

BFD Commands

This module provides command line interface (CLI) commands for configuring Bidirectional Forwarding Detection (BFD) on the Cisco ASR 9000 Series Router.

- address-family ipv4 unicast (BFD), on page 2
- bfd, on page 3
- bfd address-family ipv4 destination, on page 4
- bfd address-family ipv4 echo minimum-interval, on page 5
- bfd address-family ipv4 fast-detect, on page 7
- bfd address-family ipv4 minimum-interval, on page 7
- bfd address-family ipv4 multiplier, on page 10
- bfd address-family ipv4 timers, on page 12
- bundle coexistence bob-blb, on page 13
- bfd dampening, on page 15
- bfd dampening disable, on page 17
- bfd echo ipv4 bundle-per-member minimum-interval, on page 18
- bfd encap-mode, on page 19
- bfd fast-detect, on page 20
- bfd minimum-interval, on page 23
- bfd mode, on page 26
- bfd multipath include location, on page 27
- bfd multiplier, on page 28
- show bundle, on page 31
- clear bfd counters, on page 32
- clear bfd dampening, on page 34
- echo disable, on page 35
- echo ipv4 source, on page 37
- echo latency detect, on page 38
- echo startup validate, on page 40
- hw-module bfd-hw-offload, on page 42
- interface (BFD), on page 43
- ipv6 checksum, on page 45
- multihop ttl-drop-threshold, on page 47
- show bfd, on page 48
- show bfd client, on page 51

- show bfd counters, on page 52
- show bfd hw-offload, on page 55
- show bfd mib session, on page 57
- show bfd multipath, on page 59
- show bfd session, on page 60
- show bfd summary, on page 66

address-family ipv4 unicast (BFD)

To enable Bidirectional Forwarding Detection (BFD) fast-detection on a specific IPV4 unicast destination address prefix and on the forwarding next-hop address, use the **address-family ipv4 unicast** command in static route configuration mode. To return the router to the default setting, use the **no** form of this command.

address-family ipv4 unicast address nexthop bfd fast-detect [minimum interval interval] [multiplier multiplier]

no address-family ipv4 unicast address nexthop **bfd fast-detect** [minimum interval interval] [multiplier multiplier]

Syntax Description	address	Specifies the IPv4 unicast destination address and prefix on which to enable BFD fast-detection.	
	nexthop	Specifies the next-hop address on which to enable BFD fast-detection.	
	bfd fast-detect	Enables BFD fast-detection on the specified IPV4 unicast destination address prefix and on the forwarding next-hop address.	
	minimum interval interval	<i>al</i> (Optional) Ensures that the next hop is assigned with the same hello interval. Replace <i>interval</i> with a number that specifies the interval in milliseconds. Range is from 10 through 10000.	
	multiplier multiplier	(Optional) Ensures that the next hop is assigned with the same detect multiplier. Replace <i>multiplier</i> with a number that specifies the detect multiplier. Range is from 1 through 10.	
Command Default	interval: 100		
	multiplier: 3		
Command Modes	Static route configuration m	ode	
Command History	ry Release Modification		
	Release 3.7.2 This comman	nd was introduced.	
Usage Guidelines		nust be in a user group associated with a task group that includes appropriate task iment is preventing you from using a command, contact your AAA administrator	
	1 0	sing the bfd multiplier command, the new parameter is used to update all existing of (BGP, IS-IS, MPLS-TE, or OSPF).	

Task ID	Task ID	Operations	
Examples	static	read, write	
	The following example shows how to enable BFD on a static route. In this example, BFD sessions are established with the next-hop 3.3.3.3 when it becomes reachable.		
	RP/0/RSP0/CPU0:router# configure RP/0/RSP0/CPU0:router(config)# router static RP/0/RSP0/CPU0:router (config-static)# address-family ipv4 unicast 2.2.2.0/24 3.3.3.3 bfd fast-detection		
Related Commands	Comm	and	Description
	bfd fas	st-detect, on pa	ge 20 Enables BFD to detect failures in the path between adjacent forwarding engines.
	show	bfd, on page 48	Displays BFD information for a specific location.

bfd

To enter Bidirectional Forwarding Detection (BFD) configuration mode, use the **bfd** command in global configuration mode. To exit BFD configuration mode and return to global configuration mode, use the **no** form of this command.

	bfd no bfd	
Syntax Description	This command has no keywords or arguments.	
Command Default	No default behavior or values	
Command Modes	Global configuration	
Command History	Release Modification	
	Release 3.7.2 This command was introduced.	
Usage Guidelines	To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.	
	When you issue the bfd command in global configuration mode, the CLI prompt changes to "config-bfd," indicating that you have entered BFD configuration mode. In the following sample output, the question mat (?) online help function displays all the commands available under BFD configuration mode:	

```
RP/0/RSP0/CPU0:router(config)# bfd
RP/0/RSP0/CPU0:router(config-bfd) # ?
            Commit the configuration changes to running
  commit
  describe Describe a command without taking real actions
  do
            Run an exec command
  echo
            Configure BFD echo parameters

            Negate a command or set its defaults
  no
            Exit to the global
  root
     configuration mode
            Show contents of configuration
  show
```

Task ID	Operations
bgp	read, write
ospf	read, write
isis	read, write
mpls-te	read, write

Examples

The following example shows how to enter BFD configuration mode:

```
RP/0/RSP0/CPU0:router # configure
RP/0/RSP0/CPU0:router(config)# bfd
RP/0/RSP0/CPU0:router(config-bfd)#
```

Related Commands	Command	Description
	echo disable, on page 35	Disables echo mode on a router or on an individual interface or bundle.
	interface (BFD), on page 43	Enters BFD interface configuration mode, where you can disable echo mode on an interface.
	show bfd, on page 48	Displays BFD information for a specific location.

bfd address-family ipv4 destination

To specify the destination address for BFD sessions on bundle member links, use the **bfd address-family ipv4 destination** command in interface configuration mode. To return to the default, use the **no** form of this command.

I

	bfd address-family ipv4 destination <i>ip-address</i> no bfd address-family ipv4 destination <i>ip-address</i>		
Syntax Description	<i>ip-address</i> 32-bit IPv4 address in dotted-decimal format (A.B.C.D).		
Command Default	No destination IP	v4 address is configured.	
Command Modes	Interface configur	ation (config-if)	
Command History	Release Mo	odification	
	Release 4.0.0 Th	is command was introduced.	
Usage Guidelines	To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.		
	This command is	supported on bundle interfaces	only.
Task ID	Task Operation ID	S	
	bundle read, write	_	
Examples	The following example specifies the IPv4 address of 10.20.20.1 as the destination address for the BFD session on an Ethernet bundle interface:		
	RP/0/RSP0/CPU0:	router# configure router(config)# interface : router(config-if)# bfd add	Bundle-Ether 1 ress-family ipv4 destination 10.20.20.1
Related Commands	Command		Description
	bfd address-fami	ly ipv4 fast-detect, on page 7	Enables IPv4 BFD sessions on bundle member links.

bfd address-family ipv4 echo minimum-interval

To specify the minimum interval for echo packets on IPv4 BFD sessions on bundle member links, use the **bfd address-family ipv4 echo minimum-interval** command in interface configuration mode. To return to the default, use the **no** form of this command.

The interface configuration of the echo timer value takes precedence over the global echo timer value.

I

	bfd address-family ipv4 echo minimum-interval milliseconds no bfd address-family ipv4 echo minimum-interval [milliseconds] milliseconds Shortest interval between sending BFD echo packets to a neighbor. The range is 15 to 2000 milliseconds.			
Syntax Description				
Command Default	The default value is the product of the async and multiplier values.			
Command Modes	- Interface configuration			
Command History	Release	Modification		
	Release 5.3.0	This command was introduced.		
Usage Guidelines	To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.			
	This command is supported on only on BFD over Bundle Per-Member Link Mode using Cisco standard.			
	This command allows to configure a	an echo interval to a value greater than async x bfd multiplier value.		
Task ID	Task Operations ID			
	bundle read, write			
Examples	The following example specifies that echo packets will be sent at a minimum interval of 900 ms for IPv4 BFD sessions on member links of an Ethernet bundle:			
	<pre>RP/0/RSP0/CPU0:router# configure RP/0/RSP0/CPU0:router(config)# interface Bundle-Ether 1 RP/0/RSP0/CPU0:router(config-if)# bfd address-family ipv4 minimum-interva RP/0/RSP0/CPU0:router(config-if)# bfd address-family ipv4 echo minimum-in 900</pre>			
Related Commands	Command	Description		
	bfd address-family ipv4 multiplier, o page 10	n Specifies a number that is used as a multiplier with the minimum interval to determine BFD control and echo packet failure detection times and echo packet transmission intervals for IPv4 BFD sessions on bundle member links.		
	bfd address-family ipv4 minimum-interval, on page 7	Specifies the minimum interval for asynchronous mode control packets on IPv4 BFD sessions on bundle member links.		

bfd address-family ipv4 fast-detect

To enable IPv4 BFD sessions on bundle member links, use the **bfd address-family ipv4 fast-detect** command in interface configuration mode. To return to the default, use the **no** form of this command.

bfd address-family ipv4 fast-detect no bfd address-family ipv4 fast-detect

Syntax Description This command has no keywords or arg	uments.
--	---------

BFD sessions are disabled. **Command Default**

Release

Command History Modification

Release 4.0.0 This command was introduced.

To use this command, you must be in a user group associated with a task group that includes appropriate task **Usage Guidelines** IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

This command is supported on bundle interfaces only.

Task ID Task Operations ID bundle read, write

Examples

The following example enables IPv4 BFD sessions on member links of an Ethernet bundle:

RP/0/RSP0/CPU0:router# configure RP/0/RSP0/CPU0:router(config) # interface Bundle-Ether 1 RP/0/RSP0/CPU0:router(config-if)# bfd address-family ipv4 fast-detect

Related Commands	Command	Description
	bfd address-family ipv4 destination, on page 4	Specifies the destination address for BFD sessions on bundle member links.

bfd address-family ipv4 minimum-interval

To specify the minimum interval for asynchronous mode control packets on IPv4 BFD sessions on bundle member links, use the **bfd address-family ipv4 minimum-interval** command in interface configuration mode. To return to the default, use the **no** form of this command.

I

Syntax Description	milliseconds Shortest interval between sending BFD control packets to a neighbor. The range is 15 to 3000 milliseconds.		
	Note Although the command allows you to configure a minimum of 15 ms, the supported minimum is 50 ms.		
Command Default	The default is 150 ms.		
Command Modes	Interface configuration (config-if)		
Command History	Release Modification		
	Release 4.0.0 This command was introduced.		
Usage Guidelines	To use this command, you must be in a user group associated with a task group that includes appropriate ta IDs. If the user group assignment is preventing you from using a command, contact your AAA administration for assistance.		
	This command is supported on bundle interfaces only.		
	The BFD minimum interval is used with a configurable multiplier (bfd address-family ipv4 multiplier command) to determine the intervals and failure detection times for both control and echo packets in asynchronous mode on bundle member links.		
	For example, with a session interval of <i>I</i> and a multiplier of <i>M</i> , the following packet intervals and failure detection times apply for BFD asynchronous mode:		
	 Value of <i>I</i>—Minimum period between sending of BFD control packets. Value of <i>I</i> x <i>M</i> 		
	• BFD control packet failure detection time. This is the maximum amount of time that can elapse without receipt of a BFD control packet before the session is declared down.		
	• Minimum period between sending of BFD echo packets.		
	• Value of $(I \ge M) \ge M$ —BFD echo packet failure detection time. This is the maximum amount of time that can elapse without receipt of a BFD echo packet before the session is declared down.		
	When used with bundled VLANs, the following restrictions apply:		
	The command specifies control packet intervals only because echo packets are not supported.The minimum interval is 250 ms.		
	The bfd address-family ipv4 minimum-interval command in bundle interface configuration overrides the minimum intervals specified by the bfd minimum-interval command in other areas of BFD configuration.		

Keep the following router-specific rules in mind when configuring the minimum BFD interval:

- The maximum rate in packets-per-second (pps) for BFD sessions is linecard-dependent. If you have multiple linecards supporting BFD, then the maximum rate for BFD sessions per system is the supported linecard rate multiplied by the number of linecards.
 - The maximum rate for BFD sessions per linecard is 9600 pps.
- The maximum number of all BFD sessions on the router is 1024.
- The maximum number of all BFD sessions on the router is 1440.

To calculate the rate for BFD sessions on bundle members running in asynchronous mode without echo:

• Divide 1000 by the value of the minimum interval (as specified by the **bfd address-family ipv4 minimum-interval** command). This is also the base rate used per member session with echo:

Asynchronous rate per bundle member = (1000 / Min-interval)

To calculate the rate for BFD sessions on bundle members running in asynchronous mode with echo:

• Determine the echo interval, which is the value of the minimum interval (specified by the **bfd address-family ipv4 minimum-interval** command) multiplied by the multiplier value (specified by the **bfd address-family ipv4 multiplier** command).

Echo interval = (Min-interval x Multiplier)

• Calculate the overall rate supported for all members on the bundle:

Ethernet bundle rate = $(1000 / \text{Echo interval}) \times 64$

• Add the asynchronous base rate per bundle member to find the total rate for all bundle links:

Total bundle rate = Ethernet bundle rate + (Base asynchronous rate x Number of links)

Task ID	Task Operations ID
	bundle read, write
Examples	The following example specifies that control packets will be sent at a minimum interval of 200 ms for IPv4 BFD sessions on member links of an Ethernet bundle:
	RP/0/RSP0/CPU0:router# configure
	RP/0/RSP0/CPU0:router(config)# interface Bundle-Ether 1
	<pre>RP/0/RSP0/CPU0:router(config-if)# bfd address-family ipv4 minimum-interval 200</pre>
Related Commands	 Command Description

Examples	The following example specifies the following packet intervals and failure detection times for IPv4				

.

- The following example specifies the following packet intervals and failure detection times for IPv4 BFD sessions on member links with asynchronous echo mode on an Ethernet bundle:
 - 200 ms control packet interval
 - 600 ms control packet failure detection interval

- 600 ms echo packet interval
- 1800 ms echo packet failure detection interval

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# interface Bundle-Ether 1
RP/0/RSP0/CPU0:router(config-if)# bfd address-family ipv4 minimum-interval 200
RP/0/RSP0/CPU0:router(config-if)# bfd address-family ipv4 multiplier 3
```

Related Commands	Command	Description
	bfd address-family ipv4 minimum-interval, on page 7	Specifies the minimum interval for asynchronous mode control packets on IPv4 BFD sessions on bundle member links.
	bfd minimum-interval, on page 23	Specifies the minimum control packet interval for BFD sessions for the corresponding BFD configuration scope.

bfd address-family ipv4 timers

To configure timers to allow for delays in receipt of BFD state change notifications (SCNs) from peers before declaring a link bundle BFD session down for IPv4 BFD sessions on bundle member links, use the **bfd address-family ipv4 timers** command in interface configuration mode. To return to the default, use the **no** form of this command.

Note	BFD session flaps when the show tech-support { bfd cef spp } command is executed on the system with 30 millisecond timer configured. This occurs only when Cisco ASR 9000 Series Ethernet Line Card is installed in the system.			
	bfd address-family ipv4 timers [start nbr-unconfig] seconds no bfd address-family ipv4 timers [start nbr-unconfig] seconds			
Syntax Description	start seconds	Number of seconds after startup of a BFD member link session to wait for the expected notification from the BFD peer to be received, so that the session can be declared up. If the SCN is not received after that period of time, the BFD session is declared down. The range is 60 to 3600.		
		Note In Cisco IOS XR Releases 4.0 and 4.0.1, the available minimum is 30, but is not recommended.		
	nbr-unconfig seconds	Number of seconds to wait after receipt of notification that the BFD configuration has been removed by a BFD neighbor, so that any configuration inconsistency between the BFD peers can be fixed. If the BFD configuration issue is not resolved before the specified timer is reached, the BFD session is declared down. The range is 60 to 3600.		
		Note In Cisco IOS XR Releases 4.0 and 4.0.1, the available minimum is 30, but is not recommended.		

Command Default	No timers are configured.
Command Modes	Interface configuration (config-if)
Command History	Release Modification
	Release 4.0.0 This command was introduced.
Usage Guidelines	To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.
	This command is supported on bundle interfaces only.
Task ID	Task Operations ID
	bundle read, write
Examples	The following example configures a timer for members of the specified Ethernet bundle that allows up to 1 minute (60 seconds) after startup of a BFD member link session to wait for receipt of the expected notification from the BFD peer to declare the session up:
	RP/0/RSP0/CPU0:router# configure RP/0/RSP0/CPU0:router(config)# interface Bundle-Ether 1 RP/0/RSP0/CPU0:router(config-if)# bfd address-family ipv4 timers start 60
	The following example configures a timer for members of the specified Ethernet bundle that allows up to 1 minute (60 seconds) to wait after receipt of notification that the BFD configuration has been removed by a BFD neighbor, before declaring a BFD session down:
	RP/0/RSP0/CPU0:router# configure RP/0/RSP0/CPU0:router(config)# interface Bundle-Ether 1 RP/0/RSP0/CPU0:router(config-if)# bfd address-family ipv4 timers nbr-unconfig 60
bundle co	existence bob-blb

To configure a coexistence mechanism between BFD over Bundle (BoB) and BFD over Logical Bundle (BLB), use the **bundle coexistence bob-blb** command in BFD configuration mode. To disable this feature use the **no** form of this command.

bundle coexistence bob-blb inherit | logical no bundle coexistence bob-blb inherit | logical

Syntax Description inherit Specifies inheritance as the coexistence mechanism.

	logical	Specifies	to use BFD logical bund	le natively for coexistence.
Command Default	No coex	xistence confi	guration is enabled. The H	BLB configuration behaves the same as the BVLAN configuration.
Command Modes	BFD configuration			
Command History	Releas	e Modi	fication	_
	Releas 4.3.0	e This c	command was introduced	
Usage Guidelines		he user grou		group associated with a task group that includes appropriate task ng you from using a command, contact your AAA administrator
	The default behavior for BLB without any coexistence configuration behaves exactly as the BVLAN configuration.			
	always convers	creates a virt sion between ce in which th	ual session, and never a H BLB and the inherited n	onfigured, the BLB session always uses the inherited mode. It BFD session with real packets. This mode prevents the automatic node, which could happen in default mode, depending on the ed. The "inherited" session is in "Down" state when BoB is not
	The "lo	gical" mode	always creates BFD sess	sion with real packets.
Task ID	Task ID	Operation		
	bgp	read, write		
	ospf	read, write		
	isis	read, write

This example shows how to configure the coexistence mechanism between BFD over Bundle (BoB) and BFD over Logical Bundle (BLB) as being "inherited":

```
RP/0/RSP0/CPU0:router#configure
RP/0/RSP0/CPU0:router(config)#bfd
RP/0/RSP0/CPU0:router(config-bfd)#bundle coexistence bob-blb inherit
```

This example shows how to configure the coexitence mechanism between BFD over Bundle (BoB) and BFD over Logical Bundle (BLB) as being "logical":

RP/0/RSP0/CPU0:router#configure

I

RP/0/RSP0/CPU0:router(config)#bfd
RP/0/RSP0/CPU0:router(config-bfd)#bundle coexistence bob-blb logical

bfd dampening

To configure a device to dampen a flapping Bidirectional Forwarding Detection (BFD) session, use the **bfd dampening** command in global configuration mode. To restore the values of the dampening timers to their default values, use the **no** form of this command.

bfd dampening [bundle-member] initial-wait | 13-only-mode | maximum-wait | secondary-wait | extension down-monitoring | threshold milliseconds no bfd dampening [bundle-member] initial-wait | 13-only-mode | maximum-wait | secondary-wait | extension down-monitoring | threshold milliseconds

Syntax Description	bundle-member	Specifies initial, maximum, or secondary delays in milliseconds for BFD session startup on BFD bundle members.
	initial-wait	Specifies the initial delay in milliseconds before starting a BFD session. For bundle members, the default is 16000. For non-bundle interfaces, the default is 2000.
	13-only-mode	Applies dampening, if the failure is Layer 3 (L3)-specific.
	maximum-wait	Specifies the maximum delay in milliseconds before starting a BFD session.
		Note The maximum delay must be greater than the initial delay.
	secondary-wait	Specifies a secondary delay in milliseconds before starting a BFD session. For bundle members, the default is 20000. For non-bundle interfaces, the default is 5000.
	extensions down-monitoring	Enables session monitoring extensions in down state.
	threshold	Specifies a stability threshold to enable dampening in milliseconds. Range 6000 to 360000. The default is 120000.

	milliseconds		For bundle members, the range is 1-518400000. For non-bundle interfaces, the range is 1-3600000.		
Command Default	BFD dampeni	ng is enabled by default.			
Command Modes	Global config	uration			
Command History	Release	Modification			
	Release 3.9.0	This command was introduced.			
	Release 4.0.0	The bundle-member keyword was added.			
	Release 4.2.0	The I3-only-mode keyword was added to the other d	lampening options.		
	Release 5.1	The extensions and down-monitoring keywords w	ere added.		
Usage Guidelines		mmand, you must be in a user group associated with a r group assignment is preventing you from using a co			
Note	The initial-wa	ait, maximum-wait, and secondary-wait keywords a	are dampening timers.		
	You do not have to configure the BFD startup timers. If you do configure the initial wait startup timer (using the initial-wait keyword), then it must be less than the value of the maximum-wait timer.				
	By default, BFD dampening is applied to all sessions in the following manner:				
	initial/up • Length o • If a session	 If a session is brought down, then dampening is applied before a session is allowed to transition to initial/up states. Length of time a session is dampened grows exponentially with continuous session flap. If a session remains up for minimum two minutes, then the length of time a session dampens with the next session flap is reset to the initial dampening value. 			
	is not invoked condition and	e member applies dampening, only if the detected fail for L1 or L2 failures. BFD is started after Layer 1 an false triggers. BFD is notified to stop/ignore when L2 e when L1 or L2 recovers for a given/affected link/me	d Layer 2 (LACP) is up to prevent a race 1 or L2 goes down and must be notified		

BFD applies dampening till the session transitions from up to down state and the session is not removed. Whenever there is a failure detected at L1 or L2, the bundle manager removes BFD session on a member.

When dampening is removed a syslog message 'Exponential backoff dampening for BFD session has been cleared for specified BFD session. When/if same session gets created by application(s), only calculated initial wait time will be applied' is generated. If this is the desired behavior, then dampening can be enabled by configuring the BFD configuration, by using the command **bfd dampening bundle-member 13-failure-only**.

Task ID	Task	Operation
	חו	

ID	
bgp	read,
	write
ospf	read,
	write
isis	read,
	write
mpls-te	,
	write

This example shows how to configure BFD dampening by specifying an initial and maximum delay for BFD session startup on BFD bundle members:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# bfd dampening bundle-member initial-wait 1000
RP/0/RSP0/CPU0:router(config)# bfd dampening bundle-member maximum-wait 3000
```

This example shows how to configure BFD dampening on a non-bundle interface:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# bfd dampening initial-wait 1000
RP/0/RSP0/CPU0:router(config)# bfd dampening maximum-wait 3000
```

bfd dampening disable

To disable a device from dampening a flapping Bidirectional Forwarding Detection (BFD) session, use the **bfd dampening disable** command in global configuration mode. To revoke the dampening of a flapping BFD session **no** form of this command.

	bfd dampenii no bfd dampe	0
Syntax Description	This command	d has no arguments or keywords.
Command Default	BFD dampening is enabled by default.	
Command Modes	Global configuration	
Command History	Release	Modification
	Release 6.1.x	This command was introduced.

Tasl	(ID
------	------

Task ID	Operation
bgp	read, write
ospf	read, write
isis	read, write
mpls-te	read, write

This example shows how to disable BFD dampening

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# bfd dampening disable
```

bfd echo ipv4 bundle-per-member minimum-interval

To globally specify the minimum global interface configuration mode. To return to the default, use the **no** form of this command.

	bfd echo ipv4 bundle-per-member minimum-interval <i>milliseconds</i> bfd echo ipv4 bundle-per-member minimum-interval [<i>milliseconds</i>]			
Syntax Description	milliseconds Shortest interval between sending BFD echo packets to a neighbor. The range is 15 to 2000 milliseconds.			
Command Default	The default value is the product	of the async and multiplier values.		
Command Modes	Global configuration			
Command History	Release	Modification		
	Release 5.3.0	This command was introduced.		
Usage Guidelines	This command allows you to globally configure an echo interval to a value greater than async*bfd multiplie value. When the value of echo configured is lesser than the I*M1, where I is the Minimum period between sending of BFD Async packets and M1 is the remote multiplier, then the echo value is taken as I*M1 and echo detection time is taken as I*M1*M2 where M2 is the local Multiplier.			
	This command is supported on only on RED over Rundle Per Member Link mode using Cisco standard			

This command is supported on only on BFD over Bundle Per-Member Link mode using Cisco standard.

Task ID	Task Operations ID			
	bundle read, write			
Examples	The following example specifies that echo packets will be sent globally at a minimum interval of 500 ms for IPv4 BFD sessions on bundle member links:			
	<pre>RP/0/RSP0/CPU0:router# confi RP/0/RSP0/CPU0:router(config)# 500</pre>	PO/CPU0:router# configure PO/CPU0:router(config)# bfd echo ipv4 bundle-per-member minimum-interva		
Related Commands	Command	Description		
	bfd address-family ipv4 multiplier, page 10	on Specifies a number that is used as a multiplier with the minimum interval to determine BFD control and echo packet failure detection times and echo packet transmission intervals for IPv4 BFD sessions on bundle member links.		
	bfd address-family ipv4 minimum-interval, on page 7	Specifies the minimum interval for asynchronous mode control packets on IPv4 BFD sessions on bundle member links.		
	bfd address-family ipv4 echo minimum-interval, on page 5	Specifies the minimum interval for asynchronous mode control packets on IPv4 BFD sessions on bundle member links.		

bfd encap-mode

To enable continuity check for MPLS LSPs via BFD over Generic Associated Channel Label (GAL) (Label 13), use the **bfd encap-mode** command in MPLS Traffic Engineering Tunnel (TE) interface configuration mode. To disable continuity check for MPLS LSPs via BFD running over GAL channel, use the **no** form of this command.

bfd encap-mode gal

no bfd encap-mode gal

Syntax Description	gal	Specifies the use of BFD over Generic Associated Channel Label (GAL) (Label 13) for MPLS LSPs.	
Command Default	No default behavior or values.		
Command Modes	MPLS TE Tunnel interface configuration		
Command History	Release	Modification	
	Release 5.2.0	This command was introduced.	

I

Usage Guidelines	To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.		
	By default, BFD is enabled over an IP channel. This command enables BFD over GAL channel.		
Task ID	Task Operations ID		
	mpls-te read, write		
Examples	This example shows how to enable continuity check for MPLS LSPs via BFD over GAL channel:		
	RP/0/RSP0/CPU0:router# configure RP/0/RSP0/CPU0:router(config)# interface tunnel-te 1 RP/0/RSP0/CPU0:router(config-if)# bfd RP/0/RSP0/CPU0:router(config-if-tunte-bfd)# encap-mode gal		

bfd fast-detect

To enable Bidirectional Forwarding Detection (BFD) to detect failures in the path between adjacent forwarding engines, use the **bfd fast-detect** command in the appropriate configuration mode. To return the software to the default state in which BFD is not enabled, use the **no** form of this command.

bfd fast-detect [disable | ipv4 | strict-mode] no bfd fast-detect

Syntax Description	disable Disables the detection of failures in the path between adjacent forwarding engines for entity, such as a BGP neighbor or OSPF interface.	
		Note The disable keyword is available in the following modes only: BGP configuration, OSPF area configuration, OSPF area interface configuration, OSPFv3 area configuration, and OSPFv3 area interface configuration .
	ipv4	Enables Intermediate System-to-Intermediate System (IS-IS) BFD detection of failures in the path between adjacent forwarding engines.
		Note The ipv4 keyword is available in IS-IS router configuration mode only.
	strict-mode	Holds down neighbor session until BFD session is up.
Command Default	BFD detection of failures in the path between adjacent forwarding engines is disabled.	
Command Modes	Neighbor configuration Session group configuration	

	Neighbor group configuration		
	Interface configuration		
	Interface configuration		
	Router configuration		
	Area configuration		
	Area interface configuration		
	Router configuration		
	Area configuration		
	Area interface configuration		
	Interface configuration		
Command History	Release Modification		
	Release 3.7.2 This command was introduced.		

Release 4.0.0 The **bfd fast-detect** command was supported in the following modes: OSPFv3 router configuration, OSPFv3 area configuration, and OSPFv3 area interface configuration.

Release 5.3.2 The **bfd fast-detect strict-mode** command was supported in the following modes: OSPFv3 router configuration, OSPFv3 area configuration, and OSPFv3 area interface configuration.

Usage Guidelines

Note

BFD can support multihop for internal and external BGP peers.

Use the **bfd fast-detect** command to provide protocol- and media-independent, short-duration failure detection of the path between adjacent forwarding engines, including the interfaces and data links.

BFD must be configured on directly connected neighbors for a BFD session to be established between the neighbors.

When MPLS-TE tunnels are protected by backup tunnels, BFD failure triggers fast reroute on affected tunnels.

In OSPF and OSPFv3 environments, the setting of the **bfd fast-detect** command is inherited from the highest-level configuration mode in which the command was configured. From the lowest to the highest configuration modes, the inheritance rules are as follows:

- If you enable BFD in area interface configuration mode, it is enabled on the specified interface only.
- If you enable BFD in area configuration mode, it is enabled on all interfaces in the specified area.
- If you enable BFD in router configuration mode, it is enabled on all areas and all associated interfaces in the specified routing process.

The **disable** keyword is available in the following modes: BGP configuration, OSPF area configuration, OSPF area interface configuration, OSPFv3 area configuration, and OSPFv3 area interface configuration. In OSPF and OSPFv3 environments, the **disable** option enables you to override the inheritance rules described previously. For example, if you enable BFD in an OSPF area, BFD is enabled on all interfaces in that area. If you do not

want BFD running on one of the interfaces in that area, you must specify the **bfd fast-detect disable** command for that interface only.

To disable BFD or return the software to the default state in which BFD is not enabled in IS-IS router configuration mode and MPLS-TE configuration mode, you must enter the **no bfd fast-detect** command.

sk ID	Task ID	Operations
	bgp	read, write
	isis	read, write
	mpls-te	read, write
	ospf	read, write

multicast read,

write

Examples

The following example shows how to configure BFD on a BGP router:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# router bgp 65000
RP/0/RSP0/CPU0:router(config-bgp)# neighbor 192.168.70.24
RP/0/RSP0/CPU0:router(config-bgp-nbr)# remote-as 2
RP/0/RSP0/CPU0:router(config-bgp-nbr)# bfd fast-detect
```

The following example shows the configuration of an OSPFv3 routing process named san_jose. The example shows two areas, each of which includes Gigabit Ethernet interfaces. In area 0, BFD is enabled at the area level, which means that by virtue of the inheritance rules, BFD is enabled on all interfaces within the area except those on which BFD is explicitly disabled. Given this rule, BFD is enabled on Gigabit Ethernet interfaces 1/0/0/0 and 2/0/0/0 and is disabled on interface 3/0/0/0.

In area 1, BFD is enabled on Gigabit Ethernet interface 5/0/0/0 only. Because BFD is not enabled at the area level nor explicitly enabled on interface 4/0/0/0, it is disabled on this interface.

	bfd fast-detect ! !

	show bfd, on page 48	Displays BFD information for a specific location.

bfd minimum-interval

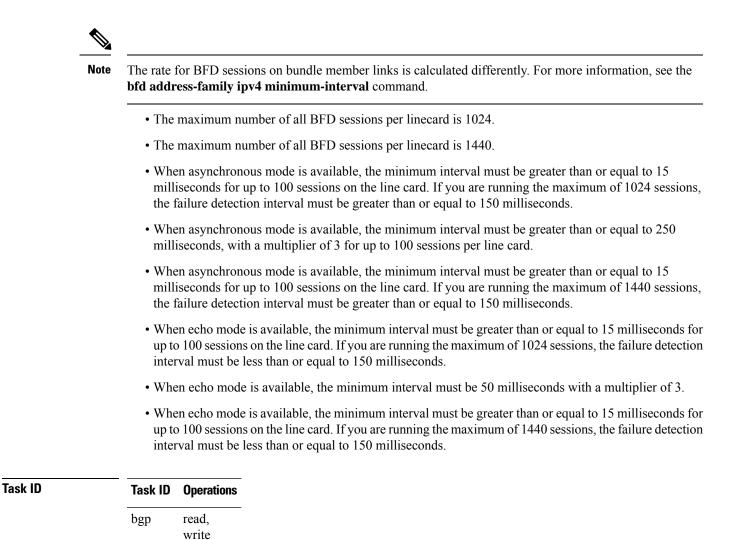

To specify the minimum control packet interval for BFD sessions for the corresponding BFD configuration scope, use the **bfd minimum-interval** command in the appropriate configuration mode. To return the router to the default setting, use the **no** form of this command.

bfd minimum-interval *milliseconds* **no bfd minimum-interval** [*milliseconds*]

Syntax Description	<i>milliseconds</i> Interval between sending BFD hello packets to the neighbor. The range is 15 to 30000 milliseconds. For MPLS-TE, the range is 15 to 200 milliseconds. For GRE tunnel, the range is 150 to 30000 milliseconds. The default is 150 milliseconds.	
Command Default	BGP <i>interval</i> : 50 milliseconds	
	IS-IS interval: 150 milliseconds	
	OSPF and OSPFv3 interval: 150 milliseconds	
	MPLS-TE interval: 15 milliseconds	
	PIM interval: 150 milliseconds

	Router configuration	
	Area configuration	
	Area interface configuration	
	Router configuration	

I

	Area configuration		
	Interface configuration		
	Tunnel configuration		
Command History	Release Modification		
	Release 3.7.2 This command was introduced.		
	Release 4.0.0 The bfd minimum-interval command was supported in the following modes: OSPFv3 router configuration, OSPFv3 area configuration, and OSPFv3 area interface configuration.		
	Release 6.5.1 The bfd minimum-interval command was supported in the tunnel configuration mode.		
Usage Guidelines	To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.		
	In OSPF and OSPFv3 environments, the setting of the bfd minimum-interval command is inherited from the highest-level configuration mode in which the command was configured. From the lowest to the highest configuration modes, the inheritance rules are as follows:		
	• If you configure the minimum interval in area interface configuration mode, the updated interval affects the BFD sessions on the specified interface only.		
	• If you configure the minimum interval in area configuration mode, the updated interval affects the BFD sessions on all interfaces in the specified area.		
	• If you configure the minimum interval in router configuration mode, the updated interval affects the BFD sessions in all areas and all associated interfaces in the specified routing process.		
•	If desired, you can override these inheritance rules by explicitly configuring the bfd minimum-interval command for a specific area interface or area.		
Note	When multiple applications share the same BFD session, the application with the most aggressive timer wins locally. Then, the result is negotiated with the peer router.		
	Keep the following router-specific rules in mind when configuring the minimum BFD interval:		
	• The maximum rate in packets-per-second (pps) for BFD sessions is linecard-dependent. If you have multiple linecards supporting BFD, then the maximum rate for BFD sessions per system is the supported linecard rate multiplied by the number of linecards.		
	The maximum rate for BFD sessions per linecard is 9600 pps.		
	• If a session is running in asynchronous mode without echo, then PPS used for this session is (1000 / asynchronous interval in milliseconds).		
	• If a session is running in asynchronous mode with echo, then PPS used for this session is (1000 / echo interval in milliseconds).		
	This is calculated as: 1000 / value of the bfd minimum-interval command.		

isis	read, write
mpls-te	read, write
ospf	read, write
multicast	read,

write

Examples

The following example shows how to set the BFD minimum interval for a BGP routing process:

RP/0/RSP0/CPU0:router(config)# router bgp 6500
RP/0/RSP0/CPU0:router(config-bgp)# bfd minimum-interval 275

The following example shows the configuration of an OSPFv3 routing process named san_jose. The example shows two areas, each of which includes Gigabit Ethernet interfaces. In area 0, the minimum interval is set to 200 at the area level, which means that by virtue of the inheritance rules, the same value is set on all interfaces within the area except those on which a different value is explicitly configured. Given this rule, Gigabit Ethernet interface 1/0/0/0 uses the interval of 200, which is inherited from the area, while interface 2/0/0/0 uses the explicitly configured value of 300.

In area 1, the minimum interval is not configured at the area or interface levels, which means that interfaces 3/0/0/0 and 4/0/0/0 use the default interval of 150.

```
router ospfv3 san_jose
bfd fast-detect
    area O
bfd minimum-interval 200
int gige 1/0/0/0
       !
int gige 2/0/0/0
bfd minimum-interval 300
        1
    !
    area 1
int gige 3/0/0/0
     !
int gige 4/0/0/0
!
    1
```

Related Commands	Command	Description

bfd mode

To enable the option to use Cisco or IETF mode for BFD over bundle, use the **bfd mode** command in interface configuration mode. To disable the option to use Cisco or IETF mode for BFD over bundle, use the **no** form of this command.

	bfd modecisco ietf		
	no bfd mode		
Syntax Description	cisco	Specifies the use of Cisco mode for BFD over bundle.	
	ietf	Specifies the use of IETF mode for BFD over bundle.	

Command Default	The default member mode is cisco . Interface configuration (config-if)		
Command Modes			
Command History	Release	Modification	
	Release 5.3.1	This command was introduced.	
Usage Guidelines	If the BFD mode is configured when the bundle is being created, the configuration goes through. This is because, both the BFD state as well as the bundle state are 'down' during bundle creation. To apply the mode change for existing sessions, bring down and then recreate the BFD sessions for that bundle.		
	A BFD session on the member interfaces can belong to only one mode (Cisco or IETF mode). Mix of the modes within the same bundle is not supported. This command is supported on bundle interfaces only.		
Task ID	Task Operations ID		
	bundle read, write		
Examples	This example shows how to ena	ble ietf mode for the BFD session on an Ethernet bundle interface:	
	RP/0/RSP0/CPU0:router# conf RP/0/RSP0/CPU0:router(confi RP/0/RSP0/CPU0:router(confi	g)# interface bundle-ether 1	

bfd multipath include location

To include specific linecards to host BFD multiple path sessions, use the **bfd multipath include location** command in the global configuration mode. To remove the configuration, use the **no** form of this command.

bfd multipath include location *node-id* **no bfd multipath include location** *node-id*

Syntax Description	location <i>node-id</i> Configures BFD multipath on the specified location. The <i>node-id</i> variable is mentioned in the <i>rack/slot/module</i> notation.	
Command Default	No default b	pehavior or values
Command Modes	Global configuration	
Command History	Release Modification	
	Release 4.2.0	This command was introduced.

Release	Modification
Release 4.3.0	This command was supported for BFD IPv6 Multihop (BFDv6Mhop) configuration.
Release 4.3.1	Support for this command was removed on ASR 9000 Ethernet Line Card.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

(ID	Task ID	Operation
	bgp	read, write
	ospf	read, write
	isis	read, write
	mpls-te	read, write

Example

This example shows how to run the **bfd multipath include location** command on a specific location:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config) # bfd multipath include location 0/5/CPU0
```

Related Commands	Command	Description	
	bfd, on page 3	Enters BFD configuration mode.	
	show bfd multipath, on page 59	Displays information regarding BFD multipath sessions.	

bfd multiplier

To set the Bidirectional Forwarding Detection (BFD) multiplier, use the bfd multiplier command in the appropriate configuration mode. To return the router to the default setting, use the no form of this command.

bfd multiplier multiplier no bfd multiplier [multiplier]

Syntax Description	-	mber of times a packet is missed before BFD declares the neighbor down. The ranges are as ows:	
		• BGP—2 to 16	
		• IS-IS—2 to 50	
		• MPLS-TE—2 to 10	
		• OSPF and OSPFv3—2 to 50	
		• PIM—2 to 50	
		• GRE tunnel—3 to 50	
Command Default	The default m	altiplier is 3.

	Area configura	ation	
	Area interface	configuration	
	Interface confi	guration	
	Tunnel configu	uration	
Command History	Release	Modification	
	Release 3.7.2	This command was introduced.	
	Release 4.0.0	The bfd multiplier command was supported in the following modes: OSPFv3 router configuration, OSPFv3 area configuration, and OSPFv3 area interface configuration.	
	Release 6.5.1	The bfd multiplier command was supported in tunnel configuration mode.	
Usage Guidelines		nmand, you must be in a user group associated with a task group that includes appropriate task group assignment is preventing you from using a command, contact your AAA administrator	
	highest-level c	DSPFv3 environments, the setting of the bfd multiplier command is inherited from the onfiguration mode in which the command was configured. From the lowest to the highest modes, the inheritance rules are as follows:	

- If you configure a multiplier in area interface configuration mode, the updated multiplier affects the BFD sessions on the specified interface only.
- If you configure a multiplier in area configuration mode, the updated multiplier affects the BFD sessions on all interfaces in the specified area.
- If you configure a multiplier in router configuration mode, the updated multiplier affects the BFD sessions in all areas and all associated interfaces in the specified routing process.

If desired, you can override these inheritance rules by explicitly configuring the **bfd multiplier** command for a specific area interface or area.

If the multiplier is changed using the **bfd multiplier** command, the new value is used to update all existing BFD sessions for the protocol (BGP, IS-IS, MPLS-TE, OSPF, or OSPFv3).

Task ID	Task ID	Operations
	bgp	read, write
	isis	read, write
	mpls-te	read, write
	ospf	read, write
	multicast	read, write

Examples

The following example shows how to set the BFD multiplier in a BGP routing process:

RP/0/RSP0/CPU0:router(config)# router bgp 65000
RP/0/RSP0/CPU0:router(config-bgp)# bfd multiplier 2

The following example shows the configuration of an OSPFv3 routing process named san_jose. The example shows two areas, each of which includes Gigabit Ethernet interfaces. In area 0, the multiplier is set to 5 at the area level, which means that by virtue of the inheritance rules, the same value is set on all interfaces within the area except those on which a different value is explicitly configured. Given this rule, Gigabit Ethernet interface 1/0/0/0 uses a multiplier of 5, which is inherited from the area, while interface 2/0/0/0 uses the explicitly configured multiplier of 2.

In area 1, a multiplier is not configured at the area or interface levels, which means that interfaces 3/0/0/0 and 4/0/0/0 use the default value of 3.

```
router ospfv3 san_jose
bfd fast-detect
    area 0
bfd multiplier 5
int gige 1/0/0/0
        !
int gige 2/0/0/0
```

clear bfd counters

To clear Bidirectional Forwarding Detection (BFD) counters, use the **clear bfd counters** command in EXEC mode.

clear bfd counters ipv4 | [**singlehop** | **multihop**] | **ipv6** | [**singlehop** | **multihop**] | **all** | **label** [**packet**] [**timing**] [**interface** *type interface-path-id*] **location** *node-id*

Syntax Description	ipv4	(Optional) Clears BFD over IPv4 information only.
	ipv6	(Optional) Clears BFD over IPv6 information only.
	singlehop	(Optional) Clears BFD singlehop information only.
	multihop	(Optional) Clears BFD multihop information only.
	all	(Optional) Clears both BFD over IPv4 and BFD over IPv6 information.
	packet	(Optional) Specifies that packet counters are cleared.
	timing	(Optional) Specifies that timing counters are cleared.
	interface	(Optional) Specifies the interface from which the BFD packet counters are cleared.
	type	Specifies the interface type. For more information, use the question mark (?) online help function.
	interface-path-id	Physical interface or virtual interface.
		Note Use the show interfaces command to see a list of all interfaces currently configured on the router.
		For more information about the syntax for the router, use the question mark (?) online help function.
	location node-id	Clears BFD counters from the specified location. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

Command Default	The default is the default address family identifier (AFI) that is set by the set default-afi command, IPv4 or IPv6.				
Command Modes	EXEC				
Command History	Release	Modification			
	Release 3.7.2	This command was introd	uced.		
	Release 4.0.0	Support for the ipv6 keyw	ord was added.		
	Release 4.2.0	Support for the singlehop	and multihop keywords were added.		
Usage Guidelines	To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.				
	For the <i>interface-path-id</i> argument, use the following guidelines:				
	• If specifying a physical interface, the naming notation is <i>rack/slot/module/port</i> . The slash between values is required as part of the notation. An explanation of each component of the naming notation is as follows:				
	• <i>rack</i> : Chassis number of the rack.				
	• <i>slot</i> : Physical slot number of the line card.				
	• module: Module number. A physical layer interface module (PLIM) is always 0.				
	• <i>port</i> : Physical port number of the interface.				
	• If specifying a virtual interface, the number range varies, depending on interface type.				
	Both IPv4 and IPv6 BFD sessions can run simultaneously on the same line card.				
Examples	The following example shows how to clear the BFD IPv6 packet counters on a POS interface:				
	RP/0/RSP0/CF	U0:router# clear bfd co u	nters packet ipv6 interface POS 0/	1/0/0 location 0/1/cpu0	
	The following example shows how to clear the BFD IPv4 timing counters:				
	RP/0/RSP0/CPU0:router# clear bfd counters ipv4 timing location 0/5/cpu0

echo ipv4 source

To specify the IP address that you want to use as the source address for BFD echo packets, use the **echo ipv4 source** command in BFD or BFD interface configuration mode. To return to the default, use the **no** form of this command.

echo ipv4 source *ip-address* no echo ipv4 source *ip-address*

Syntax Description	<i>ip-address</i> 32-bit IPv4 address in dotted-decimal format (A.B.C.D).		
Command Default	The IP address of the output interface, or the IP address in the router-id command (if configured), is the default address used for an echo packet when the echo ipv4 source command is not configured.		
Command Modes	BFD configuration		
	BFD interface configuration		
Command History	Release Modification		
	Release 3.9.0 This command was introduced.		
Usage Guidelines	To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.		
	If you do not configure the IPv4 source address for echo packets, then BFD uses the IP address of the output interface or the address in the router-id command if specified.		
	You can override the default address for BFD echo packets by specifying an IPv4 source address for echo packets globally for all BFD sessions on the router and at an individual interface. Specifying the IP address at an individual interface will override any value specified globally for BFD on the router.		

Tasl	k ID

Task ID	Operations
bgp	read, write
ospf	read, write
isis	read, write
mpls-te	read, write

Examples

The following example shows how to specify the IP address 10.10.10.1 as the source address for BFD echo packets for all BFD sessions on the router:

RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# bfd
RP/0/RSP0/CPU0:router(config-bfd)# echo ipv4 source 10.10.10.1

The following example shows how to specify the IP address 10.10.10.1 as the source address for BFD echo packets on an individual Gigabit Ethernet interface:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# bfd
RP/0/RSP0/CPU0:router(config-bfd)# interface gigabitethernet 0/1/0/0
RP/0/RSP0/CPU0:router(config-bfd-if)# echo ipv4 source 10.10.10.1
```

The following example shows how to specify the IP address 10.10.10.1 as the source address for BFD echo packets on an individual Packet-over-SONET (POS) interface:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# bfd
RP/0/RSP0/CPU0:router(config-bfd)# interface pos 0/1/0/0
RP/0/RSP0/CPU0:router(config-bfd-if)# echo ipv4 source 10.10.10.1
```

Related Commands	Command	Description
	bfd, on page 3	Enters BFD configuration mode.

echo latency detect

To enable latency detection for BFD echo packets, use the **echo latency detect** command in BFD configuration mode. To return to the default, use the **no** form of this command.

			ercentage percent-value [count packet-count]] t [percentage percent-value [count packet-count]]
Syntax Description	percent	tage percent-value	e (Optional) Percentage of the echo failure detection time to be detected as bad latency. The range is 100 to 250. The default is 100.
	count p	vacket-count	(Optional) Number of consecutive packets received with the detected bad latency that will take down a BFD session. The range is 1 to 10. The default is 1.
Command Default	Echo lat	ency detection is o	disabled.
Command Modes	BFD co	nfiguration	
Command History	Release	e Modificati	ion
	Release	e 4.0.0 This comm	nand was introduced.
Usage Guidelines		he user group assig	n must be in a user group associated with a task group that includes appropriate task gnment is preventing you from using a command, contact your AAA administrator
Note	Latency		valid where echo mode is supported for BFD. However, it is not supported on bundle
	packets address	within a period of latency between tr	, standard BFD echo failure detection tracks only the absence of receipt of echo f time based on a counter. However, this standard echo failure detection does not ransmission and receipt of any specific echo packet, which can build beyond desired e of the BFD session.
	and the		enabled, a percentage is multiplied to the echo failure detection value (I x M x %), computed for the echo packet. If this delay is greater than (I x M x %), then the n .
	•		eket count, then the system tracks the number of packets received back-to-back with down the session.
Task ID	Task ID	Operations	
	bgp	read, write	
	ospf	read, write	
	isis	read, write	
	mpls-te	read, write	

Examples

In the following examples, consider that the BFD minimum interval is 50 ms, and the multiplier is 3 for the BFD session.

The following example shows how to enable echo latency detection using the default values of 100% of the echo failure period (I x M) for a packet count of 1. In this example, when one echo packet is detected with a roundtrip delay greater than 150 ms, the session is taken down:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# bfd
RP/0/RSP0/CPU0:router(config-bfd)# echo latency detect
```

The following example shows how to enable echo latency detection based on 200% (two times) of the echo failure period for a packet count of 1. In this example, when one packet is detected with a roundtrip delay greater than 300 ms, the session is taken down:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# bfd
RP/0/RSP0/CPU0:router(config-bfd)# echo latency detect percentage 200
```

The following example shows how to enable echo latency detection based on 100% of the echo failure period for a packet count of 3. In this example, when three consecutive echo packets are detected with a roundtrip delay greater than 150 ms, the session is taken down:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# bfd
RP/0/RSP0/CPU0:router(config-bfd)# echo latency detect percentage 100 count 3
```

Related Commands	Command	Description

interface (BFD)

To enter Bidirectional Forwarding Detection (BFD) interface configuration mode, where you can disable echo mode on an interface, use the **interface** command in BFD configuration mode. To return to BFD configuration mode, use the **no** form of this command.

interface type interface-path-id **no interface** type interface-path-id

Syntax Description	<i>type</i> Interface type. For more information, use the question mark (?) online help function.		
	interface-path-id Physical interface or virtual interface.		
	Note Use the show interfaces command to see a list of all interfaces currently configured on the router.		
	For more information about the syntax for the router, use the question mark (?) online hel function.		
Command Default	No default behavior or values		
Command Modes	BFD configuration		
Command History	Release Modification		
	Release 3.7.2 This command was introduced.		
Usage Guidelines	To use this command, you must be in a user group associated with a task group that includes appropriate tas IDs. If the user group assignment is preventing you from using a command, contact your AAA administrate for assistance.		
	For the <i>interface-path-id</i> argument, use the following guidelines:		
	• If specifying a physical interface, the naming notation is <i>rack/slot/module/port</i> . The slash between value is required as part of the notation. An explanation of each component of the naming notation is as follow		

- rack: Chassis number of the rack.
- *slot*: Physical slot number of the line card.
- module: Module number. A physical layer interface module (PLIM) is always 0.
- port: Physical port number of the interface.
- If specifying a virtual interface, the number range varies, depending on interface type.

If you are using BFD with Unicast Reverse Path Forwarding (uRPF) on a particular interface, then you need to use the **echo disable** command in BFD interface configuration mode to disable echo mode on that interface; otherwise, echo packets are rejected by the interface.

Note To enable or disable IPv4 uRPF checking on an IPv4 interface, use the **[no] ipv4 verify unicast source reachable-via** command in interface configuration mode. To enable or disable loose IPv6 uRPF checking on an IPv6 interface, use the **[no] ipv6 verify unicast source reachable-via any** command in interface configuration mode.

Task ID	Operations
bgp	read, write
ospf	read, write

multihop ttl-drop-threshold

To specify the maximum time to live (TTL) value for multihop sessions per system, use the **multihop ttl-drop-threshold** command in the BFD configuration mode. To return to the default, use the **no** form of this command.

multihop ttl-drop-threshold value no multihop ttl-drop-threshold value

Syntax Description	value Sp	ecifies the configurable range of va	alues for TTL. It ranges from 0 to 254.
Command Default	No default	behavior or values	
Command Modes	BFD config	guration	
Command History	Release	Modification	-
	Release 4.2.0	This command was introduced.	-
			-

Usage Guidelines To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

When the TTL of a BFD packet is received on the router, the value is decremented by one and then compared with the configured ttl-drop-threshold.

- If the TTL of a BFD packet after decrementing is less than the configured ttl-drop-threshold, the packet will be dropped.
- If the TTL of a BFD packet received on the router after decrementing is greater than or equal to the configured ttl-drop-threshold, the packet will be processed.

Note This configuration command is only applicable for BFD multihop sessions.

Examples

The following example displays all IPv4 and IPv6 BFD MIB session information stored on the RP node:

```
RP/0/RSP0/CPU0:router# show bfd mib session
```

```
Tue Sep 9 07:49:30.828 PST DST
Local Discr: 327681(0x50001), Remote Discr: 0(0x0)
BFD session: GigabitEthernet0_1_5_2(0x11800c0), 10.27.4.7
Current State: ADMIN DOWN, Number of Times UP: 0
Running Version: 0, Last Down Diag: None
Last Up Time (s.ns): 0.0
Last Down Time (s.ns): 0.0
Detection Multiplier: 0
Desired Min TX Interval: 0
Required Min RX Interval: 0
Required Min RX Echo Interval: 0
Packets in/out: 0/0
Current Trap Bitmap: 0x0
Last Time Cached: Not yet cached
```

The following example displays all IPv4 and IPv6 BFD MIB session information stored on 0/1/CPU0:

RP/0/RSP0/CPU0:router# show bfd mib session location 0/1/CPU0

```
Tue Sep 9 07:44:49.190 PST DST
Local Discr: 327681(0x50001), Remote Discr: 0(0x0)
BFD session: GigabitEthernet0_1_5_2(0x11800c0), 10.27.4.7
Number of times UP: 0
Last Down Diag: None
Last Up Time (s.ns): 0.0
Last Down Time (s.ns): 0.0
Packets in/out: 0/1140134
```

Table 3: show	bfd mib	Field I	Descriptions
	~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~		

Field	Description
date and timestamp	Date and time stamp during which a snapshot of the BFD MIB session information is taken.
Local Discr	Local discriminator (in decimal and hexadecimal) that uniquely identifies the BFD MIB session.
Remote Discr	Session discriminator (in decimal and hexadecimal) that was chosen by the remote system for the BFD MIB session.
BFD session	Index of interface upon which the BFD MIB session is running. Also, neighboring IP address that is monitored with the BFD MIB session.
Current State	Current state of the BFD MIB session.
Number of Times UP	Number of times the BFD MIB session has gone into the up state since the router was last rebooted.
Running Version	BFD protocol version number in which the BFD MIB session is running.

Field	Description
Last Down Diag	Diagnostic value associated with the last time the BFD MIB session went down.
Last Up Time (s.ns)	Value of sysUpTime, in <i>seconds.nanoseconds</i> , during which the BFD MIB session last came up. If such an event does not exist, a zero is displayed.
Last Down Time (s.ns)	Value of sysUpTime, in <i>seconds.nanoseconds</i> , during which communication was last lost with the neighbor. If such an event does not exist, a zero is displayed.
Detection Multiplier	Failure detection multiplier.
Desired Min TX Interval	Minimum interval, in microseconds, preferred by the local system when transmitting BFD control packets.
Required Min RX Interval	Minimum interval, in microseconds, that the local system supports between received BFD control packets.
Required Min RX Echo Interval	Minimum interval, in microseconds, that the local system supports between received BFD echo packets.
Packets in/out	Total number of BFD messages received and transmitted for the BFD MIB session.
Current Trap Bitmap	Bits that control the trap for the BFD MIB session. A nonzero value indicates that the trap is generated when the next trap event is triggered.
Last Time Cached	When information for the BFD MIB session was last cached. Typically, the information is cached when SNMP operations for the BFD MIB session are performed.

## Example

This example shows the sample output for show bfd multipath command:

RP/0/RSP0/CPU0:routershow bfd multipath location 0/5/cpu0

Int/Src Addr	Label/Dest Addr	VRF ID	Discr	Node	State
pw-ether 1	10.10.10.10	0x0000002	0x4	0/5/CPU0	DOWN
tunnel-ip 1	1.1.1.1	0x8	0x5	0/5/CPU0	UP

# show bfd session

To display Bidirectional Forwarding Detection (BFD) session information, use the **show bfd session** command in EXEC mode.

show bfd [ipv4 | [singlehop | multihop] | ipv6 | [singlehop | multihop] | all | label] session [interface type interface-path-id [destination ip-address] [detail][in-label]] location node-id

Syntax Description	ipv4	(Optional) Displays BFD over IPv4 information only.				
	ipv6	(Optional) Displays BFD over IPv6 information only.				
	singlehop	(Optional) Displays BFD singlehop information only.				
	multihop	(Optional) Displays BFD multihop information only.				
	all	(Optional) Displays both BFD over IPv4 and BFD over IPv6 information.				
	label	(Optional) Displays the MPLS Transport Profile (MPLS-TP) label BFD information only.				
	interface	(Optional) Specifies the interface for which to show information.				
	type	Interface type. For more information, use the question mark (?) online help function.				
	interface-path-id	Physical interface or virtual interface.				
		<b>Note</b> Use the <b>show interfaces</b> command to see a list of all interfaces currently configured on the router.				
		For more information about the syntax for the router, use the question mark (?) online help function.				
	destination <i>ip-addres</i>	s (Optional) Displays the BFD session destined for the specified IP address.				
	detail	(Optional) Displays detailed session information, including statistics and number of state transitions.				
	in-label	(Optional) Displays the BFD session with a specific incoming MPLS-TP label.				
	location node-id	(Optional) Displays BFD sessions hosted from the specified location. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.				
Command Default	The default is the defa IPv6.	ult address family identifier (AFI) that is set by the <b>set default-afi</b> command, IPv4 or				
Command Modes	EXEC					
Command History	Release Modifi	cation				
	Release 3.7.2 This co	ommand was introduced.				
	Release 4.0.0 Support for the <b>ipv6</b> keyword was added.					
	Release 4.2.0 Support	Release 4.2.0 Support for the <b>singlehop</b> and <b>multihop</b> keywords were added.				
Usage Guidelines		you must be in a user group associated with a task group that includes appropriate task assignment is preventing you from using a command, contact your AAA administrator				
	For the <i>interface-path</i>	-id argument, use the following guidelines:				

- If specifying a physical interface, the naming notation is *rack/slot/module/port*. The slash between values is required as part of the notation. An explanation of each component of the naming notation is as follows:
  - rack: Chassis number of the rack.
  - slot: Physical slot number of the line card.
  - module: Module number. A physical layer interface module (PLIM) is always 0.
  - *port*: Physical port number of the interface.

RP/0/RSP0/CPU0:router# show bfd session detail

- If specifying a virtual interface, the number range varies, depending on interface type.
- The BFD UP time in the show output printed using CLI, and the show output from SNMP may differ. The CLI output is the appropriate value. The difference doesn't impact the functioning of the device.

Note Only VRF ID is displayed in the summary CLI (such as show bfd multiple-path, show bfd all session, show bfd counters) and VRF name and VRF ID is displayed in the detailed CLI (such as show bfd all session detail, show bfd all session status).

# Task ID

Task ID	Operations
bgp	read
ospf	read
isis	read
mpls-te	read

### **Examples**

The following example shows the output from the **show bfd session** command with the **detail** keyword and IPv4 as the default:

```
I/f:TenGigE0/2/0/0.6, Location:0/2/CPU0, dest:10.0.6.2, src:10.0.6.1
State:UP for Od:Oh:3m:4s, number of times UP:1
Session type: PR/V4/SH
Received parameters:
Version:1, desired tx interval:2 s, required rx interval:2 s
Required echo rx interval:1 ms, multiplier:3, diag:None
My discr:589830, your discr:590028, state UP, D/F/P/C/A:0/0/0/1/0
Transmitted parameters:
Version:1, desired tx interval:2 s, required rx interval:2 s
Required echo rx interval:1 ms, multiplier:3, diag:None
My discr:590028, your discr:589830, state UP, D/F/P/C/A:0/0/0/1/0
Timer Values:
 Local negotiated async tx interval:2 s
Remote negotiated async tx interval:2 s
Desired echo tx interval:250 ms, local negotiated echo tx interval:250 ms
Echo detection time: 750 ms(250 ms*3), async detection time: 6 s(2 s*3)
Local Stats:
```

Intervals between asy Tx:Number of interv Last packet tra Rx:Number of interv Last packet red	vals=100, mi ansmitted 60 vals=100, mi	.n=952 ms, m 06 ms ago .n=1665 ms, n		-
Intervals between ech	no packets:			
Tx:Number of interv	vals=100, mi	n=250 ms, m	ax=252 ms,	avg=250 ms
Last packet tra	ansmitted 18	8 ms ago		
Rx:Number of interv	vals=100, mi	.n=250 ms, m	ax=252 ms,	avg=250 ms
Last packet rec	ceived 187 m	ns ago		
Latency of echo packe	ets (time be	etween tx an	d rx):	
Number of packets:1	.00, min=1 m	ns, max=2 ms	, avg=1 ms	
	Desir	red	Adjus	ted

	E 0 0 m e			2
ipv4_static	500 ms		500 ms	
bgp-default	1500 ms	3	1500 ms	3

The following example shows the output from the **show bfd session** command with the **all** keyword, which displays both IPv4 and IPv6 information:

RP/0/RSP0/CPU0:router# show bfd all session location 0/1/CPU0 Mon Nov 5 08:51:50.339 UTC IPv4: ____ Interface Dest Addr Local det time(int*mult) State Echo Async 10.0.0.2 300ms(100ms*3) 6s(2s*3) UP PO0/1/0/0 IPv6: ____ Dest Addr Interface Echo Async Local det time(int*mult) _____ PO0/1/0/0 abcd::2 0s(0s*0) 15s(5s*3) UP

Table 4: show bfd session detail command Field Descriptions

Field	Description
I/f	Interface type.
Location	Location of the node that hosts the local endpoint of the connection, in the <i>rack/slot/module</i> notation
dest	IP address of the destination endpoint.
src	IP address of the source endpoint.
State	Current state of the connection, and the number of days, hours, minutes, and seconds that this connection has been active.
number of times UP	Number of times this connection has been brought up.

Field	Description					
Received	Provides information on the last transmitted control packet for the session:					
parameters	• Version—Version number of the BFD protocol.					
	• desired tx interval—Desired transmit interval.					
	• required rx interval—Required receive interval.					
	• Required echo rx interval—Required echo receive interval.					
	• multiplier— Number of times a packets is missed before BFD declares the neighbor down.					
	• diag—diagnostic code specifying the peer system's reason for the last transition of the session from Up to some other state.					
	• My discr—unique, nonzero discriminator value generated by the transmitting system used to demultiplex multiple BFD sessions between the same pair of systems.					
	• your discr— discriminator received from the corresponding remote system. This field reflects back the received value of My discr, or is zero if that value is unknown.					
Transmitted	Provides information on the last transmitted control packet for the session:					
parameters	Version—Version number of the BFD protocol.					
	• desired tx interval—Desired transmit interval.					
	• required rx interval—Required receive interval					
	Required echo rx interval—Required echo receive interval					
	• multiplierNumber of times a packets is missed before BFD declares the neighbor down.					
	• diag—diagnostic code specifying the local system's reason for the last transition of the session from Up to some other state.					
	• My discr—unique, nonzero discriminator value generated by the transmitting system, used to demultiplex multiple BFD sessions between the same pair of systems.					
	• your discr— discriminator received from the corresponding remote system. This field reflects back the received value of My discr, or is zero if that value is unknown.					

Field	Description						
Timer Values	Provides information on the timer values used by the local and remote ends, as follows:						
	• Local negotiated async tx interval—interval at which control packets are being transmitted by the local end.						
	• Remote negotiated async tx interval—interval at which control packets should be transmitted by the remote end.						
	• Desired echo tx interval—interval at which the local end would like to transmit echo packets.						
	• local negotiated echo tx interval—interval at which echo packets are being transmitted by the local end.						
	• Echo detection time—local failure detection time of echo packets. It is the product of the local negotiated echo tx interval and the local multiplier.						
	• async detection time—local failure detection time of the asynchronous mode (control packets). It is the product of the remote negotiated async tx interval and the remote multiplier.						
Local Stats	Displays the local transmit and receive statistics,						
	• Intervals between async packets—provides measurements on intervals between control packets (tx and rx):						
	Number of intervals—number of sampled intervals between control packets						
	• min-minimum measured interval between 2 consecutive control packets						
	max—maximum measured interval between 2 consecutive control packets						
	• avg—average measured interval between 2 consecutive control packets						
	<ul> <li>Last packet received/transmitted—indicates how long ago the last control packet was received/transmitted.</li> </ul>						
	• Intervals between echo packets—provides measurements on intervals between echo packets (tx and rx). The measurements have the same meaning as for async packets.						
	• Latency of echo packets (time between tx and rx)—provides measurements on latency of echo packets, i.e. the time between tx and rx of echo packets:						
	• Number of packets—number of sampled echo packets.						
	• min—minimum measured latency for echo packets.						
	• max—maximum measured latency of echo packets.						
	• avg—average measured latency of echo packets.						

**Related Commands** 

Field	Description			
Session owner information	Provides the following information about the session owner.			
	Client—name of the client application process.			
	• Desired interval—desired interval provided by the client, in milliseconds.			
	• Multiplier—multiplier value provided by the client.			

Description

**Displays BFD MIB session information.**
