-xr-string
      |    | +--rw listname xr:Cisco-ios-xr-string
      |    | +--rw rp-failover? Aaa-accounting-rp-failover
      |    | +--rw broadcast? Aaa-accounting-broadcast
      |    | +--rw type-xr? Aaa-accounting
      |    | +--rw method* Aaa-method
      |    | +--rw server-group-name* string
Advantages of using the Yang model are:

- Yang supports programmatic interfaces.
- Yang supports simplified network management applications.
- Yang supports interoperability that provides a standard way to model management data.

### Netconf and Yang

The workflow displayed here, will help the user to understand how Netconf-Yang can configure and control the network with minimal user intervention. The required components:

- Cisco Router (ASR9000 series or CRS) with Netconf capability
- Netconf Client Application with connection to the router

<table>
<thead>
<tr>
<th>S. No.</th>
<th>Device / component</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Cisco router (ASR 9000 or CRS router)</td>
<td>Login/ access the router.</td>
</tr>
</tbody>
</table>
| 2      | Cisco router | Prerequisites for enabling Netconf.  
  - k9sec pie must be installed.  
  - Crypto keys must be generated. |
| 3      | Cisco router | Enable Netconf agent. Use the `netconf-yang agent ssh` and `ssh server netconf` command. The port can be selected. By default, it is set as 830. |
| 4      | Cisco router | Yang models are a part of the software image. The models can be retrieved from the router, using the `<get-schema>` operation. |
Installs and processes the Yang models.
The client can offer a list of supported yang models; else the user will have to browse and locate the required yang file.

There is a yang model file for each configuration module; for instance if the user wants to configure CDP, the relevant yang model is Cisco-IOS-XR-cdp-cfg

Note: Refer the table which lists all the supported yang models. Supported Yang Models, on page 272

Sends Netconf operation request over SSH to the router. A configuration request could include Yang-based XML data to the router. Currently, SSH is the only supported transport method.

Understands the Yang-based XML data and the network is configured accordingly (in case of configuration request from the client).

The interactions between the client and the router happens until the network is configured as desired.

### Supported Yang Models

The Yang models can be downloaded from a prescribed location (ftp server) or can also be retrieved directly from the router using the get-schema operation.

For a feature, separate Yang models are available for configuring the feature and to get operational statistics (show commands). The `-cfg.yang` suffix denotes configuration and `-oper*.yang` is for operational data statistics. In some cases, `-oper` is followed by `-sub`, indicating that a submodule(s) is available.

For a list of supported Yang models, see [https://github.com/YangModels/yang/tree/master/vendor/cisco/xr](https://github.com/YangModels/yang/tree/master/vendor/cisco/xr)

### Denial of Services Defence for Netconf-Yang

In case of a DoS (Denial of Service) attack on Netconf, wherein, Netconf receives numerous requests in a short span of time, the router may become irresponsive if Netconf consumes most of the bandwidth or CPU processing time. This can be prevented, by limiting the traffic directed at the Netconf agent. This is achieved using the `netconf-yang agent rate-limit` and `netconf-yang agent session` commands.

If rate-limit is set, the Netconf processor measures the incoming traffic from the SSH server. If the incoming traffic exceeds the set rate-limit, the packets are dropped.

If session-limit is set, the Netconf processor checks for the number of open sessions. If the number of current sessions is greater than or equal to, the set limit, no new sessions are opened.
Session idle-timeout and absolute-timeout also prevent DoS attacks. The Netconf processor closes the sessions, even without user input or intervention, as soon as the time out session is greater than or equal to the set time limit.

The relevant commands are discussed in detail, in the System Security Command Reference for Cisco ASR 9000 Series Routers.

## Dynamic Loading of Operational Yang Models

Netconf is enhanced to pre-load only the configurational yang models in memory, when it starts. The operational yang models are loaded into memory only when a request is issued. This helps reduce consumption of the RAM memory.

### Enabling NETCONF over SSH

This task enables NETCONF over SSH. SSH is currently the only supported transport method.

If the client supports, Netconf over ssh can utilize the multi-channeling capabilities of IOS XR ssh server. For additional details about Multi-channeling in SSH, see Implementing Secure Shell in System Security Configuration Guide.

**Prerequisites:**
- k9sec pie must be installed, otherwise the port configuration for the netconf ssh server cannot be completed. (The Netconf subsystem for SSH, as well as, SSH cannot be configured without the k9sec pie.)
- Crypto keys must be generated prior to this configuration.
- The Netconf-YANG feature is packaged in the mgbl pie, which must be installed before enabling the Netconf-YANG agent.

**SUMMARY STEPS**

1. configure
2. netconf-yang agent ssh
3. ssh server netconf [vrf vrf-name [ipv4 access-list ipv4 access list name] [ipv6 access-list ipv6 access list name]]
4. ssh server netconf port port-number

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>

<tr>
<td><strong>Step 2</strong> netconf-yang agent ssh</td>
<td>Enables NETCONF agent over SSH connection. After NETCONF is enabled, the Yang model in the controller, can configure the relevant models.</td>
</tr>
<tr>
<td>Example: RP/0/RSP0/CPU0:router (config) # netconf agent ssh</td>
<td>Note: The Yang models can be retrieved from the router via NETCONF &lt;get-schema&gt; operation.</td>
</tr>
</tbody>
</table>

System Management Configuration Guide for Cisco ASR 9000 Series Routers, IOS XR Release 6.2.x
### Command or Action

**Step 3**

`ssh server netconf [vrf vrf-name [ipv4 access-list /ipv4 access list name] [ipv6 access-list /ipv6 access list name]]`

**Example:**

```
RP/0/RSP0/CPU0:router (config) # ssh server netconf vrf netconfvrf ipv4 access-list InternetFilter
```

**Purpose**

Brings up the netconf subsystem support with SSH server using a specified VRF of up to 32 characters. If no VRF is specified, the default VRF is used. To stop the SSH server from receiving any further connections for the specified VRF, use the `no` form of this command.

Optionally ACLs for IPv4 and IPv6 can be used to restrict access to the netconf subsystem of the ssh server before the port is opened.

**Note**

The netconf subsystem support with SSH server can be configured for use with multiple VRFs.

**Step 4**

`ssh server netconf port port-number`

**Example:**

```
RP/0/RSP0/CPU0:router (config) # ssh server netconf port 830
```

**Purpose**

Configures a port for the netconf ssh server. This command is optional. If no port is specified, port 830 is uses by default.

**Note**

830 is the IANA-assigned TCP port for NETCONF over SSH, but it can be changed using this command.

---

**What to do next**

The `show netconf-yang statistics` command and `show netconf-yang clients` command can be used to verify the configuration details of the netconf agent.

The `clear netconf-yang agent session` command clears the specified Netconf session (on the Netconf server side).

### Examples: Netconf over SSH

This section illustrates some examples relevant to Netconf:

**Enabling netconf-yang for ssh transport and netconf subsystem for default vrf with default port (830)**

```
config
netconf-yang agent ssh
ssh server netconf vrf default

Enabling netconf-yang for ssh transport and netconf subsystem for vrf green and vrf red with netconf port (831)

```

```
config
netconf-yang agent ssh

Enabling netconf-yang for ssh transport and netconf subsystem for vrf green and vrf red with netconf port (831)

```

```
```
Show command outputs

```
show netconf-yang statistics

CHAPTER 16

Configuring Disk Mirroring

This module describes the process to configure disk mirroring in Cisco IOS XR software.

For complete descriptions of the commands listed in this module, see Related Documents, on page 285. To locate documentation for other commands that might appear in the course of performing a configuration task, search online in Cisco ASR 9000 Series Aggregation Services Router Commands Master List.

Table 36: Feature History for Disk Mirroring for Cisco IOS XR Software

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>Disk mirroring was introduced.</td>
</tr>
<tr>
<td>Release 3.9.0</td>
<td>No modification.</td>
</tr>
</tbody>
</table>

This module contains the following topics:

- Disk Mirroring Prerequisites, on page 277
- Information About Disk Mirroring, on page 278
- How to Enable Disk Mirroring, on page 279
- Configuration Examples for Enabling Disk Mirroring, on page 284
- Additional References, on page 285

Disk Mirroring Prerequisites

Before enabling disk mirroring, the following conditions must be met:

- You must be in a user group associated with a task group that includes the proper task IDs. The command reference guides include the task IDs required for each command. If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

- The secondary storage device specified for the mirroring must be installed in the same node as the primary boot device. The supported storage devices are disk0: and disk1:.

- The secondary storage device must be the same size or larger than the designated primary storage device.

- The secondary storage device must be partitioned.
The primary partition on the secondary storage device must be large enough to contain all data on the primary boot device. This can be an issue if the primary boot device has not yet been partitioned. For example, in the situation where both the primary boot device and the secondary storage device are 1 GB in size, the primary boot device contains 950 MB of data, and the secondary storage device is already partitioned to 800 MB in the primary partition and 200 MB in the secondary partition. In such a case, the 950 MB of data from the primary boot device does not fit on the secondary storage device because of the partition. Such a configuration is rejected and an error is displayed. You need to replace the secondary storage device with a higher capacity device. For information about disk partition sizes, see Related Topics.

Note

Although compactflash: can be used as the secondary device on a Performance Route Processor (PRP–2), there is an issue with the ROM Monitor not being able to boot the minimum boot image (MBI) from the secondary device if the device is not disk0: or disk1:. In such a situation, you would need to go into ROMMON mode and boot the PRP-2 manually using the MBI on the compactflash:.

Related Topics

Information About Disk Mirroring, on page 278

Information About Disk Mirroring

The route switch processor (RSP) card has a primary storage device that is used to store installation packages and configuration files. This primary storage device is referred to as the primary boot device and is essential for booting the RSP and its normal operation.

Disk mirroring replicates the critical data on the primary boot device onto another storage device on the same RSP, henceforth referred to as the secondary device. If the primary boot device fails, applications continue to be serviced transparently by the secondary device, thereby avoiding a switchover to the standby RSP. The failed primary storage device can be replaced or repaired without disruption of service.

Disk mirroring should only mirror critical data on the primary boot device onto a secondary storage device and not any noncritical data such as logging data. To separate critical data from noncritical data, the disk devices need to be partitioned. Disk0: is partitioned to disk0: and disk0a:; disk1: is partitioned to disk1: and disk1a:. Disk0: and disk1: are used for critical data, whereas disk0a: and disk1a: are used for logging data and other noncritical data. Before you can configure disk mirroring on the RSP, you must have partitioned the secondary storage device. The sizes of disk partitions are related to the total disk size, and are provided in Table 37: Size of Disk Partitions in Relation to Size of Disk, on page 278.

How to Enable Disk Mirroring

The tasks in this section describe how to enable and manage disk mirroring.

Enabling Disk Mirroring

Complete the following instructions to enable disk mirroring. After disk mirroring is configured, if there is a fault on the primary boot drive or it cannot be accessed for any reason, control is automatically transferred to the secondary storage device.

**SUMMARY STEPS**

1. `format secondary-device partition [ location node-id ]`
2. Remove any noncritical data from the primary boot device.
3. `configure`
4. `mirror location node-id Primary-device Secondary-device`
5. `commit`
6. `show mirror [ location node-id ]`
7. `mirror verify location node-id`

<table>

<td><code>RP/0/RSP0/CPU0:router(config)# mirror location 0/rsp0/cpu0 disk0:disk1:</code></td>
<td>If the primary boot device is not partitioned, the following occurs:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- The contents of the primary device are replicated to the secondary device</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Control of the mirroring server switches to the secondary storage device.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- The primary device is partitioned.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Data is replicated back to the primary boot device.</td>
</tr>
</tbody>
</table>
Replacing the Secondary Mirroring Device

Follow this procedure if you need to replace the secondary boot device used in the disk mirroring process.

**SUMMARY STEPS**

1. `show mirror [location node-id]`
2. `mirror pause [location node-id]`
3. `show mirror [location node-id]`
4. `unmount secondary-device [location node-id]`
5. Remove the device and insert a new device.
6. `format secondary-device partition [location node-id]`
7. `show media [location node-id]`
8. `mirror resume [location node-id]`
9. `show mirror [location node-id]`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> show mirror [location node-id]</td>
<td>Verifies that mirroring is active. In the output, the <em>Current Mirroring State</em> should be redundant.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>RP/0/RSP0/CPU0:router# show mirror</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> mirror pause [location node-id]</td>
<td>Temporarily pauses disk mirroring.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>RP/0/RSP0/CPU0:router# mirror pause</td>
<td></td>
</tr>
<tr>

<td></td>
</tr>
<tr>
<td>RP/0/RSP0/CPU0:router# show mirror</td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

**Step 4**

*Unmounts the secondary device.*

**Example:**

RP/0/RSP0/CPU0:router# unmount disk1:

**Step 5**

*Remove the device and insert a new device.*

**Step 6**

*Formats the device.*

**Example:**

RP/0/RSP0/CPU0:router# format disk1: partition

**Step 7**

*Verifies that the device is formatted. The output should display the device that you formatted.*

**Example:**

RP/0/RSP0/CPU0:router# show media

**Step 8**

*Resumes mirroring.*

**Example:**

RP/0/RSP0/CPU0:router# mirror resume

**Step 9**

*Verifies that mirroring has restarted. In the output, the Current Mirroring State should be Syncing. It can take 15 to 30 minutes for the mirroring process to complete. The exact time depends on the number of packages or files on the boot device. When the mirroring is complete, the Current Mirroring State should be Redundant.*

**Example:**

RP/0/RSP0/CPU0:router# show mirror

---

### Replacing the Primary Mirroring Device

In the event that your primary boot disk is defective and you need to replace it while disk mirroring is enabled, perform this task.

**SUMMARY STEPS**

1. show mirror [location node-id]
2. configure
3. mirror location node-id Primary-device Secondary-device
4. commit
5. show mirror [location node-id]
6. mirror pause [location node-id]
7. show mirror
8. unmount secondary-device [location node-id]
9. Remove the device and insert a new device.
10. `show media [location node-id]`
11. (Optional) `format secondary-device partition [location node-id]`
12. `mirror resume [location node-id]`
13. `show mirror [location node-id]`
14. `configure`
15. `mirror location node-id Primary-device Secondary-device`
16. `show mirror [location node-id]`

**DETAILED STEPS**

<table>

<tr>
<td><strong>Example:</strong></td>
<td><code>RP/0/RSP0/CPU0:router# show mirror</code></td>
</tr>
<tr>
<td><strong>Step 8</strong> <code>unmount secondary-device [location node-id]</code></td>
<td>Unmounts the secondary device which is the device that you want to replace. Initially, this was the primary device.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>RP/0/RSP0/CPU0:router# unmount disk1:</code></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td>Remove the device and insert a new device.</td>
</tr>
</tbody>
</table>
| **Step 10** | Verifies that the new disk is partitioned. You should see that the new device is mounted. If the new device is not partitioned, format the device as indicated in the next step.  
  **Example:**  
  `RP/0/RSP0/CPU0:router# show media` |
| **Step 11** | (Optional) Formats the device. You only need to perform this step if the new device is not partitioned.  
  **Example:**  
  `RP/0/RSP0/CPU0:router# format disk1: partition` |
| **Step 12** | Resumes mirroring.  
  **Example:**  
  `RP/0/RSP0/CPU0:router# mirror resume` |
| **Step 13** | Verifies that mirroring has restarted. In the output, the *Current Mirroring State* should be *Syncing*. It can take 15 to 30 minutes for the mirroring process to complete. The exact time depends on the number of packages or files on the boot device. When the mirroring is complete, the *Current Mirroring State* should be *Redundant*.  
  **Example:**  
  `RP/0/RSP0/CPU0:router# show mirror` |
| **Step 14** | Swaps the device roles back so that the newly inserted device becomes the primary device. |
| **Step 15** |  
  **Example:**  
  `RP/0/RSP0/CPU0:router(config)# mirror location 0/RSP0 /CPU0:disk0:disk1:` |
| **Step 16** | Verifies that the new device is now the primary device.  
  **Example:**  
  `RP/0/RSP0/CPU0:router# show mirror` |
Configuration Examples for Enabling Disk Mirroring

Enabling Disk Mirroring: Example

In the following example, disk mirroring is enabled on a router:

```
format disk1: partition

This operation will destroy all data on "disk1:" and partition device. Continue? [confirm] y

Device partition disk1: is now formatted and is available for use.
```

```
configure
  mirror location 0/0/cpu0 disk0:disk1:
  commit
```

show mirror Command Output: Example

```
RP/0/RSP0/CPU0:router(admin)# show mirror location all

Tue Dec 7 13:02:26.520 PST
Mirror Information for 0/RSP0/CPU0.

Mirroring Enabled
  Configured Primary: disk0:
  Configured Secondary: disk1:

Current Mirroring State: Redundant
  Current Physical Primary: disk0:
  Current Physical Secondary: disk1:

Mirroring Logical Device: disk0:
  Mirroring Logical Device2: disk1:
```

```

CHAPTER 17

Configuring Open Flow Agent

OpenFlow is a specification from the Open Networking Foundation (ONF) that defines a flow-based forwarding infrastructure (L2-L4 Ethernet switch model) and a standardized application programmatic interface (protocol definition) to learn capabilities, add and remove flow control entries and request statistics. OpenFlow allows a controller to direct the forwarding functions of a switch through a secure channel.

This module has details about the Open Flow Agent, relevant concepts and configurations.

OpenFlow

OpenFlow is an open standard to communicate between controllers, which are running applications and network elements (such as, routers and switches).

For details regarding OpenFlow, please refer the OpenFlow chapter in the System Management Configuration Guide for Cisco ASR 9000 Series Routers.

An overview of OFA

OpenFlow is a specification from the Open Networking Foundation (ONF) that defines a flow-based forwarding infrastructure (L2-L4 Ethernet switch model) and a standardized application programmatic interface (protocol definition) to learn capabilities, add and remove flow control entries and request statistics. OpenFlow allows a controller to direct the forwarding functions of a switch through a secure channel. Local device configuration is out of scope of the OpenFlow protocol. OpenFlow essentially provides a forwarding instruction set, allowing applications to directly program any-to-any routing and switching, with header field rewrite. New matches and actions can be applied to packets in arbitrary unconstrained fashion, allowing routing and switching on the new criteria. Routers and switches embed the fast packet forwarding and the high level routing decisions together into their software on the same device. With only a few exceptions based on user configuration, all routing and switching decisions are made by the built-in protocols and control plane logic that reside on the switch.

Prerequisites for OpenFlow Agent

The following prerequisites are required to use the OpenFlow agent on the platforms supporting IOS-XR:

- Special build of the Release 5.1.x software that has the OpenFlow functionality is required.
- The Enhanced Ethernet line card for the Cisco ASR 9000 Series Router is required for the OpenFlow agent feature.
- Any controller with version 1.1 or 1.3 is required (example, POX, ODL).
- The asr9k-k9sec Package Installation Envelope (PIE) must be present. The asr9k-mpls PIE is required for support on MPLS core (such as, PWHE).

Restrictions for OpenFlow Agent

- Same interface cannot be added to more than one logical open flow switch.
- No support for output as an action for layer3 openflow logical switch (such as pipeline131, 132).
- Only layer 3 interface support for netflow sampling statistics.

Advantages

The advantages with Open Flow Agent are:

- increases network scalability
- reduces network complexity
- allows greater application control
About OpenFlow

The OpenFlow protocol is based on the concept of an Ethernet switch, with an internal flow-table and standardized interface to allow traffic flows on a switch to be added or removed. The OpenFlow protocol defines the communications channel between the OpenFlow agent and the OpenFlow controller. In an OpenFlow network, the OpenFlow Agent exists on the switch and the OpenFlow controller exists on a server, which is external to the switch. Any network management is either part of the controller or accomplished through the controller.

In the Cisco OpenFlow scheme, the physical switch is divided into multiple logical switches by using the CLI to configure the connection to the controller for each logical switch and enable interfaces for each logical switch. The Openflow Agent software manages these logical switches.

The following figure shows the Cisco implementation of the OpenFlow network.

OpenFlow Mode for ASR9000

OpenFlow for the Cisco ASR 9000 Series router functions in the Integrated Hybrid mode. In this mode, both Openflow and normal switching and routing (for layer 3) operations such as L2 ethernet switching, L3 routing, etc are supported. Packets processed as the Openflow forwarding path can be processed as a normal forwarding path.

OpenFlow Table Types

An OpenFlow flow table consists of a set of flows. Each flow contains a set of matches and actions. A table has a set of capabilities in terms of supported matches and actions. Just like a policy-map, a table can be applied to a set of targets but only in the ingress direction. Hence, OpenFlow matches and actions are applied to the incoming traffic only.

Note

A set of ordered tables is referred to as a pipeline. A pipeline may contain one or more ordered tables. An OpenFlow pipeline of an OpenFlow switch on ASR9K supports only one flow table.
Table 39: OpenFlow Table Types

<table>
<thead>
<tr>
<th>Table Type</th>
<th>Pipeline</th>
<th>Supported Interfaces</th>
<th>Description</th>
</tr>
</thead>
</table>
| L2         | 129      | Bridge-domain, Gigabit ethernet, Bundle, Bundle-subinterfaces, PWHE-subinterfaces | • Supports L2 header matches.  
• Supports L2 actions.  
• Can be applied to the ingress L2 interfaces. |
| L2_L3      | 130      | Bridge-domain, Gigabit ethernet, Bundle, Bundle-subinterfaces, PWHE-subinterfaces | • Supports L2 and L3 (IPv4/IPv6) header matches.  
• Supports L2 actions.  
• Can be applied to the ingress L2 interfaces. |
| L3_V4      | 131      | VRF and global interfaces, BV1 (ipv4 only), Bridge-domain, Gigabit ethernet, Bundle, Bundle-subinterfaces | • Supports L3 (IPv4) header matches.  
• Supports L3 (IPv4) actions.  
• Can be applied to the ingress L3 interfaces. |
| L3_DS      | 132      | VRF and global interfaces, BV1, Bridge-domain, Gigabit ethernet, Bundle, Bundle-subinterfaces | • Supports L2 and L3 (IPv4/IPv6) header matches.  
• Supports L3 (IPv4/IPv6) actions.  
• Can be applied to the ingress L3 interfaces. |

- L2 Table--Supports L2 header matches and has L2 actions only. This table type can be applied to the ingress of an L2 interface.
- L2_L3 Table--Supports L2 and L3 header matches and has L2 actions only. Match parameters can be IPv4 or IPv6 type. This table type can be applied to the ingress of an L2 interface.
- L3_V4 Table--Supports L3 IPv4 header matches and has L3 actions only. This table type can be applied to the ingress of L3 interfaces.
- L3_DS(Dual Stack) Table--Supports L2 and L3 IPv4 and IPv6 (Dual Stack) matches and has L3 actions only. This table type can be applied to the ingress of L3 interfaces.

OpenFlow Agent Packet In and Out Feature

The Packet In and Out feature allows a flow to be programmed by the OpenFlow Agent logical switch so that packets are sent to the Controller. The special output port: `OFP_CONTROLLER` is specified for the flow action.

The Packet In and Out feature enables support for the OpenFlow output-to-port action. The output action tells the OpenFlow Agent to send all packets matching the flow to a specific port.
OpenFlow Agent with NetFlow Collection and Analytics

Applications can be provided with on-demand analytics by using the OpenFlow protocol with NetFlow. NetFlow provides statistics on packets flowing through the router, and is the standard for acquiring IP operational data from IP networks.

The following NetFlow maps must be configured:

- **Flow Exporter Map**—Specifies the destination IP address of the NetFlow collector where the NetFlow Version 9 packets are sent.
- **Flow Monitor Map**—Specifies the profile of the NetFlow producer, including the timeout values of active and inactive timers, size of the NetFlow cache and the exporter to be used.
- **Sampler Map**—Specifies how often Network Processor (NPU) needs to sample incoming and outgoing packets and create flow-packets to punt to the Line Card (LC) Central Processing Unit (CPU).

The following parameters must be specified on the OpenFlow Agent logical switch:

- Interface associated with the OpenFlow Agent logical switch that is enabled for NetFlow.
- Flow Monitor Map
- Sampler Map
- Controller IP address

*Figure 9: OpenFlow Agent and NetFlow collection and analytics workflow*

1. The help desk application tells the analytics application that Customer 1 has a problem.
2. The analytics application determines that it requires more information and requests more network data about Customer 1 from the Controller.
3. The Controller instructs the OpenFlow logical switch on the router to look for Customer 1 packets and generate and export NetFlow data based on Customer 1 packet flows.
4. The OpenFlow Agent logical switch exports NetFlow packets to the analytics application where they are processed.
5. The analytics application informs the help desk application of the problem.

**OFA on Cisco Routers and Switches**

OpenFlow SDN Applications expect network elements to speak standard OpenFlow protocol and to implement standard OpenFlow switch model. The OpenFlow Agent as a local process provides:

- OF protocol stack
- OF switch model derived from disparate Cisco software and hardware
- Version, model and feature negotiation
- Local aggregation of state and statistics
- Native dedicated CLI and troubleshooting
- High Availability

**Functional Components**

OpenFlow supports the configuration of multiple controllers for a logical switch. The Openflow agent can connect to a single controller or up to 8 controllers. It creates connections to all configured controllers to provide the controllers access to the OpenFlow logical switch flow tables and interfaces. It will receive flow entries from the controllers and report interface and flow status and statistics to the controllers.

The set nexthop action for layer 3 matches is implemented through a Cisco extension to the OpenFlow (1.0 and 1.3) protocol.

**OFA on ASR 9000 series routers**

The OpenFlow Agent supports multiple logical switch instances on ASR9K platform, with each logical switch managing a set of physical/logical interfaces, an L2 bridge domain or a VRF. Each logical switch may have one openflow connection to a single controller, or multiple connects for reliability, each to a different controller. The openflow connection to the controller uses standard TLS or plain TCP.

When the logical switch initialises a connection to the configured controller, the signaling version for the agent-controller connection is negotiated based on the bitmap version supported on both- agent and controller sides. When a logical switch starts up for the first time or at the time a logical switch loses contact with all controllers, it operates in either fail-secure mode (with default-set rule) or fail-standalone mode depending on the CLI of fail-standalone (on or off). The default for configuration is in the fail-secure mode.

**OpenFlow Matches**

Matches are supported on ingress port and various packet headers depending upon the packet type. Flows can have priorities. Hence, the highest priority flow entry that matches the packet gets selected.

Following table shows the list of matches supported on ASR9K for various table types:
<table>
<thead>

OpenFlow Actions

Packet forwarding and packet modification types of actions are supported. The lists of actions are always immediately applied to the packet.

• Only “Apply-actions” instruction (OFPIT_APPLY_ACTIONS) of OpenFlow 1.3 is supported.
• Pipeline processing instructions that allow packets to be sent to subsequent tables for further processing are not supported in this release.
• Group tables and Meter tables are not supported.

Following table shows the list of action types supported on ASR9K for various table types.

<table>
<thead>
<tr>

<td>Pop the outer PBB service tag</td>
</tr>
</tbody>
</table>

**Cisco Extension Actions**

The set ipv4 or set ipv6 nexthop actions are used to redirect an ipv4 or ipv6 packet to the specified nexthop address, instead of using the destination address in the packet. This provides ABF (ACL Based Forwarding) kind of functionality using OpenFlow. However, VRF support and nexthop tracking as supported by CLI based ABF feature is not supported in this release.
The set fcid (Forward Class ID) action can be used to support PBTS (Policy Based Tunnel Selection) functionality using OpenFlow.

Following table shows the list of actions added by Cisco to support some extra features on ASR9K.

<table>
<thead>
<tr>
<th>Cisco proprietary actions</th>

</table>
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure</td>
<td></td>
</tr>
</tbody>
</table>
| **Step 2** openflow  
Example:  
\`RP/0/RSP0/CPU0:router(config)# openflow\` | Enters the openflow configuration mode. |
| **Step 3** switch switch -id pipeline pipeline-number  
Example:  
\`RP/0/RSP0/CPU0:router(config-openflow)# switch 1 pipeline 130\` | Enters the logical switch configuration mode. For L2-L3 switch, the pipeline number is 130. |
| **Step 4** tls trust-point local local-tp-name remote remote-tp-name  
Example:  
\`RP/0/RSP0/CPU0:router(config-openflow-switch)# tls trust-point local tp1 remote tp2\` | Enters the TLS configuration mode. Configures the local and remote trustpoints. |
| **Step 5** bridge-group SDN-id bridge-domain switch-id  
Example:  
\`RP/0/RSP0/CPU0:router (config-openflow) # bridge-group SDN-1 bridge-domain of2\` | Configures a bridge-domain for the openflow switch. |
| **Step 6** controller ipv4 ip-address security [tls | none]  
Example:  
\`RP/0/RSP0/CPU0:router(config-openflow-switch)# controller ipv4 5.0.1.1 port 6633 security tls\` | Configures the Openflow controller for the logical switch.  
Configures the Openflow controller for the logical switch.  
Once the controller command is entered, a connection to the OpenFlow controller is started for the logical switch.  
The tls keyword enables the TLS connection, whereas the none keyword enables the TCP connection.  
**Note** The OpenFlow Agent can connect to a single Controller or up to 8 Controllers. Repeat this step if you need to configure additional Controllers. An openflow switch can communicate to multiple controllers (the support for high-availability is a controller functionality). |
| **Step 7** commit  
Example:  
\`RP/0/RSP0/CPU0:router(logical-switch)# commit\` | Adds the Layer 2 logical switch configuration for the OpenFlow agent to the running configuration. |
| **Step 8** commit | |
What to do next

Repeat these steps to configure another logical switch for the OpenFlow Agent.

Configuring a Layer 3_VRF Logical Switch for the OpenFlow Agent

SUMMARY STEPS

1. configure
2. openflow
3. switch switch-id pipeline pipeline-number
4. vrf IPv4
5. tls trust-point local local-tp-name remote remote-tp-name
6. controller ipv4 ip-address security [tls | none]
7. commit
8. commit

DETAILED STEPS

<table>
<thead>

</tbody>
</table>
What to do next

Go to the “Associating the OpenFlow Agent Logical Switch with NetFlow” section to complete the second part of this configuration.

Configuration Examples: Openflow

Attaching a bridge domain to an Openflow Switch: Examples

- Attaching a L2-only Openflow switch

```openflow
switch 1 pipeline 129
  tls trust-point local tp1 remote tp1
  bridge-group SDN-2 bridge-domain OF-2
  controller ipv4 5.0.1.200 port 6653 security tls
```

- Attaching a L2_L3 Openflow switch

```openflow
switch 1 pipeline 130
  tls trust-point local tp1 remote tp1
  bridge-group SDN-2 bridge-domain OF-2
  controller ipv4 5.0.1.200 port 6653 security tls
```

- L3_V4 switch can be attached either to a VRF or directly to layer 3 interfaces under global VRF. In case of VRF, all the interfaces in that VRF become part of the OpenFlow switch.

```openflow
switch l1 pipeline 131
  vrf IPv4
  controller ipv4 5.0.1.200 port 6653 security none
```

- L3_DS switch can be attached either to a VRF or directly to layer 3 interfaces under global VRF.

```openflow
switch l2 pipeline 132
  vrf IPv4
  controller ipv4 5.0.1.200 port 6653 security none
```

OpenFlowAgentwithNetFlowCollectionandAnalyticsConfiguration:Example

The following example describes the NetFlow exporter map configuration for the OpenFlow logical switch.

```
Device> enable
Device# configure terminal
Device(config)# flow exporter-map fem
Device(config-fem)# destination 10.0.1.2
Device(config-fem)# version v9
```
The following example describes the NetFlow monitor map configuration for the OpenFlow logical switch.

```
Device(config)# flow monitor-map mmap
Device(config-fmm)# record ipv4
Device(config-fmm)# exporter fmap
Device(config-fmm)# cache entries 4096
Device(config-fmm)# commit
Device(config-fmm)# exit
```

The following example describes the NetFlow sampler map configuration for the OpenFlow logical switch.

```
Device(config)# sampler-map
Device(config-sm)# random 1 out-of 65535
Device(config-sm)# commit
Device(config-sm)# exit
```

The following example describes how the OpenFlow Agent logical switch is configured so that the NetFlow collection and analytics are associated with it.

```
Device(config)# openflow switch 100 netflow
Device(logical-switch)# flow monitor mmap sampler smap
Device(logical-switch)# interface GigabitEthernet0/1/0/6
Router(logical-switch)# controller 10.0.1.2 port 6633
Device(logical-switch)# commit
Device(logical-switch)# end
```

The following example describes `show` command output for an OpenFlow Agent logical switch that is configured with NetFlow collection and analytics.

```
Device# show openflow switch 100
Fri Jan 25 14:29:21.078 UTC
Logical Switch Context
  Id: 100
  Switch type: Netflow
  Layer: NONE
  Signal version: Openflow 1.0
  Data plane: secure
  Fallback: normal
  Config state: no-shutdown
  Working state: enabled
  TLS version: NONE
  TLS private key: none:none
  TLS private key file: NONE
  TLS certificate file: NONE
  Netflow Monitor: mmap
  Netflow Sampler: smap
  Loopback i/f: <none>
  Loopback addr: <none>
  Interfaces:
    GigabitEthernet0/1/0/6

Device# show openflow switch 100 flows
```
Fri Jan 25 14:29:24.787 UTC

Logical Openflow Switch [100]:
NXST_FLOW reply (xid=0x0):
  cookie=0x0, duration=204.729s, table=0, n_packets=0, n_bytes=0, priority=500 actions=netflow

Switch flow count: 1

Device# show openflow switch 100 controllers
Fri Jan 25 14:29:28.660 UTC

Logical Openflow Switch [100]:
  Controller [tcp:10.0.1.2:6633]
    role : Other
    connected : Yes
    state : ACTIVE
    sec_since_connect : 487

Use case for Layer2

The Scenario: Enterprise Data Center needs to perform data backup to multiple other backup sites based on the Traffic flow. The Main DC is in Vlan 100 and Backup sites are at VLAN 1000,1001,1002. These Sites are interconnected through L2VPN.

The Solution: Openflow, we can match any Layer 2 header field (in this example we have taken priority bits) and steer the traffic to go on any L2 interconnect and also rewrite the VLANs appropriately.

Use case for Layer3

The Scenario: Three different flows from 3 different sites connected to PE1 are trying to send 350 mbps of traffic each to PE2. The bandwidth of the shortest link, Path-2 (between PE1 and PE2) is only 1 Gigabit. Hence Path-2 gets congested as soon as the third site begins to send traffic.

The Solution: Openflow controller can be used to install rules on PE1:

- Match on Flow 1 (destined to Video server) and redirect traffic to Path-2
- Match on Flow 2 (destined to Web server) and redirect traffic to Path-1
- Match on Flow 3 (destined to File transfer server) and redirect traffic to Path-3

The Inference: Effectively utilizing the network bandwidth by redirecting destination specific traffic using OpenFlow rules.
CHAPTER 18

Configuring Call Home

This module describes the configuring of the Call Home feature.

Table 40: Feature History for Configuring Call Home

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>

</table>

This model contains the following topics:

- About Call Home, on page 313
- Configuring Call Home, on page 317
- Configuring Contact Information, on page 318
- Configuring and Activating Destination Profiles, on page 319
- Associating an Alert Group with a Destination Profile, on page 321
- Configuring Email, on page 324
- Enabling Call Home, on page 325
- Configuring Smart Call Home (single command), on page 326
- Configuring Call Home Data Privacy, on page 326
- Configuring Syslog Throttling, on page 327
- Enabling AAA Authorization, on page 327
- Sending Call Home Alert group Messages Manually, on page 328
- Manually sending command output message for a Command List, on page 329
- Configuring a HTTP Proxy Server, on page 330
- Configuring Snapshot alert group, on page 331
- Configuring Anonymous Reporting, on page 332
- Configuring Call Home to use VRF, on page 332
- Configuring Source Interface, on page 333

About Call Home

Call Home provides an email and http/https based notification for critical system policies. A range of message formats are available for compatibility with pager services or XML-based automated parsing applications. You can use this feature to page a network support engineer, email a Network Operations Center, or use Cisco
Smart Call Home services to generate a case with the Technical Assistance Center. The Call Home feature can deliver alert messages containing information about diagnostics and environmental faults and events.

The Call Home feature can deliver alerts to multiple recipients, referred to as Call Home destination profiles. Each profile includes configurable message formats and content categories. A predefined destination is provided for sending alerts to the Cisco TAC, but you also can define your own destination profiles. When you configure Call Home to send messages, the appropriate CLI show command is executed and the command output is attached to the message. Call Home messages are delivered in the following formats:

- Short text format which provides a one or two line description of the fault that is suitable for pagers or printed reports.
- Full text format which provides fully formatted message with detailed information that is suitable for human reading.

### Destination Profiles

A destination profile includes the following information:

- One or more alert groups—The group of alerts that trigger a specific Call Home message if the alert occurs.
- One or more e-mail or http destinations—The list of recipients for the Call Home messages generated by alert groups assigned to this destination profile.
- Message format—The format for the Call Home message (short text, full text, or XML).
- Message severity level—The Call Home severity level that the alert must meet before a Call Home message is sent to all e-mail and http url addresses in the destination profile. An alert is not generated if the Call Home severity level of the alert is lower than the message severity level set for the destination profile.

You can also configure a destination profile to allow periodic inventory update messages by using the inventory alert group that will send out periodic messages daily, weekly, or monthly.

The following predefined destination profiles are supported:

- CiscoTAC-1—Supports the Cisco-TAC alert group in XML message format.

### Call Home Alert Groups

An alert group is a predefined subset of alerts or events that Call Home detects and reports to one or more destinations. Alert groups allow you to select the set of alerts that you want to send to a predefined or custom destination profile. Alerts are sent to e-mail destinations in a destination profile only if that alert belongs to one of the alert groups associated with that destination profile and if the alert has a Call Home message severity at or above the message severity set in the destination profile.
The following table lists supported alert groups and the default CLI command output included in Call Home messages generated for the alert group.

**Table 41: Alert Groups and Executed Commands**

<table>
<thead>
<tr>
<th>Alert Group</th>
<th>Description</th>
<th>Executed Commands</th>
</tr>
</thead>
</table>
| Environmental | Events related to power, fan, and environment-sensing elements such as temperature alarms. | show environment  
show logging  
show inventory  
show environment trace  
show diag |
| Inventory     | Inventory status that is provided whenever a unit is cold booted, or when FRUs are inserted or removed. This alert is considered a noncritical event, and the information is used for status and entitlement. | admin show platform  
admin show version  
admin show diag  
admin show inventory oid |
| Syslog        | Events generated by specific interesting syslog messages                     | admin show version  
admin show logging  
admin show inventory |
| Configuration | User-generated request for configuration or configuration change event.       | • show version  
• show running config all  
• show inventory  
• show configuration history last 30  
• show configuration commit changes last 1 |
| Snapshot      | This alert group can be configured for periodic notifications                 | By default, this alert group has no commands to be run. You can add the required commands that need to be run. |

Call Home maps the syslog severity level to the corresponding Call Home severity level for syslog port group messages.

**Call Home Message Levels**

Call Home allows you to filter messages based on their level of urgency. You can associate each destination profile (predefined and user-defined) with a Call Home message level threshold. The Call Home message level ranges from 0 (lowest level of urgency) to 9 (highest level of urgency). Call Home messages are generated if they have a severity level equal to or greater than the Call Home message level threshold for the destination profile.
Call Home messages that are sent for syslog alert groups have the syslog severity level mapped to the Call Home message level.

---

**Note**

Call Home does not change the syslog message level in the message text.

The following table lists each Call Home message level keyword and the corresponding syslog level for the syslog port alert group.

**Table 42: Severity and syslog Level Mapping**

<table>
<thead>
<tr>

**Obtaining Smart Call Home**

If you have a service contract directly with Cisco Systems, you can register your devices for the Smart Call Home service. Smart Call Home provides fast resolution of system problems by analyzing Call Home messages sent from your devices and providing background information and recommendations. For issues that can be identified as known, particularly GOLD diagnostics failures, Automatic Service Requests will be generated with the Cisco-TAC.

Smart Call Home offers the following features:

- Continuous device health monitoring and real-time diagnostic alerts.
- Analysis of Call Home messages from your device and, where appropriate, Automatic Service Request generation, routed to the appropriate TAC team, including detailed diagnostic information to speed problem resolution.
• Secure message transport directly from your device or through a downloadable Transport Gateway (TG) aggregation point. You can use a TG aggregation point in cases that require support for multiple devices or in cases where security requirements mandate that your devices may not be connected directly to the Internet.

• Web-based access to Call Home messages and recommendations, inventory and configuration information for all Call Home devices. Provides access to associated field notices, security advisories and end-of-life information.

You need the following items to register:

• The SMARTnet contract number for your device
• Your e-mail address
• Your Cisco.com ID

For more information about Smart Call Home, see the Smart Call Home page at this URL: https://supportforums.cisco.com/community/netpro/solutions/smart_services/smartcallhome

Anonymous Reporting

Smart Call Home is a service capability included with many Cisco service contracts and is designed to assist customers resolve problems more quickly. If you decide not to use Smart Call Home, you can still enable Anonymous Reporting to allow Cisco to securely receive minimal error and health information from the device. If you enable Anonymous Reporting, your customer identity will remain anonymous, and no identifying information is sent.

When Call Home is configured for anonymous reporting, only inventory, and test messages are sent to Cisco. No identifying information is sent.

Note

When you enable Anonymous Reporting, you acknowledge your consent to transfer the specified data to Cisco or to vendors operating on behalf of Cisco (including countries outside the United States). Cisco maintains the privacy of all customers. For information about how Cisco treats personal information, see the Cisco Privacy Statement

Configuring Call Home

The tasks in this module describe how to configure the sending of Call Home messages. The following steps are involved:

1. Assign contact information.
2. Configure and enable one or more destination profiles.
3. Associate one or more alert groups to each profile.
4. Configure the email server options.
5. Enable Call Home.
Before enabling Call-Home, you must configure the source interface for http over IPv6. However, for http over IPv4, Call-Home works without the source interface. Use the `http client source-interface ipv6` command to configure the source interface.

### Configuring Contact Information

Each router must include a contact e-mail address. You can optionally include other identifying information for your system installation.

**SUMMARY STEPS**

1. `configure`
2. `call-home`
3. `contact-email-addr email-address`
4. (Optional) `contract-id contract-id-string`
5. (Optional) `customer-id customer-id-string`
6. (Optional) `phone-number phone-number-string`
7. (Optional) `street-address street-address`
8. (Optional) `site-id site-id-string`
9. `commit`
10. `show call-home`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure</td>
<td>Enters call home configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> call-home</td>
<td>Enters call home configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> contact-email-addr email-address</td>
<td>Configures the customer email address. Enter up to 200 characters in email address format with no spaces.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> (Optional) contract-id contract-id-string</td>
<td>Configures the contract ID. Enter up to 64 characters. If you include spaces, you must enclose the entry in quotes (&quot;&quot;&quot;).</td>

<td></td>
</tr>
</tbody>
</table>

## Configuring and Activating Destination Profiles

You must have at least one activated destination profile for Call Home messages to be sent. The CiscoTAC-1 profile exists by default but is not active.

### SUMMARY STEPS

1. configure
2. call-home
3. profile profile-name
4. destination address email email-address
5. destination message-size-limit max-size
6. destination preferred-msg-format {short-text | long-text | xml}
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure</td>
<td></td>
</tr>
<tr>
<td>2</td>

<td></td>
</tr>
</tbody>
</table>
### Associating an Alert Group with a Destination Profile

An alert is sent only to destination profiles that have subscribed to the Call Home alert group.

**Before you begin**

Use the `show call-home alert-group` command to view available alert groups.

**SUMMARY STEPS**

1. `configure`
2. `call-home`
3. `profile profile-name`
4. `subscribe-to-alert-group environment [severity severity-level`
5. `subscribe-to-alert-group inventory [periodic {daily | monthly day-of-month | weekly day-of-week} hh:mm`
6. `subscribe-to-alert-group syslog severity severity-level pattern string`
7. `subscribe-to-alert-group snapshot severity severity-level pattern string`
8. `subscribe-to-alert-group configuration severity severity-level pattern string`
9. `commit`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>configure</code></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>call-home</code></td>
</tr>
</tbody>
</table>

**Example:**

```
RP/0/RSP0/CPU0:router(config)# call-home
RP/0/RSP0/CPU0:router(config-call-home)#
```
### Command or Action

**Step 3**

**profile** profile-name

**Example:**

```
RP/0/RSP0/CPU0:router(config-call-home)# profile my_profile
RP/0/RSP0/CPU0:router(config-call-home-profile)#
```

**Purpose:**

Enters call home profile configuration mode to configure a new or existing profile.

**Step 4**

**subscribe-to-alert-group** environment [severity severity-level]

**Example:**

```
RP/0/RSP0/CPU0:router(config-call-home-profile)# subscribe-to-alert-group environment severity major
```

**Purpose:**

Configures a destination profile to receive messages for the environment alert group. Alerts with a severity the same or greater than the specified severity level are sent.

- **catastrophic**—Includes network-wide catastrophic events in the alert. This is the highest severity.
- **critical**—Includes events requiring immediate attention (system log level 1).
- **disaster**—Includes events with significant network impact.
- **fatal**—Includes events where the system is unusable (system log level 0).
- **major**—Includes events classified as major conditions (system log level 2).
- **minor**—Includes events classified as minor conditions (system log level 3)
- **normal**—Specifies the normal state and includes events classified as informational (system log level 6). This is the default.
- **notification**—Includes events informational message events (system log level 5).
- **warning**—Includes events classified as warning conditions (system log level 4).

**Step 5**

**subscribe-to-alert-group** inventory [periodic {daily | monthly day-of-month | weekly day-of-week} hh:mm]

**Example:**

```
RP/0/RSP0/CPU0:router(config-call-home-profile)# subscribe-to-alert-group inventory periodic monthly 1 10:00
```

**Purpose:**

Configures a destination profile to receive messages for the inventory alert group. Either alerts are sent periodically, or any non-normal event triggers an alert.

**Step 6**

**subscribe-to-alert-group** syslog severity severity-level pattern string

**Example:**

```
RP/0/RSP0/CPU0:router(config-call-home-profile)#
```

**Purpose:**

Configures a destination profile to receive messages for the syslog alert group. Alerts with a severity the same or greater than the specified severity level are sent.

- **catastrophic**—Includes network-wide catastrophic events in the alert. This is the highest severity.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>subscribe-to-alert-group syslog severity major pattern</td>
<td><strong>Purpose</strong></td>
</tr>
</tbody>
</table>

- **critical**—Includes events requiring immediate attention (system log level 1).
- **disaster**—Includes events with significant network impact.
- **fatal**—Includes events where the system is unusable (system log level 0).
- **major**—Includes events classified as major conditions (system log level 2).
- **minor**—Includes events classified as minor conditions (system log level 3)
- **normal**—Specifies the normal state and includes events classified as informational (system log level 6). This is the default.
- **notification**—Includes events informational message events (system log level 5).
- **warning**—Includes events classified as warning conditions (system log level 4).

You can specify a pattern to be matched in the syslog message. If the pattern contains spaces, you must enclose it in quotes (""").

**Step 7**

```
subscribe-to-alert-group snapshot severity severity-level pattern string
```

**Example:**
```
RP/0/RSP0/CPU0:router(config-call-home-profile)#
subscribe-to-alert-group snapshot severity major pattern
```

Configures a destination profile to receive messages for the snapshot alert group. Alerts with a severity the same or greater than the specified severity level are sent.

You can specify a pattern to be matched in the syslog message. If the pattern contains spaces, you must enclose it in quotes (""").

**Step 8**

```
subscribe-to-alert-group configuration severity severity-level pattern string
```

**Example:**
```
RP/0/RSP0/CPU0:router(config-call-home-profile)#
subscribe-to-alert-group configuration severity major pattern
```

Configures a destination profile to receive messages for the configuration alert group. Alerts with a severity the same or greater than the specified severity level are sent.

You can specify a pattern to be matched in the syslog message. If the pattern contains spaces, you must enclose it in quotes (""").

**Step 9**

```
commit
```

**What to do next**

Use the `show call-home profile` command to view the profile configurations.
Configuring Email

Call Home messages are sent via email. You must configure your email server before Call Home messages can be sent.

SUMMARY STEPS

1. `configure`
2. `call-home`
3. (Optional) `sender from email-address`
4. (Optional) `sender reply-to email-address`
5. `mail-server address priority priority`
6. `rate-limit events-count`
7. `commit`
8. `show call-home mail-server status`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure</td>
</tr>
</tbody>
</table>
| **Step 2** | call-home  
**Example:**  
RP/0/RSP0/CPU0:router(config)# call-home  
RP/0/RSP0/CPU0:router(config-call-home)# |
| | Enter call home configuration mode. |
| **Step 3** | (Optional) `sender from email-address`  
**Example:**  
RP/0/RSP0/CPU0:router(config-call-home)# sender from my_email@cisco.com |
| | Specify the email message “from” address. |
| **Step 4** | (Optional) `sender reply-to email-address`  
**Example:**  
RP/0/RSP0/CPU0:router(config-call-home)# sender reply-to my_email@cisco.com |
| | Specify the email message “reply-to” address. |
| **Step 5** | Required: `mail-server address priority priority`  
**Example:**  
RP/0/RSP0/CPU0:router(config-call-home)# mail-server 198.51.100.10 priority 1 |
| | Specify the mail server to use to send Call Home messages. You can specify an IP address or mail server name. You can specify up to five mail servers to use. The server with the lower priority is tried first. |
Enabling Call Home

By default the sending of Call Home messages is disabled. You must perform this task to enable the sending of Call Home messages.

**Before you begin**

Before enabling the sending of Call Home messages, you should complete the configuration tasks described in this module. Specifically, you must have enabled a destination profile for any Call Home messages to be sent.

**SUMMARY STEPS**

1. configure
2. call-home
3. service active
4. commit

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>call-home</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>RP/0/RSP0/CPU0:router (config))# call-home</td>

</tr>
</tbody>
</table>

Sending Call Home Alert group Messages Manually

This task is used to manually trigger Call Home alert group messages.

You can use the call-home send command to manually send a specific alert group message. Guidelines for the CLI options of the command:

- Only the snapshot, configuration, and inventory alert groups can be sent manually. Syslog alert groups cannot be sent manually.

- When you manually trigger a snapshot, configuration, or inventory alert group message and you specify a destination profile name, a message is sent to the destination profile regardless of the profile’s active status, subscription status, or severity setting.

- When you manually trigger a snapshot, configuration, or inventory alert group message and do not specify a destination profile name, a message is sent to all active profiles that have either a normal or periodic subscription to the specified alert group.

SUMMARY STEPS

1. call-home send alert-group snapshot [ profile name ]
2. call-home send alert-group configuration [ profile name ]
3. call-home send alert-group inventory [ profile name ]
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>call-home send alert-group snapshot [ profile name ]</td>
<td>Sends a snapshot alert group message to one destination profile if specified or to all subscribed destination profiles.</td>

<tr>
<td></td>
<td>Example: RP/0/RSP0/CPU0:router # call-home send alert-group snapshot profile p1</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>call-home send alert-group configuration [ profile name ]</td>
<td>Sends a configuration alert group message to one destination profile if specified or to all subscribed destination profiles.</td>
</tr>
<tr>
<td></td>
<td>Example: RP/0/RSP0/CPU0:router # call-home send alert-group configuration profile p1</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>call-home send alert-group inventory [ profile name ]</td>
<td>Sends an inventory alert group message to one destination profile if specified or to all subscribed destination profiles.</td>
</tr>
<tr>
<td></td>
<td>Example: RP/0/RSP0/CPU0:router # call-home send alert-group inventory profile p1</td>
<td></td>
</tr>
</tbody>
</table>

## Manually sending command output message for a Command List

You can use the `call-home send` command to execute a command or a list of commands and send the command output through HTTP or email protocol.

Guidelines when sending the output of a command:

- The specified command or list of commands can be any run command, including commands for all modules. The command must be contained in quotes (""").
- If the email option is selected using the “email” keyword and an email address is specified, the command output is sent to that address.
- If neither the email nor the HTTP option is specified, the output is sent in long-text format with the specified service request number to the Cisco TAC (attach@cisco.com).
- If neither the “email” nor the “http” keyword is specified, the service request number is required for both long-text and XML message formats and is provided in the subject line of the email.
- If the HTTP option is specified, the CiscoTAC-1 profile destination HTTP or HTTPS URL is used as the destination. The destination email address can be specified so that Smart Call Home can forward the message to the email address. The user must specify either the destination email address or an SR number but they can also specify both.

This task enables you to execute command and send the command output.
Configuring Call Home

SUMMARY STEPS

1. call-home send { cli command | cli list } [ email email msg-format { long-text | xml } ] [ http { destination-email-address email } ] [ tac-request SR# ]

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> call-home send { cli command</td>
<td>cli list } [ email email msg-format { long-text</td>
</tr>
<tr>

<td>Release 5.2.2</td>
<td>This feature was introduced</td>
</tr>
</tbody>
</table>

• Data Collection Manager, on page 335

Data Collection Manager

Cisco Data Collection Manager (DCM) is an efficient and reliable data collection agent that is embedded in managed devices, such as routers and switches. DCM works on a push model, which is based on a subscribe-and-notify data pattern, as opposed to the pull model, which is based on a request-and-response data pattern. The Data Collection Manager (DCM) supports advanced on-board data processing that includes baseline calculation, summary calculation, statistical distribution, and percentile computation.

Data Collection Manager and Bulkstat

The Data Collection Manager (DCM) and the bulkstat module are the vital units of a framework which enables the bulk collection mechanism to include multiple data sources and multiple data export mechanisms.

The Bulkstat client application is implemented using the DCM core services to retrieve data and export it to the user. The Bulkstat client provides the only available user interface for DCM access. The client also provides CLI access through a new set of configuration commands and MIB access through the CISCO-DATA-COLLECTION-MIB.

DCM provides data subscription service for different data sources (such as, SNMP MIB objects and show command outputs). It also provides data retrieval management and data filtering services. With DCM, one source can be allocated for periodically collecting all management data.

Bulkstat, is an application which will use DCM to provide the following:

• Profiles and data-groups for different data-sources.

• Data processing – Summary, Distribution, Percentile and Auto-baseline.

• Data exports – File.
Benefits of DCM

DCM is very useful for Data Retrieval and Export and Performance Management solutions. This list includes all the benefits of DCM.

- **Data export and retrieval:** The Data Collection Manager (DCM) provides data retrieval management to ensure that the data collection does not impact device resources. The DCM can export data in a file format using multiple export protocols such as FTP, TFTP, Secure copy protocol (SCP), and Secure File Transfer Protocol (SFTP). The DCM provides a query mechanism with which data can be selectively exported based on the configured time interval and other selection criteria. The DCM application also provides data filtering services and exports the filtered data. You can also set primary and secondary destinations for exporting the collected data in a raw or processed format. Snapshots of the collected data can be stored for later retrieval.

- **Performance Management:** The Data Collection Manager (DCM) can be used to manage various aspects of performance management. It can collect data with a high granularity to help the Network Management Server (NMS) make dynamic traffic engineering decisions. DCM can also be used to collect resource variables that are important for effective capacity trend information, such as memory, queue depth, broadcast volume, buffer, Frame Relay congestion notification, and backplane utilization.

- **Troubleshooting:** The streaming function of the DCM can be used for real-time troubleshooting.

- **SLA:** A service level agreement (SLA) includes a what-if analysis for network changes and application changes, a trend for defined performance variables, exception management for defined capacity and performance variables, and QoS management. The DCM can be used to collect periodic data for reporting purposes.

Bulkstat

Two challenges that network providers usually face are data gathering and data analysis. Network providers need to gather large volumes of data to analyze the performance of the network and to have operational control over their network. Large service providers are strengthening their data gathering and analysis infrastructure. Traditionally, Simple Network Management Protocol (SNMP) agents are used to expose management data on managed systems. But, SNMP is not well suited for gathering large volumes of data, especially over short time intervals. For example, service providers charge customers depending on the network usage. Also this data must be available on customer request. Accounting applications based on SNMP polling models consume significant network bandwidth because they poll large volumes of data frequently. The SNMP protocol data unit (PDU) is a complex data type specific to SNMP and is expensive to process because the SNMP objects and tables must be sorted in a lexicographic order. All the entries in SNMP MIB tables are lexicographically ordered by their object identifiers, because there is an implied ordering in the MIB based on the order of the object identifiers. In such cases, the need to continuously poll large or bulk SNMP statistics can be avoided by using applications known as collectors to retrieve data.

The Bulkstat application is one such collector that uses the services of the Data Collection Manager (DCM) to provide the following functions:

- Collecting SNMP MIB object values.

- Processing the collected data to create summary, percentiles, and auto-baselined values.

- Exporting collected data through simple file transfers.
• Scheduling calendar events for data collection and export.

The Bulkstat application provides command-line access through a set of new configuration commands and exclusive MIB access through CISCO-DATA-COLLECTION-MIB to collect SNMP data.

You can configure Bulkstat for the following functions:

• Specify the way Bulkstat retrieves bulk statistics.
• Specify the time interval in seconds at which Bulkstat transfers data to receivers.
• Specify the maximum size of the bulk statistics file.
• Specify the context, instance, and period at which the system retrieves bulk statistics.
• Configure file-related parameters.
• Configure the interface type on which you want to collect statistics.
• View the parameters that Bulkstat uses to collect statistics by using the show bulkstat commands.

Bulkstat Configuration Elements

The following list shows the elements that you can configure using the Bulkstat interface:

• Data set
• Instance set
• Filter set
• Data group
• Process set
• Data profile
• Calendar Scheduling

Data Set

This section describes the data set elements that you can configure to collect Simple Network Management Protocol (SNMP) data and CLI data. Only objects having the same index elements can be grouped in a single object list.

The SNMP data set contains the following fields:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Configuration Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Objects</td>
<td>Specifies the object to be collected. Multiple objects can be configured to form a data set. The textual name of the object can be used for configuring an object. If the device does not recognize the textual name, the object identifier (OID) format can be used for configuring the name.</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>
Filter Set

The CLI data set contains the following fields:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Configuration Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object Alias</td>
<td>Specifies the optional alias name that each object can have.</td>
<td>Optional</td>
</tr>
</tbody>
</table>

CLI

Specifies the CLI command for which the show output needs to be collected. More than one CLI can be specified in the same data set. Mandatory

Filter Set

This section describes the filter configuration per object.

The filter set elements that you can configure to collect Simple Network Management Protocol (SNMP) data are described here. More than one filter of the same type can be added to the set.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object match</td>
<td>Specifies the value to be used to match against the value retrieved for the object during collection. The value provided needs to match the type of the object. If there is an error in the type matching, the configuration is not accepted. More than one value can be specified for an object, and more than one object can have matching values.</td>
<td>Optional</td>
</tr>
</tbody>
</table>

Instance Set

This section specifies the instance set elements that you can configure to collect Simple Network Management Protocol (SNMP) data. More than one instance of the same type can be added to the set. Combinations of types of instance set elements are not supported.

The SNMP Instance set contains the following fields:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Configuration Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Exact</td>
<td>Specifies the instance for which the data should be collected. More than one instance can be specified, but only fully qualified instances should be specified.</td>
<td>Optional</td>
</tr>
</tbody>
</table>
### Process Set

Data processing allows users to derive information from raw SNMP data, by calculating summaries and percentiles. Service providers rely on monitored SNMP data to alert network management systems (NMSs) of changing network conditions. By periodically monitoring the device data and comparing it against a set of thresholds, the network can automatically alert the operators, thereby allowing efficient operations.

- **Summary**: You can enable summary processing on the collected object value and calculate minimum, maximum, and average values. A summary is calculated for only those objects that are marked as process capable in the data group and uses the absolute or delta value as per the object configuration.

- **Distribution**: You can enable distribution processing on the collected object value by specifying the object type, minimum value, maximum value, and the number of buckets to distribute the value. Based on the configuration, counters are maintained per bucket and are incremented whenever the data falls into a bucket range.

- **Percentile**: You can enable percentile processing on the collected object value. A percentile is calculated on every process interval expiry. Distribution configuration is mandatory to enable percentile processing. Percentile computation is done assuming that the distribution is normal.

- **Auto-baseline**: You can enable baseline processing on the collected object value. The baseline internally uses all summary, distribution, and percentile calculations to provide baseline values. You can configure either baseline processing or other forms of processing, such as summary, distribution, and percentile calculations. The auto-baseline feature in DCM calculates the baseline values for variables of interest on the device and allows network management applications or network operators to retrieve the baseline values. The baseline values can be displayed in terms of percentiles or a median with standard deviation.
This section describes the data group, which contains the data-group name, data-group type, data set, instance set, filter set, polling interval, SNMP context, and other processing options.

The Data Group elements are:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Configuration Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data</td>
<td>Specifies any one of the data types as defined in the topic Data Set.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>Instance</td>
<td>Specifies any one of the instance types as defined in the topic Instance Set.</td>
<td>Optional, if not specified. Default behavior of the instance set is wildcard. Only applicable for SNMP.</td>
</tr>
<tr>
<td>Filter</td>
<td>Specifies any one of the filter types as defined in the topic Filter Set.</td>
<td>Optional, if not specified. Only applicable for SNMP.</td>
</tr>
<tr>
<td>Polling Interval</td>
<td>Specifies the collection periodic interval in seconds. In case of recurring collection, the data is collected at the expiration of the collection interval until the collection is stopped.</td>
<td>Optional</td>
</tr>
<tr>
<td>Context</td>
<td>Specifies the management context from which to obtain data for this data group.</td>
<td>Optional</td>
</tr>
<tr>
<td>Process Summary</td>
<td>Enables summary processing of the data marked to be processed in the corresponding data-set configuration.</td>
<td>Optional</td>
</tr>
<tr>
<td>Process Distribution</td>
<td>Enables distribution processing of the data marked to be processed in the corresponding data-set configuration.</td>
<td>Optional</td>
</tr>
<tr>
<td>Process Percentile</td>
<td>Enables percentile processing of the data marked to be processed in the corresponding data-set configuration.</td>
<td>Optional</td>
</tr>
</tbody>
</table>
### Configuration Status

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Configuration Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Process Auto-baseline</td>
<td>Enables auto-baselines processing of the data marked to be processed in the corresponding data-set configuration. If auto-baseline process is enabled, the other processes, such as summary, distribution, and percentile configurations, if done previously, are removed because auto-baseline process uses these functionalities internally.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> Removing this configuration will not reinstate the other configurations that are removed.</td>
<td>Optional</td>
</tr>
<tr>
<td>Discard raw</td>
<td>Specifies whether to store raw data. If data is processed, the user can choose to store only process data by setting the option.</td>
<td>Optional</td>
</tr>
</tbody>
</table>

---

**Data Profile**

This section describes the data profile that is used to group multiple data groups. This is done to simplify the configuration and to aggregate data of similar nature. A data profile can have multiple data groups. A data group can have constraints in the data specified in the element. If two sets of data need to be written to the same file, the respective data groups should be linked as part of a single profile.

The Data Profile has these fields:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data groups</td>
<td>Specifies the data group to be linked to this profile. Multiple data groups can be linked to a single profile.</td>
<td>Mandatory before activating a profile</td>
</tr>
<tr>
<td>Transfer Interval</td>
<td>Specifies the transfer periodic interval in seconds. In case of recurring transfer, the data is transferred when the transfer interval expires.</td>
<td>Optional</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Status</td>
</tr>
<tr>
<td>------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>---------</td>
</tr>
<tr>
<td>Process Interval</td>
<td>Specifies the process periodic interval in seconds. The data is processed during every collection interval as soon as it is collected. When the process interval expires, the processed data is written into a file and transferred.</td>
<td>Optional</td>
</tr>
<tr>
<td>Primary URL</td>
<td>Specifies the URL of the primary management station. The files containing the collected data are transferred to this URL when the transfer interval expires.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>Secondary URL</td>
<td>Specifies the URL of the secondary management station to be used in case the transfer to the primary management station fails.</td>
<td>Optional</td>
</tr>
<tr>
<td>Schema</td>
<td>Specifies the file data format. The schema ASCII option is supported.</td>
<td>Optional</td>
</tr>
<tr>
<td>Retry</td>
<td>Specifies the number of times that the transfer is retried in case of transfer failures to both primary and secondary management stations. This command has an effect only if the retain command is configured in the profile. The retry interval is computed by dividing the retention time by the number of retries. For example, if the file is retained for 60 minutes and the retry is 6 times, the transfer is attempted every 10 minutes, until the transfer succeeds or the file is removed.</td>
<td>Optional</td>
</tr>
<tr>
<td>Buffer-size</td>
<td>Specifies the maximum size to which the file containing the collected data can grow. When it reaches the limit, the file is closed and the transfer is attempted based on the transfer configuration associated with the data group or profile.</td>
<td>Optional</td>
</tr>
<tr>
<td>Retention Memory</td>
<td>Specifies the time, in seconds, to retain the file in the memory.</td>
<td>Optional</td>
</tr>
</tbody>
</table>
Calendar Scheduling

The Bulkstat application allows you to schedule each subscription for collection. A subscription can be scheduled for one-time collection or periodic collection. A periodic subscription can be repeated infinitely or for a specified number of repetitions. A timer is instantiated for every activated subscription.

The calendar scheduling elements are:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Configuration Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>One shot</td>
<td>Specifies that the data is collected for a specified collection interval.</td>
<td>Optional</td>
</tr>
<tr>
<td>Recurring</td>
<td>Specifies that the data is collected regularly at the specified time, day, month, and for a specified collection interval.</td>
<td>Optional</td>
</tr>
</tbody>
</table>

File Data Export

The file data export feature on the Data Collection Manager (DCM) exports the collected data based on the transfer configurations. Data can be exported in various formats, and Bulkstat files are one such format to collect data. The format in which the data is inserted into the file conforms to the schema-Ascii format described in CISCO-DATA-COLLECTION-MIB and CISCO-BULK-FILE-MIB. The data sequence in which the data is stored is determined based on the sequence in which the data is received.

The Cisco File Transfer module is responsible for transferring the files as per the transfer configuration. A file can be retained in the device whether the transfer was a success or a failure.

Configuring an SNMP Bulkstat Data Set

The first step in configuring the Simple Network Management Protocol (SNMP) periodic data collection and transfer mechanism is to configure one or more data sets. A data set is used to group objects of similar types, based on the data source. The data set is defined outside of the data group. This external definition gives the user the flexibility to use the same data set across multiple data groups and to collect the output for different instances and different contexts.

All objects in an SNMP data set must be indexed by the same MIB index. However, the objects in the data set must not belong to the same MIB or the MIB table.

Perform this task to configure the SNMP Bulkstat data set.

**SUMMARY STEPS**

1. `configure`
2. `bulkstat data data-set-name type snmp`
3. object oid [ alias alias-name ]

## Detailed Steps

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure</td>
<td></td>
</tr>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>bulkstat data</td>
<td>Defines an SNMP Bulkstat data set and enters SNMP bulk statistics data set configuration mode. The creation of an SNMP Bulkstat data set creates a row in the cdcDGBaseObjectEntry table in the SNMP MIB.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>data-set-name type snmp</td>
<td>Example: RP/0/RSP0/CPU0:router (config) # bulkstat data interface-stats type snmp</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td>object oid [ alias alias-name ]</td>
<td>Adds a MIB object to the SNMP Bulkstat data set. If the object is already present in the data set, this command replaces the old object configuration with the new configuration.</td>
</tr>
<tr>
<td>Example:</td>
<td>Note Repeat this command until all objects to be monitored are added to this list.</td>
</tr>
</tbody>
</table>

### Configuring an SNMP Bulkstat Filter Set

The Simple Network Management Protocol (SNMP) filter set specifies the filter configuration for every SNMP object. Perform this task to configure the SNMP Bulkstat filter set.

#### Summary Steps

1. **configure**
2. **bulkstat filter** filter-set-name
3. **match** object-name { eq line | start line | not { eq line | start line } }

#### Detailed Steps

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure</td>
<td></td>
</tr>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>bulkstat filter</td>
<td>Defines an SNMP Bulkstat filter set and enters SNMP bulk statistics filter set configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>filter-set-name</td>
<td>Example: RP/0/RSP0/CPU0:router (config) # bulkstat filter ifType</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td>match object-name</td>
<td>(Optional) Specifies a value to be used to match against the value retrieved for the object during collection.</td>
</tr>
<tr>
<td>Example:</td>
<td>Note More than one value can be specified for an object, and more than one object can have match values.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Configuring an SNMP Bulkstat Instance Set

The Simple Network Management Protocol (SNMP) instance set specifies the instances for which the data should be collected. Each subscription can collect different entries for specified objects based on the instance configuration. While more than one instance of the same type can be added to the instance set, a combination of different types is not supported.

Perform this task to configure the SNMP Bulkstat instance set.

**SUMMARY STEPS**

1. configure
2. bulkstat instance instance-set -name type snmp
3. exact oid oid
4. exact interface interface-id
5. wildcard
6. wildcard oid oid
7. wildcard interface interface-id
8. repetition oid oid max value
9. range start oid end oid

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>bulkstat instance instance-set -name type snmp</td>
<td>Defines an SNMP Bulkstat instance set and enters SNMP Bulkstat instance set configuration mode. The creation of an SNMP Bulkstat instance set creates a row in the cdcDGInstanceEntry table in the SNMP MIB.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td>RP/0/RSP0/CPU0:router (config) # bulkstat instance exact type snmp</td>
</tr>
<tr>
<td>Note</td>
<td></td>
<td>An instance created using this command can be linked to more than one data group.</td>
</tr>
<tr>
<td>Step 3</td>
<td>exact oid oid</td>
<td>(Optional) Indicates that the specified instance, when appended to the object list, is the complete OID.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td>RP/0/RSP0/CPU0:router (config-bs-is-snmp) # exact oid 1</td>
</tr>
<tr>
<td>Step 4</td>
<td>exact interface interface-id</td>
<td>(Optional) Specifies an interface name and number, for example interface Ethernet 0, instead of specifying the ifIndex OID for the interface.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td>RP/0/RSP0/CPU0:router (config-bs-is-snmp) # exact interface Ethernet0/0 sub-if</td>
</tr>
<tr>
<td>Step 5</td>
<td>wildcard</td>
<td>(Optional) Specifies whether an object used for evaluating an expression should be made a wildcard during an event configuration.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td>RP/0/RSP0/CPU0:router (config-bs-is-snmp) # wildcard</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
<td></td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>wildcard oid <em>oid</em>&lt;br&gt;Example: RP/0/RSP0/CPU0:router (config-bs-is-snmp) # wildcard oid 1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>wildcard interface <em>interface-id</em>&lt;br&gt;Example: RP/0/RSP0/CPU0:router (config-bs-is-snmp) # wildcard interface Ethernet0/0 sub-if</td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>repetition oid <em>oid</em> max <em>value</em>&lt;br&gt;Example: RP/0/RSP0/CPU0:router (config-bs-is-snmp) # repetition oid 1.2.3.4 max 2000</td>
<td></td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td>range start <em>oid</em> end <em>oid</em>&lt;br&gt;Example: RP/0/RSP0/CPU0:router (config-bs-is-snmp) # range start 1.2.3.4 end 1.2.3.6</td>
<td></td>
</tr>
</tbody>
</table>

### Configuring a Bulkstat Data Group

The Bulkstat data group element is used to group the data set, filter set, and instance set and also to specify the processing options.

Perform this task to configure the Bulkstat data group.

**SUMMARY STEPS**

1. configure
2. bulkstat data-gorup *data-group-name*
3. collect type { { command | expression } date *date-set-name* filter *filter-set-name* | snmp { data *data-set-name* instance *instance-set-name* filter *filter-set-name* } } 
4. context *context-name*
5. interval polling *polling-interval*
6. discard
7. process

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>bulkstat data-gorup <em>data-group-name</em>&lt;br&gt;Example:</td>
</tr>
<tr>
<td></td>
<td>Defines a Bulkstat data group and enters Bulkstat data group configuration mode.</td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>RP/0/RSP0/CPU0:router (config) # bulkstat data-group if-dg</td>
<td>The creation of a Simple Network Management Protocol (SNMP) Bulkstat data group creates a row in the cdcDGEntry table in the SNMP MIB.</td>
</tr>
</tbody>
</table>

#### Step 3

**collect type**

```bash
collect type { { command | expression } date date-set-name filter filter-set-name | snmp { data data-set-name instance instance-set-name filter filter-set-name } }
```

**Example:**

```bash
RP/0/RSP0/CPU0:router (config-bs-dg) # collect type snmp data interface-stats instance ins-exact ifType
```

Specified the collection type to collect data from different sources for this data group.

#### Step 4

**context context-name**

**Example:**

```bash
RP/0/RSP0/CPU0:router (config-bs-dg) # context ctx-name
```

Specifies the management context from which to obtain data for this data group.

#### Step 5

**interval polling polling-interval**

**Example:**

```bash
RP/0/RSP0/CPU0:router (config-bs-dg) # interval polling 100
```

Specifies the collection periodic interval in seconds. In case of recurring collection, the data is collected at the expiration of the collection interval until the collection is stopped.

#### Step 6

**discard**

**Example:**

```bash
RP/0/RSP0/CPU0:router (config-bs-dg) # discard
```

Specifies whether to discard the raw data.

#### Step 7

**process**

**Example:**

```bash
RP/0/RSP0/CPU0:router (config-bs-dg) # process
```

Configures process-related parameters for a data group.

---

### Configuring a Bulkstat Profile

Perform this task to configure the Bulkstat Profile.

The profile element is used to group multiple data groups. This grouping simplifies the configuration and aggregates data of a similar nature. If two sets of data need to be written to the same file, the respective data groups should be linked as part of a single profile.

#### SUMMARY STEPS

1. **configure**
2. **bulkstat profile** *profile-name*
3. **data-group** *data-group name*
4. **interval transfer** { **process** | **raw** } *seconds*
5. **file-format** schema ASCII
6. **file retain** { **disk** *url* | **memory** *seconds* }
# Configuring a Bulkstat Profile

**Configuration Examples and Usecase Scenarios**

The usecase scenarios with examples are discussed here.
Usecase-1: Collecting MIB Statistics

Goal: To collect IF MIB Statistics

<table>
<thead>
<tr>
<th>Procedure</th>
<th>Example</th>
</tr>
</thead>
</table>
| Step1: Identifying the inputs and other parameters | MIB Objects of interest:  
• 1.3.6.1.2.1.2.2.1.2 (ifDescr)  
• 1.3.6.1.2.1.2.2.1.10 (ifInOctets)  
• 1.3.6.1.2.1.2.2.1.16 (ifOutOctets)  
Export Parameters:  
• Interval: 60 seconds  
• Protocol: TFTP  
• Server: 10.105.33.135  
• Path: dcm_data |
| Step2: Configuring the **Data set if-mib**  
For detailed procedure:  
*Configuring an SNMP Bulkstat Data Set, on page 343* | bulkstat data if-mib type snmp  
object 1.3.6.1.2.1.2.2.1.2  
object 1.3.6.1.2.1.2.2.1.10  
object 1.3.6.1.2.1.2.2.1.16 |
| Step3: Configuring the **Instance set if-mib**  
For detailed procedure:  
*Configuring an SNMP Bulkstat Instance Set, on page 345* | bulkstat instance if-mib type snmp  
wildcard |
| Step4: Configuring **Data Group if-group**  
For detailed procedure:  
*Configuring a Bulkstat Data Group, on page 346* | bulkstat data-group if-group  
interval polling 30  
collect type snmp data if-mib instance if-mib |
| Step5: Configuring **Profile snmp_profile**  
For detailed procedure:  
*Configuring a Bulkstat Profile, on page 347* | bulkstat profile snmp_profile  
file transfer url primary  
tftp://10.105.33.135/dcm_data/  
interval transfer raw 60  
data-group if-group enable |

Note: Step2 and Step3 can be interchanged.

Usecase-2: Using Filters

Goal: To collect gigabit ethernet interface statistics (using filters)
### Procedure | Example
---|---
Step 1: Identifying the inputs and other parameters | MIB Objects of interest:
  - 1.3.6.1.2.1.2.1.2 (ifDescr)
  - 1.3.6.1.2.1.2.1.10 (ifInOctets)
  - 1.3.6.1.2.1.2.1.16 (ifOutOctets)
Export Parameters:
  - Interval: 60 seconds
  - Protocol: TFTP
  - Server: 10.105.33.135
  - Path: dcm_data

Step 2: Configuring the **Data set if-mib**
For detailed procedure: **Configuring an SNMP Bulkstat Data Set**, on page 343

```
bulkstat data if-mib type snmp
object 1.3.6.1.2.1.2.1.2
object 1.3.6.1.2.1.2.1.10
object 1.3.6.1.2.1.2.1.16
```

Step 3: Configuring the **Instance set if-mib**
For detailed procedure: **Configuring an SNMP Bulkstat Instance Set**, on page 345

```
bulkstat instance if-mib type snmp wildcard
```

Step 4: Configuring the **Filter set if-mib**
For detailed procedure: **Configuring an SNMP Bulkstat Filter Set**, on page 344

```
bulkstat filter if-mib
match 1.3.6.1.2.1.2.1.2 start "GigabitEthernet"
```

Step 5: Configuring **Data Group if-group**
For detailed procedure: **Configuring a Bulkstat Data Group**, on page 346

```
bulkstat data-group if-group
interval polling 30
collect type snmp data if-mib instance if-mib
```

Step 6: Configuring **Profile snmp_profile**
For detailed procedure: **Configuring a Bulkstat Profile**, on page 347

```
bulkstat profile snmp_profile
file transfer url primary
tftp://10.105.33.135/dcm_data/
interval transfer raw 60
data-group if-group enable
```

---

**Note**
Step 2, Step 3 and Step 4 can interchanged.
# Use Case 3: Collecting CLI Output in XML Format

**Goal:** To collect show cli output in XML format

<table>
<thead>
<tr>
<th><strong>Procedure</strong></th>
<th><strong>Example</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1:</strong> Identifying the inputs and other parameters</td>
<td>CLI of interest: <code>add cmd show operational AAA xml</code>&lt;br&gt;Export Parameters:&lt;br&gt;• Interval: 5 minutes&lt;br&gt;• Protocol: TFTP&lt;br&gt;• Server: 10.64.68.12&lt;br&gt;• Path: dcm_data</td>
</tr>
<tr>
<td><strong>Step 2:</strong> Configuring the <strong>Data set process</strong>&lt;br&gt;For detailed procedure: <a href="#">Configuring an SNMP Bulkstat Data Set, on page 343</a></td>
<td><code>bulkstat data process type command add cmd show operational AAA xml</code></td>
</tr>
<tr>
<td><strong>Step 3:</strong> Configuring <strong>Data Group cli-group</strong>&lt;br&gt;For detailed procedure: <a href="#">Configuring a Bulkstat Data Group, on page 346</a></td>
<td><code>bulkstat data-group cli-group interval polling 60 collect type command data sh snmp</code></td>
</tr>
<tr>
<td><strong>Step 4:</strong> Configuring <strong>Profile cli_profile</strong>&lt;br&gt;For detailed procedure: <a href="#">Configuring a Bulkstat Profile, on page 347</a></td>
<td><code>bulkstat profile cli_profile file transfer url primary tftp://10.64.68.12/dcm_data/ interval transfer raw 300 data-group cli-group enable</code></td>
</tr>
</tbody>
</table>
CHAPTER 20

Software Entitlement

Cisco IOS XR software contains all the supported features for a given release. Before the introduction of software entitlement on Cisco IOS XR software, you could freely activate all available software packages on your network devices and could enable all the bundled features. Software entitlement has been introduced so you pay only for the features that you need today, but can upgrade when necessary while keeping your investment safe. Licensing enables you to purchase individual software features and upgrade hardware capacity in a safe and reliable way.

The licensing methods supported on Cisco IOS XR software are:

• Smart Licensing
• Default (traditional) Licensing

To locate documentation for other commands that might appear in the course of performing a configuration task, search online in Cisco ASR 9000 Series Aggregation Services Router Commands Master List.

Table 44: Feature History for Software Entitlement

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.9.0</td>
<td>The software entitlement feature was introduced.</td>
</tr>
<tr>
<td>Release 4.3.1</td>

</tr>
<tr>
<td>Release 5.2.0</td>
<td>Smart Licensing was introduced.</td>
</tr>
<tr>
<td>Release 5.3.1</td>
<td>Support for Smart Licensing was introduced on Cisco ASR 9000 High Density 100GE Ethernet line cards. General availability release for Smart Licensing on ASR 9000.</td>
</tr>
<tr>
<td>Release 6.0.1</td>
<td>Updated consumption model line card support</td>
</tr>
</tbody>
</table>

This model contains the following topics:

• What Is Software Entitlement?, on page 354
• Implementing Smart Licensing, on page 355
• Consumption Model, on page 369
• Implementing Default Licensing, on page 374
What Is Software Entitlement?

*Software entitlement* is a system that consists of a license manager on a Cisco IOS XR device that manages licenses for various software and hardware features. The license manager parses and authenticates a license before accepting it. The software features on the router use the license manager APIs to check out and release licenses. Licenses are stored in persistent storage on the router.

Core routing features are available for use without any license. The following features can be enabled on your router using licenses:

**Layer 3 VPN**

Layer 3 (virtual private network) VPN can be configured only if there is an available Layer 3 VPN license for the line card slot on which the feature is being configured. If the advanced IP license is enabled, 4096 Layer 3 VPN routing and forwarding instances (VRFs) can be configured on a line card. If the infrastructure VRF license is enabled, eight Layer 3 VRFs can be configured on the line card.

To activate the Infrastructure VRF license, you need to configure two interfaces or sub-interfaces in separate VRFs, with at least one physical interface in each of the VRFs.

The key is to have multiple (two or more) user-defined VRFs configured in at least one slot and at least one physical interface in each user-defined VRF; and repeated for each slot.

In a non-consumption model line card, configuring a physical interface in multiple VRFs would consume a L3VPN license. However, configuring other virtual interfaces (such as management, bundle, or BVI interfaces) in multiple VRFs would not consume L3VPN license.

See the following modules in *MPLS Configuration Guide for Cisco ASR 9000 Series Routers* for information about Layer 3 VPN configurations:

- *Implementing MPLS Layer 3 VPNs on the Cisco ASR 9000 Series Router*
- *Implementing Virtual Private LAN Services on the Cisco ASR 9000 Series Router*

**G.709**

If a G.709 license is available, G.709 can be enabled on 10-Gigabit Ethernet interfaces on the following line cards:

- 2-port 10 Gigabit Ethernet / 20-port Gigabit Ethernet line card
- 8-port 10 Gigabit Ethernet line card
- 24-port 10 Gigabit Ethernet line card
- 36-port 10 Gigabit Ethernet line card
- 4-port 10 Gigabit Ethernet modular port adapter
- 2-port 10 Gigabit Ethernet modular port adapter

Refer to the *Configuring Dense Wavelength Division Multiplexing Controllers on the Cisco ASR 9000 Series Router* module in *Interface and Hardware Component Configuration Guide for Cisco ASR 9000 Series Routers*.

**Video Monitoring**

Video monitoring can be enabled for the Cisco ASR 9000 chassis by using a video monitoring license.
**Satellite Network Virtualization (nV)**

The Satellite nV license entitles satellite devices to connect to the Cisco ASR 9000 chassis. Satellite licenses are chassis licenses, and can provide the ability for one, five or 20 satellites to connect to a Cisco ASR 9000 host remotely.

---

**Note**

Smart Licensing is supported on a cluster set-up. There are two A9K-NV-CLUSTR-LIC licenses required/requested, one for each of the chassis.

---

**Implementing Smart Licensing**

**Information About Smart Licensing**

Smart Licensing is a cloud-based, software license management solution that enables you to automate time-consuming, manual licensing tasks. The solution allows you to easily track the status of your license and software usage trends.

Smart Licensing helps simplify three core functions:

- **Purchasing**: The software that you have installed in your network can automatically self-register themselves, without Product Activation Keys (PAKs).
- **Management**: You can automatically track activations against your license entitlements. Additionally, there is no need to install the license file on every node. You can create license pools (logical grouping of licenses) to reflect your organization structure. Smart Licensing offers you Cisco Smart Software Manager, a centralized portal that enables you to manage all your Cisco software licenses from one centralized website. *Cisco Smart Software Manager Overview, on page 367* provides details.
- **Reporting**: Through the portal, Smart Licensing offers an integrated view of the licenses you have purchased and what has been actually deployed in your network. You can use this data to make better purchase decisions, based on your consumption.

**Smart Versus Traditional Licensing**

<table>
<thead>
<tr>
<th>Traditional (node locked) licencing</th>
<th>Smart (dynamic) licencing</th>
</tr>
</thead>
<tbody>
<tr>
<td>You must procure the license and manually install it on the device.</td>
<td>Your device initiates a call home and requests the licenses it needs. <em>Configuring Call Home on the Cisco ASR 9000 Series Router</em> describes the Smart Call Home feature.</td>
</tr>
<tr>
<td>Node-locked licences - license is associated with a specific device.</td>
<td>Pooled licences - licences are company account-specific, and can be used with any compatible device in your company. You can activate or deactivate different types of licenses on the device without actually installing a license file on the device.</td>
</tr>
<tr>
<td>No common install base location to view licenses purchased or software usage trends</td>
<td>Licenses are stored securely on Cisco servers accessible 24x7x365.</td>
</tr>
</tbody>
</table>
Licenses can be moved between product instances without a license transfer. This greatly simplifies the reassignment of a software license as part of the Return Material Authorization (RMA) process.

Limited visibility into all software licenses being used in the network. Licenses are tracked only on per node basis.

Complete view of all Smart Software Licenses used in the network using a consolidated usage report of software licenses and devices in one easy-to-use portal.

No easy means to transfer licenses from one device to another.

Smart Licensing in Cisco IOS XR 64 bit

Smart Licensing is enabled by default on Cisco IOS XR 64 bit. Here are few things to consider for Smart Licensing in Cisco IOS XR 64 bit:

- Smart Licensing cannot be disabled.
- All the Smart Licensing CLIs are executed from EXEC mode.
- EVAL Period is not supported. Hence licenses are consumed only after registration.
- Smart Licensing is supported on A9K-8X100GE-CM, A99-8X100GE-CM, A99-12PT-CM-LIC, and A9K-MOD400-CM-LIC line cards.

This table lists supported licenses for non-CM line cards:

<table>
<thead>
<tr>
<th>Non-CM Line Cards Software License PID</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A9K-800G-IVRF</td>
<td>ASR 9000 8-port 100 GE Infrastructure VRF Right to Use License</td>
</tr>
<tr>
<td>A9K-400G-IVRF</td>
<td>ASR 9000 4-port 100 GE Infrastructure VRF license Right to Use License</td>
</tr>
<tr>
<td>A99-1200G-IVRF</td>
<td>ASR 9900 Infrastructure VRF license Right to Use License</td>
</tr>
<tr>
<td>A9K-800G-AIP-SE</td>
<td>ASR 9000 8-port 100 GE Advance IP Service Edge Right to Use License</td>
</tr>
<tr>
<td>A9K-800G-AIP-TR</td>
<td>ASR 9000 8-port 100 GE Advance IP Transport Optimised Right to Use License</td>
</tr>
<tr>
<td>A9K-400G-AIP-SE</td>
<td>ASR 9000 4-port 100 GE Advance IP Service Edge Right to Use License</td>
</tr>
<tr>
<td>A9K-400G-AIP-TR</td>
<td>ASR 9000 4-port 100 GE Advance IP Transport Optimised Right to Use License</td>
</tr>
</tbody>
</table>
### Non-CM Line Cards Software License PID

<table>
<thead>
<tr>
<th>PID</th>
<th>Description</th>

</tr>
</tbody>
</table>

This is the list of show commands available for Smart Licensing in Cisco IOS XR 64 bit:

- show license all—shows all information regarding Smart license
- show license platform—shows platform-specific licensing information (cisco-support)
- show license status—shows smart licensing status information
- show license summary—shows smart licensing summary
- show license techsupport—shows smart licensing tech support information
- show license trace—shows tracing for smart licensing code (cisco-support)
- show license udi—shows smart licensing UDI information
- show license usage—shows smart licensing usage information
- show license platform detail—shows smart license detail information (cisco-support)
- show license platform summary—shows smart license summary (cisco-support)
- show license platform trace—shows platform specific licensing trace information (cisco-support)
Create a Cisco Smart Account

Cisco Smart Account is an account where all products enabled for Smart Licensing are deposited. Cisco Smart Account allows you to manage and activate your licenses to devices, monitor license use, and track Cisco license purchases. Through transparent access, you have a real-time view into your Smart Licensing products. IT administrators can manage licenses and account users within your organization’s Smart Account through the Smart Software Manager.

You can create your Cisco Smart Account at this webpage: https://webapps.cisco.com/software/company/smartaccounts/home#accountcreation-account/request.

Smart Licensing Working

Smart Licensing involves the three steps shown in the illustration below, that depicts the working model of the Smart Licensing.

*Setting up Smart Licensing:* You can place the order for Smart Licensing, to manage licenses on Cisco.com portal. You agree to the terms and conditions governing the use and access of Smart Licensing.

- **Enabling and Use Smart Licensing**: Follow the steps to enable Smart Licensing. *Smart Licensing Workflow* provides an illustration.

After you enable Smart Licensing, you can use either of the following options to communicate:

- **Smart Call Home**: The Smart Call Home feature is automatically configured after the Smart Licensing is enabled. Smart Call Home is used by Smart Licensing as a medium for communication with the Cisco license service. Call Home feature allows Cisco products to periodically call-home and perform an audit and reconciliation of your software usage information. This information helps Cisco efficiently track your install base, keep them up and running, and more effectively pursue service and support contract renewals, without much intervention from your end. For more information on Smart Call Home feature, see [http://www.cisco.com/c/dam/en/us/td/docs/switches/lan/smart_call_home/SCH_Deployment_Guide.pdf](http://www.cisco.com/c/dam/en/us/td/docs/switches/lan/smart_call_home/SCH_Deployment_Guide.pdf).

- **Smart Licensing Satellite**: The Smart licensing satellite option provides an on-premises collector that can be used to consolidate and manage Smart license usage, as well facilitate communications back to Cisco License Service at [http://www.cisco.com](http://www.cisco.com).

- **Manage and Report Licenses**: You can manage and view reports about your overall software usage in the Smart Software Manager portal. *Compliance reporting, on page 368* describes the types of Smart Licensing reports.

**Deployment Options for Smart Licensing**

The following illustration shows the various options available for deploying Smart Licensing:
1. **Direct cloud access:** In direct cloud access deployment method, Cisco products send usage information directly over the internet to Cisco.com (Cisco license service); no additional components are needed for deployment.

2. **Direct cloud access through an HTTPs proxy:** In direct cloud access through an HTTPs proxy deployment method, Cisco products send usage information over the internet through a proxy server - either a Smart Call Home Transport Gateway or off-the-shelf Proxy (such as Apache) to Cisco License Service on http://www.cisco.com.

3. **Mediated access through an on-premises collector-connected:** In mediated access through an on-premises collector-connected deployment method, Cisco products send usage information to a locally-connected collector, which acts as a local license authority. Periodically, the information is exchanged to keep the databases in synchronization.

4. **Mediated access through an on-premises collector-disconnected:** In the mediated access through an on-premises collector-disconnected deployment method, Cisco products send usage information to a local disconnected collector, which acts as a local license authority. Exchange of human-readable information is performed occasionally (maybe once a month) to keep the databases in synchronization.

Options 1 and 2 provide an easy deployment option, and options 3 and 4 provide a secure environment deployment option. Smart Software Satellite provides support for options 3 and 4.

The communication between Cisco products and Cisco license service is facilitated by the Smart Call Home software. For information on Smart Call Home, see About Call Home, on page 313.
Configure Licenses Using Smart Licensing

Enable Smart Licensing

Smart Licensing components are packaged into the asr9k mini image. The https client required for configuring the Smart Call Home is packaged into the asr9k-k9sec PIE. By default, traditional licensing mode is on. Use the steps described here to enable Smart Licensing.

Note

Smart Licensing on Cisco ASR 9001-S Router is not supported. Hence you should use the Product Authorization Key (PAK) to activate a license. PAK is provided when you order and purchase the right to use a feature set for a particular device. The PAK is an 11-character alphanumeric key printed on the purchase order document that is shipped with your device hardware. The PAK serves as a receipt and is an important component used in the process of obtaining, upgrading, and activating a license.

For information on how to activate a license using PAK, refer Cisco ASR 9001-S 120G Upgrade License Configuration Guide.

On successful registration, the device will receive an identity certificate. This certificate is saved on your device and automatically used for all future communications with Cisco. Every 30 days, Smart Licensing will automatically renew the registration information with Cisco. If registration fails, an error will be logged. Additionally, license usage data is collected and a report is sent to you every month. If required, you can configure your Smart Call Home settings such that sensitive information (like hostname, username and password) are filtered out from the usage report.

Note

Once Smart Licensing mode is enabled, all CLIs related to the traditional licensing mode are disabled.

Before you begin

You must have purchased the product for which you are adding the license. When you purchase the product, you are provided with a user name and password to the Cisco Smart Software Manager portal, from where you can generate the product instance registration tokens.

SUMMARY STEPS

1. Login to Cisco Smart Software Manager at https://tools.cisco.com/rhodui/index.
2. admin
3. configure
4. license smart enable
5. commit
6. admin
7. license smart register idtoken  token_ID
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Login to Cisco Smart Software Manager at <a href="https://tools.cisco.com/rhodui/index">https://tools.cisco.com/rhodui/index</a>.</td>
<td>Get a token from the Cisco portal using the link. You must log in to the portal using a Cisco provided username and password. Once you have generated the token, select <strong>Copy hyperlink</strong> to copy the token or download the token to a text file. The token is used to register and activate a device, and assign the device to a virtual account. <strong>Note</strong> This token is valid for 30 days.</td>
</tr>
</tbody>
</table>
| **Step 2** | `admin`  
**Example:**  
`RP/0/RSP0/CPU0:router# admin` | Enters administration EXEC mode. |
| **Step 3** | `configure`  
**Example:**  
`RP/0/RSP0/CPU0:router(admin)# configure` | Enters administration configuration mode. |
| **Step 4** | `license smart enable`  
**Example:**  
`RP/0/RSP0/CPU0:router(admin-config)#license smart enable`  
`RP/0/RSP0/CPU0:router(admin-config)#show config`  
`Building configuration...`  
`!! IOS XR Configuration 5.2.0.19I`  
`license smart enable`  
`end` | Enables basic Smart Licensing. Use the `no` form of this command to disable Smart Licensing and revert to the traditional or strict mode of licensing. |
| **Step 5** | `commit` | |
| **Step 6** | `admin`  
**Example:**  
`RP/0/RSP0/CPU0:router# admin` | Enters administration EXEC mode. |
| **Step 7** | `license smart register idtoken token_ID`  
**Example:**  
`RP/0/RSP0/CPU0:router(admin)#license smart register idtoken NmE1Yzg0OWMtYmJ4`  
`license smart register: Registration process is in progress. Please check the syslog for the registration status and result` | Use the token ID procured in step 1 to register your device. |

### What to do next

You can use the Cisco Smart Software Manager to:
Verify Smart Licensing Configuration

After enabling Smart Licensing, you can use the `show` commands to verify the default Smart Licensing configuration. If any issue is detected, take corrective action before making further configurations.

### SUMMARY STEPS

1. admin
2. show license status
3. show license register-status
4. show license entitlement
5. show license pool
6. show license cert
7. show license features
8. show license ha
9. show license all
10. exit
11. show call-home smart-licensing statistics

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>admin</td>
<td>Enters administration EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>RP/0/RSP0/CPU0:router# admin</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
</tbody>
</table>
| show license status | Displays the compliance status of Smart Licensing. Following are the possible status:
| Example:         |         |
| RP/0/RSP0/CPU0:router(admin)# show license status |         |

- **Waiting**: Indicates the initial state after your device has made a license entitlement request. The device establishes communication with Cisco and successfully registers itself with the Cisco license manager.
- **Authorized**: Indicates that your device is able to communicate with the Cisco license manager, and is authorised to initiate requests for license entitlements.
- **Out-Of-Compliance**: Indicates that one or more of your licenses are out-of-compliance. You must buy additional licenses.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>• Eval Period</strong>: Indicates that Smart Licensing is consuming the evaluation period. You must register the device with the Cisco Licensing manager, else your license expires.</td>
<td></td>
</tr>
<tr>
<td><strong>• Grace Period</strong>: Indicates that connectivity to the Cisco license manager is lost. You must try restore connectivity to renew the authorization period.</td>
<td></td>
</tr>
<tr>
<td><strong>• Disabled</strong>: Indicates that Smart Licensing is disabled.</td>
<td></td>
</tr>
<tr>
<td><strong>• Invalid</strong>: Indicates that Cisco does not recognize the entitlement tag as it is not in the database.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> show license register-status</td>
<td>Displays the Smart Licensing registration status. If your registration is pending or failed, check for connectivity issues with the Cisco license manager or register the device with a new token ID.</td>
</tr>
<tr>
<td><strong>Example:</strong> RP/0/RSP0/CPU0:router(admin)#show license register-status</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> show license entitlement</td>
<td>Displays the details of the various entitlements you own.</td>
</tr>
<tr>
<td><strong>Example:</strong> RP/0/RSP0/CPU0:router(admin)#show license entitlement</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> show license pool</td>
<td>Displays the pool to which the device belongs.</td>
</tr>
<tr>
<td><strong>Example:</strong> RP/0/RSP0/CPU0:router(admin)#show license pool</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> show license cert</td>
<td>Displays details of the licensing certificate.</td>
</tr>
<tr>
<td><strong>Example:</strong> RP/0/RSP0/CPU0:router(admin)#show license cert</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong> show license features</td>
<td>Displays the licenses that are supported on a given chassis. You can go ahead and buy the required licenses.</td>
</tr>
<tr>
<td><strong>Example:</strong> RP/0/RSP0/CPU0:router(admin)#show license features</td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong> show license ha</td>
<td>Displays the Smart Licensing high availability status, whether it is in active or standby mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> RP/0/RSP0/CPU0:router(admin)#show license ha</td>
<td></td>
</tr>
<tr>
<td><strong>Step 9</strong> show license all</td>
<td>Displays all entitlements in use. It can also be used to check if Smart Licensing is enabled. Additionally, it shows associated licensing certificates, compliance status, UDI, and other details.</td>
</tr>
<tr>
<td><strong>Example:</strong> RP/0/RSP0/CPU0:router(admin)#show license all</td>
<td></td>
</tr>
<tr>
<td><strong>Step 10</strong> exit</td>
<td>Exits administration EXEC mode and returns to EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> RP/0/RSP0/CPU0:router(admin)# exit</td>
<td></td>
</tr>
</tbody>
</table>
Purpose
Command or Action: show call-home smart-licensing statistics

Purpose: Displays the statistics of communication between the Smart Licensing manager and the Cisco back-end using Smart Call Home. In case communication fails or drops, check your call home configuration for any errors.

The following example shows sample output from the **show call-home smart-licensing statistics** command:

```
RP/0/RSP0/CPU0:router# show call-home smart-licensing statistics
Success: Successfully sent and response received.
Failed : Failed to send or response indicated error occurred.
Inqueue: In queue waiting to be sent.
Dropped: Dropped due to incorrect call-home configuration.
```

<table>

### Renew Smart Licensing Registration

In general, your registration is automatically renewed every 30 days. Use this option to make an on-demand manual update of your registration. Thus, instead of waiting 30 days for the next registration renewal cycle, you can issue this command to instantly find out the status of your license.

**Before you begin**

You must ensure that the following conditions are met to renew your smart license:

- Smart licensing is enabled.
- The device is registered.

### SUMMARY STEPS

1. admin
2. license smart renew \{auth | id\}

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> admin</td>
<td>Enters administration EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>RP/0/RSP0/CPU0:router# admin</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> license smart renew {auth</td>
<td>id}</td>
</tr>
</tbody>
</table>
De-register Smart Licensing

When your device is taken off the inventory, shipped elsewhere for redeployment or returned to Cisco for replacement using the return merchandise authorization (RMA) process, you can use the de-register option to cancel the registration on your device. Use the following steps to cancel device registration:

**SUMMARY STEPS**

1. admin
2. license smart deregister

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> admin</td>
<td>Enters administration EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>RP/0/RSP0/CPU0:router# admin</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> license smart deregister</td>
<td>Cancels the device registration, and sends it into a 30-day evaluation mode. All Smart Licensing entitlements and certificates on the platform are removed.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>RP/0/RSP0/CPU0:IMC0(admin)#license smart deregister</td>
<td>License command &quot;license smart deregister &quot; completed successfully.</td>
</tr>
</tbody>
</table>

**Note** Though the product instance has been de-registered from the Cisco license cloud service, Smart Licensing is still enabled.

Smart Licensing Workflow

The Smart Licensing workflow is depicted in this flowchart.
Cisco Smart Software Manager Overview

Cisco Smart Software Manager enables you to manage all of your Cisco Smart software licenses from one centralized website. With Cisco Smart Software Manager, you organize and view your licenses in groups called virtual accounts (collections of licenses and product instances). Use the Cisco Smart Software Manager to do the following tasks:

- Create, manage or view virtual accounts.
- Create and manage Product Instance Registration Tokens.
- Transfer licenses between virtual accounts or view licenses.
- Transfer, remove or view product instances.
- Run reports against your virtual accounts.
- Modify your email notification settings.
- View overall account information.

The Cisco Smart Software Manager Help describes the procedures for carrying out these tasks. You can access the Cisco Smart Software Manager on https://webapps.cisco.com/software/csws/ws/platform/home, by clicking Licensing, and then selecting Smart Software Manager, and then login using the username and password provided by Cisco.

---

**Note**

Use Chrome 32.0, Firefox 25.0 or Safari 6.0.5 web browsers to access the Cisco Smart Software Manager. Also, ensure that Javascript 1.5 or a later version is enabled in your browser.

---

**Licenses, Product Instances, and Registration Tokens**

**Licenses**

Licenses are required for all Cisco products. All Cisco product licenses are one of two types which vary depending on the product:

- Perpetual licenses—Licenses that do not expire.
- Term licenses—Licenses that automatically expire after a set amount of time: one year, three years, or whatever term was purchased.

In addition, there are demo licenses that expire after at most 60 days. As implied by the name, demo licenses are not intended for production use.
All product licenses reside in a virtual account.

**Product Instances**

A product instance is an individual device with a unique device identifier (UDI) that is registered using a product instance registration token (or registration token). You can register any number of instances of a product with a single registration token. Each product instance can have one or more licenses residing in the same virtual account. Product instances must periodically connect to the Cisco Smart Software Manager servers during a specific renewal period. If a product instance fails to connect, it is marked as having a license shortage, but continues to use the license. If you remove the product instance, its licenses are released and made available within the virtual account.

**Product Instance Registration Tokens**

A product requires a registration token until you have registered the product. Registration tokens are stored in the Product Instance Registration Token Table associated with your enterprise account. Once the product is registered the registration token is no longer necessary and can be revoked and removed from the table without effect. Registration tokens can be valid from 1 to 365 days.

**Virtual Accounts**

Smart Licencing allows you to create multiple license pools or virtual accounts within the Smart Software Manager portal. Using the Virtual Accounts option you can aggregate licenses into discrete bundles associated with a cost center so that one section of an organization cannot use the licenses of another section of the organization. For example, if you segregate your company into different geographic regions, you can create a virtual account for each region to hold the licenses and product instances for that region.

All new licenses and product instances are placed in the default virtual account in the Smart Software Manager, unless you specify a different one during the order process. Once in the default account, you may choose to transfer them to any other account as desired, provided you have the required access permissions. See Licenses, Product Instances, and Registration Tokens, on page 367 for details.

Use the Smart Software Manager portal at https://tools.cisco.com/rhodui/index to create license pools or transfer licenses.

**Compliance reporting**

On a periodic basis, as described by the terms of the Smart Licensing contract, reports are automatically sent to you containing inventory and license compliance data. These reports will take one of three forms:

- **Periodic Record**: This record is generated on a periodic (configurable) basis with relevant inventory data saved at a given point of time. This report is saved within the Cisco cloud for archival.

- **Manual Record**: You can manually generate this record with relevant inventory data saved at any given point of time. This report will be saved within the Cisco cloud for archival.

- **Compliance Warning Report**: This report is automatically or manually generated when a license compliance event occurs. This report does not contain a full inventory data, but only any shortfalls in entitlements for a given software license.

You can view these reports from the Smart Software Manager portal at https://tools.cisco.com/rhodui/index.
Traditional Licensing Consideration in Smart Licensing

Traditional licensing, and the associated commands, currently co-exist with Smart Licensing. By default, the software image is loaded with the traditional, strictly-enforced mode of licensing. You may want to retain the traditional licensing model in the following scenarios:

- when there are multiple users, and you do not know the actual end user of your software.
- when the software is deployed in a location with limited access to the license and inventory management solution.
- when the user has opted not to establish a Smart Call Home relationship with Cisco.
- when a Smart Call Home relationship cannot be maintained with the user owing to logistics and a fallback is required.

All traditional licensing CLI commands are disabled if Smart Licensing is enabled. However, you can continue to access the traditional licenses stored under: /disk0:/license/*. Certificates used by Smart Licensing are located under /disk0:/sla/*. Respective CLIs are restored when licensing schemes are switched.

Consumption Model

The consumption model is a new pricing model for line cards to align the initial purchase to your actual needs. This model provides the ability to deploy a line card on day 1 with minimum ports activated to meet the current traffic demands. Over time as the traffic grows, you can add additional ports in 10G port increments. This provides a flexible deployment model with the ability to increase bandwidth to meet your demands.

The consumption model line cards require the users to deploy Smart Licensing to help track and provide visibility into license usage across their network. For information on Smart Licensing see Information About Smart Licensing, on page 355.

You must have a Smart Account created to place an order for the consumption model line card. You can create your Cisco Smart Account at this webpage: https://webapps.cisco.com/software/company/smartaccounts/home#accountcreation-account/request. For information on how to create a Cisco Smart Account, see: http://www.cisco.com/c/en/us/products/collateral/software/one-software/solution-overview-c22-733273.html.
Supported Consumption Model Line Cards

The line cards that can be deployed using consumption model are referred to as the consumption model line cards. The supported consumption model line cards are:

- A9K-8X100GE-CM
- A99-8X100GE-CM
- A99-12X100GE-CM
- A9K-MOD400-CM

Ordering the Consumption Model Line Card using the Consumption Model

The three steps involved in ordering a consumption model line card using the Consumption Model are:

1. Choose the hardware: Select a line card that supports Consumption Model.

   The consumption model line cards require Smart Licensing to be installed at your location to function. When placing an order, you must enter their Smart Account information. For more information on how to create a Cisco Smart Account, see: http://www.cisco.com/c/en/us/products/collateral/software/one-software/solution-overview-c22-733273.html.
Table 46: Minimum Foundation Software Licenses for the CM line cards

<table>

</table>

2. Choose your foundation software licenses: This provides the transport protocol (IP/MPLS, L2VPN, L3VPN, or L2VPN and L3VPN) as well as "per 10G" port activation.

Pick your foundation software licenses based on the feature set and the scale required. The following is the list of the available licenses. The licenses listed are per 10G RTU (Right to Use) and are required to activate a port.

Table 47: Foundation Software Licenses for Cisco IOS XR and Cisco IOS XR 64 bit

3. Choose your advanced software licenses: This provides the advanced feature support such as hierarchical QoS, OAM (Operations, Administration, and Maintenance), and virtual interfaces.

Pick your advanced software licenses, optional, you can select one or more of them from the following list. The licenses listed are per 10G RTU (Right to Use).

Below tables list supported advance software licenses for Cisco IOS XR and Cisco IOS XR 64 bit respectively:

Table 48: Advanced Software Licenses for Cisco IOS XR

Advanced Software License PID | Description
--- | ---
S-A9K-HQOS-RTU-10 | ASR 9000 H-QoS 10G Right to Use License
S-A9K-OAM-RTU-10 | ASR 9000 OAM 10G Right to Use License
S-A9K-VIRT-RTU-10 | ASR 9000 Virtual Interfaces 10G Right to Use License
S-A9K-EVPN-RTU-10 | ASR 9000 E-VPN 10G Right to Use License
S-A9K-VXLAN-RTU-10 | ASR 9000 VxLAN 10G Right to Use License
S-A9K-DWDM-RTU-10 | ASR 9000 IPoDWDM 10G Right to Use License
S-A9K-MAC-RTU-10 | ASR 9000 MACSec 10G Right to Use License
A9K-NVSAT1-LIC | ASR 9000 NV Satellite Right to Use License
A9K-LI-LIC | ASR 9000 Lawful Intercept Right to Use License
A9K-MOBILE-LIC | ASR 9000 Timing Advanced Mobile License Right to Use License

Configuration Examples:
The Consumption Model line cards provide the flexibility to configure the line card on a per 10G port basis. Here are a few examples of configurations of the existing TR and SE versions of line cards using the Consumption Model.

TR Equivalent Configuration

The TR equivalent configuration is a configuration with L2 Premium Foundation Software License plus OAM and Virtual Advanced Software licenses.
### SE Equivalent Configuration

The SE equivalent configuration is a configuration with L2 Premium Foundation Software License plus H-QoS, OAM, and Virtual Advanced Software licenses.

Implementing Default Licensing

Prerequisites for Configuring Software Entitlement

You must be in a user group associated with a task group that includes the proper task IDs. The command reference guides include the task IDs required for each command. If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Information About Default (Traditional) Licensing

To configure software license entitlements using the default mode of licensing, you need to understand the concepts described in this module.

Types of Licenses

The following types of licenses are currently defined:

- Permanent licenses—Licenses that enable a designated feature permanently, as long as the license resides on the router.

Router License Pools

License pools are maintained by the router. By default, all added licenses are allocated to the owner secure domain router (SDR) license pool, and they can be freely allocated to any slot in the router. Features on cards belonging to the owner SDR are granted licenses based on availability in the owner SDR license pool.

Chassis-Locked Licenses

Licenses are locked to a unique device identifier (UDI). The UDI is comprised of the chassis serial number, along with an additional identifier. The complete set of UDI information can be displayed using the `show license udi` command. The license manager parses the user-provided license and verifies that it is valid for the chassis it is running on and determines if the license is being readded.

Slot-Based Licenses

Feature licenses are allocated to router slots and not cards. Therefore, if a card is replaced, the existing license is applied to the newly inserted card. For example, if you have eight licenses for Layer 3 VPN in the system, you can configure Layer 3 VPN features on any eight cards in the router, and the licenses are allocated to the slots within which the cards are installed. If a card is removed from one of these licensed slots, say slot 3, and entered into an empty slot with no license, say slot 5, the license remains with slot 3 and the feature cannot be activated on slot 5 with the permanent license entered earlier by the user. In this case, you can release the license to the appropriate license pool by removing the configuration of the card (while it is inserted), or by using the `license move slot` command. When you configure the feature on slot 5, the license is checked out.
Configure Licenses Using Default Licensing

Adding a License for a New Feature

This task describes how to acquire a permanent license for a feature that you have purchased or an evaluation license for a feature that you have arranged with your sales representative to try. Use this procedure to replace evaluation licenses with permanent licenses.

Before you begin

You must have purchased the feature for which you are adding the license. When you purchase the feature, you are provided with a product authorization key (PAK) that you use to download the license.

SUMMARY STEPS

1. admin
2. show license udi
4. Copy the license to your TFTP server.
5. admin
6. license add license-name [ sdr sdr-name ]
7. configure
8. license license-name location {all | node-id}
9. exit

DETAILED STEPS

<table>
<thead>
<tr>

<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td><a href="http://www.cisco.com/go/license">http://www.cisco.com/go/license</a></td>
<td>Go to the license tool on Cisco.com. You must log in to the site before you can access the license tool. Follow the instructions for product license registration. You are</td>
</tr>
</tbody>
</table>
Adding a License for a New Feature

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Required to enter the feature PAK and the chassis UDI to acquire the license.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> If you are installing a permanent license, you should have received the PAK when you purchased the feature. If you are installing an evaluation license, your sales representative should provide you with the PAK.</td>
</tr>
</tbody>
</table>

**Step 4** Copy the license to your TFTP server. You will be issued a license. You can copy the license and store it on your computer, or alternatively, you can request that the license be sent to you in an e-mail. When you have received the license, copy it to a TFTP server that is accessible by your router.

**Step 5** *admin*

**Example:**

```
RP/0/RSP0/CPU0:router# admin
```

**Step 6** `license add license-name [ sdr sdr-name ]`

**Example:**

```
RP/0/RSP0/CPU0:router(admin)# license add tftp://192.10.10.10/mylicenses/lc40g_lic
```

**Step 7** `configure`

**Example:**

```
RP/0/RSP0/CPU0:router(admin)# configure
```

**Step 8** `license license-name location { all | node-id }`

**Example:**

```
RP/0/RSP0/CPU0:router(admin-config)# license A9K-ADV-OPTIC-LIC location 0/0/CPU0
```

(Optional) Binds the license to the slot where it is to be used.

**Note** Beginning with Cisco IOS XR Release 4.3.1, this command is optional. If you do not use this command, it is configured as though the license is bound to all slots.

**Step 9** `exit`

**Example:**

```
RP/0/RSP0/CPU0:router(admin)# exit
```

**What to do next**

To use the feature associated with the added license, you must configure it on your router. To configure Layer 3VPN, see the Implementing MPLS Layer 3 VPNs on Cisco IOS XR Software module in the MPLS Configuration Guide for Cisco ASR 9000 Series Routers.
To verify that your Layer 3 VPN configuration is operational, use the `show rsi interface all global` command.

### Backing Up Licenses

When your router is configured with the licenses that you require, you should perform this task to back up all licenses. Backing up licenses makes it easier to restore them if there is a problem.

#### SUMMARY STEPS

1. `admin`
2. `license backup backup-file`
3. `show license backup backup-file`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters administration EXEC mode.</td>
</tr>
<tr>
<td><code>admin</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Enter administration EXEC mode.</td>
</tr>
<tr>
<td>RP/0/RSP0/CPU0:router# admin</td>
<td>Enters administration EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Backs up all licenses on the router to a backup file in the specified location. The backup file can be a local file or a remote file on a TFTP or RCP server.</td>
</tr>
<tr>
<td><code>license backup backup-file</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Backs up all licenses on the router to a backup file in the specified location. The backup file can be a local file or a remote file on a TFTP or RCP server.</td>
</tr>
<tr>
<td>RP/0/RSP0/CPU0:router@admin# license backup disk1:/license_back</td>
<td>Backs up all licenses on the router to a backup file in the specified location. The backup file can be a local file or a remote file on a TFTP or RCP server.</td>
</tr>
<tr>
<td>License command &quot;license backup disk1:/license_back&quot; completed successfully.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Displays the contents of the backup file.</td>
</tr>
<tr>
<td><code>show license backup backup-file</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Displays the contents of the backup file.</td>
</tr>
<tr>
<td>RP/0/RSP0/CPU0:router@admin# show license backup disk1:/license_back</td>
<td>Displays the contents of the backup file.</td>
</tr>
</tbody>
</table>

#### Examples

The following example shows sample output from the `show license backup` command.

```
RP/0/RSP0/CPU0:router@admin# show license backup disk1:/license_back

Local Chassis UDI Information:
S/N: TBA09370035
Operation ID: 5
Licenses:
FeatureID  Type          #installed
CRS-MSC-40G Slot based, Permanent 2
XC-L3VPN  Slot based, Permanent 1
```
Restoring Licenses

If your licenses become corrupted, and you have previously created a backup of your licenses, you can perform this task to restore the licenses to your router.

Before you begin

You must have created a backup file of your licenses before you can restore them on your router.

SUMMARY STEPS

1. admin
2. show license backup backup-file
3. license restore backup-file

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> admin</td>
<td>Enters administration EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RSP0/CPU0:router# admin</td>
</tr>
</tbody>
</table>
### Purpose

**Step 2**

**Command or Action**: `show license backup backup-file

Example:

```
RP/0/RSP0/CPU0:router(admin)# show license backup
disk1:/license_back
```

**Purpose**: Displays the contents of the backup file. You should verify the contents of the backup file before you restore your licenses.

**Step 3**

**Command or Action**: `license restore backup-file

Example:

```
RP/0/RSP0/CPU0:router(admin)# license restore
disk1:/license_back
```

**Purpose**: Restores all licenses on the router from a backup file in the specified location. This can be a local file, or a remote file on a TFTP or RCP server.

### Examples

This example shows sample output from the `license restore` command.

```
RP/0/RSP0/CPU0:router(admin)# license restore disk1:/license_back

Info: This command will erase all existing licenses.
Info: It is strongly recommended to backup existing licenses first.
Do you wish to proceed? [yes/no]: y

License command "license restore disk1:/license_back" completed successfully.
```

### Transferring Licenses to a new Route Switch Processor 440

To upgrade a route switch processor (RSP) to the RSP440 with your active licenses, perform this task.

### SUMMARY STEPS

1. Save the original license file that you received from Cisco, in a USB drive or TFTP server.
2. `save configuration running`
3. Replace the RSP with the RSP440.
4. `load`
5. Add all licenses as described in Adding a License for a New Feature, on page 375.

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**

Save the original license file that you received from Cisco, in a USB drive or TFTP server.

Stores the license files in a location that is accessible to the new RSP after it is installed.

**Step 2**

`save configuration running`

**Example**:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# save configuration running tftp://192.10.10.10/mylicenses/rc_03132013
RP/0/RSP0/CPU0:router(config)# exit
RP/0/RSP0/CPU0:router# admin
RP/0/RSP0/CPU0:router(admin)# configure
```

Saves the running-configuration from both global configuration and administration configuration modes to files. The administration configuration contains user group information that is required for the licenses.
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>RP/0/RSP0/CPU0:router(admin-config)# save configuration running tftp://192.10.10.10/mylicenses/rc_admin_03132013</td>
<td></td>
</tr>
</tbody>
</table>

**Step 3**
Replace the RSP with the RSP440.

**Step 4**
Load the saved running-configuration files on the new RSP440. This must be done in both global configuration mode and administration configuration mode.

**Example:**

```plaintext
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# load tftp://192.10.10.10/mylicenses/rc_03132013
RP/0/RSP0/CPU0:router(config)# exit
RP/0/RSP0/CPU0:router# admin
RP/0/RSP0/CPU0:router(admin)# configure
RP/0/RSP0/CPU0:router(admin-config)# load tftp://192.10.10.10/mylicenses/rc_admin_03132013
```

**Step 5**
Add all licenses as described in Adding a License for a New Feature, on page 375.
Installs the licenses to the new RSP.

### Upgrading Line Cards and Licenses

You may have a number of licenses running on the line cards in your router. Before you upgrade these line cards to advanced models, you need to install new licenses that are appropriate for these line cards. This task describes the steps necessary to upgrade your line cards and their licenses.

**Before you begin**

- You must have purchased all relevant licenses for the line cards that you are upgrading, prior to performing this task.
- You must have placed the license files on your router disk drive or a TFTP server such that they accessible from your router. Refer to Adding a License for a New Feature, on page 375 for more information.

**SUMMARY STEPS**

1. **admin**
2. **license add license-name**
3. **configure**
4. **license license-name location {all | node-id }**
5. Remove the old line cards and install the new ones.
6. **show license**

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>admin</strong></td>
</tr>
<tr>
<td>Example:</td>
<td>Enters administration EXEC mode.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td>RP/0/RSP0/CPU0:router# admin</td>
<td></td>
</tr>
</tbody>
</table>

### Step 2

**license add license-name**  
**Example:**  
RP/0/RSP0/CPU0:router(admin)# license add  
tftp://192.10.10.10/mylicenses/A9K-24X10G-AIP-TR-lic  
**Purpose:** Adds the license to the license pool.

### Step 3

**configure**  
**Example:**  
RP/0/RSP0/CPU0:router(admin)# configure  
**Purpose:** Enters administration configuration mode.

### Step 4

**license license-name location {all | node-id}**  
**Example:**  
RP/0/RSP0/CPU0:router(admin-config)# license  
A9K-24X10G-AIP-TR location 0/0/CPU0  
**Purpose:** (Optional) Binds the license to the slot where it is used.  
**Note:** Beginning with Cisco IOS XR Release 4.3.1, this command is optional. If you do not use this command, it is configured as though the license is bound to all slots.

### Step 5

Remove the old line cards and install the new ones.  
**Purpose:** Associates the new license on the slot with the new line card.  
**Note:** You need to wait for the new line cards to boot.

### Step 6

**show license**  
**Example:**  
RP/0/RSP0/CPU0:router# show license  
Thu May 31 08:52:39.876 PST  
FeatureID: A9K-24X10G-AIP-TR (Slot based, Permanent)  
  Total licenses 1  
  Available for use 0  
  Allocated to location 0  
  Active 1  
  Store name Permanent  
  Store index 3  
  Pool: Owner  
  Total licenses in pool: 1  
  Status: Available 0 Operational: 1  
  Locations with licenses: (Active/Allocated)  
  [SDR]  
  0/0/CPU0 (1/0) [Owner]  
**Purpose:** Verifies the status of the licenses.  
**Note:** Old licenses remaining on the router are not a problem.

**Troubleshooting License Issues after a Software Upgrade**

In the instance that you were running Cisco IOS XR Release 3.9.0 and had the optic feature enabled on a interface and the A9K-ADV-OPTIC-LIC license was active on a particular slot, when you upgrade to Cisco
IOS XR Release 4.0.0, the A9K-ADV-OPTIC-LIC license is still active, but you may get the following warning message:

```
RP/0/RSP0/CPU0:Jul 27 14:22:22.594 : licmgr[236]:
%LICENSE-LICMGR-4-PACKAGE_LOCATION_LICENSE_INVALID : Feature associated to package A9K-ADV-OPTIC-LIC configured on node 0/4/CPU0 without a valid license
```

To solve this issue, configure the `license` command in administration EXEC mode. This binds the A9K-ADV-OPTIC-LIC license to the slot on which you are using the license. For example:

```
RP/0/RSP0/CPU0:router(admin-config)# license A9K-ADV-OPTIC-LIC location 0/4/CPU0
RP/0/RSP0/CPU0:router(admin-config)# commit
```
CHAPTER 21

Configuring Frequency Synchronization

Frequency Synchronization is used to distribute precision frequency around a network. Frequency is synchronized accurately using Synchronized Ethernet (SyncE) in devices connected by Ethernet in a network.

This module describes the concepts around this and details the various configurations involved. For information on SyncE commands, see System Management Command Reference for Cisco ASR 9000 Series Routers.

This module contains the following topics:

- Overview, on page 383
- Configuring Frequency Synchronization, on page 386

Overview

Frequency or timing synchronization is the ability to distribute precision frequency around a network. In this context, timing refers to precision frequency, not an accurate time of day. Precision frequency is required in next generation networks for applications such as circuit emulation.

To achieve compliance to ITU specifications for TDM, differential method circuit emulation must be used, which requires a known, common precision frequency reference at each end of the emulated circuit. The incumbent example of frequency synchronization is provided by SDH equipment. This is used in conjunction with an external timing technology to provide synchronization of precision timing across the network.

SDH equipments are widely replaced by Ethernet equipments and synchronized frequency is required over such Ethernet ports. Synchronous Ethernet (SyncE) is used to accurately synchronize frequency in devices connected by Ethernet in a network. SyncE provides level frequency distribution of known common precision frequency references to a physical layer Ethernet network.

To maintain SyncE links, a set of operational messages are required. These messages ensure that a node is always deriving timing information from the most reliable source and then transfers the timing source quality information to clock the SyncE link. In SDH networks, these are known as Synchronization Status Messages (SSMs). SyncE uses Ethernet Synchronization Message Channel (ESMC) to provide transport for SSMs.

Source and Selection Points

Frequency Synchronization implementation involves Sources and Selection Points.

A Source inputs frequency signals into a system or transmits them out of a system. There are four types of sources:

- Line interfaces. This includes SyncE interfaces and SONET interfaces.
Clock interfaces. These are external connectors for connecting other timing signals, such as BITS, UTI and GPS.

PTP clock. If IEEE 1588 version 2 is configured on the router, a PTP clock may be available to frequency synchronization as a source of the time-of-day and frequency.

Internal oscillator. This is a free-running internal oscillator chip.

Each source has a Quality Level (QL) associated with it which gives the accuracy of the clock. This QL information is transmitted across the network using ESMC or SSMs contained in the SDH frames. This provides information about the best available source the devices in the system can synchronize to. To define a predefined network synchronization flow and prevent timing loops, you can assign priority values to the sources on each router. The combination of QL information and user-assigned priority levels allow each router to choose a source to synchronize its SyncE or SDH interfaces, as described in the ITU standard G.781.

A Selection Point is any point where a choice is made between several frequency signals and possibly one or many of them are selected. Selection points form a graph representing the flow of timing signals between different cards in a router running Cisco IOS XR software. For example, there can be one or many selection points between different Synchronous Ethernet inputs available on a single line card. This information is forwarded to a selection point on the RSP, to choose between the selected source from each card.

The input signals to the selection points can be:

- Received directly from a source.
- Received as the output from another selection point on the same card.
- Received as the output from a selection point on a different card.

The output of a selection point can be used in a number of ways, like:

- To drive the signals sent out of a set of interfaces.
- As input into another selection point on a card.
- As input into a selection point on an another card.

Use `show frequency synchronization selection` command to see a detailed view of the different selection points within the system.

### SyncE Hardware Support Matrix

This table provides details on the hardware that supports SyncE:

<table>
<thead>
<tr>
<th>Hardware Variant</th>
<th>Cisco IOS XR</th>
<th>Cisco IOS XR 64 bit</th>
</tr>
</thead>
<tbody>
<tr>
<td>A9K-8X100GE-L-SE/TR (10GE and 100GE)</td>
<td>5.3.0</td>
<td>6.1.1</td>
</tr>
<tr>
<td>A9K-RSP880-SE/TR</td>
<td>5.3.0</td>

SyncE Restrictions

This section lists a few restrictions in configuring frequency synchronization. They are:

- On SyncE line interfaces, only one interface from each PHY can be configured as SyncE input (there is no restriction on SyncE output) on the A9K-24X10GE-1G-SE/TR and A9K-48X10GE-1G-SE/TR line cards.

Configuring Frequency Synchronization

Enabling Frequency Synchronization on the Router

This task describes the router-level configuration required to enable frequency synchronization.

**SUMMARY STEPS**

1. configure
2. frequency synchronization
3. clock-interface timing-mode {independent | system}
4. quality itu-t option {1 | 2 generation {1 | 2}}
5. log selection {changes | errors}
6. Use one of these commands:
   - end
   - commit

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure</td>
<td></td>
</tr>
<tr>
<td>Step 2 frequency synchronization</td>
<td>Enables frequency synchronization on the router.</td>
</tr>
<tr>
<td>Example: RP/0/RSP0/CPU0:router(config)# frequency synchronization</td>
<td></td>
</tr>
<tr>
<td>Step 3 clock-interface timing-mode {independent</td>
<td>system}</td>
</tr>
<tr>
<td>Example: RP/0/RSP0/CPU0:router(config-freqsync)# clock-interface timing-mode system</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>------------------</td>
<td>---------</td>
</tr>
<tr>
<td>• independent — Specifies that the output of clock interfaces is driven only by the line interfaces (SyncE and SONET/SDH), as in the default mode. Loopback detection is disabled.</td>
<td></td>
</tr>
<tr>
<td>• system — Specifies that the output of a clock interface is driven by the system-selected timing source (the source used to drive all SyncE and SONET/SDH interfaces), including clock interfaces. Loopback detection is disabled.</td>
<td></td>
</tr>
</tbody>
</table>

**Step 4**

quality itu-t option {1 | 2 generation {1 | 2}}

Example:

```
RP/0/RSP0/CPU0:router(config-freqsync)# quality itu-t
option 2 generation 1
```

(Optional) Specifies the quality level for the router. The default is option 1.

- **option 1** — Includes PRC, SSU-A, SSU-B, SEC and DNU.
- **option 2 generation 1** — Includes PRS, STU, ST2, ST3, SMC, ST4, RES and DUS.
- **option 2 generation 2** — Includes PRS, STU, ST2, ST3, TNC, ST3E, SMC, ST4, PROV and DUS.

**Note**

The quality option configured here must match the quality option specified in the quality receive and quality transmit commands in interface frequency synchronization configuration mode.

**Step 5**

log selection {changes | errors}

Example:

```
RP/0/RSP0/CPU0:router(config-freqsync)# log selection changes
```

Enables logging to frequency synchronization.

- **changes** — Logs every time there is a change to the selected source, in addition to errors.
- **errors** — Logs only when there are no available frequency sources, or when the only available frequency source is the internal oscillator.

**Step 6**

Use one of these commands:

- **end**
- **commit**

Example:

```
RP/0/RSP0/CPU0:router(config-freqsync)# end
RP/0/RSP0/CPU0:router(config-freqsync)# commit
```

Saves configuration changes.

- When you issue the **end** command, the system prompts you to commit changes:

```
Uncommitted changes found, commit them before exiting(yes/no/cancel)? [cancel]:
```

- Entering **yes** saves configuration changes to the running configuration file, exits the configuration session, and returns the router to EXEC mode.
- Entering **no** exits the configuration session and returns the router to EXEC mode without committing the configuration changes.
What to do next
Configure frequency synchronization on any interfaces that should participate in frequency synchronization.

Configuring Frequency Synchronization on an Interface

By default, there is no frequency synchronization on line interfaces. Use this task to configure an interface to participate in frequency synchronization.

Before you begin
You must enable frequency synchronization globally on the router.

SUMMARY STEPS

1. `configure`
2. `interface type interface-path-id`
3. `frequency synchronization`
4. `selection input`
5. `priority priority-value`
6. `wait-to-restore minutes`
7. `ssm disable`
8. `time-of-day-priority priority`
9. `quality transmit {exact | highest | lowest} itu option ql-option`
10. `quality receive {exact | highest | lowest} itu option ql-option`
11. Use one of these commands:
   - `end`
   - `commit`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure</td>
<td>Enters interface configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> interface type interface-path-id</td>
<td></td>
</tr>
</tbody>
</table>

- Entering `cancel` leaves the router in the current configuration session without exiting or committing the configuration changes.
- Use the `commit` command to save the configuration changes to the running configuration file, and remain within the configuration session.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 3**
RP/0/RSP0/CPU0:router(config)# interface GigabitEthernet0/1/1/0 | Enables frequency synchronization on the interface and enters interface frequency synchronization mode to configure the various options. By default, this causes the system selected frequency signal to be used for clocking transmission, but does not enable the use of the interface as an input. |
| **Step 4**
frequency synchronization Example: RP/0/RSP0/CPU0:router(config-if)# frequency synchronization | (Optional) Specifies the interface as a timing source to be passed to the selection algorithm. |
| **Step 5**
selection input Example: RP/0/RSP0/CPU0:router(config-if-freqsync)# selection input | (Optional) Configures the priority of the frequency source on a controller or an interface. Values can range from 1 (highest priority) to 254 (lowest priority). The default value is 100. This command is used to set the priority for an interface or clock interface. The priority is used in the clock-selection algorithm to choose between two sources that have the same quality level (QL). Lower priority values are preferred. |
| **Step 6**
wait-to-restore minutes Example: RP/0/RSP0/CPU0:router(config-if-freqsync)# wait-to-restore 300 | (Optional) Configures the wait-to-restore time, in minutes, for frequency synchronization on an interface. This is the amount of time after the interface comes up before it is used for synchronization. Values can range from 0 to 12. The default value is 5. |
| **Step 7**
ssm disable Example: RP/0/RSP0/CPU0:router(config-if-freqsync)# ssm disable | (Optional) Disables Synchronization Status Messages (SSMs) on the interface. |
| • For SyncE interfaces, this disables sending ESMC packets, and ignores any received ESMC packets. |
| • For SONET and clock interfaces, this causes DNUs to be sent, and ignores any received QL value. |
| **Step 8**
time-of-day-priority priority Example: RP/0/RSP0/CPU0:router(config-if-freqsync)# time-of-day-priority 50 | (Optional) Specifies the priority of this time source as the time-of-day (ToD) source. The priority is used as the first criterion when selecting between sources for a time-of-day selection point. Values can range from 1 (highest priority) to 254 (lowest priority); the default value is 100. |
| **Step 9**
quality transmit {exact | highest | lowest} itu-t option ql-option Example: RP/0/RSP0/CPU0:router(config-clk-freqsync)# quality transmit highest itu-t option 1 prc | (Optional) Adjusts the QL that is transmitted in SSMs. |
<p>| • exact ql—Specifies the exact QL to send, unless DNU would otherwise be sent. |</p>
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 10</strong> quality receive {exact</td>
<td>highest</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>RP/0/RSP0/CPU0:router(config-clk-freqsync)# quality receive highest itu-t option 1 prc</td>
<td></td>
</tr>
</tbody>
</table>

**Step 11** Use one of these commands:  
• end  
• commit  
**Example:**  
RP/0/RSP0/CPU0:router(config-if-freqsync)# end  
or  
RP/0/RSP0/CPU0:router(config-if-freqsync)# commit  
Saves configuration changes.  
• When you issue the end command, the system prompts you to commit changes:  
  
  Uncommitted changes found, commit them before exiting(yes/no/cancel)? [cancel]:  
  
  • Entering yes saves configuration changes to the running configuration file, exits the configuration session, and returns the router to EXEC mode.  

- **highest ql**—Specifies an upper limit on the QL to be sent. If the selected source has a higher QL than the QL specified here, this QL is sent instead.
- **lowest ql**—Specifies a lower limit on the QL to be sent. If the selected source has a lower QL than the QL specified here, DNU is sent instead.

The quality option specified in this command must match the globally-configured quality option in the quality itu-t option command.  
**Note** For clock interfaces that do not support SSM, only the lowest QL can be specified. In this case, rather than sending DNU, the output is squelched, and no signal is sent.  

- **exact ql**—Specifies the exact QL regardless of the value received, unless the received value is DNU.  
- **highest ql**—Specifies an upper limit on the received QL. If the received value is higher than this specified QL, this QL is used instead.  
- **lowest ql**—Specifies a lower limit on the received QL. If the received value is lower than this specified QL, DNU is used instead.

The quality option specified in this command must match the globally-configured quality option in the quality itu-t option command.  
**Note** For clock interfaces that do not support SSM, only the exact QL can be specified.
Configuring Clock Interface with DTI input

This procedure describes the steps involved to configure a Clock interface with DTI input.

1. To configure a clock interface, use `clock-interface sync value location node` command in the configuration mode.

   ```
   RP/0/RSP0/CPU0:router(config)# clock-interface sync 1 location 0/RSP0/CPU0
   ```

2. To configure port parameters for the given clock interface, use `port-parameters dti` command in the clock-interface configuration mode.

   ```
   RP/0/RSP0/CPU0:router(config-clock-if)# port-parameters dti
   ```

3. To enable frequency synchronization, use `frequency synchronization` command in the clock-interface configuration mode.

   ```
   RP/0/RSP0/CPU0:router(config-clock-if)# frequency synchronization
   ```

4. To configure selection input for the given clock interface, use `selection input` command in the frequency-synchronization clock-configuration mode.

   ```
   RP/0/RSP0/CPU0:router(config-clk-freqsync)# selection input
   ```

5. To configure priority for the clock interface, use `priority number` command in the frequency-synchronization clock-configuration mode.

   ```
   RP/0/RSP0/CPU0:router(config-clk-freqsync)# priority 1
   ```

6. To configure wait-to-restore time for the clock interface, use `wait-to-restore number` command in the frequency-synchronization clock-configuration mode.

   ```
   RP/0/RSP0/CPU0:router(config-clk-freqsync)# wait-to-restore 0
   ```

7. To disable SSM packets for the clock interface, use `ssm disable` command in the frequency-synchronization clock-configuration mode.

   ```
   RP/0/RSP0/CPU0:router(config-clk-freqsync)# ssm disable
   ```
8. To configure quality settings for the clock interface, use `quality receive exact itu-t option number generation number PRS` command in the frequency-synchronization clock-configuration mode.

   RP/0/RSP0/CPU0:router(config-clk-freqsync)# quality receive exact itu-t option 2 generation 2 PRS

**Verification**

To display the current running configuration of an interface, use `show run clock-interface` command.

   RP/0/RSP0/CPU0:router# show run clock-interface sync 1 location 0/RSP0/CPU0

```
clock-interface sync 1 location 0/RSP0/CPU0
  port-parameters
dti

! frequency synchronization
  selection input
  priority 1
  wait-to-restore 0
  ssm disable
  quality receive exact itu-t option 2 generation 2 PRC

!RP/0/RSP0/CPU0:router#
```

**Configuring GPS Settings for a sync2 interface**

This procedure describes the steps involved to configure GPS settings for a sync2 interface.

1. To configure a clock interface, use `clock-interface sync port-number location interface-location` command in the configuration mode.

   RP/0/RSP0/CPU0:router(config)# clock-interface sync 2 location 0/RSP0/CPU0

2. To configure port parameters for the given clock interface, use `port-parameters` command in the clock-interface configuration mode.

   RP/0/RSP0/CPU0:router(config-clock-if)# port-parameters

3. To configure GPS input parameters, use `gps-input tod-format gprmc pps-input ttl` command.

   RP/0/RSP0/CPU0:router(config-clk-parms)# gps-input tod-format gprmc pps-input ttl

4. To return to the clock-interface configuration mode, use `exit` command.

   RP/0/RSP0/CPU0:router(config-clk-parms)# exit

5. To enable frequency synchronization, use `frequency synchronization` command in the clock-interface configuration mode.

   RP/0/RSP0/CPU0:router(config-clock-if)# frequency synchronization
6. To configure selection input for the given clock interface, use `selection input` command in the frequency-synchronization clock-configuration mode.

   ```
   RP/0/RSP0/CPU0:router(config-clk-freqsync)# selection input
   ```

7. To configure priority for the clock interface, use `priority number` command in the frequency-synchronization clock-configuration mode.

   ```
   RP/0/RSP0/CPU0:router(config-clk-freqsync)# priority 10
   ```

8. To configure wait-to-restore time for the clock interface, use `wait-to-restore number` command in the frequency-synchronization clock-configuration mode.

   ```
   RP/0/RSP0/CPU0:router(config-clk-freqsync)# wait-to-restore 0
   ```

9. To disable SSM packets for the clock interface, use `ssm disable` command in the frequency-synchronization clock-configuration mode.

   ```
   RP/0/RSP0/CPU0:router(config-clk-freqsync)# ssm disable
   ```

10. To configure quality settings for the clock interface, use `quality receive exact itu-t option number generation number PRS` command in the frequency-synchronization clock-configuration mode.

    ```
    RP/0/RSP0/CPU0:router(config-clk-freqsync)# quality receive exact itu-t option 2 generation 2 PRS
    ```

Verification

To verify the configured GPS parameters, use `show run clock-interface` command.

```
RP/0/RSP0/CPU0:router# show run clock-interface sync 2 location 0/RSP0/CPU0
```

GPS ToD Support for NMEA

National Marine Electronics Associations (NMEA) 0183 is a standard protocol used by GPS receivers to transmit data and is responsible for creating a standard uniform interface for digital data exchange between different marine electronic products. NMEA provides protocol strings to send out GPS updates. GPRMC is one such NMEA string that provides exact data and time (Greenwich time), latitude, longitude, heading, and speed. Router receives GPS ToD messages in serial ASCII stream through the RS422 interface in three formats - NTP Type 4, Cisco, and GPRMC. The timing data is extracted from this stream.

Note

Cisco ASR 9000 Series Routers can support ToD in NMEA or GPRMC format. Currently, this is supported only on RS422.
You can refer to the below support information in context of the current release and see relevant *Release Notes* for more information on supported features and hardware.

Supported hardware are:

- A9K-RSP440-SE/TR
- A9K-RSP880-SE/TR
- A99-RP2-SE/TR
- A9K-RSP880-LT-SE/TR

**Verifying the Frequency Synchronization Configuration**

After performing the frequency synchronization configuration tasks, use this task to check for configuration errors and verify the configuration.

**SUMMARY STEPS**

1. `show frequency synchronization configuration-errors`
2. `show frequency synchronization interfaces brief`
3. `show frequency synchronization interfaces node-id`
4. `show processes fsyncmgr location node-id`

**DETAILED STEPS**

**Step 1**

`show frequency synchronization configuration-errors`

**Example:**

```
RP/0/RSP0/CPU0:router# show frequency synchronization configuration-errors

Node 0/2/CPU0:
================================
interface GigabitEthernet0/2/0/0 frequency synchronization
  * Frequency synchronization is enabled on this interface, but isn't enabled globally.

interface GigabitEthernet0/2/0/0 frequency synchronization quality transmit exact itu-t option 2 generation 1 PRS
  * The QL that is configured is from a different QL option set than is configured globally.
```

Displays any errors that are caused by inconsistencies between shared-plane (global) and local-plane (interface) configurations. There are two possible errors that can be displayed:

- Frequency Synchronization is configured on an interface (line interface or clock-interface), but is not configured globally. Refer to *Enabling Frequency Synchronization on the Router*, on page 386

- The QL option configured on some interface does not match the global QL option. Under an interface (line interface or clock interface), the QL option is specified using the `quality transmit` and `quality receive` commands. The value
specified must match the value configured in the global **quality itu-t option** command, or match the default (option 1) if the global **quality itu-t option** command is not configured.

Once all the errors have been resolved, meaning there is no output from the command, continue to the next step.

**Step 2**  
**show frequency synchronization interfaces brief**

**Example:**

```
RP/0/RSP0/CPU0:router# show frequency synchronization interfaces brief
```

**Flags:**  
- > - Up  
- D - Down  
- S - Assigned for selection  
- d - SSM Disabled  
- x - Peer timed out  
- i - Init state

<table>
<thead>
<tr>
<th>Fl</th>
<th>Interface</th>
<th>QLrcv</th>
<th>QLuse</th>
<th>Pri</th>
<th>QLsnd</th>
<th>Source</th>
</tr>
</thead>
<tbody>
<tr>
<td>&gt;S</td>
<td>GigabitEthernet0/2/0/0</td>
<td>Fail</td>
<td>Fail</td>
<td>100</td>
<td>DNU</td>
<td>None</td>
</tr>
<tr>
<td>Dd</td>
<td>GigabitEthernet0/2/0/1</td>
<td>n/a</td>
<td>Fail</td>
<td>100</td>
<td>n/a</td>
<td>None</td>
</tr>
</tbody>
</table>

**Step 3**  
**show frequency synchronization interfaces node-id**

**Example:**

```
RP/0/RSP0/CPU0:router# show frequency synchronization interfaces GigabitEthernet0/2/0/2
```

Verifies the configuration. Note the following points:

- All line interface that have frequency synchronization configured are displayed.
- All clock interfaces and internal oscillators are displayed.
- Sources that have been nominated as inputs (in other words, have **selection input** configured) have ‘S’ in the Flags column; sources that have not been nominated as inputs do not have ‘S’ displayed.

**Note**  
Internal oscillators are always eligible as inputs.

- ‘>’ or ‘D’ is displayed in the flags field as appropriate.

If any of these items are not true, continue to the next step.
Verifying the Frequency Synchronization Configuration

Interface GigabitEthernet0/2/0/2 (shutdown)
Assigned as input for selection
SSM Enabled
Input:
  Down
  Last received QL: Failed
  Effective QL: Failed, Priority: 100
Output:
  Selected source: Sync0 [0/0/CPU0]
  Selected source QL: Opt-I/PRC
  Effective QL: Opt-I/PRC
  Next selection points: LC_INGRESS

RP/0/RSP0/CPU0:router# show frequency synchronization clock-interfaces location 0/1/CPU0

Node 0/1/CPU0:
-----------
Clock interface Sync0 (Down: mode not configured)
SSM supported and enabled
Input:
  Down
  Last received QL: Opt-I/PRC
  Effective QL: Failed, Priority: 100
Output:
  Selected source: Internal0 [0/1/CPU0]
  Selected source QL: Opt-I/SSU-B
  Effective QL: Opt-I/SSU-B
  Next selection points: RP_SYSTEM

Clock interface Sync1 (Down: mode not configured)
SSM supported and enabled
Input:
  Down
  Last received QL: Opt-I/PRC
  Effective QL: Failed, Priority: 100
Output:
  Selected source: Internal0 [0/1/CPU0]
  Selected source QL: Opt-I/SSU-B
  Effective QL: Opt-I/SSU-B
  Next selection points: RP_SYSTEM

Clock interface Internal0 (Up)
Assigned as input for selection
Input:
  Default QL: Opt-I/SSU-B
  Effective QL: Opt-I/SSU-B, Priority: 255
  Next selection points: RP_SYSTEM RP_CLOCK_INTF

Investigates issues within individual interfaces. If the clock interface is down, a reason is displayed. This may be because there is missing or conflicting platform configuration on the clock interface.

Step 4 show processes fsyncmgr location node-id

Example:

RP/0/RSP0/CPU0:router# show processes fsyncmgr location 0/0/CPU0

  Job Id: 134
  PID: 30202
  Executable path: /pkg/bin/fsyncmgr
  Instance #: 1
Verifies that the fsynmgr process is running on the appropriate nodes.
Verifying the Frequency Synchronization Configuration
Configuring Precision Time Protocol

_Precision Time Protocol_ (PTP) is a protocol that defines a method to distribute time around a network. PTP support is based on the IEEE 1588-2008 standard.

This module describes the concepts around this protocol and details the various configurations involved. For information on PTP commands, see _System Management Command Reference for Cisco ASR 9000 Series Routers_.

This module contains the following topics:

- Overview, on page 399
- ITU-T Telecom Profiles for PTP, on page 408
- Configuring PTP, on page 413
- Configuration Examples, on page 425

**Overview**

The Precision Time Protocol (PTP), as defined in the IEEE 1588 standard, synchronizes with nanosecond accuracy the real-time clocks of the devices in a network. The clocks are organized into a master-slave hierarchy. PTP identifies the port that is connected to a device with the most precise clock. This clock is referred to as the master clock. All the other devices on the network synchronize their clocks with the master and are referred to as members. Constantly-exchanged timing messages ensure continued synchronization. PTP ensures that the best available clock is selected as the source of time (the grandmaster clock) for the network and that other clocks in the network are synchronized to the grandmaster.

_Table 50: PTP Clocks_

<table>
<thead>
<tr>
<th>Network Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Grandmaster (GM)</td>
<td>A network device physically attached to the primary time source. All clocks are synchronized to the grandmaster clock.</td>
</tr>
</tbody>
</table>
**Overview**

<table>
<thead>
<tr>
<th>Network Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ordinary Clock (OC)</td>
<td>An ordinary clock is a 1588 clock with a single PTP port that can operate in one of the following modes:</td>
</tr>
<tr>
<td></td>
<td>• Master mode—Distributes timing information over the network to one or more slave clocks, thus allowing the slave to synchronize its clock to the master.</td>
</tr>
<tr>
<td></td>
<td>• Slave mode—Synchronizes its clock to a master clock. You can enable the slave mode on up to two interfaces simultaneously in order to connect to two different master clocks.</td>
</tr>
<tr>
<td>Boundary Clock (BC)</td>
<td>The device participates in selecting the best master clock and can act as the master clock if no better clocks are detected.</td>
</tr>
<tr>
<td></td>
<td>Boundary clock starts its own PTP session with a number of downstream slaves. The boundary clock mitigates the number of network hops and results in packet delay variations in the packet network between the Grand Master and Slave.</td>
</tr>
<tr>
<td>Transparent Clock (TC)</td>
<td>A transparent clock is a device or a switch that calculates the time it requires to forward traffic and updates the PTP time correction field to account for the delay, making the device transparent in terms of time calculations.</td>
</tr>
</tbody>
</table>

PTP consists of two parts:

- The port State machine and Best Master Clock Algorithm: This provides a method to determine the ports in the network that will remain passive (neither master nor slave), run as a master (providing time to other clocks in the network), or run as slaves (receiving time from other clocks in the network).

- Delay-Request/Response mechanism and a Peer-delay mechanism: This provides a mechanisms for slave ports to calculate the difference between the time of their own clocks and the time of their master clock.

---

**Note**

Cisco ASR 9000 Series routers do not support Peer-delay mechanism.

The implementation of PTP on Cisco IOS XR software is designed to operate effectively in Telecommunication networks, which are different from the networks for which PTP was originally designed.

PTP is configurable on Gigabit Ethernet interfaces (1G, 10G, 40G, and 100G), Bundle Ethernet interfaces, and sub-interfaces. PTP is not configurable on LAG Ethernet sub-interfaces.
Frequency and Time Selection

The selection of the source to synchronize the backplane clock frequency is made by frequency synchronization, and is outside of the scope of PTP. The Announce, Sync, and Delay-request frequencies must be the same on the master and slave.

Delay-Response Mechanism

The Delay Request-response mechanism (defined in section 11.3 of IEEE Std 1588-2008) lets a slave port estimate the difference between its own clock-time and the clock-time of its master. The following options are supported:

- One-step mechanism - The timestamp for a Sync message is sent in the Sync message itself.
- Two-step mechanism - The timestamp for a Sync message is sent later in a Follow-up message.

When running a port in Slave state, a router can send Delay-request messages and handle incoming Sync, Follow-up, and Delay-response messages. The timeout periods for both Sync and Delay-response messages are individually configurable.

Hybrid Mode

Your router allows the ability to select separate sources for frequency and time-of-day (ToD). Frequency selection can be between any source of frequency available to the router, such as: BITS, GPS, SyncE or IEEE 1588 PTP. The ToD selection is between the source selected for frequency and PTP, if available (ToD selection is from GPS, DTI or PTP). This is known as hybrid mode, where a physical frequency source (BITS or SyncE) is used to provide frequency synchronization, while PTP is used to provide ToD synchronization.

Frequency selection uses the algorithm described in ITU-T recommendation G.871, and is described in the Configuring Frequency Synchronization module in this document. The ToD selection is controlled using the time-of-day priority configuration. This configuration is found under the source interface frequency synchronization configuration mode and under the global PTP configuration mode. It controls the order for which sources are selected for ToD. Values in the range of 1 to 254 are allowed, with lower numbers indicating higher priority.

Port States

State machine indicates the behavior of each port. The possible states are:

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INIT</td>
<td>Port is not ready to participate in PTP.</td>
</tr>
<tr>
<td>LISTENING</td>
<td>First state when a port becomes ready to participate in PTP: In this state, the port listens to PTP masters for a (configurable) period of time.</td>
</tr>
<tr>
<td>PRE-MASTER</td>
<td>Port is ready to enter the MASTER state.</td>
</tr>
<tr>
<td>MASTER</td>
<td>Port provides timestamps for any Slave or boundary clocks that are listening.</td>
</tr>
<tr>
<td>UNCALIBRATED</td>
<td>Port receives timestamps from a Master clock but, the router’s clock is not yet synchronized to the Master.</td>
</tr>
</tbody>
</table>
PTP Support Information

This table lists different types of support information related to PTP:

<table>
<thead>
<tr>
<th>Transport Media</th>
<th>---</th>
</tr>
</thead>
<tbody>
<tr>
<td>• UDP over IPv4</td>
<td></td>
</tr>
<tr>
<td>• Ethernet</td>
<td></td>
</tr>
<tr>
<td>• IPv6</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Messages</th>
<th>---</th>

<td></td>
</tr>
<tr>
<td>• Delay-response</td>
<td></td>
</tr>
<tr>
<td>• Management</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Transport Modes</th>
<th>---</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Unicast: This is the default mode. All packets are sent as unicast messages.</td>
<td></td>
</tr>
<tr>
<td>• Mixed: Announce and Sync messages are sent as multicast messages. Signaling, Delay-request, and Delay-response messages are sent as unicast messages.</td>
<td></td>
</tr>
<tr>
<td>• Multicast: All packets are sent as multicast messages.</td>
<td></td>
</tr>
</tbody>
</table>

PTP Hardware Support Matrix

Note The table also contains support details of upcoming releases. You can read this table in context of the current release and see relevant Release Notes for more information on supported features and hardware.

This table provides a detailed information on the supported hardware:

### Restrictions

- PTP Grandmaster (GM) is not supported with all the PTP profiles.
- RSP IEEE 1588 port on RSP/RP is not supported.
- Two-step clock operation is recommended over one-step clock operation for a PTP Master.
- 1 Pulse per Second (1PPS) output is not supported on Cisco ASR 9000 Series Routers.
- One-step clock operation on G.8275.1 profile is not supported on a PTP Master.
- G.8275.1 and G.8275.2 profiles are not supported on Cisco ASR 9001 chassis, Cisco ASR 9000 Ethernet line cards, Cisco ASR 9000 Enhanced Ethernet line cards, and A9K-400G-DWDM-SE/TR line cards.
- As recommended in Appendix VI of ITU-T G.8275.1 document, G.8275.1 profile is supported only on Bundle Link Aggregation (LAG) member links and not supported on a bundle interface.
- G.8273.2 Telecom Boundary Clock (T-BC) performance is not supported on 40G interfaces.
- The G.8273.2 Class B performance is observed when the same type of line card is used for both PTP Master and PTP Slave ports. Class A performance is observed when different types of line cards are used for PTP Master and PTP Slave on T-BC.
- G.8275.2 profile is supported on Cisco ASR 9000 Series Routers. However, the performance standards of this profile are not aligned with any of the ITU-T standards because performance specifications for G.8275.2 profile has not yet been made available by ITU-T.
- Transparent Clock (TC) is not supported.
- PTP Multiprofile is not supported for G.8273.2 Class B performance.
- Platform Fault Manager (PFM) alarms for the 10MHz port are not supported on A9K-RSP5-SE, A9K-RSP5-TR, A99-RP3-SE, and A99-RP3-TR.

### ITU-T Telecom Profiles for PTP

Cisco IOS XR software supports ITU-T Telecom Profiles for PTP as defined in the ITU-T recommendation. A profile consists of PTP configuration options applicable only to a specific application.

Separate profiles can be defined to incorporate PTP in different scenarios based on the IEEE 1588-2008 standard. A telecom profile differs in several ways from the default behavior defined in the IEEE 1588-2008 standard and the key differences are mentioned in the subsequent sections.
The following sections describe the ITU-T Telecom Profiles that are supported for PTP.

**G.8265.1 Profile**

G.8265.1 profile fulfills specific frequency-distribution requirements in telecom networks. Features of G.8265.1 profile are:

- **Clock advertisement**: G.8265.1 profile specifies changes to values used in Announce messages for advertising PTP clocks. The clock class value is used to advertise the quality level of the clock, while the other values are not used.

- **Clock Selection**: G.8265.1 profile also defines an alternate Best Master Clock Algorithm (BMCA) to select port states and clocks is defined for the profile. This profile also requires to receive Sync messages (and optionally, Delay-Response messages) to qualify a clock for selection.

- **Port State Decision**: The ports are statically configured to be Master or Slave instead of using FSM to dynamically set port states.

- **Packet Rates**: The packet rates higher than rates specified in the IEEE 1588-2008 standard are used. They are:
  - Sync/Follow-Up Packets: Rates from 128 packets-per-second to 16 seconds-per-packet.
  - Delay-Request/Delay-Response Packets: Rates from 128 packets-per-second to 16 seconds-per-packet.
  - Announce Packets: Rates from 8 packets-per-second to 64 packets-per-second.

- **Transport Mechanism**: G.8265.1 profile only supports IPv4 PTP transport mechanism.

- **Mode**: G.8265.1 profile supports transport of data packets only in unicast mode.

- **Clock Type**: G.8265.1 profile only supports Ordinary Clock-type (a clock with only one PTP port).

- **Domain Numbers**: The domain numbers that can be used in a G.8265.1 profile network ranges from 4 to 23. The default domain number is 4.

- **Port Numbers**: All PTP port numbers can only be 1 because all clocks in a this profile network are Ordinary Clocks.

G.8265.1 profile defines an alternate algorithm to select between different master clocks based on the local priority given to each master clock and their quality levels (QL). This profile also defines Packet Timing Signal Fail (PTSF) conditions to identify the master clocks that do not qualify for selection. They are:

- **PTSF-lossSync condition**: Raised for master clocks that do not receive a reliable stream of Sync and Delay-Resp messages. Cisco IOS XR software requests Sync and Delay-Resp grants for each configured master clock to track the master clock with this condition.

- **PTSF-lossAnnounce condition**: Raised for master clocks that do not receive a reliable stream of Announce messages.

- **PTSF-unusable condition**: Raised for master clocks that receives a reliable stream of Announce, Sync, and Delay-Resp messages, but not usable by slave clocks. Cisco IOS XR software does not use this condition.

**Hardware variant-specific behavior**
The profile G.8265.1 displays the following behavior on these hardware variants A9K-RSP5-SE, A9K-RSP5-TR, A99-RP3-SE, and A99-RP3-TR:

- Configuring either a master or slave clock type is mandatory.
- G.8265.1 is only a frequency synchronization profile and the servo state is displayed as FREQ_LOCKED and the PTP slave interface remains as slave. Phase synchronization is not supported.
- G.8265.1 profile supports only PTP pure mode and not PTP hybrid mode.

**G.8275.1 Profile**

G.8275.1 profile fulfills the time-of-day and phase synchronization requirements in telecom networks with all network devices participating in the PTP protocol. G.8275.1 profile with SyncE provides better frequency stability for the time-of-day and phase synchronization.

Features of G.8275.1 profile are:

- **Synchronization Model**: G.8275.1 profile adopts hop-by-hop synchronization model. Each network device in the path from master to slave synchronizes its local clock to upstream devices and provides synchronization to downstream devices.

- **Clock Selection**: G.8275.1 profile also defines an alternate BMCA that selects a clock for synchronization and port state for the local ports of all devices in the network is defined for the profile. The parameters defined as a part of the BMCA are:
  - Clock Class
  - Clock Accuracy
  - Offset Scaled Log Variance
  - Priority 2
  - Clock Identity
  - Steps Removed
  - Port Identity
  - notSlave flag
  - Local Priority

- **Port State Decision**: The port states are selected based on the alternate BMCA algorithm. A port is configured to a **master-only** port state to enforce the port to be a master for multicast transport mode.

- **Packet Rates**: The nominal packet rate for Announce packets is 8 packets-per-second and 16 packets-per-second for Sync/Follow-Up and Delay-Request/Delay-Response packets.

- **Transport Mechanism**: G.8275.1 profile only supports Ethernet PTP transport mechanism.

- **Mode**: G.8275.1 profile supports transport of data packets only in multicast mode. The forwarding is done based on forwardable or non-forwardable multicast MAC address.

- **Clock Type**: G.8275.1 profile supports the following clock types:
• **Telecom Grandmaster (T-GM):** Provides timing for other network devices and does not synchronize its local clock to other network devices.

• **Telecom Time Slave Clock (T-TSC):** A slave clock synchronizes its local clock to another PTP clock, but does not provide PTP synchronization to any other network devices.

• **Telecom Boundary Clock (T-BC):** Synchronizes its local clock to a T-GM or an upstream T-BC clock and provides timing information to downstream T-BC or T-TSC clocks.

• **Domain Numbers:** The domain numbers that can be used in a G.8275.1 profile network ranges from 24 to 43. The default domain number is 24.

**Hardware variant-specific behavior**

The profile G8275.1 displays the following behavior on these hardware variants A9K-RSP5-SE, A9K-RSP5-TR, A99-RP3-SE, and A99-RP3-TR:

• SyncE input is mandatory as only PTP hybrid mode is supported.

• The frequency is derived from the SyncE interface and phase adjustments are based on PTP.

• If you configure SyncE before you configure PTP, the Servo state is set to FREQ_LOCKED by default.

• After the Servo is in PHASE_LOCKED state, if the SyncE input is lost or removed, the Servo transitions to HOLDOVER state.

• After the Servo is in PHASE_LOCKED state, if the PTP input is lost or removed, the Servo transitions to FREQ_LOCKED state.

---

**Note**

For the hardware variants A9K-8X100GE-X-TR, A9K-16X100GE-TR and A9K-32X100GE-TR you are not required to shut the 100 GE link to configure this profile.

**G.8275.2 Profile**

G.8275.2 profile fulfills the time-of-day and phase synchronization requirements in telecom networks with partial timing support from the network. Features of G.8275.2 profile are:

• **Clock Selection:** G.8275.2 profile also defines an alternate BMCA that selects a clock for synchronization and port state for the local ports of all devices in the network is defined for the profile. The parameters defined as a part of the BMCA are:

  • Clock Class
  • Clock Accuracy
  • Offset Scaled Log Variance
  • Priority 2
  • Clock Identity
  • Steps Removed
  • Port Identity
• notSlave flag
• Local Priority

Note: See ITU-T G.8275.2 document to determine the valid values for Clock Class parameter.

• Port State Decision: The port states are selected based on the alternate BMCA algorithm. A port is configured to a master-only port state to enforce the port to be a master for unicast transport mode.

• Packet Rates:
  • Synchronization/Follow-Up—minimum is one packet-per-second and maximum of 128 packets-per-second.
  • Packet rate for Announce packets—minimum of one packet-per-second and maximum of eight packets-per-second.
  • Delay-Request/Delay-Response packets—minimum is one packet-per-second and maximum of 128 packets-per-second

• Transport Mechanism: G.8275.2 profile supports only IPv4 and IPv6 PTP transport mechanism.

• Mode: G.8275.2 profile supports transport of data packets only in unicast mode.

• Clock Type: G.8275.2 profile supports the following clock types:
  • Telecom Grandmaster (T-GM): Provides timing for other network devices and does not synchronize its local clock to other network devices.
  • Telecom Time Slave Clock (T-TSC): A slave clock synchronizes its local clock to another PTP clock, but does not provide PTP synchronization to any other network devices.
  • Telecom Boundary Clock (T-BC): Synchronizes its local clock to a T-GM or an upstream T-BC clock and provides timing information to downstream T-BC or T-TSC clocks.

• Domain Numbers: The domain numbers that can be used in a G.8275.2 profile network ranges from 44 to 63. The default domain number is 44.

Hardware variant-specific behavior
The profile G8275.2 displays the following behavior on these hardware variants A9K-RSP5-SE, A9K-RSP5-TR, A99-RP3-SE, and A99-RP3-TR:

• Hybrid PTP and pure PTP are supported on this profile.
• The physical-layer-frequency command must be used to configure Hybrid PTP.
• To switch from Hybrid PTP to Pure PTP, you must remove the physical-layer-frequency configuration and frequency synchronization configuration to remove SyncE inputs from line card interfaces and RSP clock-interfaces.
Configuring PTP

Prerequisite
You must be in a user group associated with a task group that includes the proper task IDs. The command reference guides include the task IDs required for each command. If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

PTP Interface and Profile Configuration
When a global PTP profile is attached to an interface, its values are used as default settings for that interface. When additional settings are configured under an interface itself, these settings override the defaults in that profile. When no profile is attached to an interface, the configuration on the interface is used to determine the PTP settings for that interface.

When configuring PTP, use one of the following approaches:
• Create a profile (or multiple profiles) containing all the default settings to use on all PTP interfaces. Override any settings that differ for particular interfaces by using the interface configuration under the interfaces themselves.
• Configure all settings separately for each interface, without using any global profiles. Use this approach if the interfaces do not have consistent settings, or if you are configuring only a small number of PTP interfaces.

Configuring Frequency Synchronization and Quality Settings for PTP
This procedure describes the steps involved to configure frequency and quality settings for PTP on a router.

1. To enable frequency synchronization on the router, use frequency synchronization command in the configuration mode.

   RP/0/RSP0/CPU0:router(config)# frequency synchronization

2. To configure ITU-T quality parameters, use quality itu-t option option generation number command in the frequency synchronization configuration mode.
   • option 1: Includes PRC, SSU-A, SSU-B, SEC, and DNU. This is the default option.
   • option 2 generation 1: Includes PRS, STU, ST2, ST3, SMC, and DUS.
   • option 2 generation 2: Includes PRS, STU, ST2, ST3, TNC, ST3E, SMC, and DUS.

   The quality option configured here must match the quality option specified in the quality receive and quality transmit commands.

   RP/0/RSP0/CPU0:router(config-freqsync)# quality itu-t option 2 generation 2
Verification

To display the frequency synchronization selection, use `show frequency synchronization selection` command.

```
RP/0/RSP0/CPU0:router# show frequency synchronization selection
Node 0/RSP1/CP0:

```
Configuring Global Profile

This procedure describes the steps involved to create a global configuration profile for a PTP interface that can then be assigned to any interface as required.

1. To enter the PTP configuration mode, use `ptp` command in the configuration mode.

   ```
   RP/0/RSP0/CPU0:router(config)# ptp
   ```

2. To configure a PTP profile, use `profile` command in the ptp configuration mode.

   ```
   RP/0/RSP0/CPU0:router(config-tp)# profile tp64
   ```
3. To configure frequency for a Sync message for the given PTP profile, use `sync frequency rate` command in the ptp-profile configuration mode.

```
RP/0/RSP0/CPU0:router(config-tp-profile)# sync frequency 16
```

4. To configure delay-request frequency for the given PTP profile, use `delay-request frequency rate` command in the ptp-profile configuration mode.

```
RP/0/RSP0/CPU0:router(config-tp-profile)# delay-request frequency 16
```

**Verification**

To display the configured PTP profile details, use `show run ptp` command.

```
RP/0/RSP0/CPU0:router# show run ptp

Wed Feb 28 11:16:05.943 UTC
ptp
clock
domain 24
    profile g.8275.1 clock-type T-BC
profile slave
    transport ethernet
    sync frequency 16
    announce interval 1
    delay-request frequency 16
profile master
    transport ethernet
    sync frequency 16
    announce interval 1
    delay-request frequency 16
profile slave1
    transport ethernet
    sync frequency 64
    announce interval 1
    delay-request frequency 64
```

**Configuring PTP Slave Interface**

This procedure describes the steps involved to configure a PTP interface to be a Slave.

1. To configure an interface, use `interface type interface-path-id` command in the configuration mode.

```
RP/0/RSP0/CPU0:router(config)# interface TenGigE 0/1/0/5
```

2. To enter the PTP configuration mode for the given interface, use `ptp` command in the interface configuration mode.

```
RP/0/RSP0/CPU0:router(config-if)# ptp
```

3. To configure a PTP profile (or specify a previously defined profile), use `profile name` command in the ptp interface configuration mode.
Any additional commands entered in ptp-interface configuration mode overrides the global profile settings.

4. To configure the transport mode for all PTP messages in the given PTP profile, use `transport mode_type` command in the ptp interface configuration mode.

```
RP/0/RSP0/CPU0:router(config-if-ptp)# transport ipv4
```

5. To configure timeout for PTP announce messages in the given PTP profile, use `announce interval interval-value` command in the ptp interface configuration mode.

```
RP/0/RSP0/CPU0:router(config-if-ptp)# announce interval 1
```

6. To configure the port state, use `port state` command in the ptp interface configuration mode.

```
RP/0/RSP0/CPU0:router(config-if-ptp)# port state slave-only
```

7. To configure IPv4 or IPv6 address for PTP master, use `master ipv4|ipv6 address` command in the ptp interface configuration mode.

```
RP/0/RSP0/CPU0:router(config-if-ptp)# master ipv4 192.168.2.1
RP/0/RSP0/CPU0:router(config-if-ptp)# master ipv6 2001:DB8::1
```

8. To return to the interface configuration mode, use `exit` command.

```
RP/0/RSP0/CPU0:router(config-if-ptp)# exit
```

9. To configure a gateway for the given interface, use `ipv4 address address mask` command in the interface configuration mode.

```
RP/0/RSP0/CPU0:router(config-if)# ipv4 address 1.7.1.2 255.255.255.0
```

**Verification**

To verify the port state details, use `show run interface interface-name` command.

```
RP/0/RSP0/CPU0:router# show run interface TenGigE 0/1/0/5
Fri Aug 3 19:57:14.184 UTC
interface TenGigE 0/1/0/5
  ptp
    profile tp64
    transport ipv4
    port state slave-only
    master ipv4 192.168.2.1
    !
    announce interval 1
    !
    ipv4 address 1.7.1.2 255.255.255.0
```
Configuring PTP Master Interface

This procedure describes the steps involved to configure a PTP interface to be a Master.

1. To configure an interface, use `interface type interface-path-id` command in the configuration mode.

   ```sh
   RP/0/RSP0/CPU0:router(config)# interface TenGigE 0/1/0/5
   ```

2. To enter the PTP configuration mode for the given interface, use `ptp` command in the interface configuration mode.

   ```sh
   RP/0/RSP0/CPU0:router(config-if)# ptp
   ```

3. To configure a PTP profile (or specify a previously defined profile), use `profile name` command in the ptp interface configuration mode.

   ```sh
   RP/0/RSP0/CPU0:router(config-if-ptp)# profile tp64
   ```

   **Note**

   Any additional commands entered in PTP interface configuration mode override settings in this profile.

4. To configure the transport mode for all PTP messages in the given PTP profile, use `transport mode_type` command in the ptp interface configuration mode.

   ```sh
   RP/0/RSP0/CPU0:router(config-if-ptp)# transport ipv4
   ```

5. To configure timeout for PTP announce messages in the given PTP profile, use `announce interval interval-value` command in the ptp interface configuration mode.

   ```sh
   RP/0/RSP0/CPU0:router(config-if-ptp)# announce interval 1
   ```

6. To return to the interface configuration mode, use `exit` command.

   ```sh
   RP/0/RSP0/CPU0:router(config-if-ptp)# exit
   ```

7. To configure a gateway for the given interface, use `ipv4 address address mask` command in the interface configuration mode.

   ```sh
   RP/0/RSP0/CPU0:router(config-if)# ipv4 address 1.7.1.2 255.255.255.0
   ```

**Verification**

To verify the port state details, use `show run interface interface-name` command.

```sh
RP/0/RSP0/CPU0:router# show run interface TenGigE 0/1/0/5

Fri Aug 3 13:57:44.366 PST
interface TenGigE 0/1/0/5
ptp
```
Configuring PTP Hybrid Mode

This procedure describes the steps involved to configure router in a hybrid mode. You can do this by selecting PTP for Time-of-Day (ToD) and another source for frequency.

1. To enable frequency synchronization on the router, use `frequency synchronization` command in the configuration mode.

   ```
   RP/0/RSP0/CPU0:router(config)# frequency synchronization
   ```

2. To configure a SyncE source, create an interface to be a SyncE input. This can be configured using `interface` command in the configuration mode.

   ```
   Note
   The time-of-day-priority setting specifies that SyncE to be used as a ToD source if there is no source available with a lower priority.
   ```

   ```
   RP/0/RSP0/CPU0:router(config)# interface GigabitEthernet 0/1/0/0
   RP/0/RSP0/CPU0:router(config-if)# frequency synchronization
   RP/0/RSP0/CPU0:router(config-if-freqsync)# selection input
   RP/0/RSP0/CPU0:router(config-if-freqsync)# time-of-day-priority 100
   RP/0/RSP0/CPU0:router(config-if-freqsync)# commit
   ```

3. To configure PTP as the source for ToD, enable PTP on the router using `ptp` command in command in the configuration mode. ToD priority values can range from 1 (highest priority) to 254 (lowest priority).

   ```
   RP/0/RSP0/CPU0:router(config)# ptp
   RP/0/RSP0/CPU0:router(config-ptp)# time-of-day-priority 1
   RP/0/RSP0/CPU0:router(config)# commit
   ```

4. To configure a PTP interface, use `interface` command in configuration mode. To enable this interface as a PTP Master, use `master` command in ptp-interface configuration mode.

   ```
   RP/0/RSP0/CPU0:router(config)# interface gigabitEthernet 0/1/0/1
   RP/0/RSP0/CPU0:router(config-if)# ipv4 address 10.0.0.1/24
   RP/0/RSP0/CPU0:router(config-if)# ptp
   RP/0/RSP0/CPU0:router(config-if-ptp)# master ipv4 10.0.0.2
   RP/0/RSP0/CPU0:router(config-if-ptp)# commit
   ```

Verification

To display the frequency synchronization selection, use `show frequency synchronization selection` command.

```
```
show frequency synchronization selection

Configuring PTP Telecom Profile Interface

This procedure describes the steps involved to create an interface for PTP ITU-T Telecom Profiles.

It is also possible to make these definitions within a global PTP profile and attach them to the interface using the profile command in PTP interface configuration mode.

1. To configure an interface, use **interface** type **interface-path-id** command in the configuration mode.

```
RP/0/RSP0/CPU0#router(config)#interface gigabitethernet 0/1/0/1
```

2. To enter the PTP configuration mode for the given interface, use **ptp** command in the interface configuration mode.
3. To configure a PTP profile (or specify a previously defined profile), use `profile name` command in the ptp-interface configuration mode.

   **Note**
   Any additional commands entered in ptp-interface configuration mode overrides the global profile settings.

   ```
   RP/0/RSP0/CPU0:router(config-if-ptp)# profile tele64
   ```

4. To configure frequency for Sync or Delay-request messages for the given ptp interface, use `sync frequency rate` command or `delay-request frequency rate` command appropriately in the ptp-interface configuration mode. The valid configurable values are 2, 4, 8, 16, 32, 64 or 128.

   ```
   RP/0/RSP0/CPU0:router(config-if-ptp)# sync frequency 128
   ```

   ```
   RP/0/RSP0/CPU0:router(config-if-ptp)# delay-request frequency 128
   ```

5. To configure duration for different PTP messages, use one of the following commands in the ptp-interface configuration mode: `announce grant-duration duration`, `sync grant-duration duration`, or `delay-response grant-duration duration`. The duration value can be between 60 and 1000 seconds.

   **Note**
   This duration value represents the length of grant that is requested for a port in Slave state and represents the maximum grant-duration allowed when the port is in Master state.

   ```
   RP/0/RSP0/CPU0:router(config-if-ptp)# announce grant-duration 120
   ```

   ```
   RP/0/RSP0/CPU0:router(config-if-ptp)# sync grant-duration 120
   ```

   ```
   RP/0/RSP0/CPU0:router(config-if-ptp)# delay-response grant-duration 120
   ```

6. To configure a timeout value, length of time by when a PTP message must be received (before PTSF-lossSync is raised), use one of the following commands in the ptp-interface configuration mode: `sync timeout timeout` or `delay-response timeout timeout`. The timeout value can be between 100 to 10000 micro seconds.

   ```
   RP/0/RSP0/CPU0:router(config-if-ptp)# sync timeout 120
   ```

   ```
   RP/0/RSP0/CPU0:router(config-if-ptp)# delay-response timeout 120
   ```

7. To configure a response for unicast-grant invalid-request, use `unicast-grant invalid-request {reduce | deny}` command. The response for requests with unacceptable parameters would either be denied or granted with reduced parameters.

   ```
   RP/0/RSP0/CPU0:router(config-if-ptp)# unicast-grant invalid-request reduce
   ```

8. To configure IPv4 or IPv6 address for a PTP master, use `master {ipv4 | ipv6} ip-address` command in the ptp-interface configuration mode.
9. To override the clock-class received in Announce messages from the specified Master, use `clock-class` command in the ptp-master-interface configuration mode. The class values can range from 0 to 255.

RP/0/RSP0/CPU0:router(config-if-ptp-master)# clock-class 2

**Verification**

To display the PTP interface details, use `show ptp interfaces brief` command.

```
RP/0/RSP0/CPU0:router# show ptp interfaces brief
Fri Feb  9 11:16:45.248 UTC
Intf Port Port Line
Name Number State Encap State Mechanism
--------------------------------------------------------------------------------
BE1 1 Slave IPv4 up 2-step DRRM
Gi0/0/0/40 2 Master IPv4 up 2-step DRRM
```

To verify the configured profile details, use `show run interface interface-name` command.

```
RP/0/RSP0/CPU0:router# show run interface Gi0/0/0/33
Wed Feb 28 11:49:16.940 UTC
interface GigabitEthernet0/0/0/33
    ptp
        profile slave
data multicast target-address ethernet 01-1B-19-00-00-00
transport ethernet
        port state slave-only
clock operation two-step
!ipv4 address 21.1.1.2 255.255.255.0
data frequency synchronization
    selection input
data priority 5
    wait-to-restore 0
```

**Configuring PTP Telecom Profile Clock**

This procedure describes the steps involved to configure PTP clock and its settings to be consistent with ITU-T Telecom Profiles for Frequency.

1. To enter the PTP configuration mode, use `ptp` command in the configuration mode.

```
RP/0/RSP0/CPU0:router(config)# ptp
```

2. To enter the PTP-clock configuration mode, use `clock` command in the ptp-configuration mode.

```
RP/0/RSP0/CPU0:router(config-ptp)# clock
```
3. To configure the domain-number for a PTP profile, use `domain number` command in the ptp-configuration mode. The allowed domain number range for G.8265.1 profile is between 4 and 23 and the range for G.8275.1 profile is between 24 and 43.

   RP/0/RSP0/CPU0:router(config-ptp)# domain 24

4. To configure timescale, use `timescale source` command in the ptp-clock configuration mode.

   RP/0/RSP0/CPU0:router(config-ptp-clock)# timescale PTP

5. To configure the time-source that will be advertised in Announce messages, use `time-source source` command in the ptp-clock configuration mode. The allowed options are: atomic-clock, GPS, hand-set, internal-oscillator, NTP, other, PTP, and terrestrial-radio.

   RP/0/RSP0/CPU0:router(config-ptp-clock)# time-source GPS

6. To exit the ptp-clock configuration mode, use `exit` command.

   RP/0/RSP0/CPU0:router(config-ptp-clock)# exit

7. To configure the desired telecom profile and the clock type for the profile, use `clock profile { g.8265.1 | g.8275.1 | g.8275.2} clock-type {T-GM | T-BC | T-TSC}` command in the ptp configuration mode.

   The `clock-selection telecom-profile` and `clock-advertisement telecom-profile` commands are deprecated from Release 6.1.2. They are replaced by the `clock profile` command.

   RP/0/RSP0/CPU0:router(config-ptp)# clock profile g.8275.1 clock-type T-BC

**Verification**

To display the configured PTP clock profile details, use `show run ptp` command.

   RP/0/RSP0/CPU0:router# show run ptp
   ptp
   clock
     domain 24
     profile g.8275.1 clock-type T-BC
   !
   profile slave
     sync frequency 16
     announce frequency 8
     delay-request frequency 16
   !
   profile master
     sync frequency 16
     announce frequency 8
     delay-request frequency 16
   !
   log
     servo events
     best-master-clock changes
     !
To verify that PTP has been enabled on the router and the device is in LOCKED Phase, use `show ptp platform servo` command.

```
RP/0/RSP0/CPU0:router # show ptp platform servo
Fri Feb  9 11:16:54.568 UTC
Servo status: Running
Servo stat_index: 2
Device status: PHASE_LOCKED
Servo log level: 0
Phase Alignment Accuracy: 1 ns
Sync timestamp updated: 111157
Sync timestamp discarded: 0
Delay timestamp updated: 111157
Delay timestamp discarded: 0
Previous Received Timestamp T1: 1518155252.263409770 T2: 1518155252.263410517 T3: 1518155252.263409770 T4: 1518155252.263410517
Last Received Timestamp T1: 1518155252.325429435 T2: 1518155252.325430194 T3: 1518155252.325429435 T4: 1518155252.325430194
Offset from master: 0 secs, 11 nsecs
Mean path delay : 0 secs, 748 nsecs
```

**Configuration Examples**

**Slave Configuration Example**

The following example shows a PTP slave configuration:

```
interface TenGigE 0/1/0/5
ptp
 profile tp64
 transport ipv4
 port state slave-only
 master ipv4 1.7.1.2

 announce interval 1

 ipv4 address 1.7.1.1 255.255.255.0
```

**Master Configuration Example**

This example shows a PTP master configuration:

```
ptp
 profile tp64
 transport ipv4
 announce interval 1

 ipv4 address 1.7.1.2 255.255.255.0
```
PTP Hybrid Mode Configuration Example

This example shows the configuration of PTP hybrid mode:

```
ptp
time-of-day priority 10
!
interface GigabitEthernet0/1/1/0
ptp
transport ipv4
port state slave-only
master ipv4 192.168.52.38
!  
sync frequency 64
announce interval 1
delay-request frequency 64
!
interface GigabitEthernet 0/1/0/1
ipv4 address 192.168.52.41 255.255.255.0
speed 100
frequency synchronization
selection input
priority 10
wait-to-restore 0
ssm disable
time-of-day-priority 100
!
```

ITU-T Telecom Profiles Configuration Examples

**Master global** configuration for the telecom profile:

```
-- For G.8265.1 profile --

ptp
clock
domain 4
profile g.8265.1
!
profile master
transport ipv4
sync frequency 16
announce interval 1
delay-request frequency 16
interface gi 0/2/0/4
ptp
profile master
transport ipv4
clock operation two-step
!
ipv4 address 17.1.1.1/24

-- For G.8275.1 profile --

ptp
clock
domain 24
```
Slave global configuration for the telecom profile:

-- For G.8265.1 profile --

ptp
clock
domain 4
profile g.8265.1
  profile slave
  transport ipv4
  sync frequency 16
  announce interval 1
  delay-request frequency 16
interface gi 0/1/0/0
ptp
profile slave
transport ipv4
Master ipv4 18.1.1.1
port state slave-only
  clock operation two-step
  ipv4 address 18.1.1.2/24

-- For G.8275.1 profile --

ptp
clock
domain 24
profile g.8275.1 clock-type T-TSC
  profile slave
  transport ethernet
  sync frequency 16
  announce interval 1
  delay-request frequency 16
interface gi 0/1/0/0
ptp
profile slave
transport ethernet
multicast target-address ethernet 01-1B-19-00-00-00
  clock operation two-step
  !
ipv4 address 18.1.1.2/24

--- For G.8275.2 profile ---

ptp
clock
domain 44
profile g.8275.2 clock-type T-TSC
profile slave
transport ipv6
port state slave-only
sync frequency 64
announce frequency 8
unicast-grant invalid-request deny
delay-request frequency 64
log
servo events
best-master-clock changes
!
interface GigabitEthernet0/2/0/12
ptp
profile slave
master ipv6 30::2
!
ipv6 address 30::1/64
!

Global configuration with clock type as T-Boundary Clock (T-BC) for the telecom profile:

-- For G.8275.1 profile --

ptp
clock
domain 24
profile g.8275.1 clock-type T-BC
profile master
transport ethernet
sync frequency 16
announce interval 1
delay-request frequency 16
exit
profile slave
transport ethernet
sync frequency 16
announce interval 1
delay-request frequency 16
exit
interface gi 0/2/0/4
ptp
profile slave
transport ethernet
multicast target-address ethernet 01-1B-19-00-00-00
!
clock operation two-step
interface gi 0/2/0/0
  ptp
  profile master
  transport ethernet
  multicast target-address ethernet 01-1B-19-00-00-00
  clock operation two-step
!
ipv4 address 18.1.1.1/24

When G.8275.1 profile is configured on a 100G interface, keywords commit replace and rollback config last 1 does not work and the router configuration rollback fails entirely. Use rollback config last 1 best-effort instead.

```c
! **For G.8275.2 profile**

ptp
  clock
domain 44
  profile g.8275.2 clock-type T-BC
!
profile slave
  transport ipv6
  port state slave-only
  sync frequency 64
  announce frequency 8
  unicast-grant invalid-request deny
  delay-request frequency 64
!
profile master
  transport ipv6
  sync frequency 64
  announce frequency 8
  unicast-grant invalid-request deny
  delay-request frequency 64
!
log
  servo events
  best-master-clock changes
!
!
interface GigabitEthernet0/2/0/11
  ptp
  profile master
!
ipv6 address 30::1/64
!
interface GigabitEthernet0/2/0/12
  ptp
  profile slave
  master ipv6 40::2
!
ipv6 address 40::1/64
!
```
