Communications, Services, and Additional Information

- To receive timely, relevant information from Cisco, sign up at Cisco Profile Manager.
- To get the business impact you’re looking for with the technologies that matter, visit Cisco Services.
- To submit a service request, visit Cisco Support.
- To discover and browse secure, validated enterprise-class apps, products, solutions and services, visit Cisco Marketplace.
- To obtain general networking, training, and certification titles, visit Cisco Press.
- To find warranty information for a specific product or product family, access Cisco Warranty Finder.

Cisco Bug Search Tool

Cisco Bug Search Tool (BST) is a web-based tool that acts as a gateway to the Cisco bug tracking system that maintains a comprehensive list of defects and vulnerabilities in Cisco products and software. BST provides you with detailed defect information about your products and software.
IGMP Commands on Cisco ASR 9000 Series Router

This chapter describes the commands used to configure and monitor IPv4 multicast protocol on Cisco ASR 9000 Series Routers.

The commands in this chapter apply to the Internet Group Management Protocol (IGMP), versions 1, 2, and 3.

For detailed information about multicast routing concepts, configuration tasks, and examples, refer to the Implementing Multicast Routing on Cisco IOS XR Software configuration module in Multicast Configuration Guide for Cisco ASR 9000 Series Routers.

access-group (IGMP)

To set limits on an interface for multicast-group join requests by hosts, use the access-group command in the appropriate configuration mode. To return to the default behavior, use the no form of this command.

```
access-group access-list
no access-group access-list
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>access-list</td>
<td>Number or name of a standard IP access list. Range is 1 to 99.</td>
</tr>
</tbody>
</table>

**Command Default**

No default behavior or values

**Command Modes**

IGMP interface configuration

**Command History**

- **Modification**
- **Release**
- This command was introduced.

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

If this command is not specified in router Internet Group Management Protocol (IGMP) configuration mode, the interface accepts all multicast join requests by hosts.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>multicast</td>
</tr>
<tr>
<td></td>
<td>read,</td>
</tr>
<tr>
<td></td>
<td>write</td>
</tr>
</tbody>
</table>

**Examples**

In the following example, hosts serviced by GigabitEthernet interface 0/1/0/1 can join only group 225.2.2.2:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipv4 access-list mygroup permit 225.2.2.2 0.0.0.0
RP/0/RSP0/CPU0:router(config)# router igmp
RP/0/RSP0/CPU0:router(config-igmp)# interface GigE 0/1/0/1
RP/0/RSP0/CPU0:router(config-igmp-default-if)# access-group mygroup
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipv4 access-list mygroup permit 225.2.2.2 0.0.0.0
RP/0/RSP0/CPU0:router(config)# router igmp
RP/0/RSP0/CPU0:router(config-igmp)# interface GigE 0/1/0/1
RP/0/RSP0/CPU0:router(config-igmp-default-if)# access-group mygroup
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipv4 access-list</td>
<td>Defines a standard IP access list. For information, see IP Addresses and Services Command Reference for Cisco ASR 9000 Series Routers</td>
</tr>
</tbody>
</table>
clear igmp counters

To clear IGMP traffic statistics, use the `clear igmp counters` command in EXEC mode.

```
clear igmp [{ipv4} vrf vrf-name|vrf vrf-name} counters
```

**Syntax Description**

- `ipv4` (Optional) Specifies IPv4 addressing. IPv4 is the default for Internet Group Management Protocol (IGMP) groups.
- `vrf vrf-name` (Optional) Specifies a VPN routing and forwarding (VRF) instance.

**Command Default**

No default behavior or values

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

After IGMP statistics are cleared, statistics begin incrementing again.

**Task ID**

```
Task ID Operations
multicast execute
```

**Examples**

The following example shows sample output before and after clearing IGMP traffic statistics:

```
RP/0/RSP0/CPU0:router# show igmp traffic

IGMP Traffic Counters
Elapsed time since counters cleared: 00:00:19

Received       Sent
Valid IGMP Packets     0       12
Queries          0       3
Reports          0       9

</tr>
</thead>
<tbody>
<tr>
<td>show igmp traffic, on page 47</td>
<td>Displays all the Internet Group Management Protocol (IGMP) traffic-related counters.</td>
</tr>
</tbody>
</table>
**clear igmp group**

To clear Internet Group Management Protocol (IGMP) groups on one or all interfaces, use the `clear igmp group` command in EXEC mode.

```
clear igmp [{ipv4 vrf vrf-name[vrf vrf-name]}] group [{ip-address|type interface-path-id}]
```

**Syntax Description**

- `ipv4` (Optional) Specifies IPv4 addressing. IPv4 is the default for IGMP groups.
- `vrf vrf-name` (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- `ip-address` (Optional) IP hostname or group address.
- `type` (Optional) Interface type. For more information, use the question mark (?) online help function.
- `interface-path-id` (Optional) Physical interface or virtual interface.

**Note**

Use the `show interfaces` command to see a list of all interfaces currently configured on the router.

For more information about the syntax for the router, use the question mark (?) online help function.

**Command Default**

If no group address is specified, all IGMP groups are cleared.

**Command Modes**

EXEC

**Command History**

Release 3.7.2  This command was introduced.

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

To clear all IGMP groups, use the `clear igmp group` command without using an argument. To clear a particular group, use the `ip-address` or `type interface-path-id` arguments.

The following groups cannot be cleared:

- 224.0.0.2
- 224.0.0.13
- 224.0.0.22
- 224.0.0.40

**Task ID**

- `multicast`  `execute`
The following example uses the `show igmp groups` command to display the IGMP Connected Group Membership, the `clear igmp group` command to clear address 239.1.1.1, and the `show igmp groups` command again to display the updated list.

```
RP/0/RSP0/CPU0:router# show igmp groups tenGigE 0/4/0/0

IGMP Connected Group Membership
Group Address  Interface    Uptime   Expires   Last Reporter
224.0.0.2     TenGigE0/4/0/0  3w6d     never   10.114.8.44

224.0.0.13    TenGigE0/4/0/0  3w6d     never   10.114.8.44
224.0.0.22    TenGigE0/4/0/0  3w6d     never   10.114.8.44
```

### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show igmp groups</code>, on page 33</td>
<td>Displays the multicast groups that are directly connected to the router and that were learned through Internet Group Management Protocol (IGMP).</td>
</tr>
</tbody>
</table>
clear igmp reset

To clear all Internet Group Management Protocol (IGMP) membership entries and reset connection in the Multicast Routing Information Base (MRIB), use the clear igmp reset command in EXEC mode.

```
clear igmp [ { ipv4 vrf vrf-name | vrf vrf-name } ] reset
```

**Syntax Description**
- **ipv4** (Optional) Specifies IPv4 addressing. IPv4 is the default for IGMP groups.
- **vrf vrf-name** (Optional) Specifies a VPN routing and forwarding (VRF) instance.

**Command Default**
No default behavior or values

**Command Modes**
EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Every IGMP group membership that IGMP learns is downloaded to the MRIB database.

The clear igmp reset command is used to clear all information from the IGMP topology table and reset the MRIB connection.

**Note**
This command is reserved to force synchronization of IGMP and MRIB entries when communication between the two components is malfunctioning.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>execute</td>
</tr>
</tbody>
</table>

**Examples**
The following example shows how to clear the group memberships in MRIB:

```
RP/0/RSP0/CPU0:router# clear igmp reset
```

**Related Commands**

explicit-tracking

To configure explicit host tracking under Internet Group Management Protocol (IGMP) Version 3, use the `explicit-tracking` command in the appropriate configuration mode. To disable explicit host tracking, use the `no` form of this command.

```
explicit-tracking [{access-list|disable}]
no explicit-tracking
```

**Syntax Description**

- `access-list` (Optional) Access list that specifies the group range for host tracking.
- `disable` (Optional) Disables explicit host tracking on a specific interface. This option is available only in interface configuration mode.

**Command Default**

If this command is not specified in IGMP configuration mode, then explicit host tracking is disabled.

**Command Modes**

- IGMP VRF configuration
- IGMP interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

By default, IGMP supports Version 3, unless a Version 2 or Version 1 IGMP host message is detected in the network. For backward compatibility, IGMP downgrades to run at the IGMP version level that is installed.

This feature allows the router to achieve minimal leave latencies when hosts leave a multicast group or channel. To monitor IGMP membership of hosts, use the `show igmp groups` command in EXEC mode.

In router configuration mode, the `explicit-tracking` command enables explicit host tracking for all interfaces. To disable explicit tracking for all interfaces, use the `no` form of the command from IGMP configuration mode. To disable the feature on specific interfaces, use the `explicit-tracking` command in interface configuration mode with the `disable` keyword, as shown in the following example.

```
Note
If you configure this command in IGMP VRF configuration mode, parameters are inherited by all new and existing interfaces. However, you can override these parameters on individual interfaces from IGMP interface configuration mode.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>
The following example shows how to enable explicit host tracking for the access list named router1 on all interfaces and how to disable explicit host tracking for a specific GigabitEthernet interface:

```
RP/0/RSP0/CPU0:router(config)# router igmp
RP/0/RSP0/CPU0:router(config-igmp)# explicit-tracking router1
RP/0/RSP0/CPU0:router(config-igmp)# interface GigabitEthernet 0/1/0/0
RP/0/RSP0/CPU0:router(config-igmp-default-if)# explicit-tracking disable
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show igmp groups, on page 33</td>
<td>Displays the multicast groups that are directly connected to the router and that were learned through Internet Group Management Protocol (IGMP).</td>
</tr>
</tbody>
</table>
**join-group**

To have the router join a multicast group, use the `join-group` command in the appropriate configuration mode. To return to the default behavior, use the `no` form of this command.

```
join-group group-address [source-address]
no join-group group-address [source-address]
```

**Syntax Description**

- `group-address`  Address of the multicast group. This is a multicast IP address group in IPv4 format
  - IP address as defined in the Domain Name System (DNS) hosts table or with the domain IPv4 host in the format `A.B.C.D`.

- `source-address`  (Optional) Source address of the multicast group to include in IPv4 prefixing format
  - IP address as defined in the Domain Name System (DNS) hosts table or with the domain IPv4 host in the format `A.B.C.D`.

**Command Default**

No multicast group memberships are predefined. If not specified, include is the default.

**Command Modes**

IGMP interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `join-group` command permits the IP packets that are addressed to the group address to pass to the IP client process in the Cisco IOS XR software.

If all the multicast-capable routers that you administer are members of a multicast group, pinging that group causes all routers to respond. This command can be a useful administrative and debugging tool.

Another reason to have a router join a multicast group is when other hosts on the network are prevented from correctly answering IGMP queries. When the router joins the multicast group, upstream devices learn multicast routing table information for that group and keep the paths for that group active.

**Caution**

Joining a multicast group can result in a significant performance impact, because all subscribed multicast packets are punted to the route processor.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>
Examples

In the following example, the router joins multicast group 225.2.2.2:

```
RP/0/RSP0/CPU0:router(config)# router igmp
RP/0/RSP0/CPU0:router(config-igmp)# interface GigabitEthernet 0/1/0/0
RP/0/RSP0/CPU0:router(config-igmp-default-if)# join-group 225.2.2.2
```

The `join-group` command can have an include/exclude mode for IGMPv3 interfaces as shown in the following example:

```
RP/0/RSP0/CPU0:router(config)# router igmp
RP/0/RSP0/CPU0:router(config-igmp)# int gigabitEthernet 0/5/0/1
RP/0/RSP0/CPU0:router(config-igmp-default-if)# join-group ?
A.B.C.D  IP group address
RP/0/RSP0/CPU0:router(config-igmp-default-if)# join-group 225.0.0.0 ?
A.B.C.D  Source address to include
        exclude  Exclude the only following source address
        include  Include only the following source address
<cr>
RP/0/RSP0/CPU0:router(config-igmp-default-if)# join-group 225.0.0.0 10.10.10.10 ?
<cr>
RP/0/RSP0/CPU0:router(config-igmp-default-if)# join-group 225.0.0.0 ?
A.B.C.D  Source address to include
        exclude  Exclude the only following source address
        include  Include only the following source address
<cr>
RP/0/RSP0/CPU0:router(config-igmp-default-if)# join-group 225.0.0.0
```

maximum groups

To configure the maximum number of groups used by Internet Group Management Protocol (IGMP) and accepted by a router, use the `maximum groups` command in the appropriate configuration mode. To return to the default behavior, use the `no` form of this command.

```
maximum groups number
no maximum groups
```

**Syntax Description**

| number | Maximum number of groups accepted by a router. Range is 1 to 75000. |

**Command Default**

number : 50000

**Command Modes**

IGMP configuration

IGMP VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

When configuring this command within IGMP VRF configuration mode, you may either use the default (unspecified) VRF or a specific VRF by specifying its name.

The maximum combined number of groups on all interfaces can be 75000. After the maximum groups value is met, all additional memberships learned are ignored. The maximum number includes external and local membership.

The following groups obtain local membership on each interface when multicast is enabled and are added into the group totals for each interface: 224.0.0.13 (for PIM), 224.0.0.22 and 224.0.0.2 (for IGMP).

You cannot use the `maximum groups` command to configure the maximum number of groups below the number of existing groups. For instance, if the number of groups is 39, and you set the maximum number of groups to 10, the configuration is rejected.

Although Cisco IOS XR Software Release 3.9.0 supports 40,000 groups per interface, the ASR9000 router supports a maximum of 16,000 multicast routes per system.

Furthermore, you can use the `maximum groups per-interface` command to configure the maximum number of groups for each interface accepted by a router.
The following example shows how to display the number of groups (39) and the maximum number of groups configured (50000). Through use of the `maximum groups` command, a configuration is committed to change the maximum number of groups to 40. Before and after configuration, the `show igmp summary` command is used to confirm the configuration change:

```
RP/0/RSP0/CPU0:router# show igmp summary

IGMP summary

maximum groups-per-interface

To configure the maximum number of groups for each interface accepted by a router, use the `maximum groups-per-interface` command in the appropriate configuration mode. To return to the default behavior, use the `no` form of this command.

```
maximum groups-per-interface number
no maximum groups-per-interface
```

### Syntax Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>number</code></td>
<td>Maximum number of groups accepted by a router for each interface. Range is 1 to 16000.</td>
</tr>
</tbody>
</table>

### Command Default

```
number : 20000
```

### Command Modes

- IGMP configuration
- IGMP VRF configuration
- IGMP interface configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The following groups obtain local membership on each interface when multicast is enabled and are added into the group totals for each interface: 224.0.0.13 (for Protocol Independent Multicast [PIM]), 224.0.0.22 and 224.0.0.2 (for Internet Group Management Protocol [IGMP]). The number of groups for each interface reflects both external and local group membership.

**Note**

You cannot use the `maximum groups-per-interface` command to configure the maximum number of groups for each interface below the number of existing groups on an interface. For example, if the number of groups is 39, and you set the maximum number of groups to 10, the configuration is rejected.

When you use the `maximum groups-per-interface` command for a specific interface, it overrides the inheritance property of this command specified under IGMP configuration mode.

### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

### Examples

The following example shows how to display the maximum number of groups for each interface. A configuration is committed to change the maximum number of groups for each interface to 12. Before
and after configuration, use the `show igmp summary` command to confirm the configuration change:

```
RP/0/RSP0/CP00:router# show igmp summary

nsf lifetime (IGMP)

To configure the maximum time for the nonstop forwarding (NSF) timeout on the Internet Group Management Protocol (IGMP) process, use the `nsf lifetime` command in the appropriate configuration mode. To return to the default behavior, use the `no` form of this command.

```
nsf lifetime seconds
no nsf lifetime
```

**Syntax Description**

- `seconds` Maximum time for NSF mode. Range is 10 to 3600 seconds.

**Command Default**

- `seconds : 60`

**Command Modes**

- IGMP configuration
- IGMP VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The IGMP NSF process is triggered by the restart of the IGMP process. While in IGMP NSF mode, the Multicast Routing Information Base (MRIB) purges the routes installed by the previous IGMP process when the IGMP NSF process times out.

The IGMP NSF lifetime is the period for IGMP to relearn all the host membership of the attached network through membership queries and reports. During this NSF period, PIM continues to maintain forwarding state for the local members while IGMP recovers their membership reports.

Additionally, IGMP recovers the internal receiver state from Local Packet Transport Services (LPTS) for IP group member applications (including the Session Announcement Protocol (SAP) Listener) and updates the MRIB.

**Examples**

The following example shows how to set the IGMP NSF timeout value to 120 seconds:

```
RP/0/RSP0/CPU0:router(config)# router igmp
RP/0/RSP0/CPU0:router(config-igmp)# nsf lifetime 120
```

query-interval

To configure the frequency at which the Cisco IOS XR Software sends Internet Group Management Protocol (IGMP) host-query messages, use the **query-interval** command in the appropriate configuration mode. To return to the default frequency, use the `no` form of this command.

```
query-interval  seconds
no  query-interval
```

**Syntax Description**

- `seconds` Frequency used to send IGMP host-query messages. Range is 1 to 3600.

**Command Default**

If this command is not specified in interface configuration mode, the interface adopts the query interval parameter specified in IGMP configuration mode.

If this command is not specified in IGMP configuration mode, the query interval time is 60 seconds.

**Command Modes**

- IGMP VRF configuration
- IGMP interface configuration

**Command History**

Release | Modification
--- | ---
3.7.2 | This command was introduced.

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Multicast routers send host membership query messages (host-query messages) to discover which multicast groups have members on the attached networks of the router. Hosts respond with IGMP report messages indicating that they want to receive multicast packets for specific groups (that is, that the host wants to become a member of the group). Host-query messages are addressed to the all-hosts multicast group, which has the address 224.0.0.1, and has an IP time-to-live (TTL) value of 1.

The designated router for a LAN is the only router that sends IGMP host-query messages:

- For IGMP Version 1 (only), the designated router is elected according to the multicast routing protocol that runs on the LAN.
- For IGMP Versions 2 and 3, the designated querier is the lowest IP-addressed multicast router on the subnet.

If the router hears no queries for the timeout period (controlled by the query-timeout command), it becomes the querier.

**Note**

Changing the value of the `seconds` argument may severely impact network performance. A short query interval may increase the amount of traffic on the attached network, and a long query interval may reduce the querier convergence time.
If you configure the `query-interval` command in IGMP configuration mode, parameters are inherited by all new and existing interfaces. You can override these parameters on individual interfaces from interface configuration mode.

---

**Examples**

This example shows how to change the frequency at which the designated router sends IGMP host-query messages to 2 minutes:

```
RP/0/RSP0/CPU0:router(config)# router igmp
RP/0/RSP0/CPU0:router(config-igmp)# interface gigabitEthernet 0/1/0/0
RP/0/RSP0/CPU0:router(config-igmp-default-if)# query-interval 120
```

---

query-max-response-time

To configure the maximum response time advertised in Internet Group Management Protocol (IGMP) queries, use the `query-max-response-time` command in the appropriate configuration mode. To return to the default behavior, use the `no` form of this command.

```
query-max-response-time  seconds
no  query-max-response-time
```

**Syntax Description**
- `seconds` Maximum response time, in seconds, advertised in IGMP queries. Range is 1 to 12.

**Command Default**
- If this command is not specified in interface configuration mode, the interface adopts the maximum response time parameter specified in IGMP configuration mode.
- If this command is not specified in IGMP configuration mode, the maximum response time is 10 seconds.

**Command Modes**
- IGMP VRF configuration
- IGMP interface configuration

**Command History**
- **Release 3.7.2** This command was introduced.

**Usage Guidelines**
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `query-max-response-time` command is not supported on IGMP Version 1.

This command is used to control the maximum response time for hosts to answer an IGMP query message. Configuring a value less than 10 seconds enables the router to prune groups much faster, but this action results in network burstiness because hosts are restricted to a shorter response time period.

If you configure this command in IGMP configuration mode, parameters are inherited by all new and existing interfaces. You can override these parameters on individual interfaces in interface configuration mode.

**Note**
If the hosts do not read the maximum response time in the query message correctly, group membership might be pruned inadvertently. Therefore, the hosts must know to respond faster than 10 seconds (or the value you configure).

**Task ID**
```
<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>
```

**Examples**
The following example shows how to configure a maximum response time of 8 seconds:
RP/0/RSP0/CPU0:router(config)# router igmp
RP/0/RSP0/CPU0:router(config-igmp)# interface gigabitEthernet 0/1/0/0
RP/0/RSP0/CPU0:router(config-igmp-default-if)# query-max-response-time 8

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>hello-interval (PIM)</strong></td>
<td>Configures the frequency of PIM hello messages.</td>
</tr>
<tr>
<td><strong>show igmp groups, on page 33</strong></td>
<td>Displays the multicast groups that are directly connected to the router and that were learned through IGMP.</td>
</tr>
</tbody>
</table>
query-timeout

To configure the timeout value before the router takes over as the querier for the interface, use the `query-timeout` command in the appropriate configuration mode. To return to the default behavior, use the `no` form of this command.

```
query-timeout  seconds
no  query-timeout
```

**Syntax Description**

- `seconds` Number of seconds that the router waits after the previous querier has stopped querying before it takes over as the querier. Range is 60 to 300.

**Command Default**

If this command is not specified in interface configuration mode, the interface adopts the timeout value parameter specified in IGMP VRF configuration mode. If this command is not specified in IGMP VRF configuration mode, the maximum response time is equal to twice the query interval set by the `query-interval` command.

**Command Modes**

- IGMP VRF configuration
- IGMP interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `query timeout` command is not supported on Internet Group Management Protocol (IGMP) Version 1.

By default, the router waits twice the query interval specified by the `query-interval` command, after which, if the router has heard no queries, it becomes the querier. By default, the query interval is 60 seconds, which means that the `query timeout` value defaults to 120 seconds.

If you configure a query timeout value less than twice the query interval, routers in the network may determine a query timeout and take over the querier without good reason.

**Note**

If you configure this command in IGMP configuration mode, parameters are inherited by all new and existing interfaces. You can override these parameters on individual interfaces in interface configuration mode.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast  read, write</td>
</tr>
</tbody>
</table>
Examples

The following example shows how to configure the router to wait 30 seconds from the time it received the last query before it takes over as the querier for the interface:

```
RP/0/RSP0/CPU0:router(config)# router igmp
RP/0/RSP0/CPU0:router(config-igmp)# interface gigabitEthernet 0/1/0/0
RP/0/RSP0/CPU0:router(config-igmp-default-if)# query-timeout 30
```

Related Commands

<table>

</tbody>
</table>
robustness-count

To set the robustness variable to tune for expected packet loss on a network, use the `robustness-count` command in the appropriate configuration mode. To return to the default setting, use the `no` form of this command.

```
robustness-count  count
no robustness-count
```

### Syntax Description

| `count` | Value of the robustness count variable. Range is 2 to 10 packets. |

### Command Default

Default is 2 packets.

### Command Modes

- IGMP VRF configuration
- IGMP interface configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

IGMP is a soft-state protocol. State must be periodically refreshed or it times out. At a `robustness-count` command setting, for example, of 4, a network might lose three IGMP packets related to some specific state yet still maintain the state. If, however, a network lost more than three IGMP packets in the sequence, the state would time out. You might then consider changing the `robustness-count` setting to maintain state.

### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

### Examples

The following example illustrates the use of the `robustness-count` command:

```
RP/0/RSP0/CPU0:router(config)# configure
RP/0/RSP0/CPU0:router(config)# router igmp
RP/0/RSP0/CPU0:router(config-igmp)# robustness-count 2
```
router

To disable or enable Internet Group Management Protocol (IGMP) membership tracking, use the `router` command in the appropriate configuration mode. To return to the default behavior, use the `no` form of this command.

```
router {disable|enable}
no router {disable|enable}
```

**Syntax Description**
- `disable` Turns off IGMP membership tracking.
- `enable` Turns on IGMP membership tracking.

**Command Default**
If this command is not specified in IGMP VRF configuration mode, router functionality is enabled on all interfaces.

**Command Modes**
IGMP interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
</table>
| 3.7.2   | This command was introduced.

**Usage Guidelines**
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `router` command is used to enable and disable the IGMP router functionality on a specific interface. For instance, IGMP stops queries from an interface when the router functionality is disabled on that interface. Disabling IGMP router functionality does not prevent local group membership from being announced through the group membership report.

**Note**
This command is useful if you want to disable or enable IGMP interfaces that have been previously enabled through the `multicast-routing` command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**
The following example shows how to enable IGMP membership tracking functionality on all multicast enabled interfaces, except Packet-over-SONET/SDH (POS) interface 0/1/0/0:

```
RP/0/RSP0/CPU0:router(config)# router igmp
RP/0/RSP0/CPU0:router(config-igmp)# interface gigabitEthernet 0/1/0/0
RP/0/RSP0/CPU0:router(config-igmp-default-if)# router enable
```
### Related Commands

</table>
router igmp

To enter Internet Group Management Protocol (IGMP) configuration mode, use the `router igmp` command in global configuration mode. To return to the default behavior, use the `no` form of this command.

```
router igmp
no router igmp
```

### Syntax Description

This command has no keywords or arguments.

### Command Default

No default behavior or values

### Command Default

Global configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

From IGMP VRF configuration mode, you can configure the maximum response time advertised in IGMP queries and modify the host query interval.

### Note

The IGMP process is turned on when the `router igmp` command or the `multicast-routing` command is initiated.

### Task ID

<table>

</tr>
</thead>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `show igmp nsf` command displays the current multicast NSF state for IGMP. The NSF state that is displayed may be either normal or activated for NSF. The activated state indicates that recovery is in progress due to an IGMP failure. The total NSF timeout and time remaining are displayed until NSF expiration.

**Task ID**

**show igmp nsr**

To display the nonstop routing (NSR) information in Internet Group Management Protocol (IGMP), use the `show igmp nsr` command in EXEC mode.

```
show igmp ipv4|ipv6 nsr
```

**Syntax Description**

- `ipv4` (Optional) Specifies IPv4 address prefixes.
- `ipv6` (Optional) Specifies IPv6 address prefixes

**Command Default**

No default behavior or values

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.2.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `show igmp nsr` command displays the current multicast NSR information for IGMP. The NSR state that is displayed may be either normal or activated for NSR. The activated state indicates that recovery is in progress due to an IGMP failure. The total NSR timeout and time remaining are displayed until NSR expiration.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>

</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read</td>
</tr>
</tbody>
</table>

**Examples**

The following is sample output from the `show igmp nsr` command:

```
RP/0/RSP0/CPU0:router# show igmp nsr

IGMP NSR Data :-
NSR State : Not Ready (uptime 4w0d)
Converged with collaborators : Y
Partner connection state : Not-coverged/Down
RMF Notif done : Y
Last RMF ready notified : Never [0]
Last RMF not ready notified : 4w0d [1]
Last partner process conn up : Never [0]
Last partner process conn down : Never [0]
```
This table describes the significant fields shown in the display.

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `show igmp summary` command is used to display the total group membership. The value for number of groups is the total number of group members on all interfaces. The value for maximum number of groups is the total number of external and local members possible for all interfaces. The maximum number of groups and the default value for the maximum number of groups is 50000 members. The maximum number of groups for each interface, and the default value for the maximum number of groups for each interface, is 25000 members.

**Task ID**

**show igmp ssm map**

To query the source-specific mapping (SSM) state, use the `show igmp ssm map` command in EXEC mode.

```
show igmp [vrf vrf-name] ssm map [group-address] [detail]
```

### Syntax Description

- **vrf** (Optional) Specifies a VPN routing and forwarding (VRF) instance to be queried.
- **vrf-name** (Optional) Specifies the name of the specific VRF instance.
- **group-address** (Optional) Specifies the address of the SSM group for which to obtain the mapping state.
- **detail** (Optional) Displays detailed source information.

### Command Default

No default behavior or values

### Command Modes

EXEC

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

### Task ID

- **Task ID** Operations
  - multicast read

### Examples

The following example illustrates the use of the `show igmp ssm map` command:

```
RP/0/RSP0/CPU0:router# show igmp ssm map 232.1.1.1

232.1.1.1 is static with 1 source
```
**show igmp traffic**

To display all the Internet Group Management Protocol (IGMP) traffic-related counters, use the `show igmp traffic` command in EXEC mode.

```
show igmp [vrf vrf-name] traffic
```

**Syntax Description**

- `vrf vrf-name` (Optional) Specifies a VPN routing and forwarding (VRF) instance.

**Command Default**

No default behavior or values

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `show igmp traffic` command is used to display the state of all counters for IGMP traffic. It gives information about the length of time the counters have been active and the count of different types of IGMP packets received, such as queries, leaves, and reports. Also, this command keeps a count of all the erroneous IGMP packets received.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read</td>
</tr>
</tbody>
</table>

**Examples**

The following is sample output from the `show igmp traffic` command:

```
RP/0/RSP0/CPU0:router# show igmp traffic

IGMP Traffic Counters
Elapsed time since counters cleared: 15:27:38

Received       Sent
Valid IGMP Packet 2784     5576
Queries         0           2784
Reports         2784     2792
Leaves           0           0
Mtrace packets  0           0
DVMRP packets  0           0
PIM packets     0           0

Errors:
Malformed Packets 0
Bad Checksums    0
```
This table describes the significant fields shown in the display for the `show igmp traffic` command.

### Table 7: `show igmp traffic` Field Descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Valid IGMP Packet</td>
<td>Total number of valid protocol packets sent and received. Valid packet types include:</td>

<tr>
<td></td>
<td>• Queries</td>
</tr>
<tr>
<td></td>
<td>• Membership reports</td>
</tr>
<tr>
<td></td>
<td>• Leaves</td>
</tr>
<tr>
<td>Queries</td>
<td>Total number of query packets sent and received. IP Multicast routers send queries to determine the multicast reception state of neighboring interfaces.</td>
</tr>
<tr>
<td>Reports</td>
<td>Total number of membership report packets received. Membership reports indicate either the current multicast reception state of a neighboring interface or a change to that state.</td>
</tr>
<tr>
<td>Leaves</td>
<td>Total number of leaves received. A leave group packet indicates a neighboring interface no longer has multicast reception state for a particular group.</td>
</tr>
<tr>
<td>Mtrace packets</td>
<td>Total number of Mtrace packets sent and received. Mtrace traces the route from a receiver to a source using a particular multicast address.</td>
</tr>
<tr>
<td>DVMRP packets</td>
<td>Total number of Distance Vector Multicast Routing Protocol (DVMRP) packets sent and received. DVMRP is an Internet routing protocol that provides a mechanism for connectionless datagram delivery to a group of hosts across an internetwork. This protocol dynamically generates IP multicast delivery trees using Reverse Path Multicasting. Packet type 0x13 indicates a DVMRP packet.</td>
</tr>
<tr>
<td>PIM packets</td>
<td>Total number of sent and received Protocol Independent Multicast (PIM) packets.</td>
</tr>
<tr>
<td>Malformed Packets</td>
<td>Total number of malformed packets received. A malformed packet is a packet smaller than the smallest valid protocol packet.</td>
</tr>
<tr>
<td>Bad Checksums</td>
<td>Total number of packets received with a bad protocol header checksum.</td>
</tr>
<tr>
<td>Socket Errors</td>
<td>Total number of read and write failures on the protocol socket.</td>
</tr>
<tr>
<td>Bad Scope Errors</td>
<td>Total number of packets received with an invalid multicast scope.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> IGMP has no invalid scopes; this counter, therefore, never increments in IGMP.</td>
</tr>
<tr>
<td>Auxiliary Data Len Errors</td>
<td>Total number of packets received with a non-zero auxiliary data length.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Subnet Errors</td>
<td>Total number of packets received that were not sourced on the same subnet as the router. DVMRP and MTRACE packets received are not checked for this error as they may be validly sourced from a different subnet.</td>
</tr>
<tr>
<td>Packets dropped due to invalid socket</td>
<td>Total number of packets dropped due to an invalid socket.</td>
</tr>
</tbody>
</table>
| Packets which couldn’t be accessed | Total number of packets that could not be sent or received. This might occur if:  
  • Packet buffer does not form a valid protocol packet.  
  • IP header is not written to the packet.  
  • Outgoing packet interface handle was not set.  
  • Errors occurred calculating the protocol checksum. |
| Other Packet Drops            | Packets dropped for any other reason.                                                                                                                                 |

### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>

</tbody>
</table>
**show igmp vrf vrf_name groups**

To display the IGMP group membership information, use the `show igmp vrf vrf_name groups` command in the EXEC mode.

```plaintext
show igmp vrf vrf_name groups ip_address
```

**Syntax Description**

- `ip_address` Specifies the IP address or group address.

**Command Default**

No default behavior or values

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.2.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read</td>
</tr>
</tbody>
</table>

```plaintext
RP/0/RSP0/CPU0:router# show igmp vrf vrf1 groups 232.1.1.1
IGMP Connected Group Membership
Group Address Interface Uptime Expires Last Reporter
232.1.1.1 tunnel-mte1 12:39:31 never 110.110.110.110
```
ssm map

To map group memberships from legacy hosts in Source-Specific Multicast (SSM) groups accepted by an access control list (ACL) to a Protocol Independent Multicast (PIM)-SSM source or to configure DNS mapping for PIM-SSM sources to a set of SSM groups, use the `ssm map` command in the appropriate configuration mode. To revert to default behavior, use the `no` form of this command.

```
ssm map { static source-address access-list | query dns }
no ssm map { static source-address access-list | query dns }
```

**Syntax Description**

- `source-address`: PIM-SSM source address to be used to create a static mapping.
- `access-list`: ACL specifying the groups to be used to create a static mapping.
- `query`: Configure a mapping of sources to groups quering external database.
- `dns`: Configure a DNS mapping for sources to a set of SSM groups.

**Command Default**

Legacy host membership reports in the SSM group range are discarded and DNS-based SSM mapping is not enabled.

**Command Modes**

IGMP VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>5.3.2</td>
<td>The keywords &quot;query&quot; and &quot;DNS&quot; were introduced to configure DNS-based SSM mapping.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

PIM-SSM requires the use of IGMPv3 (IPv4) to determine local memberships. Under normal operating conditions, IGMP discards older version group membership reports for groups in the SSM group range. This means that a host with a legacy group membership protocol is unable to receive data from a PIM-SSM source.

The `ssm map static` command maps an older group membership report to a set of PIM-SSM sources. If the ACL associated with a configured source accepts the SSM group, then that source is included in its set of sources for the SSM group.

**Examples**

The following example shows PIM-SSM mapping in IGMP routing configuration mode:

```
RP/0/RSP0/CPU0:router(config)# configuration
```
RP/0/RSP0/CPU0:router(config)# router igmp
RP/0/RSP0/CPU0:router(config-igmp)# ssm map static 10.0.0.1 mc2
RP/0/RSP0/CPU0:router(config-igmp)#
static-group

To configure the router to be a statically configured member of the specified group on the interface, or to statically forward for a multicast group onto the interface, use the `static-group` command in the appropriate configuration mode. To return to the default behavior, use the `no` form of this command.

```
static-group group-address [inc-mask mask count cnt] [source-address [inc-mask mask count cnt]]
no static-group group-address [inc-mask mask count cnt] [source-address [inc-mask mask count cnt]]
```

**Syntax Description**

- `group-address` IP address of the multicast group in IPv4 prefixing format:
  - IP address as defined in the Domain Name System (DNS) hosts table or with the domain IPv4 host in the format `A.B.C.D`.

- `inc-mask mask` (Optional) Specifies a mask for the increment range. This is an IP address expressed range in IPv4 format. This mask is used with the group address to generate subsequent group addresses:
  - IP address as defined in the Domain Name System (DNS) hosts table or with the domain IPv4 host in the format `A.B.C.D`.

- `count cnt` (Optional) Specifies a number of group addresses to generate using the increment mask. Range is 1 to 512.

- `source address` (Optional) Source address of the multicast group to include in IPv4 prefixing format:
  - IP address as defined in the Domain Name System (DNS) hosts table or with the domain IPv4 host in the format `A.B.C.D`.

**Command Default**

A router is not a statically connected member of an IP multicast group.

**Command Modes**

IGMP interface configuration

**Command History**

```
Release  Modification
3.7.2        This command was introduced.
```

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

When you configure the `static-group` command, packets to the group are switched out the interface, provided that packets were received on the correct Reverse Path Forwarding (RPF) interface.

The `static-group` command differs from the `join-group` command. The `join-group` command allows the router to join the multicast group and draw traffic to an IP client process (that is, the route processor). If you
configure both the `join-group` and `static-group` command for the same group address, the `join-group` command takes precedence and the group behaves like a locally joined group.

**Note**
The `static-group` command has no impact on system performance. Configuring a static-group on a loopback interface has no effect on the ASR 9000 Series Aggregation Services Router.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

In the following example, the router statically joins two multicast groups 225.2.2.2 and 225.2.2.4 for the specific source 1.1.1.1:

```
RP/0/RSP0/CPU0:router(config)# router igmp
RP/0/RSP0/CPU0:router(config-igmp)# interface GigE 0/1/0/0
RP/0/RSP0/CPU0:router(config-igmp-default-if)# static-group 225.2.2.2 inc-mask 0.0.0.2 count 2 1.1.1.1
```
version

To configure an Internet Group Management Protocol (IGMP) version for the router, use the `version` command in the appropriate configuration mode. To restore the default value, use the `no` form of this command.

```
version {1|2|3}
no version
```

**Syntax Description**

- 1 Specifies IGMP Version 1.
- 3 Specifies IGMP Version 3.

**Command Default**

- If this command is not specified in interface configuration mode, the interface adopts the IGMP version parameter specified in IGMP VRF configuration mode.
- If this command is not specified in IGMP configuration mode, IGMP uses Version 3.

**Command Modes**

- IGMP configuration
- IGMP VRF configuration
- IGMP interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

All routers on the subnet must be configured with the same version of IGMP. For example, a router running Cisco IOS XR software does not automatically detect Version 1 systems and switch to Version 1. Hosts can have any IGMP version and the router will correctly detect their presence and query them appropriately.

The `query-max-response-time` and `query-timeout` commands require IGMP Version 2 or 3.

**Note**

If you configure this command in IGMP configuration mode, parameters are inherited by all new and existing interfaces. You can override these parameters on individual interfaces from interface configuration mode.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>
The following example shows how to configure the router to use IGMP Version 3:

```
RP/0/RSP0/CPU0:router(config)# router igmp
RP/0/RSP0/CPU0:router(config-igmp)# version 3
```
**vrf (igmp)**

To configure a virtual private network (VRF) instance, use the `vrf` command in IGMP routing configuration mode. To remove the VRF instance from the configuration file and restore the system to its default condition, use the `no` form of this command.

```
vrf vrf-name
no vrf vrf-name
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrf-name</td>
<td>Name of the VRF instance.</td>
</tr>
</tbody>
</table>

**Command Default**

No default behavior or values.

**Command Modes**

IGMP configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

When you use the `vrf` command from the IGMP routing configuration mode to configure a VRF instance, you enter the IGMP VRF configuration submode.

A VRF instance is a collection of VPN routing and forwarding tables maintained at the provider edge (PE) router.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to configure a VRF instance in IGMP configuration submode and to enter VRF configuration submode:

```
RP/0/RSP0/CPU0:router(config)# router igmp
RP/0/RSP0/CPU0:router(config-igmp)# vrf
vrf_1
RP/0/RSP0/CPU0:router(config-igmp-vrf_1)#
```
vrf (igmp)
Multicast Source Discovery Protocol Commands

This chapter describes the commands used to configure and monitor the Multicast Source Discovery Protocol (MSDP) on the Cisco ASR 9000 Series Router.

For detailed information about multicast routing concepts, configuration tasks, and examples, refer to the Implementing Multicast Routing on the Cisco ASR 9000 Series Router configuration module in Multicast Configuration Guide for Cisco ASR 9000 Series Routers.

cache-sa holdtime

To configure the cache source-active (SA) state hold-time period on a router, use the `cache-sa-holdtime` command in MSDP configuration mode. To return to the default behavior, use the `no` form of this command.

```
cache-sa-holdtime  holdtime-number
no cache-sa-holdtime  holdtime-number
```

**Syntax Description**

`holdtime-number`  Hold-time period (in seconds). Range is 150 to 3600.

**Command Default**

`holdtime-number` : 150 seconds

**Command Modes**

MSDP configuration

**Command History**

<table>
<thead>
<tr>

<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `cache-sa-holdtime` command is used to increase the cache SA state hold time. Any cache entry that is created usually expires after 150 seconds. For troubleshooting purposes, you may need Multicast Source Discovery Protocol (MSDP) to keep SA cache entries for a longer period.

**Examples**

The following example shows how to set the cache SA state hold-time period to 200 seconds:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# router
msdp
RP/0/RSP0/CPU0:router(config-msdp)# cache-sa-holdtime
200
```

**Related Commands**

<table>
<thead>
<tr>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cache-sa-state, on page 61</td>
<td>Controls cache source-active (SA) state on a router.</td>
</tr>
</tbody>
</table>
cache-sa-state

To control cache source-active (SA) state on a router, use the `cache-sa-state` command in MSDP configuration mode. To return to the default behavior, use the `no` form of this command.

```plaintext
cache-sa-state {list access-list-number|rp-list access-list-name}
no cache-sa-state {list access-list-number|rp-list access-list-name}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>list access-list-number</code></td>
<td>Specifies an IP access list that defines which (S, G) pairs to cache.</td>
</tr>
<tr>
<td><code>rp-list access-list-name</code></td>
<td>Specifies an access list name for the originating rendezvous point (RP).</td>
</tr>
</tbody>
</table>

### Command Default

The router creates SA state.

### Command Modes

MSDP configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

When a new member joins a group immediately after an SA message arrives, latency may occur and an SA message may be missed. To overcome this problem, you can configure this command and the router will supply SA information (from cache memory) to the new member instead of requiring that the member wait until the next SA message is received.

The `cache-sa-state` command is required in every Multicast Source Discovery Protocol (MSDP) speaker, to cache SA messages received from peers.

### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

### Examples

The following example shows how to configure the cache state for all sources in 10.0.0.0/16 sending to groups 224.2.0.0/16:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# MSDP
RP/0/RSP0/CPU0:router(config-madp)# cache-sa-state list 100
RP/0/RSP0/CPU0:router(config-madp)# exit
RP/0/RSP0/CPU0:router(config)# ipv4
access-list 100 permit 10.0.0.0 0.0.255.255 224.2.0.0 0.0.255.255
```
The source and destination fields in the access list matches on the \((S,G)\) fields in the SA messages. We recommend that the first address and mask field in the access list is used for the source and the second field in the access list is used for the group or destination.

### Related Commands

<table>

</tbody>
</table>
clear msdp peer

To clear the TCP connection of the specified Multicast Source Discovery Protocol (MSDP) peer, use the clear msdp peer command in EXEC mode.

```
clear msdp [ipv4] peer peer-address
```

**Syntax Description**

- **ipv4** (Optional) Specifies IPv4 address prefixes.
- **peer-address** IPv4 address or hostname of the MSDP peer to which the TCP connection is cleared.

**Command Default**

IPv4 addressing is the default.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The clear msdp peer command closes the TCP connection to the MSDP peer, resets all the MSDP peer statistics, and clears the input and output queues to and from the MSDP peer.

**Task ID**

- **Task**
  - multicast
- **Operations**
  - execute

**Examples**

The following example shows how to clear the TCP connection of the MSDP peer at address 224.15.9.8:

```
RP/0/RSP0/CPU0:router# clear msdp peer 224.15.9.8
```

**Related Commands**

</table>
clear msdp sa-cache

To clear external Multicast Source Discovery Protocol (MSDP) source-active (SA) cache entries, use the clear msdp sa-cache command in EXEC mode.

clear msdp [ipv4] sa-cache [group-address]

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipv4</td>
<td>(Optional) Specifies IPv4 address prefixes.</td>
</tr>
<tr>
<td>group-address</td>
<td>(Optional) Multicast group address or name for which external SA entries are cleared from the SA cache.</td>
</tr>
</tbody>
</table>

**Command Default**

No default behavior or values

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

**Note**

SA caching is enabled by default on Cisco IOS XR software.

If you do not specify a multicast group by group address or group name with the group-address argument, the clear msdp sa-cache command clears all external SA cache entries.

**Note**

Local SA cache entries can be cleared using the clear pim topology command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>execute</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to clear the external SA entries for the multicast group at address 224.5.6.7 from the cache:
RP/0/RSP0/CPU0:router# clear msdp sa-cache 224.5.6.7

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
clear msdp stats

To reset Multicast Source Discovery Protocol (MSDP) peer statistic counters, use the `clear msdp stats` command in EXEC mode.

```
clear msdp [ipv4] stats [peer peer-address] [allvalues]
```

**Syntax Description**
- `ipv4` (Optional) Specifies IPv4 address prefixes.
- `peer peer-address` (Optional) Clears MSDP peer statistic counters for the specified IPv6 MSDP peer address or peer name.
- `allvalues` (Optional) Clears all statistic counters for all MSDP peers.

**Command Default**
No default behavior or values

**Command Modes**
EXEC

**Command History**
- **Release 3.7.2**  This command was introduced.

**Usage Guidelines**
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `clear msdp stats` command resets MSDP peer statistic counters such as the number of keepalives sent and received and the number of Source Active (SA) entries sent and received.

If you do not specify an MSDP peer with the `peer` keyword and `peer-address` argument, this command clears statistic counters for all MSDP peers.

**Examples**
The following example shows how to clear all statistics for all peers:

```
RP/0/RSP0/CPU0:router# clear msdp stats peer 224.0.1.1
```

**Related Commands**
- `show msdp statistics peer`, on page 95

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show msdp statistics peer</td>
<td>Displays Multicast Source Discovery Protocol (MSDP) peer statistic counters.</td>
</tr>
</tbody>
</table>
**connect-source**

To configure a source address used for a Multicast Source Discovery Protocol (MSDP) connection, use the `connect-source` command in the appropriate configuration mode. To return to the default behavior, use the `no` form of this command.

```
close-source type [interface-path-id]
no connect-source type [interface-path-id]
```

**Syntax Description**

- `type` Interface type. For more information, use the question mark (?) online help function.
- `interface-path-id` (Optional) Physical interface or virtual interface.

**Note**

Use the `show interfaces` command in EXEC mode to see a list of all interfaces currently configured on the router.

For more information about the syntax for the router, use the question mark (?) online help function.

**Command Default**

If a source address is not configured for the MSDP connection, the IP address of the interface toward the peer is used as a source address.

**Command Modes**

- MSDP configuration
- MSDP peer configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `connect-source` command:

- Specifies the interface type and path ID whose primary address becomes the source IP address for the TCP connection.
- Is recommended for MSDP peers that peer with a router inside the remote domain.
- Can be configured globally for MSDP (and is inheritable by MSDP peers). This global configuration can be overridden if the command is issued again in peer configuration mode.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to configure a loopback interface source address for an MSDP connection:
RP/0/RSP0/CPU0:router(config)# interface loopback 0
RP/0/RSP0/CPU0:router(config-if)# ipv4 address 10.1.1.1/24
RP/0/RSP0/CPU0:router(config-if)# exit
RP/0/RSP0/CPU0:router(config)# router msdp
RP/0/RSP0/CPU0:router(config-msdp)# connect-source loopback 0
default-peer

To define a default peer from which to accept all Multicast Source Discovery Protocol (MSDP) source-active (SA) messages, use the default-peer command in MSDP configuration mode. To return to the default behavior, use the no form of this command.

```
default-peer ip-address
no default-peer
```

**Syntax Description**

- **ip-address**: IP address or Domain Name System (DNS) name of the MSDP default peer.

**Command Default**

No default MSDP peer exists.

**Command Modes**

MSDP configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

A default peer configuration accepts all MSDP Source-Active (SA) messages, as a last Reverse Path Forwarding (RPF) rule, when all other MSDP RPF rules fail.

Use the default-peer command if you do not want to configure your MSDP peer to be a BGP peer also.

When the prefix-list list keyword and argument are not specified, all SA messages received from the configured default peer are accepted.

Remember to configure a BGP prefix list to configure the prefix-list list keyword and argument with the default-peer command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to configure the router 172.16.12.0 as the default peer to the local router:

```
RP/0/RSP0/CPU0:router(config)# router msdp
RP/0/RSP0/CPU0:router(config-msdp)# default-peer 172.16.12.0
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>peer (MSDP), on page 80</td>
<td>Configures a Multicast Source Discovery Protocol (MSDP) peer.</td>
</tr>
</tbody>
</table>
description (peer)

To add descriptive text to the configuration for a Multicast Source Discovery Protocol (MSDP) peer, use the `description` command in peer configuration mode. To return to the default behavior, use the `no` form of this command.

```
description peer-address text
no description peer-address text
```

**Syntax Description**
- **peer-address**: IP address or hostname for the peer to which this description applies.
- **text**: Description of the MSDP peer. Use up to 80 characters to describe this peer.

**Command Default**
No description is associated with an MSDP peer.

**Command Modes**
- MSDP peer configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Configure a description to make the MSDP peer easier to identify. This description is visible in the `show msdp peer` command output.

**Task ID**
- **Task ID**: Operations
  - multicast: read, write

**Examples**
The following example shows how to configure the router at the IP address 10.0.5.4 with a description indicating that it is a router at customer site A:

```
RP/0/RSP0/CPU0:router(config)# router msdp
RP/0/RSP0/CPU0:router(config-mGRP)# peer 10.0.5.4
RP/0/RSP0/CPU0:router(config-mGRP-peer)# description 10.0.5.4 router_at_customer_site_A
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>peer (MSDP), on page 80</td>
<td>Configures a Multicast Source Discovery Protocol (MSDP) peer.</td>
</tr>
<tr>
<td>show msdp peer, on page 86</td>
<td>Displays information about the Multicast Source Discovery Protocol (MSDP) peer.</td>
</tr>
</tbody>
</table>
global maximum external-sa

To limit the total number of source active (SA) messages across all VRFs, use the `global maximum external-sa` command in the MSDP configuration mode. To remove the set SA messages limit use the `no` form of the command.

```
global maximum external-sa value
no global maximum external-sa
```

**Syntax Description**

- `value` Specifies the maximum-limit for the source active messages. Range is 1 to 75000.

**Command Default**

None

**Command Modes**

MSDP configuration mode

**Command History**

```
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.3.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>
```

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The value configured using the `global maximum external-sa` command must be greater than the maximum value of any VRF, which, in turn, must be greater than the maximum value of any peer in that VRF. When the set limit is reached, a syslog message is issued.

**Task ID**

```
<table>
<thead>
<tr>
<th>Task ID Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast read, write</td>
</tr>
</tbody>
</table>
```

This example shows the maximum-limit value for the source active messages, set to 100:

```
RP/0/RSP0/CPU0:router (config-madp) # global maximum external-sa 100
```
**maximum external-sa**

To configure the maximum number of external Multicast Source Discovery Protocol (MSDP) source-active (SA) entries that can be learned by the router or by a specific MSDP peer, use the `maximum external-sa` command in the appropriate configuration mode. To return to the default behavior, use the `no` form of this command.

```
maximum external-sa entries
no maximum external-sa
```

**Syntax Description**

- `entries` Maximum number of SA entries that can be learned by the router or a specific MSDP peer. Range is 1 to 75000.

**Command Default**

- `entries : 20000`

**Command Modes**

- MSDP peer configuration
- MSDP configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

When issued from MSDP configuration mode, the `maximum external-sa` command configures the total number of external SA entries (that is, the total cumulative SA state for all peers) that can be learned by the router. This command is used to control router resource utilization under heavy traffic conditions.

**Note**

The configuration fails if you configure the maximum number of external SA entries to be lower than the current accumulated SA state.

When issued from MSDP peer configuration mode, the `maximum external-sa` command configures the total number of external SA entries that can be learned by a specific MSDP peer. From MSDP configuration mode, this command can also be used to configure a specific MSDP peer to override the maximum external SA entry value configured with the `maximum peer-external-sa` command.

**Note**

The configuration fails if you configure the maximum number of external SA entries for a specific MSDP peer to be higher than the maximum number of external SA entries that can be learned by the router.
Task ID  |  Task ID  |  Operations
---|---|---
multicast  |  read, write

Examples

This example shows how to configure the maximum number of external SA entries that can be learned by the router to 30000 SA entries:

```
RP/0/RSP0/CPU0:router(config)# router msdp
RP/0/RSP0/CPU0:router(config-msdp)# maximum external-sa 30000
```

This example shows how to configure the maximum number of external SA entries that can be learned by the MSDP peer at address 10.1.5.3 to 25000 SA entries:

```
RP/0/RSP0/CPU0:router(config)# router msdp
RP/0/RSP0/CPU0:router(config-msdp)# peer 10.1.5.3
RP/0/RSP0/CPU0:router(config-msdp-peer)# maximum external-sa 25000
```

Related Commands

<table>

maximum peer-external-sa

To configure the maximum number of external Multicast Source Discovery Protocol (MSDP) Source-Active (SA) entries that can be learned from MSDP peers, use the `maximum peer-external-sa` command in MSDP configuration mode. To return to the default behavior, use the `no` form of this command.

```
maximum peer-external-sa entries
no maximum peer-external-sa
```

**Syntax Description**
- `entries`: Maximum number of SA entries to be learned by MSDP peers. Range is 1 to 75000.

**Command Default**
- `entries`: 20000

**Command Modes**
- MSDP configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `maximum peer-external-sa` command configures the maximum number of external SA entries that can be learned for each configured MSDP peer, whereas the `maximum external-sa` command (in MSDP configuration mode) configures the maximum number of SA entries accepted by the router as a cumulative total.

**Note**

The configuration fails if you attempt to configure the maximum number of external SA entries for MSDP peers to be higher than the maximum number of external SA entries that can be learned by the router.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>

</tbody>
</table>

RP/0/RSP0/CPU0:router(config)# router msdp
RP/0/RSP0/CPU0:router(config-msdp)# maximum peer-external-sa 27000
mesh-group (peer)

To configure a Multicast Source Discovery Protocol (MSDP) peer to be a member of a mesh group, use the `mesh-group` command in peer configuration mode. To return to the default behavior, use the `no` form of this command.

```
mesh-group name
no mesh-group name
```

**Syntax Description**
- `name` Name of the mesh group.

**Command Default**
MSDP peers do not belong to a mesh group.

**Command Modes**
MSDP peer configuration

**Command History**
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

A mesh group is a group of MSDP speakers that have fully meshed MSDP connectivity among themselves. Any Source-Active (SA) messages received from a peer in a mesh group are not forwarded to other peers in the same mesh group.

Mesh groups can be used to:
- Reduce SA message flooding
- Simplify peer Reverse Path Forwarding (RPF) flooding (no need to run Border Gateway Protocol [BGP] among MSDP peers)

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**
The following example shows how to configure the MSDP peer at address 10.0.5.4 to be a member of the mesh group named `internal`:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# router msdp
RP/0/RSP0/CPU0:router(config-msdp)# peer 10.0.5.4
RP/0/RSP0/CPU0:router(config-msdp-peer)# mesh-group internal
```
originator-id

To identify an interface type and instance to be used as the rendezvous point (RP) address in a Multicast Source Discovery Protocol (MSDP) Source-Active (SA) message, use the **originator-id** command in MSDP configuration mode. To return to the default behavior, use the **no** form of this command.

```
originator-id  type  interface-path-id
no originator-id  type  interface-path-id
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>Interface type. For more information, use the question mark (?) online help function.</td>
</tr>
<tr>
<td>interface-path-id</td>
<td>Physical interface or virtual interface.</td>
</tr>
</tbody>
</table>

**Note**

Use the **show interfaces** command in EXEC mode to see a list of all interfaces currently configured on the router.

For more information about the syntax for the router, use the question mark ( ? ) online help function.

**Command Default**

The RP address is used as the originator ID.

**Command Modes**

MSDP configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The **originator-id** command allows an MSDP speaker that originates an SA message to use the IP address of the interface as the RP address in the SA message.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to configure Gigabit Ethernet interface 0/1/1/0 to be used as the RP address in SA messages:

```
RP/0/RSP0/CPU0:router(config)# router msdp
RP/0/RSP0/CPU0:router(config-msdp)# originator-id GigE0/1/1/0
```
password (peer)

To enable Message Digest 5 (MD5) authentication on a TCP connection between two Multicast Source Discovery Protocol (MSDP) peers, use the `password` command in MSDP peer configuration mode. To return to the default behavior, use the `no` form of this command.

```
password {clear|encrypted} password
no password {clear|encrypted} password
```

**Syntax Description**

- **clear**: Specifies that an unencrypted password follows. The password must be a case-sensitive, clear-text unencrypted password.
- **encrypted**: Specifies that an encrypted password follows. The password must be a case-sensitive, encrypted password.
- **password**: Password of up to 80 characters. The password can contain any alphanumeric characters. However, if the first character is a number or the password contains a space, the password must be enclosed in double quotation marks; for example, “2 password.”

**Command Default**

No password is configured.

**Command Modes**

MSDP peer configuration

**Command History**

- **Release 3.7.2**: This command was introduced.

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `password` command supports MD5 signature protection on a TCP connection between two MSDP peers. When MD5 authentication is enabled between two MSDP peers, each segment sent on the TCP connection between the peers is verified. MD5 authentication must be configured with the same password on both MSDP peers; otherwise, the connection between them is not made. Configuring MD5 authentication causes the Cisco IOS XR software to generate and verify the MD5 digest of every segment sent on the TCP connection.

Use the `show msdp peer` command to check if a password has been configured on a peer.

**Task ID**

- **Task ID**: Operations
  - multicast: read, write

**Examples**

The following example shows how to configure the MSDP password on a peer:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# router msdp
```
RP/0/RSP0/CPU0:router(config-msdp)# **peer 10.0.5.4**
RP/0/RSP0/CPU0:router(config-msdp-peer)# **password encrypted a34bi5m**

<tbody>
<tr>
<td><strong>show msdp peer, on page 86</strong></td>
<td>Displays information about the Multicast Source Discovery Protocol (MSDP) peer.</td>
<td></td>
</tr>
</tbody>
</table>
**peer (MSDP)**

To configure a Multicast Source Discovery Protocol (MSDP) peer, use the **peer** command in MSDP configuration mode. To return to the default behavior, use the **no** form of this command.

```
peer peer-address
no peer peer-address
```

**Syntax Description**

- **peer-address**: IP address or Domain Name System (DNS) name of the router that is to be the MSDP peer.

**Command Default**

No MSDP peer is configured.

**Command Modes**

MSDP configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Configure the specified router as a Border Gateway Protocol (BGP) neighbor.

If you are also BGP peering with this MSDP peer, use the same IP address for MSDP as you do for BGP. However, you are not required to run BGP with the MSDP peer, as long as there is a BGP path between the MSDP peers. If there is no path, you must configure the **default-peer** command from MSDP configuration mode.

**Task ID**

- **Task ID**: Operations
  - multicast read, write

**Examples**

The following example shows how to configure the router at the IP address 172.16.1.2 as an MSDP peer to the local router and enter MSDP peer configuration mode:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# router msdp
RP/0/RSP0/CPU0:router(config-msdp)# peer 172.16.1.2
RP/0/RSP0/CPU0:router(config-msdp-peer)#
```

```
sa-filter

To configure an incoming or outgoing filter list for Source-Active (SA) messages received from the specified Multicast Source Discovery Protocol (MSDP) peer, use the `sa-filter` command in the appropriate configuration mode. To return to the default behavior, use the `no` form of this command.

```
sa-filter {in|out} {list access-list-name|rp-list access-list-name}
no sa-filter {in|out} {list access-list-name|rp-list access-list-name}
```

**Syntax Description**

- `in | out` Specifies incoming or outgoing SA filtering.
- `list access-list-name` Specifies an IP access list number or name. If no access list is specified, no (S, G) pairs from the peer are filtered.
- `rp-list access-list-name` Specifies an originating rendezvous point (RP) access list in SA messages.

**Command Default**

If the `sa-filter` command is not configured, no incoming or outgoing messages are filtered; all incoming SA messages are accepted from the peer, and all outgoing SA messages received are forwarded to the peer.

**Command Modes**

- MSDP configuration
- MSDP peer configuration

**Command History**

- **Release 3.7.2** This command was introduced.

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

**Note**

You can configure the `sa-filter` command globally for MSDP (and is inheritable by MSDP peers); however, this global configuration can be overridden if it is issued again in peer configuration mode.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

In the following example, only (S, G) pairs that pass access list 10 are forwarded in an SA message to the peer with IP address 131.107.5.4:

```
RP/0/RSP0/CPU0:router(config)# router msdp
RP/0/RSP0/CPU0:router(config-msdp)# peer 131.107.5.4
RP/0/RSP0/CPU0:router(config-msdp-peer)# sa-filter out list_10
```
In the following example, only (S, G) pairs for the rendezvous point that passes access list 151 are forwarded in an SA message to the peer with the IP address 131.107.5.4:

```
RP/0/RSP0/CPU0:router(config)# router msdp
RP/0/RSP0/CPU0:router(config-msdp)# peer 131.107.5.4
RP/0/RSP0/CPU0:router(config-msdp-peer)# sa-filter out rp-list list_151
```

**Note**
The source and destination fields in the access list matches on the (S,G) fields in the SA messages. We recommend that the first address and mask field in the access list is used for the source and the second field in the access list is used for the group or destination.

show msdp rpf

To display the Multicast Source Discovery Protocol (MSDP) Reverse Path Forwarding (RPF) rule that governs whether an Source-Active (SA) from an originating RP will be accepted, use the `show msdp rpf` command in EXEC mode.

```
show msdp [ipv4] rpf rpf-address
```

**Syntax Description**

- `ipv4` (Optional) Specifies IPv4 address prefixes.
- `rpf-address` IP address or hostname of the RPF next hop.

**Command Default**
IPv4 addressing is the default.

**Command Modes**
EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>

<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `show msdp rpf` command displays the peer interface and autonomous system to which the SAs are sent and forwarded based on the MSDP RPF rule. The rule is displayed and applied on the RP address field of the arriving SAs.

**Examples**

The following is sample output from the `show msdp rpf` command for RP peer 10.1.1.1:

```
RP/0/RSP0/CPU0:router# show msdp rpf 10.1.1.1
RP peer for 172.16.1.1 is 10.1.1.1 AS 200, rule: 1
bgp/rib lookup: nexthop: 10.1.1.1, asnum: 200
```

This table describes the significant fields shown in the display.

</tr>
</tbody>
</table>
**Field** | **Description**
---|---
AS 200 | Autonomous system to which the peer belongs.
rule: 1 | MSDP RPF rule that matches what was learned from SAs.
bgp/rib lookup: | Multicast RPF routing table lookup.
nexthop: 10.1.1.1 | Router where the SA is sent to reach the final destination.
asnum: 200 | Autonomous system number for the next-hop neighbor router.
show msdp nsr

To display nonstop routing (NSR) information in the Multicast Source Discovery Protocol (MSDP), use the show mrib nsr command in the appropriate mode.

```plaintext
show msdp [ipv4|ipv6] nsr
```

**Syntax Description**

- `ipv4` (Optional) Specifies IPv4 address prefixes.
- `ipv6` (Optional) Specifies IPv6 address prefixes.

**Command Default**

IPv4 addressing is the default.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>

</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The **show msdp nsr** command displays the current multicast NSR state for the MSDP. The state may be normal or activated for NSR. The activated state indicates that recovery is in progress due to a failure in MRIB or Protocol Independent Multicast (PIM). The total NSR timeout and time remaining are displayed until NSR expiration.

**Task ID**

<table>

show msdp sa-cache

To display the (S, G) state learned from Multicast Source Discovery Protocol (MSDP) peers, use the show msdp sa-cache command in EXEC mode.

```
show msdp [ipv4] sa-cache [source-address] [group-address] [all] [asnum as-number] [peer peer-address] [rpaddr rp-address] [summary]
```

**Syntax Description**

- `ipv4` (Optional) Specifies IPv4 address prefixes.
- `source-address` (Optional) Source address or hostname of the source about which (S, G) information is displayed.
- `group-address` (Optional) Group address or name of the group about which (S, G) information is displayed.
- `all` (Optional) Displays all Source Active (SA) entries with PI (PIM Interested) flags.
- `asnum as-number` (Optional) Displays SA entries of the specified autonomous system number. Range for 2-byte Autonomous system numbers (ASNs) is 1 to 65535. Range for 4-byte Autonomous system numbers (ASNs) in asplain format is 1 to 4294967295. Range for 4-byte Autonomous system numbers (ASNs) in asdot format is 1.0 to 65535.65535.
- `peer peer-address` (Optional) Displays peer entry information, including peer name and peer address.
- `rpaddr rp-address` (Optional) Displays SA entries that match the specified rendezvous point (RP) address.
- `summary` (Optional) Displays the count of all SA entries, RPs, sources, and groups.

**Command Default**

IPv4 addressing is the default.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>

<tr>
<td>3.9.0</td>
<td>Asplain format for 4-byte Autonomous system numbers notation was supported. The input parameters and output were modified to display 4-byte autonomous system numbers and extended communities in either asplain or asdot notations.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The show msdp sa-cache command is used to examine the (S, G) entries and the attributes, flags (L, E, EA), uptime, autonomous system number, and RP addresses that are stored in the SA cache.
These guidelines apply when this command is used:

- The `cache-sa-state` command is enabled by default.
- When you specify the `summary` keyword, the total number of cache, group, and source entries, and entries advertised by each RP and autonomous system are displayed.
- When you specify two addresses or names, an (S, G) entry corresponding to those addresses is displayed.
- When you specify a single group address, all sources for that group are displayed.
- When you specify no options, the entire SA cache is displayed, excluding the PI flag entries.

### Task ID

<table>

show msdp sa-cache

Originator-RP
SA information based on the individual RPs and the originating domains that distributed them.

AS-num
SA information based on the originating autonomous system.

The following is sample output using the **asnum** keyword option:

```
RP/0/RSP0/CPU0:router# show msdp sa-cache asnum 200

MSDP Flags:
E - set MRIB E flag, L - domain local source is active,
EA - externally active source, PI - FIM is interested in the group,
DE - SAs have been denied. Timers age/expiration,
Cache Entry:
(172.31.1.1, 239.1.1.1), RP 5.1.1.1, AS 200, 00:00:25/00:02:04

show msdp statistics peer

To display Multicast Source Discovery Protocol (MSDP) peer statistic counters, use the `show msdp statistics peer` command in EXEC mode.

```
show msdp [ipv4] statistics peer [peer-address]
```

**Syntax Description**
- `ipv4` (Optional) Specifies IPv4 address prefixes.
- `peer-address` (Optional) IP address or name of the MSDP peer.

**Command Default**
IPv4 addressing is the default.

**Command Modes**
EXEC

**Command History**
- Release 3.7.2 This command was introduced.

**Usage Guidelines**
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `show msdp statistics peer` command displays MSDP peer statistics such as the number of keepalive messages sent and received and the number of Source-Active (SA) entries sent and received.

If you do not specify an MSDP peer with the `peer-address` argument, this command displays statistics for all MSDP peers.

**Examples**

The following is sample output from the `show msdp statistics peer` command:

```
RP/0/RSP0/CPU0:router# show msdp statistics peer

MSDP Peer Statistics :-

Peer 10.1.2.3 : AS is 10, State is Up, 0 active SAs
  TLV Rcvd : 57 total
    57 keepalives, 0 notifications
    0 SAs, 0 SA Requests
    0 SA responses, 0 unknowns
  TLV Sent : 57 total
    54 keepalives, 0 notifications
    3 SAs, 0 SA Requests
    0 SA responses
  SA msgs : 0 received, 3 sent
```
Peer 10.2.3.4: AS is 0, State is Connect, 0 active SAs

TLV Rcvd: 0 total
0 keepalives, 0 notifications
0 SAs, 0 SA Requests
0 SA responses, 0 unknowns

TLV Sent: 0 total
0 keepalives, 0 notifications
0 SAs, 0 SA Requests
0 SA responses

SA msgs: 0 received, 0 sent

This table describes the significant fields shown in the display.

### Table 14: show msdp statistic peer Field Descriptions

<table>
<thead>
<tr>
<th>Field</th>

show msdp summary

To display Multicast Source Discovery Protocol (MSDP) peer status, use the show msdp summary command in EXEC mode.

```
show msdp [ipv4] summary
```

**Syntax Description**

- `ipv4` (Optional) Specifies IPv4 address prefixes.

**Command Default**

IPv4 addressing is the default.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The show msdp summary command displays peer status such as the following:

- Peer address
- Peer autonomous system
- Peer state
- Uptime and downtime
- Number of Source-Active (SA) messages sent or received

**Examples**

The following is sample output from the show msdp summary command:

```
RP/0/RSP0/CPU0:router# show msdp summary

Out of Resource Handling Enabled
Maximum External SA's Global : 20000
Current External Active SAs : 0

MSDP Peer Status Summary
Peer Address AS State Uptime/ Downtime Reset Count Name Active Cfg.Max Ext.SAs TLV recv/sent
10.1.1.1 0 NoIntf 00:10:07 0 ? 0 0 0/0
```
This table describes the significant fields shown in the display.

shutdown (MSDP)

To shut down a Multicast Source Discovery Protocol (MSDP) peer, use the shutdown command in peer configuration mode. To return to the default behavior, use the no form of this command.

```
shutdown
no shutdown
```

Syntax Description

This command has no keywords or arguments.

Command Default

No default behavior or values

Command Modes

MSDP peer configuration

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the shutdown command to shut down the peer. To configure many MSDP commands for the same peer, shut down the peer, configure it, and activate the peer later.

You might also want to shut down an MSDP session without losing configuration information for the peer.

When a peer is shut down, the TCP connection is terminated and is not restarted.

<table>

<tr>
<th>Task ID</th>
<th>Task ID Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>multicast read,</td>
</tr>
<tr>
<td></td>
<td>write</td>
</tr>
</tbody>
</table>

Examples

The following example shows how to shut down the peer with the address 172.16.5.4:

```
RP/0/RSP0/CPU0:router(config)# router msdp
RP/0/RSP0/CPU0:router(config-msdp)# peer 172.16.5.4
RP/0/RSP0/CPU0:router(config-msdp-peer)# shutdown
```

Related Commands

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show msdp peer, on page 86</td>
<td>Displays information about the Multicast Source Discovery Protocol (MSDP) peer.</td>
</tr>
</tbody>
</table>
### ttl-threshold (MSDP)

To limit which multicast data packets are sent in Source-Active (SA) messages to a Multicast Source Discovery Protocol (MSDP) peer, use the `ttl-threshold` command in MSDP configuration mode or peer configuration mode. To return to the default behavior, use the `no` form of this command.

```plaintext
ttl-threshold ttl
no ttl-threshold ttl
```

#### Syntax Description

- **ttl**: Time to live value. Range is 1 to 255.

#### Command Default

**ttl**: 1

#### Command Modes

- MSDP configuration
- MSDP peer configuration

#### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

#### Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `ttl-threshold` command limits which multicast data packets are sent in data-encapsulated Source-Active (SA) messages. Only multicast packets with an IP header time-to-live (TTL) greater than or equal to the `ttl` argument are sent to the MSDP peer specified by the IP address or name.

Use the `ttl-threshold` command to use TTL to examine your multicast data traffic. For example, you can limit internal traffic to a TTL of 8. If you want other groups to go to external locations, send the packets with a TTL greater than 8.

#### Note

This command can be configured globally for MSDP (and to be inheritable by MSDP peers). However, this global configuration can be overridden if issued again in peer configuration mode.

#### Task ID

- **Task ID**: Operations
  - multicast read,
    - write

#### Examples

The following example shows how to configure a TTL threshold of eight hops:
RP/0/RSP0/CPU0:router(config)# router msdp
RP/0/RSP0/CPU0:router(config-msdp)# ttl-threshold 8

accounting per-prefix

To enable accounting for multicast routing, use the `accounting per-prefix` command in the appropriate configuration mode. To return to the default behavior, use the `no` form of this command.

```
accounting per-prefix
no accounting per-prefix
```

**Syntax Description**

This command has no keywords or arguments.

**Command Default**

This feature is disabled by default.

**Command Modes**

Multicast routing configuration

Multicast routing address family IPv4 configuration

Multicast VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `accounting per-prefix` command is used to enable per-prefix counters only in hardware. Cisco IOS XR Software counters are always present. When enabled, every existing and new (S, G) route is assigned forward, punt, and drop counters on the ingress route and forward and punt counters on the egress route. The (*, G) routes are assigned a single counter.

There are a limited number of counters on all nodes. When a command is enabled, counters are assigned to routes only if they are available.

To display packet statistics, use the `show mfib route` and the `show mfib hardware route statistics` commands. These commands display “N/A” for counters when no hardware statistics are available or when the `accounting per-prefix` command is disabled.

**Task ID**

<table>

accounting per-prefix forward-only

To reduce hardware statistics resource allocations when enabling accounting, particularly for multicast VPN (MVPN), use the accounting per-prefix forward-only command under multicast routing configuration mode. To return to the default mode of accounting per-prefix, on page 108, use the no form of this command.

accounting per-prefix forward-only
no accounting per-prefix forward-only

Syntax Description
This command has no keywords or arguments.

Command Default
If no counters were configured, there is no default.
If the accounting prefix counter was previously configured, it becomes the default.
If no accounting was configured for multicast routing, forwarding-only is the default mode and triggers a data MDT transition in the case of MVPN deployment.

Command Modes
- Multicast routing configuration
- Multicast routing address family IPv4 and IPv6 configuration
- Multicast VRF configuration

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.8.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Note
The accounting per-prefix forward-only command has only one fwd-only counter. In other words, there is no punt or drop counter allocated.

We recommended this command for configuration of multicast VPN routing or for any line card that has a route-intensive configuration. Each individual router can support up to 150,000 routes.

Note
To verify the number of statistics allocated or free on a line card, use the show mfib hardware resource-counters, on page 179 command in EXEC mode.

There are a limited number of counters on all nodes. When accounting on a prefix is enabled, counters are assigned to routes only if they are available.

To display packet statistics, use the show mfib route and the show mfib hardware route statistics commands. These commands display “N/A” for counters when no hardware statistics are available or when...
neither the accounting-per-prefix, on page 108 command nor the accounting per-prefix forward-only command are enabled.

You may switch between accounting-per-prefix and accounting per-prefix forward-only statistics for ipv4 or ipv6 multicast family. However, be aware that only one set of counters is supported on the (*,G) routes (with fwd/punt/drop on ingress and fwd/drop on egress) regardless of whether you enabled the accounting-per-prefix or accounting-per-prefix fwd-only command.

Although you can switch accounting modes, this involves freeing the hardware statistics and reallocating them, thereby resulting in a loss of any previously collected data. Therefore, it is preferable to decide which statistics mode you want to use at the start to avoid the resource cost entailed by resetting the statistics counter values with a change in mode.

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Task ID Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

### Examples

The following example shows how to enable accounting per-prefix forward-only for MVPN routing:

```
RP/0/RSP0/CPU0:router(config)# multicast-routing
RP/0/RSP0/CPU0:router(config-mcast)# accounting per-prefix forward-only
```

address-family (multicast)

To display available IP prefixes to enable multicast routing and forwarding on all router interfaces, use the `address-family` command in multicast-routing configuration mode or multicast VRF configuration submode. To disable use of an IP address prefix for routing, use the `no` form of this command.

```
address-family [vrf vrf-name] {ipv4|ipv6}
no address-family [vrf vrf-name] {ipv4|ipv6}
```

**Syntax Description**
- `vrf vrf-name` (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- `ipv4` Specifies IPv4 address prefixes.
- `ipv6` Specifies IPv6 address prefixes.

**Command Default**
No default behavior or values

**Command Modes**
- Multicast routing configuration
- Multicast VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Release 4.2.0</td>
<td>The <code>ipv6</code> keyword was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the `address-family` command either from multicast routing configuration mode or from multicast VRF configuration sub to enter either the multicast IPv4 or IPv6 address family configuration submode, depending on which keyword was chosen. Use the `address-family` command with the `multicast-routing`, on page 148 command to start the following multicast processes:

- Multicast Routing Information Base (MRIB)
- Multicast Forwarding Engine (MFWD)
- Protocol Independent Multicast Sparse mode (PIM-SM)
- Internet Group Management Protocol (IGMP)
- Multicast Listener Discovery Protocol (MLD)

Basic multicast services start automatically when the multicast PIE is installed, without any explicit configuration required. The following multicast services are started automatically:

- Multicast Routing Information Base (MRIB)
- Multicast Forwarding Engine (MFWD)
- Protocol Independent Multicast Sparse mode (PIM-SM)
- Internet Group Management Protocol (IGMP)
Other multicast services require explicit configuration before they start. For example, to start the Multicast Source Discovery Protocol (MSDP) process, you must enter the `router msdp` command and explicitly configure it.

To enable multicast routing and protocols on interfaces, you must explicitly enable the interfaces using the `interface` command in multicast routing configuration mode. This action can be performed on individual interfaces or by configuring a wildcard interface using the `alias` command.

To enable multicast routing on all interfaces, use the `interface all enable` command in multicast routing configuration mode. For any interface to be fully enabled for multicast routing, it must be enabled specifically (or configured through the `interface all enable` command for all interfaces) in multicast routing configuration mode, and it must not be disabled in the PIM and IGMP configuration modes.

The `enable` and `disable` keywords available under the IGMP and PIM interface configuration modes have no effect unless the interface is enabled in multicast routing configuration mode—either by default or by explicit interface configuration.

To allow multicast forwarding functionality, while turning multicast routing functionality off, `interface-inheritance disable`, on page 134 command on a per interface or `interface all enable` basis in PIM or IGMP configuration mode.

### Task ID

### Examples

This example shows how to enter IPv4 and IPv6 multicast routing configuration mode:

```
RP/0/RSP0/CPU0:router(config)# multicast-routing
RP/0/RSP0/CPU0:router(config-mcast)# address-family ipv4
RP/0/RSP0/CPU0:router(config-mcast-default-ipv4)#

RP/0/RSP0/CPU0:router(config-mcast)# address-family ipv6
RP/0/RSP0/CPU0:router(config-mcast-default-ipv6)#
```

This example shows how to enter IPv4 and IPv6 VRF multicast routing configuration submode:

```
RP/0/RSP0/CPU0:router(config)# multicast-routing
RP/0/RSP0/CPU0:router(config-mcast)# vrf vrf-name address-family ipv4
RP/0/RSP0/CPU0:router(config-mcast-vrf-name-ipv4)#

RP/0/RSP0/CPU0:router(config-mcast)# vrf vrf-name address-family ipv6
RP/0/RSP0/CPU0:router(config-mcast-vrf-name-ipv6)#
```

address-family ipv4 mvpn (bgp)

To enable Border Gateway Protocol (BGP) on a specific IPv4 unicast destination address prefix, use the `address-family ipv4 mvpn` command in the BGP sub-configuration mode. To disable this feature, use the `no` form of this command.

```
address-family ipv4 mvpn [{{additional-paths|advertise best-external|as-path-loopcheck out|disable|bgp {{client-to-client reflection cluster-id ip_address|disable|dampening {time|value|route-policy policy param_value}|label-delay time|inter-as install|nexthop {resolution|prefix-length minimum value|route-policy policy param_value|trigger-delay {critical value|non-critical value}|retain}|route-target download|update limit {address-family limit|sub-group {ebgp limit|ibgp limit}}}}]}
no address-family ipv4 mvpn [{{additional-paths|advertise best-external|as-path-loopcheck out|disable|bgp {{client-to-client reflection cluster-id ip_address|disable|dampening {time|value|route-policy policy param_value}|label-delay time|inter-as install|nexthop {resolution|prefix-length minimum value|route-policy policy param_value|trigger-delay {critical value|non-critical value}|retain}|route-target download|update limit {address-family limit|sub-group {ebgp limit|ibgp limit}}}}]}
```

**Syntax Description**

- `additional-paths` Specifies the additional paths configuration.
- `advertise` Advertises the border gateway protocol path.
- `as-path-loopcheck` Configures AS path loop checking.
- `bgp` Configures the border gateway protocol commands.
- `inter-as` Controls the installation of the BGP MVPN routes into PIM/MLDP.
- `nexthop` Specifies the BGP nexthop location.
- `retain` Accepts or retains the specified BGP parameters.
- `route-target` Routes the target RIB installation.
- `update` Specifies the BGP update generation configuration.

**Command Default**

No default behavior or values

**Command Modes**

Multicast routing configuration
Multicast VRF configuration

RP/0/RSP0/CPU0:router(config-mcast)# vrf vrf1
RP/0/RSP0/CPU0:router(config-mcast-vrf1)# address-family ipv4
RP/0/RSP0/CPU0:router(config-mcast-vrf1-ipv4)# bgp auto-discovery mldp inter-as
To configure the multicast boundary on an interface for administratively scoped multicast addresses, use the `boundary` command in the appropriate configuration mode. To return to the default behavior, use the `no` form of this command.

```
boundary access-list
no boundary access-list
```

### Syntax Description

- **access-list**: Access list specifying scoped multicast groups. The name cannot contain a space or quotation mark; it may contain numbers.

### Command Default

A multicast boundary is not configured.

### Command Modes

- Multicast routing interface configuration
- Multicast routing VRF interface configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The `boundary` command is used to set up a boundary to keep multicast packets from being forwarded.

The boundary acl can specify a mcast source address in addition to a mcast group address. The keyword "any" can be added before the mcast group range.

### Examples

The following example shows how to set up a boundary for all administratively scoped addresses:

```
RP/0/RSP0/CPU0:router(config) # ipv4 access-list myboundary2
RP/0/RSP0/CPU0:router (config) # 10 deny ipv4 any 239.0.0.0 0.255.255.255
RP/0/RSP0/CPU0:router(config) # 20 permit ipv4 any 224.0.0.0 15.255.255.255
RP/0/RSP0/CPU0:router(config) # multicast-routing
RP/0/RSP0/CPU0:router (config-mcast) # address-family ipv4
RP/0/RSP0/CPU0:router(config-mcast-default-ipv4)# interface GigE 0/2/0/2
RP/0/RSP0/CPU0:router(config-mcast-default-ipv4-if)# boundary myboundary2
```
clear mfib counter

To clear Multicast Forwarding Information Base (MFIB) route packet counters, use the `clear mfib counter` command in the appropriate mode.

```
clear mfib [vrf vrf-name] ipv4 counter [{group-addresssource-address}] [location {node-idall}]
```

**Syntax Description**
- `vrf vrf-name` (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- `ipv4` (Optional) Specifies IPv4 address prefixes.
- `group-address` (Optional) IP address of the multicast group.
- `source-address` (Optional) IP address of the source of the multicast route.
- `location node-id` (Optional) Clears route packet counters from the designated node.
- `all` The `all` keyword clears route packet counters on all nodes.

**Command Default**
IPv4 addressing is the default.

**Command Modes**
EXEC

**Command History**
```
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>

</tr>
</tbody>
</table>
```

**Usage Guidelines**
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

**Note**
This command only clears MFIB route packet software counters. To clear MFIB hardware statistics counters use the `clear mfib hardware route statistics` command.

**Task ID**
```
<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>
```

**Examples**

The following example shows how to clear MFIB route packet counters on all nodes:

```
RP/0/RSP0/CPU0:router# clear mfib counter location all
```
clear mfib database

To clear the Multicast Forwarding Information Base (MFIB) database, use the `clear mfib database` command in the appropriate mode.

```
clear mfib [{ipv4|ipv6}] database [location {node-id|all}]
```

### Syntax Description

<table>

### Examples

The following example shows how to clear the Multicast Forwarding Information Base (MFIB) database on all nodes:

```
RP/0/RSP0/CPU0:router# clear mfib database location all
```
clear mfib hardware resource-counters

To clear global resource counters, use the clear mfib hardware resource-counters command in EXEC mode.

```
clear mfib [vrf vrf-name] [{ipv4|ipv6}] hardware resource-counters [location {node-id|all}]
```

**Syntax Description**

- `vrf vrf-name` (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- `ipv4` (Optional) Specifies IPv4 address prefixes.
- `ipv6` (Optional) Specifies IPv6 address prefixes.
- `location node-id` (Optional) Clears global resource counters from the designated node.
- `all` The all keyword clears all global resource counters.

**Command Default**

IPv4 addressing is the default.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the clear mfib hardware resource-counters to estimate resource usage for an operation.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write, execute</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to clear all global resource counters:

```
RP/0/RSP0/CPU0:router# clear mfib hardware resource-counters location all
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show mfib hardware resource-counters, on page 179</td>
<td>Displays the allocated and freed hardware resources for the Multicast Forwarding Information Base (MFIB) process.</td>
</tr>
</tbody>
</table>
clear mfib hardware route statistics

To reset all allocated counter values regardless of the Multicast Forwarding Information Base (MFIB) hardware statistics mode (accounting per-prefix or accounting per-prefix forward-only), use the clear mfib hardware route statistics command in EXEC mode.

```
clear mfib [vrf vrf-name] [(ipv4|ipv6)] hardware route statistics {egress|ingress|ingress-and-egress} [{{*source-address}} [group-address [/*prefix-length]]] [location {node-id|all}]
```

**Syntax Description**

- **vrf vrf-name** (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- **ipv4** (Optional) Specifies IPv4 address prefixes.
- **ipv6** (Optional) Specifies IPv6 address prefixes.
- **ingress-and-egress** (Optional) Clears hardware statistics on both the incoming (ingress) and outgoing (egress) routes.
- ***** (Optional) Clears shared tree route statistics.
- **source-address** (Optional) IP address or hostname of the multicast route source.
- **group-address** (Optional) IP address or hostname of the multicast group.
- **/ prefix-length** (Optional) Prefix length of the multicast group. A decimal value that indicates how many of the high-order contiguous bits of the address compose the prefix (the network portion of the address). A slash must precede the decimal value.
- **location** (Optional) Clears route packet counters from the designated node.
- **node-id** The `node-id` argument is entered in the `rack/slot/module` notation.
- **all** The `all` keyword clears route packet counters on all nodes

**Command Default**

If not specified, IPv4 addressing is the default.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes the proper task IDs.

The Multicast Forwarding (MFWD) process exists on each line card and assigns hardware counters to each (S, G) route. Additionally, one global counter is assigned for all (*, G) routes, depending on resource availability.
To clear the set of counters for \((*, G)\) routes, the MFWD process assigns a single set of counters to count packets that match \((*, G)\) routes. Consequently, the `clear mfib hardware route statistics` command must be used in a form that either clears counters on all routes or matches all \((*, G)\) routes.

**Note**

This command only clears MFIB hardware statistics counters. To clear MFIB route packet software counters, use the `clear mfib counter` command.

### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write, execute</td>
</tr>
</tbody>
</table>

### Examples

The following command shows how to clear counters by route statistics for all multicast routes on both ingress and egress forwarding engines for the line card 0/1/CPU0:

```
RP/0/RSP0/CPU0:router# clear mfib ipv4 hardware route statistics ingress-and-egress location 0/1/CPU0
```

### Related Commands

disable (multicast)

To disable multicast routing and forwarding on an interface, use the disable command in the appropriate configuration mode. To return to the default behavior, use the no form of this command.

```
disable
no disable
```

**Syntax Description**

This command has no keywords or arguments.

**Command Default**

Multicast routing and forwarding settings are inherited from the global interface enable all command. Otherwise, multicast routing and forwarding is disabled.

**Command Modes**

Multicast routing interface configuration

Multicast routing VRF interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The disable command modifies the behavior of a specific interface to disabled. This command is useful if you want to disable multicast routing on specific interfaces, but leave it enabled on all remaining interfaces.

The following guidelines apply when the enable and disable commands (and the no forms) are used in conjunction with the interface all enable command:

- If the interface all enable command is configured:
  - The enable and no forms of the command have no additional effect on a specific interface.
  - The disable command disables multicast routing on a specific interface.
  - The no disable command enables a previously disabled interface.

- If the interface all enable command is not configured:
  - The enable command enables multicast routing on a specific interface.
  - The no enable command enables the previously disabled interface.
  - The disable and no forms of the command have no additional effect on a specific interface.

**Task ID Operations**

<table>
<thead>
<tr>

</tbody>
</table>
enable (multicast)

To enable multicast routing and forwarding on an interface, use the `enable` command in the appropriate configuration mode. To return to the default behavior, use the `no` form of this command.

```
enable
no enable
```

**Syntax Description**

This command has no keywords or arguments.

**Command Default**

Multicast routing and forwarding settings are inherited from the global `interface enable all` command. Otherwise, multicast routing and forwarding is disabled.

**Command Modes**

- Multicast routing interface configuration
- Multicast routing VRF interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `enable` command modifies the behavior of a specific interface to enabled. This command is useful if you want to enable multicast routing on specific interfaces, but leave it disabled on all remaining interfaces.

The following guidelines apply when the `enable` and `disable` commands (and the `no` forms) are used in conjunction with the `interface all enable` command:

- **If the** `interface all enable` **command is configured:**
  - The `enable` and `no` forms of the command have no additional effect on a specific interface.
  - The `disable` command disables multicast routing on a specific interface.
  - The `no disable` command enables a previously disabled interface.

- **If the** `interface all enable` **command is not configured:**
  - The `enable` command enables multicast routing on a specific interface.
  - The `no enable` command enables a previously enabled interface.
  - The `disable` and `no` forms of the command have no additional effect on a specific interface.

</tbody>
</table>
forwarding-latency

To delay traffic being forwarded on a route, use the `forwarding-latency` command. To return to the default behavior, use the `no` form of this command.

```
forwarding-latency [delay milliseconds]
no forwarding-latency
```

### Syntax Description

- **delay milliseconds** (Optional) Specifies the delay time in milliseconds. Range is 5 - 500.

### Command Default

The default delay time is 30 milliseconds.

### Command Modes

- Multicast routing configuration
- IPv4 and IPv6 multicast routing configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.8.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the `forwarding-latency` command when you expect a receiver to leave and rejoin the same multicast group within a very short period such as 20 or 30 milliseconds. The delay may be required to provide the router sufficient time to update its Multicast Forwarding Information Base (MFIB) table.

When the `forwarding-latency` command is enabled, each interface is allocated a separate table lookup unit (TLU) block in the output interface list (olist), thereby increasing TLU hardware resource usage, and, for this reason, it should be used with caution when many multicast routes are present.

When the `forwarding-latency` command is disabled, up to three interfaces may share a single TLU block in the olist.

### Task ID

<table>

<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

### Examples

The following example shows how to delay traffic from being forwarded for 120 milliseconds:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# multicast-routing
RP/0/RSP0/CPU0:router# forwarding-latency delay 120
```
To configure multicast interface properties, use the `interface` command in the appropriate configuration mode. To disable multicast routing for interfaces, use the `no` form of this command.

```
interface type interface-path-id
no interface type interface-path-id
```

**Syntax Description**

- **type** Interface type. For more information, use the question mark (?) online help function.
- **interface-path-id** Physical interface or virtual interface.

**Note** Use the `show interfaces` command in EXEC mode to see a list of all interfaces currently configured on the router.

For more information about the syntax for the router, use the question mark (?) online help function.

**Command Default**

No default behavior or values

**Command Modes**

- Multicast routing configuration
- IPv4 or multicast routing configuration
- Multicast VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the `interface` command to configure multicast routing properties for specific interfaces.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to enable multicast routing on all interfaces and disable the feature only on GigabitEthernet interface 0/1/0/0:

```
RP/0/RSP0/CPU0:router(config)# multicast-routing
RP/0/RSP0/CPU0:router(config-mcast)# interface all enable
RP/0/RSP0/CPU0:router(config-mcast-default-ipv4-if)# interface GigE 0/1/0/0
```
RP/0/RSP0/CPU0:router(config-mcast-default-ipv4-if)# disable

<table>
<thead>
<tr>
<th>Related Commands</th>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>disable (multicast), on page 125</td>
<td>Disables multicast routing and forwarding on an interface.</td>
</tr>
<tr>
<td></td>
<td>enable (multicast), on page 127</td>
<td>Enables multicast routing and forwarding on an interface.</td>
</tr>
<tr>
<td></td>
<td>interface all enable, on page 132</td>
<td>Enables multicast routing and forwarding on all new and existing interfaces.</td>
</tr>
</tbody>
</table>
interface all enable

To enable multicast routing and forwarding on all new and existing interfaces, use the **interface all enable** command in the appropriate configuration mode. To return to the default behavior, use the **no** form of this command.

```
interface all enable
no interface all enable
```

**Syntax Description**

This command has no keywords or arguments.

**Command Default**

Multicast routing and forwarding is disabled by default.

**Command Modes**

- Multicast routing configuration
- Multicast VRF configuration

**Command History**

```
Release   Modification
---------   --------------
3.7.2       This command was introduced.
```

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

This command modifies the default behavior for all new and existing interfaces to enabled unless overridden by the **enable** or **disable** keywords available in interface configuration mode.

The following guidelines apply when the **enable** and **disable** commands (and the **no** forms) are used in conjunction with the **interface all enable** command:

- If the **interface all enable** command is configured:
  - The **enable** and **no** forms of the command have no additional effect on a specific interface.
  - The **disable** command disables multicast routing on a specific interface.
  - The **no disable** command enables a previously disabled interface.

- If the **interface all enable** command is not configured:
  - The **enable** command enables multicast routing on a specific interface.
  - The **no enable** command enables a previously enabled interface.
  - The **disable** and **no** forms of the command have no additional effect on a specific interface.

**Task ID**

```
Task ID   Operations
---------   -------------
multicast   read, write
```
Examples

The following example shows how to enable multicast routing on all interfaces and disable the feature only on GigabitEthernet interface 0/1/0/0:

RP/0/RSP0/CPU0:router (config)# multicast-routing
RP/0/RSP0/CPU0:router (config-mcast)# interface all enable
RP/0/RSP0/CPU0:router (config-mcast)# interface GigE 0/1/0/0
RP/0/RSP0/CPU0:router (config-mcast-default-ipv4-if)# disable

Related Commands

</tbody>
</table>
To separate PIM and IGMP routing from multicast forwarding on all interfaces, use the `interface-inheritance disable` command under multicast routing address-family IPv4 submode. To restore the default functionality, use the `no` form of the command.

```
interface-inheritance disable
no interface-inheritance disable
```

### Syntax Description

This command has no keywords or arguments.

### Command Default

This feature is not enabled by default.

### Command Modes

Multicast routing configuration

Address-family IPv4 configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use of the `interface-inheritance disable` command together with the `interface type interface-path-id` or `interface all enable` command under multicast routing address-family IPv4 submode separates PIM and IGMP routing functionality from multicast forwarding on specified interfaces. You can nonetheless enable multicast routing functionality explicitly under PIM or IGMP routing configuration mode for individual interfaces.

- **Note**

  Although you can explicitly configure multicast routing functionality on individual interfaces, you cannot explicitly disable the functionality. You can only disable the functionality on all interfaces.

  Used from the address-family ipv4 configuration submode, it prevents IGMP and PIM from inheriting the multicast-routing interface configuration.

### Examples

The following configuration disables PIM and IGMP routing functionality on all the interfaces using the `interface-inheritance disable` command, but multicast forwarding is still enabled on all the interfaces in the example, based on use of the keywords `interface all enable`.

```
```
PIM is enabled on Loopback 0 based on its explicit configuration (interface Loopback0 enable) under router pim configuration mode.

IGMP protocol is enabled on GigabitEthernet0/6/0/3, because it too has been configured explicitly under router igmp configuration mode (interface GigabitEthernet0/6/0/3 router enable):

```
RP/0/RSP0/CPU0:router(config)# multicast-routing
RP/0/RSP0/CPU0:router(config-mcast)# address-family ipv4
RP/0/RSP0/CPU0:router(config-mcast-default-ipv4)# interface-inheritance disable
RP/0/RSP0/CPU0:router(config-mcast-default-ipv4)# interface loopback 1 enable
```

```
RP/0/RSP0/CPU0:router(config-mcast-default-ipv4)# show run router pim
```

With the interface-inheritance disable command in use, IGMP and PIM configuration are enabled in the protocol configuration as follows:

```
router igmp
  interface loopback 0
  router enable

router pim
  interface loopback 0
  enable

router pim vrf default address-family ipv4
  interface Loopback0
  enable
```

```
RP/0/RSP0/CPU0:router(config-mcast-default-ipv4)# show run router igmp
```

```
router igmp
  vrf default
    interface GigabitEthernet0/6/0/3
      router enable
```
**log-traps**

To enable logging of trap events, use the **log-traps** command in the appropriate configuration mode. To remove this functionality, use the **no** form of this command.

```
log-traps
no log-traps
```

**Syntax Description**

This command has no keywords or arguments.

**Command Default**

This command is disabled by default.

**Command Modes**

Multicast routing configuration

Multicast routing address family IPv4 configuration

Multicast VRF configuration

**Command History**

<table>

**Examples**

The following example shows how to enable logging of trap events:

```
RP/0/RSP0/CPU0:router# multicast-routing
RP/0/RSP0/CPU0:router(config-mcast)# log-traps
```
maximum disable

To disable maximum state limits, use the **maximum disable** command in the appropriate configuration mode. To remove this functionality, use the **no** form of this command.

```
maximum disable
no maximum disable
```

**Syntax Description**

This command has no keywords or arguments.

**Command Default**

Maximum state limits are enabled.

**Command Modes**

Multicast routing configuration

Multicast routing address family IPv4 configuration

Multicast VRF configuration

**Command History**

<table>
<thead>
<tr>

**Examples**

The following example shows how to disable maximum state limits:

```
RP/0/RSP0/CPU0:router# multicast-routing
RP/0/RSP0/CPU0:router(config-mcast)# maximum disable
```
**mdt c-multicast-routing**

To configure customer multicast routing (c-multicast-routing) for multicast distribution trees (MDT) and to enter the c-multicast-routing mode, use the `mdt c-multicast-routing` command in the appropriate mode. To delete the configuration, use the `no` form of the command.

```plaintext
mdt c-multicast-routing [ bgp | pim ]
no mdt c-multicast-routing [ bgp | pim ]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>bgp</code></td>
<td>Enables customer multicast routing for BGP.</td>
</tr>
<tr>
<td><code>pim</code></td>
<td>Enables customer multicast routing for PIM.</td>

</tbody>
</table>

**Command Default**

None

**Command Modes**

PIM VRF address-family configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Example**

This example shows how to run the `mdt c-multicast-routing`:

```
RP/0/RSP0/CPU0:router(config-pim-v1-ipv4) # mdt c-multicast-routing bgp
```
**mdt data**

To configure multicast data to be part of a multicast distribution tree (MDT) data group for multicast VPN (MVPN), use the **mdt data** command in the appropriate configuration mode. To remove this functionality, use the **no** form of this command.

```
mdt data mdt-group-address / mask [threshold threshold-value] [acl-name]
no mdt data mdt-group-address / prefix-length [threshold threshold-value] [acl-name]
```

**Syntax Description**

- **mdt-group-address**: IP address of the MDT group.
- **/ mask**: A decimal value that indicates how many of the high-order contiguous bits of the address compose the prefix (the network portion of the address). A slash must precede the decimal value.
- **threshold threshold**: Specifies the traffic rate threshold to trigger data MDT. Range is 1 to 4294967295.
- **acl-name**: Access list (ACL) for the customer’s VRF groups allowed to perform data MDT.

**Command Default**

```
threshold : 1
```

**Command Modes**

- Multicast routing configuration
- Multicast routing address family IPv4 and IPv6 configuration
- Multicast VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.5.0</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Release 3.7.0</td>
<td>Additional keyword information was added to the command. The bottom of the threshold value range was increased by 1.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

When certain multicast streams exceed a configured bandwidth, the multicast data is moved to an MDT data group that is dynamically chosen from an available pool of multicast addresses. If the traffic bandwidth falls below the threshold, the source is switched back to the default MDT. To avoid transitions between the MDTs, traffic only reverts to the default MDT if traffic below the data MDT threshold is at least one minute old.

**Task ID**

```
Task ID Operations
multicast read, write
```

**Examples**

The following example shows how to configure the data MDT group:
**RP/0/RSP0/CPU0:router# multicast-routing**  
**RP/0/RSP0/CPU0:router(config-mcast)# mdt data 172.23.2.2/24 threshold 1200 acl_A**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mdt default, on page 142</td>

</tr>
</tbody>
</table>
mdt data ingress replication

To configure ingress replication (IR) data for Multicast Distribution Trees (MDT), use the `mdt data ingress replication` command in the appropriate mode. To remove the configuration, use the `no` form of the command.

```
mdt data ingress replication [ acl_name | immediate-switch | number value | threshold value ]
```

```
no mdt data ingress replication [ acl_name | immediate-switch | number value | threshold value ]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>immediate-switch</td>
<td>Enables switching to data MDT immediately.</td>
</tr>
<tr>
<td>acl_name</td>
<td>ACL for vrf groups that are enabled for data MDT</td>

<td>number value</td>
<td>Maximum number of data MDTs to be triggered. Range is 1 to 262143.</td>
</tr>
<tr>
<td>immediate-switch</td>
<td>Traffic rate threshold (in kbps) to trigger data MDT. Range is 1 to 4294967.</td>
</tr>
</tbody>
</table>

### Command Default

None

### Command Modes

Multicast routing VRF address-family configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.1.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

### Example

This example shows how to run the `mdt data ingress replication` command:

```
RP/0/RSP0/CPU0:router (config-mcast-v1-ipv4) # mdt data ingress-replication immediate-switch
```
To configure the default group address of the multicast VPN (MVPN) multicast distribution tree (MDT), use the `mdt default` command in the appropriate configuration mode. To remove this functionality, use the `no` form of this command.

```
mdt default {mdt-default-group-address|ipv4 mdt-default-address}
no mdt default {mdt-default-group-address|ipv4 mdt-default-address}
```

### Syntax Description

- **mdt-default-group-address**: IP address of the MDT default group entered in `A.B.C.D.` format.
- **ipv4**: Specifies IPv4-encapsulated MDT.
- **mdt-default-address**: MDT IPv4 default address entered in `A.B.C.D.` format

### Command Default

The MDT default group address must be unique.

### Command Modes

- Multicast routing configuration
- Multicast routing address family IPv4 and IPv6 configuration
- Multicast VRF configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.5.0</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Release 3.7.0</td>
<td>Additional keyword information was added.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The default MDT has a unique group address used to create MVPN multicast tunnel interfaces.

Although within the multicast VRF configuration submode, the MDT configuration uses either the `ipv4` or `ipv6` keyword to distinguish the appropriate multicast VPN, the MDT core tree is IPv4.

### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

### Examples

The following example shows how to configure the MDT default group address from multicast routing configuration mode:

```
RP/0/RSP0/CPU0:router# multicast-routing
RP/0/RSP0/CPU0:router(config-mcast)# mdt default 172.16.10.1
```
The following example shows how to configure the MDT default group address from multicast VRF configuration submode for an IPv6 address family:

```
RP/0/RSP0/CPU0:router# multicast-routing
RP/0/RSP0/CPU0:router(config-mcast)# vrf vrf-name address-family ipv6
RP/0/RSP0/CPU0:router(config-mcast-vrf-name-ipv6)# mdt default 172.16.10.1
```

### Related Commands

<table>

</tbody>
</table>
To configure the maximum transmission unit (MTU) configuration of the multicast VPN (MVPN) multicast distribution tree (MDT), use the `mdt mtu` command in multicast VPN configuration mode. To remove this functionality, use the `no` form of this command.

```
mdt mtu value
no mdt mtu value
```

**Syntax Description**
- `value` Specifies the MTU value and ranges between 401 to 65535. The configured mdt mtu value includes 24 bytes of GRE encapsulation.

**Command Default**
The MDT tunnel default size is 1376.

**Command Modes**
Multicast VRF configuration

**Command History**
- Release 3.5.0  This command was introduced.

**Usage Guidelines**
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

**Examples**
The following example shows how to configure the MTU of the multicast distribution tree:

```
RP/0/RSP0/CPU0:router# multicast-routing
RP/0/RSP0/CPU0:router(config-mcast)# vrf vrf_A
RP/0/RSP0/CPU0:router(config-mcast-vrf_A-ipv4)# mdt mtu 2345
```

**Related Commands**

<table>
<thead>

</thead>
<tbody>
<tr>
<td><code>type</code></td>
<td>Interface type. For more information, use the question mark (?) online help function.</td>
</tr>
<tr>
<td><code>interface-path-id</code></td>
<td>Physical interface or virtual interface.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>Use the <code>show interfaces</code> command to see a list of all interfaces currently configured on the router.</td>
</tr>
</tbody>
</table>

For more information about the syntax for the router, use the question mark (?) online help function.

**Command Default**

No default behavior or values

**Command Modes**

- Multicast routing configuration
- Multicast routing address family IPv4 configuration
- Multicast VRF configuration

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the `mdt source` command to identify the root of the multicast distribution tree in the service provider network. This address is used to update all MVPN peers through multiprotocol BGP.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to configure the interface used to set the MDT source address:

```
RP/0/RSP0/CPU0:router# multicast-routing
RP/0/RSP0/CPU0:router(config-mcast)# mdt source POS 0/1/0/0
```

**Note**

Per VRF MDT Source is a new feature introduced in IOS XR Software Release 3.9.0 apart from the existing default MDT source. Each VRF can have its own MDT source interface co-existing with the default MDT source to achieve core diversity.
The following example shows how to configure a per VRF MDT source:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# multicast-routing
RP/0/RSP0/CPU0:router(config-mcast)# address-family ipv4
RP/0/RSP0/CPU0:router(config-mcast-default-ipv4)# mdt source loopback0
RP/0/RSP0/CPU0:router(config-mcast)# vrf foo
RP/0/RSP0/CPU0:router(config-mcast-foo)# address-family ipv4
RP/0/RSP0/CPU0:router(config-mcast-foo-ipv4)# mdt source loopback1 !
```

<td>Enables multicast routing and forwarding on all new and existing interfaces.</td>
</tr>
</tbody>
</table>
### multipath

To enable Protocol Independent Multicast (PIM) to divide the multicast load among several equal cost paths, use the `multipath` command in the appropriate configuration mode. To return to the default behavior, use the `no` form of this command.

```
[address-family ipv4] multipath [hash {source|source next-hop}]
no multipath
```

#### Syntax Description

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>hash</code></td>
<td>(Optional) Enables multipath hashing.</td>
</tr>
<tr>
<td><code>source</code></td>
<td>Enables source-based multipath hashing.</td>
</tr>
<tr>
<td><code>source-nexthop</code></td>
<td>(Optional) Enables source with next-hop hashing.</td>
</tr>
</tbody>
</table>

#### Command Default

This command is disabled by default.

#### Command Modes

- Multicast routing configuration
- Multicast routing address-family ipv4
- Multicast VRF configuration

#### Note

Effective with IOS XR release 6.1.2 and later versions, `multipath` command is available only under the PIM configuration mode and not supported under the multicast routing configuration mode.

#### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

#### Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

By default, equal-cost multipath (ECMP) paths are not load balanced. A single path from each unicast route is used for all multicast routes (which is the equivalent of the `no` form of the multipath command).

#### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

#### Examples

The following example shows how to enable multipath functionality for IOS XR release versions prior to 6.1.2.
Effective with IOS XR release 6.1.2 and later versions, the **multipath** command is available only under the PIM configuration mode and not supported under the multicast routing configuration mode.

This example shows how to enable multipath functionality for IOS XR release 6.1.2 and later versions.
nsf (multicast)

To turn on the nonstop forwarding (NSF) capability for the multicast routing system, use the `nsf` command in multicast routing configuration mode. To turn off this function, use the `no` form of this command.

```
nsf [lifetime seconds]
nof nsf [lifetime]
```

**Syntax Description**

| lifetime seconds | (Optional) Specifies the maximum time (in seconds) for NSF mode. Range is 30 to 3600. |

**Command Default**

This command is disabled by default.

**Command Modes**

- Multicast routing configuration
- Multicast routing address family ipv4 configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `nsf` command does not enable or disable the multicast routing system, but just the NSF capability for all the relevant components. When the `no` form of this command is used, the NSF configuration is returned to its default disabled state.

Enable multicast NSF when you require enhanced availability of multicast forwarding. When enabled, failures of the control-plane multicast routing components (Multicast Routing Information Base (MRIB) or Protocol Independent Multicast (PIM)) will not cause multicast forwarding to stop. When these components fail or communication with the control plane is otherwise disrupted, existing Multicast Forwarding Information Base (MFIB) entries continue to forward packets until either the control plane recovers or the MFIB NSF timeout expires.

Enable multicast NSF when you upgrade control-plane Cisco IOS XR Software packages so that the live upgrade process does not interrupt forwarding.

When the MFIB partner processes enter NSF mode, forwarding on stale (nonupdated) MFIB entries continues as the control-plane components attempt to recover gracefully. Successful NSF recovery is signaled to the Multicast Forwarding Engine (MFWD) partner processes by MRIB. MRIB remains in NSF mode until Internet Group Management Protocol (IGMP) has recovered state from the network and host stack and until PIM has recovered state from the network and IGMP. When both PIM and IGMP have recovered and fully updated the MRIB, MRIB signals the MFIBs that NSF is ending, and begins updating the stale MFIB entries. When all updates have been sent, the MFWD partner processes delete all remaining stale MFIB entries and returns to normal operation, ending the NSF mode. MFIB NSF timeout prior to the signal from MRIB may cause NSF to end, and thus forwarding to stop.

When forwarding is in NSF mode, multicast flows may continue longer than necessary when network conditions change due to multicast routing protocols, unicast routing protocol reachability information, or local sender and receiver changes. The MFWD partner processes halt forwarding on stale MFIB entries when the potential
for a multicast loop is detected by receipt of incoming data on a forwarding interface for the matching MFIB entry.

Note
For NSF to operate successfully in your multicast network, you must also enable NSF for the unicast protocols (such as Intermediate System-to-Intermediate System [IS-IS], Open Shortest Path First [OSPF] and Border Gateway Protocol [BGP]) that PIM relies on for Reverse Path Forwarding (RPF) information. See the appropriate configuration modules to learn how to configure NSF for unicast protocols.

Examples
The following example shows how to enable NSF for the multicast routing system:

```bash
RP/0/RSP0/CPU0:router(config)# multicast-routing
RP/0/RSP0/CPU0:router(config-mcast)# nsf
```

Related Commands

</table>
oom-handling

To enable the out-of-memory (OOM) functionality on multicast routing software components, use the **oom-handling** command in multicast routing configuration mode. To remove this functionality, use the **no** form of this command.

```
oom-handling
no oom-handling
```

**Syntax Description**

This command has no keywords or arguments.

**Command Default**

This command is disabled by default.

**Command Modes**

Multicast routing configuration

Multicast routing address family ipv4 configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

When the **oom-handling** command is enabled, and the router memory is low or in a warning state, the following states are not created:

- Protocol Independent Multicast (PIM) route states in response to PIM join and prune messages, and register messages
- Internet Group Management Protocol (IGMP) group states
- External Source-Active (SA) states in Multicast Source Discovery Protocol (MSDP)

Multicast routing **show** commands such as the **show pim topology** command indicate when the router is running low on memory and that new state creation has stopped.

**Task ID**

show mfib hardware interface

To display hardware switching interface information for the Multicast Forwarding Information Base (MFIB) process, use the `show mfib hardware interface` command in EXEC mode.

```
show mfib [vrf vrf-name] [ipv4|ipv6] hardware interface [detail] [type interface-path-id] [location node-id]
```

### Syntax Description

**vrf vrf-name**
- (Optional) Specifies a VPN routing and forwarding (VRF) instance.

**ipv4**
- (Optional) Specifies IPv4 address prefixes.

**ipv6**
- (Optional) Specifies IPv6 address prefixes.

**detail**
- (Optional) Displays detailed information about the MFIB interface.

**type**
- (Optional) Interface type. For more information, use the question mark (?) online help function.

**interface-path-id**
- (Optional) Physical interface or virtual interface.

**location node-id**
- (Optional) Specifies an MFIB-designated node.

### Command Default
IPv4 addressing is the default.

### Command Modes
EXEC

### Command History

<table>
<thead>
<tr>

show mfib hardware ltrace

To display IP Multicast platform specific trace information for the Multicast Forwarding Information Base (MFIB) process, use the **show mfib hardware ltrace** command in EXEC mode.

```
show mfib [vrf vrf-name] [ipv4|ipv6] hardware ltrace
{error|event|frequent-event|hexdump|init|last|netio|reverse|stats|tailf|unique|verbose|wrapping} file
file-name location node-id
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrf vrf-name</td>
<td>(Optional) Specifies a VPN routing and forwarding (VRF) instance.</td>
</tr>
<tr>
<td>ipv4</td>
<td>(Optional) Specifies IPv4 address prefixes.</td>
</tr>
<tr>
<td>ipv6</td>
<td>(Optional) Specifies IPv6 address prefixes.</td>
</tr>
<tr>
<td>error</td>
<td>(Optional) Displays error events.</td>
</tr>
<tr>
<td>event</td>
<td>(Optional) Displays non-frequent events.</td>
</tr>
<tr>
<td>frequent-event</td>
<td>(Optional) Displays frequent events.</td>
</tr>
<tr>
<td>hexdump</td>
<td>(Optional) Displays traces in hexadecimal output.</td>
</tr>
<tr>
<td>init</td>
<td>(Optional) Displays initiation and configuration events.</td>
</tr>
<tr>
<td>last</td>
<td>(Optional) Displays the last n entries.</td>
</tr>
<tr>
<td>netio</td>
<td>(Optional) Displays the netio events.</td>
</tr>
<tr>
<td>reverse</td>
<td>(Optional) Displays the traces in the reverse order starting with the latest events.</td>
</tr>
<tr>
<td>stats</td>
<td>(Optional) Displays the statistics.</td>
</tr>
<tr>
<td>tailf</td>
<td>(Optional) Displays the new traces as they are added.</td>
</tr>
<tr>
<td>unique</td>
<td>(Optional) Displays the unique entries with the counts.</td>
</tr>
<tr>
<td>verbose</td>
<td>(Optional) Displays the internal debugging information.</td>
</tr>
<tr>
<td>wrapping</td>
<td>(Optional) Displays the wrapping entries.</td>
</tr>
<tr>
<td>file file-name</td>
<td>(Optional) Specifies the file name.</td>
</tr>
<tr>
<td>location node-id</td>
<td>Specifies an MFIB-designated node.</td>
</tr>
</tbody>
</table>

**Command Default**

IPv4 addressing is the default.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Note

This command will not display any useful output if only RSP is specified or if no location is specified.

Task ID

<table>

show mfib platform interface

To display hardware switching interface information for the Multicast Forwarding Information Base (MFIB) process, use the `show mfib platform interface` command in EXEC mode.

```
show mfib [vrf vrf-name] [[ipv4|ipv6]] platform interface [detail] [type interface-path-id] [location node-id]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrf vrf-name</td>
<td>(Optional) Specifies a VPN routing and forwarding (VRF) instance.</td>
</tr>
<tr>
<td>ipv4</td>
<td>(Optional) Specifies IPv4 address prefixes.</td>
</tr>
<tr>
<td>ipv6</td>
<td>(Optional) Specifies IPv6 address prefixes.</td>
</tr>
<tr>
<td>detail</td>
<td>(Optional) Displays detailed information about the MFIB interface.</td>
</tr>
<tr>
<td>type</td>
<td>(Optional) Interface type. For more information, use the question mark (?) online help function.</td>
</tr>
<tr>
<td>interface-path-id</td>
<td>(Optional) Physical interface or virtual interface.</td>
</tr>
</tbody>
</table>

**Note**
- Use the `show interfaces` command to see a list of all interfaces currently configured on the router.
- For more information about the syntax for the router, use the question mark (?) online help function.

| location node-id | (Optional) Specifies an MFIB-designated node. |

### Command Default

IPv4 addressing is the default.

### Command Modes

EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

show mfib hardware resource-counters

To display the allocated and freed hardware resources for the Multicast Forwarding Information Base (MFIB) process, use the `show mfib hardware resource-counters` command in EXEC mode.

```
show mfib [vrf vrf-name] [{ipv4|ipv6}] hardware resource-counters location node-id
```

**Syntax Description**
- `vrf vrf-name` (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- `ipv4` (Optional) Specifies IPv4 address prefixes.
- `ipv6` (Optional) Specifies IPv6 address prefixes.
- `location node-id` Specifies an MFIB-designated node.

**Command Default**
IPv4 addressing is the default.

**Command Modes**
EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the `show mfib hardware resource-counters` command to understand the table lookup unit (TLU) resource usage by MFIB.

- Usage for each channel
- Storing of specific data
- Allocation counts for metro statistics
- Failure counts for metro statistics

**Note**
Use the location option in the `show mfib hardware resource-counters` command to indicate for which linecard you need information. The command will not display any useful output if only RSP is specified or if no location is specified.

**Task ID**

show mfib hardware route accept-bitmap

To display platform-specific Multicast Forwarding Information Base (MFIB) information for the interface list that accepts bidirectional routes, use the `show mfib hardware route accept-bitmap` command in EXEC mode.

```
show mfib [vrf vrf-name] [ipv4|ipv6] hardware route accept-bitmap [*] [group-address [/prefix-length]] [detail] [location node-id]
```

**Syntax Description**

- **vrf vrf-name** (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- **ipv4** (Optional) Specifies IPv4 address prefixes.
- **ipv6** (Optional) Specifies IPv6 address prefixes.
- ***** (Optional) Displays shared tree entry.
- **source-address** (Optional) IP address or hostname of the multicast route source:
- **group-address** (Optional) IP address or hostname of the multicast group.
- **/prefix-length** (Optional) Prefix length of the multicast group. A decimal value that indicates how many of the high-order contiguous bits of the address compose the prefix (the network portion of the address). A slash must precede the decimal value.
- **detail** (Optional) Detailed list of the routing database.
- **location node-id** (Optional) Specifies an MFIB-designated node.

**Command Default**
IPv4 addressing is the default.

show mfib hardware route logical

RP/0/RSP0/CPU0:RTP-VIKING-MCAST-04#
show mfib hardware route location

To display the platform-specific Multicast Forwarding Information Base (MFIB)-enabled location in the hardware, use the `show mfib hardware route location` command in EXEC mode.

```
show mfib [vrf vrf-name] [(ipv4|ipv6)] [*] [source-address] [group-address [/prefix-length]] location node-id
```

**Syntax Description**

- **vrf vrf-name** (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- **ipv4** (Optional) Specifies IPv4 address prefixes.
- **ipv6** (Optional) Specifies IPv6 address prefixes.
- **source-address** (Optional) IP address or hostname of the multicast route source.
- **group-address** (Optional) IP address or hostname of the multicast group.
- **/prefix-length** (Optional) Prefix length of the multicast group. A decimal value that indicates how many of the high-order contiguous bits of the address compose the prefix (the network portion of the address). A slash must precede the decimal value.
- **node-id** Node ID for an MFIB-designated node.

**Command Default**

IPv4 addressing is the default.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.0.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The command does not display any useful output if only RSP is specified or if no location is specified.

**Task ID**

<table>

show mfib hardware route mofrr

To display the platform-specific Multicast Forwarding Information Base (MFIB) information for the MoFRR (multicast only fast reroute)- enabled list stored in the hardware, use the **show mfib hardware route mofrr** command in EXEC mode.

**show mfib hardware route mofrr {[*][source-address] [group-address [/prefix-length]] [detail]} [location node-id]**

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>

<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.9.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

MoFRR is a mechanism in which two copies of the same multicast stream flow through disjoint paths in the network. At the point in the network (usually the PE closer to the receivers) where the two streams merge, one of the streams is accepted and forwarded on the downstream links, while the other stream is discarded. When a failure is detected in the primary stream due to a link or node failure in the network, MoFRR instructs the forwarding plane to start accepting packets from the backup stream (which now becomes the primary stream).

MoFRR is triggered when the hardware detects traffic loss on the primary path of a given flow or route. Traffic loss is defined as no data packet having been received for 30 ms. When MoFRR is triggered, the primary and secondary reverse-path forwarding (RPF) interfaces are exposed to the forwarding plane and switchover occurs entirely at the hardware level.

The **show mfib hardware route mofrr** command displays the output MoFRR route list of the platform. If there is no MoFRR route enabled in the platform, then the output result is “There are no MoFRR routes configured”.

The command does not display any useful output if only RSP is specified or if no location is specified.
The following is a sample output from the `show mfib hardware route mofrr` command:

```
RP/0/RSP0/CPU0:router# show mfib hardware route mofrr location 0/0/cpu0

show mfib hardware route olist

To display platform-specific Multicast Forwarding Information Base (MFIB) information in the output interface list (olist) stored in the hardware, use the `show mfib hardware route olist` command in the appropriate mode.

```
show mfib [vrf vrf-name] [{ipv4|ipv6}] hardware route olist [{*}][source-address] [group-address [/prefix-length]] [location node-id]
```

**Syntax Description**

- `vrf vrf-name` (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- `ipv4` (Optional) Specifies IPv4 address prefixes.
- `ipv6` (Optional) Specifies IPv6 address prefixes.
- `*` (Optional) Displays shared tree entries.
- `source-address` (Optional) IP address or hostname of the multicast route source.
- `group-address` (Optional) IP address or hostname of the multicast group.
- `/ prefix-length` (Optional) Prefix length of the multicast group. A decimal value that indicates how many of the high-order contiguous bits of the address compose the prefix (the network portion of the address). A slash must precede the decimal value.
- `location node-id` Specifies an MFIB-designated node.

**Command Default**

IPv4 addressing is the default.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `show mfib hardware route olist` command displays the output interface list (olist) for each route. The Multicast Forwarding (MFWD) process stores olist interfaces in a table lookup unit (TLU) block (in groups of three). As such, the command displays each route three times. The command does not display any useful output if only RSP is specified or if no location is specified.
Examples

The following is sample output from the `show mfib hardware route olist` command. (The output fields are described in the header.)

```
RP/0/RSP0/CPU0:router# show mfib hardware route olist location 0/0/CPU0

**show mfib hardware route statistics**

To display platform-specific Multicast Forwarding Information Base (MFIB) information for the packet and byte counters for each route, use the **show mfib hardware route statistics** command in EXEC mode.

```
show mfib [vrf vrf-name] [ipv4|ipv6] hardware route statistics [detail] [*] [source-address] [group-address [/prefix-length]] [location node-id]
```

**Syntax Description**

- `vrf vrf-name` (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- `ipv4` (Optional) Specifies IPv4 address prefixes.
- `ipv6` (Optional) Specifies IPv6 address prefixes.
- `*` (Optional) Displays shared tree entries.
- `source-address` (Optional) IP address or hostname of the multicast route source.
- `group-address` (Optional) IP address or hostname of the multicast group.
- `/prefix-length` (Optional) Prefix length of the multicast group. A decimal value that indicates how many of the high-order contiguous bits of the address compose the prefix (the network portion of the address). A slash must precede the decimal value.
- `detail` (Optional) Displays a detailed list of the routing database.
- `location node-id` (Optional) Specifies an MFIB-designated node.

**Command Default**

IPv4 addressing is the default.

**Command Modes**

EXEC

**Command History**

</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **show mfib hardware route statistics** command to display the hardware packet and byte counter for a route. Route counters are kept for (S, G) routes only. A single set of counters is provided for all (`*, G`) routes.

This command displays the hardware packet and bytes count on a per-route basis. Per-route hardware counters are kept for (S, G) routes only. However, counters are managed dynamically and allocated on a priority basis and may not be available for each (S, G) route. There is a single set of counters for all (`*, G`) routes. For example, interface counters and access list counters have higher priority than route counters.
**Note**

Route counters are local to each line card.

show mfib hardware route summary

To display summary platform-specific Multicast Forwarding Information Base (MFIB) hardware information for each route entry, use the `show mfib hardware route summary` command in EXEC mode.

```
show mfib [vrf vrf-name] [ipv4 | ipv6] hardware route summary location node-id
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrf vrf-name (Optional) Specifies a VPN routing and forwarding (VRF) instance.</td>
</tr>
<tr>
<td>ipv4 (Optional) Specifies IPv4 address prefixes.</td>
</tr>
<tr>
<td>ipv6 (Optional) Specifies IPv6 address prefixes.</td>
</tr>
<tr>
<td>location node-id (Optional) Specifies an MFIB-designated node.</td>
</tr>
</tbody>
</table>

**Command Default**

IPv4 addressing is the default.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the `show mfib hardware summary` command to display hardware information for the route of the node.

The hardware information of MoFRR (multicast only fast reroute) enabled routes are also displayed. In IOS XR Software Release 3.9.0, the maximum platform supported MoFRR routes are 1024.

The longest-prefix match route is displayed depending on the provided source and group addresses. The command does not display any useful output if only RSP is specified or if no location is specified.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read</td>
</tr>
</tbody>
</table>

**Examples**

The following is sample output from the `show mfib hardware route summary` command:

```
RP/0/RSP0/CPU0:router# show mfib hardware route summary location 0/1/cpu0
LC Type: Trident
H/W IP Multicast Forwarding Information Base Summary
  No. of (*,G) routes = 5
  No. of (S,G) routes = 10

RP/0/RSP0/CPU0:router# show mfib hardware route summary location 0/0/CPU0
```
LC Type: Trident
H/W IP Multicast Forwarding Information Base Summary
No. of (*,G) routes = 6
No. of (S,G) routes = 5
No. of (S,G) MoFRR routes = 0, Maximum supported MoFRR routes = 1024

RP/0/RSP0/CPU0:router# show mfib hardware route summary location 0/4/CPU0

LC Type: A9K-SIP-700
Hardware IP Multicast Forwarding Information Base Route Summary
Number of hardware (*, G) routes = 6
Number of hardware (S, G) routes = 1
Number of hardware route-interfaces = 4
Number of hardware Rx adjacencies = 7
Number of hardware Tx adjacencies = 3
Number of ref to decap adjacency = 0
Mvpn master LC status = False

If there is no MoFRR configured in the platform:

RP/0/RSP0/CPU0:router# show mfib hardware route summary location 0/0/CPU0

LC Type: Trident
H/W IP Multicast Forwarding Information Base Summary
No. of (*,G) routes = 6
No. of (S,G) routes = 5
No. of (S,G) MoFRR routes = 0, Maximum supported MoFRR routes = 1024

This table describes the significant fields shown in the display.

show mfib hardware table

To display the platform-specific multicast table information for the Multicast Forwarding Information Base (MFIB) in the hardware, use the `show mfib hardware table` command in EXEC mode.

```
show mfib [vrf vrf-name] [ipv4|ipv6] hardware table [detail] [location node-id]
```

**Syntax Description**

- `vrf vrf-name` (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- `ipv4` (Optional) Specifies IPv4 address prefixes.
- `ipv6` (Optional) Specifies IPv6 address prefixes.
- `detail` (Optional) Displays detailed platform-specific multicast table information.
- `location node-id` (Optional) Specifies the MFIB location.

**Command Default**
IPv4 addressing is the default.

**Command Modes**
EXEC

**Command History**

<table>

<tbody>
<tr>
<td>Release 6.4.1</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td></td>
<td>This command replaces <code>show mfib hardware ltrace</code> command.</td>
</tr>
</tbody>
</table>

Usage Guidelines

This command will not display any useful output if only RSP is specified or if no location is specified.

Note

The command output is for internal use by Cisco support and development teams.

show mfib platform resource-counters

To display the allocated and freed hardware resources for the Multicast Forwarding Information Base (MFIB) process, use the `show mfib platform resource-counters` command in EXEC mode.

```
show mfib [vrf vrf-name] [{ipv4|ipv6}] platform resource-counters location node-id
```

**Syntax Description**

- `vrf vrf-name` (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- `ipv4` (Optional) Specifies IPv4 address prefixes.
- `ipv6` (Optional) Specifies IPv6 address prefixes.
- `location node-id` Specifies an MFIB-designated node.

**Command Default**

IPv4 addressing is the default.

**Command Modes**

EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.4.1</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td></td>
<td>This command replaces <code>show mfib platform resource-counters</code> command.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `show mfib platform resource-counters` command to show the resource usage of NP structures per NP.

Use the `location` option in the `show mfib platform resource-counters` command to indicate for which linecard you need information. The command will not display any useful output if only RSP is specified or if no location is specified.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read</td>
</tr>
</tbody>
</table>

**Examples**

The following is sample output from the `show mfib platform resource-counters` command:

```
RP/0/RSP0/CPU0:router# show mfib ipv4 platform resource-counters location 0/3/cpu0
!! File saved at 15:30:43 EST Wed Feb 14 2018 by root
LC Type: A9K-8X100GE-SE
--------------------------------------------------------------------
Num NP: 4, NP Running Mask: 0xf, NP Inactive Mask: 0x0
--------------------------------------------------------------------
Note:
For IPv4, the (*,G) resource counter represents both the (*,G) and (S,G)
entries. For IPv6, the (*,G) and (S,G) entries are maintained separately. The MVPN, MVPN Decap and MLC counters are all logical entries in the same structure so you will see similar counts across those columns. The 'shared' resources represent HW NP structures that are shared between IPv4 and IPv6 processes.

---

show mfib platform route location

To display the platform-specific Multicast Forwarding Information Base (MFIB)-enabled location in the hardware, use the `show mfib platform route location` command in EXEC mode.

```
show mfib [vrf vrf-name] [ipv4|ipv6] [platform route] [detail] [source-address] [group-address [prefix-length]] location node-id
```

**Syntax Description**

- `vrf vrf-name` (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- `ipv4` (Optional) Specifies IPv4 address prefixes.
- `ipv6` (Optional) Specifies IPv6 address prefixes.
- `source-address` (Optional) IP address or hostname of the multicast route source.
- `group-address` (Optional) IP address or hostname of the multicast group.
- `/ prefix-length` (Optional) Prefix length of the multicast group. A decimal value that indicates how many of the high-order contiguous bits of the address compose the prefix (the network portion of the address). A slash must precede the decimal value.
- `node-id` Node ID for an MFIB-designated node.

**Command Default**
IPv4 addressing is the default.

**Command Modes**
EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.4.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This command replaces `show mfib hardware route location` command.

**Usage Guidelines**
No specific guidelines impact the use of this command.

```
show mfib platform route olist

To display platform-specific Multicast Forwarding Information Base (MFIB) information in the output interface list (olist) stored in the hardware, use the **show mfib platform route olist** command in the appropriate mode.

```
show mfib [vrf vrf-name] [ipv4|ipv6] platform route olist {[*]|[source-address] [group-address [/prefix-length]]} [location node-id]
```

**Syntax Description**

- **vrf vrf-name** (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- **ipv4** (Optional) Specifies IPv4 address prefixes.
- **ipv6** (Optional) Specifies IPv6 address prefixes.
- ***** (Optional) Displays shared tree entries.
- **source-address** (Optional) IP address or hostname of the multicast route source.
- **group-address** (Optional) IP address or hostname of the multicast group.
- **/prefix-length** (Optional) Prefix length of the multicast group. A decimal value that indicates how many of the high-order contiguous bits of the address compose the prefix (the network portion of the address). A slash must precede the decimal value.
- **detail** (Optional) Displays a detailed list of the routing database. Requires 140 columns.
- **location node-id** Specifies an MFIB-designated node.

**Command Default**

IPv4 addressing is the default.

**Command Modes**

EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

show mfib platform table

To display the platform-specific multicast table information for the Multicast Forwarding Information Base (MFIB) in the hardware, use the `show mfib platform table` command in EXEC mode.

```
show mfib [vrf vrf-name] [ipv4|ipv6] platform table [detail] [location node-id]
```

**Syntax Description**
- `vrf vrf-name`: (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- `ipv4`: (Optional) Specifies IPv4 address prefixes.
- `ipv6`: (Optional) Specifies IPv6 address prefixes.
- `detail`: (Optional) Displays detailed platform-specific multicast table information.
- `location node-id`: (Optional) Specifies the MFIB location.

**Command Default**
IPv4 addressing is the default.

**Command Modes**
EXEC mode

**Command History**

</tbody>
</table>
show mfib platform route logical

To display the route internal structures for the platform-specific Multicast Forwarding Information Base (MFIB) in the hardware, use the **show mfib platform route logical** command in EXEC mode.

```
show mfib [vrf vrf-name] [(ipv4|ipv6)] platform route logical [*] [source-address] [group-address [/prefix-length]] [detail] [location node-id]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*</td>
<td>(Optional) Displays shared tree entries.</td>
</tr>
<tr>
<td>A.B.C.D</td>

RP/0/RSP0/CPU0:RTP-VIKING-MCAST-04#
show mfib platform connection

To display the state of connections between MFIB Platform and other dependent components on the linecard, use the **show mfib platform connection** command in EXEC mode.

```
show mfib platform connection [location node-id]
```

**Syntax Description**

- **location node-id**  
  Specifies the Node ID for an MFIB-designated node.

**Command Default**

None

**Command Modes**

EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.4.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The command also displays the state of each NP on the line card based on the notifications received from the Resource Manager component.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read</td>
</tr>
</tbody>
</table>

**Examples**

The following is a sample output from the **show mfib platform connection** command:

```
RP/0/RSP0/CPU0:router# show mfib platform connection location 0/2/CPU0

LC Type: A9K-8X100GE-L-SE

```
show mfib platform route statistics

To display platform-specific Multicast Forwarding Information Base (MFIB) information for the packet and byte counters for each route, use the `show mfib platform route statistics` command in EXEC mode.

```
show mfib [vrf vrf-name] [ipv4|ipv6] platform route statistics [detail] [*] [source-address] [group-address [/prefix-length]] [location node-id]
```

**Syntax Description**

- **vrf vrf-name** (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- **ipv4** (Optional) Specifies IPv4 address prefixes.
- **ipv6** (Optional) Specifies IPv6 address prefixes.
- ***** (Optional) Displays shared tree entries.
- **source-address** (Optional) IP address or hostname of the multicast route source.
- **group-address** (Optional) IP address or hostname of the multicast group.
- **/prefix-length** (Optional) Prefix length of the multicast group. A decimal value that indicates how many of the high-order contiguous bits of the address compose the prefix (the network portion of the address). A slash must precede the decimal value.
- **detail** (Optional) Displays a detailed list of the routing database.
- **location node-id** (Optional) Specifies an MFIB-designated node.

**Command Default**
IPv4 addressing is the default.

**Command Modes**
EXEC mode

**Command History**

- **Release** Modification
  - Release 6.4.1 This command was introduced.
    - This command replaces `show mfib hardware route statistics` command.

**Usage Guidelines**

Use the `show mfib platform route statistics` command to display the hardware packet and byte counter for a route.

**Task ID**

- Task ID Operations
  - multicast read

**Examples**

The following is sample output from the `show mfib platform route statistics` command.

```
RP/0/RSP0/CPU0:router# show mfib platform route statistics location 0/4/CPU0
!! File saved at 16:01:01 EST Wed Feb 14 2018 by root

**show mfib platform route summary**

To display summary platform-specific Multicast Forwarding Information Base (MFIB) hardware information for each route entry, use the `show mfib platform route summary` command in EXEC mode.

```plaintext
show mfib [vrf vrf-name] [ipv4|ipv6] platform route summary location node-id
```

**Syntax Description**

- `vrf vrf-name` (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- `ipv4` (Optional) Specifies IPv4 address prefixes.
- `ipv6` (Optional) Specifies IPv6 address prefixes.
- `location node-id` (Optional) Specifies an MFIB-designated node.

**Command Default**

IPv4 addressing is the default.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.4.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This command replaces `show mfib hardware route summary` command.

**Usage Guidelines**

Use the `show mfib platform summary` command to display hardware information for the route of the node. The longest-prefix match route is displayed depending on the provided source and group addresses. The command does not display any useful output if only RSP is specified or if no location is specified.

**Examples**

The following is sample output from the `show mfib platform route summary` command:

```plaintext
RP/0/RSP0/CPU0:router# show mfib platform route summary location 0/3/cpu0

!! File saved at 16:02:02 EST Wed Feb 14 2018 by root
LC Type: A9K-8X100GE-SE
H/W IP Multicast Forwarding Information Base Summary
  No. of (*,G) routes = 7
  No. of (S,G) routes = 3
  No. of (S,G) HW based ECMP-MoFRR routes = 0
  No. of (S,G) HW based TI-MoFRR clone routes (primary/backup) = 0/0
```
This table describes the significant fields shown in the display.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>No. of (*,G) routes</td>
<td>Number of (*,G) routes installed in hardware.</td>
</tr>
<tr>
<td>No. of (S,G) routes</td>
<td>Number of (S,G) routes installed in hardware.</td>
</tr>
<tr>
<td>No. of (S,G) MoFRR routes</td>
<td>Number of MoFRR (S,G) routes installed in hardware.</td>
</tr>
</tbody>
</table>
clear mfib platform route statistics

To reset all allocated counter values regardless of the Multicast Forwarding Information Base (MFIB) hardware statistics mode (accounting per-prefix or accounting per-prefix forward-only), use the clear mfib platform route statistics command in EXEC mode.

```
clear mfib [vrf vrf-name] [(ipv4|ipv6)] platform route statistics {egress|ingress|ingress-and-egress} [{*source-address}] [group-address [/prefix-length]] [location {node-id|all}]
```

**Syntax Description**

- **vrf vrf-name** (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- **ipv4** (Optional) Specifies IPv4 address prefixes.
- **ipv6** (Optional) Specifies IPv6 address prefixes.
- **ingress-and-egress** (Optional) Clears hardware statistics on both the incoming (ingress) and outgoing (egress) routes.
- ***source-address** (Optional) Clears shared tree route statistics.
- **group-address** (Optional) Specifies the multicast group.
- **/ prefix-length** (Optional) Prefix length of the multicast group. A decimal value that indicates how many of the high-order contiguous bits of the address compose the prefix (the network portion of the address). A slash must precede the decimal value.
- **location** (Optional) Clears route packet counters from the designated node.
- **node-id** The node-id argument is entered in the rack/slot/module notation.
- **all** The all keyword clears route packet counters on all nodes

**Command Default**
If not specified, IPv4 addressing is the default.

**Command Modes**
EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.4.1</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td></td>
<td>This command replaces clear mfib hardware route statistics command.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
To use this command, you must be in a user group associated with a task group that includes the proper task IDs.

The Multicast Forwarding (MFWD) process exists on each line card and assigns hardware counters to each (S, G) route.
To clear the set of counters for (*, G) routes, the MFWD process assigns a single set of counters to count packets that match (*, G) routes. Consequently, the `clear mfib platform route statistics` command must be used in a form that either clears counters on all routes or matches all (*, G) routes.

**Note**

This command only clears MFIB hardware statistics counters. To clear MFIB route packet software counters, use the `clear mfib counter` command.

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write, execute</td>
</tr>
</tbody>
</table>

**Examples**

The following command shows how to clear counters by route statistics for all multicast routes on both ingress and egress forwarding engines for the line card 0/1/CPU0:

```
RP/0/RSP0/CPU0:router# clear mfib ipv4 platform route statistics ingress-and-egress location 0/1/CPU0
```
show mfib platform route location

To display the platform-specific Multicast Forwarding Information Base (MFIB)-enabled location in the hardware, use the `show mfib platform route location` command in EXEC mode.

```
show mfib [vrf vrf-name] [(ipv4|ipv6)] [platform route] [detail] [source-address] [group-address [prefix-length]] location node-id
```

**Syntax Description**

- `vrf vrf-name` (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- `ipv4` (Optional) Specifies IPv4 address prefixes.
- `ipv6` (Optional) Specifies IPv6 address prefixes.
- `source-address` (Optional) IP address or hostname of the multicast route source.
- `group-address` (Optional) IP address or hostname of the multicast group.
- `/ prefix-length` (Optional) Prefix length of the multicast group. A decimal value that indicates how many of the high-order contiguous bits of the address compose the prefix (the network portion of the address). A slash must precede the decimal value.
- `node-id` Node ID for an MFIB-designated node.

**Command Default**

IPv4 addressing is the default.

**Command Modes**

EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>6.4.1</td>
<td>This command replaces <code>show mfib hardware route location</code> command.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read</td>
</tr>
</tbody>
</table>

**Examples**

The following is sample output from the `show mfib platform route location` command:

```
RP/0/RSP0CP00:RTP-VIKING-MCAST-04#show mfib platform route 227.0.0.0/8 location 0/3/cpu0
```

show mfib platform route olist

To display platform-specific Multicast Forwarding Information Base (MFIB) information in the output interface list (olist) stored in the hardware, use the **show mfib platform route olist** command in the appropriate mode.

```
show mfib [vrf vrf-name] [ipv4|ipv6] platform route olist {[*]|source-address |group-address [/prefix-length]} [location node-id]
```

### Syntax Description
- **vrf vrf-name** *(Optional)* Specifies a VPN routing and forwarding (VRF) instance.
- **ipv4** *(Optional)* Specifies IPv4 address prefixes.
- **ipv6** *(Optional)* Specifies IPv6 address prefixes.
- *** (Optional)* Displays shared tree entries.
- **source-address** *(Optional)* IP address or hostname of the multicast route source.
- **group-address** *(Optional)* IP address or hostname of the multicast group.
- **/prefix-length** *(Optional)* Prefix length of the multicast group. A decimal value that indicates how many of the high-order contiguous bits of the address compose the prefix (the network portion of the address). A slash must precede the decimal value.
- **detail** *(Optional)* Displays a detailed list of the routing database. Requires 140 columns.
- **location node-id** *(Optional)* Specifies an MFIB-designated node.

### Command Default
IPv4 addressing is the default.

### Command Modes
EXEC mode

### Command History
- **Release 6.4.1** This command was introduced.
- **Release 6.4.1** This command replaces **show mfib hardware route olist** command.

### Usage Guidelines
The **show mfib platform route olist** command displays the output interface list (olist) for each route. As such, the command displays each route three times. The command does not display any useful output if only RSP is specified or if no location is specified.

show mfib platform table

To display the platform-specific multicast table information for the Multicast Forwarding Information Base (MFIB) in the hardware, use the **show mfib platform table** command in EXEC mode.

```
show mfib [vrf vrf-name] [ipv4|ipv6] platform table [detail] [location node-id]
```

**Syntax Description**

- `vrf vrf-name` (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- `ipv4` (Optional) Specifies IPv4 address prefixes.
- `ipv6` (Optional) Specifies IPv6 address prefixes.
- `detail` (Optional) Displays detailed platform-specific multicast table information.
- `location node-id` (Optional) Specifies the MFIB location.

**Command Default**

IPv4 addressing is the default.

**Command Modes**

EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.4.1</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td></td>
<td>This command replaces <strong>show mfib hardware table</strong> command.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The command does not display any useful output if only RSP is specified or if no location is specified.

**Examples**

The following example shows a sample output of the **show mfib platform table** command:

```
RP/0/RSP0/CPU0:router# show mfib platform table location 0/3/CPU0
!! File saved at 15:57:37 EST Wed Feb 14 2018 by root
LC Type: A9K-8X100GE-SE

RSI Table id: 0xe0000000
VRF Table id: 0
MLC : False
Default MNP : True
MNP NP ID : 0
MNP Bitmask : 0x1
```

---

The following example shows a sample output of the **show mfib platform table** command:
The following example shows the detailed sample output of the `show mfib platform table detail location` command:

```
RP/0/RSP0/CPU0# show mfib platform table detail location 0/3/CPU0
!! File saved at 15:58:03 EST Wed Feb 14 2018 by root

show mfib platform route summary

To display summary platform-specific Multicast Forwarding Information Base (MFIB) hardware information for each route entry, use the `show mfib platform route summary` command in EXEC mode.

```
show mfib [vrf vrf-name] [ipv4|ipv6] platform route summary location node-id
```

**Syntax Description**

- **vrf vrf-name**: (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- **ipv4**: (Optional) Specifies IPv4 address prefixes.
- **ipv6**: (Optional) Specifies IPv6 address prefixes.
- **location node-id**: (Optional) Specifies an MFIB-designated node.

**Command Default**

IPv4 addressing is the default.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.4.1</td>
<td>This command was introduced. This command replaces <code>show mfib hardware route summary</code> command.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `show mfib platform summary` command to display hardware information for the route of the node. The longest-prefix match route is displayed depending on the provided source and group addresses. The command does not display any useful output if only RSP is specified or if no location is specified.

**Examples**

The following is sample output from the `show mfib platform route summary` command:

```
RP/0/RSP0/CPU0:router# show mfib platform route summary location 0/3/cpu0

!! File saved at 16:02:02 EST Wed Feb 14 2018 by root
LC Type: A9K-8X100GE-SE
H/W IP Multicast Forwarding Information Base Summary
No. of (*,G) routes = 7
No. of (S,G) routes = 3
No. of (S,G) HW based ECMP-MoFRR routes = 0
No. of (S,G) HW based TI-MoFRR clone routes (primary/backup) = 0/0
```
This table describes the significant fields shown in the display.

**Table 28: show mfib platform route summary Field Descriptions**

<table>

</table>
clear mfb platform resource-counters

To clear global resource counters, use the `clear mfb platform resource-counters` command in EXEC mode.

```
clear mfb [vrf vrf-name] [(ipv4|ipv6)] platform resource-counters [location {node-id|all}]
```

**Syntax Description**
- `vrf vrf-name` (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- `ipv4` (Optional) Specifies IPv4 address prefixes.
- `ipv6` (Optional) Specifies IPv6 address prefixes.
- `location node-id` (Optional) Clears global resource counters from the designated node.
- `all` (Optional) The `all` keyword clears all global resource counters.

**Command Default**
IPv4 addressing is the default.

**Command Modes**
EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.4.1</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td></td>
<td>This command replaces <code>clear mfb hardware resource-counters</code></td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use the `clear mfb platform resource-counters` to estimate resource usage for an operation.

**Task ID**
- **Task ID**
- **Operations**
- `multicast` read, write, execute

**Examples**
The following example shows how to clear all global resource counters:

```
RP/0/RSP0/CPU0:router# clear mfb platform resource-counters location all
```
show mfib platform resource-counters

To display the allocated and freed hardware resources for the Multicast Forwarding Information Base (MFIB) process, use the `show mfib platform resource-counters` command in EXEC mode.

```
show mfib [vrf vrf-name] [{ipv4|ipv6}] platform resource-counters location node-id
```

**Syntax Description**

- **vrf vrf-name** (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- **ipv4** (Optional) Specifies IPv4 address prefixes.
- **ipv6** (Optional) Specifies IPv6 address prefixes.
- **location node-id** Specifies an MFIB-designated node.

**Command Default**

IPv4 addressing is the default.

**Command Modes**

EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>6.4.1</td>
<td>This command replaces <code>show mfib platform resource-counters</code> command.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `show mfib platform resource-counters` command to show the resource usage of NP structures per NP.

- Use the location option in the `show mfib platform resource-counters` command to indicate for which linecard you need information. The command will not display any useful output if only RSP is specified or if no location is specified.

**Examples**

The following is sample output from the `show mfib platform resource-counters` command:

```
RP/0/RSP0/CPU0:router# show mfib ipv4 platform resource-counters location 0/3/cpu0
!! File saved at 15:30:43 EST Wed Feb 14 2018 by root
LC Type: A9K-8X100GE-SE
--------------------------------------------------------------------
Num NP: 4, NP Running Mask: 0xf, NP Inactive Mask: 0x0
--------------------------------------------------------------------
Note:
For IPv4, the (*,G) resource counter represents both the (*,G) and (S,G)
```
entries. For IPv6, the \((*,G)\) and \((S,G)\) entries are maintained separately. The MVPN, MVPN Decap and MLC counters are all logical entries in the same structure so you will see similar counts across those columns. The 'shared' resources represent HW NP structures that are shared between IPv4 and IPv6 processes.

show mfib platform route accept-bitmap

To display platform-specific Multicast Forwarding Information Base (MFIB) information for the interface list that accepts bidirectional routes, use the `show mfib platform route accept-bitmap` command in EXEC mode.

```
show mfib [vrf vrf-name] [ipv4|ipv6] platform route accept-bitmap [*] [group-address [/prefix-length]] [detail] [location node-id]
```

**Syntax Description**

- `vrf vrf-name` (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- `ipv4` (Optional) Specifies IPv4 address prefixes.
- `ipv6` (Optional) Specifies IPv6 address prefixes.
- `*` (Optional) Displays shared tree entry.
- `source-address` (Optional) IP address or hostname of the multicast route source.
- `group-address` (Optional) IP address or hostname of the multicast group.
- `/prefix-length` (Optional) Prefix length of the multicast group. A decimal value that indicates how many of the high-order contiguous bits of the address compose the prefix (the network portion of the address). A slash must precede the decimal value.
- `detail` (Optional) Detailed list of the routing database.
- `location node-id` (Optional) Specifies an MFIB-designated node.

**Command Default**
IPv4 addressing is the default.

**Command Modes**
EXEC mode

**Command History**

**Related Commands**

- **Command** | **Description** |
  - `show mfib hardware interface` | Displays hardware switching interface information for the Multicast Forwarding Information Base (MFIB) process. |
show mfib nsf

To display the state of a nonstop forwarding (NSF) operation for the Multicast Forwarding Information Base (MFIB) line cards, use the `show mfib nsf` command in EXEC mode.

```
show mfib [ipv4] nsf [location node-id]
```

**Syntax Description**

- `ipv4` (Optional) Specifies IPv4 address prefixes.
- `location node-id` (Optional) Specifies the MFIB NSF designated node.

**Command Default**

IPv4 addressing is the default.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `show mfib nsf` command displays the current multicast NSF state for the MFIB process contained on all line cards and route processors (RPs) in the router.

For multicast NSF, the state may be one of the following:

- **Normal**—Normal operation: The MFIBs in the card contain only up-to-date MFIB entries.
- **Boot Card Booting**—Card is initializing and has not yet determined its NSF state.
- **Not Forwarding**—Multicast Forwarding Disabled: Multicast routing failed to recover from a failure-induced NSF state prior to the MFIB NSF timeout.
- **Non-stop Forwarding Activated**—Multicast NSF active. The router is operating in NSF mode while attempting to recover from a control-plane failure. In this mode, data is forwarded based on MFIB entries that are either updated by the recovered Multicast Routing Information Base (MRIB), or MFIB entries that were marked stale when NSF mode began. The times remaining until multicast NSF and multicast-unicast NSF expiration are displayed.

### Task ID Operations

- `multicast read`

### Examples

The following is sample output from the `show mfib nsf` command:

```
RP/0/RSP0/CPU0:router# show mfib nsf

IP MFWD Non-Stop Forwarding Status:
  NSF Lifetime: 00:15:00
```
On node 0/1/CPU0:
Multicast routing state: Non-Stop Forwarding is activated
NSF Time Remaining: 00:14:54

On node 0/3/CPU0:
Multicast routing state: Non-Stop Forwarding is activated
NSF Time Remaining: 00:14:54

On node 0/4/CPU0:
Multicast routing state: Non-Stop Forwarding is activated
NSF Time Remaining: 00:14:53

On node 0/6/CPU0:
Multicast routing state: Non-Stop Forwarding is activated
NSF Time Remaining: 00:14:53

This table describes the significant fields shown in the display.

Table 31: show mfib nsf Field Descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP MFWD Non-Stop Forwarding Status</td>
<td>MFIB NSF status of each node in the system: booting, normal, not forwarding, or activated.</td>

**Usage Guidelines**
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.
All entries in the MFIB table are derived from the Multicast Routing Information Base (MRIB). The flags have the same connotation as in the MRIB. The flags determine the forwarding and signaling behavior according to a set of forwarding rules for multicast packets. In addition to the list of interfaces and flags, each route entry shows various counters. Byte count is the number of total bytes forwarded. Packet count is the number of packets received for this entry.

The `show mfib counter` command displays global counters independent of the routes.

This command displays counters for the number of packets and bytes that are handled by software switching. Counters for packets processed by hardware are displayed by the appropriate `show mfib hardware` command.

The command displays the cumulative rates per route for all line cards in the Multicast Forwarding Information Base (MFIB) table when the `rate` keyword is used with the source and group IP addresses.

The show mfib route rate command is not supported on interfaces such as bundle virtual interfaces and Bridge Group virtual interfaces (BVIs).

The command displays the rate per route for one line card in Multicast Forwarding Information Base (MFIB) table when the `statistics` keyword is used.

The following is a sample output for MoFRR enabled route without and with the detail keyword:

```
RP/0/RSP0/CPU0:router# show mfib route

IP Multicast Forwarding Information Base
Entry flags: C - Directly-Connected Check, S - Signal, D - Drop,
IA - Inherit Accept, IF - Inherit From, MA - MDT Address,
ME - MDT Encap, MD - MDT Decap, MT - MDT Threshold Crossed,
MH - MDT interface handle, CD - Conditional Decap,
DT - MDT Decap True, EX - Extranet
MoFE - MoFRR Enabled, MoFS - MoFRR State
Interface flags: F - Forward, A - Accept, IC - Internal Copy,
NS - Negate Signal, DP - Don't Preserve, SP - Signal Present,
EG - Egress, EI - Encapsulation Interface, MI - MDT Interface,
In the above command, A flag represents the primary RPF of the MoFRR route, and A2 flag represents the backup RPF of the MoFRR route.
The detail option illustrates the MoFRR state of each MoFRR route. At any moment, only one RPF forwards the traffic to the egress. The inactive state means the primary RPF forwards the traffic to the egress. The active state means that the backup RPF forwards the traffic to the egress. The sequence number reflects the number of switchovers of the MoFRR route.

Multicast Routing and Forwarding Commands

show mfib route
show mfib table-info

To display Multicast Forwarding Information Base (MFIB) table information, use the `show mfib table-info` command in EXEC mode.

```
show mfib {ipv4|ipv6} table-info {table-id|vrf-name} {local|remote} {location node-id}
```

**Syntax Description**

- `ipv4` (Optional) Specifies IPv4 address prefixes.
- `ipv6` (Optional) Specifies IPv6 address prefixes.
- `table-id` Specifies the table identifier. Range is 0 to 4294967295.
- `vrf-name` Specifies the VRF name.
- `local` Specifies local tables only.
- `remote` Specifies remote tables only.
- `location node-id` (Optional) Specifies MFIB connections associated with an interface of the designated node.

**Command Default**
IPv4 addressing is the default.

**Command Modes**
EXEC

**Command History**

```
Release 3.7.2  This command was introduced.
```

**Usage Guidelines**
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

**Task ID**

```
Task ID  Operations
multicast  read
```

**Examples**

The following is sample output from the `show mfib table-info` command:

```
RP/0/RSP0/CPU0:router# show mfib table-info table-id location 0/0/CPU0

Table Name : default
VRid/TID/VID : 0x0 / 0xe0000000 / 0x6000000
Table type : TBL_TYPE_TID
Active/Linked : Y / Y
Prev Table ID : 0x0
Location : Local
Local ifcount : 16
Default MDT Encap : (*, */32)
```
MDT Master LC : N  
Loopback (Encap Src) : 0x0 (Ha0x0)  
Local EG intf cnt : 6  
Data MDT : Acl - (-), All vrf routes N, 0 Kbps

RP/0/RSP0/CPU0:router#show mfib table-info vrf 101

Table Name : vrf15  
VRid/TID/VID : 0x0 / 0xe000000f / 0x6000000f  
Table type : TBL_TYPE_NAME_VID  
Active/Linked : Y / Y  
Prev Table ID : 0x0  
Location : Local  
Local ifcount : 2  
Child routes : (5.5.5.5, 225.101.1.15/32)  
Default MDT Handle : 0x0 (Ha0x0)

MDT Master LC : Y  
Loopback (Encap Src) : 0x9000180 (Loopback0)  
Local EG intf cnt : 508  
Data MDT : Acl - (-), All vrf routes N, 0 Kbps

This table describes the significant fields shown in the display.

show mrib client

To display the state of the Multicast Routing Information Base (MRIB) client connections, use the `show mrib client` command in the appropriate mode.

`show mrib [vrf vrf-name] ipv4 client [filter] [client-name]`

**Syntax Description**

- `vrf vrf-name` (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- `ipv4` (Optional) Specifies IPv4 address prefixes.
- `ipv6` (Optional) Specifies IPv6 address prefixes.
- `filter` (Optional) Displays route and interface level flag changes that various MRIB clients have registered and shows what flags are owned by the MRIB clients.
- `client-name` (Optional) Name of a multicast routing protocol that acts as a client of MRIB, such as Protocol Independent Multicast (PIM) or Internet Group Management Protocol (IGMP).

**Command Default**

IPv4 addressing is the default.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>

**Examples**

The following is sample output from the `show mrib client` command using the `filter` option:

```
RP/0/RSP0/CPU0:router# show mrib client filter
IP MRIB client-connections
igmp:417957 (connection id 0)
ownership filter:
  interface attributes: II ID LI LD
  groups:
    include 0.0.0.0/0
  interfaces:
    include All
pim:417959 (connection id 1)
  interest filter:
    entry attributes: E
```
This table describes the significant fields shown in the display.

**Table 33: show mrib client Field Descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>igmp</td>
<td>Name of the client.</td>
</tr>
<tr>
<td>417957</td>
<td>Personal identifier (PID) or a unique ID assigned by MRIB.</td>
</tr>
<tr>
<td>(connection id 0)</td>
<td>Unique client connection identifier.</td>
</tr>
<tr>
<td>ownership filter:</td>
<td>Specifies all the route entry and interface-level flags that are owned by the client. As the owner of the flag, only the client can add or remove the flag. For example, only the Internet Group Management Protocol (IGMP) client can add the II flag on an interface. MRIB does not allow a non-owner to register or modify the same flag.</td>
</tr>
<tr>
<td>groups: include 0.0.0.0/0</td>
<td>Groups and interfaces registered by the clients consisting of two lists. One is an include list (items for which the client requests to be notified.) The use of “All” implies all interfaces and 0.0.0.0/0 to indicate all groups. Not shown in this example is the exclude list. This list contains items for which the client requests not to be notified when modifications occur.</td>
</tr>
<tr>
<td>interfaces: include All</td>
<td>Interface-level flags set on the interface belong to a route.</td>
</tr>
<tr>
<td>interest filter:</td>
<td>Specifies all the flags, groups, and interfaces from which the client requests information. When a flag of interest for a client is modified, the client is notified.</td>

```
RP/0/RSP0/CPU0:router # show mrib bvi route bvi 200
```
show mrib mpls forwarding

To display the Multicast Routing Information Base (MRIB) MPLS forwarding table information of all tunnels, use the `show mrib mpls forwarding` command in EXEC mode.

```
show mrib mpls forwarding [{detail|labels|s2l|source|summary|tunnels}]
```

**Syntax Description**
- **detail**: Provides the detail information of each tunnel.
- **labels**: Filters based on label.
- **s2l**: Filters based on s2l.
- **source**: Filters based on source PE address.
- **summary**: Displays the summary output of entries.

**Command Default**
None

**Command Modes**
EXEC

**Command History**
- **Release**: 4.1.0
- **Modification**: This command was introduced.

**Usage Guidelines**
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

**Task ID**
- **Task ID**
- **Operations**
  - multicast
  - read

**Examples**
The following is a sample output from the `show mrib mpls forwarding` command:

```
RP/0/RSP0/CPU0:router# show mrib mpls forwarding
LSP information (RSVP-TE):

show mrib nsr end

To display nonstop routing (NSR) operation in the Multicast Routing Information Base (MRIB), use the `show mrib nsr end` command in the appropriate mode.

```
show mrib ipv4|ipv6 nsr end
```

**Syntax Description**

- `ipv4` (Optional) Specifies IPv4 address prefixes.
- `ipv6` (Optional) Specifies IPv6 address prefixes.

**Command Default**

IPv4 addressing is the default.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use this command after an NSR event (for example, RPFO or a process restart) to determine when each of the MRIB or MRIB6's NSR clients finished re-downloading the information to the MRIB and if any previously downloaded information was purged in the process.

**Task ID**

```
Task ID    Operations
multicast  read
```

**Examples**

The following is sample output from the `show mrib nsr end` command:

```
RP/0/RSP0/CPU0:router# show mrib nsr end
Time   Client       Idx  Change
Oct 17 18:43:36 Membership 1  N
Oct 17 18:43:40 Routing    2  Y
```

This table describes the significant fields shown in the display.

**Table 35: show mrib nsr end Field Descriptions**

<table>
<thead>
<tr>

show mrib platform bundle

To display bundle information for the Multicast Routing Information Base (MRIB), use the `show mrib platform bundle` command in EXEC mode.

```
show mrib platform bundle [{hash ip ip-address | hash label label-name } | member-db member-db-name }
```

**Syntax Description**

**hash**
The hash option is used to preview which specific bundle member will be chosen for a given multicast route or label before the route is created in PIM or MRIB.

(Optional) `hash ip ip-address` Enter the hash 

(*)  G) or (S,G) IP address to preview load balancing information. Enter the source IP address followed by the group IP address. For the 

(*)  G) option where there is no source IP address, enter 0.0.0.0 as the source IP address.

(Optional) `hash label label-name` Enter the hash label name.

**member-db**
Displays the current bundle member database in MRIB platform.

To see all the variable options for this keyword, use the question mark (?) online help function.

```
show mrib platform bundle member-db ?
ATM ATM Network Interface(s) | short name is ATM
BVI Bridge-Group Virtual Interface
Bundle-Ether Aggregated Ethernet interface(s) | short name is BE
Bundle-POS Aggregated POS interface(s) | short name is BP
```

**Command Default**
IPv4 addressing is the default.

**Command Modes**
EXEC

**Command History**

<table>
<thead>

**show mrib platform interface**

To display interface-related information used in the Multicast Routing Information Base (MRIB) process use the `show mrib platform interface` command in EXEC mode.

```
show mrib platform bundle [{} detail location rsp-location | detail | begin | exclude | file | include | utility {}] [{} detail location rsp-location | begin | exclude | file | include | utility {}]
```

**Syntax Description**

- **detail**
  - Displays detailed information about connections.
  - (Optional) detail location `rsp-location` Enter the RSP location name.
  - (Optional) detail | `begin` Begins with the line that matches.
  - (Optional) detail | `exclude` Excludes the lines that match.
  - (Optional) detail | `file` Saves the configuration.
  - (Optional) detail | `include` Includes lines that match.
  - (Optional) detail | `begin` Lists a set of common UNIX utilities.

- **location**
  - Specifies the location of the platform connections.
  - (Optional) location `rsp-location` Enter the RSP location name.
  - (Optional) location | `begin` Begins with the line that matches.
  - (Optional) location | `exclude` Excludes the lines that match.
  - (Optional) location | `file` Saves the configuration.
  - (Optional) location | `include` Includes lines that match.
  - (Optional) location | `begin` Lists a set of common UNIX utilities.

**Command Default**

IPv4 addressing is the default.

**Command Modes**

EXEC

</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

**Task ID**

- `multicast read`

**Examples**

The following example shows a sample output of `show mrib platform connections` command:
show mrib platform connections
begin LINE | utility wc
Wed Aug 30 00:48:43.482 EDT
23 69 858
show mrib platform regdb

To display regulatory the core registration database information used in the platform-specific part of the Multicast Routing Information Base (MRIB) process, use the `show mrib platform regdb` command in EXEC mode.

```
show mrib platform regdb [all detail location location-name | all detail | begin | exclude | file | include | utility | ] | { all location location-name | | } { all begin | exclude | file | include | utility | } | { label next-hop-IP-address | | pwhe next-hop-IP-address | | tunnel next-hop-IP-address | }
```

### Syntax Description

**all**
Displays all the core regdb entries in the regulatory platform database.

(Optional) all detail location location-name Displays the location details.

(Optional) all detail begins with the line that matches.

(Optional) all detail exclude Excludes the lines that match.

(Optional) all detail file Saves the configuration.

(Optional) all detail include Includes lines that match.

(Optional) all detail utility Lists a set of common UNIX utilities.

(Optional) all location location-name Displays the location details.

**label**
Displays all core information in the platform-specific regdb related to P2MP label, based on the next-hop IP Address.

(Optional) label next-hop-IP-address Enter the next-hop IP address.

**pwhe**
Displays all core information in the platform-specific regdb related to PWHE interface, based on the next-hop IP Address.

(Optional) pwhe next-hop-IP-address Enter the next-hop IP address.

**tunnel**
Displays all core information in the platform-specific regdb related to GRE tunnel interfaces, based on the next-hop IP Address.

(Optional) tunnel next-hop-IP-address Enter the next-hop IP address.

### Command Default
IPv4 addressing is the default.

### Command Modes
EXEC

### Command History

<table>

show mrrib platform regdb

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>multicast read</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows a sample output of `show mrrib platform regdb pwhe` command:

```plaintext
#show mrrib platform regdb pwhe 162.104.38.129
----------------------------
NH Type: LABEL
NH IP address: 162.104.38.129
NH VRF ID: 0xe0000000
IDB Refcount: 1
ECD Present: Y
ECD Length: 44360
RegDB Handle: 0x120ab460
```
show mrib platform resources

To display resource counters for the platform-specific part of the Multicast Routing Information Base (MRIB) process, use the `show mrib platform resources` command in EXEC mode.

```
show mrib platform resources [{memory detail location location-name | memory detail | begin | exclude | file | include | utility } | {memory location location-name | | } {memory begin | exclude |file | include | utility }
```

### Syntax Description

**memory** Displays the memory resources allocated.

(Optional) `memory detail location location-name` Displays the location details.

(Optional) `memory detail | begin` Begins with the line that matches.

(Optional) `memory detail | exclude` Excludes the lines that match.

(Optional) `memory detail | file` Saves the configuration.

(Optional) `memory detail | include` Includes lines that match.

(Optional) `memory detail | utility` Lists a set of common UNIX utilities.

(Optional) `memory location location-name` Displays location details.

show mrib platform trace location standby

To display platform-specific data for the Multicast Routing Information Base (MRIB) on a standby RP, use the `show mrib platform trace location standby` command in EXEC mode.

```
show mrib [vrf vrf-name] ipv4 platform trace
[ {file|hexdump|last|reverse|stats|tail|unique|verbose|wrapping} ]
location standby [ {allnode-id} ]
```

### Syntax Description

- **vrf vrf-name** (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- **ipv4** (Optional) Specifies IPv4 address prefixes.
- **file** (Optional) Specifies the filename.
- **hexdump** (Optional) Displays the traces in hexadecimal form.
- **last** (Optional) Displays the last `n` entries.
- **reverse** (Optional) Displays the traces in reverse order.
- **stats** (Optional) Displays statistics.
- **tail** (Optional) Displays new traces as they are added.
- **unique** (Optional) Displays unique entries with counts.
- **verbose** (Optional) Displays internal debugging information.
- **wrapping** (Optional) Displays wrapping entries.
- **location standby node-id** (Optional) Specifies the location of the trace.
- **location standby all** (Optional) Specifies that the trace be performed for all locations.

### Command Default
IPv4 addressing is the default.

### Command Modes
EXEC

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.2.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.
### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read</td>
</tr>
</tbody>
</table>

### Examples

The following example shows a sample output of `show mrib platform trace location standby` command:

```
RP/0/RSP0/CPU0:router#show mrib platform trace location standby

2 wrapping entries (512 possible, 0 filtered, 2 total)
```
show mrib route

To display all entries in the Multicast Routing Information Base (MRIB), use the **show mrib route** command in the appropriate mode.

```plaintext
show mrib [vrf vrf-name] [(ipv4|ipv6)] [old-output] route
[summary|outgoing-interface] [source-address] [group-address /prefix-length]] [detail]
```

**Syntax Description**

- **vrf vrf-name** (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- **ipv4** (Optional) Specifies IPv4 address prefixes.
- ***** (Optional) Displays shared tree entries.
- **source-address** (Optional) Source IP address or hostname of the MRIB route. Format is: 
  
  A.B.C.D or X:X::X.
- **group-address** (Optional) Group IP address or hostname of the MRIB route. Format is: 
  
  A.B.C.D or X:X::X.
- **/prefix-length** (Optional) Prefix length of the MRIB group address. A decimal value that indicates how many of the high-order contiguous bits of the address compose the prefix (the network portion of the address). A slash must precede the decimal value. Format is: 
  
  A.B.C.D or X:X::X.
- **outgoing-interface** (Optional) Displays the outgoing-interface information.
- **summary** (Optional) Displays a summary of the routing database.
- **detail** (Optional) Displays the routing database with the platform data.

**Command Default**

IPv4 addressing is the default.

**Command Modes**

EXEC

**Command History**

Release 3.7.2  This command was introduced.

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Each line card has an individual Multicast Forwarding Information Base (MFIB) table. The MFIB table maintains a subset of entries and flags updated from MRIB. The flags determine the forwarding and signaling behavior according to a set of forwarding rules for multicast packets. In addition to the list of interfaces and flags, each route entry shows various counters. Byte count is the number of total bytes forwarded. Packet count is the number of packets received for this entry.

The **show mfib counter, on page 162** command displays global counters independent of the routes.
<table>

show mrib route outgoing-interface

To display the outgoing-interface information on the Multicast Routing Information Base (MRIB), use the show mrib route outgoing-interface command in the appropriate mode.

show mrib route outgoing-interface [{*source-address}] [group-address /prefix-length]

Syntax Description

* (Optional) Displays shared tree entries.

A.B.C.D (Optional) Source IP address or hostname of the MRIB route. Format is:

A.B.C.D

A.B.C.D (Optional) Group IP address or hostname of the MRIB route and the prefix length.

A.B.C.D

/prefix-length (Optional) Prefix length of the MRIB group address. A decimal value that indicates how many of the high-order contiguous bits of the address compose the prefix (the network portion of the address). A slash must precede the decimal value. Format is:

A.B.C.D

Command Default

IPv4 addressing is the default.

Command Modes

EXEC

To configure a static Reverse Path Forwarding (RPF) rule for a specified prefix mask, use the static-rpf command in an appropriate configuration mode. To return to the default behavior, use the no form of this command.

```
static-rpf prefix-address prefix-mask type path-id next-hop-address
no static-rpf
```

**Syntax Description**

- **prefix-address**: IP address of a prefix for an address range.
- **prefix-mask**: Prefix mask for an address range. Range is 0 to 32 for IPv4.
- **type**: Interface type. For more information, use the question mark (?) online help function.
- **interface-path-id**: Physical interface or virtual interface.

**Note**: Use the `show interfaces` command in EXEC mode to see a list of all interfaces currently configured on the router.

For more information about the syntax for the router, use the question mark (?) online help function.

- **next-hop-address**: IP address for an RPF neighbor.

**Command Default**

A static RPF rule for a specified prefix mask is not configured.

**Command Modes**

Multicast routing address family ipv4 and ipv6 configuration

Multicast VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The static-rpf command is used to configure incompatible topologies for unicast and multicast traffic.

Use the static-rpf command to configure a static route to be used for RPF checking in Protocol Independent Multicast (PIM) instead of using the unicast routing table.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example configures the static RPF rule for IP address 10.0.0.1:
RP/0/RSP0/CPU0:router(config)# multicast-routing
RP/0/RSP0/CPU0:router(config-mcast)# vrf green
RP/0/RSP0/CPU0:router(config-mcast)# static-rpf 10.0.0.1 32 GigE 0/0/5/0 10.1.1.1

source-tree-prune-delay

To set the delay-time for the (S,G) prune of the ingress-PE (provider edge), use the source-tree-prune-delay command in the appropriate mode. To remove the set delay, use the no form of the command.

source-tree-prune-delay  
no source-tree-prune-delay

time

Syntax Description

time  Delay in seconds. Range is 0 to 300.

Command Default

60 seconds

Command Modes

C-multicast-routing configuration mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
</table>
| 4.3     | This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

This command is used to delay (S,G) Prune on the Ingress-PE, when the last Type-7 route is withdrawn.

Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

Example

This example shows how to use the source-tree-prune-delay command:

RP/0/RSP0/CPU0:router (config-pim-v1-ipv4-mdt-cmcast) # source-tree-prune-delay 100
suppress-pim-data-signaling

To suppress PIM data signaling, use the `suppress-pim-data-signaling` command in the appropriate mode. To remove the suppressed condition, use the `no` form of the command.

`suppress-pim-data-signaling`
`nosuppress-pim-data-signaling`

**Syntax Description**
This command has no keywords or arguments.

**Command Default**
None

**Command Modes**
PIM C-multicast routing configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

This command supports c-anycast RP and can be used only under the PIM c-multicast routing mode.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Example**
This example shows how to use the `suppress-pim-data-signaling` command:

```
RP/0/RSP0/CPU0:router (config-pim-v1-ipv4-mdt-cmcast) # suppress-pim-data-signaling
```
**suppress-shared-tree-join**

To suppress shared tree joins and support the SPT-only mode, use the `suppress-shared-tree-join` command in the appropriate mode.

To remove the suppress condition, use the `no` form of the command.

`suppress-shared-tree-join`  
`nosuppress-shared-tree-join`

**Syntax Description**

This command has no keywords or arguments.

**Command Default**

None

**Command Modes**

C-multicast-routing configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

This command enables the SPT-only (Shortest Path Tree) mode.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Example**

This command shows how to use the `suppress-shared-tree-join` command:

```
RP/0/RSP0/CPU0:router(config-pim-v1-ipv4-mdt-cmcast)# suppress-shared-tree-join
```
ttl-threshold (multicast)

To configure the time-to-live (TTL) threshold for packets being forwarded out an interface, use the `ttl-threshold` command in the appropriate configuration mode. To return to the default behavior, use the `no` form of this command.

```
ttl-threshold  ttl
no  ttl-threshold  ttl
```

**Syntax Description**

- `ttl`  Time to live value. Range is 1 to 255.

**Command Default**

`ttl : 0`

**Command Modes**

- Multicast routing interface configuration
- Multicast routing VRF interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Only multicast packets with a TTL value greater than the threshold are forwarded out of the interface. The TTL threshold is compared to the TTL of the packet after it has been decremented by one and before being forwarded.

Configure the TTL threshold only on border routers.

**Note**

Do not confuse this command with the `ttl-threshold (MSDP)` command in router MSDP configuration mode that is used to confine the multicast data packet TTL to be sent by an Multicast Source Discovery Protocol (MSDP) Source-Active (SA) message.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to configure the TTL threshold to 23, which means that a multicast packet is dropped and not forwarded out of the GigE 0/1/0/0 interface:

```
RP/0/RSP0/CPU0:router(config)# multicast-routing
RP/0/RSP0/CPU0:router(config-mcast)# interface GigE 0/1/0/CPU0
RP/0/RSP0/CPU0:router(config-mcast-default-ipv4-if)# ttl-threshold 23
```
### Related Commands

<table>

</tr>
<tr>
<td>vrf-route-import-disable</td>
<td>Disables VRF route import extended community addition.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command Modes**

C-multicast routing configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

This command controls addition of extended communities to unicast VPN-IP routes. These attributes have specific purposes in PIM and BGP C-multicast Routing.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Example**

This example shows how to use the **unicast-reachability** command:

```
RP/0/RSP0/CPU0:router (config-pim-v1-ipv4-mdt-cmcast) # unicast-reachability connector-disable
```
vrf (multicast)

To configure a virtual routing and forwarding (VRF) instance for a VPN table, use the `vrf` command in multicast routing configuration mode. To remove the VRF instance from the configuration file and restore the system to its default condition, use the `no` form of this command.

```
 vrf vrf-name ipv4
 no vrf vrf-name ipv4
```

**Syntax Description**

- **vrf-name**: Name of the VRF instance. The following names cannot be used: all, default, and global.
- **ipv4**: (Optional) Configures IPv4 address prefixes.

**Command Default**

No default behavior or values.

**Command Modes**

Multicast routing configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

A VRF instance is a collection of VPN routing and forwarding tables maintained at the provider edge (PE) router.

**Task ID**

```
Task ID Operations
multicast read,
     write
```

**Examples**

The following example shows how to configure a VRF instance and enter VRF configuration mode:

```
RP/0/RSP0/CPU0:router(config)# multicast-routing
RP/0/RSP0/CPU0:router(config-mcast)# vrf vrf_1
RP/0/RSP0/CPU0:router(config-mcast-vrf_1-ipv4)# mdt ?
```

```
data  Data MDT group configuration
default MDT default group address
mtu    MDT mtu configuration
source Interface used to set MDT source address
```

cef platform lsm frr-holdtime

To configure the frr-holdtime of MLDP LSPs in a scale setup (with more than 500 LSPs configured), use the cef platform lsm frr-holdtime command in global configuration mode.

```
cef platform lsm frr-holdtime  seconds
```

**Syntax Description**

- `seconds` The number of seconds to set the frr-holdtime. Default value is 2 seconds.

**Note**

The range of the frr-holdtime (in seconds) is 3 to 180 seconds.

---

**Command Default**

None

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Example**

The following example shows how to set the frr-holdtime value to 45 seconds.

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# cef platform lsm frr-holdtime 45
```
cef platform ism frr-holdtime
IGMP and MLD Snooping Commands on Cisco ASR 9000 Series Routers

This chapter describes the commands used to configure and monitor IGMP and MLD snooping on Cisco ASR 9000 Series Router.

For detailed information about IGMP snooping concepts, configuration tasks, and examples, refer to the Implementing Layer 2 Multicast Using IGMP / MLD Snooping on Cisco ASR 9000 Series Routers module in the Multicast Configuration Guide for Cisco ASR 9000 Series Routers.

access-group (snooping profile)

To instruct IGMP/MLD snooping to apply the specified access list filter to received membership reports, use the `access-group` command in the appropriate snooping profile configuration mode. To discontinue membership report filtering, use the `no` form of this command.

```
access-group acl-name
no access-group
```

**Syntax Description**

- `acl-name` Name of the ACL filter.

**Command Default**

Membership reports are not filtered by default.

**Command Modes**

- IGMP snooping profile configuration
- MLD snooping profile configuration

**Command History**

<table>
<thead>
<tr>

<td>This command was introduced.</td>
</tr>
<tr>
<td>Release 3.9.0</td>
<td>This command was modified to clear new statistical information added in the current release to support multicast admission control.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

In Release 3.7.2, the only items available for clearing are counters and statistics. You have the option to clear statistics for one or all bridge domains. You also have the option to clear only bridge domain statistics, or bridge domain statistics plus all statistics for all ports under the cleared bridge domains.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>

<td><code>port interface-name</code></td>
<td>(Optional) Clears groups for the named interface from the forwarding tables.</td>
</tr>
<tr>
<td><code>port neighbor ipaddr pw-id id</code></td>
<td>(Optional) Clears groups for the named pseudowire (PW) from the forwarding tables.</td>
</tr>
<tr>
<td><code>bridge-domain bridge-domain</code></td>
<td>(Optional) Clears groups for the named bridge domain from the forwarding tables.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

IGMP snooping propagates the request to clear group information through the L2FIB to the forwarding plane. After this command is issued, IGMP snooping relearns group information by snooping packets as they are received from the network.

Use the `address` keyword to clear one group, identified by address. Otherwise, all groups are cleared. You can clear the named group from all ports or bridges, or from a specifically identified port or bridge.

Use the `bridge-domain` keyword to clear groups only for a named bridge domain. Use the `port` keyword to clear groups for a named port. A port can be an access interface or a pseudowire. The `bridge-domain` and `port` keywords are mutually exclusive.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>12vpn</td>
<td>execute</td>
</tr>
</tbody>
</table>

**Examples**

The following example clears all group membership information from the forwarding tables:
The following example clears one group from the forwarding table for one identified access circuit:

```
RP/0/RSP0/CPU0:router# clear igmp snooping group port GigabitEthernet 0/1/1/1
```

The following example clears all group membership information from the forwarding table for one identified pseudowire:

```
RP/0/RSP0/CPU0:router# clear igmp snooping group port neighbor 10.5.5.5 pw-id 5
```

The following example clears one group from the forwarding table for one identified pseudowire:

```
RP/0/RSP0/CPU0:router# clear igmp snooping group 10.10.10.1 port neighbor 10.5.5.5 pw-id 5
```

</tr>
<tr>
<td><code>bridge-domain bridge-domain-name</code></td>
<td>(Optional) Clears information for all ports under the named bridge domain.</td>
</tr>
<tr>
<td><code>statistics</code></td>
<td>Clears counters and other statistics. In Release 3.7.2, this keyword is required.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command Default</th>
<th>None</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command Modes</td>
<td>EXEC</td>
</tr>
<tr>
<td>Command History</td>
<td>Release 3.7.2  This command was introduced.</td>
</tr>
<tr>
<td></td>
<td>Release 3.9.0  This command was modified to clear new statistical information added in the current release to support multicast admission control.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

You can use this command to clear IGMP snooping information at the port level for:

- All ports on the router
- A specific port, using its interface name
- A specific PW, using the `neighbor` keyword
- All ports under a named bridge domain, using the `bridge-domain` keyword. In this case, only the port-level information is cleared under the bridge-domain. Use the `clear igmp snooping bridge-domain` command to clear statistics at the bridge-domain level.

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Task</th>
<th>Operations</th>

</thead>
<tbody>
<tr>
<td>12vpn</td>
<td>execute</td>
<td></td>
</tr>
</tbody>
</table>
### Examples

The following example clears IGMP snooping port-level counters for all ports on the router.

```
RP/0/RSP0/CPU0:router# clear igmp snooping port statistics
```

The following example clears IGMP snooping counters for one AC.

```
RP/0/RSP0/CPU0:router# clear igmp snooping port GigabitEthernet 0/1/1/1 statistics
```

The following example clears IGMP snooping counters for one PW.

```
RP/0/RSP0/CPU0:router# clear igmp snooping port neighbor 10.5.5.5 pw-id 5 statistics
```

</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

This command clears summary level statistics about IGMP snooping. This command does not affect statistics at the bridge domain level or the port level.

**Task ID**

- **Task ID**: 12vpn
- **Operations ID**: execute

**Examples**

The following example clears all IGMP snooping statistics.

```
RP/0/RSP0/CPU0:router# clear igmp snooping summary statistics
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show igmp snooping summary, on page 419</td>
<td>Displays IGMP snooping configuration and traffic statistics at a summary level for the router.</td>
</tr>
</tbody>
</table>
clear l2vpn forwarding bridge-domain mroute

To clear multicast routes from the Layer-2 forwarding tables, use the `clear l2vpn forwarding bridge-domain mroute` command in EXEC mode.

```
clear l2vpn forwarding bridge-domain [bg:bd] mroute [{ipv4|ipv6}] [location node-id ]
```

**Syntax Description**
- `[bg:bd]` (Optional) Clears Layer-2 multicast routes only for the specified bridge group and bridge domain.
- `ipv4` (Optional) Specifies the IPv4 addressing scheme.
- `location node-id` (Optional) Clears Layer-2 multicast routes only for the specified node ID.

**Command Default**
None

**Command Modes**
EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

This command removes multicast routes in the Layer-2 forwarding information base (l2fib) tables. If you issue the command without a specific bridge group and bridge domain, information for all bridge groups and domains is cleared.

This command does not remove the state from the control plane. So, multicast routes will not be recreated. You can use the `clear igmp snooping group` command which not only clears state from the control plane but also clears the state from the forwarding plane.

**Note**

The following example clears all multicast routes across all bridge domains on one module.

```
RP/0/RSP0/CPU0:router# clear l2vpn forwarding mroute location 0/5/CPU0
```
group limit

To specify the maximum number of groups or source-groups that may be joined on a port, use the `group limit` command in the appropriate snooping profile configuration mode. By default, each group or source-group contributes a weight of 1 towards this limit. To remove the group limit, use the `no` form of this command.

```
group limit group-limit-value
no group limit group-limit-value
```

**Syntax Description**

- `group-limit-value`: Limit value for the port. Range is from 0-65535.

**Command Default**

No group limit

**Command Modes**

- IGMP snooping profile configuration
- MLD snooping profile configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.9.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

No new group or source group will be accepted if its contributed weight would cause this limit to be exceeded.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>l2vpn</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to set the group limit of a port for weighting:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)#igmp snooping profile
RP/0/RSP0/CPU0:router(config-igmp-snooping-profile)# group limit 699
```

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)#mld snooping profile
RP/0/RSP0/CPU0:router(config-mld-snooping-profile)# group limit 699
```

**Related Commands**

</tr>
</tbody>
</table>
To instruct IGMP / MLD snooping to use the specified route policy to determine the weight contributed by a new <*,G> or <S,G> membership request, use the `group policy` command in the appropriate snooping profile configuration mode. To remove the group weight route policy from the profile and use the default group weight of 1 for all groups, use the `no` form of this command.

```plaintext
group policy policy-name
no group policy
```

**Syntax Description**

- `policy-name`: Name of the route policy that should determine the weight contributed by a new <*,G> or <S,G> membership request.

**Command Default**

Default weight for all groups is 1. By default, no route policy is configured to determine the weight of new <*,G> or <S,G> membership requests.

**Command Modes**

- IGMP snooping profile configuration
- MLD snooping profile configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.9.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

To limit the number of IGMP v2/v3 groups, in which the maximum number of concurrently allowed multicast channels must be configurable on a per EFP-basis and per PW-basis, configure group weighting.

IGMP snooping limits the membership on a bridge port to a configured maximum limit. This feature also supports IGMPv3 source groups and allows different weights to be assigned to individual groups or source groups. This enables the IPTV provider, for example, to associate standard and high-definition IPTV streams, as appropriate, to specific subscribers.

This feature does not limit the actual multicast bandwidth that may be transmitted on a port. Rather, it limits the number of IGMP groups and source-groups, of which a port can be a member. It is the responsibility of the IPTV operator to configure subscriber membership requests to the appropriate multicast flows.

igmp snooping profile

To create or change an IGMP snooping profile, or to attach an IGMP snooping profile to a bridge or a port, use the `igmp snooping profile` command in the appropriate configuration mode. To detach a profile from a bridge domain or port, use the `no` form of this command. To delete a profile from the database, use the `no` form of this command in global configuration mode.

```
igmp snooping profile profile-name
no igmp snooping
```

**Syntax Description**

| profile-name | Name that uniquely identifies the IGMP snooping profile. |

**Command Default**

IGMP snooping is inactive on a bridge domain until a profile is attached to the bridge domain.

**Command Modes**

- Global configuration
- L2 VPN bridge group bridge domain configuration
- L2 VPN bridge group bridge domain interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

This command accomplishes different tasks depending on the configuration mode you are in when you issue it.

- In global configuration mode, this command creates and changes profiles.
- In L2 VPN bridge group bridge domain configuration mode, this command attaches profiles to bridge domains.
- In L2 VPN bridge group bridge domain interface configuration mode, this command attaches profiles to ports.

Use the `igmp snooping profile` command in global configuration mode to create a new IGMP snooping profile or to change an existing profile. The command enters you into IGMP snooping profile configuration mode, from which you can issue commands that configure IGMP snooping.

The minimum configuration is an empty profile. An empty profile enables IGMP snooping with a default configuration.

To enable IGMP snooping on a bridge domain, you must attach a profile to the bridge domain. To disable IGMP snooping on a bridge domain, detach the profile from the bridge domain.

To attach a profile to a bridge domain, use the `igmp snooping profile` command in Layer-2 VPN bridge group bridge domain configuration mode. At the bridge domain level, only one IGMP snooping profile can be attached to a bridge.
If a profile attached to a bridge domain contains port-specific configuration options, the values apply to all of the ports under the bridge, unless a port-specific profile is attached to one of the ports. In that case, the port with the attached profile is configured using only the commands in the port profile, and any port configurations in the bridge profile are ignored.

Optionally, profiles can be attached to specific ports under a bridge domain. To attach a profile to a port, use the `igmp snooping profile` command in Layer-2 VPN bridge group bridge domain interface configuration mode. Each port can have only one port-specific profile attached to it.

IGMP snooping must be enabled on the bridge domain for any port-specific configurations to take effect. When a profile is attached to a port, IGMP snooping reconfigures that port, disregarding any port configurations that may exist in the bridge-level profile.

To detach a profile from a bridge domain, use the `no` form of this command in Layer-2 VPN bridge group bridge domain configuration mode. To detach a profile from a port, use the `no` form of this command in the interface configuration mode under the bridge domain.

When you detach a profile from a bridge domain or a port, the profile still exists and is available for use at a later time.

Detaching a profile has the following results:

- If you detach a profile from a bridge domain, IGMP snooping is deactivated in the bridge domain.
- If you detach a profile from a port, IGMP snooping configuration values for the port are instantiated from the bridge domain profile.

An active profile is one that is currently attached.

If you need to change an active profile, you must detach it from all bridges or ports, change it, and reattach it. An alternate procedure is to create a new profile incorporating the desired changes, detach the existing one, and immediately attach the new one.

To access an existing profile, use the `igmp snooping profile` command with the existing `profile-name` in global configuration mode. The command enters you into IGMP snooping profile configuration mode, from which you can issue commands to add to the current configuration or enter the `no` form of existing commands to delete them from the configuration.

To delete a profile from the router database, use the `no` form of this command in global configuration mode.

---

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>l2vpn</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to create a new IGMP snooping profile or edit an existing profile:

```
router(config)# igmp snooping profile Profile-1
router(config-igmp-snooping-profile)#
```

The following example attaches a profile to the bridge domain ISP1:

```
RP/0/RSP0/CPU0:router(config)# l2vpn
RP/0/RSP0/CPU0:router(config-l2vpn)# bridge group GRP1
RP/0/RSP0/CPU0:router(config-l2vpn-bg)# bridge-domain ISP1
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# igmp snooping profile profile-1
```
The following example attaches a profile to the GigabitEthernet 0/1/1 port:

```
RP/0/RSP0/CPU0:router(config)# 12vpn
RP/0/RSP0/CPU0:router(config-12vpn)# bridge group GRP1
RP/0/RSP0/CPU0:router(config-12vpn-bg)# bridge-domain ISP1
RP/0/RSP0/CPU0:router(config-12vpn-bg-bd)# interface GigabitEthernet 0/1/1
RP/0/RSP0/CPU0:router(config-12vpn-bg-bd-if)# igmp snooping profile mrouter-port-profile
RP/0/RSP0/CPU0:router(config-12vpn-bg-bd-if)# commit
```
immediate-leave

To configure fast leave processing on a port for IGMPv2 / MLDv1 queriers, use the `immediate-leave` command in the appropriate snooping profile configuration mode. To remove the functionality, use the `no immediate-leave` command.

```
immediate-leave
no immediate-leave
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

Disabled

**Command Modes**

- IGMP snooping profile configuration
- MLD snooping profile configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Immediate leave is an optional port-level configuration parameter. Immediate leave processing causes IGMP snooping to remove a Layer-2 interface from the forwarding table entry immediately, without first sending IGMP group-specific queries to the interface. Upon receiving an IGMP leave message, IGMP snooping immediately removes the interface from the Layer-2 forwarding table entry for that multicast group, unless a multicast router was learned on the port.

Immediate leave processing improves leave latency but is appropriate only when one receiver is configured on a port. For example, immediate leave is appropriate in the following situations:

- Point-to-point configurations, such as an IPTV channel receiver.
- Downstream DSLAMS with proxy reporting.

**Caution**

Do not use immediate leave on a port when the possibility exists for more than one receiver per port. Doing so could prevent an interested receiver from receiving traffic. For example, immediate leave is not appropriate in a LAN.

Immediate leave processing is a port-level option. You can configure this option explicitly per port in port profiles or in the bridge domain profile, in which case it applies to all ports under the bridge.

For MLD snooping - Immediate-leave should only be configured if there is a single MLD host on the port. Immediate-leave is implicitly enabled for MLDv2, if explicit-tracking is enabled.

**internal-querier**

To configure an internal IGMP / MLD querier on a bridge domain, use the `internal-querier` command in the appropriate snooping profile configuration mode. To disable the internal querier, use the `no` form of this command.

```
internal-querier
no internal-querier
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

The internal querier is disabled by default.

**Command Modes**

IGMP snooping profile configuration
MLD snooping profile configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use this command to configure an IGMP querier in a bridge domain where no external querier exists. An internal querier injects query packets into the bridge domain.

In a network where IP multicast routing is configured, the IP multicast router acts as the IGMP querier. In situations when no mrouter port exists in the bridge domain (because the multicast traffic does not need to be routed), but local multicast sources exist, you must configure an internal querier to implement IGMP snooping. The internal querier solicits membership reports from hosts in the bridge domain so that IGMP snooping can build constrained multicast forwarding tables for the multicast traffic within the bridge domain.

An internal querier might also be useful when there are interoperability issues that prevent IGMP snooping from working correctly with an external querier. In this case, you can:

1. Prevent the uncooperative external querier from being discovered by placing the `router-guard` command on that port.
2. Configure an internal querier to learn group membership interests from the ports in the bridge domain.
3. Configure static mrouter ports to receive multicast traffic.

The minimum configuration for an internal querier is as follows. Both of the following commands are required.

- Add the `internal-querier` command to a profile attached to the bridge domain. This command configures the internal querier with the default configuration.
- Add the `system-ip-address` command to a profile attached to the bridge domain to configure an address other than the default 0.0.0.0.

You can disable the internal querier (using the `no` form of the `internal-querier` command) without removing any other internal querier commands. The additional internal querier commands are ignored in that case.
The scope for the `internal-querier` command is per bridge domain. If the command appears in profiles attached to ports, it has no effect.

The local IGMP snooping process responds to the internal querier's general queries. In particular, the IGMPv3 proxy (if enabled) generates a current-state report and forwards it to all mrouters. For IGMPv2 or when the IGMPv3 proxy is disabled, IGMP snooping generates current-state reports for static group state only.

```
Task ID | Task ID | Operations
-------|---------|-------------
12vpn   | read,   | write       
        |         |             
```

### Examples

The following example activates an internal querier with default configuration values:

```
RP/0/RSP0/CPU0:router(config-igmp-snooping-profile)# system-ip-address 10.1.1.1
RP/0/RSP0/CPU0:router(config-igmp-snooping-profile)# internal-querier
RP/0/RSP0/CPU0:router(config-mld-snooping-profile)# internal-querier
```

**internal-querier (MLD)**

To configure an internal MLD querier on a bridge domain, use the `internal querier` command in the MLD snooping profile configuration mode. To disable the internal querier, use the `no` form of the command.

```
internal-querier

no internal-querier
```

**Syntax Description**

This command has no keywords or arguments.

**Command Default**

The internal querier is disabled by default.

**Command Modes**

MLD snooping profile configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.3.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The internal-querier is disabled by default. However, if PIMv6 snooping is active in the domain, then the internal-querier is active. If queries are received from another querier in the domain, MLD querier election is performed (where the lowest ip-address wins). If the internal-querier is the election-loser, then a timer (the other-querier-present-timer) is run for the timer expiry interval. If this timer expires before another query is received from the election-winner, then the internal-querier becomes the querier.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>l2vpn</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Example**

The following example shows how to use the internal-querier command:

```
RP/0/RSP0/CPU0:router(config-mld-snooping-profile) # internal-querier
```
**internal-querier max-response-time**

To configure the maximum response time advertised by the internal querier, use the `internal-querier max-response-time` command in the appropriate snooping profile configuration mode. To return to the default value, use the `no` form of this command.

`internal-querier max-response-time` *seconds*

no `internal-querier max-response-time`

**Syntax Description**

| `seconds` | Configures the maximum response time included in queries from the internal querier. Valid values are from 1 to 25 (seconds). |

**Command Default**

10 (seconds)

**Command Modes**

- IGMP snooping profile configuration
- MLD snooping profile configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The maximum response time (MRT) is the amount of time during which receivers are required to report their membership state.

In addition, the maximum response time is used in the calculation of the Group Management Interval (GMI). GMI controls when IGMP snooping expires stale group membership states. See the “Implementing IGMP Snooping on Cisco ASR 9000 Series Router” module in the *Cisco ASR 9000 Series Routers Multicast Configuration Guide* for more information about the GMI.

The maximum response time is advertised in general queries issued by the internal querier.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>12vpn</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example configures a maximum response time for the internal querier, overriding the default value:

```
RP/0/RSP0/CPU0:router(config-igmp-snooping-profile)# internal-querier max-response-time 5
```

```
RP/0/RSP0/CPU0:router(config-mld-snooping-profile)# internal-querier max-response-time 5
```
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>

<tr>
<td><code>igmp snooping profile, on page 342</code></td>
<td>Creates or edits a profile, and attaches a profile to a bridge domain or port.</td>
</tr>
<tr>
<td><code>internal-querier, on page 347</code></td>
<td>Enables an internal querier in the bridge domain.</td>
</tr>
</tbody>
</table>
**internal-querier query-interval**

To configure the time between general queries issued by the internal querier, use the `internal-querier query-interval` command in the appropriate snooping profile configuration mode. To return to the default value, use the `no` form of this command.

```
internal-querier query-interval seconds
no internal-querier query-interval
```

**Syntax Description**

`seconds` Configures the number of seconds between general queries for membership reports issued by the internal querier. Valid values are from 1 to 18000 (seconds).

**Command Default**

60 (seconds). This is a nonstandard default value.

**Command Modes**

IGMP snooping profile configuration
MLD snooping profile configuration

**Command History**

Release 3.7.2 This command was introduced.

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

When the internal querier is the active querier in the domain, it solicits membership reports by sending IGMP general queries at the interval specified by this command on every active port in the bridge domain.

**Note**

Cisco IOS and Cisco IOS XR software use the non-standard default value of 60 for query interval.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>l2vpn</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example sets a query interval for the internal querier, overriding the default value:

```
RP/0/RSP0/CPU0:router(config-igmp-snooping-profile)# internal-querier query-interval 125
```

```
RP/0/RSP0/CPU0:router(config-mld-snooping-profile)# internal-querier query-interval 125
```
## Related Commands

internal-querier tcn query count

To configure the number of queries the internal querier sends after receiving a group leave from the snooping process, use the `internal-querier tcn query count` command in the appropriate snooping profile configuration mode. To return to the default value, use the `no` form of this command.

```
internal-querier tcn query count number
no internal-querier tcn query count
```

**Syntax Description**

- `number`: Configures the number of queries the internal querier sends after receiving a group leave from IGMP snooping. Valid values are from 0 to 3. The time between queries is controlled by the `internal-querier tcn query interval` command.

**Command Default**

2

**Command Modes**

- IGMP snooping profile configuration
- MLD snooping profile configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Snooping reacts to Spanning Tree Protocol (STP) topology change notifications (TCNs) by flooding all multicast traffic and sending group leaves to expedite relearning. When the internal querier receives a group leave, it sends queries to solicit membership reports. This command configures the number of queries to send. The time between queries is controlled by the `internal-querier tcn query interval` command.

If you set `internal-querier tcn query count` to 0, the internal querier does not respond to group leaves.

**internal-querier timer expiry**

To configure the time IGMP/MLD snooping waits to receive messages from an external querier before making the internal querier the active querier, use the `internal-querier timer expiry` command in the appropriate snooping profile configuration mode. To return to the default value, use the `no` form of this command.

```plaintext
internal-querier timer expiry  seconds
no internal-querier timer expiry
```

**Syntax Description**

- `seconds` The time IGMP snooping waits to receive messages from an external querier before making the internal querier the active querier. Valid values are from 60 to 300 (seconds).

**Command Default**

125 (seconds), as defined in RFC-3376, Section 8.5:

$$(\text{robustness-variable} \times \text{query-interval}) + \frac{1}{2}(\text{max-response-time})$$

Using the default values for all components:

$$((2 \times 60) + \frac{1}{2}(10)) = 125$$

**Command Modes**

- IGMP snooping profile configuration
- MLD snooping profile configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

A bridge domain can have only one active querier at a time. If the internal querier receives queries from another querier in a bridge domain, it performs querier election. The lowest IP address wins. If the internal querier is the election loser, the snooping technique sets a timer to the `internal-querier timer expiry` value. If this timer expires before another query is received from the election winner, the internal querier becomes the active querier.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>l2vpn</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example configures the timer expiry value for an internal querier, overriding the default value:

```
RP/0/RSP0/CPU0:router(config-igmp-snooping-profile)# internal-querier timer expiry 100
```
RP/RSP0:CPU0>router(config-mld-snooping-profile)# internal-querier timer expiry 100

</tbody>
</table>
**internal-querier version**

To configure the version for the internal querier, use the `internal-querier version` command in the appropriate snooping profile configuration mode. To return to the default value, use the `no` form of this command.

```
internal-querier version version
no internal-querier version
```

**Syntax Description**

- `version` Controls the version of the internal querier. Valid values are 2 or 3 (for IGMP) and 1 or 2 (for MLD).

**Command Default**

3

**Command Modes**

- IGMP snooping profile configuration
- MLD snooping profile configuration

**Command History**

<table>

</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The internal querier sends IGMP queries on the bridge domain. This command sets the internal querier to run as either an IGMPv2 or IGMPv3 querier.

This command sets the internal querier to run as either a MLDv1 or MLDv2 querier.

**Task ID**

- `l2vpn` read, write

**Examples**

The following example configures the internal querier to send version 2 queries, overriding the default value:

```
RP/0/RSP0/CPU0:router(config-igmp-snooping-profile)# internal-querier version 2

RP/0/RSP0/CPU0:router(config-mld-snooping-profile)# internal-querier version 2
```

last-member-query count

To configure the number of group-specific queries IGMP snooping sends in response to a leave message, use the `last-member-query count` command in IGMP snooping profile configuration mode. To return to the default value, use the `no` form of this command.

```
last-member-query count number
no last-member-query count
```

### Syntax Description

`number` Specifies the number of queries IGMP snooping sends in response to a leave message. Valid values are from 1 to 7.

### Command Default

2

### Command Modes

IGMP snooping profile configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>

</tr>
</tbody>
</table>

### Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Last member query is the default group leave processing method used by IGMP snooping. With last member query processing, IGMP snooping processes leave messages as follows:

- IGMP snooping sends group-specific queries on the port that receives the leave message to determine if any other devices connected to that interface are interested in traffic for the specified multicast group. Using the following two configuration commands, you can control the latency between the request for a leave and the actual leave:
  - `last-member-query-count` command—Controls the number of group-specific queries IGMP snooping sends in response to a leave message.
  - `last-member-query-interval` command—Controls the amount of time between group-specific queries.

- If IGMP snooping does not receive an IGMP Join message in response to group-specific queries, it assumes that no other devices connected to the port are interested in receiving traffic for this multicast group, and it removes the port from its Layer-2 forwarding table entry for that multicast group.
- If the leave message was from the only remaining port, IGMP snooping removes the group entry and generates an IGMP leave to the multicast routers.

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

**Task ID**

```
Task ID | Operation
-------|------------
l2vpn   | read, write
```

**Example**

The following example shows how to set the last member query interval to 2000 ms:

```
RP/0/RSP0/CPU0:router(config-mld-snooping-profile) # last-member-query interval 2000
```
**minimum-version**

To change the IGMP versions supported by IGMP snooping, use the `minimum-version` command in IGMP snooping profile configuration mode. To return to the default value, use the `no` form of this command.

**minimum-version number**

**no minimum-version**

**Syntax Description**

- `number` Specifies the minimum IGMP version supported by IGMP snooping. Supported values are:
  - 2—Snoops messages from IGMPv2 and IGMPv3.
  - 3—Only IGMPv3 messages are snooped. All IGMPv2 messages are ignored by IGMP snooping.

**Command Default**

2 (supporting IGMPv2 and IGMPv3)

**Command Modes**

IGMP snooping profile configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `minimum-version` command controls which IGMP versions are supported by IGMP snooping in the bridge domain.

- When `minimum-version` is 2, IGMP snooping intercepts IGMPv2 and IGMPv3 messages. This is the default value.
- When `minimum-version` is 3, IGMP snooping intercepts only IGMPv3 messages and drops all IGMPv2 messages.

The scope for this configuration option is per bridge domain. If the command appears in profiles attached to ports, it has no effect.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>12vpn</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example configures IGMP snooping to support only IGMPv3 and to ignore IGMPv2 reports and queries:

```
RP/0/RSP0/CPU0:router(config-igmp-snooping-profile)# minimum-version 3
```
<table>
<thead>
<tr>
<th>Command</th>

</table>
minimum version (MLD)

To enable MLD snooping to filter out all packets of MLD versions, less than the minimum-version, use the `minimum-version` command in the MLD snooping profile configuration mode. To disable minimum version, use the `no` form of the command.

**Syntax Description**

- `minimum-version number`  
- `no minimum-version number`

**Command Default**

By default, MLD snooping supports minimum-version 1.

**Command Modes**

MLD snooping profile configuration mode.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.3.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

If minimum version is set to 2, all MLD packets set to (minimum version) 1, are dropped.

**Task ID**

- Operation
  - multicast: read, write

**Example**

This example shows how to use the `minimum-version` command:

```
RP/0/RSP0/CPU0:router (config-mld-snooping-profile) # minimum-version 2
```
mld snooping profile

To enter Multicast Listener Discovery (MLD) snooping profile configuration mode, use the `mld snooping profile` command in configuration mode. To exit from the MLD snooping profile configuration mode, use the `no` form of the command.

```
mld snooping profile profile-name
nomld snooping profile profile-name
```

**Syntax Description**

- `profile-name` Name that uniquely identifies the MLD snooping profile.

**Command Default**

No default behavior or values.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td>4.3.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

**Task ID**

- `multicast` read, write

**Example**

This example shows how to use the `mld snooping profile` command:

```
RP/0/RSP0/CPU0:router(config) #mld snooping profile p1
```
To statically configure a port to receive query packets, use the `mrouter` command in the appropriate snooping profile configuration mode. To remove the configuration, use the `no` form of this command.

```
mrouter
no mrouter
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

No default behavior or values

**Command Modes**

IGMP snooping profile configuration  
MLD snooping profile configuration

**Command History**

Release 3.7.2 This command was introduced.

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

You can statically configure a port as an mrouter port with the `mrouter` command.

You can use the `router-guard` and the `mrouter` commands on the same port to configure a guarded port as a static mrouter. For example:

- In situations where there are a large number of downstream host ports, you may want to block dynamic mrouter discovery and configure static mrouters. In this case, configure the router guard feature at the domain level. By default, it will be applied to all ports, including the (typically) large number of downstream host ports. Then use another profile without router guard configured for the relatively few upstream ports on which you want to permit dynamic mrouter discovery or configure static mrouters.
- In situations when incompatibilities with non-Cisco equipment prevents correct dynamic discovery, you can disable all attempts for dynamic discovery using the router guard feature, and statically configure the mrouter.

If you are using the router guard feature because there is an incompatible IGMP router on the port, you should also configure the `mrouter` command on the port to ensure that the router receives snooping reports and multicast flows.

The scope of this command is port level. If you use this command in a profile attached to a bridge domain, you are configuring all ports as mrouter ports.

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Task</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>l2vpn</td>
<td>read, write</td>
<td></td>
</tr>
</tbody>
</table>
Examples

The following example shows how to add static mrouter configuration to a profile:

RP/0/RSP0/CPU0:router(config-igmp-snooping-profile)# mrouter

RP/0/RSP0/CPU0:router(config-mld-snooping-profile)# mrouter

</tbody>
</table>

**Example**

This example shows how to enable the IPv4 Multicast Offload feature on the Satellite nV System:

```
RP/0/0/CPU0:ios(config)#l2vpn
RP/0/0/CPU0:ios(config-l2vpn)#bridge group <bg>
RP/0/0/CPU0:ios(config-l2vpn-bg)#bridge-domain <bd>
RP/0/0/CPU0:ios(config-l2vpn-bg-bd)#nv
RP/0/0/CPU0:ios(config-l2vpn-bg-bd-nv)#nv satellite offload ipv4 multicast enable
```
**querier query-interval**

To configure the query interval for processing IGMPv2 membership states, use the `querier query-interval` command in IGMP snooping profile configuration mode. To return to the default setting, use the `no` form of this command.

```
querier query-interval  seconds
no querier query-interval
```

**Syntax Description**

`seconds` Specifies the integer to use as the query interval in calculations performed by IGMP snooping when processing IGMPv2 messages.

*Note* IGMPv3 messages convey the query interval from the querier.

Valid values are integers from 1 to 18000 (seconds). The default is 60.

**Command Default**

60 (seconds). This is a nonstandard default value.

**Command Modes**

IGMP snooping profile configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Query interval is the interval between general queries and is used in the calculated group management interval (GMI). GMI controls when IGMP snooping expires stale group membership states. For more information about GMI, see the “Implementing IGMP Snooping on Cisco ASR 9000 Series Routers” module in the *Cisco ASR 9000 Series Routers Multicast Configuration Guide*.

If the querier is running IGMPv2, IGMP snooping uses the IGMP snooping configured values for robustness variable and query interval. These parameter values must match the configured values for the querier. In most cases, if you are interacting with other Cisco routers, you should not need to explicitly configure these values—the default values for IGMP snooping should match the default values of the querier. If they do not, use the `querier robustness-variable` and `querier query-interval` commands to configure matching values.

**Note**

Cisco IOS and Cisco IOS XR software use the nonstandard default value of 60 for query interval.

**Note**

IGMPv3 general queries convey values for robustness variable and query interval (QRV and QOI, respectively). IGMP snooping uses the values from the query, making the IGMP snooping GMI exactly match that of the querier.
The scope for this command is per bridge domain. If the command appears in profiles attached to ports, it has no effect.

### Examples

The following example shows how to add the command to a profile that configures the query interval:

```
RP/0/RSP0/CPU0:router(config-igmp-snooping-profile)# querier query-interval 1500
```

querier robustness-variable

To configure the robustness variable for processing IGMPv2 membership states, use the `querier robustness-variable` command in IGMP snooping profile configuration mode. To return to the default setting, use the `no` form of this command.

`querier robustness-variable robustness-number`
`no querier robustness-variable`

**Syntax Description**

- `robustness-number` Specifies the integer to use as the robustness variable in calculations performed by IGMP snooping when processing IGMPv2 messages.

**Note**

- IGMPv3 messages convey the robustness variable from the querier.

Valid values are integers from 1 to 7. The default is 2.

**Command Default**

2

**Command Modes**

IGMP snooping profile configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

redundancy iccp-group report-standby-state disable

To enable IGMP Snooping for generating unsolicited state-change reports only when the port transitions from standby to active, use the `redundancy iccp-group report-standby-state disable` command in IGMP snooping profile configuration mode. To use the default behavior, use the `no` form of this command.

```
redundancy iccp-group report-standby-state disable
no redundancy iccp-group report-standby-state disable
```

**Note**
By default, IGMP Snooping generates state-change and current-state reports to all multicast routers to reflect state that exists on standby MC-LAG ports only. This causes the upstream sources to forward multicast streams to the router, where they will be dropped (on egress side).

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
None

**Command Modes**
IGMP snooping profile configuration (config-igmp-snooping-profile)

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

**Note**
This command is applicable only when MC-LAG is configured.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>

<td>Creates or edits a profile, and attaches a profile to a bridge domain or port.</td>
</tr>
</tbody>
</table>
**report-suppression disable**

To disable IGMPv2 report suppression or IGMPv3 proxy reporting, use the `report-suppression disable` command in IGMP snooping profile configuration mode. To enable report suppression or proxy reporting functionality, use the `no` form of this command.

```
report-suppression disable
no report-suppression disable
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

Report suppression and proxy reporting, whichever is appropriate, are enabled by default.

**Command Modes**

IGMP snooping profile configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use this command to disable report suppression for IGMPv2 queriers and proxy reporting for IGMPv3 queriers.

Both features are enabled by default, with the following results:

- IGMPv2 report suppression—For IGMPv2 bridge domain queriers, IGMP snooping suppresses reports from a host if the report was previously forwarded from another host. IGMP snooping sends only the first join and last leave to mrouter ports.
- IGMPv3 proxy reporting—For IGMPv3 bridge domain queriers, IGMP snooping acts as a proxy, generating state change reports from a proxy reporting IP address. You can configure that IP address using the `system-ip-address` command. The default is 0.0.0.0.

These features are enabled and disabled per bridge domain. This command is ignored if it appears in a profile attached to a port.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>l2vpn</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to add the command to a profile to turn off report suppression and proxy reporting:

```
RP/0/RSP0/CPU0:router(config-igmp-snooping-profile)# report-suppression disable
```
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>igmp snooping profile, on page 342</td>

</tr>
<tr>
<td>system-ip-address, on page 472</td>
<td>Configures an IP address used by IGMP snooping.</td>
</tr>
</tbody>
</table>
**report-suppression disable(MLD)**

To minimize the number of MLD reports sent to the mrouters, use the `report-suppression disable` command in the MLD snooping profile configuration mode.

```
report-suppression disable
noreport-suppression disable
```

**Syntax Description**

This command has no keywords or arguments.

**Command Default**

By default, report suppression is enabled.

**Command Modes**

MLD snooping profile configuration mode.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.3.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The report suppression command instructs MLD Snooping to suppress the forwarding of reports from individual hosts and instead to send the first-join and last-leave reports to the mrouters.

If the querier in the BD is running at MLD version 1, then report-suppression is performed and the snooper suppresses reports from a host if it has already forwarded the same report from another host. If the querier is on version 2, then proxy-reporting is performed. In this mode, the snooper acts as a proxy, generating reports from the proxy reporting IP address.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Example**

This example shows how to use the report suppression disable command:

```
RP/0/RSP0/CPU0:router (config-mld-snooping-profile) # report suppression disable
```
**router-alert-check disable**

To disable the IGMP snooping check for the presence of the router alert option in the IP packet header, use the `router-alert-check disable` command in IGMP snooping profile configuration mode. To enable this functionality after a disable, use the **no** form of this command.

```
router-alert-check disable
no router-alert-check disable
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

The router alert check feature is enabled by default.

**Command Modes**

IGMP snooping profile configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

By default, IGMP snooping checks for the presence of the router alert option in the IP packet header of the IGMP message and drops packets that do not include this option. If your network performs this validation elsewhere, you can disable this IGMP snooping validation.

You can disable this check using the `router-alert-check disable` command, in which case IGMP snooping does perform the validation before processing the message.

The scope for this configuration option is per bridge domain. If the command appears in profiles attached to ports, it has no effect.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>l2vpn</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to add the command to a profile that turns off the router alert check:

```
RP/0/RSP0/CPU0:router(config-igmp-snooping-profile)# router-alert-check disable
```
<table>
<thead>
<tr>
<th>Related Commands</th>

</thead>
<tbody>
<tr>
<td></td>
<td>igmp snooping profile, on page 342</td>
<td>Creates or edits a profile, and attaches a profile to a bridge domain or port.</td>
</tr>
</tbody>
</table>
router-guard

To block a port from receiving query packets, use the **router-guard** command in the appropriate snooping profile configuration mode. To remove the restriction, use the **no** form of this command.

```
router-guard
no router-guard
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command Modes**

- IGMP snooping profile configuration
- MLD snooping profile configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Router guard is a security feature that prevents malicious users from making a host port into an mrouter port. (This undesirable behavior is known as spoofing.) When a port is protected with the **router-guard** command, it cannot be dynamically discovered as an mrouter. When router guard is on a port, IGMP snooping filters protocol packets sent to the port and discards any that are multicast router control packets.

**Caution**

If you add the **router-guard** command in a bridge domain profile, you disable dynamic discovery of all m routers in that bridge domain.

You can use the **router-guard** and the **mrouter** commands on the same port to configure a guarded port as a static mrouter. For example:

- In situations where there are a large number of downstream host ports, you may want to block dynamic mrouter discovery and configure static m routers. In this case, configure the router guard feature at the domain level. By default, it will be applied to all ports, including the (typically) large number of downstream host ports. Then use another profile without router guard configured for the relatively few upstream ports on which you want to permit dynamic mrouter discovery or configure static m routers.
- In situations when incompatibilities with non-Cisco equipment prevents correct dynamic discovery, you can disable all attempts for dynamic discovery using the router guard feature, and statically configure the mrouter.

If you are using the router guard feature because there is an incompatible IGMP router on the port, you should also configure the **mrouter** command on the port to ensure that the router receives reports and multicast flows.
Task ID

show igmp snooping bridge-domain

To display IGMP snooping configuration information and traffic statistics for bridge domains, use the `show igmp snooping bridge-domain` command in EXEC mode.

```
show igmp snooping bridge-domain [bridge-domain-name] [detail [statistics [include-zeroes]]]
```

**Syntax Description**

- `bridge-domain-name` (Optional) Displays information only for the specified bridge domain.
- `detail` (Optional) Includes more details, including configuration information about the bridge domain querier.
- `statistics` (Optional) Includes traffic counters and statistics.
- `include-zeroes` (Optional) Includes all statistics, even if they are zero. Without this keyword, many statistics are omitted from the display when their values are zero.

**Command Default**

None

**Command Modes**

EXEC

**Command History**

<table>

</tr>
<tr>
<td>Release 5.2.2</td>
<td>The command output was enhanced to include the Multicast Offload information.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

This command displays IGMP snooping information by bridge domain. Use the command without any keywords to display summary information about all bridge domains, in a single line per bridge domain.

Use optional keywords to request additional details and traffic statistics per bridge domain. You can also limit the display to a single bridge domain.

The `statistics` keyword displays IGMP traffic information, including IGMP queries, reports, and leaves. The three columns in the statistics section of the display are:

- Received—Number of packets received.
- Rejected—Number of packets received, processed, and re-injected back into the forwarding path.
- Generated—Number of packets generated by the IGMP snooping application and injected into the forwarding path.
The following example shows the basic command without any keywords.

```
RP/0/RSP0/CPU0:router# show igmp snooping bridge-domain
```

<table>

<td>Clears traffic counters at the bridge domain level.</td>
</tr>
</tbody>
</table>
```
show igmp snooping group

To display IGMP group membership information, use the **show igmp snooping group** command in EXEC mode.

```
/show igmp snooping group [summary [group-address] [{bridge-domain bridge-domain-name|port
{interface-name|neighbor ipaddr pw-id id}]}][{group-address} [{bridge-domain
bridge-domain-name|port {interface-name|neighbor ipaddr pw-id id}]}] [source source-address]
{detail}]
```

**Syntax Description**

</tr>
<tr>
<td>Release 5.2.2</td>
<td>The Bidirectional IGMP Snoop Sync feature enhancement enables the command to be run on both active and standby nodes.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use this command to display information about group membership in the Layer-2 forwarding tables. The display includes indicators identifying whether the group information was obtained dynamically (for example, snooped) or statically configured.

The command offers the following levels of detail:
• The basic command with no keywords displays group membership information as one line per port within group.

• The summary keyword summarizes the port statistics into one line per group. The summary keyword is mutually exclusive with the port-view, source, and detail keywords.

• The detail keyword includes traffic statistics and counters.

### Examples

The following example shows group membership information by groups within bridge domains.

```
RP/0/RSP0/CPU0:router# show igmp snooping group

Key: GM=Group Filter Mode, PM=Port Filter Mode

Group Filter Mode: Exclude
Source: {}
Exclude Port Count: 1
Bundle-Ether10
ICCP Group: 1
Redundancy State: Standby
Uptime: 01:43:25
Persistence: dynamic
Expires: 249
```
show igmp snooping port

To display IGMP snooping configuration information and traffic counters by router interface port, use the `show igmp snooping port` command in EXEC mode.

```
show igmp snooping port
interface-name|neighbor ipaddr  pw-id  id|bridge-domain  bridge-domain-name
detail [statistics [include-zeroes]]
group [  group-address  ] [source  source-address] [detail]
```

### Syntax Description

<table>

</table>
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

This command displays IGMP snooping information organized by IGMP snooping port. Use the command without any keywords to display summary information about all ports, in a single line per port.

Use optional arguments and keywords to request the following:

- Limit the display to a specified port.
- Limit the display to ports under a specified bridge.
- Request details and traffic statistics per port.

Note: The `statistics` keyword cannot be used in the same command with the `group` keyword.

- Organize the display by group within ports. Use the `group` keyword with or without a specified interface or bridge domain.
- Limit the group information to specific groups or source addresses.

The `statistics` keyword displays IGMP traffic information, including IGMP queries, reports, and leaves. The three columns in the statistics section of the display are:

- Received—Number of packets received.
- Re injected—Number of packets received, processed, and re injected back into the forwarding path.
- Generated—Number of packets generated by the IGMP snooping application and injected into the forwarding path.

### Examples

The following example shows summary information per port:

```
RP/0/RSP0/CPU0:router# show igmp snooping port

Bridge Domain bg1:bg1_bd1

<table>
<thead>
<tr>
<th>Port</th>
<th>Oper</th>
<th>STP</th>
<th>Red</th>
<th>#Grps</th>
<th>#SGs</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bundle-Ether10</td>
<td>Up</td>
<td>-</td>
<td>S</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>Neighbor 40.40.40.40 pw-id 1</td>
<td>Up</td>
<td>-</td>
<td>-</td>
<td>4</td>
<td>0</td>
</tr>
</tbody>
</table>
```

The following example shows summary information for a specific port.

```
RP/0/RSP0/CPU0:router# show igmp snooping port GigabitEthernet 0/1/0/3.215

Bridge Domain 215:215

<table>
<thead>
<tr>
<th>Port</th>
<th>Oper</th>
<th>STP</th>
<th>Red</th>
<th>#Grps</th>
<th>#SGs</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>

</tbody>
</table>

**Usage Guidelines**

Use this command to display the contents of profiles and to see associations of profiles with bridge-domains and ports.
The `summary` keyword lists profile names and summarizes their usage on bridge domains and ports. No other keywords can be used with `summary`.

Use the `details` keyword with a profile name to show the contents of a specific profile. Without a profile name, the `detail` keyword shows the contents of all profiles.

Use the `references` keyword to list the relationships between profiles and bridge domains or profiles and ports. You have the following options:

- Use the `references` keyword without any other keywords to show all profiles and the ports and bridge domains they are attached to.
- Use the `references` keyword with the `name` keyword to show a specific profile and where it is attached.
- Use the `port` keyword to list all ports and the profiles attached to them.
- Use the `port` keyword with a specific AC interface or PW to see the profile attached to the named port.
- Use the `bridge-domain` keyword to list all bridge domains and the profiles attached to them.
- Use the `bridge-domain` keyword with a specific bridge domain name to see the profile attached to a specific bridge domain.

### Examples

The following example lists profile names and shows summary level profile usage.

```bash
RP/0/RSP0/CPU0:router# show igmp snooping profile

<table>
<thead>
<tr>
<th>Profile</th>
<th>Bridge Domain</th>
<th>Port</th>
</tr>
</thead>
<tbody>
<tr>
<td>profile1</td>
<td>3</td>
<td>0</td>
</tr>
<tr>
<td>profile2</td>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>profile3</td>
<td>0</td>
<td>1</td>
</tr>
</tbody>
</table>
```

The following example shows summary level profile usage for a named profile.

```bash
RP/0/RSP0/CPU0:router# show igmp snooping profile profile1

<table>
<thead>
<tr>
<th>Profile</th>
<th>Bridge Domain</th>
<th>Port</th>
</tr>
</thead>
<tbody>
<tr>
<td>profile1</td>
<td>3</td>
<td>0</td>
</tr>
</tbody>
</table>
```

The following example shows the contents of each profile.

```bash
RP/0/RSP0/CPU0:router# show igmp snooping profile detail

IGMP Snoop Profile profile1:

- Bridge Domain References: 3
- Port References: 0

IGMP Snoop Profile profile2:

- Static Groups: 225.1.1.1
- Bridge Domain References: 0
- Port References: 1
```
IGMP Snoop Profile profile3:

- Static Mrouter: Enabled
- Bridge Domain References: 0
- Port References: 1

The following example shows output reflecting the **access-group**, **group limit**, and **tcn flood disable** parameters:

RP/0/RSP0/CPU0:router# show igmp snooping profile detail

IGMP Snoop Profile profile:

- Querier LMQ Count: 2
- Access Group ACL: iptv-white-list
- Group Policy: iptv-group-weights
- Group Limit: 16
- Immediate Leave: Enabled
- TCN Flood: Disabled

- Bridge Domain References: 1
- Port References: 0

The following example shows the contents of a named profile. In this example, the profile is empty.

RP/0/RSP0/CPU0:router# show igmp snooping profile profile1 detail

IGMP Snoop Profile profile1:

- Bridge Domain References: 3
- Port References: 0

The following example shows the contents of a named profile and the implied default configurations:

RP/0/RSP0/CPU0:router# show igmp snooping profile profile1 detail include-defaults

IGMP Snoop Profile profile1:

- System IP Address: 10.144.144.144

Group Policy:
Group Limit: -1

ICCP Group Report Standby State: Enabled

Startup Query Interval: 15 (seconds)
Startup Query Count: 2
Startup Query Max Response Time: 10 (seconds)
Startup Query on Port Up: Enabled
Startup Query on IG Port Active: Disabled
Startup Query on Topology Change: Disabled
Startup Query on Process Start: Disabled

Bridge Domain References: 1
Port References: 0

The following command shows a summary of profile usage, by profile name.

RP/0/RSP0/CPU0:router# show igmp snooping profile summary

Number of profiles: 3
Number of bridge domain references: 3
Number of port references: 2

The following command lists all IGMP snooping profiles and shows which bridge domains and ports are configured to use each profile.

RP/0/RSP0/CPU0:router# show igmp snooping profile references

Profile: profile1
Bridge Domains: Group1:BD-5
Group1:BD-3
Group1:BD-1
No Port References

Profile: profile2
No Bridge Domain References
Ports: GigabitEthernet0/2/0/10.1

Profile: profile3
No Bridge Domain References
Ports: GigabitEthernet0/2/0/10.2

The following command lists all bridges or ports that are configured to use the profile named profile1.

RP/0/RSP0/CPU0:router# show igmp snooping profile profile1 references

Profile: profile1
Bridge Domains: None
Ports:
- GigabitEthernet 0/1/0/0
- GigabitEthernet 0/1/0/1
- GigabitEthernet 0/1/0/2
- GigabitEthernet 0/1/0/3
- GigabitEthernet 0/1/0/4
- GigabitEthernet 0/1/0/5
- GigabitEthernet 0/3/3/1109
- GigabitEthernet 0/3/3/1110
- GigabitEthernet 0/3/3/1111

The following example shows the profile attached to a specific bridge domain.

RP/0/RSP0/CPU0:router# show igmp snooping profile references bridge-domain Group1:BD-1
Profile: profile1
Bridge Domains: Group1:BD-1

The following example shows the profile attached to a specific port.

RP/0/RSP0/CPU0:router# show igmp snooping profile references port GigabitEthernet 0/2/0/10.1
Profile: profile2
Ports: GigabitEthernet0/2/0/10.1

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use this command to display the contents of profiles and to see associations of profiles with bridge-domains and ports.
The `summary` keyword lists profile names and summarizes their usage on bridge domains and ports. No other keywords can be used with `summary`.

Use the `details` keyword with a profile name to show the contents of a specific profile. Without a profile name, the `detail` keyword shows the contents of all profiles.

Use the `references` keyword to list the relationships between profiles and bridge domains or profiles and ports. You have the following options:

- Use the `references` keyword without any other keywords to show all profiles and the ports and bridge domains they are attached to.
- Use the `references` keyword with the `name` keyword to show a specific profile and where it is attached.
- Use the `port` keyword to list all ports and the profiles attached to them.
- Use the `port` keyword with a specific AC interface or PW to see the profile attached to the named port.
- Use the `bridge-domain` keyword to list all bridge domains and the profiles attached to them.
- Use the `bridge-domain` keyword with a specific bridge domain name to see the profile attached to a specific bridge domain.

### Examples

The following example lists profile names and shows summary level profile usage.

```
RP/0/RSP0/CPU0:router# show igmp snooping redundancy
Profile   Bridge Domain Port
------- ------------- ----
profile1  3     0    
profile2  0     1    
profile3  0     1    
```

From an active host:

```
RP/0/RSP0/CPU0:router# show igmp snooping redundancy iccp group 1
Fri Oct 10 08:40:26.231 UTC

ICCP
Group Id #Peers Active Standby Down ICCP Group State
-----------------------------------------------
1      1     15   0      0 Connected Peer Present
```

From a standby host:

```
RP/0/RSP0/CPU0:PE2#

Fri Oct 10 09:35:19.273 UTC

ICCP
Group Id #Peers Active Standby Down ICCP Group State
-----------------------------------------------
1      1     0    15    0 Connected Peer Present
```
show igmp snooping redundancy

RP/0/RSP0/CPU0:PI#

Multicast Command Reference for Cisco ASR 9000 Series Routers, IOS XR Release 6.6.x
show igmp snooping summary

To display summary information about IGMP snooping configuration and traffic statistics for the router, use the `show igmp snooping summary` command in EXEC mode.

`show igmp snooping summary [statistics [include-zeroes]]`

**Syntax Description**

- `statistics` (Optional) Displays IGMP traffic counters and statistics.
- `include-zeroes` (Optional) Displays all statistics, even if they are zero. Without this keyword, many statistics are omitted from the display when their values are zero.

**Command Default**

None

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>3.9.0</td>
<td>Three new fields were added to the output for the statistics display.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

This command summarizes the number of bridge domains, mrouter ports, host ports, groups, and sources configured on the router.

The `statistics` keyword displays IGMP traffic information, including IGMP queries, reports, and leaves. The three columns in the statistics section of the display are:

- Received—Number of packets received.
- Reinjected—Number of packets received, processed, and reinjected back into the forwarding path.
- Generated—Number of packets generated by the IGMP snooping application and injected into the forwarding path.

**show igmp snooping trace**

To display IGMP snooping process activity, use the `show igmp snooping trace` command in EXEC mode.

```
show igmp snooping trace [(all|error|packet-error)]
```

**Syntax Description**

- **all** (Optional) Displays all IGMP snooping process activity.
- **error** (Optional) Displays only error tracepoints.
- **packet-error** (Optional) Displays packet error tracepoints.

**Command Default**

The **all** keyword is the default when no keywords are used.

**Command Modes**

EXEC

**Command History**

<table>

show l2vpn forwarding bridge-domain mroute

To display multicast routes in the forwarding tables, use the **show l2vpn forwarding bridge-domain mroute** command in EXEC mode.

**show l2vpn forwarding bridge-domain [bridge-group-name : bridge-domain-name] mroute [ipv4] location rack/slot/module**

**Syntax Description**

- **bridge-group-name**
  - (Optional) Displays information for a specific bridge domain. The colon that separates the two arguments is required.

- **bridge-domain-name**
  - This keyword is required.

- **ipv4**
  - This keyword is required.

- **location**
  - **rack/slot/module**
  - Displays route information for a specific rack/slot/module.

**Command Default**

None

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Release 5.2.2</td>
<td>The show output command was enhanced to include the satellite multicast offload information.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

This command displays multicast routes as they are converted into the forwarding plane forwarding tables. The source for the conversion is the multicast routes configured in the control plane with IGMP snooping configuration commands. If the routes displayed by this command are not as expected, check the control plane configuration and correct the corresponding IGMP snooping profiles.

Use optional arguments to limit the display to a specific bridge domain.

**Task ID**

<table>

**show mld snooping bridge-domain**

To display MLD snooping configuration information and traffic statistics for bridge domains, use the `show mld snooping bridge-domain` command in EXEC mode.

```
show mld snooping bridge-domain [bridge-domain-name] [detail [statistics [include-zeroes]]]
```

**Syntax Description**

- `bridge-domain-name` 
  (Optional) Displays information only for the specified bridge domain.

- `detail` 
  (Optional) Includes more details, including configuration information about the bridge domain querier.

- `statistics` 
  (Optional) Includes traffic counters and statistics.

- `include-zeroes` 
  (Optional) Includes all statistics, even if they are zero. Without this keyword, many statistics are omitted from the display when their values are zero.

**Command Default**

None

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 4.3.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

This command displays mld snooping information by bridge domain. Use the command without any keywords to display summary information about all bridge domains, in a single line per bridge domain.

Use optional keywords to request additional details and traffic statistics per bridge domain. You can also limit the display to a single bridge domain.

The `statistics` keyword displays mld traffic information, including mld queries, reports, and leaves. The three columns in the statistics section of the display are:

- Received—Number of packets received.
- Reinjected—Number of packets received, processed, and reinjected back into the forwarding path.
- Generated—Number of packets generated by the mld snooping application and injected into the forwarding path.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>l2vpn</td>
<td>read</td>
</tr>
</tbody>
</table>
## Examples

The following example shows the basic command without any keywords.

```plaintext
RP/0/RSP0/CPU0:router# show mld snooping bridge-domain
```

<table>
<thead>
<tr>
<th>Bridge Domain</th>
<th>Profile</th>
<th>Act Ver</th>
<th>#Ports</th>
<th>#Mrtrs</th>
<th>#Grps</th>
<th>#Srcs</th>
</tr>
</thead>
<tbody>
<tr>
<td>Domain1:BD-1</td>
<td>profile1</td>
<td>Y V2</td>
<td>8195</td>
<td>0</td>
<td>4096</td>
<td>0</td>
</tr>
<tr>
<td>Domain1:BD-4</td>
<td>profile1</td>
<td>Y V2</td>
<td>100</td>
<td>2</td>
<td>512</td>
<td>0</td>
</tr>
<tr>
<td>Domain1:BD-7</td>
<td>profile1</td>
<td>Y V2</td>
<td>55</td>
<td>0</td>
<td>44</td>
<td>0</td>
</tr>
</tbody>
</table>

The following example shows the summary line for a named bridge domain.

```plaintext
RP/0/RSP0/CPU0:router# show mld snooping bridge-domain Group1:BD-1
```

<table>
<thead>
<tr>
<th>Bridge Domain</th>
<th>Profile</th>
<th>Act Ver</th>
<th>#Ports</th>
<th>#Mrtrs</th>
<th>#Grps</th>
<th>#Srcs</th>
</tr>
</thead>
<tbody>
<tr>
<td>Domain1:BD-1</td>
<td>profile1</td>
<td>Y V2</td>
<td>8195</td>
<td>0</td>
<td>4096</td>
<td>0</td>
</tr>
</tbody>
</table>

The following example shows detailed information about all bridge domains:

```plaintext
RP/0/RSP0/CPU0:router# show mld snooping bridge-domain detail
```

```
Bridge Domains: 5
MLD Snooping Bridge Domains: 3
```

<table>
<thead>
<tr>
<th>Bridge Domain</th>
<th>Profile</th>
<th>Act Ver</th>
<th>#Ports</th>
<th>#Mrtrs</th>

show mld snooping group

To display MLD group membership information, use the `show mld snooping group` command in EXEC mode.

```
/show mld snooping group [summary [group-address] [bridge-domain bridge-domain-name|port [interface-name] neighbor ipaddr pw-id id]]
/or [group-address] [bridge-domain bridge-domain-name|port [interface-name] neighbor ipaddr pw-id id]] [source source-address] [detail]]
```

</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use this command to display information about group membership in the Layer-2 forwarding tables. The display includes indicators identifying whether the group information was obtained dynamically (for example, snooped) or statically configured.

The command offers the following levels of detail:

- The basic command with no keywords displays group membership information as one line per port within group.
• The **summary** keyword summarizes the port statistics into one line per group. The **summary** keyword is mutually exclusive with the **port-view**, **source**, and **detail** keywords.
• The **detail** keyword includes traffic statistics and counters.

### Examples

The following example shows group membership information by groups within bridge domains.

```plaintext
RP/0/RSP0/CPU0:router# show mld snooping group

show mld snooping port

To display MLD snooping configuration information and traffic counters by router interface port, use the `show mld snooping port` command in EXEC mode.

```
show mld snooping port
interface-name|neighbor ipaddr pw-id id|bridge-domain bridge-domain-name
detail [statistics [include-zeroes]]
group [ group-address ] [source source-address] [detail]
```

### Syntax Description

- **interface-name** (Optional) Displays information only for the specified AC port.
- **neighbor ipaddr pw-id id** (Optional) Displays information only for the specified PW port.
- **bridge-domain bridge-domain-name** (Optional) Displays information for ports in the specified bridge domain.
- **detail** (Optional) Includes port details, rather than a single line summary.
- **statistics** (Optional) Includes mld traffic counters and statistics in the detail display.
- **include-zeroes** (Optional) Includes all statistics, even if they are zero. Without this keyword, many statistics are omitted from the display when their values are zero.
- **group** (Optional) Provides group membership information in its entirety as received at each port. The display is organized by port, showing groups within ports.
- **group-address** (Optional) Displays information only for the specified group address, organized by port.
- **source source-address** (Optional) Displays information only for the specified source address, organized by port.
- **detail** (Optional) Includes group details.

</tbody>
</table>

### Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.
show mld snooping port

This command displays mld snooping information organized by mld snooping port. Use the command without any keywords to display summary information about all ports, in a single line per port.

Use optional arguments and keywords to request the following:

- Limit the display to a specified port.
- Limit the display to ports under a specified bridge.
- Request details and traffic statistics per port.

Note: The statistics keyword cannot be used in the same command with the group keyword.

- Organize the display by group within ports. Use the group keyword with or without a specified interface or bridge domain.
- Limit the group information to specific groups or source addresses.

The statistics keyword displays mld traffic information, including mld queries, reports, and leaves. The three columns in the statistics section of the display are:

- Received—Number of packets received.
- Reinjected—Number of packets received, processed, and reinjected back into the forwarding path.
- Generated—Number of packets generated by the mldsnooping application and injected into the forwarding path.

### Examples

show mld snooping profile

To display MLD snooping profile information, use the `show mld snooping profile` command in EXEC mode.

```plaintext
{show mld snooping profile [summary] [profile-name] [detail [include-defaults]] [references [bridge-domain [bridge-domain-name]]] [port [interface-name] [neighbor ipaddr | ip-id] id]}
```

**Syntax Description**

- **summary**: (Optional) Displays a summary of profile instances, bridge domain references, and port references.
- **profile-name**: (Optional) Displays information only for the named profile.
- **detail**: (Optional) Displays the contents of profiles.
- **include-defaults**: (Optional) Displays all default configurations with the profile contents. Without this keyword, only configured profile information is displayed.
- **references**: (Optional) Shows which bridge domains and bridge ports reference each profile.
- **bridge-domain [bridge-domain-name]**: (Optional) Provides a bridge domain filter for the `references` keyword. Without `bridge-domain-name`, the display shows profiles attached to all bridge domains. With `bridge-domain-name`, the display shows only the profile attached to the specified bridge domain.
- **port [interface-name]**: (Optional) Provides a port filter for the `references` keyword.
  - With `interface-name` or `neighbor` specified, the display shows the profile attached to the named AC or PW.
  - Using the `port` keyword alone shows profiles attached to all ports.

**Command Default**

None

**Command Modes**

EXEC

**Command History**

**Release** | **Modification**
--- | ---
Release 4.3.0 | This command was introduced.

**Usage Guidelines**

Use this command to display the contents of profiles and to see associations of profiles with bridge-domains and ports.

The `summary` keyword lists profile names and summarizes their usage on bridge domains and ports. No other keywords can be used with `summary`.

Use the `details` keyword with a profile name to show the contents of a specific profile. Without a profile name, the `detail` keyword shows the contents of all profiles.
Use the `references` keyword to list the relationships between profiles and bridge domains or profiles and ports. You have the following options:

- Use the `references` keyword without any other keywords to show all profiles and the ports and bridge domains they are attached to.
- Use the `references` keyword with the `name` keyword to show a specific profile and where it is attached.
- Use the `port` keyword to list all ports and the profiles attached to them.
- Use the `port` keyword with a specific AC interface or PW to see the profile attached to the named port.
- Use the `bridge-domain` keyword to list all bridge domains and the profiles attached to them.
- Use the `bridge-domain` keyword with a specific bridge domain name to see the profile attached to a specific bridge domain.

Examples

The following example lists profile names and shows summary level profile usage.

```
RP/0/RSP0/CPU0:router# show mld snooping profile
Profile  Bridge Domain  Port
-------  --------------  ----
profile1  0             8193
profile2  1             0
profile3  1             0
profile4  0             0
profile5  1             0
profile6  0             0
profile7  1             2
```

The following example shows summary level profile usage for a named profile.

```
RP/0/RSP0/CPU0:router# show mld snooping profile profile1
Profile  Bridge Domain  Port
-------  --------------  ----
profile1  0             8193
```

The following example shows the contents of each profile.

```
RP/0/RSP0/CPU0:router# show mld snooping profile detail
mld Snoop Profile profile1:
   Bridge Domain References: 3
   Port References: 0
MLD Snoop Profile profile2:
   Static Groups: ff28:1:1::2
                  ff29:1:1::4
                  2000:1::2
   Bridge Domain References: 0
   Port References: 1
```
MLD Snoop Profile profile3:

Static Mrouter: Enabled

Bridge Domain References: 0
Port References: 1

The following example shows output reflecting the access-group, group limit, and tcn flood disable parameters:

RP/0/RSP0/CPU0:router# show mld snooping profile detail
MLD Snoop Profile profile:

Querier LMQ Count: 2
Access Group ACL: iptv-white-list
Group Policy: iptv-group-weights
Group Limit: 16
Immediate Leave: Enabled
TCN Flood: Disabled

Bridge Domain References: 1
Port References: 0

The following example shows the contents of a named profile and the implied default configurations:

RP/0/RSP0/CPU0:router# show mld snooping profile profile1 detail include-defaults
mld Snoop Profile profile p1:

System IP Address: fe80::1aef:63ff:fee2:5fc6

The following example shows the profile attached to a specific port.

```
RP/0/RSP0/CPU0:router# show mld snooping profile references port GigabitEthernet 0/1/0/2
```

Profile: profile2
Ports: GigabitEthernet0/1/0/2
**show mld snooping summary**

To display summary information about MLD snooping configuration and traffic statistics for the router, use the `show mld snooping summary` command in EXEC mode.

```plaintext
show mld snooping summary [statistics [include-zeroes]]
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>statistics</td>
<td>(Optional) Displays mld traffic counters and statistics.</td>
</tr>
<tr>
<td>include-zeroes</td>
<td>(Optional) Displays all statistics, even if they are zero. Without this keyword, many statistics are omitted from the display when their values are zero.</td>
</tr>
</tbody>
</table>

**Command Default**

None

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.3.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

This command summarizes the number of bridge domains, mrouter ports, host ports, groups, and sources configured on the router.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>

(… missing lines)
startup query count

To configure the number of startup G-queries that are to be sent to the recipient routers, use the `startup query count` command in the appropriate snooping profile configuration mode. To restore the default startup query count to be the Querier’s Robustness Value (QRV), use the `no` form of this command.

```
startup query count number
no startup query count
```

**Syntax Description**

- `number`: Indicates the number of startup queries sent. The range is from 0-7.

**Command Default**

2

**Command Modes**

IGMP snooping profile configuration (config-igmp-snooping-profile)
MLD snooping profile configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 4.0.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

**Task ID**

- `Task ID`
- `Operations`
- `l2vpn` read, write

**Examples**

The following examples show how to configure the startup query count:

```
RP/0/RSP0/CPU0:router(config-igmp-snooping-profile)# startup query count

RP/0/RSP0/CPU0:router(config-mld-snooping-profile)# startup query count
```

**Related Commands**

</thead>
<tbody>
<tr>
<td>igmp snooping profile, on page 342</td>
<td>Creates or edits a profile, and attaches a profile to a bridge domain or port.</td>
</tr>
</tbody>
</table>
startup query iccp-group

To enable the generation of startup G-query on a port, when an MC-LAG transitions from standby state to active state, use the `startup query iccp-group` command in the appropriate snooping profile configuration mode. The snooping technique performs a mark and sweep synchronization of the snooping state over the startup query period.

To disable the startup query generation on this event, use the `no` form of this command.

```
startup query iccp-group port-active
no startup query iccp-group
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>port-active</code> (Optional) Issues startup queries when iccp-group goes active. This parameter is specific to IGMP Snooping over MC-LAG.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command Modes**

IGMP snooping profile configurationMLD snooping profile configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 4.0.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

If configured in a bridge-domain profile, the `startup query iccp-group` command applies to all ports in that bridge-domain. If configured in a profile attached to a specific port, this command applies to that port only.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>l2vpn</td>
</tr>
</tbody>
</table>

**Operations**

read, write

**Examples**

The following examples show how to enable the startup G-query configuration:

```
RP/0/RSP0/CPU0:router(config-igmp-snooping-profile)# startup query iccp-group
```

</tbody>
</table>
startup query interval

To configure the time between successive startup G-queries, use the `startup query interval` command in the appropriate snooping profile configuration mode. To restore the default startup query interval of 1/4 querier's query-interval (up to a max of 32 secs), use the `no` form of this command.

```
startup query interval number
no startup query interval
```

**Syntax Description**

- `number` Interval, in seconds. The range is from 1 to 18000.

**Command Default**

15 seconds

**Command Modes**

IGMP snooping profile configurationMLD snooping profile configuration

**Command History**

<table>
<thead>
<tr>

</tbody>
</table>
startup query max-response-time

To configure the maximum response time (MRT) transmitted in the startup G-queries in seconds, use the 
**startup query max-response-time** command in the appropriate snooping profile configuration mode. To 
restore the default startup query max-response-time to be the querier's max-response-time (MRT), use the **no** 
form of this command.

```
startup query max-response-time number
no startup query max-response-time
```

**Syntax Description**

- `number` Enter an interval between 1 to 25 seconds.

**Command Default**

- 10 seconds

**Command Modes**

- IGMP snooping profile configuration
- MLD snooping profile configuration

**Command History**

```
Release 4.0.0  This command was introduced.
```

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task 
IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator 
for assistance.

**Task ID**

- **Task ID**
  - l2vpn 
    - read, write

**Examples**

The following examples show how to configure the MRT:

```
RP/0/RSP0/CPU0:router(config-igmp-snooping-profile)# startup query max-response-time
RP/0/RSP0/CPU0:router(config-mld-snooping-profile)# startup query max-response-time
```

</tbody>
</table>
### startup query port-up disable

To disable the sending of startup G-queries on port-up, use the `startup query port-up disable` command in IGMP snooping profile configuration mode. To restore the default behavior that sends G-queries on port-up, use the `no` form of this command.

```
startup query port-up disable
no startup query port-up disable
```

**startup query process start**

To enable the startup G-query generation on all ports in the bridge domain when the IGMP Snooping (IGMPSN) process restarts, use the `startup query process start` command in IGMP snooping profile configuration mode. To disable the startup query generation of this event, use the `no` form of this command. This command must be included in the bridge-domain profile.

```
startup query process start [sync]
no startup query process start
```

**Syntax Description**

- `sync` (Optional) Removes the unrefreshed membership state. This parameter instructs the IGMPSN to perform a mark and sweep synchronization of the IGMP snooping state over the startup query period.

**Command Default**

None

**Command Modes**

IGMP snooping profile configuration

**Command History**

- **Release 4.0.0** This command was introduced.

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

**Task ID**

- **l2vpn** read,
  write

**Examples**

The following examples show how to use the `startup query process start` command into an IGMP snooping profile:

```
RP/0/RSP0/CPU0:router(config-igmp-snooping-profile)# startup query process start
```

**Related Commands**

- `igmp snooping profile, on page 342`
  Creates or edits a profile, and attaches a profile to a bridge domain or port.
startup query topology-change

To enable startup G-query generation on all ports in the bridge domain when a topology change is indicated and the bridge is the root, use the `startup query topology-change` command in IGMP snooping profile configuration mode.

To disable the startup query generation on this event, use the `no` form of this command.

```
startup query topology-change [{sync|always}]
no startup query topology-change
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Description</th>
</tr>

static group

To configure static group membership entries in the Layer-2 forwarding tables, use the `static group` command in IGMP snooping profile configuration mode. To remove a static group entry from the forwarding tables, use the `no` form of this command.

```
static group group-addr [source source-addr]
no static group group-addr [source source-addr]
```

**Syntax Description**

- **group-addr**: IP multicast group address.
- **source**: (Optional) Statically forwards an (S, G) channel out of the port.
- **source-addr**: IP multicast source address.

**Command Default**

None

**Command Modes**

IGMP snooping profile configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

IGMP snooping learns Layer-2 multicast groups dynamically. You can also statically configure Layer-2 multicast groups.

You can use the `static group` command in profiles intended for bridge domains or ports. If you configure this option in a profile attached to a bridge domain, it applies to all ports under the bridge.

A profile can contain multiple static groups. You can define different source addresses for the same group address. Using the `source` keyword, you can configure IGMPv3 source groups.

Static group membership supersedes any dynamic manipulation by IGMP snooping. Multicast group membership lists can contain both static and dynamic group definitions.

When you configure a static group or source group on a port, IGMP snooping adds the port as an outgoing port to the corresponding <S/*,G> forwarding entry and sends an IGMPv2 join or IGMPv3 report to all mrouter ports. IGMP snooping continues to send the membership report in response to general queries for as long as the static group remains configured on the port.

The scope of this command can be either bridge domain level or port level. If you use this command in a profile attached to a bridge domain, the static group membership applies to all ports under the bridge. If you use the command in a profile attached to a port, the static group membership applies only to that port.
### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>l2vpn</td>
<td>read, write</td>
</tr>
</tbody>
</table>

### Examples

The following examples show how to add static group membership configuration into an IGMP snooping profile:

```
RP/0/RSP0/CPU0:router(config-igmp-snooping-profile)# static group 10.1.1.1
RP/0/RSP0/CPU0:router(config-igmp-snooping-profile)# static group 10.1.1.1 source 10.1.12.0
```

system-ip-address

To configure an IP address for the internal querier, use the `system-ip-address` command in IGMP snooping profile configuration mode. To return to the default value, use the **no** form of this command.

```
  system-ip-address  ip-address
  no  system-ip-address
```

**Syntax Description**

Assigns an IP address for IGMP use.

**Command Default**

0.0.0.0

**Command Modes**

IGMP snooping profile configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `system-ip-address` command configures an IP address for IGMP snooping use. If not explicitly configured, the default address is 0.0.0.0. The default is adequate except in the following circumstances:

- If you are configuring an internal querier. The internal querier cannot use 0.0.0.0.
- If the bridge needs to communicate with a non-Cisco IGMP router that does not accept the 0.0.0.0 address.

IGMP snooping uses the value set by the `system-ip-address` command in the following ways:

- The internal-querier sends queries from the system IP address. An address other than the default 0.0.0.0 must be configured.
- IGMPv3 sends proxy reports from the system IP address. The default address 0.0.0.0 is preferred but may not be acceptable to some IGMP routers.
- In response to topology change notifications (TCNs) in the bridge domain, IGMP snooping sends global-leaves from the system IP address. The default address 0.0.0.0 is preferred but may not be acceptable to some IGMP routers.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>

**tcn flood query count**

To configure how long IGMP snooping floods all routes in response to topology changes, use the `tcn flood query count` command in IGMP snooping profile configuration mode. To return to the default value, use the `no` form of this command.

```
tcn flood query count number
no tcn flood query count
```

**Syntax Description**

- `number`: Specifies the number of general queries that must occur after a TCN before IGMP snooping stops multicast flooding to all ports and resumes restricted forwarding.

  Valid values are integers from 1 to 10.

**Command Default**

2

**Command Modes**

IGMP snooping profile configuration

**Command History**

- **Release**: 3.7.2
  - This command was introduced.

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

In a Spanning Tree Protocol (STP) topology, a topology change notification (TCN) indicates that an STP topology change has occurred. As a result of a topology change, mrouter and hosts reporting group membership may migrate to other STP ports under the bridge domain. Mrouter and membership states must be relearned after a TCN.

IGMP snooping reacts to TCNs in the following way:

1. IGMP snooping temporarily extends the flood set for all known multicast routes to include all ports participating in STP that are in forwarding state. The short term flooding ensures that multicast delivery continues to all mrouter and all member hosts in the bridge domain while mrouter and membership states are relearned.

2. The STP root bridge issues a global leave (leave for group 0.0.0.0) on all ports. This action triggers mrouter to send general queries, expediting the relearning process.

**Note**

Sending global leaves for query solicitation is a Cisco-specific implementation.

1. When the TCN refresh period ends, IGMP snooping withdraws the non-mrouter and non-member STP ports from the multicast route flood sets. You can control the amount of time that flooding occurs with the `tcn flood query count` command. This command sets the number of IGMP general queries for which the multicast traffic is flooded following a TCN, thus influencing the refresh period.
IGMP snooping default behavior is that the STP root bridge always issues a global leave in response to a TCN, and the non-root bridges do not issue global leaves.

With the `tcn query solicit` command, you can enable a bridge to always issue a global leave in response to TCNs, even when it is not the root bridge. In that case, the root bridge and the non-root bridge would issue the global leave and both would solicit general queries in response to a TCN. Use the `no` form of the command to turn off soliciting when the bridge is not the root.

The root bridge always issues a global leave in response to a TCN. This behavior cannot be disabled.

The internal querier has its own set of configuration options that control its reactions to TCNs.

The scope for this configuration option is per bridge domain. If the command appears in profiles attached to ports, it has no effect.

<table>

**Example**

The following example shows how to set the query count to 5:

```
tcn flood query count 5
```
RP/0/RSP0/CPU0:router(config-mld-snooping-profile) # tcn flood query count 5
**tcn query solicit**

To enable global leave messaging on non-root bridges in response to STP topology changes, use the `tcn query solicit` command in IGMP snooping profile configuration mode. To disable this functionality (on non-root bridges), use the `no` form of this command.

```
tcn query solicit
no tcn query solicit
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

It is disabled by default.

**Command Modes**

IGMP snooping profile configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

In a Spanning Tree Protocol (STP) topology, a topology change notification (TCN) indicates that an STP topology change has occurred. As a result of a topology change, mrouters and hosts reporting group membership may migrate to other STP ports under the bridge domain. Mrouter and membership states must be relearned after a TCN.

IGMP snooping reacts to TCNs in the following way:

1. IGMP snooping temporarily extends the flood set for all known multicast routes to include all ports participating in STP that are in forwarding state. The short term flooding ensures that multicast delivery continues to all mrouters and all member hosts in the bridge domain while mrouter and membership states are relearned.
2. The STP root bridge issues a global leave (leave for group 0.0.0.0) on all ports. This action triggers mrouters to send general queries, expediting the relearning process.

**Note**

Sending global leaves for query solicitation is a Cisco-specific implementation.

1. When the TCN refresh period ends, IGMP snooping withdraws the non-mrouter and non-member STP ports from the multicast route flood sets. You can control the amount of time that flooding occurs with the `tcn flood query count` command. This command sets the number of IGMP general queries for which the multicast traffic is flooded following a TCN, thus influencing the refresh period.

IGMP snooping default behavior is that the STP root bridge always issues a global leave in response to a TCN, and the non-root bridges do not issue global leaves.
With the `tcn query solicit` command, you can enable a bridge to always issue a global leave in response to TCNs, even when it is not the root bridge. In that case, the root bridge and the non-root bridge would issue the global leave and both would solicit general queries in response to a TCN. Use the `no` form of the command to turn off soliciting when the bridge is not the root.

The root bridge always issues a global leave in response to a TCN. This behavior cannot be disabled.

The internal querier has its own set of configuration options that control its reactions to TCNs.

The scope for this configuration option is per bridge domain. If the command appears in profiles attached to ports, it has no effect.

</tr>
</thead>
<tbody>
<tr>
<td>l2vpn</td>
<td>read, write</td>
</tr>
</tbody>
</table>

### Example

The following example shows how to ensure that a bridge will always issue a global leave in response to a TCN, even when it is not the STP root-bridge:

```
RP/0/RSP0/CPU0:router (config-mld-snooping-profile) # tcn query solicit
```
ttl-check disable

To disable the IGMP snooping check on the time-to-live (TTL) field in the IGMP header, use the `ttl-check disable` command in IGMP snooping profile configuration mode. To enable this functionality after a disable, use the `no` form of this command.

```
ttl-check disable
no ttl-check disable
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

It is enabled by default.

**Command Modes**

IGMP snooping profile configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

By default, IGMP snooping examines the time-to-live (TTL) field in the IGMP header and processes packets as follows:

- If the TTL field is 1, IGMP snooping processes the packet. The TTL field is always set to 1 in the headers of IGMP reports and queries.
- If the TTL field is not 1, IGMP snooping drops the packet

When the IGMP snooping TTL check feature is disabled, IGMP snooping processes all packets without examining the TTL field in the IGMP header.

The scope for this configuration option is per bridge domain. If the command appears in profiles attached to ports, it has no effect.

unsolicited-report-interval

To set the length of time that IGMP snooping has to send state change reports for IGMPv3 queriers when proxy reporting is enabled, use the `unsolicited-report-interval` command in IGMP snooping profile configuration mode. To return to the default value, use the `no` form of this command.

```
unsolicited-report-interval  timer-value
no  unsolicited-report-interval
```

**Syntax Description**

<table>
<thead>
<tr>
<th>timer-value</th>
<th>Specifies the length of time that IGMP snooping can take to send state change reports for IGMPv3 queriers. Valid values are integers from 100 to 5000 (milliseconds).</th>
</tr>
</thead>
</table>

**Command Default**

1000 (milliseconds)

**Command Modes**

IGMP snooping profile configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

If a bridge domain querier is running IGMPv3 and proxy reporting is enabled, IGMP snooping acts as a proxy, generating reports from the proxy reporting address. As insurance against lost reports, IGMP snooping generates and forwards state change reports `robustness-variable` times, where the `robustness-variable` is the QRV value in the querier’s general query. IGMP snooping forwards the reports at random intervals within the timeframe configured with the `unsolicited-report-timer` command.

Proxy reporting is enabled by default. To disable proxy reporting, use the `report-suppression disable` command.

Multicast PIM Commands

This chapter describes the commands used to configure and monitor Protocol Independent Multicast (PIM).

For detailed information about multicast routing concepts, configuration tasks, and examples, refer to Multicast Configuration Guide for Cisco ASR 9000 Series Routers.

- accept-register, on page 489
- auto-rp candidate-rp, on page 490
- bsr candidate-bsr, on page 492

accept-register

To configure a rendezvous point (RP) router to filter Protocol Independent Multicast (PIM) register messages, use the `accept-register` command in PIM configuration mode. To return to the default behavior, use the `no` form of this command.

```
accept-register access-list-name
no accept-register
```

### Syntax Description

| access-list-name | Access list number or name. |

### Command Default

No default behavior or values

### Command Modes

PIM configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `accept-register` command prevents unauthorized sources from registering with the rendezvous point. If an unauthorized source sends a register message to the rendezvous point, the rendezvous point immediately sends back a register-stop message.

### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

### Examples

The following example shows how to restrict the rendezvous point. Sources in the Source Specific Multicast (SSM) range of addresses are not allowed to register with the rendezvous point. These statements need to be configured only on the rendezvous point.

```
RP/0/RSP0/CPU0:router(config)# router pim
RP/0/RSP0/CPU0:router(config-pim-default-ipv4)# accept-register no-ssm-range
RP/0/RSP0/CPU0:router(config-pim-default-ipv4)# exit
RP/0/RSP0/CPU0:router(config)# ipv4 access-list no-ssm-range
RP/0/RSP0/CPU0:router(config-ipv4-acl)# deny ipv4 any 232.0.0.0 0.255.255.255
RP/0/RSP0/CPU0:router(config-ipv4-acl)# permit any
```
**auto-rp candidate-rp**

To configure a router as a Protocol Independent Multicast (PIM) rendezvous point (RP) candidate that sends messages to the well-known CISCO-RP-ANNOUNCE multicast group (224.0.1.39), use the `auto-rp candidate-rp` command in PIM configuration mode. To return to the default behavior, use the `no` form of this command.

```
auto-rp candidate-rp type interface-path-id scope ttl-value [group-list access-list-name] [interval seconds] [bidir]
no auto-rp candidate-rp type interface-path-id scope ttl-value [group-list access-list-name] [interval seconds] [bidir]
```

**Syntax Description**

- `type` Interface type. For more information, use the question mark (?) online help function.

- `interface-path-id` Physical interface or virtual interface.
  
  **Note** Use the `show interfaces` command in EXEC mode to see a list of all interfaces currently configured on the router.

  For more information about the syntax for the router, use the question mark (?) online help function.

- `scope ttl-value` Specifies a time-to-live (TTL) value (in router hops) that limits the scope of the auto-rendezvous point (Auto-RP) announce messages that are sent out of that interface. Range is 1 to 255.

- `group-list access-list-name` (Optional) Specifies an access list that describes the group ranges for which this router is the rendezvous point.

- `interval seconds` (Optional) Specifies the time between rendezvous point announcements. Range is 1 to 600.

- `bidir` (Optional) Specifies a bidirectional rendezvous point for PIM.

**Command Default**

A router is not configured as a PIM rendezvous point candidate by default.

`seconds` : 60

**Command Modes**

PIM configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `auto-rp candidate-rp` command is used by the rendezvous point for a multicast group range. The router sends an Auto-RP announcement message to the well-known group CISCO-RP-ANNOUNCE (224.0.1.39).
This message announces the router as a candidate rendezvous point for the groups in the range described by the access list.

When the **interval** keyword is specified, the interval between Auto-RP announcements is set to number of seconds with the total hold time of the announcements automatically set to three times the interval time. The recommended interval time range is from 1 to 180 seconds.

The hold time of the Auto-RP announcement is the time for which the announcement is valid. After the designated hold time, the announcement expires and the entry is purged from the mapping cache until there is another announcement.

If the optional **group-list** keyword is omitted, the group range advertised is 224.0.0.0/4. This range corresponds to all IP multicast group addresses, which indicates that the router is willing to serve as the rendezvous point for all groups.

A router may be configured to serve as a candidate rendezvous point for more than one group range by a carefully crafted access list in the router configuration.

---

The **auto-rp candidate-rp** command is available for IPv4 address prefixes only.

### Examples

The following example shows how to send rendezvous point announcements from all PIM-enabled interfaces for a maximum of 31 hops. The IP address by which the router wants to be identified as a rendezvous point is the IP address associated with GigabitEthernet interface 0/1/0/1. Access list 5 designates the groups that this router serves as the rendezvous point.

```bash
RP/0/RSP0/CPU0:router(config)# ipv4 access-list 5
RP/0/RSP0/CPU0:router(config-ipv4-acl)# permit ipv4 any 224.0.0.0 15.255.255.255
RP/0/RSP0/CPU0:router(config-ipv4-acl)# exit
RP/0/RSP0/CPU0:router(config)# router pim
RP/0/RSP0/CPU0:router(config-pim-default-ipv4)# auto-rp candidate-rp GigE 0/1/0/1 scope 31
        group-list 5
RP/0/RSP0/CPU0:router(config-pim-default-ipv4)# end
```

The router identified in the following example advertises itself as the candidate rendezvous point and is associated with loopback interface 0 for the group ranges 239.254.0.0 to 239.255.255.255 and 224.0.0.0 to 231.255.255.255:

```bash
RP/0/RSP0/CPU0:router(config)# ipv4 access-list 10
RP/0/RSP0/CPU0:router(config-ipv4-acl)# permit ipv4 any 239.254.0.0 0.0.255.255
RP/0/RSP0/CPU0:router(config-ipv4-acl)# exit
RP/0/RSP0/CPU0:router(config)# router pim
RP/0/RSP0/CPU0:router(config-pim-default-ipv4)# auto-rp candidate-rp loopback 0 scope 16
        group-list 10
RP/0/RSP0/CPU0:router(config-pim-default-ipv4)# end
```
bsr candidate-bsr

To configure the router to announce its candidacy as a bootstrap router (BSR), use the `bsr candidate-bsr` command in PIM configuration mode. To return to the default behavior, use the `no` form of this command.

```
bsr candidate-bsr ip-address [hash-mask-len length] [priority value]
nosl bsr candidate-bsr
```

**Syntax Description**

- `ip-address`: IP address of the BSR router for the domain. For IPv4, this is an IP address in four-part dotted-decimal notation. For IPv6, the IP address is specified in hexadecimal format using 16-bit values between colons.

- `hash-mask-len length`: (Optional) Specifies the length of a mask that is to be used in the hash function.
  - All groups with the same seed hash (correspond) to the same rendezvous point (RP). For example, if this value is 24, only the first 24 bits of the group addresses matter. This fact allows you to get one RP for multiple groups.
  - For IPv4 addresses, we recommend a value of 30. The range is 0 to 32.
  - For IPv6 addresses, we recommend a value of 126. The range is 0 to 128.

- `priority value`: (Optional) Specifies the priority of the candidate BSR. Range is 1 to 255. We recommend the BSR with the higher priority. If the priority values are the same, the router with the higher IP address is the BSR.

**Command Default**

- `value`: 1

- Default C-RP cache state limit in both Candidate BSR and Elected BSR is 100.

- Configurable maximum C-RP cache in both BSR and Elected BSR is in the range of 1 - 100000.

- Default RP-group mapping state limit in PIMv2 router is 100.

- Configurable maximum RP-group mapping state in PIMv2 router is in the range of 1 - 100000.

**Command Modes**

PIM configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.2</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Release 4.3</td>
<td>PIM BSR limits were introduced for this command.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `bsr candidate-bsr` command causes the router to send bootstrap messages to all its Protocol Independent Multicast (PIM) neighbors, with the address of the designated interface as the BSR address. Each neighbor compares the BSR address with the address it had from previous bootstrap messages (not necessarily received on the same interface). If the current address is the same or higher address, the PIM neighbor caches the current address and forwards the bootstrap message. Otherwise, the bootstrap message is dropped.
This router continues to be the BSR until it receives a bootstrap message from another candidate BSR saying that it has a higher priority (or if the same priority, a higher IP address).

**Note**
Use the `bsr candidate-bsr` command only in backbone routers with good connectivity to all parts of the PIM domain. A subrouter that relies on an on-demand dial-up link to connect to the rest of the PIM domain is not a good candidate BSR.

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>multicast read, write</td>
</tr>
</tbody>
</table>

**Examples**
The following example shows how to configure the router as a candidate BSR with a hash mask length of 30:

```
RP/0/RSP0/CPU0:router(config)# router pim
RP/0/RSP0/CPU0:router(config-pim-default-ipv4)# bsr candidate-bsr 10.0.0.1 hash-mask-len 30
```
bsr candidate-rp

To configure the router to advertise itself as a Protocol Independent Multicast (PIM) Version 2 candidate rendezvous point (RP) to the bootstrap router (BSR), use the `bsr candidate-rp` command in PIM configuration mode. To return to the default behavior, use the `no` form of this command.

```
bsr candidate-rp ip-address [group-list access-list] [interval seconds] [priority value] [bidir]
no bsr candidate-rp ip-address [bidir]
```

**Syntax Description**
- `ip-address` (Optional) Specifies the IP access list number or name that defines the group prefixes that are advertised in association with the rendezvous point address. The access list name cannot contain a space or quotation mark, and must begin with an alphabetic character to avoid confusion with numbered access lists.
- `group-list access-list` (Optional) Specifies the candidate rendezvous point advertisement interval in seconds. Range is 30 to 600.
- `interval seconds` (Optional) Indicates the rendezvous point priority value. Range is 1 to 255.
- `priority value` (Optional) Configures a bidirectional (bidir) rendezvous point.
- `bidir` (Optional) Configures a bidirectional (bidir) rendezvous point.

**Command Default**
- `value`: 1
- Default C-RP cache state limit in both Candidate BSR and Elected BSR is 100.
- Configurable maximum C-RP cache in both BSR and Elected BSR is in the range of 1 - 100000.
- Default RP-group mapping state limit in PIMv2 router is 100.
- Configurable maximum RP-group mapping state in PIMv2 router is in the range of 1 - 100000.

**Command Modes**
- PIM configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.0.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `bsr candidate-rp` command causes the router to send a PIM Version 2 message advertising itself as a candidate rendezvous point to the BSR. The addresses allowed by the access list, together with the router identified by the IP address, constitute the rendezvous point and its range of addresses for which it is responsible.
Use the `bsr candidate-rp` command only in backbone routers that have good connectivity to all parts of the PIM domain. That is, a stub router that relies on an on-demand dial-up link to connect to the rest of the PIM domain is not a good candidate rendezvous point.

### Examples

The following example shows how to configure the router to advertise itself as a candidate rendezvous point to the BSR in its PIM domain. Access list number 4 specifies the group prefix associated with the candidate rendezvous point address 172.16.0.0. This rendezvous point is responsible for the groups with the prefix 239.

```
RP/0/RSP0/CPU0:router(config)# router pim
RP/0/RSP0/CPU0:router(config-pim-default-ipv4)# bsr candidate-rp 172.16.0.0 group-list 4
RP/0/RSP0/CPU0:router(config-pim-default-ipv4)# exit
RP/0/RSP0/CPU0:router(config)# ipv4 access-list 4
RP/0/RSP0/CPU0:router(config-ipv4-acl)# permit ipv4 any 239.0.0.0 0.255.255.255
RP/0/RSP0/CPU0:router(config-ipv4-acl)# end
```

clear pim counters

To clear Protocol Independent Multicast (PIM) counters and statistics, use the `clear pim counters` command in EXEC mode.

```
clear pim [vrf vrf-name] [ipv4] counters
```

**Syntax Description**
- `vrf vrf-name` (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- `ipv4` (Optional) Specifies IPv4 address prefixes.
- `ipv6` (Optional) Specifies IPv6 address prefixes.

**Command Default**
No default behavior or values

**Command Modes**
EXEC

**Command History**
- **Release 3.7.2**  This command was introduced.

**Usage Guidelines**
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

If you do not explicitly specify a particular VRF, the default VRF is used.

**Task ID**
- `multicast` read, write

**Examples**
The following example shows sample output before and after clearing PIM counters and statistics:

```
RP/0/RSP0/CPU0:router# show pim traffic
PIM Traffic Counters
Elapsed time since counters cleared: 1d01h

  Received                 Sent
Valid PIM Packets 15759217 15214426
Hello                   9207   12336

clear pim topology

To clear group entries from the Protocol Independent Multicast (PIM) topology table and reset the Multicast Routing Information Base (MRIB) connection, use the `clear pim topology` command in EXEC mode.

```
clear pim [vrf vrf-name] [ipv4] topology [ip-address-name][reset]
```

**Syntax Description**

- `vrf vrf-name` (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- `ipv4` (Optional) Specifies IPv4 address prefixes.
- `ip-address-name` (Optional) Can be either one of the following:
  - Name of the multicast group, as defined in the Domain Name System (DNS) hosts table or with the `domain IPv4` or `domain IPv6 host` command.
  - IP address of the multicast group, in IPv4 or IPv6 format according to the specified address family.
- `reset` (Optional) Deletes all entries from the topology table and resets the MRIB connection.

**Command Default**

No default behavior or values

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `clear pim topology` command clears existing PIM routes from the PIM topology table. Information obtained from the MRIB table, such as Internet Group Management Protocol (IGMP) local membership, is retained. If a multicast group is specified, only those group entries are cleared.

When the command is used with no arguments, all group entries located in the PIM topology table are cleared of PIM protocol information.

If the `reset` keyword is specified, all information from the topology table is cleared and the MRIB connections are automatically reset. This form of the command can be used to synchronize state between the PIM topology table and the MRIB database. The `reset` keyword should be strictly reserved to force synchronized PIM and MRIB entries when communication between the two components is malfunctioning.

If you do not explicitly specify a particular VRF, the default VRF is used.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>
Examples

The following example shows how to clear the PIM topology table:

RP/0/RSP0/CPU0:router# clear pim topology
clone source

To clone the S,G traffic as S1, G traffic and S2,G traffic, use the clone source command in the mofrr configuration submode.

```
clone source source S to source S1 and source S2 masklen value
```

**Syntax Description**

| source S | IP address of the source traffic (S). |

**Command Default**

No default behavior or value.

**Command Modes**

MOFRR configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.3.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Example**

This example shows how to use the clone source command:

```
RP/0/RSP0/CPUD:router(config-pim-ipv4-mofrr) # clone source 1.1.1.1 to 3.3.3.3 and 5.5.5.5 masklen 30
```
dr-priority

To configure the designated router (DR) priority on a Protocol Independent Multicast (PIM) router, use the `dr-priority` command in the appropriate configuration mode. To return to the default behavior, use the `no` form of this command.

```
   dr-priority value
   no dr-priority
```

**Syntax Description**

- `value` An integer value to represent DR priority. Range is from 0 to 4294967295.

**Command Default**

If this command is not specified in interface configuration mode, the interface adopts the DR priority value specified in PIM configuration mode.

If this command is not specified in PIM configuration mode, the DR priority value is 1.

**Command Modes**

PIM interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

If all the routers on the LAN support the DR priority option in the PIM Version 2 (PIMv2) hello message that they send, you can force the DR election by use of the `dr-priority` command so that a specific router on the subnet is elected as DR. The router with the highest DR priority becomes the DR.

When PIMv2 routers receive a hello message without the DR priority option (or when the message has priority of 0), the receiver knows that the sender of the hello message does not support DR priority and that DR election on the LAN segment should be based on IP address alone.

**Note**

If this command is configured in PIM configuration mode, parameters are inherited by all new and existing interfaces. You can override these parameters on individual interfaces from PIM interface configuration mode.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to configure the router to use DR priority 4 for Packet-over-SONET/SDH (POS) interface 0/1/0/0, but other interfaces will inherit DR priority 2:

```
RP/0/RSP0/CPU0:router(config)# router pim
```
RP/0/RSP0/CP00:router(config-pim-default-ipv4)# **dr-priority 2**
RP/0/RSP0/CP00:router(config-pim-default-ipv4)# **interface pos 0/1/0/0**
RP/0/RSP0/CP00:router(config-pim-ipv4-if)# **dr-priority 4**
global maximum

To configure the global maximum limit states that are allowed by Protocol Independent Multicast (PIM) for all VRFs, use the `global maximum` command in PIM configuration mode. To return to the default behavior, use the `no` form of this command.

```
[global maximum [{register states|route-interfaces|routes number}]]
no global maximum [{register states|route-interfaces|routes}]
```

### Syntax Description
- **register states** (Optional) Specifies the PIM source register states for all VRFs. Range is 0 to 75000.
  - **Note**: PIM registers throttle at 20000 due to the default global threshold set.
- **route-interfaces** (Optional) Specifies the total number of PIM interfaces on routes for all VRFs. Range is 1 to 600000.
- **routes** (Optional) Specifies the PIM routes for all VRFs. Range is 1 to 200000.

### Command Default
Default value is 20000.

### Command Modes
PIM configuration

### Command History
- **Release 3.9.0** This command was introduced.

### Usage Guidelines
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `global maximum` command is used to set an upper limit for register states, route interfaces, and routes on all VRFs. When the limit is reached, PIM discontinues route interface creation for its topology table.

### Note
After the maximum threshold values for routes or route-interfaces are reached, throttling begins and will remain in effect until the values fall below 95% of the Maximum value.

### Task ID
<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

### Examples
The following example shows how to set the upper limit for PIM route interfaces on all VRFs to 200000:

```
RP/0/RSP0/CPU0:router# router pim
RP/0/RSP0/CPU0:router(config-pim-default-ipv4)# global maximum route-interfaces 200000
```
**global maximum bsr crp-cache threshold**

To configure the global maximum bsr crp-cache threshold limit that are allowed by Protocol Independent Multicast (PIM) for all VRFs, use the `global maximum bsr crp-cache threshold` command in PIM configuration mode. To return to the default behavior, use the `no` form of this command.

```
[global] maximum [{bsr  crp-cache threshold}]
no  [global] maximum [{bsr  crp-cache threshold}]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>global</td>
<td>(Optional) Configures the maximum value for CRP cache and threshold limit to the sum of the caches in all VRFs.</td>
</tr>
<tr>
<td>crp-cache</td>
<td>Specifies the CRP cache value. The range is from 1 to 10000.</td>
</tr>
<tr>
<td>threshold</td>
<td>Specifies the threshold value for the crp-cache value. Range is between 1 to the set crp-cache value.</td>
</tr>
</tbody>
</table>

**Command Default**

No default behavior or values.

**Command Modes**

PIM configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.2.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `global maximum bsr` command is used to the threshold limits for the crp-cache levels.

Use the `global` keyword to configure the maximum value for CRP cache and threshold limit to the sum of the caches in all VRF. However, each VRF, including the default, will still have its own smaller maximum and threshold values. To set the maximum and threshold values in the default VRF, you should omit the `global` keyword.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to set a crp-cache of 2000 and the threshold level to 500 for the crp-cache in the router PIM configuration mode.
The following example shows how to set a crp-cache of 2000 and the threshold level to 500 for the crp-cache in the router PIM configuration mode in VRF sub-mode.

The following configuration shows how to set the maximum and threshold level in the default VRF, while all VRFs together have a larger global maximum and threshold level:
**global maximum group-mappings bsr threshold**

To configure the global maximum group-mappings and the threshold levels that are allowed by Protocol Independent Multicast (PIM) for all VRFs, use the `global maximum group-mappings bsr threshold` command in PIM configuration mode. To return to the default behavior, use the `no` form of this command.

```
global maximum [{group-mappings  bsr threshold}]
no  global maximum [{group-mappings  bsr threshold}]
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
</tr>

<tbody>
<tr>
<td>bsr</td>
<td>Specifies the bsr value. Range is 1 to 10000.</td>
</tr>
<tr>
<td>threshold</td>
<td>Specifies the threshold value for the bsr value. Range is between 1 to the set bsr value.</td>
</tr>
</tbody>
</table>

| Command Default     | No default behavior or values. |
| Command Modes       | PIM configuration |

**Command History**

Release 4.2.0 This command was introduced.

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `global maximum group-mappings` command is used to set the threshold limits for the crp-cache levels.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to set a bsr of 2000 and the threshold level to 500 for the bsr in the router PIM configuration mode.

```
RP/0/RSP0/CPU0:router# router pim
RP/0/RSP0/CPU0:router(config-pim)# global maximum group-mappings bsr
RP/0/RSP0/CPU0:router(config-pim)# global maximum group-mappings bsr 2000 threshold ?
<1-2000>  Threshold value
RP/0/RSP0/CPU0:router(config-pim)# global maximum group-mappings bsr 2000 threshold 500
RP/0/RSP0/CPU0:router(config-pim)#
```

The following example shows how to set a crp-cache of 2000 and the threshold level to 500 for the crp-cache in the router PIM configuration mode in VRF sub-mode.
RP/0/RSP0/CPU0:router# router pim
RP/0/RSP0/CPU0:router(config-pim)# address-family ipv4
RP/0/RSP0/CPU0:router(config-pim-default-ipv4)# global maximum bsr-crp-cache 2000 threshold 500
RP/0/RSP0/CPU0:router(config-pim-default-ipv4)# maximum bsr-crp-cache 1800 threshold 450
hello-interval (PIM)

To configure the frequency of Protocol Independent Multicast (PIM) hello messages, use the `hello-interval` command in the appropriate configuration mode. To return to the default behavior, use the `no` form of this command.

```
hello-interval seconds
no hello-interval
```

**Syntax Description**

- `seconds` Interval at which PIM hello messages are sent. Range is 1 to 3600.

**Command Default**

Default is 30 seconds.

**Command Modes**

PIM interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Routers configured for IP multicast send PIM hello messages to establish PIM neighbor adjacencies and to determine which router is the designated router (DR) for each LAN segment (subnet).

To establish these adjacencies, at every hello period, a PIM multicast router multicasts a PIM router-query message to the All-PIM-Routers (224.0.0.13) multicast address on each of its multicast-enabled interfaces.

PIM hello messages contain a hold-time value that tells the receiver when the neighbor adjacency associated with the sender should expire if no further PIM hello messages are received. Typically the value of the hold-time field is 3.5 times the interval time value, or 120 seconds if the interval time is 30 seconds.

Use the `show pim neighbor` command to display PIM neighbor adjacencies and elected DRs.

**Note**

If you configure the `hello-interval` command in PIM configuration mode, parameters are inherited by all new and existing interfaces. You can override these parameters on individual interfaces from PIM interface configuration mode.

**Examples**

The following example shows how to configure the PIM hello message interval to 45 seconds. This setting is adopted by all interfaces excluding the 60 second interval time set for Packet-over-SONET/SDH (POS) interface 0/1/0/0:
RP/0/RSP0/CPU0:router(config)# router pim
RP/0/RSP0/CPU0:router(config-pim-default-ipv4)# hello-interval 45
RP/0/RSP0/CPU0:router(config-pim-default-ipv4)# interface pos 0/1/0/0
RP/0/RSP0/CPU0:router(config-pim-ipv4-if)# hello-interval 60

### Related Commands

</tr>
</tbody>
</table>
**join-prune-interval**

To configure the join and prune interval time for Protocol Independent Multicast (PIM) protocol traffic, use the `join-prune-interval` command in the appropriate configuration mode. To return to the default behavior, use the `no` form of this command.

```
join-prune-interval  seconds
no join-prune-interval
```

**Syntax Description**

```
seconds          Interval, in seconds, at which PIM multicast traffic can join or be removed from the shortest path tree (SPT) or rendezvous point tree (RPT). Range is 10 to 600.
```

**Command Default**

If this command is not specified in PIM interface configuration mode, the interface adopts the join and prune interval parameter specified in PIM configuration mode.

If this command is not specified in PIM configuration mode, the join and prune interval is 60 seconds.

**Command Modes**

PIM interface configuration

PIM configuration

**Command History**

```
Release    Modification
3.7.2       This command was introduced.
```

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

**Note**

If this command is configured in PIM configuration mode, parameters are inherited by all new and existing interfaces. You can override these parameters on individual interfaces from PIM interface configuration mode.

The `join-prune-interval` command is used to configure the frequency at which a PIM sparse-mode router sends periodic join and prune messages.

**Task ID**

```
Task ID   Operations
multicast read, write
```

**Examples**

The following example shows how to change the join and prune interval time to 90 seconds on Packet-over-SONET/SDH (POS) interface 0/1/0/0:

```
RP/0/RSP0/CPU0:router(config)# router pim
RP/0/RSP0/CPU0:router(config-pim-default-ipv4)# interface pos 0/1/0/0
RP/0/RSP0/CPU0:router(config-pim-ipv4-if)# join-prune-interval 90
```
join-prune-mtu

To configure the maximum size of a PIM Join/Prune message, use the `join-prune-mtu` command in the appropriate mode. To return to the default value, use the `no` form of the command.

```
join-prune-mtu  value
no join-prune-mtu  value
```

**Syntax Description**

- `value`  Join-prune MTU in bytes. Range is 576 to 65535.

**Command Default**

65535 bytes

**Command Modes**

Router PIM configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.3.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The actual maximum size used for PIM Join/Prune messages is the smaller of the, IP MTU value of the interface and the join-prune-mtu value. In normal operation without this configuration, the PIM Join/Prune packet is packed with Join/Prune messages until the interface MTU size limit is reached. This can lead to large PIM Join/Prune message packets getting sent out, which may affect the processing efficiency on some neighboring routers. Configuring the maximum size of a PIM Join/Prune message helps controlling the MTU size of the PIM Join/Prune packet getting sent out.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Example**

This example shows how to use the `join-prune mtu` command:

```
RP/0/RSP0/CPU0:router (config-pim) # join-prune-mtu 1000
```
maximum register-states

To configure the maximum number of sparse-mode source register states that is allowed by Protocol Independent Multicast (PIM), use the `maximum register-states` command in PIM configuration mode. To return to the default behavior, use the `no` form of this command.

```
maximum register-states number
no maximum register-states
```

**Syntax Description**

```
number    Maximum number of PIM sparse-mode source register states. Range is 0 to 75000.
```

**Command Default**

```
number : 20000
```

**Command Modes**

PIM configuration

**Command History**

```
Release       Modification
3.7.2          This command was introduced.
```

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `maximum register-states` command is used to set an upper limit for PIM register states. When the limit is reached, PIM discontinues route creation from PIM register messages.

**Examples**

The following example shows how to set the upper limit for PIM register states to 10000:

```
RP/0/RSP0/CPU0:router# router pim
RP/0/RSP0/CPU0:router(config-pim-default-ipv4)# maximum register-states 10000
```

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `maximum routes` command is used to set an upper limit for PIM routes. When the limit is reached, PIM discontinues route creation for its topology table.

**Examples**

The following example shows how to set the upper limit for PIM routes to 200000:

```
RP/0/RSP0/CPU0:router# router pim
RP/0/RSP0/CPU0:router(config-pim-default-ipv4)# maximum routes 200000
```

**Related Commands**

- `show pim summary`, on page 573
  - Displays configured Protocol Independent Multicast (PIM) out-of-resource (OOR) limits and current counts.
mofrr

To perform a fast convergence (multicast-only fast reroute, or MoFRR) of specified routes/flows when a failure is detected on one of multiple equal-cost paths between the router and the source, use the mofrr command under PIM address-family IPv4 configuration submode

```
mofrr acl_name
no mofrr acl_name
```

**Syntax Description**
- `acl_name`: Specifies the flows (S, G) s to be enabled by MoFRR.

**Command Default**
MoFRR is not enabled by default.

If no VRF is specified, the default VRF is operational.

**Command Modes**
- PIM vrf configuration
- PIM address-family IPv4 configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.9.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

MoFRR is a mechanism in which two copies of the same multicast stream flow through disjoint paths in the network. At the point in the network (usually the PE closer to the receivers) where the two streams merge, one of the streams is accepted and forwarded on the downstream links, while the other stream is discarded. When a failure is detected in the primary stream due to a link or node failure in the network, MoFRR instructs the forwarding plane to start accepting packets from the backup stream (which now becomes the primary stream).

MoFRR is triggered when the hardware detects traffic loss on the primary path of a given flow or route. Traffic loss is defined as no data packet having been received for 30 ms. When MoFRR is triggered, the primary and secondary reverse-path forwarding (RPF) interfaces are exposed to the forwarding plane and switchover occurs entirely at the hardware level.

**Note**
MoFRR supports all ECMP hashing algorithms except the source-only hash algorithm. The secondary path is chosen by running the same algorithm on the set of paths that does not include the primary path.
The following example shows how to configure MoFRR:

```
RP/0/RSP0/CPU0:router# router pim
RP/0/RSP0/CPU0:router(config-pim)# mofrr rib acl-green

RP/0/RSP0/CPU0:router# router pim
RP/0/RSP0/CPU0:router(config-pim)# address-family ipv4
RP/0/RSP0/CPU0:router(config-pim-default-ipv4)# mofrr acl-green
```

<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `neighbor-filter` command is used to prevent unauthorized routers on the LAN from becoming PIM neighbors. Hello messages from addresses specified in the command are ignored.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to configure PIM to ignore all hello messages from IP address 10.0.0.1:

```
RP/0/RSP0/CPU0:router(config-pim-default-ipv4)# neighbor-filter 1
RP/0/RSP0/CPU0:router(config-pim-default-ipv4)# exit
RP/0/RSP0/CPU0:router(config)# ipv4 access-list 1
RP/0/RSP0/CPU0:router(config-ipv4-acl)# deny ipv4 any 10.0.0.1/24
```
nsf lifetime (PIM)

To configure the nonstop forwarding (NSF) timeout value for the Protocol Independent Multicast (PIM) process, use the `nsf lifetime` command in PIM configuration mode. To return to the default behavior, use the `no` form of this command.

```
nsf lifetime seconds
go nsf lifetime
```

**Syntax Description**

- `seconds`: Maximum time for NSF mode in seconds. Range is 10 to 600.

**Command Default**

- `seconds`: 120

**Command Modes**

- PIM configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

While in PIM NSF mode, PIM is recovering multicast routing topology from the network and updating the Multicast Routing Information Base (MRIB). After the PIM NSF timeout value is reached, PIM signals the MRIB and resumes normal operation.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following command shows how to set the PIM NSF timeout value to 30 seconds:

```
RP/0/RSP0/CPU0:router(config)# router pim
RP/0/RSP0/CPU0:router(config-pim-default-ipv4)# nsf lifetime 30
```

old-register-checksum

To configure a Cisco IOS XR designated router (DRs) in a network where the rendezvous point is running an older version of Cisco IOS software, use the `old-register-checksum` command in PIM configuration mode. To return to the default behavior, use the `no` form of this command.

```
old-register-checksum
no old-register-checksum
```

**Syntax Description**
This command has no keywords or arguments.

**Command Default**
No default behavior or values

**Command Modes**
PIM configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Cisco IOS XR software accepts register messages with checksum on the Protocol Independent Multicast (PIM) header and the next 4 bytes only. This differs from the Cisco IOS method that accepts register messages with the entire PIM message for all PIM message types. The `old-register-checksum` command generates and accepts registers compatible with Cisco IOS software. This command is provided entirely for backward compatibility with Cisco IOS implementations.

**Note**
To allow interoperability with Cisco IOS rendezvous points running older software, run this command on all DRs in your network running Cisco IOS XR software. Cisco IOS XR register messages are incompatible with Cisco IOS software.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**
The following example shows how to set a source designated router (DR) to generate a register compatible with an earlier version of Cisco IOS XR PIM rendezvous point:

```
RP/0/RSP0/CPU0:router(config)# router pim
RP/0/RSP0/CPU0:router(config-pim-default-ipv4)# old-register-checksum
```
To enter Protocol Independent Multicast (PIM) configuration mode, use the `router pim` command in global configuration mode. To return to the default behavior, use the `no` form of this command.

```
router pim [address family {ipv4|ipv6}]
no router pim [address family {ipv4|ipv6}]
```

**Syntax Description**

- `address-family` (Optional) Specifies which address prefixes to use.
- `ipv4` (Optional) Specifies IPv4 address prefixes.
- `ipv6` (Optional) Specifies IPv6 address prefixes.

**Command Default**

The default is IPv4 address prefixes.

**Command Modes**

Global configuration

**Command History**

- **Release 3.7.2** This command was introduced.
- **Release 4.2.0** The `ipv6` keyword was added.

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

From PIM configuration mode, you can configure the address of a rendezvous point (RP) for a particular group, configure the nonstop forwarding (NSF) timeout value for the PIM process, and so on.

**Examples**

This example shows how to enter PIM configuration mode for IPv4 address prefixes:

```
RP/0/RSP0/CPU0:router(config)# router pim
RP/0/RSP0/CPU0:router(config-pim-default-ipv4)#
```

This example shows how to enter PIM configuration mode for IPv4 address prefixes and specify the `address-family ipv6` keywords:

```
RP/0/RSP0/CPU0:router(config)# router pim address-family ipv4
RP/0/RSP0/CPU0:router(config-pim-default-ipv4)#
```
RP/0/RSP0/CPU0:router(config)# router pim address-family ipv6
RP/0/RSP0/CPU0:router(config-pim-default-ipv6)#
rp-address

To statically configure the address of a Protocol Independent Multicast (PIM) rendezvous point (RP) for a particular group, use the `rp-address` command in PIM configuration mode. To return to the default behavior, use the `no` form of this command.

```
rp-address ip-address [group-access-list] [override] [bidir]
no rp-address ip-address [group-access-list] [override] [bidir]
```

**Syntax Description**
- `ip-address` (Required) IP address of a router to be a PIM rendezvous point. This address is a unicast IP address in four-part dotted-decimal notation.
- `group-access-list` (Optional) Name of an access list that defines for which multicast groups the rendezvous point should be used. This list is a standard IP access list.
- `override` (Optional) Indicates that if there is a conflict, the rendezvous point configured with this command prevails over the rendezvous point learned through the auto rendezvous point (Auto-RP) or BSR mechanism.
- `bidir` (Optional) Configures a bidirectional (bidir) rendezvous point.

**Command Default**
No PIM rendezvous points are preconfigured.

**Command Modes**
PIM configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

All routers within a common PIM sparse mode (PIM-SM) require the knowledge of the well-known PIM rendezvous point address. The address is learned through Auto-RP, BSR, or is statically configured using this command.

If the optional `group-access-list-number` argument is not specified, the rendezvous point for the group is applied to the entire IP multicast group range (224.0.0.0/4).

You can configure a single rendezvous point to serve more than one group. The group range specified in the access list determines the PIM rendezvous point group mapping. If no access list is specified, the rendezvous point default maps to 224/4.

If the rendezvous point for a group is learned through a dynamic mechanism, such as Auto-RP, this command might not be required. If there is a conflict between the rendezvous point configured with this command and one learned by Auto-RP, the Auto-RP information is used unless the `override` keyword is specified.
The following example shows how to set the PIM rendezvous point address to 10.0.0.1 for all multicast groups:

```
RP/0/RSP0/CPU0:router(config)# router pim
RP/0/RSP0/CPU0:router(config-pim-default-ipv4)# rp-address 10.0.0.1
```

The following example shows how to set the PIM rendezvous point address to 172.16.6.21 for groups 225.2.2.0 - 225.2.2.255:

```
RP/0/RSP0/CPU0:router(config)# ipv4 access-list 1
RP/0/RSP0/CPU0:router(config-ipv4-acl)# permit ipv4 any 225.2.2.0 0.0.0.255
RP/0/RSP0/CPU0:router(config-ipv4-acl)# exit
RP/0/RSP0/CPU0:router(config)# router pim
RP/0/RSP0/CPU0:router(config-pim-ipv4)# rp-address 172.16.6.21
```

```
RP/0/RSP0/CPU0:router(config)# router pim
RP/0/RSP0/CPU0:router(config-pim-default-ipv4)# rp-address 172.16.6.21
```

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

For information about routing policy commands and how to create a routing policy, see *Routing Command Reference for Cisco ASR 9000 Series Routers* and *Routing Configuration Guide for Cisco ASR 9000 Series Routers*.

To assign a route policy using an IPv6 address family prefix, you must enter the command as shown in the Examples section.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following examples show how to associate a specific routing policy in PIM with a RPF topology table for IPv4 address family prefixes:

```
RP/0/RSP0/CPU0:router(config)# router pim
RP/0/RSP0/CPU0:router(config-pim-default-ipv4)# rpf topology route-policy mypolicy
RP/0/RSP0/CPU0:router(config)# router pim address-family ipv6
RP/0/RSP0/CPU0:router(config-pim-default-ipv6)# rpf topology route-policy mypolicy
```
rpf-redirect

To assign a rpf-redirect route policy in PIM, use the `rpf-redirect route-policy` command in PIM command mode. To disable this configuration, use the `no` form of this command.

```
rpf-redirect route-policy policy-name
no rpf-redirect route-policy policy-name
```

**Syntax Description**  
`policy-name` (Required) Name of the specific route policy that you want PIM to associate with a reverse-path forwarding topology.

**Command Default**  
No default behavior or values

**Command Modes**  
PIM configuration

**Command History**  
```
<table>
<thead>

</thead>
<tbody>
<tr>
<td>4.3.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>
```

**Usage Guidelines**  
For information about routing policy commands and how to create a routing policy, see *Routing Command Reference for Cisco ASR 9000 Series Routers* and *Routing Configuration Guide for Cisco ASR 9000 Series Routers*.

**Task ID**  
```
<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>
```

**Example**

The following example shows how to associate a specific rpf-redirect routing policy to an rpf-redirect bundle for IPv4 address family prefixes:

```
RP/0/RSP0/CPU0:router (config)# router pim
RP/0/RSP0/CPU0:router (config-pim)# address-family ipv4
RP/0/RSP0/CPU0:router (config-pim-default-ipv4)# rpf-redirect route-policy <route-policy>
```
To enable Reverse Path Forwarding (RPF) vector signaling for Protocol Independent Multicast (PIM), use the `rpf-vector` command in PIM configuration mode. To return to the default behavior, use the `no` form of this command.

```
rpf-vector
no rpf-vector
```

**Syntax Description**
This command has no keywords or arguments.

**Command Default**
By default, RPF vector signaling is disabled.

**Command Modes**
PIM configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

RPF vector is a PIM proxy that lets core routers without RPF information forward join and prune messages for external sources (for example, a Multiprotocol Label Switching [MPLS]-based BGP-free core, where the MPLS core router is without external routes learned from Border Gateway Protocol [BGP]).

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**
The following example shows how to enable RPF vector:

```
RP/0/RSP0/CPU0:router(config)# router pim
RP/0/RSP0/CPU0:router(config-pim-default-ipv4)# rpf-vector
```
To enable Reverse Path Forwarding (RPF) vector signaling for Protocol Independent Multicast (PIM) that is RFC compliant, use the `rpf-vector use-standard-encoding` command in PIM configuration mode. To return to the default behavior, use the `no` form of this command.

```
rpf-vector use-standard-encoding [allow-ebgp | disable-ibgp]
```

**Syntax Description**
- `allow-ebgp` (Optional) Allows RPF vector to originate over an eBGP session.
- `disable-ibgp` (Optional) Disable RPF vector to originate over an iBGP session.

**Command Default**
By default, RPF vector signaling is disabled.

**Command Modes**
PIM configuration

**Command History**
- **Release 6.5.1** This command was introduced.

**Usage Guidelines**
RPF vector is a PIM proxy that lets core routers without RPF information forward join and prune messages for external sources (for example, a MPLS-based BGP-free core, where the MPLS core router is without external routes learned from BGP).

The RPF vector feature is RFC compliant. The new IETF standard encodes PIM messages using PIM Hello option 26.

**Examples**
The following example shows how to enable RPF vector:

```
RP/0/RSP0/CPU0:router(config)# router pim
RP/0/RSP0/CPU0:router(config-pim-default-ipv4)# rpf-vector use-standard-encoding
```
rp-static-deny

To configure the deny range of the static Protocol Independent Multicast (PIM) rendezvous point (RP), use the `rp-static-deny` command in PIM configuration mode. To return to the default behavior, use the `no` form of this command.

```
rp-static-deny access-list
no rp-static-deny
```

**Syntax Description**

| access-list | Name of an access list. This list is a standard IP access list. |

**Command Default**

No default behavior or values

**Command Modes**

PIM configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

**Examples**

The following example shows how to configure the PIM RP deny range:

```
RP/0/RSP0/CPU0:router(config)# router pim
RP/0/RSP0/CPU0:router(config-pim-default-ipv4)# rp-static-deny listA
```

**Related Commands**

</tbody>
</table>
show auto-rp candidate-rp

To display the group ranges that this router represents (advertises) as a candidate rendezvous point (RP), use the `show auto-rp candidate-rp` command in EXEC mode.

```
show auto-rp [ipv4] candidate-rp
```

**Syntax Description**
- ipv4 (Optional) Specifies IPv4 address prefixes.

**Command Default**
IPv4 addressing is the default.

**Command Modes**
EXEC

**Command History**
- **Release** Modification
  - Release 3.7.2 This command was introduced.

**Usage Guidelines**
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `show auto-rp candidate-rp` command displays all the candidate rendezvous points configured on this router.

Information that is displayed is the time-to-live (TTL) value; the interval from which the rendezvous point announcements were sent; and the mode, such as Protocol Independent Multicast (PIM) sparse mode (SM), to which the rendezvous point belongs.

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read</td>
</tr>
</tbody>
</table>

**Examples**
The following is sample output from the `show auto-rp candidate-rp` command:

```
RP/0/RSP0/CPU0:router# show auto-rp candidate-rp
Group Range Mode  Candidate RP  ttl  interval
224.0.0.0/4 SM       10.0.0.6   30  30
```

This table describes the significant fields shown in the display.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>

show pim context table

To display a summary list of all tables currently configured for a VRF context, use the `show pim context table` command in EXEC mode.

```
show pim [vrf vrf-name] [ipv4] context table
```

**Syntax Description**

- `vrf vrf-name` (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- `ipv4` (Optional) Specifies IPv4 address prefixes.

**Command Default**

IPv4 addressing is the default. If no VRF is specified, the default VRF is operational.

**Command Modes**

EXEC

**Command History**

- **Release**: 3.7.2
- **Modification**: This command was introduced.

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

**Task ID**

- **Task ID Operations**
  - `multicast read`

**Examples**

The following example illustrates the output for PIM table contexts for a VRF default after using the `show pim context table` command:

```
RP/0/ RSP0/CPU0:router# show pim ipv4 context table

PIM Table contexts for VRF default

</tbody>
</table>
**show pim global summary**

To display configured Protocol Independent Multicast (PIM) out-of-resource (OOR) limits and current counts for all VRFs, use the `show pim global summary` command in EXEC mode.

**Syntax Description**

This command has no keywords or arguments.

**Command Default**

None

**Command Modes**

EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `show pim global summary` command to display global limits that are shared by all VRFs.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read</td>
</tr>
</tbody>
</table>

**Examples**

The following is sample output from the `show pim global summary` command that shows PIM routes, with the maximum number of routes allowed being 100000:

```
RP/0/RSP0/CPU0:router# show pim global summary

PIM Global Summary

PIM State Counters

<table>
<thead>

</table>
show pim group-map

To display group-to-PIM mode mapping, use the `show pim group-map` command in EXEC mode.

```
show pim [vrf vrf-name] [ipv4] group-map [ip-address-name] [info-source]
```

**Syntax Description**

- **vrf vrf-name** (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- **ipv4** (Optional) Specifies IPv4 address prefixes.
- **ip-address-name** (Optional) IP address name as defined in the Domain Name System (DNS) hosts table or with the domain **ipv4** host in the format **A.B.C.D**.
- **info-source** (Optional) Displays the group range information source.

**Command Default**

IPv4 addressing is the default. If no VRF is specified, the default VRF is operational.

**Command Modes**

- EXEC

**Command History**

- Release 3.7.2 This command was introduced.

**Usage Guidelines**

- To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

- The `show pim group-map` command displays all group protocol address mappings for the rendezvous point. Mappings are learned from different clients or through the auto rendezvous point (Auto-RP) mechanism.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read</td>
</tr>
</tbody>
</table>

**Examples**

The following is sample output from the `show pim group-map` command:

```
RP/0/RSP0/CPU0:router# show pim group-map

IP PIM Group Mapping Table
(* indicates group mappings being used)
(+ indicates BSR group mappings active in MRIB)

<table>
<thead>
<tr>
<th>Group Range</th>
<th>Proto</th>
<th>Client</th>
<th>Groups</th>
<th>RP address</th>
<th>Info</th>
</tr>
</thead>
<tbody>
<tr>
<td>224.0.1.39/32*</td>
<td>DM</td>
<td>perm</td>
<td>1</td>
<td>0.0.0.0</td>
<td></td>
</tr>
<tr>
<td>224.0.1.40/32*</td>
<td>DM</td>
<td>perm</td>
<td>1</td>
<td>0.0.0.0</td>
<td></td>
</tr>
<tr>
<td>224.0.0.0/24*</td>
<td>NO</td>
<td>perm</td>
<td>0</td>
<td>0.0.0.0</td>
<td></td>
</tr>
</tbody>
</table>
```
In lines 1 and 2, Auto-RP group ranges are specifically denied from the sparse mode group range.

In line 3, link-local multicast groups (224.0.0.0 to 224.0.0.255 as defined by 224.0.0.0/24) are also denied from the sparse mode group range.

In line 4, the Protocol Independent Multicast (PIM) Source Specific Multicast (PIM-SSM) group range is mapped to 232.0.0.0/8.

Line 5 shows that all the remaining groups are in sparse mode mapped to rendezvous point 10.10.3.2.

This table describes the significant fields shown in the display.

### Table 44: show pim interface Field Descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Address</td>
<td>IP address of the interface.</td>
</tr>
<tr>
<td>Interface</td>
<td>Interface type and number that is configured to run PIM.</td>
</tr>
<tr>
<td>PIM</td>
<td>PIM is turned off or turned on this interface.</td>
</tr>
<tr>
<td>Nbr Count</td>
<td>Number of PIM neighbors in the neighbor table for the interface.</td>
</tr>
<tr>
<td>Hello Intvl</td>
<td>Frequency, in seconds, of PIM hello messages, as set by the <code>ip pim hello-interval</code> command in interface configuration mode.</td>
</tr>
<tr>
<td>DR Priority</td>
<td>Designated router priority is advertised by the neighbor in its hello messages.</td>
</tr>
</tbody>
</table>
### Field | Description
--- | ---
DR | IP address of the DR on the LAN. Note that serial lines do not have DRs, so the IP address is shown as 0.0.0.0. If the interface on this router is the DR, “this system” is indicated; otherwise, the IP address of the external neighbor is given.

### Related Commands

</table>
show pim join-prune statistic

To display Protocol Independent Multicast (PIM) join and prune aggregation statistics, use the `show pim join-prune statistics` command in EXEC mode.

```
show pim [vrf vrf-name] [ipv4] join-prune statistic [type interface-path-id]
```

**Syntax Description**

- **vrf vrf-name**: (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- **ipv4**: (Optional) Specifies IPv4 address prefixes.
- **type**: (Optional) Interface type. For more information, use the question mark (?) online help function.
- **interface-path-id**: (Optional) Physical interface or virtual interface.

**Note** Use the `show interfaces` command in EXEC mode to see a list of all interfaces currently configured on the router.

For more information about the syntax for the router, use the question mark (?) online help function.

**Command Default**

IP addressing is the default. If no VRF is specified, the default VRF is operational.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `show pim join-prune statistics` command displays the average PIM join and prune groups for the most recent packets (in increments of 1000/10000/50000) that either were sent out or received from each PIM interface. If fewer than 1000/10000/50000 join and prune group messages are received since PIM was started or the statistics were cleared, the join-prune aggregation shown in the command display is zero (0).

Because each PIM join and prune packet can contain multiple groups, this command can provide a snapshot view of the average pace based on the number of join and prune packets, and on the consideration of the aggregation factor of each join and prune packet.

**Examples**

The following is sample output from the `show pim join-prune statistics` command with all router interfaces specified:
RP/0/RSP0/CPU0:router# show pim join-prune statistics

PIM Average Join/Prune Aggregation for last (100/1K/10K) packets

<table>
<thead>
<tr>
<th>Interface</th>
<th>MTU</th>

</tbody>
</table>
**show pim rpf-redirect**

To display the maximum bandwidth, the bandwidth used by traffic flowing through the local box, and the bandwidth used by other routers sharing the PIM bundle member interfaces of all members of bundles known to the system, use `show pim rpf-redirect` command in EXEC mode.

```
show pim  ipv4 rpf-redirect
```

**Syntax Description**

`ipv4` (Optional) Specifies IPv4 address prefixes.

**Command Default**

IPv4 addressing is the default.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 4.3.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- **Task ID**
  - multicast read

**Example**

The following sample output from the `show pim rpf-redirect` command displays statistics about the PIM bundles:

```
RP/0/RSP0/CPU0:router#show pim rpf-redirect
Mon Aug 11 16:50:35.811 IST
PIM RPF-Redirect bundle database

Member   Available/Allocated   Available/Allocated   Local / Network   Total
                          Bandwidth   Threshold Bandwidth   Bandwidth (Kbps)
Gi0/0/0/0  100000/100000  80000/80000  0/0      0

Bundle: east
```

where, Available/Allocated Bandwidth (kbps) is the total multicast bandwidth (in kbps) available/allocated for multicast transmission; Available/Threshold Bandwidth (kbps) is the multicast bandwidth threshold beyond which the redirects are enabled, displays the available and the threshold bandwidth (kbps); Local/Network Bandwidth (in kbps) is the difference between the Allocated Bandwidth and Available Bandwidth; and the Total Bandwidth (kbps) is represented by the Local/Network Bandwidth.
show pim rpf-redirect route

To display the content of the snooping database, use `show pim rpf-redirect` command in EXEC mode.

```
show pim  ipv4 rpf-redirect route
```

<table>

</table>
show pim mstatic

To display multicast static routing information, use the **show pim mstatic** command in EXEC mode.

```
show pim [ipv4] mstatic [ipv4]
```

**Syntax Description**

- **ipv4** (Optional) Specifies IPv4 address prefixes.

**Command Default**

IPv4 addressing is the default.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Release 3.7.2 This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The **show pim mstatic** command is used to view all the multicast static routes. Multicast static routes are defined by the **static-rpf** command.

**Task ID**

- **Task ID**
  - multicast
  - read

**Examples**

The following is sample output from the **show pim mstatic** command that shows how to reach IP address 10.0.0.1:

```
RP/0/RSP0/CPU0:router# show pim mstatic

IP Multicast Static Routes Information
* 10.0.0.1/32 via pos0/1/0/1 with nexthop 172.16.0.1 and distance 0
```

This table describes the significant fields shown in the display.

show pim neighbor

To display the Protocol Independent Multicast (PIM) neighbors discovered by means of PIM hello messages, use the `show pim neighbor` command in EXEC mode.

```
show pim [vrf vrf-name] [ipv4] neighbor [type interface-path-id] [{count|detail}]
```

**Syntax Description**

- `vrf vrf-name` (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- `ipv4` (Optional) Specifies IPv4 address prefixes.
- `type` (Optional) Interface type. For more information, use the question mark (?) online help function.
- `interface-path-id` (Optional) Physical interface or virtual interface.

**Note** Use the `show interfaces` command in EXEC mode to see a list of all interfaces currently configured on the router.

For more information about the syntax for the router, use the question mark (?) online help function.

- `count` (Optional) Number of neighbors present on the specified interface, or on all interfaces if one is not specified. The interface on this router counts as one neighbor in the total count.
- `detail` (Optional) Displays detailed information.

**Command Default**

IPv4 addressing is the default. If no VRF is specified, the default VRF is operational.

**Command Modes**

EXEC

**Command History**

<table>
<thead>

show pim nsf

To display the state of nonstop forwarding (NSF) operation for Protocol Independent Multicast (PIM), use the `show pim nsf` command in EXEC mode.

```
show pim [ipv4] nsf
```

**Syntax Description**
- `ipv4` (Optional) Specifies IPv4 address prefixes.

**Command Default**
IPv4 addressing is the default.

**Command Modes**
EXEC

**Command History**
- **Release** Modification
  - Release 3.7.2 This command was introduced.

**Usage Guidelines**
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `show pim nsf` command displays the current multicast NSF state for PIM. For multicast NSF, the state may be normal or activated for nonstop forwarding. The latter state indicates that recovery is in progress due to a failure in the Multicast Routing Information Base (MRIB) or PIM. The total NSF timeout and time remaining are displayed until NSF expiration.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read</td>
</tr>
</tbody>
</table>

**Examples**

The following is sample output from the `show pim nsf` command:

```
RP/0/RSP0/CPU0:router# show pim nsf
IP PIM Non-Stop Forwarding Status:
Multicast routing state: Non-Stop Forwarding Activated
NSF Lifetime: 00:02:00
NSF Time Remaining: 00:01:56
```
This table describes the significant fields shown in the display.

<td>NSF Time Remaining</td>
<td>Time remaining in NSF recovery for PIM if NSF recovery is activated.</td>
</tr>
</tbody>
</table>
show pim nsr

To display the nonstop routing (NSR) information for Protocol Independent Multicast (PIM), use the show pim nsr command in EXEC mode.

show pim [ipv4|ipv6] nsr

Syntax Description

ipv4 (Optional) Specifies IPv4 address prefixes.

ipv6 (Optional) Specifies IPv6 address prefixes.

Command Default

IPv4 addressing is the default.

Command Modes

EXEC

Command History

Release Modification

5.2.2 This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The show pim nsr command displays the current multicast NSR state for PIM. For multicast NSR, the state may be Ready or Not activated for non-stop routing. The latter state indicates that recovery is in progress due to a failure in the Multicast Routing Information Base (MRIB) or PIM. The total NSR timeout and time remaining are displayed until NSR expiration.

Task ID

<table>
<thead>
<tr>
<th>Task ID</th>

show pim range-list

To display range-list information for Protocol Independent Multicast (PIM), use the show pim range-list command in EXEC mode.

```
show pim [vrf vrf-name] [ipv4] range-list [config] [ip-address-name]
```

**Syntax Description**

- **vrf vrf-name** (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- **ipv4** (Optional) Specifies IPv4 address prefixes.
- **config** (Optional) Displays PIM command-line interface (CLI) range list information.
- **ip-address-name** (Optional) IP address of the rendezvous point.

**Command Default**
IPv4 addressing is the default. If no VRF is specified, the default VRF is operational.

**Command Modes**
EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The show pim range-list command is used to determine the multicast forwarding mode to group mapping. The output also indicates the rendezvous point (RP) address for the range, if applicable. The config keyword means that the particular range is statically configured.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read</td>
</tr>
</tbody>
</table>

**Examples**

The following is sample output from the show pim range-list command:

```
RP/0/RSP0/CPU0:router# show pim range-list

config SSM Exp: never Src: 0.0.0.0
230.0.0.0/8 Up: 03:47:09
config BD RP: 172.16.1.3 Exp: never Src: 0.0.0.0
239.0.0.0/8 Up: 03:47:16
config SM RP: 172.18.2.6 Exp: never Src: 0.0.0.0
235.0.0.0/8 Up: 03:47:09
```
This table describes the significant fields shown in the display.

### Table 50: show pim range-list Field Descriptions

show pim rpf

To display information about reverse-path forwarding (RPF) in one or more routing tables within Protocol Independent Multicast (PIM), use the **show pim rpf** command in EXEC mode.

```
show pim [vrf vrf-name] [ipv4] {multicast|safi-all|unicast} [topology {tablename|all}] rpf [ip-address/name]
```

**Syntax Description**
- `vrf vrf-name` (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- `ipv4` (Optional) Specifies IPv4 address prefixes.
- `multicast` (Optional) Specifies a multicast secondary address family (SAFI).
- `safi-all` (Optional) Specifies a secondary address family (SAFI) wildcard.
- `unicast` (Optional) Specifies a unicast secondary address family (SAFI).
- `topology` (Optional) Specifies the display of multitopology routing table information.
- `table-name` Name of the specific multitopology table to show.
- `all` Specifies that detailed information be displayed for all multitopology routing tables in PIM.
- `ip-address/name` (Optional) IP address or name, or both, for the default or selected route policy with the domain IPv4 host in the format `A.B.C.D`.

**Note** The `ip-address` argument can also be a Protocol Independent Multicast (PIM) rendezvous point (RP) address.

**Command Default**
IPv4 addressing is the default. If no VRF is specified, the default VRF is operational.

**Command Modes**
EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

**Task ID**
- `Task ID  Operations`
- `multicast  read`
The following example shows output from the `show pim rpf` command:

```
RP/0/RSP0/CPU0:router# show pim rpf
Table: IPv4-Unicast-default
* 61.61.1.10/32 [90/181760]
  via GigabitEthernet0/1/0/1.201 with rpf neighbor 11.21.0.20
  via GigabitEthernet0/1/0/1.202 with rpf neighbor 11.22.0.20
  via GigabitEthernet0/1/0/1.203 with rpf neighbor 11.23.0.20
* 61.61.1.91/32 [90/181760]
  via GigabitEthernet0/1/0/1.201 with rpf neighbor 11.21.0.20

  via GigabitEthernet0/1/0/1.203 with rpf neighbor 11.23.0.20
```
show pim rpf hash

To display information for Routing Information Base (RIB) lookups used to predict RPF next-hop paths for routing tables in Protocol Independent Multicast (PIM), use the `show pim rpf hash` command in EXEC mode.

```
show pim [vrf vrf-name] [ipv4] [[multicast|safi-all|unicast]] [topology {table-name|all}] rpf hash root/group ip-address/name [{hash-mask-length bit-length|mofrr}]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrf vrf-name</td>
<td>(Optional) Specifies a VPN routing and forwarding (VRF) instance.</td>
</tr>

<tr>
<td>name</td>
<td>the domain <code>ipv4</code> host in the format <code>A.B.C.D</code>.</td>
</tr>
<tr>
<td>hash-mask-length bit-length</td>
<td>(Optional) Specifies the bootstrap router (BSR) hash mask length to be applied to the next-hop hashing. Default is the BSR hash mask length known for the matching group range (or host mask length if BSR is not configured for the range). The range in bit length is 0 to 32.</td>
</tr>
<tr>
<td>mofrr</td>
<td>(Optional) Specifies MOFRR hashing.</td>
</tr>
</tbody>
</table>

**Command Default**

IPv4 addressing is the default. If no VRF is specified, the default VRF is operational.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.
The `show pim rpf hash` command lets you predict the way routes balance across Equal-Cost Multipath (ECMP) next hops. It does not require that route to exist in the Multicast Routing Information Base (MRIB) at the time.

When using the `ip-address` argument for a (*,G) route, use the rendezvous point address and omit the `group-address` argument. For (S,G) routes, use the `ip-address` and the `group-address` arguments.

### Examples

When you use the `show pim rpf hash` command, Cisco IOS XR software displays statistics regarding route policy invocations in topology tables:

```
RP/0/RSP0/CPU0:router# show pim rpf hash 10.0.0.1 239.0.0.1
Multipath RPF selection is enabled.
RPF next-hop neighbor selection result: POS0/2/0,10.1.0.1
```

The following example shows the results from use of the `mofrr` keyword:

```
RP/0/RSP0/CPU0:router# show pim rpf hash 11.11.0.4 226.1.1.2 mofrr
Table: IPv4-Unicast-default
Multipath RPF selection is enabled.
RPF next-hop neighbor selection result: POS0/2/0/0,10.1.0.1
Secondary RPF next-hop neighbor selection result: GigabitEthernet0/4/0/4,55.55.55.101
```

```
RP/0/RSP0/CPU0:router# show pim ipv4 rpf route-policy test 10.11.11.11 225.2.0.1

RPF route-policy test for VRF default:
Route-policy name: mt4-p2
Source 10.11.11.11, Group 225.2.0.1
Result: Pass
Default RPF Table selected
RPF Table: IPv4-Unicast-default (Created, Active)
```
This table describes the significant fields shown in the display.

**Table 52: show pim rpf route-policy test Field Descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Route-policy name</td>
<td>Name of a specific route policy.</td>
</tr>
<tr>
<td>Source</td>
<td>Source IP name for the route policy.</td>
</tr>
<tr>
<td>Group</td>
<td>Group IP name for the route policy.</td>
</tr>
<tr>
<td>Result</td>
<td>Specifies whether the (S,G) entry was accepted by the route policy.</td>
</tr>
<tr>
<td>Default RPF Table</td>
<td>Specifies whether the (S,G) entry uses the default or a specific RPF table.</td>
</tr>
<tr>
<td>RPF Table</td>
<td>Specifies which RPF table was selected, and whether or not the table was created in PIM and is active.</td>
</tr>
</tbody>
</table>
show pim rpf summary

To display summary information about the interaction of Protocol Independent Multicast (PIM) with the Routing Information Base (RIB), including the convergence state, current default RPF table, and the number of source or rendezvous point registrations created, use the **show pim rpf summary** command in EXEC mode.

```
show pim [vrf vrf-name] [ipv4] [{multicast|safi-all|unicast}] [topology {table-name|all}] rpf summary
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrf vrf-name</td>
<td>(Optional) Specifies a VPN routing and forwarding (VRF) instance.</td>
</tr>
<tr>
<td>ipv4</td>
<td>(Optional) Specifies IPv4 address prefixes.</td>
</tr>
<tr>
<td>multicast</td>
<td>(Optional) Specifies a multicast secondary address family (SAFI).</td>
</tr>
<tr>
<td>safi-all</td>
<td>(Optional) Specifies a secondary address family (SAFI) wildcard.</td>
</tr>
<tr>
<td>unicast</td>
<td>(Optional) Specifies a unicast secondary address family (SAFI).</td>
</tr>
<tr>
<td>topology</td>
<td>(Optional) Specifies the display of multitopology routing table information.</td>
</tr>
<tr>
<td>table-name</td>
<td>Name of the specific multitopology table to show.</td>
</tr>
<tr>
<td>all</td>
<td>Specifies that detailed information be displayed for all multitopology routing tables in PIM.</td>
</tr>
</tbody>
</table>

**Command Default**

IPv4 addressing is the default. If no VRF is specified, the default VRF is operational.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read</td>
</tr>
</tbody>
</table>

**Examples**

The following sample output shows RPF information for multiple tables. The first part of the output example describes VRF-level information. The remainder consists of information specific to one or more tables.
RPF table indicates the table in which the RPF lookup was performed for this route entry.

```
RP/0/RSP0/CPU0:router# show pim ipv4 unicast topology all rpf summary

MBGP Not configured
  OSPF Mcast-intact Not configured
  ISIS Mcast-intact Not configured
  ISIS Mcast Topology Not configured

PIM RPFs registered with Unicast RIB table

Default RPF Table: IPv4-Unicast-default
  RIB Convergence Timeout Value: 00:30:00
  RIB Convergence Time Left: 00:00:00
  Multipath RPF Selection is Enabled

Table: IPv4-Multicast-default
  PIM RPF Registrations = 0
  RIB Table converged

Table: IPv4-Multicast-t300
  PIM RPF Registrations = 3
  RIB Table converged

Table: IPv4-Multicast-t310
  PIM RPF Registrations = 5
  RIB Table converged

Table: IPv4-Multicast-t320
  PIM RPF Registrations = 5
  RIB Table converged

The first part of the output example describes VRF-level information. The remainder consists of information specific to one or more tables.

The following example shows the sample output for `show pim rpf summary` command:

```
RP/0/RSP0/CPU0:router# show pim rpf summary

MBGP Not configured
  OSPF Mcast-intact Configured
  ISIS Mcast-intact Not configured
  ISIS Mcast Topology Not configured
  MoFRR Flow-based Configured
  MoFRR RIB Not configured

PIM RPFs registered with Multicast RIB table

Default RPF Table: IPv4-Multicast-default
  RIB Convergence Timeout Value: 00:30:00
  RIB Convergence Time Left: 00:00:00
  Multipath RPF Selection is Disabled

Table: IPv4-Multicast-default
  PIM RPF Registrations = 3
  RIB Table converged
```
show pim summary

To display configured Protocol Independent Multicast (PIM) out-of-resource (OOR) limits and current counts, use the `show pim summary` command in EXEC mode.

```
show pim [vrf vrf-name] [ipv4] summary
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrf vrf-name</td>
<td>(Optional) Specifies a VPN routing and forwarding (VRF) instance associated with this count.</td>
</tr>
<tr>
<td>ipv4</td>
<td>(Optional) Specifies IPv4 address prefixes.</td>
</tr>
</tbody>
</table>

**Command Default**

IPv4 addressing is the default. If no VRF is specified, the default VRF is operational.

**Command Modes**

EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `show pim summary` command is used to identify configured OOR information for the PIM protocol, such as number of current and maximum routes.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read</td>
</tr>
</tbody>
</table>

**Examples**

The following is sample output from the `show pim summary` command that shows PIM routes, with the maximum number of routes allowed being 100000:

```
RP/0/RSP0/CPU0:router# show pim summary

PPIM Summary for VRF:default

PIM State Counters

<table>
<thead>
<tr>
<th>Counters</th>
<th>Current</th>
<th>Maximum</th>
<th>Warning-threshold</th>
</tr>
</thead>
<tbody>
<tr>
<td>Routes</td>

</tr>
<tr>
<td>BSR C-RP caches</td>
<td>The number of candidate-RP caches in BSR and the set range.</td>
</tr>
</tbody>
</table>
show pim topology

To display Protocol Independent Multicast (PIM) routing topology table information for a specific group or all groups, use the `show pim topology` command in EXEC mode.

```
show pim [vrf vrf-name] [ipv4] topology [src-ip-address / grp-address]
```

**Syntax Description**
- `vrf vrf-name` (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- `ipv4` (Optional) Specifies IPv4 address prefixes.
- `src-ip-address / grp-address` Source IP address or group IP address, as defined in the Domain Name System (DNS) hosts table or with the domain IPv4 host in the format `A.B.C.D`.

**Command Default**
IPv4 addressing is the default. If no VRF is specified, the default VRF is operational.

**Command Modes**
EXEC

**Command History**
Release 3.7.2  This command was introduced.

**Usage Guidelines**
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the PIM routing topology table to display various entries for a given group, (`*`, G), (S, G), and (S, G) RPT, each with its own interface list.

PIM communicates the contents of these entries through the Multicast Routing Information Base (MRIB), which is an intermediary for communication between multicast routing protocols, such as PIM; local membership protocols, such as Internet Group Management Protocol (IGMP); and the multicast forwarding engine of the system.

The MRIB shows on which interface the data packet should be accepted and on which interfaces the data packet should be forwarded, for a given (S, G) entry. Additionally, the Multicast Forwarding Information Base (MFIB) table is used during forwarding to decide on per-packet forwarding actions.

When multicast-only fast reroute (MoFRR) feature is enabled, the `show pim topology` command shows the SGs that are configured for MoFRR. For information about the MoFRR primary and secondary paths, see the description of the command `show pim topology` detail, on page 581.

**Note**
For forwarding information, use the `show mfib route` and `show mrib route` commands.
The following is sample output from the `show pim topology` command:

```
RP/0/RSP0/CPU0:router# show pim topology

Table 54: show pim topology Field Descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(11.0.0.1,239.9.9.9)SPT</td>
<td>Entry state. Source address, group address, and tree flag (shortest path tree or rendezvous point tree) for the route entry. Note that the tree flag may be missing from the entry.</td>
</tr>
<tr>
<td>SM</td>
<td>Entry protocol. PIM protocol mode in which the entry operates: sparse mode (SM), source specific multicast (SSM), bidirectional (BD), or dense-mode (DM).</td>
</tr>
<tr>
<td>Up: 00:00:13</td>
<td>Entry uptime. Time (in hours, minutes, and seconds) this entry has existed in the topology table.</td>
</tr>
<tr>
<td>RP: 11.0.0.1*</td>
<td>Entry information. Additional information about the route entry. If route entry is a sparse mode or bidirectional PIM route, the RP address is given.</td>
</tr>
<tr>
<td>JP: Null(never)</td>
<td>Entry join/prune state. Indicates if and when a join or prune message is sent to the RPF neighbor for the route.</td>
</tr>
<tr>
<td>MoFRR RIB, Flags:</td>
<td>Indicates whether the (S,G) route is a RIB-based MoFRR route.</td>
</tr>
</tbody>
</table>
### Description

Indicates whether the (S,G) route is a flow-based MoFRR route. By default, a flow-based MoFRR route will be a RIB-based MoFRR route but not in the reverse way.

### RPF Table

IPv4 Unicast default.

### RPF Secondary

Secondary path interface

### Entry Information Flags

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>KAT - Keep Alive Timer</td>
<td>The keepalive timer tracks whether traffic is flowing for the (S, G) route on which it is set. A route does not time out while the KAT is running. The KAT runs for 3.5 minutes, and the route goes into KAT probing mode for as long as 65 seconds. The route is deleted if no traffic is seen during the probing interval, and there is no longer any reason to keep the route—for example, registers and (S, G) joins.</td>
</tr>
<tr>
<td>AA - Assume Alive</td>
<td>Flag that indicates that the route was alive, but recent confirmation of traffic flow was not received.</td>
</tr>
<tr>
<td>PA - Probe Alive</td>
<td>Flag that indicates that the route is probing the data plane to determine if traffic is still flowing for this route before it is timed out.</td>
</tr>
<tr>
<td>RA - Really Alive</td>
<td>Flag that indicates that the source is confirmed to be sending traffic for the route.</td>
</tr>
<tr>
<td>LH - Last Hop</td>
<td>Flag that indicates that the entry is the last-hop router for the entry. If (S, G) routes inherit the LH list from an (<em>, G) route, the route entry LH flag appears only on the (</em>, G) route.</td>
</tr>
<tr>
<td>IA - Inherit Alive</td>
<td>Flag that indicates a source VPN routing and forwarding (VRF) route with the KAT active.</td>
</tr>
<tr>
<td>DSS - Don’t Signal Sources</td>
<td>Flag that may be set on the last-hop (*, G) entries that indicates that new matching sources should not be signaled from the forwarding plane.</td>
</tr>
<tr>
<td>DCC - Don’t Check Connected</td>
<td>Flag that is set when the KAT probes, which indicates that the connected check for new sources should be omitted in the forwarding plane.</td>
</tr>
<tr>
<td>RR - Register Received</td>
<td>Flag that indicates that the RP has received and answered PIM register messages for this (S, G) route.</td>
</tr>
<tr>
<td>SR - Sending Registers</td>
<td>Flag that indicates that the first-hop DR has begun sending registers for this (S, G) route, but has not yet received a Register-Stop message.</td>
</tr>
<tr>
<td>E - MSDP External</td>
<td>Flag that is set on those entries that have sources, learned through Multicast Source Discovery Protocol (MSDP), from another RP.</td>
</tr>
<tr>
<td>ME - MDT Encap</td>
<td>Flag that indicates a core encapsulation route for a multicast distribution tree (MDT).</td>
</tr>
<tr>
<td>MD - MDT Decap</td>
<td>Flag that indicates a core decapsulation route for an MDT.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>MT - Crossed Data MDT threshold</td>
<td>Flag that indicates that traffic on this route passed a threshold for the data MDT.</td>
</tr>
<tr>
<td>MA - Data MDT group assigned</td>
<td>Flag that indicates a core encapsulation route for the data MDT.</td>
</tr>
<tr>
<td>POS0/2/0/0</td>
<td>Interface name. Name of an interface in the interface list of the entry.</td>
</tr>
<tr>
<td>03:54:23</td>
<td>Interface uptime. Time (in hours, minutes, and seconds) this interface has existed in the entry.</td>
</tr>
<tr>
<td>off</td>
<td>Interface forwarding status. Outgoing forwarding status of the interface for the entry is “fwd” or “off”.</td>
</tr>
</tbody>
</table>

**Interface Information Flags**

<table>
<thead>
<tr>
<th>Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LI - Local Interest</td>
<td>Flag that indicates that there are local receivers for this entry on this interface, as reported by Internet Group Management Protocol (IGMP).</td>
</tr>
<tr>
<td>LD - Local Disinterest</td>
<td>Flag that indicates that there is explicit disinterest for this entry on this interface, as reported by IGMP exclude mode reports.</td>
</tr>
<tr>
<td>II - Internal Interest</td>
<td>Flag that indicates that the host stack of the router has internal receivers for this entry.</td>
</tr>
<tr>
<td>ID - Internal Disinterest</td>
<td>Flag that indicates that the host stack of the router has explicit internal disinterest for this entry.</td>
</tr>
<tr>
<td>LH - Last Hop</td>
<td>Flag that indicates that this interface has directly connected receivers and this router serves as a last hop for the entry. If the (S, G) outgoing interface list is inherited from a (<em>, G) route, the LH flag is set on the (</em>, G) outgoing LH interface.</td>
</tr>
<tr>
<td>AS - Assert</td>
<td>Flag that indicates that a PIM assert message was seen on this interface and the active PIM assert state exists.</td>
</tr>
<tr>
<td>AB - Administrative Boundary</td>
<td>Flag that indicates that forwarding on this interface is blocked by a configured administrative boundary for this entry’s group range.</td>
</tr>
</tbody>
</table>

</tbody>
</table>
show pim topology detail

To display detailed Protocol Independent Multicast (PIM) routing topology information that includes references to the tables in which reverse path forwarding (RPF) lookups occurred for specific topology route entries, use the `show pim topology detail` command in EXEC mode.

```
show pim [vrf vrf-name] [ipv4] topology detail
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrf vrf-name</td>
<td>(Optional) Specifies a VPN routing and forwarding (VRF) instance.</td>
</tr>
<tr>
<td>ipv4</td>
<td>(Optional) Specifies IPv4 address prefixes.</td>
</tr>
</tbody>
</table>

**Command Default**
IPv4 addressing is the default. If no VRF is specified, the default VRF is operational.

**Command Modes**
EXEC

**Command History**
Release 3.7.2 This command was introduced.

**Usage Guidelines**
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the PIM topology table to display various entries for a given group, (*, G), (S, G), and (S, G)RPT, each with its own interface list.

PIM communicates the contents of these entries through the Multicast Routing Information Base (MRIB), which is an intermediary for communication between multicast routing protocols, such as PIM; local membership protocols, such as Internet Group Management Protocol (IGMP); and the multicast forwarding engine of the system.

The MRIB shows on which interface the data packet should be accepted and on which interfaces the data packet should be forwarded, for a given (S, G) entry. Additionally, the Multicast Forwarding Information Base (MFIB) table is used during forwarding to decide on per-packet forwarding actions.

When the multicast-only fast reroute (MoFRR) feature is enabled, the `show pim topology detail` command shows the primary and secondary paths for SGs configured for MoFRR.

**Note**
For forwarding information, use the `show mfib route` and `show mrib route` commands.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read</td>
</tr>
</tbody>
</table>
Examples

The following is sample output from the `show pim topology detail` command, showing the RPF table information for each topology entry:

```

show pim topology entry-flag

To display Protocol Independent Multicast (PIM) routing topology information for a specific entry flag, use the `show pim topology entry-flag` command in EXEC mode.

```
show pim [vrf vrf-name] [ipv4] topology entry-flag flag [detail|route-count]
```

**Syntax Description**

- `vrf vrf-name` (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- `ipv4` (Optional) Specifies IPv4 address prefixes.
- `flag` Configures a display of routes with the specified entry flag. Valid flags are the following:
  - AA — Assume alive
  - DCC — Don’t check connected
  - DSS — Don’t signal sources
  - E — MSDP External
  - EX — Extranet flag set
  - IA — Inherit except flag set
  - KAT — Keepalive timer
  - LH — Last hop
  - PA — Probe alive
  - RA — Really alive
  - RR — Registered receiver
  - SR — Sending registers
- `detail` (Optional) Specifies details about the entry flag information.
- `route-count` (Optional) Displays the number of routes in the PIM topology table.

**Command Default**

IPv4 addressing is the default. If no VRF is specified, the default VRF is operational.

**Command Modes**

EXEC

**Command History**

Release 3.7.2  This command was introduced.

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the PIM topology table to display various entries for a given group, (*, G), (S, G), and (S, G)RPT, each with its own interface list.
PIM communicates the contents of these entries through the Multicast Routing Information Base (MRIB), which is an intermediary for communication between multicast routing protocols, such as PIM; local membership protocols, such as Internet Group Management Protocol (IGMP); and the multicast forwarding engine of the system.

The MRIB shows on which interface the data packet should be accepted and on which interfaces the data packet should be forwarded, for a given (S, G) entry. Additionally, the Multicast Forwarding Information Base (MFIB) table is used during forwarding to decide on per-packet forwarding actions.

For forwarding information, use the `show mfib route` and `show mrib route` commands.

The following is sample output from the `show pim topology entry-flag` command:

```
RP/0/RSP0/CPU0:router# show pim topology entry-flag E

IP PIM Multicast Topology Table
Entry state: (*/S,G)[RPT/SPT] Protocol Uptime Info
Entry flags: KAT - Keep Alive Timer, AA - Assume Alive, PA - Probe Alive

show pim tunnel info

To display information for the Protocol Independent Multicast (PIM) tunnel interface, use the `show pim tunnel info` command in EXEC mode.

```
show pim [vrf vrf-name] [ipv4] tunnel info {interface-unit|all} [netio]
```

**Syntax Description**
- **vrf vrf-name** (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- **ipv4** (Optional) Specifies IPv4 address prefixes.
- **interface-unit** Name of virtual tunnel interface that represents the encapsulation tunnel or the decapsulation tunnel.
- **all** Specifies both encapsulation and decapsulation tunnel interfaces.
- **netio** (Optional) Displays information obtained from the Netio DLL.

**Command Default**
IPv4 addressing is the default. If no VRF is specified, the default VRF is operational.

**Command Modes**
EXEC

**Command History**
```
Release | Modification
-------------------
3.7.2     | This command was introduced.
```

**Usage Guidelines**
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

PIM register packets are sent through the virtual encapsulation tunnel interface from the source’s first-hop designated router (DR) router to the rendezvous point (RP). On the RP, a virtual decapsulation tunnel is used to represent the receiving interface of the PIM register packets. This command displays tunnel information for both types of interfaces.

Register tunnels are the encapsulated (in PIM register messages) multicast packets from a source that is sent to the RP for distribution through the shared tree. Registering applies only to sparse mode (SM), not to Source Specific Multicast (SSM).

**Task ID**
```
Task ID | Operations
--------|-------------
multicast | read
```

**Examples**
The following is sample output from the `show pim tunnel info` command:
RP/0/RSP0/CPU0:router# show pim tunnel info all

<table>
<thead>
<tr>
<th>Interface</th>

show pim segment-database

To display information about the segment databases configured for Protocol Independent Multicast (PIM), use the `show pim segment-database` command in EXEC mode.

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>segment-database</th>
<th>Physical database.</th>
</tr>
</thead>
</table>

**Note**

Use the `show pim segment-database` command in EXEC mode to see a list of all databases currently configured on the router.

For more information about the syntax for the router, use the question mark (?) online help function.

**Command Default**

No default behavior or values

**Command Modes**

EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `show pim segment-database` command displays information on all PIM-enabled databases, such as Ingress PE, Upstream Info, Upstream Core Added, Downstream Info, and Downstream Core Added.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read</td>
</tr>
</tbody>
</table>

**Examples**

The following is sample output from the `show pim segment-database` command on iABR with MLDP between iPE and iABR, and IR between iABR and eABR.

```
RP/0/RSP0/CPU0:router#show pim segment-database
Mon Nov 2 17:30:44.728 EST
RD: 4:1, Prefix : [1][4.4.4.4]/40
Created : Nov 25 05:51:07.804 (Up: 01:02:13)
Leaf Type: I-PMSI, UMH: 4.4.4.4, LSM-ID: 524292 (0x80004)
Upstream Info: 1 [global-id 2]
Upstream Core Added, S,I Pmsi Received: [0, 1], S/U Leaf Ad Sent: [1,0]
Downstream Info: 1 [Tunnel:Type 4 IR ID:0x80004 Label 24012]
Downstream Core Added, S,I Pmsi Sent/Orig: [0/0, 1]
Leaf AD List:
  Originating router: 2.2.2.2, Label: 24012
```
In the above sample output, RD: 4:1, Prefix : [1][4.4.4.4]/40 represents the BGP route advertised by iPE with RD 4:1 and loopback address 4.4.4.4. Leaf Type: I-PMSI, UMH: 4.4.4.4, LSM-ID: 524292 (0x80004) represents the LSM-ID of downstream core. Downstream Info: 1 [Tunnel:Type 4 IR ID:0x80004 Label 24012] represents the Head local-label of the downstream core, and Originating router: 2.2.2.2, Label: 24012 represents the Outgoing label for the downstream core.
show pim vrf vrf_name mdt cache

To display the data mdt cache information for the protocol independent multicast, use the **show pim vrf vrf_name mdt cache** command in the EXEC mode.

**Syntax Description**

This command has no keywords or arguments.

**Command Default**

No default behavior or values

**Command Modes**

EXEC

**Command History**

```
**spt-threshold infinity**

To change the behavior of the last-hop router to always use the shared tree and never perform a shortest-path tree (SPT) switchover, use the `spt-threshold infinity` command in PIM configuration mode. To return to the default behavior, use the `no` form of this command.

```
spt-threshold infinity [group-list access-list]
no spt-threshold infinity
```

**Syntax Description**
- `group-list access-list` (Optional) Indicates the groups restricted by the access list.

**Command Default**
- The last-hop Protocol Independent Multicast (PIM) router switches to the shortest-path source tree by default.

**Command Modes**
- PIM configuration

**Command History**
- **Release** 3.7.2  This command was introduced.

**Usage Guidelines**
- To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `spt-threshold infinity` command causes the last-hop PIM router to always use the shared tree instead of switching to the shortest-path source tree.

If the `group-list` keyword is not used, this command applies to all multicast groups.

**Task ID**
- Task ID  Operations
  - multicast  read, write

**Examples**
- The following example shows how to configure the PIM source group `grp1` to always use the shared tree:

  ```
  RP/0/RSP0/CPU0:router(config)# router pim
  RP/0/RSP0/CPU0:router(config-pim-default-ipv4)# spt-threshold infinity group-list grp1
  ```
ssm

To define the Protocol Independent Multicast (PIM)-Source Specific Multicast (SSM) range of IP multicast addresses, use the `ssm` command in the appropriate configuration mode. To return to the default behavior, use the `no` form of this command.

```
ssm  [{allow-override|disable|range  access-list}]
no  ssm  [{allow-override|disable|range}]
```

**Syntax Description**

- **allow-override** (Optional) Allows SSM ranges to be overridden by more specific ranges.
- **disable** (Optional) Disables SSM group ranges.
- **range access-list** (Optional) Specifies an access list describing group ranges for this router when operating in PIM SSM mode.

**Command Default**

Interface operates in PIM sparse mode (PIM-SM). IPv4 addressing is the default.

**Command Modes**

Multicast routing configuration
Multicast routing address-family configuration
Multicast VPN configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `ssm` command performs source filtering, which is the ability of a router to report interest in receiving packets from specific source addresses (or from all but the specific source addresses) to an IP multicast address. Unlike PIM-sparse mode (SM) that uses a rendezvous point (RP) and shared trees, PIM-SSM uses information on source addresses for a multicast group provided by receivers through the local membership protocol Internet Group Management Protocol (IGMP) and is used to directly build source-specific trees.

IGMP Version 3 must be enabled on routers that want to control the sources they receive through the network.

When multicast routing is enabled, the default is PIM-SSM enabled on the default SSM range, 232/8. SSM may be disabled with the `disable` form of the command, or any ranges may be specified in an access list with the `range` form. All forms of this command are mutually exclusive. If an access list is specified, the default SSM range is not used unless specified in the access list.

Multicast Command Reference for Cisco ASR 9000 Series Routers, IOS XR Release 6.6.x
Examples

The following example shows how to configure SSM service for the IP address range defined by access list 4, using the `ssm` command:

```
RP/0/RSP0/CPU0:router(config)# ipv4 access-list 4
RP/0/RSP0/CPU0:router(config-ipv4-acl)# permit ipv4 any 224.2.151.141
RP/0/RSP0/CPU0:router(config)# multicast-routing
RP/0/RSP0/CPU0:router(config-mcast)# ssm range 4
```
Multicast Tool and Utility Commands

This chapter describes the commands used to troubleshoot multicast routing sessions on Cisco IOS XR Software.

For detailed information about multicast routing concepts, configuration tasks, and examples, refer to the Implementing Multicast Routing on configuration module in .

- mrinfo, on page 606
- mtrace, on page 608
- sap cache-timeout, on page 610
- sap listen, on page 611
- show sap, on page 612
mrinfo

To query neighboring multicast routers peering with the local router, use the `mrinfo` command in EXEC mode.

```
mrinfo [ipv4] host-address [source-address]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipv4</td>
<td>(Optional) Specifies IPv4 address prefixes.</td>
</tr>
<tr>
<td>host-address</td>
<td>Can be either the Domain Name System (DNS) name or IP address of a multicast router entered in <code>A.B.C.D</code> format.</td>
</tr>
<tr>
<td>source-address</td>
<td>(Optional) Source address used on multicast routing information (mrinfo) requests. If omitted, the source is based on the outbound interface for the destination.</td>
</tr>
<tr>
<td>Note</td>
<td>If omitted, the router queries itself.</td>
</tr>
</tbody>
</table>

**Command Default**

IPv4 addressing is the default.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `mrinfo` command determines which neighboring multicast routers are peering with a multicast router. You can query a multicast router with this command. The output format is identical to the multicast routed version of Distance Vector Multicast Routing Protocol (DVMRP). (The mrouted software is the UNIX software that implements DVMRP.)

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>execute</td>
</tr>
</tbody>
</table>

**Examples**

The following is sample output from the `mrinfo` command. The first line shows the multicast configuration with version number and flags Parent Multicast Agent (PMA). The flags mean that the configuration is prune capable, mtrace capable, and SNMP capable. For each neighbor of the queried multicast router, the IP address of the queried router is displayed, followed by the IP address of the neighbor. The metric (cost of connect) and the threshold (multicast time to live) are displayed. Other information is available, such as whether this router is

- Running the PIM protocol
- An IGMP querier
- A leaf router
RP/0/RSP0/CPU0:router# mrinfo 192.168.50.1

192.168.50.1 (version 0.37.0) [flags: FBA]:
  172.16.1.1 -> 172.16.1.1 [1/0/pim/querier/leaf]
  172.16.2.2 -> 172.16.2.2 [1/0/pim/querier/leaf]
  192.168.50.1 -> 192.168.50.1 [1/0/pim/querier]
  192.168.50.1 -> 192.168.50.101 [1/0/pim/querier]
  192.168.40.101 -> 192.168.40.1 [1/0/pim]
**mtrace**

To trace the path from a source to a destination branch for a multicast distribution tree, use the **mtrace** command in EXEC mode.

```
mtrace [ipv4] [vrf] source destination [group_addr] [resp_addr][ttl]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipv4</td>
<td>(Optional) Specifies IPv4 address prefixes.</td>
</tr>
<tr>
<td>vrf</td>
<td>(Optional) Specifies the vrf table for the route lookup.</td>
</tr>
<tr>
<td>source</td>
<td>Domain Name System (DNS) name or the IP address of the multicast-capable source. This is a unicast address of the beginning of the path to be traced.</td>
</tr>
<tr>
<td>destination</td>
<td>DNS name or address of the unicast destination. This is a unicast address of the end of the path to be traced.</td>
</tr>
<tr>
<td>group_addr</td>
<td>(Optional) DNS name or multicast address of the group to be traced. Default address is 224.2.0.1 (the group used for MBONE Audio). When address 0.0.0.0 is used, the software invokes a weak mtrace. A weak mtrace is one that follows the Reverse Path Forwarding (RPF) path to the source, regardless of whether any router along the path has multicast routing table state.</td>
</tr>
<tr>
<td>resp_addr</td>
<td>(Optional) DNS name or multicast address of the querier address to receive response. If the querier is not reachable by the RP or the source, this value should be provided.</td>
</tr>
<tr>
<td>ttl</td>
<td>(Optional) Time-to-live (TTL) threshold for a multicast trace request. Range is 1 to 255 router hops.</td>
</tr>
</tbody>
</table>

### Command Default

By default, this feature is disabled. IPv4 addressing is the default.

### Command Modes

EXEC

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The trace request generated by the **mtrace** command is multicast to the multicast group to find the last-hop router to the specified destination. The trace follows the multicast path from destination to source by passing the mtrace request packet using unicast to each hop. Responses are unicast to the querying router by the first-hop router to the source. This command allows you to isolate multicast routing failures.

If no arguments are entered, the router interactively prompts you for them.

This command is identical in function to the UNIX version of **mtrace**.
### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>execute</td>
</tr>
</tbody>
</table>

### Examples

The following is sample output from the `mtrace` command:

```
RP/0/RSP0/CPU0:router# mtrace 172.16.1.0 172.16.1.10 239.254.254.254
Type escape sequence to abort.
Mtrace from 172.16.1.0 to 172.16.1.10 via group 239.254.254.254
From source (?) to destination (?)
Querying full reverse path...
Switching to hop-by-hop:
  0 172.16.1.10
  -1 172.17.20.101 PIM Reached RP/Core [172.16.1.0/24]
  -2 172.18.10.1 PIM [172.16.1.0/32]
  -3 172.16.1.0 PIM [172.16.1.0/32]
```

```
RP/0/RSP0/CPU0:router# mtrace vrf vrf1 172.16.1.0 172.16.1.10 239.254.254.254 45.244.244.244 49
```

```
```

```
```
### sap cache-timeout

To limit how long a Session Announcement Protocol (SAP) cache entry stays active in the cache, use the `sap cache-timeout` command in global configuration mode. To return to the default behavior, use the `no` form of this command.

```
sap cache-timeout minutes
no sap cache-timeout
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>minutes</code></td>
<td>Time that a SAP cache entry is active in the cache. Range is 1 to 1440.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command Default</th>
<th>1440 (24 hours)</th>
</tr>
</thead>
</table>

| Command Modes      | Global configuration                             |

<table>
<thead>
<tr>
<th>Command History</th>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td></td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

#### Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `sap cache-timeout` command defines how long session announcements are cached by the router. Active session announcements are periodically re-sent by the originating site, refreshing the cached state in the router.

The minimum interval between announcements for a single group is 5 minutes. Setting the cache timeout to a value less than 30 minutes is not recommended. Set the cache timeout to 0 to keep entries in the cache indefinitely.

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

#### Examples

The following example shows the SAP cache entry timeout being configured at 10 minutes:

```
RP/0/RSP0/CPU0:router(config)# sap cache-timeout 10
```
sap listen

To configure the Session Announcement Protocol (SAP) designated router (SDR) listener on a group address, use the `sap listen` command in global configuration mode. To return to the default behavior, use the `no` form of this command.

```
sap listen [{ip-addressname}]
no sap listen
```

**Syntax Description**

- `ip-address` (Optional) Group IP address for an address range.
- `name` (Optional) Name of a prefix for an address range.

**Command Default**

When no group address is configured, the SDR listener is configured on the global SAP announcement group (224.2.127.254).

**Command Modes**

Global configuration

**Command History**

- **Release 3.7.2** This command was introduced.

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `sap listen` command configures an SDR listener that listens to SAP announcements on the configured group address. The group IP address can be any group in the range from 224.2.128.0 to 224.2.255.255.

**Task ID**

- **Task ID** Operations
  - `multicast` read,
  - `write` write

**Examples**

The following example configures an SDR listener for group on IP address 224.2.127.254:

```
RP/0/RSP0/CPU0:router(config)# sap listen 224.2.127.254
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show sap</code>, on page 612</td>
<td>Displays the SAP sessions learned on the configured multicast groups.</td>
</tr>
</tbody>
</table>
show sap

To display the Session Announcement Protocol (SAP) sessions learned on the configured multicast groups, use the `show sap` command in EXEC mode

```
show sap [ipv4] [{group-addresssession-name}] [detail]
```

**Syntax Description**

- **ipv4** (Optional) Specifies IPv4 address prefixes.
- **group-address** (Optional) Group IP address or name of the session that is learned.
- **session-name** (Optional) Session name.
- **detail** (Optional) Provides more SAP information.

**Command Default**

IPv4 addressing is the default.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
