Configure EVPN IRB

This chapter introduces you to Ethernet VPN (EVPN) Integrated Routing and Bridging (IRB) feature and describe how you can configure the EVPN IRB feature.

EVPN IRB

Ethernet Virtual Private Network Integrated Routing and Bridging (EVPN IRB) is a category of network technology that provides an extensible and flexible solution for Layer 2 (L2) and Layer 3 (L3) connectivity among hosts across different IP subnets over an MPLS core and IP network.

The EVPN IRB feature is a component that

- enables L3 forwarding among hosts across different IP subnets,
- while maintaining the multi-homing capabilities of EVPN.
- Additionally, it allows EVPN hosts or subnets to communicate with IP VPNs, enhancing network flexibility and connectivity.

EVPN IRB components

To implement EVPN IRB, the network uses these key components to ensure effective traffic management and routing:

- **BGP (Border Gateway Protocol)**: It advertises subnet and host routes to the EVPN core using route-type 5 and route-type 2 messages.
- **EVPN**: It manages ethernet segment configurations and handles host route advertisements and failover scenarios.
- **L2RIB (Layer 2 Routing Information Base)**: It handles MAC or IP mobility, resolves routes, and computes the best routes.
- **BVI MA (Bridge Virtual Interface Manager)**: It manages IRB interfaces and supports routing by advertising the BVI's subnet and MAC addresses.
- **L2FIB (Layer 2 Forwarding Information Base)**: It ensures correct forwarding based on MAC and IP addresses.

EVPN IRB environments

The EVPN IRB supports these environments:

- **Single-homing interface**: Customer Edge (CE) devices connect directly to a single Physical Edge (PE) router.
- **Multi-homing interface**: CE device connect to multiple PE routers through dual links, a Link Aggregation Group (LAG), or a switch.
- **Anycast gateway or Bridge Virtual Interface (BVI)**: BVI interfaces use the same IP and MAC addresses on all PE routers, enabling devices in the network to reach the gateway using the same address, regardless of which router is the designated forwarder.

EVPN-IRB core and access options

EVPN-IRB supports these core and access options:

- **Core options**:
  - **Host routing**: Enable or disable host routing to manage subnet and host route advertisements.
  - **VRF**: Integrate with VRF for seamless route management.
- **Access options**:
  - **Switch devices**: Supports switch devices with or without LAG.
  - **Y-cable configurations**: Use Y-cable configurations for redundancy.
  - **Mixed environments connections**: Operate in mixed environments with single-homing, single-active multi-homing, and all-active multi-homing connections.
  - **Single-Flow-Active (SFA) load-balancing mode**: Implement SFA for load balancing.

Limitations and restrictions for EVPN IRB

These are the limitations and restrictions for EVPN IRB:

- Traffic from the Bridge Virtual Interface (BVI) does not use the BVI's configured MAC address but instead uses the MAC address of the physical interface, devices in the network are unable to properly learn the BVI's MAC address. This results in unnecessary traffic flooding as devices repeatedly attempt to resolve the MAC address associated with the BVI IP. To address this, implement a configurable timer under the BVI interface to periodically broadcast the BVI's MAC and IP pairing using Gratuitous ARP (GARP) for IPv4 or unsolicited Neighbor Advertisement for IPv6.
- You must enable host routing when configuring EVPN-IRB.

EVPN single-homing access EVPN gateway

EVPN single-homing access EVPN gateway is a network architecture that leverages EVPN technology to provide L2 and L3 VPN services. This setup is particularly useful for connecting CE devices to a service provider's network in a single-homed configuration by connecting each CE device to only one PE device.

How EVPN single-homing access EVPN gateway works

Summary

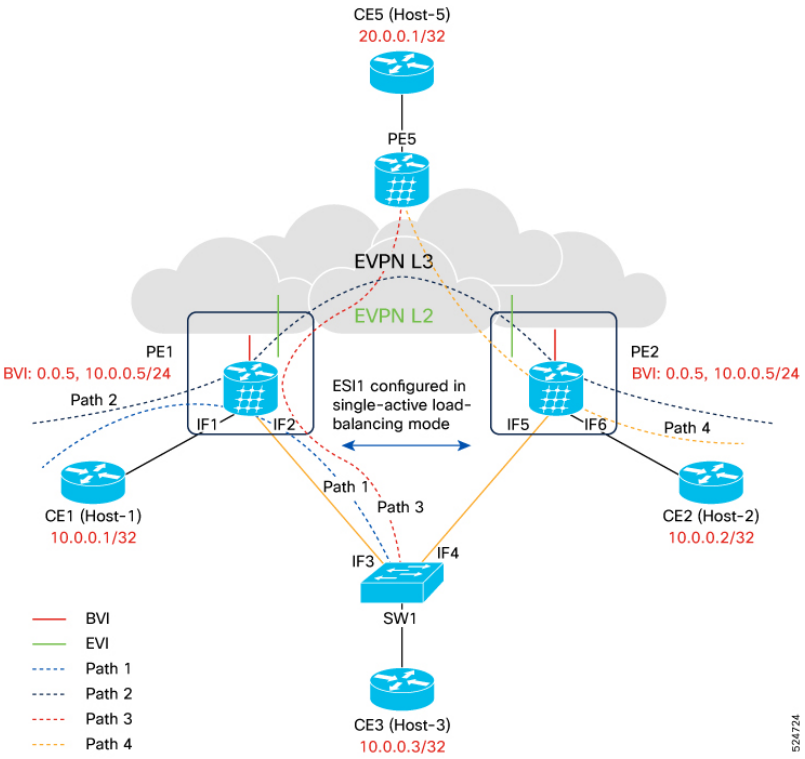
EVPN IRB single-homing workflow includes these key components:

- **CE or host routers**:
  - CE1 or Host-1 with IP address 10.0.0.1/32
  - CE2 or Host-2 with IP address 10.0.0.2/32
  - CE3 or Host-3 with IP address 10.0.0.3/32
  - CE5 or Host-5 with IP address 20.0.0.1/32
- **PE routers**:
  - PE1 with BVI IP address 10.0.0.5/24 and BVI mac address 0.0.5
  - PE2 with BVI IP address 10.0.0.5/24 and BVI mac address 0.0.5
  - PE5
- **Interfaces**:
  - IF1: Connects Host-1 to PE1
  - IF2: Connects Host-3 to PE1
  - IF3: Connects PE1 to Host-3
  - IF4: Connects PE2 to Host-3
  - IF5: Connects Host-3 to PE2

- **Paths**:
  - Path 1: Host-1 communicating with Host-2 using a EVPN single-homing access EVPN gateway interface
  - Path 2: Host-1 communicating with Host-3 using a EVPN single-homing access EVPN gateway interface
  - Path 3: Host-3 communicating with Host-5 using a EVPN single-active multihoming interface
  - Path 4: Host-2 communicating with Host-5 using a EVPN multihoming active-active interface
- Switch device: SW1, connects Host-3 to PE1 and PE2
- Host routing is enabled on PE1 and PE2.
- IRB interfaces are configured as anycast.
- Host-1 and Host-2 connect to PE1 and PE2 using a EVPN single-homing interfaces.
- Host-3 connect to PE1 and PE2 using a EVPN multihoming interfaces.
- IOS XR Software performs the Designated Forwarder (DF) election for the shared Ethernet Segment Identifier (ESI) and elects IF2 as DF and IF5 as Non-Designated Forwarder (NDF).
- Interface IF5 is set to blocked state which blocks both BUM and unicast traffic.

Workflow

Figure 1: EVPN IRB single-homing network topology



Let's consider these scenarios:

- Where Host-1 wants to communicate with Host-2, which are in same subnet.
  1. Host-1 sends an ARP request, which is received by the Bridge Domain (BD) on PE1.
  2. PE1 learn the Host-1 MAC and IP addresses from these ARP packets and replicates this information across all output interfaces.
  3. PE1 advertises Host-1 route using EVPN route type-2 to remote PEs. Remote PEs, such as PE2, import and install this route as a remote route.
  4. Since Host-2 is directly connected to PE2, it receives the ARP request and responds with a unicast ARP response.
  5. The ARP process ensures that PE2 learns Host-2 IP address 10.0.0.2/32.
  6. PE2 performs a MAC lookup for Host-1 and forwards packet to peering PE1, enabling communication between Host-2 and Host-1.

- Where Host-1 wants to communicate with Host-3, which are in same subnet.
  1. Host-1 sends an ARP request, which is received by the BD on PE1.
  2. PE1 learn the Host-1 MAC and IP addresses from these ARP packets and replicates this information across all output interfaces.
  3. Since Host-3 is directly connected to PE1, it receives the ARP request and responds with a unicast ARP response.
  4. The ARP process ensures that PE1 learns Host-3 IP address 10.0.0.3/32, enabling communication between Host-1 and Host-3.

EVPN multi-homing active-active

EVPN multi-homing access gateway enables redundant network connectivity by allowing a CE device to connect to more than one PE devices. Disruptions to the network connectivity are prevented by allowing a CE device to be connected to a PE device or several PE devices through multi-homing. Ethernet segment is the bunch of Ethernet links through which a CE device is connected to more than one PE devices.

In EVPN IRB, both EVPN and IP VPN (both VPNv4 and VPNv6) address families are enabled between ASR 9000 Data Center Interconnect (DCI) gateways. When Layer 2 (L2) stretch is not available in multiple datacenters (DC), routing is established through VPNv4 or VPNv6 routes. When Layer 2 stretch is available, host routing is applied where IP-MAC routes are learnt by ARP/IPv6 ND and are distributed to EVPN/BGP. In remote peer gateway, these IP-MAC EVPN routes are imported into IP VPN routing table from EVPN route-type 2 routes with secondary label and Layer 3 VRF route-target.

How EVPN multi-homing active-active works

Summary

EVPN IRB multi-homing active-active workflow includes these key components:

- **CE or host routers**:
  - CE1 or Host-1 with IP address 10.0.0.1/32

- CE2 or Host-2 with IP address 10.0.0.2/32
- CE3 or Host-3 with IP address 10.0.0.3/32
- CE5 or Host-5 with IP address 20.0.0.1/32

- **PE routers**:
  - PE1 with BVI IP address 10.0.0.5/24 and BVI mac address 0.0.5
  - PE2 with BVI IP address 10.0.0.5/24 and BVI mac address 0.0.5
  - PE5

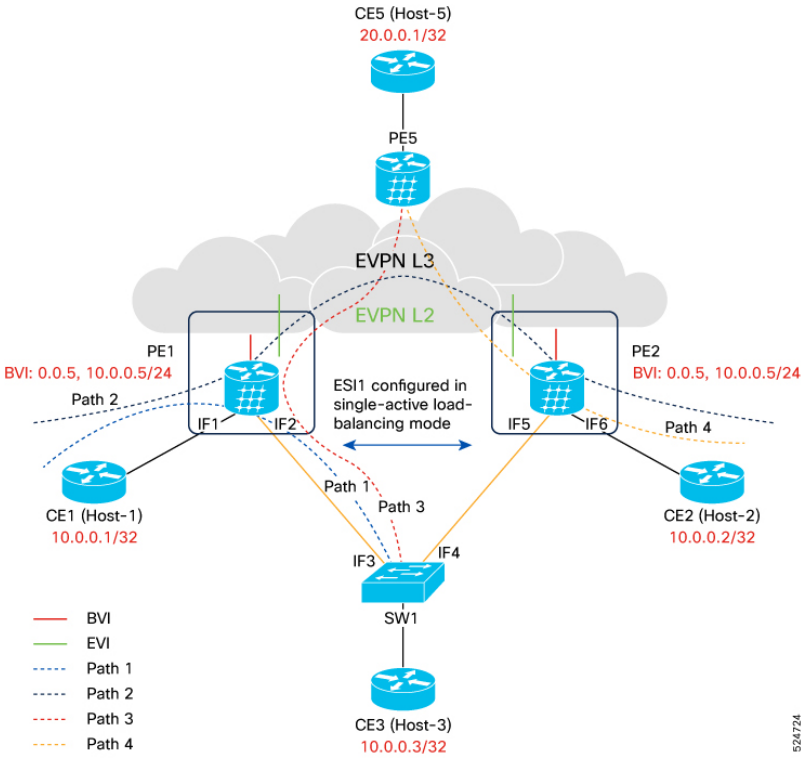
- **Interfaces**:
  - IF1: Connects Host-1 to PE1
  - IF2: Connects Host-3 to PE1
  - IF3: Connects PE1 to Host-3
  - IF4: Connects PE2 to Host-3
  - IF5: Connects Host-3 to PE2

- **Paths**:
  - Path 1: Host-1 communicating with Host-2 using a EVPN single-homing access EVPN gateway interface
  - Path 2: Host-1 communicating with Host-3 using a EVPN single-homing access EVPN gateway interface
  - Path 3: Host-3 communicating with Host-5 using a EVPN single-active multihoming interface
  - Path 4: Host-2 communicating with Host-5 using a EVPN multihoming active-active interface

- Switch device: SW1, connects Host-3 to PE1 and PE2
- Host routing is enabled on PE1 and PE2.
- IRB interfaces are configured as anycast.
- Host-1 and Host-2 connect to PE1 and PE2 using a EVPN single-homing interfaces.
- Host-3 connect to PE1 and PE2 using a EVPN multihoming interfaces.
- IOS XR Software performs the Designated Forwarder (DF) election for the shared Ethernet Segment Identifier (ESI) and elects IF2 as DF and IF5 as Non-Designated Forwarder (NDF).
- Interface IF5 is set to blocked state which blocks both BUM and unicast traffic.

Workflow

Figure 2: EVPN IRB multi-homing network topology



Let's consider these scenarios:

- Where Host-2 wants to communicate with Host-5, which are in different subnet.
  1. Host-2 send an ARP request to its gateway which is IRB interface. It basically ARPs the BVI IP address 10.0.0.5.
  2. PE2 learn the Host-2 MAC and IP addresses from these ARP packets and replicates this information across all output interfaces where it is added to the BVI interface.
  3. The BVI interface on PE2 sends an ARP response to Host-2 using its BVI IP address 10.0.0.5 and MAC address 0.0.5.
  4. PE2 advertises Host-2 route using EVPN route type-2 to remote PEs. Remote PEs, such as PE5, import and install this route as a remote route.
  5. Since Host-5 is directly connected to PE5, it receives the ARP request and responds with a unicast ARP response.
  6. The ARP process ensures that PE5 learns Host-5 IP address 20.0.0.1/32, enabling communication between Host-2 and Host-5.
  7. If PE2 doesn’t have Host-5 specific route, it may use an EVPN route type-5 to forward traffic to PE5, where ARP resolves Host-5, enabling Host-2 and Host-5 to communicate.

- Where Host-5 sends a packet to Host-2. If Host-2 hasn't communicated yet, PE5 might not have Host-2 specific route.

- If PE5 directs traffic to PE1 first, a Generalized Learning (G-LEAN) adjacency process occurs, and traffic is dropped until it is resolved.
- Once PE5 identifies PE2 as the best destination for Host-2, it forwards the packet to PE2, and PE2 performs these steps:
  1. PE2 performs an IP lookup, finding the BVI interface as the destination.
  2. Destination MAC is set to Host-2 MAC as learned by ARP and source MAC remains as the BVI MAC address 0.0.5.
  3. PE2 performs a MAC lookup within the bridge domain and forwards the packet to Host-2.

EVPN single-active multihoming for anycast gateway IRB

The EVPN single-active multihoming for anycast gateway IRB feature supports single-active redundancy mode. In this mode, the PE nodes locally connected to an Ethernet Segment load balance traffic to and from the Ethernet Segment based on EVPN service instance (EVI). Within an EVPN service instance, only one PE forwards traffic to and from the Ethernet Segment (ES). This feature supports intersubnet scenario only.

How EVPN single-active multihoming works

Summary

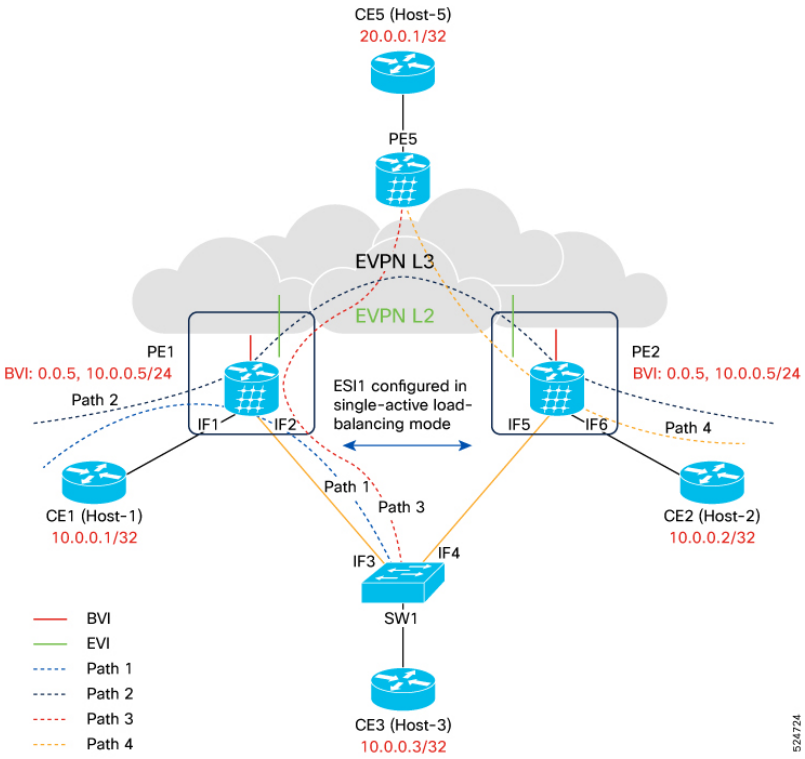
EVPN IRB single-active multihoming workflow includes these key components:

- **CE or host routers**:
  - CE1 or Host-1 with IP address 10.0.0.1/32
  - CE2 or Host-2 with IP address 10.0.0.2/32
  - CE3 or Host-3 with IP address 10.0.0.3/32
  - CE5 or Host-5 with IP address 20.0.0.1/32
- **PE routers**:
  - PE1 with BVI IP address 10.0.0.5/24 and BVI mac address 0.0.5
  - PE2 with BVI IP address 10.0.0.5/24 and BVI mac address 0.0.5
  - PE5
- **Interfaces**:
  - IF1: Connects Host-1 to PE1
  - IF2: Connects Host-3 to PE1
  - IF3: Connects PE1 to Host-3
  - IF4: Connects PE2 to Host-3
  - IF5: Connects Host-3 to PE2

- **Paths**:
  - Path 1: Host-1 communicating with Host-2 using a EVPN single-homing access EVPN gateway interface
  - Path 2: Host-1 communicating with Host-3 using a EVPN single-homing access EVPN gateway interface
  - Path 3: Host-3 communicating with Host-5 using a EVPN single-active multihoming interface
  - Path 4: Host-2 communicating with Host-5 using a EVPN multihoming active-active interface
- Switch device: SW1, connects Host-3 to PE1 and PE2
- Host routing is enabled on PE1 and PE2.
- IRB interfaces are configured as anycast.
- Host-1 and Host-2 connect to PE1 and PE2 using a EVPN single-homing interfaces.
- Host-3 connect to PE1 and PE2 using a EVPN multihoming interfaces.
- IOS XR Software performs the Designated Forwarder (DF) election for the shared Ethernet Segment Identifier (ESI) and elects IF2 as DF and IF5 as Non-Designated Forwarder (NDF).
- Interface IF5 is set to blocked state which blocks both BUM and unicast traffic.

Workflow

Figure 3: EVPN IRB single-active multihoming network topology



Let's consider these scenarios:

- Where Host-3 wants to communicate with Host-5, which are in different subnet.
  1. Host-3 sends an ARP request to its IRB gateway, configured with the BVI IP address 10.0.0.5.
  2. SW1 learns Host-3 MAC and IP addresses as it forwards the ARP response to PE1, which is the DF. The packet sent to PE2 is dropped since IF5 is in a blocked state as a NDF.
  3. PE1 learns Host-3's MAC and IP addresses from the ARP packet and replicates this information across all output interfaces associated with the BVI interface.
  4. The BVI interface on PE1 sends an ARP response to Host-3 using its BVI IP address 10.0.0.5 and MAC address 0.0.5.
     a. SW1 updates its MAC address table with the BVI MAC address of PE1 as it forwards the ARP response to Host-3.
  5. PE1 advertises Host-3 host route through EVPN using route type-2. Remote PEs, including PE2 and PE5, learn about Host-3 and install the route in their hardware tables.
  6. Since Host-5 is directly connected to PE5, it receives an ARP request and responds with a unicast ARP response.
  7. The ARP process ensures that PE5 learns Host-5 IP address 20.0.0.1/32, enabling communication between Host-5 and Host-3.
- Where Host-5 sends a packet to Host-3. If Host-3 hasn't communicated yet, PE5 might not have Host-3 specific route.
  - If PE5 directs traffic to PE2, a Generalized Learning (G-LEAN) adjacency process occurs, and traffic is dropped until it is resolved.
  - If PE2 receives, it performs these steps:
    1. PE2 floods an ARP request within the bridge domain to resolve Host-3 MAC address. However, as PE2 is the NDF, direct forwarding to Host-3 is not possible due to the blocked state of IF5.
    2. A copy of the ARP request is sent to PE1 through the L2 stretch.
    3. PE1 forwards the ARP request to Host-3. Once Host-3 responds to the ARP request, PE1 learns Host-3 MAC address.
    4. After receiving the ARP response, PE1 updates the route for Host-3 and advertises it as an EVPN route type-2 across the network.
    5. This allows packets from Host-5 to reach Host-3 efficiently once the address resolution is complete.

Configure EVPN Single-Active Multihoming

Perform the following tasks on PE1 and PE2 to configure EVPN Single-Active Multihoming feature:

- Configure EVPN IRB with host routing
- Configure EVPN Ethernet Segment
- Configure Layer 2 Interface

- Configure a Bridge Domain
- Configure VRF

Configure EVPN IRB with Host Routing

Perform this task to configure EVPN IRB with host routing.

Configuration Example

```
Router# configure
Router(config)# l2vpn
Router(config-l2vpn)# bridge group 6005
Router(config-l2vpn-bg)# bridge-domain 6005
Router(config-l2vpn-bg-bd)# routed interface BVI50
Router(config-l2vpn-bg-bd-bvi)# exit
Router(config-l2vpn-bg-bd-bvi)# interface Bundle-Ether2.1
Router(config-l2vpn-bg-bd-ac)# evi 6005
Router(config-l2vpnbg-bd-evi)# commit
Router(config-l2vpnbg-bd-evi)# exit
Router(config)# interface BVI50
Router(config-if)# host-routing
Router(config-if)# vrf 30
Router(config-if)# ipv4 address 10.0.0.5 255.0.0.0
Router(config-if)# local-proxy-arp
Router(config-if)# mac-address 1.1.1
Router(config-if)# commit
```

Running Configuration

This section shows EVPN IRB with host routing running configuration.

```
configure
l2vpn
 bridge group 6005
  bridge-domain 6005
   interface Bundle-Ether2.1
    evi 6005
!
   !
 interface BVI34
 host-routing
 vrf 30
 ipv4 address 10.0.0.5 255.0.0.0
 arp learning local
 local-proxy-arp
 mac-address 1.1.1
```

Configure EVPN Ethernet Segment

Perform this task to configure the EVPN Ethernet segment.

```
Router# configure
Router(config)# evpn
Router(config-evpn)# interface Bundle-Ether1
Router(config-evpn-ac)# ethernet-segment
Router(config-evpn-ac-es)# identifier type 0 40.00.00.00.00.00.00.00.01
Router(config-evpn-ac-es)# load-balancing-mode single-active
```

```
Router(config-evpn-ac-es)# bgp route-target 4000.0000.0001
Router(config-evpn-ac-es)# commit
```

Running Configuration

```
configure
evpn
 interface Bundle-Ether1
   ethernet-segment
    identifier type 0 40.00.00.00.00.00.00.00.01
    load-balancing-mode single-active
    bgp route-target 4000.0000.0001
    !
!
!
```

Configure EVPN Service Instance (EVI) Parameters

Perform this task to define EVPN service instance (EVI) parameters.

```
Router# configure
Router(config)# evpn
Router(config-evpn)# evi 6005
Router(config-evpn-evi)# bgp
Router(config-evpn-evi-bgp)# rd 200:50
Router(config-evpn-evi-bgp)# route-target import 100:6005
Router(config-evpn-evi-bgp)# route-target export 100:6005
Router(config-evpn-evi-bgp)# commit
```

Running Configuration

```
configure
 evpn
  evi 6005
   bgp
    rd 200:50
    route-target import 100:6005
    route-target export 100:6005
!
!
```

Configure Layer 2 Interface

Perform this task to define Layer 2 interface.

```
Router# configure
Router(config)# interface bundle-ether2.1 l2transport
Router(config-subif-l2)# no shutdown
Router(config-subif-l2)# encapsulation dot1q 1
Router(config-subif-l2)# rewrite ingress tag pop 1 symmetric
Router(config-subif-l2)#commit
Router(config-subif-l2)#exit
```

Running Configuration

This section shows the Layer 2 interface running configuration.

```
configure
```

```
 interface bundle-ether2.1 l2transport
  no shutdown
  encapsulation dot1q 1
  rewrite ingress tag pop 1 symmetric
!
```

Configure a Bridge Domain

Perform the following steps to configure the bridge domain on PE1 and PE2.

```
Router# configure
Router(config)# l2vpn
Router(config-l2vpn)# bridge group 6005
Router(config-l2vpn-bg)# bridge-domain 6005
Router(config-l2vpn-bg-bd)# interface Bundle-Ether2.1
Router(config-l2vpn-bg-bd-ac)# evi 6005
Router(config-l2vpnbg-bd-evi)# commit
Router(config-l2vpnbg-bd-evi)# exit
```

Running Configuration

This section shows the bridge domain running configuration.

```
configure
l2vpn
 bridge group 6005
  bridge-domain 6005
   interface Bundle-Ether2.1
    evi 6005
!
```

Configure VRF

Perform this task to configure VRF.

Configuration Example

```
Router# configure
Router(config)# vrf 30
Router(config-vrf)# address-family ipv4 unicast
Router(config-l2vpn-vrf-af)# route-target import 100:6005
Router(config-l2vpn-vrf-af)# route-target export 100:6005
Router(config-l2vpn-vrf-af)# commit
```

Running Configuration

This section shows the VRF running configuration.

```
configure
 vrf 30
  address-family ipv4 unicast
   route-target import 100:6005
   route-target export 100:6005

!
```

EVPN IRB Support

EVPN IRB supports the following scenarios:

- In single-homing scenario, only physical, VLAN, .1q, .1ad, or QinQ access methods are supported.
- In dual-homing scenario, only two PE gateways in a redundancy group are supported.
- Both IPv4 and IPv6 are supported.

Distributed Anycast Gateway

EVPN IRB for the given subnet is configured on all the EVPN PEs that are hosted on this subnet. To facilitate optimal routing while supporting transparent virtual machine mobility, hosts are configured with a single default gateway address for their local subnet. That single (anycast) gateway address is configured with a single (anycast) MAC address on all EVPN PE nodes locally supporting that subnet. This process is repeated for each locally defined subnet requires Anycast Gateway support.

The host-to-host Layer 3 traffic, similar to Layer 3 VPN PE-PE forwarding, is routed on the source EVPN PE to the destination EVPN PE next-hop over an IP or MPLS tunnel, where it is routed again to the directly connected host. Such forwarding is also known as Symmetric IRB because the Layer 3 flows are routed at both the source and destination EVPN PEs.

The following solutions are part of the Distributed Anycast Gateway feature:

EVPN IRB with Active-Active Multi-Homing with Subnet Stretch or Host-Routing across the Fabric

For a bridge domain or subnet that is stretched across remote EVPN PEs, both /32 host routes and MAC routes are distributed in a EVPN overlay control plane to enable Layer 2 and Layer 3 traffic to the end points in a stretched subnet.

This type of multi-homing has the following characteristics:

- Layer 2 or Layer 3 ECMP for the fabric for dual-homed hosts based on Route Type 1 and Route Type 2
- Layer 3 unipath over the Fabric for single-homed hosts based on Route Type 2
- Layer 2 subnet stretch over the fabric
- Layer 2 stretch within redundancy group of leafs with orphan ports

MAC and IP Unicast Control Plane

This use case has following types:

Prefix Routing or No Subnet Stretch

IP reachability across the fabric is established using subnet prefix routes that are advertised using EVPN Route Type 5 with the VPN label and VRF RTs. Host ARP and MAC sync are established across multi-homing

EVPN PEs using MAC+IP Route Type 2 based on a shared ESI to enable local switching through both the multi-homing EVPN PEs.

Host Routing or Stretched Subnet

When a host is discovered through ARP, the MAC and IP Route Type 2 is advertised with both MAC VRF and IP VRF router targets, and with VPN labels for both MAC-VRF and IP-VRF. Particularly, the VRF route targets and Layer 3 VPN label are associated with Route Type 2 to achieve PE-PE IP routing identical to traditional L3VPNs. A remote EVPN PE installs IP/32 entries directly in Layer 3 VRF table through the advertising EVPN PE next-hop with the Layer 3 VPN label encapsulation, much like a Layer 3 VPN imposition PE. This approach avoids the need to install separate adjacency rewrites for each remote host in a stretched subnet. Instead, it inherits a key Layer 3 VPN scale benefit of being able to share a common forwarding rewrite or load-balance resource across all IP host entries reachable through a set of EVPN PEs.

ARP and MAC sync

For hosts that are connected through LAG to more that one EVPN PE, the local host ARP and MAC entries are learnt in data plane on either or both of the multihoming EVPN PEs. Local ARP and MAC entries are synced across the two multihoming EVPN PEs using MAC and IP Route Type 2 based on a shared ESI to enable local switching through both the multihoming EVPN PEs. Essentially, a MAC and IP Route Type 2 that is received with a local ESI causes the installation of a synced MAC entry that points to the local AC port, and a synced ARP entry that is installed on the local BVI interface.

Note Only one Ethernet Flow Point (EFP) is supported per non-Zero ESI per bridge domain or EVI. This is a limitation of EVPN.

MAC and IP Route Re-origination

MAC and IP Route Type 2 received with a local ESI, which is used to sync MAC and ARP entries, is also re-originated from the router that installs a SYNC entry, if the host is not locally learnt and advertised based on local learning. This route re-origination is required to establish overlay IP ECMP paths on remote EVPN PEs, and to minimize traffic hit on local AC link failures, that can result in MAC and IP route withdraw in the overlay.

Intra-subnet Unicast Data Plane

The Layer 2 traffic is bridged on the source EVPN PE using ECMP paths to remote EVPN PEs, established through MAC+IP RT2, for every ES and for every EVI, ES and EAD Route Type 2 routes that are advertised from the local EVPN PEs.

Inter-subnet Unicast Data Plane

Inter-subnet traffic is routed on the source EVPN PEs through overlay ECMP to the destination EVPN PEs next-hops. Data packet are encapsulated with the VPN label advertised from the EVPN PE and tunnel label for the BGP next-hop towards the spine. It is then routed again on the destination EVPN PE using a local ARP adjacency towards the host. IP ECMP on the remote EVPN PEs is established through local and re-originated routes advertised from the local EVPN PEs.

Centralized Anycast Gateway for EVPN IRB

Table 1: Feature History Table

Feature Name	Release Information	Feature Description
Centralized Anycast Gateway for EVPN IRB	Release 7.5.1	This feature enables configuring the IRB interface in a central location called the Centralized Anycast Gateway. Such a centralized, single-point makes it easier to configure and maintain, reducing the overall operational cost. It also makes it easy to configure the IRB because it's configured only on the centralized gateway of edge L2 devices. This feature is supported only on Single-active mode and this feature introduces **virtual access-evi** command.

EVPN Integrated Routing and Bridging (IRB) allows hosts across the overlay to communicate with each other across the subnets in the VPN. Distributed anycast gateway allows you to configure EVPN IRB for the given subnet on all the access side EVPN PEs that are hosted on the subnet. The distributed gateway provides inner and intra subnet optimal forwarding.

However, the distributed anycast gateway doesn’t provide a centralized point to perform services such as QOS and ACL. Moreover, distributed gateway brings the complexity of setting up and maintaining IRB L3 domains across leaf or edge nodes. Distributed anycast is a bit complex for mobile networks. Customers are looking at connecting and aggregating mobile antennas using cell site routers to core backbone networks in a simple way especially when access networks aren't complex or multilayered Cos fabrics. There’s a need for a single gateway device to carry the load at a lesser cost and that is easy to configure.

With this feature, you can add a centralized gateway to configure IRB in the central location that is known as Centralized Anycast Gateway. The gateway is centralized on a pair of nodes that act as an interface point between the layer-2 and layer-3 routed networks. The Centralized Anycast Gateway uses anycast IRB.

Centralized Anycast GW supports the following services:

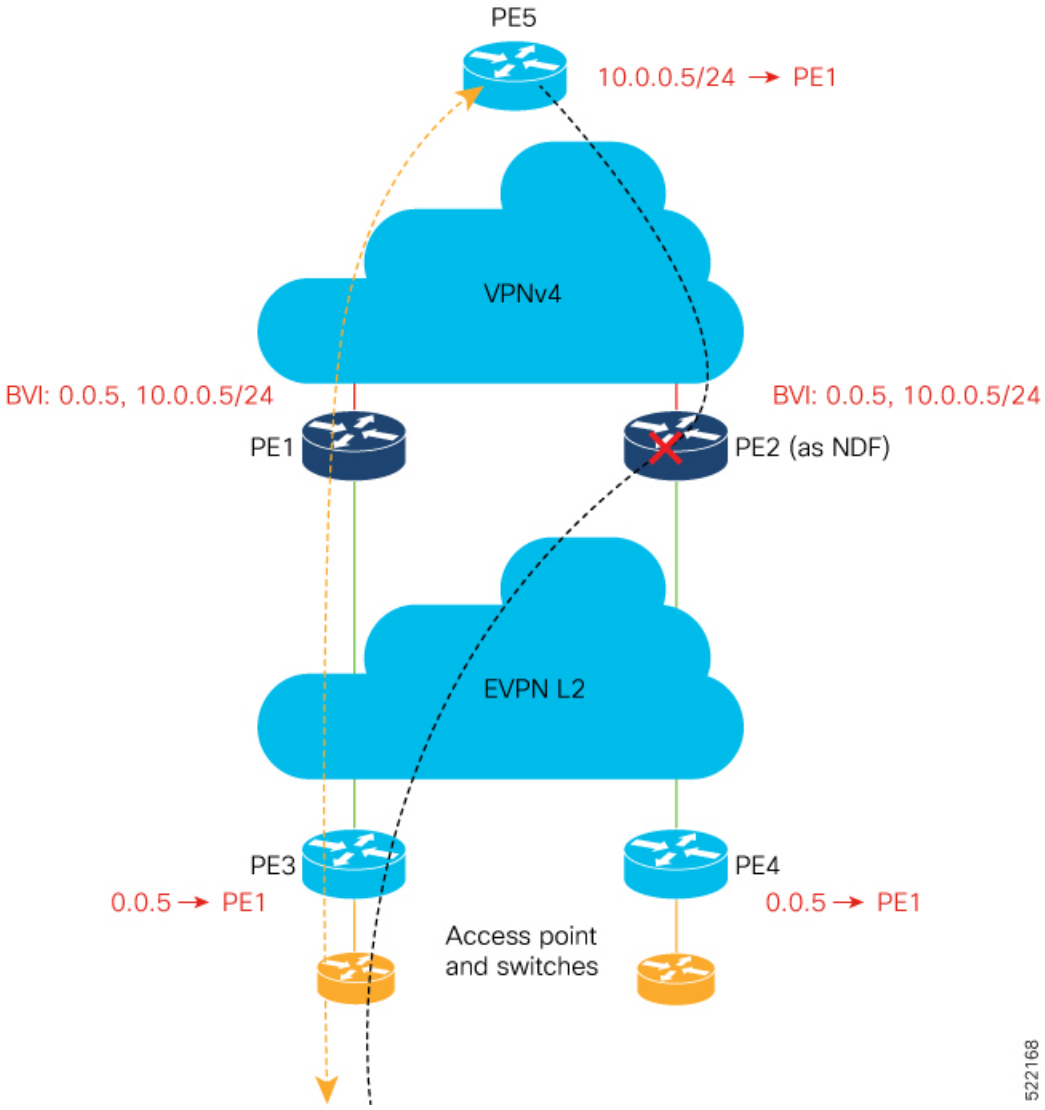
- Unicast Traffic – IPv4/IPv6 on BVI, Global VRF, customer VRF
- Core Isolation
- Cost-in/Cost-out
- DHCP Relay Agent
- MAC Mobility
- Convergence – with Unicast traffic

How Does Centralized Anycast Gateway Work?

EVPN performs DF election between centralized gateways to elect DF and non-DF node at EVI level for load balancing across subnets.

This example shows the centralized gateway without locally attached interface running in a single-active multi-homing mode.

Figure 4: Topology



In this topology, PE1 and PE2 are the centralized gateways where IRB interfaces are configured. Centralized gateways perform EVPN DF election based on EVI/ESI. PE1 is elected as DF whereas PE2 is elected as non-DF.

The following describes the centralized anycast gateway advertisement:

- PE1 is DF and PE2 is non-DF.

- PE1 advertises its EVI to remote PE (PE3 and PE4) where it gets installed as remote entry in the MAC forwarding database. PE2 does not install PE1 as remote MAC.
- PE1 and PE2 advertise their route to the remote PEs (PE3 and PE4).
- PE2 blocks all traffic from EVI to BVI interface.
- MAC-IP addresses of hosts are learned only at the IRB termination point, which is the centralized gateway. PE1 and PE2 advertise host MAC-IP to synchronize with the access EVI.

The following describes how the inter subnet communication happens:

- Host attached to PE3 sends an ARP request to EVPN L2 fabric.
- PE3 learns the host MAC as local and advertises its reachability using EVPN Route-Type2 to remote PEs, including gateways.
- The ARP request reaches PE1 through dataplane and gets blocked on PE2.
- PE1 learns the ARP request locally as the first-hop router.
- PE1 synchronizes ARP entry with PE2 to complete the adjacency.
- PE1 and PE2 receive corresponding host MAC route from BGP and installs it as remote MAC.
- PE1 responds with appropriate ARP reply to source host through PE3.
- PE3 sends unicast traffic to PE1.

The following describes how the intra subnet communication with a host connected to PE4 happens:

- EVPN layer-2 bridging capability where MAC reachability is learned over EVPN Route-Type2.
- Host H3 (attached to PE3) sends direct ARP request to the host IP connected to PE4.
- The PE4 host responds with an ARP reply using the unicast MAC address.

Restrictions

- Physical and bundle AC interfaces are not supported on centralized gateway. Configuration is not prevented but a warning syslog is generated and traffic from locally attached ACs is not supported.
- Only single-active multihoming mode is supported.
- Locally attached interface on gateway is supported only when the access-EVI is configured as Virtual Interface (VES) and EVPN non-DF blocking scheme is used.
- IRB interfaces on peering PE must be configured with anycast gateway.

Configuration

Perform this task to configure centralized gateway. You must have the same configuration on PE1 and PE2:

```
/* EVPN configuration */

Router(config)# evpn
Router(config-evpn)# virtual access-evi
Router(config-evpn-ac-evi)# ethernet-segment
```

```
Router(config-evpn-ac-evi-es)# identifier type 0 00.00.00.34.34.34.34.34.34
Router(config-evpn-ac-evi-es)# exit

Router(config-evpn-ac-evi)# core-isolation-group 1
Router(config-evpn-ac-evi)# exit
Router(config-evpn)# exit

/* L2VPN configuration for centralized gateway */

Router(config)# l2vpn
Router(config-l2vpn)#bridge group evpn_access_evi_8
Router(config-l2vpn-bg)#bridge-domain bd_8001
Router(config-l2vpn-bg-bd)#access-evi 8001
Router(config-l2vpn-bg-bd)#routed interface BVI8001
Router(config-l2vpn-bg-bd-bvi)#exit
Router(config-l2vpn-bg-bd)#exit
Router(config-l2vpn-bg)#exit
Router(config-l2vpn)#exit

/* BVI configuration */

Router(config)#Interface BVI8001
Router(config-if)#ipv4 address 10.1.1.1/24
Router(config-if)#mac-address 00aa.8001.00aa
Router(config-if)#commit
```

Show running configuration for centralized gateway:

```
interface BVI8001
 ipv4 address 10.1.1.1 255.255.255.0
 mac-address aa.8001.aa
!
evpn
 virtual access-evi
  ethernet-segment
   identifier type 0 00.00.00.34.34.34.34.34.34
  !
  core-isolation-group 1
 !
 !
l2vpn
 bridge group evpn_access_evi_8
  bridge-domain bd_8001
   access-evi 8001
   routed interface BVI8001
   !
  !
 !
!
```

Perform this task to configure PE2 and PE3:

Note Regular L2 EVPN configuration on PE2 and PE3 and BVI configurations aren't required.

```
Router#configure
Router(config)#evpn
Router(config-evpn)#evi 8001
Router(config-evpn-instance)#advertise-mac
```

```
Router(config)#interface bundle-ether80.1 l2transport
Router(config-subif)#encapsulation dot1q 0
Router(config-subif)#rewrite ingress tag pop 1 symmetric
Router(config-subif)#exit

Router(config)#l2vpn
Router(config-l2vpn)#bridge group evpn_access_evi_8
Router(config-l2vpn-bg)#bridge-domain bd_8001
Router(config-l2vpn-bg-bd)#interface bundle-ether 80.1
Router(config-l2vpn-bg-bd-ac)#evi 8001
Router(config-l2vpn-bg-bd-evi)#
```

Verification

Verify the configuration on PE1 and PE2 using the following show commands:

```
Router-PE1# show evpn ethernet-segment carving detail
Ethernet Segment Id      Interface                         Nexthops
------------------------ --------------------------------- --------------------
0000.0000.3434.3434.3434 Access-EVI:all                    192.168.30.1
                                                           192.168.40.1

     Interface name : Access-EVI/all
Topology          :
Configured     : Single-active (AApS) (default)
  Service Carving   : Auto-selection
Service Carving Results:
     Forwarders     : 200
     Elected        : 100
Not Elected     : 100
```

ARP ND sync for DF and non-DF:

For DF, the state should be `dynamic` and for non-DF, it shows `EVPN-SYNC`.

```
/*For DF:*/
Router-PE1# show arp bvi 9002
Address         Age        Hardware Addr   State      Type  Interface
90.1.2.1        -          0011.0090.1111  Interface  ARPA  BVI9002
90.1.2.34       00:00:46   0012.9001.0002  Dynamic    ARPA  BVI9002

/* For NON-DF*/

Router-PE2# show arp bvi 9002
Address         Age        Hardware Addr   State      Type  Interface
90.1.2.1        -          0011.0090.1111  Interface  ARPA  BVI9002
90.1.2.34       -          0012.9001.0002  EVPN_SYNC  ARPA  BVI9002
```

BVI-Coupled Mode

When ACs go down, the BVI also goes down. However, with this mode enabled, the state of the BVI remains Up even though the ACs go down. Hence, the BVI state becomes EVPN-aware.

BVI tracks the Up or Down state of ACs and PWs in a bridge. When the EVPN port is available, there may be an L2 redirect path over EVI to carry the traffic between L3 to L2. However, this depends on the remote or peer EVI-EAD routes received.

Under certain conditions, you can reduce the churns of BVI state adjacency by keeping the BVI state Up. BVI state drives the state of EVPN_SYNC adjacencies being pushed to forwarding entries, thereby reducing the churns further. Keeping the BVI state Up, the router creates adjacencies in the forwarding table, which indicates that a local adjacency is invalid when an interface is down.

Configure BVI-Coupled Mode

Perform this task to configure BVI-coupled mode.

```
evpn
 evi 101
  bgp
   route-target import 60000:101
   route-target export 60000:101
  !
  bvi-coupled-mode

l2vpn
 bridge group BG-1
  bridge-domain BD-1
   interface Bundle-Ether100.101
   !
   routed interface BVI101
   !
   evi 101
```

Verification

Verify that the BVI-coupled mode is enabled.

```
Router# show evpn evi detail

VM Mobility Support

VM mobility is the ability of virtual machines to migrate between one server and another while retaining their existing MAC and IP addresses.

The following are the two key components in EVPN Route Type 2 that enable VM Mobility:

- Host MAC advertisement component that is imported into local bridge MAC table, and Layer 2 bridged traffic across the network overlay.
- Host IP advertisement component that is imported into the IP routing table in a symmetric IRB design, enables routed traffic across the network overlay.

The above-mentioned components are advertised together in a single MAC + IP host route advertisement. An additional MAC-only route could also be advertised.

The following behaviors of VM are supported. The VM can:

- retain existing MAC and acquire a new IP address
- retain existing IP address and acquire a new MAC
- retain both existing MAC and IP address

Note IRB solution supports VM mobility with IP+MAC pair. VM mobility move, with new IP to MAC, or new MAC to IP, is not supported.

Configuring EVPN IRB

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# interface Bundle-Ether 3
RP/0/RSP0/CPU0:router(config-if)# lacp system mac 1.1.1
RP/0/RSP0/CPU0:router(config-if)# exit

/* Configure EVPN L3VRF per DC tenant. */

RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# vrf irb1

Verify the entries to obtain details learnt in L2FIB RP when it is an aggregator. Route processor (RP) entries are aggregated entries obtained from the line cards. In some cases of MAC move, there could be different states for the same MAC. This is displayed in RP aggregated entries. RP determines the update to be sent to L2RIB according to MAC-Learning algorithms.

```
RP/0/RSP0/CPU0:router#  show l2vpn mac-learning mac-ipv4 all location 0/RSP0/CPU0

Topo ID  Producer        Next Hop(s)        Mac Address         IP Address
-------      --------    -----------       --------------      ----------
6            0/0/CPU0       BV1            1000.0001.0001      10.1.1.11
7            0/0/CPU0       BV2            0000.f65a.3570      10.1.2.91
7            0/0/CPU0       BV2            0000.f65a.357d      10.1.2.93
```

Verify the entries in L2RIB that are updated by RP L2FIB. Note the following when you verify the entries:

- The entries with producer as L2VPN and NH as remote IP are learnt from the remote peer gateways, which are learnt from BGP, updated to EVPN, and then updated to L2RIB. So these entries are not from local IP-MAC learning.
- The entries with producer as L2VPN and NH as local bundle interfaces are synced entries from MH-AA peer gateway.
- The entries with producer as LOCAL and NH as local bundle interfaces are dynamically learnt local entries.

```
RP/0/RSP0/CPU0:router# show l2route evpn mac-ip evi 6

```

Verify the remote peer gateway BGP entries with correct label and route-target. Particularly verify the local auto-generated RD on a remote EVPN gateway. EVPN type-2 routes are imported into EVPN. The host routes of IPv4 /32 addresses are imported only into IP VRF route-table in the remote EVPN gateway, but not in the local EVPN gateway where local BVI adjacency is used to overwrite RIB entries.

The following sections describe how to verify the subnet stretching.

Verify the VRF.

```
RP/0/RP0/CPU0:leafW# show run vrf cust130
```

```
vrf cust130
address-family ipv4 unicast
  import route-target
   130:130
  !
  export route-target
   130:130
  !
!
!
```

Verify the BGP configuration.

```
 RP/0/RP0/CPU0:leafW# show run router bgp | begin vrf cust130

vrf cust130
  rd auto
  address-family ipv4 unicast
   label mode per-vrf
   maximum-paths ibgp 10
   redistribute connected
  !
!
```

Verify the L2VPN.

```

EVPN IPv6 Hosts with Mobility

EVPN IPv6 Hosts with Mobility feature enables you to provide EVPN IPv6 service over IPv4-MPLS core network. This feature supports all-active multihoming and virtual machine (VM) or host move.

Service Providers (SPs) use a stable and established core with IPv4-MPLS backbone for providing IPv4 VPN services. The IPv6 VPN Provider Edge Transport over MPLS (IPv6 on Provider Edge Routers [6PE] and IPv6 on VPN Provider Edge Routers [6VPE]) facilitates SPs to offer IPv6 VPN services over IPv4 backbone without an IPv6 core. The provide edge (PE) routers run MP-iBGP to advertise IPv6 reachability and IPv6 label distribution. For 6PE, the labels are allocated per IPv6 prefix learnt from connected customer edge (CE) routers and for 6VPE, the PE router can be configured to allocate labels on a per-prefix or per-CE and per-VRF level.

Mobility Support

In global VRF, mobility is not supported. However, you can move a host from one ES to another ES within the same bridge domain. The host gets a new MAC address and IP address. The host can have multiple IP addresses for the same MAC address.

In non-default VRF, mobility is supported with the following conditions:

- Basic MAC move: The IP address and MAC address remains the same. You can move a host from one ES to another ES with the same IP address and MAC address.
- Same MAC address but with a different IP address: The host gets a new IP address
- Same IP address but with a different MAC address: The host gets a new MAC address but retains the same IP address
- Multiple IP addresses with the same MAC address: Many VMs are involved in the same the MAC move

Restrictions

- In customer VRFs, when host routing is not configured, MAC-IP advertisement is different between zero ESI and none-zero ESI. When host routing is not configured, MAC-IP with non-zero ESI is advertised without L3 RT (VRF RT). MAC-IP with zero ESI is not advertised. The following table lists the behavior of MAC-IP advertisement with respect to ESI and host routing.

ESI Type	With host routing	Without host routing
MAC-IP with non-zero ESI	Advertised with L3 VRF RT	Advertised without L3 VRF RT
MAC-IP with zero ESI	Advertised with L3 VRF RT	Not advertised

- In global VRF, Layer 2 stretch is not supported.
- MAC move in global VRF is only supported if the host is within the same bridge domain. You can move a host from one ES to another ES within the same bridge domain.
- Duplication of IP address detection is not supported.
- Maximum number of leafs allowed per ESI is two.

Configure EVPN IPv6 Hosts with Mobility

Perform the following tasks to configure EVPN IPv6 Hosts with Mobility feature:

- Configure VRF
- Configure ISIS
- Configure BGP
- Configure AC interface
- Configure BVI interface
- Configure EVPN
- Configure L2VPN

Note

- You cannot configure the EVPN remote peer using the VPNv4 unicast if you have configured the **advertise vpnv4 unicast re-originated** command under the L2VPN EVPN address-family. You can either configure the VPNv4 unicast or the advertise vpnv4 unicast re-originated under L2VPN EVPN address-family.
- You cannot configure the EVPN remote peer using the VPNv6 unicast if you have configured the **advertise vpnv6 unicast re-originated** command under the L2VPN EVPN address-family. You can either configure the VPNv6 unicast or the advertise vpnv6 unicast re-originated under L2VPN EVPN address-family.

EVPN IRB: DHCPv4 and DHCPv6 Relay

EVPN IRB: DHCPv4 and DHCPv6 Relay feature provides DHCP support for the end users in EVPN multi-homing Active-Active (MH-AA) deployment scenario. This feature enables reduction of traffic flooding, increase in load sharing at VTEP, faster convergence during link and device failures, and simplification of data center automation.

DHCPv4 and DHCPv6 Relay agents relay request packets, coming over the access interface, to external DHCPv4 and DHCPv4 server to request allocation of addresses (/32) and IANA (::/128) for the end user.

DHCPv4 and DHCPv6 Relay profiles are configured on BVI interfaces which relay DHCPv4 or DHCPv4 requests from Layer 2 (L2) attachment circuit (AC) to external DHCP servers for host IPv4 addresses (/32) and IANA (::128) IPv6 addresses.

This feature is compliant with RFC-6607.

Multi-homing Active-Active EVPN Gateways

Multi-homing Active-Active EVPN Gateways are configured with anycast IP address and MAC addresses. ASR 9000 devices have centralized L2//Layer 3 (L3) gateway. Based on native EVPN and MAC learning, IRB uses distributed anycast IP and anycast MAC address. Static clients are configured with anycast gateway address as the default gateway. DHCP client sends DHCP requests for IP addresses with BVI as the gateway. L2 access can be either single homing or multi-homing, Not all access protocols is supported with IRB. There

may or may not be L2 stretch between DC centers. Internet gateway is also included for clients to access external network. No EVPN is configured on the Internet gateway.

EVPN IRB Route Distribution

In EVPN IRB DHCPv4 and DHCPv6, DHCP application processes and DHCP packet forwarding are independent of EVPN IRB L2 and L3 routing. There is no subscriber routing information with the stateless DHCP relay. But DHCP clients work similar to static clients in the EVPN core for L2 and L3 bridging and routing. When the **relay information option**, **relay information option vpn**, **relay information option von-mode cisco** and **relay information option von-mode rfc** commands are configured on the DHCP relay agent, the DHCP relay agent inserts the sub options of DHCP Option 82, such as subnet selection and VPN ID options. These options are considered by DHCP server while allocating IP address.

DHCP clients use the L2 AC interface to access EVPN bridge domain and use BVI interface as default gateway. So the clients must get the IP addresses from the DHCP server as in the same subnet of BVI interface.

DHCP Request Forwarding Path

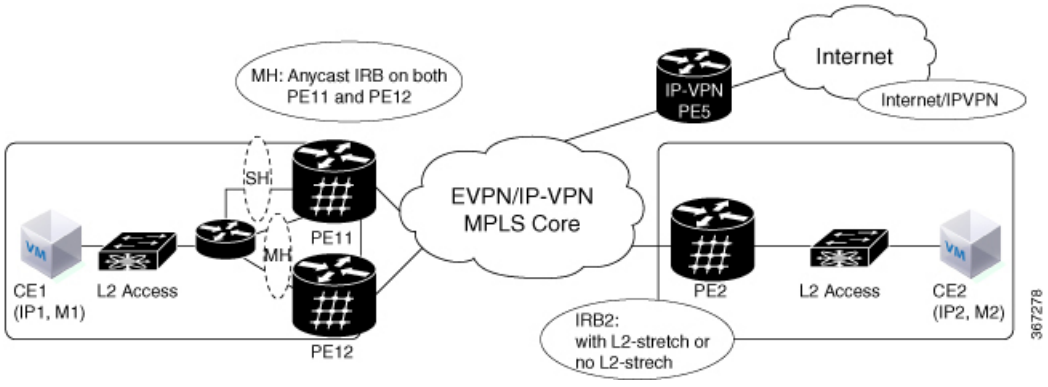
Clients broadcast requests to the access switch with DHAA to EVPN PE routers. The access switch does load balancing. The load balancing configurations in access switch will impact PE in DH-AA and DHCP to send the DHCP requests. The DHCP request reaches the Bridge Domain (BD) BVI interface which is configured with DHCP relay. Because AA PE routers are configured the same IP addresses, BVI IP addresses cannot be used as DHCP relay source IP address.

For DHCPv4, configuring GIADDR field for each DHCP relay profile is allowed. Loopback interface with unique IP addresses can be configured in VRF which is reachable to DHCP servers. Configuring DHCP relay source address is not supported.

In case of DHCPv6 servers, DHCPv6 relay picks up an available Loopback interface IPv6 address as DHCPv6 relay source IP address. After the DHCP clients get the IP address. DHCP clients are not normally routable to DHCP servers. DHCP clients send unicast DHCP renew messages to the DHCP server. If the DHCP servers are not routable, the DHCP unicast messages fail, then the DHCP client sends broadcast rebinding messages with the corrsponding DHCP relay.

In the below figure, DHCP clients are configured on PE11 and PE12.

Figure 5: EVPN IRB with ASR 9000 as Centralized DCI Gateway



Configure EVPN IRB: DHCPv4 and DHCPv6 Relay

Perform the following tasks to configure the EVPN IRB: DHCPv4 and DHCPv6 Relay feature:

```
/* PE11 configuration */

Router(config)# dhcp ipv4
Router(config-dhcpv4)# profile DHCPv4_RELAY relay
Router(config-dhcpv4-relay-profile)# helper-address vrf default 10.20.20.20 giaddr 192.0.2.1
Router(config-dhcpv4-relay-profile)# relay information option vpn
Router(config-dhcpv4-relay-profile)# relay information option vpn-mode rfc
Router(config-dhcpv4-relay-profile)# exit
Router(config-dhcpv4)# exit
Router(config)# interface BVI1 relay profile DHCPv4_RELAY

Router(config)# dhcp ipv6
Router(config-dhcpv6)# profile DHCPv6_RELAY relay
Router(config-dhcpv6-relay-profile)# helper-address vrf default 20::20
Router(config-dhcpv6-relay-profile)# exit
Router(config-dhcpv6)# exit
Router(config)# interface BVI1 relay profile  DHCPv6_RELAY
Router(config-if)# exit
Router(config)# interface Loopback 5
Router(config-if)# ipv4 address 192.0.2.1 255.255.255.255
Router(config-if)# exit
Router(config)# interface BVI1
Router(config-if)# host-routing
Router(config-if)# ipv4 address 10.10.10.2 255.255.255.0
Router(config-if)# ipv6 address 2001:DB8:0:ABCD::1/64
Router(config-if)# ipv6 enable
Router(config-if)# mac-address 0.12.3456

/* PE12 configuration */
Router# dhcp ipv4
Router(config-dhcpv4)# profile DHCPv4_RELAY relay
Router(config-dhcpv4-relay-profile)# helper-address vrf default 10.20.20.20 giaddr 127.0.0.1
Router(config-dhcpv4-relay-profile)# relay information option vpn
Router(config-dhcpv4-relay-profile)# relay information option vpn-mode cisco
Router(config-dhcpv4-relay-profile)# exit
Router(config-dhcpv4)# exit
Router(config)# interface BVI1 relay profile DHCPv4_RELAY
Router(config)#  dhcp ipv6
Router(config-dhcpv6)# profile DHCPv6_RELAY relay
Router(config-dhcpv6-relay-profile)# helper-address vrf default 20::20
Router(config-dhcpv6-relay-profile)# exit
Router(config-dhcpv6)# exit
Router(config) interface BVI1 relay profile DHCPv6_RELAY
Router(config)# interface Loopback 6
Router(config)# exit
Router(config-if)# ipv4 address 127.0.0.1 255.255.255.255

Router(config)# interface BVI1
Router(config-if)# host-routing
Router(config-if)# vrf evpn 1
Router(config-if)# exit
Router(config-if)# ipv4 address 10.10.10.2 255.255.255.0
Router(config-if)# proxy-arp
Router(config-if)# ipv6 address 3000:0:0:8003::2/64
Router(config-if)# ipv6 enable
Router(config-if)# mac-address 1122.3344.5566
```

Running Configuration

```

Duplicate IP Address Detection

The Duplicate IP Address Detection feature automatically detects any host with a duplicate IP address and blocks all MAC-IP routes that have a duplicate IP address.

This protects the network from hosts that are assigned duplicate IP addresses unintentionally or by malicious intent in an EVPN fabric. Hosts with duplicate IP address cause unnecessary churn in a network and causes traffic loss to either or both the hosts with the same IP address.

The system handles mobility of EVPN hosts by keeping track of MAC and IP addresses as they move from one host to another. If two hosts are assigned the same IP address, the IOS XR system keeps learning and re-learning MAC-IP routes from both the hosts. Each time it learns the MAC-IP route from one host, it is counted as one move since the newly learnt route supersedes the route previously learnt from the other host. This continues back and forth until the IP address is marked as duplicate based on the configured parameters.

It uses the following parameters to determine when an IP address should be marked as duplicate, and frozen or unfrozen as it moves between different hosts. The configurable parameters are:

- **move-interval**: The period within which a MAC or IP address has to move certain number of times between different hosts to be considered as duplicate and frozen temporarily. This number is specified in the **move-count** parameter.
- **move-count**: The number of times a MAC or IP address has to move within the interval specified for the **move-interval** parameter between different hosts to be considered a duplicate.
- **freeze-time**: The length of time a MAC or IP address is locked after it has been detected as a duplicate. After this period, the IP address is unlocked and it is allowed to learn again.
- **retry-count**: The number of times a MAC or IP address is unlocked after it has been detected as a duplicate before it is frozen permanently.

The system maintains a count of the number of times an IP address has been moved from one host to another host, either to another local host or to a host behind a remote Top of Rack (TOR). If an IP address moves certain number of times specified in the **move-count** parameter within the interval specified in the **move-interval** parameter is considered a duplicate IP address. All MAC-IP routes with that IP address is frozen for the time specified in the **freeze-time** parameter. A syslog notifies the user that the particular IP address is frozen. While an IP address is frozen, any new MAC-IP routes or updates to existing MAC-IP routes with the frozen IP address are ignored.

After **freeze-time** has elapsed, the corresponding MAC-IP routes are unfrozen and the value of the **move-count** is reset to zero. For any unfrozen local MAC-IP routes, an ARP probe and flush are initiated while the remote MAC-IP routes are put in the probe mode. This restarts the duplicate detection process.

The system also maintains the information about the number of times a particular IP address has been frozen and unfrozen. If an IP address is marked as duplicate after it is unfrozen **retry-count** times, it is frozen permanently until user manually unfreezes it. Use the following commands to manually unfreeze frozen MAC, IPv4 and IPV6 addresses respectively:

- **clear l2route evpn mac** {*mac-address*} | **all** [**evi** *evi*] **frozen-flag**

- **clear l2route evpn ipv4** {*ipv4-address*} | **all** [**evi** *evi*] **frozen-flag**
- **clear l2route evpn ipv6** {*ipv6-address*} | **all** [**evi** *evi*] **frozen-flag**

Configure Duplicate IP Address Detection

Perfrom these tasks to configure Duplicate IP Address Detection feature.

Configuration Example

```
/* Ipv4 Address Duplicate Detection Configuration */

RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# evpn
RP/0/RSP0/CPU0:router(config-evpn)# host ipv4-address duplicate-detection
RP/0/RSP0/CPU0:router(config-evpn-host-ipv4-addr)# move-count 2
RP/0/RSP0/CPU0:router(config-evpn-host-ipv4-addr)# freeze-time 10
RP/0/RSP0/CPU0:router(config-evpn-host-ipv4-addr)# retry-count 2
RP/0/RSP0/CPU0:router(config-evpn-host-ipv4-addr)# commit

/* Ipv6 Address Duplicate Detection Configuration */

RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# evpn
RP/0/RSP0/CPU0:router(config-evpn)# host ipv6-address duplicate-detection
RP/0/RSP0/CPU0:router(config-evpn-host-ipv6-addr)# move-count 2
RP/0/RSP0/CPU0:router(config-evpn-host-ipv6-addr)# freeze-time 10
RP/0/RSP0/CPU0:router(config-evpn-host-ipv6-addr)# retry-count 2
RP/0/RSP0/CPU0:router(config-evpn-host-ipv6-addr)# commit
```

Running Configuration

This section shows the running configuration to detect duplicate IP address.

```
evpn
 host ipv4-address duplicate-detection
  move-count 2
  freeze-time 10
  retry-count 2
 !
evpn
 host ipv6-address duplicate-detection
  move-count 2
  freeze-time 10
  retry-count 2
 !
```

Verification

The show output given in the following section display the details of the duplicate IP address detection and recovery parameters.

```
RP/0/RSP0/CPU0:router#show l2route evpn mac-ip all detail

EVPN E-Tree Using RT Constraints

The EVPN E-Tree using RT constraints feature enables you to configure BGP RT import and export policies for an attachment circuit. This feature allows you to define communication between the leaf and root nodes. The provider edge (PE) nodes can receive L2 traffic either from the attachment circuit (AC) of a bridge domain (BD) or from the remote PE node. For a given BD, L2 communication can only happen from root to leaf and leaf to root. This feature does not allow any L2 communication between the ACs of two or more leafs. This feature uses two BGP RTs for every EVI. Associate one RT with root ACs and the other with leaf ACs. For example, there are two distinct sets of RTs, one for root-rt and another for leaf-rt.

This feature provides you with the following benefits by performing filtering of unicast and multicast traffic at the ingress PE nodes:

- Achieve efficiency of the BGP MAC routes scale
- Reduce the consumption of hardware resources
- Utilize the link bandwidth efficiently

Rules for Import and Export Policies under the BGP of EVPN EVI Instances

- Root PE exports its ROOT-RT using BGP export policy. It also imports other ROOT-RT from the corresponding root PE for the same EVI. This is necessary where there is more than one root for a particular BD and EVPN EVI. For example, in a multihome active-active scenario or multihome port-active and single-active scenarios.
- Root PE imports LEAF-RT using BGP import policy for a EVPN EVI. This enables the root to be aware of all remote L2 MAC addresses through EVPN RT2 advertisement of leaf PE node for a given E-Tree EVI.
- Leaf PE exports its LEAF-RT using BGP export policy to let the root to be aware of the reachability of its directly connected L2 endpoints through EVPN RT2 advertisement.

- Leaf PE imports ROOT-RT using BGP import policy. It helps the leaf to know about the L2 endpoints which are reachable through the AC of BD under EVPN EVI instance of root PE. You must not import LEAF-RT using BGP Import policy to avoid L2 Communication between two leaf PEs.
- Use split-horizon filtering to block traffic among leaf ACs on a BD for a given E-Tree EVI.

The BGP import and export policies applies to all EVPN RTs along with the RT2 advertisement.

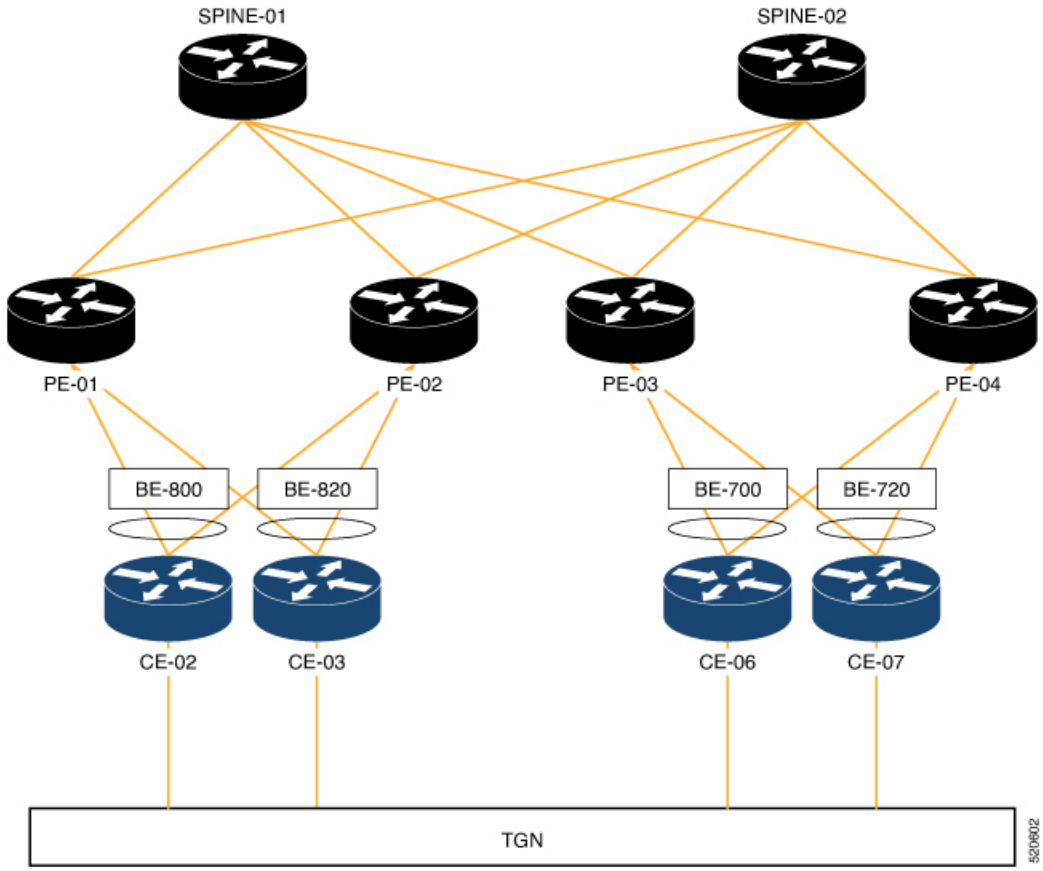
MAC Address Learning

- L2 MAC addresses are learnt on AC of a particular BD on leaf PE as type LOCAL. The same MAC address is advertised to root PE as EVPN RT2. On the remote root PE, the MAC table replicates the entry of MAC address with the learn type as L2VPN. Also, it associates the MPLS label of its BGP peer, which advertises RT2 to root PE node.
- L2 MAC addresses are learnt on AC of a particular BD on the root as type LOCAL. The same MAC address is advertised to peer root (except for MH A/A) or leaf PE as EVPN RT2. On the remote root PE or leaf PE, the MAC table replicates the entry of MAC address with the learn type as L2VPN. Also, it associates the MPLS label of its BGP peer, which advertises RT2 to PE node.
- L2 MAC addresses are learnt on AC of a particular BD on the root as type LOCAL. The same MAC address is advertised to peer root for MH A/A as EVPN RT2. The MAC table of the peer root node synchronizes the replicated entry of MAC address with the learn type as L2VPN for same the ESI and with the same AC as the next hop. This avoids flooding and duplication of known unicast traffic.

The following scenario describes the feature topology:

CE with Multihoming Active-Active and CE with Multihoming Active-Active

Consider a topology where you connect CE-02 and CE-03 to PE-01 and PE-02. Both the CEs are in multihoming active-active mode. Connect CE-02 to PE-01 and PE-02 using AC BE-800.305. Connect CE-03 to PE-01 and PE-02 using AC BE-820.305. Connect CE-06 and CE-07 to PE-03 and PE-04. Connect CE-06 to PE-03 and PE-04 using AC BE-700.305. Connect CE-07 to PE-03 and PE-04 using AC BE-720.305. Associate the bridge domain BD-305 with other AC on the respective PEs along with EVI-305 instance. Configure the respective RT on root and leaf with its import and export RTs for EVI-305. Configure PE-01 and PE-02 as root. Configure PE-03 and PE-04 as leaf.



Configuration

Perform the following tasks on PE-01, PE-02, PE-03, and PE-04.

- Configure bridge domain
- Configure attachment circuit
- Configure EVPN EVI
- Configure bundle Ethernet
- Configure EVPN interface

Note Use the **etree rt-leaf** command only if the leaf sites are in the EVPN all-active multihoming mode and not required for EVPN single homing mode.

Configuration Example

```
/* Configure PE-01 (as root) */

/* Configure bridge domain */
Router # configure
```

```
Router(config)# l2vpn
Router(config-l2vpn)# bridge group EVPN_BD
Router(config-l2vpn-bg)# bridge-domain evpn_bvi_305
Router(config-l2vpn-bg-bd)# interface Bundle-Ether800.305
Router(config-l2vpn-bg-bd-ac)# exit
Router (config-l2vpn-bg-bd)# interface Bundle-Ether820.305
Router(config-l2vpn-bg-bd-ac)# exit
Router (config-l2vpn-bg-bd)# evi 305
Router (config-l2vpn-bg-bd-evi)# commit

/* Configure attachment circuit */
Router# configure
Router(config)# interface Bundle-Ether800.305 l2transport
Router(config-l2vpn-subif)# encapsulation dot1q 305

Verification

This section shows how the L2 MAC addresses are synchronized as LOCAL and L2VPN with multihoming active-active peers PE. Also, the root PE is aware of MAC addresses learnt on leaf PE remotely through RT2 advertisements.

```
Router:PE-01# show l2route evpn mac all
Topo ID  Mac Address    Producer    Next Hop(s)
-------- -------------- ----------- --------------------------------------
204      001f.0100.0001 LOCAL       Bundle-Ether820.305, N/A

```

The following output shows how the multihoming PE is aware of its local L2 MAC addresses as well as the MAC addresses learnt on the root node only. Leaf multihoming PE is not aware of any other MAC addresses learnt on other leaf PE nodes except if they are learnt on a multihoming active-active ethernet-segment on the peer leaf PE.

EVPN E-Tree Per-PE (Scenario1b)

Table 2: Feature History Table

Feature Name	Release Information	Feature Description
EVPN E-Tree Per-PE (Scenario1b)	Release 7.5.1	This feature allows you to configure an attachment circuit on a PE device either as a root site or a leaf site using the **etree leaf** label for a given bridge-domain. By preventing communication among leaf ACs connected to the same PE and belonging to the same bridge-domain, you can segregate traffic received and sent from different geographical locations. This segregation helps in securing traffic and Denial of Service Prevention (DoS). This feature is compliant with RFC 8317.

EVPN Ethernet Tree (E-Tree) is a rooted-multipoint Ethernet service over MPLS core and enables you to define attachment circuits (ACs) as either a root site or a leaf site. The provider edge (PE) nodes can receive L2 traffic either from the attachment circuit (AC) of a bridge domain (BD) or from the remote PE node. For a given BD, L2 communication can only happen from root to leaf and leaf to root, and root to root. L2 communication between the ACs of two or more leafs is not allowed.

You can implement E-Tree in the following two ways:

- Scenario 1 - All ACs at a particular PE for a given BD can be either root or leaf site and all traffic for an EVI from a PE in the network is from either a root or a leaf. In this scenario you have two options to configure E-Tree:
  - Scenario 1a - You can configure E-Tree with route-targets (RT) constraints using two RTs per EVI. For more information, see the *EVPN E-Tree Using RT Constraints* section.
  - Scenario 1b - You can configure E-Tree without route-targets (RT) constraints and using **etree leaf** label.
- Scenario 2 - A PE for a given EVI can have both root and leaf sites. The root and leaf designation increases from bridge-domain level in Scenario 1, to a per AC level. For more information, see the *EVPN ETREE Per-AC (Scenario 2)* section.

Scenario 1b

In this scenario, you can configure E-Tree without route-targets (RT) constraints and using **etree leaf** label.

When you configure E-Tree with Scenario 1b, for known unicast traffic, MAC advertisements originating from a leaf site is identified with an **etree leaf** label to classify that the source is a leaf. Ingress filtering is performed, and traffic originating at leaf AC destined for a remote leaf MAC is dropped. If the remote PE is

also a leaf, the ingress traffic from the source leaf is dropped. If the remote PE is a root, the ingress traffic from the source leaf is forwarded.

For BUM traffic, egress filtering is performed and leaf nodes transmit an **etree leaf** label to identify that leaf sites are connected to the PE. Then, at the ingress node, BUM traffic originating from a leaf node is tagged with the corresponding remote **etree leaf** label. At the egress PE, traffic is tagged with the matching **etree leaf** label that is dropped at leaf ACs.

Scenario 1b Behavior

- E-Tree leaf is configured per bridge domain. If there is no leaf configuration, the bridge domain is always a root.
- All ACs inherit E-Tree leaf designation from the bridge domain.
- Split-horizon group between ACs of a leaf is enabled automatically.
- All local MACs learned under the BD is advertised to BGP with **etree leaf** indicator.
- Upon first leaf configuration, a special E-Tree ethernet segment with ESI-0 is created to allocate a split-horizon label, referred to as the local etree leaf label.
- ES/EAD with ESI-0 (ES-0/EAD) is advertised to BGP with etree leaf label.

You can use scenario 1b to interact with scenario 2 when a remote node is NCS 5500, NCS 540, or NCS 560, and configure E-Tree using scenario 1b with ASR 9000.

Configure EVPN E-Tree Per-PE (Scenario1b)

Perform this task to configure EVPN E-Tree Per-PE (Scenario1b).

Configure EVPN E-Tree leaf per bridge domain.

```
Router# configure
Router(config)# l2vpn
Router(config-l2vpn)# bridge group bg1
Router(config-l2vpn-bg)# bridge-domain bd_1
Router(config-l2vpn-bg-bd)# etree
Router(config-l2vpn-bg-bd-etree)# leaf
Router(config-l2vpn-bg-bd-etree)# interface Bundle-Ether400.1
Router(config-l2vpn-bg-bd-ac)# exit
Router(config-l2vpn-bg-bd-etree)#  interface Bundle-Ether401.1001
Router(config-l2vpn-bg-bd-ac)# exit
Router(config-l2vpn-bg-bd-etree)# interface Bundle-Ether4701.2001
Router(config-l2vpn-bg-bd-ac)# exit
Router(config-l2vpn-bg-bd-ac)# exit
Router(config-l2vpn-bg-bd)# routed interface BVI1
Router(config-l2vpn-bg-bd-bvi)# split-horizon group core
Router(config-l2vpn-bg-bd-bvi)# exit
Router(config-l2vpn-bg-bd)# evi 200
Router(config-l2vpn-bg-bd-evi)# commit
```

Running Configuration

```
l2vpn
 bridge group bg1

EVPN ETREE Per-AC (Scenario 2)

Table 3: Feature History Table

Feature Name	Release Information	Feature Description
EVPN E-TREE Per-AC (Scenario 2)	Release 7.5.1	This feature allows a provider edge (PE) device to have both root and leaf sites for a given EVI. This feature increases the granularity of leaf designation from the entire bridge to AC bridge ports; ACs under a bridge may be root or leaf.

Customer sites represented by ACs can be defined as root or leaf. PE can receive traffic from both root and leaf ACs for a given EVI from a remote node. An EVI can be associated with both root(s) and leaf(s). If an AC is not configured as E-Tree leaf, it is considered as root by default.

In Scenario 2, a PE for a given EVI can have both root and leaf sites. The granularity of root or leaf designation increases from bridge-domain level in Scenario 1 to a per AC level. Traffic for an EVI from a PE in the network can be from either a root or a leaf site.

Scenario 2 Behavior

For unicast traffic:

- Remote PE performs ingress filtering to prevent traffic from being sent unnecessarily over the core to be filtered at egress PE.
- PE indicates if the MAC address is associated with a root or a leaf.
- MAC advertisements originating from a leaf site are colored with a leaf-indication flag in an extended community; routes that do not have this flag are from a root site.
- Remote PEs perform ingress filtering, when MAC is programmed and the leaf-indication is present, a cross-check is performed with the originating AC; if the AC is also a leaf, packets will not be forwarded.
- Supports E-Tree extcomm of type 0x06 (EVPN) and sub-type 0x05 used for leaf-indication for known-unicast and BUM traffic.
- Enable unknown unicast suppression at EVIs connected to both root and leaf sites to prevent egress unknown unicast traffic arriving at an EVI from being flooded to ACs. This eliminates the leaf-to-leaf traffic during a BD MAC flush.

- MAC advertises local ESI and there is no leaf indicator from root.

  When processing the root sync-route, the root or leaf status of the individual AC is considered, instead of the entire bridge-domain. If a root MAC with a matching local ESI is received, and if the corresponding AC is a leaf, a syslog message is generated for the misconfiguration.

For BUM traffic:

- The PE performs egress filtering for BUM traffic. BUM traffic originating from leaf sites is filtered at egress nodes if the destination is also a leaf.
- A PE with leaf sites allocate a leaf label, and communicate this label to remote PEs using an ES/EAD route with ESI 0 with the ETREE extended community.
- BUM traffic originating from single-homed leaf AC is tagged with destination **etree leaf** label.
- BUM traffic originating from single-homed root AC is not tagged with any ESI or **etree leaf** label.
- BUM traffic originating from multi-homed leaf AC is tagged with destination **etree leaf** label.
- BUM traffic originating from multi-homed root AC is tagged with ESI label.
- The ingress PE tags MPLS frames with the **etree leaf** label for traffic originating from a leaf site; this label allows the disposition PE to perform egress filtering to native EVPN ESI label filtering.
- Intra-PE forwarding between leaf sites is prevented by putting all leaf ACs under a given bridge domain in a single split-horizon group.

Restrictions

- This feature is supporeted only on physical and bundle interfaces.
- You can use either Scenario 1 or Scenario 2 for a given EVI within a network.
- Scenario 2 interoperates only with scenario 1b and vice-versa.
- You can use scenario 1b to interact with scenario 2 when a remote node is NCS 5500, NCS 540, or NCS 560, and configure E-Tree using scenario 1b with ASR 9000.
