

Enhancements to Data Models

This section provides an overview of the enhancements made to data models.

- [NETCONF Accounting Logs, on page 1](#)
- [Install Label in oc-platform Data Model, on page 4](#)
- [OAM for MPLS and SR-MPLS in mpls-ping and mpls-traceroute Data Models, on page 6](#)

NETCONF Accounting Logs

Table 1: Feature History Table

Feature Name	Release Information	Description
Accounting Records for NETCONF Operations	Release 7.6.1	Depending on the accounting configuration command you use, every NETCONF operation that the router performs is reported to the local server as syslog messages or remote AAA servers like TACACS+ as accounting messages, or both.

With this feature, you can view the accounting logs of all NETCONF operations such as `edit-config`, `get-config`, `get` operations that are performed on the router. The logs include the following data:

- RPC name
- Commit ID
- Session ID
- Message ID
- XPath

For more information, see *Implementing System Logging* chapter in the *System Monitoring Configuration Guide for Cisco ASR 9000 Series Routers*.

To enable NETCONF accounting logs, do the following steps:

Procedure

Step 1 Enter the configuration mode.

Example:

```
Router#conf t
```

Step 2 Create a method list for accounting.

Example:

```
Router(config)#aaa accounting commands default start-stop group tacacs+ local
```

Use one or both of the method list value to enable system accounting.

- **TACACS+**—The logs are stored on the TACACS+ server.
- **Local**—The logs are stored in a user-specified file on the router. The maximum file size is 2047 MB.

Step 3 Commit the configuration.

Example:

```
Router(config)#commit
```

Note

Syslog message about start and end of the session with details such as session ID, user, and remote address information is displayed for NETCONF operations only when both the EXEC accounting and local command accounting is enabled.

```
Router(config)#aaa accounting exec default start-stop group tacacs+
Router(config)#aaa accounting commands default start-stop local
```

Example

NETCONF Accounting Logs

With the RPC commit operation, the configuration changes are reported in the form of CLI commands.

In this example, the `edit-config` operation is converted into its equivalent CLI `aaa accounting system default start-stop none` command in the logs; the user ID and session ID details are logged.

```
RP/0/RP0/CPU0:Mar 15 17:04:34.950 UTC: locald_DLRSC[233]: %SECURITY-LOCALD-6-LOCAL_CMD_ACCT
:
RPC CMD: "aaa accounting system default start-stop none" by <user> from TTY
netconf-3745105668
10.0.0.1 rpc_name commit rpc_commitid 808464433 rpc_sessid 3745105668
rpcmsgid 6ed74d71-1eda-4757-a4d6-8223b6fcfa58
```

For other RPCs, the data is reported in the form of XPaths. In this example, the NETCONF operation does not report equivalent CLI command. The RPC name is recorded in the logs. For syslogs with length greater than 400 characters, the log is split into two entries. Here, the XPath is split for brevity

```
RP/0/RP0/CPU0:Mar 15 18:39:45.412 UTC: locald_DLRSC[418]: %SECURITY-LOCALD-6-LOCAL_CMD_ACCT

Install Label in oc-platform Data Model

Table 2: Feature History Table

Feature Name	Release Information	Description
Enhancements to openconfig-platform YANG Data Model	Release 7.3.2	<p>The openconfig-platform YANG data model provides a structure for querying hardware and software router components via the NETCONF protocol. This release delivers an enhanced openconfig-platform YANG data model to provide information about:</p> <ul style="list-style-type: none"> • software version • golden ISO (GISO) label • committed IOS XR packages <p>You can access this data model from the Github repository.</p>

The openconfig-platform (oc-platform.yang) data model is enhanced to provide the following data:

- IOS XR software version (optionally with GISO label)
- Type, description, operational status of the component. For example, a CPU component reports its utilization, temperature or other physical properties.
- List of the committed IOS XR packages

To retrieve oc-platform information from a router via NETCONF, ensure you configured the router with the SH server and management interface:

```
Router#show run
Building configuration...
!! IOS XR Configuration version = 7.3.2
!! Last configuration change at Tue Sep  7 16:18:14 2016 by USER1
!
.....
.....
netconf-yang agent ssh
ssh server netconf vrf default
interface MgmtEth 0/RP0/CPU0/0
  no shut
  ipv4 address dhcp
```

The following example shows the enhanced OPERATING_SYSTEM node component (line card or route processor) of the oc-platform data model:

```
<component>
<name>IOSXR-NODE 0/RP0/CPU0</name>
<config>
<name>0/RP0/CPU0</name>
```

```
</config>
<state>
<name>0/RP0/CPU0</name>
<type xmlns:idx="http://openconfig.net/yang/platform-types">idx:OPERATING_SYSTEM</type>
<location>0/RP0/CPU0</location>
<description>IOS XR Operating System</description>
<software-version>7.3.2</software-version> -----> Label Info
<removable>true</removable>
<oper-status xmlns:idx="http://openconfig.net/yang/platform-types">idx:ACTIVE</oper-status>
</state>
<subcomponents>
<subcomponent>
<name><platform>-af-ea-7.3.2v1.0.0.1</name>
<config>
<name><platform>-af-ea-7.3.2v1.0.0.1</name>
</config>
<state>
<name><platform>-af-ea-7.3.2v1.0.0.1</name>
</state>
</subcomponent>
...
...
```

The following example shows the enhanced `OPERATING_SYSTEM_UPDATE` package component (RPMs) of the `oc-platform` data model:

```
<component>
<name>IOSXR-PKG/1 <platform>-isis-2.1.0.0-r732</name>
<config>
<name><platform>-isis-2.1.0.0-r732</name>
</config>
<state>
<name><platform>-isis-2.1.0.0-r732</name>
<type xmlns:idx="http://openconfig.net/yang/platform-types">idx:OPERATING_SYSTEM_UPDATE</type>
<description>IOS XR Operating System Update</description>
<software-version>7.3.2</software-version>-----> Label Info
<removable>true</removable>
<oper-status xmlns:idx="http://openconfig.net/yang/platform-types">idx:ACTIVE</oper-status>
</state>
</component>
```

Associated Commands

- **show install committed**—Shows the committed IOS XR packages.
- **show install committed summary**—Shows a summary of the committed packages along with the committed IOS XR version that is displayed as a label.

OAM for MPLS and SR-MPLS in mpls-ping and mpls-traceroute Data Models

Table 3: Feature History Table

Feature Name	Release Information	Description
YANG Data Models for MPLS OAM RPCs	Release 7.3.2	<p>This feature introduces the Cisco-IOS-XR-mpls-ping-act and Cisco-IOS-XR-mpls-traceroute-act YANG data models to accommodate operations, administration and maintenance (OAM) RPCs for MPLS and SR-MPLS.</p> <p>You can access these Cisco IOS XR native data models from the Github repository.</p>

The Cisco-IOS-XR-mpls-ping-act and Cisco-IOS-XR-mpls-traceroute-act YANG data models are introduced to provide the following options:

- Ping for MPLS:
 - MPLS IPv4 address
 - MPLS TE
 - FEC-129 Pseudowire
 - FEC-128 Pseudowire
 - Multisegment Pseudowire
- Ping for SR-MPLS:
 - SR policy name or BSID with LSP end-point
 - SR MPLS IPv4 address
 - SR Nil-FEC labels
 - SR Flexible Algorithm
- Traceroute for MPLS:
 - MPLS IPv4 address
 - MPLS TE
- Traceroute for SR-MPLS:
 - SR policy name or BSID with LSP end-point

- SR MPLS IPv4 address
- SR Nil-FEC labels
- SR Flexible Algorithm

The following example shows the ping operation for an SR policy and LSP end-point:

```
<mpls-ping xmlns="http://cisco.com/ns/yang/Cisco-IOS-XR-mpls-ping-act">
  <sr-mpls>
    <policy>
      <name>srte_c_10_ep_10.10.10.1</name>
      <lsp-endpoint>10.10.10.4</lsp-endpoint>
    </policy>
  </sr-mpls>
  <request-options-parameters>
    <brief>true</brief>
  </request-options-parameters>
</mpls-ping>
```

Response:
