Preface

From Release 6.1.2 onwards, Cisco introduces support for the 64-bit Linux-based IOS XR operating system. Extensive feature parity is maintained between the 32-bit and 64-bit environments. Unless explicitly marked otherwise, the contents of this document are applicable for both the environments. For more details on Cisco IOS XR 64 bit, refer to the Release Notes for Cisco ASR 9000 Series Routers, Release 6.1.2 document.

This guide describes the Cisco ASR 9000 Series Router configurations. The preface for the Cisco ASR 9000 Series Aggregation Services Router MPLS Layer 3 VPN Configuration Guide contains these sections:

• Changes to This Document, page xix
• Obtaining Documentation and Submitting a Service Request, page xix

Changes to This Document

The following table lists the technical changes made to this document since it was first published.

<table>
<thead>
<tr>
<th>Date</th>
<th>Change Summary</th>
</tr>
</thead>
<tbody>
<tr>
<td>July 2014</td>
<td>Initial release of this document.</td>
</tr>
<tr>
<td>October 2014</td>
<td>Republished with documentation updates for Cisco IOS XR Release 5.2.2 features.</td>
</tr>
</tbody>
</table>

Obtaining Documentation and Submitting a Service Request

For information on obtaining documentation, submitting a service request, and gathering additional information, see the monthly What's New in Cisco Product Documentation, which also lists all new and revised Cisco technical documentation, at:

Subscribe to the What's New in Cisco Product Documentation as a Really Simple Syndication (RSS) feed and set content to be delivered directly to your desktop using a reader application. The RSS feeds are a free service and Cisco currently supports RSS version 2.0.
New and Changed VPN Features

This table summarizes the new and changed feature information for the L2VPN and Ethernet Services Configuration Guide for Cisco ASR 9000 Series Routers, and tells you where they are documented.

The Carrier Ethernet Model

This chapter introduces you to Layer 2 (L2) features and standards. This chapter also describes how to configure L2VPN features.

The distributed Gigabit Ethernet and 10-Gigabit Ethernet architecture and features deliver network scalability and performance, while enabling service providers to offer high-density, high-bandwidth networking solutions designed to interconnect the router with other systems in POPs, including core and edge routers and L2 and Layer 3 (L3) switches.

Note

This chapter does not include configuration information for Management Ethernet interfaces. To set up a Management Ethernet interface and enable Telnet servers, see the Cisco ASR 9000 Series Aggregation Services Routers Getting Started Guide. To configure a Management Ethernet interface for routing or to modify the configuration of a Management Ethernet interface, see the Advanced Configuration and Modification of the Management Ethernet Interface on the Cisco ASR 9000 Series Router chapter of the Cisco ASR 9000 Series Aggregation Services Router Interface and Hardware Component Configuration Guide.

• Configuration Examples, page 34
• Where to Go Next, page 38
Prerequisites for Configuring Layer 2 Ethernet Interfaces

Before configuring Ethernet interfaces, ensure that these tasks and conditions are met:

- You must be in a user group associated with a task group that includes the proper task IDs. The command reference guides include the task IDs required for each command.
  If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.
- Confirm that at least one of these line cards is installed on the router:
  - 4-port 10-Gigabit Ethernet (4 x 10 GE) line card
  - 8-port 10-Gigabit Ethernet (4 x 10 GE) line card
  - 40-port 1-Gigabit Ethernet line card
- You know the interface IP address.
- You know how to apply the specify the generalized interface name with the generalized notation `rack/slot/module/port`.

Layer 2 Theory and Standards Adherence

To configure Ethernet interfaces, you must understand these concepts:

Ethernet Technology Overview

Ethernet is defined by the IEEE 802.3 international standard. It enables the connection of up to 1024 nodes over coaxial, twisted-pair, or fiber-optic cable.

The Cisco ASR 9000 Series Routers support Gigabit Ethernet (1000 Mbps) and 10-Gigabit Ethernet (10 Gbps) interfaces.

Carrier Ethernet Services

Cisco endorses Metro Ethernet Forum (MEF) Carrier Ethernet (CE) 2.0 services:

- E-LINE: An E-Line is a point-to-point Ethernet service that connects exactly 2 UNIs.
- E-LAN: An E-LAN is a multipoint-to-multipoint service that connects a number of UNIs (2 or more) providing full mesh connectivity for those sites.
- E-TREE: An E-Tree is a rooted multipoint service that connects a number of UNIs providing sites with hub and spoke multipoint connectivity.
- E-ACCESS: An E-Access Service is an OVC-based service with at least one UNI OVC End Point and one ENNI End Point.

When discussing an Ethernet WAN (EWAN), these terminologies should be used:
Ethernet Wire Service

An Ethernet Wire Service is a service that emulates a point-to-point Ethernet segment. This is similar to Ethernet private line (EPL), a Layer 1 point-to-point service, except the provider edge operates at Layer 2 and typically runs over a Layer 2 network. The EWS encapsulates all frames that are received on a particular UNI and transports these frames to a single-egress UNI without reference to the contents contained within the frame. The operation of this service means that an EWS can be used with VLAN-tagged frames. The VLAN tags are transparent to the EWS (bridge protocol data units [BPDUs])—with some exceptions. These exceptions include IEEE 802.1x, IEEE 802.2ad, and IEEE 802.3x, because these frames have local significance and it benefits both the customer and the Service Provider to terminate them locally.

Since the service provider simply accepts frames on an interface and transmits these without reference to the actual frame (other than verifying that the format and length are legal for the particular interface) the EWS is indifferent to VLAN tags that may be present within the customer Ethernet frames.

EWS subscribes to the concept of all-to-one bundling. That is, an EWS maps a port on one end to a point-to-point circuit and to a port on another end. EWS is a port-to-port service. Therefore, if a customer
needs to connect a switch or router to n switches or routers it will need n ports and n pseudowires or logical circuits.

One important point to consider is that, although the EWS broadly emulates an Ethernet Layer 1 connection, the service is provided across a shared infrastructure, and therefore it is unlikely that the full interface bandwidth will be, or needs to be, available at all times. EWS will typically be a sub-line rate service, where many users share a circuit somewhere in their transmission path. As a result, the cost will most likely be less than that of EPL. Unlike a Layer 1 EPL, the SP will need to implement QoS and traffic engineering to meet the specific objectives of a particular contract. However, if the customer's application requires a true wire rate transparent service, then an EPL service—delivered using optical transmission devices such as DWDM (dense wavelength division multiplexing), CDWM (coarse wavelength division multiplexing), or SONET/SDH—should be considered.

**Ethernet Virtual Private Line**

Ethernet Virtual Private Line (EVPL) is similar to EWS in that it offers point-to-point connectivity. The key differentiation between EWS and EVPL is that an EVPL uses a VLAN tag to multiplex several, non-same-destination pseudowires to one port. That is, unlike EPL and EWS, EVPL is a one-to-many multiplexed service. Service multiplexing simply means that multiple pseudowires utilize a single access interface or UNI. These circuits can terminate within an L2VPN or on, for example, an Internet gateway. From the service user's perspective, this service multiplexing capability offers more efficient interface utilization, simplification of cable plant, and reduced maintenance costs associated with additional interfaces.

Using the same example as above, where a router connects to n other routers, the source router only needs one port for the service instead of n, as is the case with an EWS. The service need not be port-to-port, but can be logical-pseudowire-to-logical-pseudowire. In the case of an EVPL, each circuit can terminate at a different remote location, whereas using EWS, all frames are mapped to a single circuit and therefore a single egress point.

![Figure 2: EVPL Service Multiplexing Example: One Port (Left) Can Be Used for All Destinations (Right)](image)

Like Frame Relay, EVPL allows a customer device to access multiple connections through a single physical port attached to the service provider network. The service offered by EVPL can be thought of as being similar in concept to Frame Relay, in that a VLAN number is used as a virtual circuit identifier in a similar fashion to Frame Relay data link connection identifier (DLCI). Unlike EWS, EVPL does not forward BPDUs, because IEEE 802.1Q (VLAN tagging) only sends BPDUs on a default VLAN. In a hub-and-spoke network, only one spoke at most would receive BPDUs, thus breaking the spanning tree in the rest of the network. Therefore, an EVPL does not transmit any BPDUs and runs routing protocols instead of Ethernet Spanning Tree. The routing protocols give the customer and provider greater flexibility, traffic determination characteristics, and value-added services.

**Ethernet LAN Service**

An Ethernet LAN Service (E-LAN) differs from EWS and ERS in that an E-LAN provides a multipoint connectivity model. It should be noted that an E-LAN service definition is still under review within the IETF Multipoint Layer 2 Services working group. Although E-LAN uses a multipoint model, it can forward unicast packets to single destinations; that is, it also supports point-to-point connections. To the end user, the network
looks like a giant Ethernet switch where each customer has their own VLAN or broadcast domain, rather than end-to-end pseudowire link(s).

**E-LAN Example**

An E-LAN does not map an interface or VLAN to a specific point-to-point pseudowire. Instead, it models the operation of a virtual Ethernet switch: E-LAN uses the customer's MAC address to forward frames to the correct egress UNI within the service provider's network. An E-LAN emulates the service attributes of an Ethernet switch and learns source MAC to interface associations, floods unknown broadcast and multicast frames, and (optionally) monitors the service user's spanning tree protocol. One important point to note is that although the service provider may utilize spanning tree within the transport network, there is no interaction with the service user's spanning tree.

This service works similar to an MPLS VPN, except it functions at L2 instead of L3. While a VPLS E-LAN is a viable solution, its scalability and QoS control are suspect compared to that of MPLS VPNs. In addition, it is much more difficult, and may be impossible, for the service provider to offer value-added Layer 3 services (this is discussed later in the document).

**Ethernet Flow Point**

An Ethernet Flow Point (EFP) is a substream partition of a main interface. On Cisco ASR 9000 Series Routers, the EFP is implemented as an L2 subinterface with an encapsulation statement.

**Ethernet Virtual Circuit**

An Ethernet Virtual Circuit (EVC) is a point-to-point tunnel. On Cisco ASR 9000 Series Routers, the EVC is implemented as a pseudowire (PW).

**Ethernet OAM Protocols**

Ethernet as a Metro Area Network (MAN) or a Wide Area Network (WAN) technology benefits greatly from the implementation of Operations, Administration and Maintenance (OAM) features. OAM features allow Service Providers to monitor the quality of the connections on a MAN or WAN. Service providers can monitor specific events, take actions on events, and if necessary, put specific interfaces into loopback mode for troubleshooting. Ethernet OAM features can be configured to monitor either side or both sides of a link.

For more information on Ethernet OAM protocols, refer to the Configuring Ethernet Interfaces chapter of the Cisco ASR 9000 Series Aggregation Services Router Interface and Hardware Component Configuration Guide.

**Layer 2 VPN on Ethernet Interfaces**

Layer 2 Virtual Private Network (L2VPN) connections emulate the behavior of a LAN across an IP or MPLS-enabled IP network, allowing Ethernet devices to communicate with each other as if they were connected to a common LAN segment.

The L2VPN feature enables service providers (SPs) to provide L2 services to geographically disparate customer sites. Typically, an SP uses an access network to connect the customer to the core network. This access network may use a mixture of L2 technologies, such as Ethernet and Frame Relay. The connection between the customer site and the nearby SP edge router is known as an attachment circuit (AC). Traffic from the customer travels
over this link to the edge of the SP core network. The traffic then tunnels through a pseudowire over the SP core network to another edge router. The edge router sends the traffic down another AC to the customer's remote site.

The L2VPN feature enables the connection between different types of L2 attachment circuits and pseudowires, allowing users to implement different types of end-to-end services.

Cisco IOS XR software supports a point-to-point end-to-end service, where two Ethernet circuits are connected together. An L2VPN Ethernet port can operate in one of two modes:

- **Port Mode**—In this mode, all packets reaching the port are sent over the pseudowire, regardless of any VLAN tags that are present on the packets. In VLAN mode, the configuration is performed under the l2transport configuration mode.

- **VLAN Mode**—Each VLAN on a CE (customer edge) or access network to PE (provider edge) link can be configured as a separate L2VPN connection (using either VC type 4 or VC type 5). To configure L2VPN on VLANs, see *The Carrier Ethernet Model* chapter in this manual. In VLAN mode, the configuration is performed under the individual subinterface.

Switching can take place in three ways:

- **AC-to-PW**—Traffic reaching the PE is tunneled over a PW (pseudowire) (and conversely, traffic arriving over the PW is sent out over the AC). This is the most common scenario.

- **Local switching**—Traffic arriving on one AC is immediately sent out of another AC without passing through a pseudowire.

- **PW stitching**—Traffic arriving on a PW is not sent to an AC, but is sent back into the core over another PW.

Keep these in mind when configuring L2VPN on an Ethernet interface:

- L2VPN links support QoS (Quality of Service) and MTU (Maximum Transmission Unit) configuration.

- If your network requires that packets are transported transparently, you may need to modify the packet's destination MAC (Media Access Control) address at the edge of the Service Provider (SP) network. This prevents the packet from being consumed by the devices in the SP network.

Use the `show interfaces` command to display AC and pseudowire information.

## Gigabit Ethernet Protocol Standards Overview

The Gigabit Ethernet interfaces support these protocol standards:

- **IEEE 802.3 Physical Ethernet Infrastructure**
- **IEEE 802.3ab 1000BASE-T Gigabit Ethernet**
- **IEEE 802.3z 1000 Mbps Gigabit Ethernet**
- **IEEE 802.3ae 10 Gbps Ethernet**

These standards are further described in the sections that follow.
IEEE 802.3 Physical Ethernet Infrastructure

The IEEE 802.3 protocol standards define the physical layer and MAC sublayer of the data link layer of wired Ethernet. IEEE 802.3 uses Carrier Sense Multiple Access with Collision Detection (CSMA/CD) access at a variety of speeds over a variety of physical media. The IEEE 802.3 standard covers 10 Mbps Ethernet. Extensions to the IEEE 802.3 standard specify implementations for Gigabit Ethernet, 10-Gigabit Ethernet, and Fast Ethernet.

IEEE 802.3ab 1000BASE-T Gigabit Ethernet

The IEEE 802.3ab protocol standards, or Gigabit Ethernet over copper (also known as 1000BaseT) is an extension of the existing Fast Ethernet standard. It specifies Gigabit Ethernet operation over the Category 5e/6 cabling systems already installed, making it a highly cost-effective solution. As a result, most copper-based environments that run Fast Ethernet can also run Gigabit Ethernet over the existing network infrastructure to dramatically boost network performance for demanding applications.

IEEE 802.3z 1000 Mbps Gigabit Ethernet

Gigabit Ethernet builds on top of the Ethernet protocol, but increases speed tenfold over Fast Ethernet to 1000 Mbps, or 1 Gbps. Gigabit Ethernet allows Ethernet to scale from 10 or 100 Mbps at the desktop to 100 Mbps up to 1000 Mbps in the data center. Gigabit Ethernet conforms to the IEEE 802.3z protocol standard. By leveraging the current Ethernet standard and the installed base of Ethernet and Fast Ethernet switches and routers, network managers do not need to retrain and relearn a new technology in order to provide support for Gigabit Ethernet.

IEEE 802.3ae 10 Gbps Ethernet

Under the International Standards Organization’s Open Systems Interconnection (OSI) model, Ethernet is fundamentally a L2 protocol. 10-Gigabit Ethernet uses the IEEE 802.3 Ethernet MAC protocol, the IEEE 802.3 Ethernet frame format, and the minimum and maximum IEEE 802.3 frame size. 10 Gbps Ethernet conforms to the IEEE 802.3ae protocol standards.

Just as 1000BASE-X and 1000BASE-T (Gigabit Ethernet) remained true to the Ethernet model, 10-Gigabit Ethernet continues the natural evolution of Ethernet in speed and distance. Because it is a full-duplex only and fiber-only technology, it does not need the carrier-sensing multiple-access with the CSMA/CD protocol that defines slower, half-duplex Ethernet technologies. In every other respect, 10-Gigabit Ethernet remains true to the original Ethernet model.

General Ethernet Standards

- Ethernet II framing also known as DIX.
- IEEE 802.3 framing also includes LLC and LLC/SNAP protocol frame formats.
- IEEE 802.1d MAC Bridges and Spanning Tree—This standard specifies the MAC learning and MAC aging in a bridging environment. It also defines the original spanning tree protocol. Also MSTP is defined in IEEE 802.1s and IEEE 802.1q.
IEEE 802.1q VLAN tagging—This standard defines VLAN tagging, and also the traditional VLAN trunking between switches. Technically, it also defines QinQ tagging, and MSTP. The Cisco ASR 9000 Series Routers do NOT support ISL.

IEEE 802.1ad Provider Bridges—This standard is a subset of 802.1q and is often referred to as 802.1ad. The Cisco ASR 9000 Series Routers do not adhere to the entire standard, but large portions of the standard's functionality are supported.

MAC Address

A MAC address is a unique 6-byte address that identifies the interface at L2.

Ethernet MTU

The Ethernet Maximum Transmission Unit (MTU) is the size of the largest frame, minus the 4-byte Frame Check Sequence (FCS), that can be transmitted on the Ethernet network. Every physical network along the destination of a packet can have a different MTU.

Cisco IOS XR software supports two types of frame forwarding processes:

- Fragmentation for IPV4 packets—In this process, IPv4 packets are fragmented as necessary to fit within the MTU of the next-hop physical network.

  Note IPv6 does not support fragmentation.

- MTU discovery process determines largest packet size—This process is available for all IPV6 devices, and for originating IPv4 devices. In this process, the originating IP device determines the size of the largest IPv6 or IPv4 packet that can be sent without being fragmented. The largest packet is equal to the smallest MTU of any network between the IP source and the IP destination devices. If a packet is larger than the smallest MTU of all the networks in its path, that packet will be fragmented as necessary. This process ensures that the originating device does not send an IP packet that is too large.

  Jumbo frame support is automatically enable for frames that exceed the standard frame size. The default value is 1514 for standard frames and 1518 for 802.1Q tagged frames. These numbers exclude the 4-byte FCS.

Flow Control on Ethernet Interfaces

The flow control used on 10-Gigabit Ethernet interfaces consists of periodically sending flow control pause frames. It is fundamentally different from the usual full- and half-duplex flow control used on standard management interfaces. On the Cisco ASR 9000 Series Routers both ingress and egress flow control are off by default.

VRRP

The Virtual Router Redundancy Protocol (VRRP) eliminates the single point of failure inherent in the static default routed environment. VRRP specifies an election protocol that dynamically assigns responsibility for
a virtual router to one of the VPN concentrators on a LAN. The VRRP VPN concentrator controlling the IP addresses associated with a virtual router is called the master, and forwards packets sent to those IP addresses. When the master becomes unavailable, a backup VPN concentrator takes the place of the master.

For more information on VRRP, see the Implementing VRRP chapter of Cisco ASR 9000 Series Routers IP Addresses and Services Configuration Guide.

**HSRP**

Hot Standby Routing Protocol (HSRP) is a proprietary protocol from Cisco. HSRP is a routing protocol that provides backup to a router in the event of failure. Several routers are connected to the same segment of an Ethernet, FDDI, or token-ring network and work together to present the appearance of a single virtual router on the LAN. The routers share the same IP and MAC addresses and therefore, in the event of failure of one router, the hosts on the LAN are able to continue forwarding packets to a consistent IP and MAC address. The transfer of routing responsibilities from one device to another is transparent to the user.

HSRP is designed to support non disruptive failover of IP traffic in certain circumstances and to allow hosts to appear to use a single router and to maintain connectivity even if the actual first hop router they are using fails. In other words, HSRP protects against the failure of the first hop router when the source host cannot learn the IP address of the first hop router dynamically. Multiple routers participate in HSRP and in concert create the illusion of a single virtual router. HSRP ensures that one and only one of the routers is forwarding packets on behalf of the virtual router. End hosts forward their packets to the virtual router.

The router forwarding packets is known as the active router. A standby router is selected to replace the active router should it fail. HSRP provides a mechanism for determining active and standby routers, using the IP addresses on the participating routers. If an active router fails, a standby router can take over without a major interruption in the host's connectivity.

HSRP runs on top of User Datagram Protocol (UDP), and uses port number 1985. Routers use their actual IP address as the source address for protocol packets, not the virtual IP address, so that the HSRP routers can identify each other.

For more information on HSRP, see the Implementing HSRP chapter of Cisco ASR 9000 Series Routers IP Addresses and Services Configuration Guide.

**Link Autonegotiation on Ethernet Interfaces**

Link autonegotiation ensures that devices that share a link segment are automatically configured with the highest performance mode of interoperation. Use the `negotiation auto` command in interface configuration mode to enable link autonegotiation on an Ethernet interface. On line card Ethernet interfaces, link autonegotiation is disabled by default.

Note

The `negotiation auto` command is available on Gigabit Ethernet interfaces only.

**What is an Ethernet Flow Point?**

An Ethernet Flow Point (EFP) is a Layer 2 logical subinterface used to classify traffic under a physical or a bundle interface.
A physical interface can be a Gigabit Ethernet 0/0/0/1 or a 10 Gigabit Ethernet 0/0/0/0 interface and has ports on the line card. A bundle interface is a virtual interface, created by grouping physical interfaces together. For example, physical interfaces such as Gigabit Ethernet 0/0/0/1 and 10 Gigabit Ethernet 0/0/0/0 can be configured as members of a bundle interface.

Grouping physical interfaces together can:

- Reduce the routing entries
- Increase the bandwidth of the bundle interface
- Balance the traffic on the bundle members

EFP has the following characteristics:

- An EFP represents a logical demarcation point of an Ethernet Virtual Connection (EVC) on an interface. For an EVC associating two or more UNIs, there is a flow point on each interface of every device, through which that EVC passes.

- An EFP can be regarded as an instantiation of a particular service. An EFP is defined by a set of filters. These filters are applied to all the ingress traffic to classify the frames that belong to a particular EFP. An EFP filter is a set of entries, where each entry looks similar to the start of a packet (ignoring source/destination MAC address). Each entry usually contains 0, 1 or 2 VLAN tags. A packet that starts with the same tags as an entry in the filter is said to match the filter; if the start of the packet does not correspond to any entry in the filter then the packet does not match the filter.

- An EFP serves four purposes:
  - Identifies all frames that belong to a particular flow on a given interface
  - Performs ingress and egress Ethernet header manipulations
  - Adds features to the identified frames
  - Optionally define how to forward those frames in the data path

You can perform a variety of operations on the traffic flows when a router is configured with EFPs on various interfaces. Also, you can bridge or tunnel the traffic by many ways from one or more of the router’s ingress
EFPs to one or more egress EFPs. This traffic is a mixture of VLAN IDs, single or double (QinQ) encapsulation, and ethertypes.

**Figure 3: EFP Model**

An EFP subinterface is configured to specify which traffic on ingress is vectored to that EFP. This is done by specifying a VLAN, range of VLANs, or QinQ tagging to match against on ingress. All traffic on ingress is compared to each EFP’s matching criterion, and processed by that EFP if a match occurs. The processing performed by an EFP can change VLAN IDs, add or remove VLAN tags, and change ethertypes.

## Improving the Scalability of EFPs on Bundle Interfaces

You can improve the scalability of EFPs on bundle interfaces in two ways:

- Increase the number of EFPs per chassis from 32000 to 64000.
- Increase the number of EFPs per line card, on a single node point, to the same scale as the physical interface scaling.

The following example illustrates how to improve the scalability of EFPs per line card:

Consider a B module line card type 1 with a bundle interface scaling of 4000 and a physical interface scaling of 16000. The scalability of EFPs on the B module is improved by adding three additional bundles of 4000 EFPs per bundle.

### Note

The maximum number of EFPs that can be added to a bundle interface is 4000.

The number of EFPs per line card is now scaled to 16000 or 4 bundles of 4000 EFPs each.

## EFP CLI Overview

Cisco IOS XR implements a structured CLI for EFP and EVC configuration. The following commands are typically used to configure an EFP:

- `l2transport` command - This command identifies a subinterface (or a physical port or bundle-port parent interface) as an EFP.
• **encapsulation** command - This command is used to specify matching criteria.

• **rewrite** command - This command is used to specify the VLAN tag rewrite criteria.

## Egress EFP Filtering

The Egress EFP Filtering feature implements a means of filtering EFP egress traffic, ensuring that all the given EFP's egress traffic complies with the ingress matching criterion.

An ingress EFP is similar to an egress EFP. The router is configured to send traffic on the EFP, that matches that EFP's ingress matching criterion. It is possible to configure a router so that this does not occur, and there is no safeguard to prevent such mismatching egress EFP traffic from exiting the router.

The Cisco ASR 9000 Series Routers allow for different VLANs on different ports within the same bridge domain. This allows a bridge to forward a packet out of a port not configured for the VLAN tag on the packet. Egress EFP filtering checks this and drops invalid packets at the egress port.

## Identifying Frames of an EFP

The EFP identifies frames belonging to a particular flow on a given port, independent of their Ethernet encapsulation. An EFP can flexibly map frames into a flow or EFP based on the fields in the frame header.

The frames can be matched to an EFP using:

- VLAN tag or tags
- MAC address (source address, destination address, or both)
- 802.1p CoS bits
- Logical conjunction of two or more of the above: VLAN, MAC, and CoS
- Default match (that is, any other traffic that has not matched a more specific EFP)
- Protocol ethertype

The frames cannot be matched to an EFP through use of any of these:

- Any information outside the outermost Ethernet frame header and its associated tags such as
  - IPv4, IPv6, or MPLS tag header data
  - C-DMAC, C-SMAC, or C-VLAN
- Logical disjunction of the valid frame matches above: VLAN, MAC, and CoS

The specific match criteria are covered in more detail in these sections.

### VLAN Tag Matching

Below table describes the different encapsulation types and the EFP identifier corresponding to each.
### Encapsulation Type | EFP Identifier
--- | ---
Untagged | Static configuration on the ingress physical interface or a subinterface that uses the `untagged` keyword in the `encapsulation` command. There can be only one untagged subinterface. If an untagged subinterface has been created, traffic goes to this interface instead of the main interface.
Priority-tagged Ethernet frames | A priority-tagged frame is defined as having a single 802.1Q VLAN header, with a VLAN id of zero.
Native VLAN | Cisco ASR 9000 Series Routers do not support native VLAN. Use this command: `encapsulation dot1q <vlan-id>, untagged`
Single tagged frames | 802.1Q customer-tagged Ethernet frames
Double tagged frames | 802.1Q (ethertype 0x8100) double tagged frames
| 802.1ad double tagged frames
| Legacy 0x9100 and 0x9200 double tagged frames
Default tagging | An EFP which has a maximum-match wildcard. The effect is to receive any traffic that does not match any other EFP on the same physical interface.

You can use wildcards as well as VLAN ranges while defining frames that map to a given EFP. EFPs can distinguish flows based on a single VLAN tag, a range of VLAN tags, a stack of VLAN tags or a combination of both (VLAN stack with wildcards). It provides the EFP model, a flexibility of being encapsulation agnostic, and allows it to be extensible as new tagging or tunneling schemes are added.

### MAC Address Matching
The source MAC address, the destination MAC address, or both can be matched. In all cases, the MAC address requires an exact match. A wildcard match or partial match is not adequate.

### 802.1p CoS Bits Matching
One or more exact CoS matches are specified. Because CoS is only 3 bits, this limits it to 8 possible choices.

### Logical Conjunction
All of the match criteria above can be selectively combined those frames that match all of the separate criteria.

### Default Match
A single EFP can be defined that matches all other traffic that has not been matched by a more specific EFP.
Match Precedence and Config Verification

Overlapping EFPs are allowed to be configured, where it is possible to determine an order in which they should be used for matching. But EFPs that conflict with other EFPs or subinterfaces on the parent trunk interface should be blocked at config verification.

An ordering precedence is used for how EFP matches are applied in hardware. The model is for matches that are more specific to be processed before matches that are less specific.

Egress Behavior

The EFP matching criteria can also be used on egress to police the frames that can egress from the EFP, based on the platform support. Frames that do not match the criteria (source/destination MAC match criteria are reversed) are dropped.

Applying Features

After the frames are matched to a particular EFP, any appropriate features can be applied. In this context, "features" means any frame manipulations specified by the configuration as well as things such as QoS and ACLs. The Ethernet infrastructure provides an appropriate interface to allow the feature owners to apply their features to an EFP. Hence, IM interface handles are used to represent EFPs, allowing feature owners to manage their features on EFPs in the same way the features are managed on regular interfaces or subinterfaces.

The only L2 features that can be applied on an EFP that is part of the Ethernet infrastructure are the L2 header encapsulation modifications. The L2 features are described in this section.

Encapsulation Modifications

EFP supports these L2 header encapsulation modifications on both ingress and egress:

- Push 1 or 2 VLAN tags
- Pop 1 or 2 VLAN tags

This modification can only pop tags that are matched as part of the EFP.

- Rewrite 1 or 2 VLAN tags:
  - Rewrite outer tag
  - Rewrite outer 2 tags
  - Rewrite outer tag and push an additional tag
  - Remove outer tag and rewrite inner tag

For each of the VLAN ID manipulations, these can be specified:

- The VLAN tag type, that is, C-VLAN, S-VLAN, or I-TAG. The ethertype of the 802.1Q C-VLAN tag is defined by the dot1q tunneling type command.

- The VLAN ID. 0 can be specified for an outer VLAN tag to generate a priority-tagged frame.
For tag rewrites, the CoS bits from the previous tag should be preserved in the same way as the DEI bit for 802.1ad encapsulated frames.

Defining Data-Forwarding Behavior

The EFP can be used to designate the frames belonging to a particular Ethernet flow forwarded in the data path. These forwarding cases are supported for EFPs in Cisco IOS XR software:

- **L2 Switched Service (Bridging)**—The EFP is mapped to a bridge domain, where frames are switched based on their destination MAC address. This includes multipoint services:
  - Ethernet to Ethernet Bridging
  - Multipoint Layer 2 Services
- **L2 Stitched Service (AC to AC xconnect)**—This covers point-to-point L2 associations that are statically established and do not require a MAC address lookup.
  - Ethernet to Ethernet Local Switching—The EFP is mapped to an S-VLAN either on the same port or on another port. The S-VLANs can be identical or different.
- **Tunneled Service (xconnect)**—The EFP is mapped to a Layer 3 tunnel. This covers point-to-point services only:
  - EoMPLS
  - L2TPv3
- **L2 Terminated Service (Ethernet access to Layer 3 service)**—The EFP is mapped to an IP interface that has a global address or belongs to a VRF (includes both IP and MPLS Layer 3 VPNs).

802.1Q VLAN

A VLAN is a group of devices on one or more LANs that are configured so that they can communicate as if they were attached to the same wire, when in fact they are located on a number of different LAN segments. Because VLANs are based on logical instead of physical connections, it is very flexible for user and host management, bandwidth allocation, and resource optimization.

The IEEE's 802.1Q protocol standard addresses the problem of breaking large networks into smaller parts so broadcast and multicast traffic does not consume more bandwidth than necessary. The standard also helps provide a higher level of security between segments of internal networks.

The 802.1Q specification establishes a standard method for inserting VLAN membership information into Ethernet frames.

Cisco IOS XR software supports VLAN subinterface configuration on Gigabit Ethernet and 10-Gigabit Ethernet interfaces.
802.1Q Tagged Frames

The IEEE 802.1Q tag-based VLAN uses an extra tag in the MAC header to identify the VLAN membership of a frame across bridges. This tag is used for VLAN and Quality of Service (QoS) priority identification. The VLANs can be created statically by manual entry or dynamically through Generic Attribute Registration Protocol (GARP) VLAN Registration Protocol (GVRP). The VLAN ID associates a frame with a specific VLAN and provides the information that switches must process the frame across the network. A tagged frame is four bytes longer than an untagged frame and contains two bytes of Tag Protocol Identifier (TPID) residing within the type and length field of the Ethernet frame and two bytes of Tag Control Information (TCI) which starts after the source address field of the Ethernet frame.

Subinterfaces

Subinterfaces are logical interfaces created on a hardware interface. These software-defined interfaces allow for segregation of traffic into separate logical channels on a single hardware interface as well as allowing for better utilization of the available bandwidth on the physical interface.

Subinterfaces are distinguished from one another by adding an extension on the end of the interface name and designation. For instance, the Ethernet subinterface 23 on the physical interface designated TenGigE 0/1/0/0 would be indicated by TenGigE 0/1/0/0.23.

Before a subinterface is allowed to pass traffic it must have a valid tagging protocol encapsulation and VLAN identifier assigned. All Ethernet subinterfaces always default to the 802.1Q VLAN encapsulation. However, the VLAN identifier must be explicitly defined.

Subinterface MTU

The subinterface Maximum Transmission Unit (MTU) is inherited from the physical interface with an additional four bytes allowed for the 802.1Q VLAN tag.

VLAN Subinterfaces on Ethernet Bundles

An Ethernet bundle is a group of one or more Ethernet ports that are aggregated together and treated as a single link. Multiple VLAN subinterfaces can be added to a single Ethernet bundle.

For more information about configuring Ethernet bundles, see the Configuring Link Bundles chapter in this document. The procedure for creating VLAN subinterfaces on an Ethernet bundle is exactly the same as the procedure for creating VLAN subinterfaces on a physical Ethernet interface.

To create a VLAN subinterface on an Ethernet bundle, see the Configuring 802.1Q VLAN Interfaces section later in this chapter.

Layer 2 VPN on VLANs

The Layer 2 Virtual Private Network (L2VPN) feature enables Service Providers (SPs) to provide L2 services to geographically disparate customer sites, as described in the Layer 2 VPN on Ethernet Interfaces section of the The Carrier Ethernet Model, on page 3 chapter.

The configuration model for configuring VLAN Attachment Circuits (ACs) is similar to the model used for configuring basic VLANs, where the user first creates a VLAN subinterface, and then configures that VLAN
in subinterface configuration mode. To create an Attachment Circuit, you need to include the `l2transport` keyword in the `interface` command string to specify that the interface is a L2 interface.

VLAN ACs support three modes of L2VPN operation:

- **Basic Dot1Q Attachment Circuit**—The Attachment Circuit covers all frames that are received and sent with a specific VLAN tag.

- **QinQ Attachment Circuit**—The Attachment Circuit covers all frames received and sent with a specific outer VLAN tag and a specific inner VLAN tag. QinQ is an extension to Dot1Q that uses a stack of two tags.

- **Q-in-Any Attachment Circuit**—The Attachment Circuit covers all frames received and sent with a specific outer VLAN tag and any inner VLAN tag, as long as that inner VLAN tag is not Layer 3 terminated. Q-in-Any is an extension to QinQ that uses wildcarding to match any second tag.

  **Note**
  
  The Q-in-Any mode is a variation of the basic Dot1Q mode. In Q-in-Any mode, the frames have a basic QinQ encapsulation; however, in Q-in-Any mode the inner tag is not relevant, except for the fact that a few specific inner VLAN tags are siphoned for specific services. For example, a tag may be used to provide L3 services for general internet access.

Each VLAN on a CE-to-PE link can be configured as a separate L2VPN connection (using either VC type 4 or VC type 5).

Keep these in mind when configuring L2VPN on a VLAN:

- Cisco IOS XR software supports 4000 Attachment Circuits per line card.

- In a point-to-point connection, the two Attachment Circuits do not have to be of the same type. For example, a port mode Ethernet Attachment Circuit can be connected to a Dot1Q Ethernet Attachment Circuit.

- Pseudowires can run in VLAN mode or in port mode. A pseudowire running in VLAN mode has a single Dot1Q tag, while a pseudowire running in port mode has no tags. Some interworking is required to connect these different types of circuits together. This interworking takes the form of popping, pushing, and rewriting tags. The advantage of L2VPN is that it simplifies the interworking required to connect completely different media types together.

- The Attachment Circuits on either side of an MPLS pseudowire can be different types. In this case, the appropriate conversion is carried out at one or both ends of the Attachment Circuit to pseudowire connection.

Use the `show interfaces` command to display Attachment Circuit and pseudowire information.

  **Note**
  
  For more information on the `show interfaces` command, refer to the *Cisco ASR 9000 Series Aggregation Services Router Interface and Hardware Component Configuration Guide*.

How to Configure Layer 2 Features on Ethernet Interfaces

Note
For more information on configuring interfaces, refer to the Cisco ASR 9000 Series Aggregation Services Router Interface and Hardware Component Configuration Guide.

Default Configuration Values for Gigabit Ethernet and 10-Gigabit Ethernet

The below table describes the default interface configuration parameters that are present when an interface is enabled on a Gigabit Ethernet or 10-Gigabit Ethernet modular services card and its associated PLIM.

Note
You must use the shutdown command to bring an interface administratively down. The interface default is no shutdown. When a modular services card is first inserted into the router, if there is no established preconfiguration for it, the configuration manager adds a shutdown item to its configuration. This shutdown can be removed only be entering the no shutdown command.

### Configuring Ethernet Interfaces

For more information on configuring Ethernet interfaces, see the *Cisco ASR 9000 Series Aggregation Services Router Interface and Hardware Component Configuration Guide*.

#### Configuring a 10-Gigabit Ethernet Interface

Perform this task to configure an Ethernet interface:

**SUMMARY STEPS**

1. configure interface TenGigE \[ instance \]
2. l2transport
3. mtu bytes
4. no shutdown
5. Use the commit or end command.

**DETAILED STEPS**

**Step 1**

**configure interface TenGigE \[ instance \]**

**Example:**

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router# interface TenGigE 0/0/0/1
```

Enters interface configuration mode for a 10-Gigabit Ethernet interface.

**Step 2**

**l2transport**

**Example:**

```
RP/0/RSP0/CPU0:router(config-if)# l2transport
```

Enables Layer 2 transport mode on a port and enter Layer 2 transport configuration mode.
### Configuring Ethernet Interfaces

Perform this task to configure a basic Gigabit Ethernet or 10-Gigabit Ethernet interface:

**SUMMARY STEPS**

1. configure
2. interface  type  interface-path-id
3. ipv4 address  ip-address  mask
4. flow-control  { bidirectional | egress | ingress }
5. mtu  bytes
6. mac-address  value1.value2.value3
7. negotiation auto (on Gigabit Ethernet interfaces only)
8. no shutdown
9. Use the commit or end command.
10. show interfaces [ GigabitEthernet | TenGigE ] instance

---

**Step 3**  
**mtu**  bytes

**Example:**

```
RP/0/RSP0/CPU0:router(config-if-l2)# mtu 1448
```

Adjusts the maximum packet size or Maximum Transmission Unit (MTU) size for the bridge domain.

- Use the bytes argument to specify the MTU size, in bytes. The range is from 64 to 65535.

**Step 4**  
**no shutdown**

**Example:**

```
RP/0/RSP0/CPU0:router(config-if-l2)# no shutdown
```

Removes the shutdown configuration, which forces an interface administratively down.

**Step 5**

Use the commit or end command.

- **commit** - Saves the configuration changes and remains within the configuration session.
- **end** - Prompts user to take one of these actions:
  - **Yes** - Saves configuration changes and exits the configuration session.
  - **No** - Exits the configuration session without committing the configuration changes.
  - **Cancel** - Remains in the configuration mode, without committing the configuration changes.
DETAILED STEPS

Step 1 configure

Example:

RP/0/RSP0/CPU0:router# configure terminal
Enters the Global Configuration mode.

Step 2 interface type interface-path-id

Example:

RP/0/RSP0/CPU0:router(config)# interface GigabitEthernet 0/1/0/0
Enters interface configuration mode and specifies the Ethernet interface name and notation rack/slot/module/port.

Step 3 ipv4 address ip-address mask

Example:

RP/0/RSP0/CPU0:router(config-if)# ipv4 address 172.18.189.38 255.255.255.224
Assigns an IP address and subnet mask to the interface.

- Replace ip-address with the primary IPv4 address for the interface.
- Replace mask with the mask for the associated IP subnet. The network mask can be specified in either of two ways:
  - The network mask can be a four-part dotted decimal address. For example, 255.0.0.0 indicates that each bit equal to 1 means that the corresponding address bit belongs to the network address.
  - The network mask can be indicated as a slash (/) and number. For example, /8 indicates that the first 8 bits of the mask are ones, and the corresponding bits of the address are network address.

Step 4 flow-control { bidirectional | egress | ingress }

Example:

RP/0/RSP0/CPU0:router(config-if)# flow control ingress
(Optional) Enables the sending and processing of flow control pause frames.

- egress—Enables the sending of flow control pause frames in egress.
- ingress—Enables the processing of received pause frames on ingress.
- bidirectional—Enables the sending of flow control pause frames in egress and the processing of received pause frames on ingress.

Step 5 mtu bytes
Example:

RP/0/RSP0/CPU0:router(config-if)# mtu 1448

(Optional) Sets the MTU value for the interface.

- The default is 1514 bytes for normal frames and 1518 bytes for 802.1Q tagged frames.
- The range for Gigabit Ethernet and 10-Gigabit Ethernet mtu values is 64 bytes to 65535 bytes.

Step 6  **mac-address**  value1.value2.value3

Example:

RP/0/RSP0/CPU0:router(config-if)# mac address 0001.2468.ABCD

(Optional) Sets the MAC layer address of the Management Ethernet interface.

- The values are the high, middle, and low 2 bytes, respectively, of the MAC address in hexadecimal. The range of each 2-byte value is 0 to ffff.

Step 7  **negotiation auto** (on Gigabit Ethernet interfaces only)

Example:

RP/0/RSP0/CPU0:router(config-if)# negotiation auto

(Optional) Enables autonegotiation on a Gigabit Ethernet interface.

- Autonegotiation must be explicitly enabled on both ends of the connection, or speed and duplex settings must be configured manually on both ends of the connection.
- If autonegotiation is enabled, any manually configured speed or duplex settings take precedence.

**Note**  The negotiation auto command is available on Gigabit Ethernet interfaces only.

Step 8  **no shutdown**

Example:

RP/0/RSP0/CPU0:router(config-if)# no shutdown

Removes the shutdown configuration, which forces an interface administratively down.

Step 9  Use the **commit** or **end** command.

**commit** - Saves the configuration changes and remains within the configuration session.

**end** - Prompts user to take one of these actions:

- **Yes** - Saves configuration changes and exits the configuration session.
- **No** - Exits the configuration session without committing the configuration changes.
- **Cancel** - Remains in the configuration mode, without committing the configuration changes.
Step 10  

show interfaces [ GigabitEthernet | TenGigE ] instance

Example:

RP/0/RSP0/CPU0:router #show interfaces TenGigE 0/3/0/0

(Optional) Displays statistics for interfaces on the router.

What to Do Next

• To configure an 802.1Q VLAN subinterface on the Ethernet interface, see the “The Carrier Ethernet Model” chapter later in this manual.

• To configure an AC on the Ethernet port for L2VPN implementation, see the “Configuring an Attachment Circuit on an Ethernet Port” section later in this chapter.

Configuring an Attachment Circuit on an Ethernet Port

Use this procedure to configure an attachment circuit on a Gigabit Ethernet or 10-Gigabit Ethernet port. For more information on configuring an attachment circuit, refer to the Cisco ASR 9000 Series Aggregation Services Router Interface and Hardware Component Configuration Guide.

Note

The steps in this procedure configure the L2VPN Ethernet port to operate in EFP mode.

SUMMARY STEPS

1. configure
2. interface [ GigabitEthernet | TenGigE ] instance.subinterface  l2transport
3. encapsulation dot1q vlan-id
4. interface [ GigabitEthernet | TenGigE ] instance.subinterface  l2transport
5. encapsulation dot1q vlan-id
6. l2vpn
7. bridge group  bridge-group-name
8. bridge-domain domain-name
10. interface [ GigabitEthernet | TenGigE ] instance.subinterface
11. Use the commit or end command.
12. show run interface [ GigabitEthernet | TenGigE ] instance.subinterface
DETAILED STEPS

Step 1  configure

Example:
```
RP/0/RSP0/CPU0:router# configure
```
Enters the Global Configuration mode.

Step 2  interface [GigabitEthernet | TenGigE] instance.subinterface l2transport

Example:
```
RP/0/RSP0/CPU0:router(config)# interface GigabitEthernet0/5/0/0.20 l2transport
```
Enters subinterface configuration mode and specifies the interface type, location, and subinterface number.

  * Replace the instance argument with one of these instances:
    * Physical Ethernet interface instance, or with an Ethernet bundle instance. Naming notation is rack/slot/module/port, and a slash between values is required as part of the notation.
    * Ethernet bundle instance. Range is from 1 through 65535.

  * Replace the subinterface argument with the subinterface value. Range is from 0 through 4095.

  * Naming notation is instance.subinterface, and a period between arguments is required as part of the notation.

Step 3  encapsulation dot1q vlan-id

Example:
```
RP/0/RSP0/CPU0:router(config-subif)# encapsulation dot1q 50
```
Assigns the matching VLAN ID and Ethertype to the interface.

Step 4  interface [GigabitEthernet | TenGigE] instance.subinterface l2transport

Example:
```
RP/0/RSP0/CPU0:router(config)# interface GigabitEthernet0/5/0/0.20 l2transport
```
Enters subinterface configuration mode and specifies the interface type, location, and subinterface number.

  * Replace the instance argument with one of these instances:
    * Physical Ethernet interface instance, or with an Ethernet bundle instance. Naming notation is rack/slot/module/port, and a slash between values is required as part of the notation.
    * Ethernet bundle instance. Range is from 1 through 65535.

  * Replace the subinterface argument with the subinterface value. Range is from 0 through 4095.
• Naming notation is instance.subinterface, and a period between arguments is required as part of the notation.

Step 5  encapsulation dot1q  vlan-id

Example:
RP/0/RSP0/CPU0:router(config-subif)# encapsulation dot1q 50
Assigns the matching VLAN ID and Ethertype to the interface.

Step 6  l2vpn

Example:
RP/0/RSP0/CPU0:router(config-subif)# l2vpn
Enters L2VPN configuration mode.

Step 7  bridge group  bridge-group-name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn)# bridge group ce-doc-examples
Enters configuration mode for the named bridge group. This command creates a new bridge group or modifies the existing bridge group if it already exists. A bridge group organizes bridge domains.

Step 8  bridge-domain  domain-name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bg)# bridge-domain ac-example
Enters configuration mode for the named bridge domain. This creates a new bridge domain modifies the existing bridge domain if it already exists.

Step 9  interface [GigabitEthernet | TenGigE]  instance.subinterface

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# interface GigabitEthernet0/5/0/0.20
Adds an interface to a bridge domain that allows packets to be forwarded and received from other interfaces that are part of the same bridge domain. The interface EFP now becomes an attachment circuit on this bridge domain.

Step 10  interface [GigabitEthernet | TenGigE]  instance.subinterface

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-ac)# interface GigabitEthernet0/5/0/1.15
Adds an interface to a bridge domain that allows packets to be forwarded and received from other interfaces that are part of the same bridge domain. The interface EFP now becomes an attachment circuit on this bridge domain.

Step 11  Use the commit or end command.
**commit** - Saves the configuration changes and remains within the configuration session.

**end** - Prompts user to take one of these actions:

- **Yes** - Saves configuration changes and exits the configuration session.
- **No** - Exits the configuration session without committing the configuration changes.
- **Cancel** - Remains in the configuration mode, without committing the configuration changes.

**Step 12**

`show run interface [GigabitEthernet | TenGigE] instance.subinterface`

**Example:**

```
RP/0/RSP0/CPU0:router# show run interface GigabitEthernet0/5/0/1.15
```

(Optional) Displays statistics for the subinterface on the router.

---

**Configuring Egress EFP Filtering**

This section describes the procedures for configuring the egress EFP filtering feature on the Cisco ASR 9000 Series Routers.

Egress EFP filtering is a L2 subinterface specific feature that controls how strictly subinterface encapsulation filtering is performed in the egress direction. According to the EFP behavior and model, all packets transmitted out of a subinterface should match the subinterface encapsulation or rewrite criteria if the same packet is to be received on the subinterface (with the source and destination MAC addresses swapped).

Egress EFP filtering has two stages; first stage is without rewrite command, and the second stage is with rewrite command.

In the first stage filtering, the packet is checked against the encapsulation to ensure the match, the same way it is checked on ingress to determine that the packet is forwarded to that EFP.

In the second stage filtering, the packet is checked before the egress rewrite occurs to ensure that the packet in its egress pre-rewrite state is correct. This means that the egress packet's VLAN encapsulation should be same as a hypothetical ingress packet after the ingress rewrite occurs.

In case of an interface configured with both a rewrite and egress EFP filtering, where egress traffic is getting dropped unexpectedly due to egress EFP filtering, the user must first ascertain which stage the drops occur.

**Note**

Output drops counter displays the drops occurred due to egress EFP filtering in the "show interface" display for that interface. Output drops counter is a summation of drops from multiple causes and not necessarily due to egress EFP filtering.

By using the `ethernet egress-filter` command, you can configure egress EFP filtering in either global or L2 subinterface mode:

- `ethernet egress-filter strict` configures Egress EFP Filtering in Global Configuration mode.
- `ethernet egress-filter {strict | disabled}` configures Egress EFP Filtering in L2 subinterface mode.
SUMMARY STEPS

1. configure
2. ethernet egress-filter strict
3. interface {GigabitEthernet | TenGigE | FastEthernet | Bundle-Ether} instance.subinterface
4. ethernet egress-filter {strict | disabled}
5. exit

DETAILED STEPS

Step 1 configure

Example:
RP/0/RSP0/CPU0:PE44_ASR-9010# config Thu Jun 4 07:50:02.660 PST
RP/0/RSP0/CPU0:PE44_ASR-9010(config)#

Enters Global Configuration mode.

Step 2 ethernet egress-filter strict

Example:
RP/0/RSP0/CPU0:PE44_ASR-9010(config)# ethernet egress-filter strict

Enables strict egress filtering on all subinterfaces on the device by default.

Step 3 interface {GigabitEthernet | TenGigE | FastEthernet | Bundle-Ether} instance.subinterface

Example:
RP/0/RSP0/CPU0:PE44_ASR-9010(config)# interface GigabitEthernet 0/1/0/1.1
RP/0/RSP0/CPU0:PE44_ASR-9010(config-subif)#

Creates an L2 subinterface.

Step 4 ethernet egress-filter {strict | disabled}

Example:
RP/0/RSP0/CPU0:PE44_ASR-9010(config-subif)# ethernet egress-filter strict

Allows egress filtering to be explicitly enabled or disabled on any L2 subinterface. It can also be used to override global settings.

Step 5 exit

Example:
RP/0/RSP0/CPU0:PE44_ASR-9010(config-subif)# exit
RP/0/RSP0/CPU0:PE44_ASR-9010(config)# exit

Exit from the configuration mode.
Configuring 802.1Q VLAN Interfaces

Configuring 802.1Q VLAN Subinterfaces

This task explains how to configure 802.1Q VLAN subinterfaces. To remove these subinterfaces, see the “Removing an 802.1Q VLAN Subinterface” section of this chapter.

SUMMARY STEPS

1. configure
2. interface {GigabitEthernet | TenGigE | Bundle-Ether} instance.subinterface
3. l2transport
4. encapsulation dot1q vlan-id
5. Use the commit or end command.
6. show ethernet trunk bundle-ether instance

DETAILED STEPS

Step 1 configure

Example:
RP/0/RSP0/CPU0:router# configure

Enters the Global Configuration mode.

Step 2 interface {GigabitEthernet | TenGigE | Bundle-Ether} instance.subinterface

Example:
RP/0/RSP0/CPU0:router(config)# interface TenGigE 0/2/0/4.10

Enters subinterface configuration mode and specifies the interface type, location, and subinterface number.

- Replace the instance argument with one of these instances:
  - Physical Ethernet interface instance, or with an Ethernet bundle instance. Naming notation is rack/slot/module/port, and a slash between values is required as part of the notation.
  - Ethernet bundle instance. Range is from 1 through 65535.

- Replace the subinterface argument with the subinterface value. Range is from 0 through 4095.
- Naming notation is instance.subinterface, and a period between arguments is required as part of the notation.

Step 3 l2transport
Example:

RP/0/RSP0/CPU0:router(config-subif)# l2transport

Enables Layer 2 transport mode on a port and enter Layer 2 transport configuration mode.

Step 4  encapsulation dot1q vlan-id

Example:

RP/0/RSP0/CPU0:router(config-subif-l2)# encapsulation dot1q 100

Assigns a VLAN Attachment Circuit to the subinterface.

- Replace the vlan-id argument with a subinterface identifier. Range is from 1 to 4094 inclusive (0 and 4095 are reserved). To configure a basic Dot1Q Attachment Circuit, use this syntax:
  \n  encapsulation dot1q vlan-id

- To configure a QinQ Attachment Circuit, use this syntax:
  \n  encapsulation dot1q vlan-id second-dot1q vlan-id

  Note  Following are the varieties of encapsulation commands:

  - encapsulation dot1q 100
  - encapsulation dot1q 100 second-dot1q 101
  - encapsulation dot1ad 200 dot1q 201

Step 5  Use the commit or end command.

commit - Saves the configuration changes and remains within the configuration session.

end - Prompts user to take one of these actions:

  - Yes - Saves configuration changes and exits the configuration session.
  - No - Exits the configuration session without committing the configuration changes.
  - Cancel - Remains in the configuration mode, without committing the configuration changes.

Step 6  show ethernet trunk bundle-ether instance

Example:

RP/0/RSP0/CPU0:router# show ethernet trunk bundle-ether 5

(Optional) Displays the interface configuration.

The Ethernet bundle instance range is from 1 through 65535.
Configuring Native VLAN

This task explains how to configure a native VLAN on an interface.

SUMMARY STEPS

1. configure
2. interface [GigabitEthernet | TenGigE | Bundle-Ether] instance.subinterface l2transport
3. encapsulation [dot1q vlan-id, untagged]
4. Use the commit or end command.

DETAILED STEPS

Step 1 configure

Example:
RP/0/RSP0/CPU0# configure
Enters Global Configuration mode.

Step 2 interface [GigabitEthernet | TenGigE | Bundle-Ether] instance.subinterface l2transport

Example:
RP/0/RSP0/CPU0# interface GigabitEthernet 0/2/0/4.2 l2transport
Enters subinterface configuration mode and specifies the interface type, location, and subinterface number.

- Replace the instance argument with one of these instances:
  * Physical Ethernet interface instance, or with an Ethernet bundle instance. Naming notation is rack/slot/module/port, and a slash between values is required as part of the notation.
  * Ethernet bundle instance. Range is from 1 through 65535.

- Replace the subinterface argument with the subinterface value. Range is from 0 through 4095.

- Naming notation is instance.subinterface, and a period between arguments is required as part of the notation.

Note You must include the l2transport keyword in the command string; otherwise, the configuration creates a Layer 3 subinterface rather than an Attachment Circuit.

Step 3 encapsulation [dot1q vlan-id, untagged]

Example:
RP/0/RSP0/CPU0# interface GigabitEthernet 0/2/0/4.2 l2transport
Enters subinterface configuration mode and specifies the interface type, location, and subinterface number.

- The vlan-id argument is the ID of the subinterface.
- Range is from 1 through 4094 inclusive (0 and 4095 are reserved).
It is possible to receive both dot1q 400 and untagged frames by issuing the `encapsulation` command with the `untagged` keyword.

**Step 4**

Use the `commit` or `end` command.

- **commit** - Saves the configuration changes and remains within the configuration session.
- **end** - Prompts user to take one of these actions:
  - **Yes** - Saves configuration changes and exits the configuration session.
  - **No** - Exits the configuration session without committing the configuration changes.
  - **Cancel** - Remains in the configuration mode, without committing the configuration changes.

---

**Removing an 802.1Q VLAN Subinterface**

This task explains how to remove 802.1Q VLAN subinterfaces that have been previously configured using the “Configuring 802.1Q VLAN Subinterfaces” task in this chapter.

**SUMMARY STEPS**

1. `configure`
2. `no interface {GigabitEthernet | TenGigE | Bundle-Ether} instance.subinterface`
3. Repeat Step 2 to remove other VLAN subinterfaces.
4. Use the `commit` or `end` command.
5. `show ethernet trunk bundle-ether instance`

**DETAILED STEPS**

**Step 1**

`configure`

**Example:**

```
RP/0/RSP0/CPU0:router# configure
```

Enters the Global Configuration mode.

**Step 2**

`no interface {GigabitEthernet | TenGigE | Bundle-Ether} instance.subinterface`

**Example:**

```
RP/0/RSP0/CPU0:router(config)# no interface TenGigE 0/2/0/4.10
```

Removes the subinterface, which also automatically deletes all the configuration applied to the subinterface.

- Replace the `instance` argument with one of these instances:
  - Physical Ethernet interface instance, or with an Ethernet bundle instance. Naming notation is `rack/slot/module/port`, and a slash between values is required as part of the notation.
  - Ethernet bundle instance. Range is from 1 through 65535.
• Replace the `subinterface` argument with the subinterface value. Range is from 0 through 4095.

Naming notation is `instance.subinterface`, and a period between arguments is required as part of the notation.

**Step 3**
Repeat Step 2 to remove other VLAN subinterfaces.

**Step 4**
Use the `commit` or `end` command.

- **commit** - Saves the configuration changes and remains within the configuration session.
- **end** - Prompts user to take one of these actions:
  - **Yes** - Saves configuration changes and exits the configuration session.
  - **No** - Exits the configuration session without committing the configuration changes.
  - **Cancel** - Remains in the configuration mode, without committing the configuration changes.

**Step 5**

`show ethernet trunk bundle-ether instance`

**Example:**
RP/0/RSP0/CPU0:router# show ethernet trunk bundle-ether 5

(Optional) Displays the interface configuration.

The Ethernet bundle instance range is from 1 through 65535.

---

**Configuration Examples**

**Configuring an Ethernet Interface: Example**

This example shows how to configure an interface for a 10-Gigabit Ethernet modular services card:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# interface TenGigE 0/0/0/1
RP/0/RSP0/CPU0:router(config-if)# l2transport
RP/0/RSP0/CPU0:router(config-if)# mtu 1448
RP/0/RSP0/CPU0:router(config-if)# no shutdown
RP/0/RSP0/CPU0:router(config-if)# end
Uncommitted changes found, commit them? [yes]: yes

RP/0/RSP0/CPU0:router# show interfaces TenGigE 0/0/0/1
TenGigE0/0/0/1 is down, line protocol is down
  Hardware is TenGigE, address is 0001.2468.abcd (bia 0001.81a1.6b23)
  Internet address is 172.18.189.38/27
  MTU 1448 bytes, BW 10000000 Kbit
  reliability 0/255, txload Unknown, rxload Unknown
  Encapsulation ARPA,
  Full-duplex, 10000Mb/s, LR
  output flow control is on, input flow control is on
  loopback not set
  ARP type ARPA, ARP timeout 01:00:00
  Last clearing of "show interface" counters never
  5 minute input rate 0 bits/sec, 0 packets/sec
  5 minute output rate 0 bits/sec, 0 packets/sec
  0 packets input, 0 bytes, 0 total input drops
```
0 drops for unrecognized upper-level protocol
Received 0 broadcast packets, 0 multicast packets
0 runts, 0 giants, 0 throttles, 0 parity
0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored, 0 abort
0 packets output, 0 bytes, 0 total output drops
Output 0 broadcast packets, 0 multicast packets
0 output errors, 0 underruns, 0 applique, 0 resets
0 output buffer failures, 0 output buffers swapped out
0 carrier transitions

Configuring a L2VPN AC: Example

This example indicates how to configure a L2VPN AC on an Ethernet interface:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# interface gigabitethernet 0/5/0/0.2 l2transport
RP/0/RSP0/CPU0:router(config-subif)# encapsulation dot1q 100
RP/0/RSP0/CPU0:router(config-subif)# ethernet egress-filter strict
RP/0/RSP0/CPU0:router(config-subif)# l2vpn
RP/0/RSP0/CPU0:router(config-l2vpn)# clear

RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# interface gigabitethernet 0/5/0/0.2 l2transport
RP/0/RSP0/CPU0:router(config-subif)# encapsulation dot1q 100
RP/0/RSP0/CPU0:router(config-subif)# ethernet egress-filter strict
RP/0/RSP0/CPU0:router(config-subif)# interface gigabitethernet 0/5/0.1.100 l2transport
RP/0/RSP0/CPU0:router(config-subif)# encapsulation dot1q 100
RP/0/RSP0/CPU0:router(config-subif)# ethernet egress-filter strict
RP/0/RSP0/CPU0:router(config-subif)# l2vpn
RP/0/RSP0/CPU0:router(config-l2vpn)# bridge group example
RP/0/RSP0/CPU0:router(config-l2vpn)# bridge-domain mybridge
RP/0/RSP0/CPU0:router(config-l2vpn-bd-ac)# interface gigabitethernet 0/5/0/0.2
RP/0/RSP0/CPU0:router(config-l2vpn-bd-ac)# interface gigabitethernet 0/5/0/1.100
RP/0/RSP0/CPU0:router(config-l2vpn-bd-ac)# exit
RP/0/RSP0/CPU0:router(config-l2vpn-bd-bd)# exit
RP/0/RSP0/CPU0:router(config-l2vpn-bd-bd)# exit
RP/0/RSP0/CPU0:router(config-l2vpn)# exit
RP/0/RSP0/CPU0:router(config)# show

```
Configuring Ethernet Bundle with L2 and L3 Services: Example

This example shows how to configure an Ethernet bundle interface with L3 services:

configure
interface Bundle-Ether 100
ipv4 address 12.12.12.2 255.255.255.0
!

This example shows how to configure an Ethernet bundle subinterface with L3 services:

configure
interface Bundle-Ether 100.1
ipv4 address 13.13.13.2 255.255.255.0
!

This example shows how to configure an Ethernet bundle interface with L2 services:

configure
interface Bundle-Ether 101
l2transport
!

This example shows how to configure an Ethernet bundle interface with L2 services:

configure
interface Bundle-Ether1.1 l2transport
!

Configuring VLAN Subinterfaces: Example

This example shows how to create VLAN subinterfaces:

RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# interface TenGigE 0/2/0/4.1 l2transport
RP/0/RSP0/CPU0:router(config-subif)# encapsulation dot1q 20
RP/0/RSP0/CPU0:router(config-subif)# interface TenGigE0/2/0/4.2 l2transport
RP/0/RSP0/CPU0:router(config-subif)# encapsulation dot1q 30
RP/0/RSP0/CPU0:router(config-subif)# interface TenGigE0/2/0/4.3 l2transport
RP/0/RSP0/CPU0:router(config-subif)# encapsulation dot1q 40
RP/0/RSP0/CPU0:router(config-subif)# commit
RP/0/RSP0/CPU0:router(config-subif)# exit
RP/0/RSP0/CPU0:router(config)# exit

This example shows how to create two VLAN subinterfaces on an Ethernet bundle at one time:

RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# interface Bundle-Ether 1 l2transport
RP/0/RSP0/CPU0:router(config-if-l2)# exit
RP/0/RSP0/CPU0:router(config)# interface Bundle-Ether 1.1 l2transport
RP/0/RSP0/CPU0:router(config-subif-l2)# encapsulation dot1q 10
RP/0/RSP0/CPU0:router(config-subif-l2)# exit
RP/0/RSP0/CPU0:router(config)# interface Bundle-Ether 1.2 l2transport
RP/0/RSP0/CPU0:router(config-subif-l2)# encapsulation dot1q 20
RP/0/RSP0/CPU0:router(config-subif-l2)# exit
RP/0/RSP0/CPU0:router(config)# exit

This example shows how to create a basic Dot1Q Attachment Circuit:

RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# interface TenGigE 0/2/0/4.1 l2transport
RP/0/RSP0/CPU0:router(config-subif)# encapsulation dot1q 20
RP/0/RSP0/CPU0:router(config-subif)# commit
RP/0/RSP0/CPU0:router(config-subif)# exit
RP/0/RSP0/CPU0:router(config)# exit
This example shows how to create a QinQ Attachment Circuit:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# interface TenGigE 0/2/0/4.2 l2transport
RP/0/RSP0/CPU0:router(config-subif)# encapsulation dot1q 20 second-dot1q 10
RP/0/RSP0/CPU0:router(config-subif)# commit
RP/0/RSP0/CPU0:router(config-subif)# exit
RP/0/RSP0/CPU0:router(config)# exit
```

This example shows how to create a Q-in-Any Attachment Circuit:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# interface TenGigE 0/2/0/4.3 l2transport
RP/0/RSP0/CPU0:router(config-subif)# encapsulation dot1q 30 second-dot1q any
RP/0/RSP0/CPU0:router(config-subif)# commit
RP/0/RSP0/CPU0:router(config-subif)# exit
RP/0/RSP0/CPU0:router(config)# exit
```

Where to Go Next

When you have configured an Ethernet interface, you can configure individual VLAN subinterfaces on that Ethernet interface. For information about configuring VLAN subinterfaces, see the The Carrier Ethernet Model chapter later in this document.

For information about IPv6, see the Cisco ASR 9000 Series Aggregation Services Router IP Addresses and Services Configuration Guide.
CHAPTER 3

Ethernet Features

This chapter describes how to configure Layer 2 (L2) Ethernet features on the Cisco ASR 9000 Series Aggregation Services Routers supporting Cisco IOS XR software.

For more information on configuring Ethernet interfaces, refer to The Carrier Ethernet Model module of this configuration guide.

Feature History for Configuring Ethernet Interfaces on the Cisco ASR 9000 Series Routers

- How to Implement Ethernet Features, page 46
- Configuration Examples, page 50

Prerequisites for Implementing Ethernet Features

You must be in a user group associated with a task group that includes the proper task IDs. The command reference guides include the task IDs required for each command.

If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Information About Implementing Ethernet Features

To configure 10-Gigabit Ethernet interfaces, you must understand these concepts:
Policy Based Forwarding

The Cisco ASR 9000 Series Routers allow a single MAC address to be mapped to a VLAN that is different from the port's configured VLAN. To separate the traffic entering two different EFPs, you must define an EFP using the source VLAN tag and the source MAC address.

Note
This feature is supported only in the ASR 9000 Ethernet Line Card.

Layer 2 Protocol Tunneling

Layer 2 Protocol Tunneling (L2PT) is a Cisco proprietary protocol for tunneling Ethernet protocol frames across Layer 2 (L2) switching domains.

When an L2 protocol frame enters the interface of an L2 switching device, the switch or router performs one of these actions on the frame:

- forward—the frame is switched or routed with no exceptional handling.
- drop—the frame is discarded on the router.
- terminate—the router recognizes that the frame is an L2 protocol frame, and therefore sends it to the router's control plane for protocol processing.
- tunnel—the router encapsulates the frame to hide its identity as a protocol frame. This prevents the frame from being terminated on other routers. The opposite end of the tunnel performs a decapsulation, returning the frame to its original state.

L2PT Features

The Cisco ASR 9000 Series Routers offer these functions:

- Tunnels these protocols:
  - Cisco Discovery Protocol (CDP)
  - Spanning Tree Protocol (STP and its derivatives)
  - Virtual Trunking Protocol (VTP)
- Supports these modes of tunneling
  - Forward
  - Reverse
- L2PT encapsulates and decapsulates protocol frames that have VLAN headers.
- Supports capability of handling enormous frame rates. The Cisco ASR 9000 Series Routers perform L2PT encapsulation and decapsulation at the interface line rates.
There are no dedicated L2PT counters. There are no L2PT-specific adjustments for QoS or other miscellaneous parameters.

**L2PT in the Forward Mode**

Figure below shows L2PT configured in the forward mode.

---

**Figure 4: L2PT in forward mode**

---

A Service Provider network (S-network) is depicted in Figure 1. The customer network (C-network) connects to router R1 at the GigabitEthernet subinterface 0/1/0/1.1, and to router R2 at the GigabitEthernet subinterface 0/5/0/2.1. The C-network is not shown in the diagram; however, the C-network sends L2 traffic through the S-network, and the S-network switches the traffic from end to end. The customer traffic also carries L2 protocol frames. The purpose of L2PT is to allow these protocol frames to pass through the S-network. In forward mode, L2PT is applied to the customer facing interfaces of the S-network, R1 GigabitEthernet 0/1/0/1.1 and R2 GigabitEthernet 0/5/0/2.1.

Figure above depicts the configuration for L2PT in forward mode: :

R1:

```
! interface GigabitEthernet0/1/0/1
  negotiation auto
! interface GigabitEthernet0/1/0/1.1 l2transport
  encapsulation default
  l2protocol cpsv tunnel
! interface GigabitEthernet0/1/0/2
  negotiation auto
! interface GigabitEthernet0/1/0/2.1 l2transport
  encapsulation default
! l2vpn
  xconnect group examples
    p2p r1-connect
      interface GigabitEthernet0/1/0/1.1
      interface GigabitEthernet0/1/0/2.1
    !
! R2:

! interface GigabitEthernet0/5/0/1
  negotiation auto
```
L2PT in the Reverse Mode with Protocol Frame Tagging

The Cisco ASR 9000 Series Routers can perform L2PT encapsulation and decapsulation on supported L2 protocol frames that have VLAN headers. The L2 protocol frames do not have VLAN headers. However, in a service provider (SP) network that transports customer protocol traffic from one customer campus to another, this capability can be put to use within the SP network.

Figure below shows L2PT configured in the reverse mode. Assume that the customer traffic that enters R1 is trunked, that is all traffic is tagged. The only untagged traffic is the protocol traffic, that comes from the customer network.

**Figure 5: L2PT in reverse mode**

When L2PT is configured in the reverse mode, the L2PT encapsulation occurs when the frame exits the interface. Likewise, in reverse mode decapsulation is performed when the frame enters the interface. Therefore,
the L2PT tunnel is formed between the service provider-facing interfaces, instead of the customer-facing
interfaces.

In this example, once the protocol traffic enters router R1, a VLAN tag is added to it. Before the traffic is sent
through the service provider network, a second VLAN tag is added (100). The Cisco ASR 9000 Series Routers
perform the L2PT encapsulation on a double-tagged protocol frame.

The above figure above shows four customer-facing interfaces (R1: GigabitEthernet subinterface 0/1/0.1.1,
GigabitEthernet subinterface 0/1/0/2.1 and R2: GigabitEthernet subinterface 0/5/0/5.1, GigabitEthernet
subinterface 0/5/0/6.1) and two service provider-facing interfaces (R1: GigabitEthernet subinterface 0/1/0/3.1
and R2: GigabitEthernet subinterface 0/5/0/4.1).

Figure above depicts the configuration for L2PT in reverse mode:

At R1:

```
! interface GigabitEthernet0/1/0/1
  negotiation auto
!
interface GigabitEthernet0/1/0/1.1 l2transport
  encapsulation untagged
  rewrite ingress tag push dot1q 100 symmetric
  ethernet egress-filter strict
!
interface GigabitEthernet0/1/0/2
  negotiation auto
!
interface GigabitEthernet0/1/0/2.1 l2transport
  encapsulation untagged
  rewrite ingress tag push dot1q 200 symmetric
  ethernet egress-filter strict
!
interface GigabitEthernet0/1/0/3
  negotiation auto
!
interface GigabitEthernet0/1/0/3.1 l2transport
  encapsulation dot1q 500
  rewrite ingress tag pop 1 symmetric
  l2protocol cpsv reverse-tunnel
  ethernet egress-filter strict
!
l2vpn
  bridge group examples
  bridge-domain r1-bridge
  interface GigabitEthernet0/1/0/1.1
    !
  interface GigabitEthernet0/1/0/2.1
    !
  interface GigabitEthernet0/1/0/3.1
    !
  !
  !
  !
```

At R2:

```
!
interface GigabitEthernet0/5/0/4
  negotiation auto
!
interface GigabitEthernet0/5/0/4.1 l2transport
  encapsulation dot1q 500
  rewrite ingress tag pop 1 symmetric
  l2protocol cpsv reverse-tunnel
  ethernet egress-filter strict
!
interface GigabitEthernet0/5/0/5
  negotiation auto
!
```
These assumptions are made:

- Customer traffic entering router R1 is trunked, that is all traffic is tagged. The only untagged traffic is the protocol traffic, which arrives from the customer network.

- The Customer-facing interfaces GigabitEthernet 0/1/0/1 at router R1 and GigabitEthernet 0/5/0/5 at router R2 belong to the same customer. Customer-facing interfaces GigabitEthernet 0/1/0/2 at router R1 and GigabitEthernet 0/5/0/6 at router R2 belong to a different customer.

- Traffic from different customers remain segregated.

- Only L2 protocol traffic is sent through the customer-facing interfaces.

- L2 protocol traffic entering the customer-facing interfaces is untagged.

- Traffic must be L2PT encapsulated to successfully pass through the switch cloud.

The purpose of this topology is that router R1 and R2 must receive customer protocol traffic from multiple customer interfaces, and multiplex the traffic across a single service provider interface and link. At the decapsulation end, the reverse is performed. Traffic entering router R1 on the GigabitEthernet subinterface 0/1/0/1.1 exits router R2 from the GigabitEthernet subinterface 0/5/0/5.1 only while traffic entering router R1 at GigabitEthernet subinterface 0/1/0/2.1 exits router R2 from GigabitEthernet subinterface 0/5/0/6.1 only.

A protocol frame entering router R1 on GigabitEthernet interface 0/1/0/1 travels through the network in this manner:

- The protocol frame is directed to GigabitEthernet subinterface 0/1/0/1.1, as the frame is untagged.

- The rewrite statement with GigabitEthernet subinterface 0/1/0/1.1 causes a tag of ID 100 to be added to the frame.

- The frame enters router R1’s bridge domain r1-bridge.

- The bridge (r1-bridge) floods the frame to all attachment circuits (AC) on the bridge domain, except the originating AC (split horizon AC).
• Ethernet egress filtering on GigabitEthernet subinterface 0/1/0/2.1 detects a tag ID mismatch, and drops the frame. In this way, the bridge domain’s flooded traffic is prevented from exiting other customer interfaces.

• A flooded copy of the frame is sent to GigabitEthernet subinterface 0/1/0/3.1.

• GigabitEthernet subinterface 0/1/0/3.1 adds a second tag.

• The frame receives an L2PT encapsulation by GigabitEthernet subinterface 0/1/0/3.1 before it leaves router R1 through the GigabitEthernet interface 0/1/0/3.

Note: The frame is now double-tagged (100 inner, 500 outer) and has the L2PT MAC DA.

• The frame passes to router R2 GigabitEthernet interface 0/5/0/4 because of the L2PT encapsulation.

• The frame after having entered router R2 on GigabitEthernet interface 0/5/0/4 is directed to GigabitEthernet subinterface 0/5/0/4.1.

• On entering GigabitEthernet subinterface 0/5/0/4.1, an L2PT decapsulation operation is performed on the frame.

• The outer tag ID 500 is removed by GigabitEthernet subinterface 0/5/0/4.1

• Router R2’s bridge (r2-bridge) floods the frames to all ACs.

• Ethernet egress filtering drops the frames on all ACs except the AC through which the frame exits.

• As the frame exits router R2 from GigabitEthernet subinterface 0/5/0/5.1, the tag of ID 100 is removed.

• The frame that exits router R2 from GigabitEthernet interface 0/5/0/5 is identical to the original frame that entered router R1 through GigabitEthernet interface 0/1/0/1.

L2PT Configuration Notes

Keep these points in mind while configuring L2PT:

• The l2protocol command can be configured on either a main or L2 subinterface.

• The l2protocol command can be configured on physical or bundle interfaces.

• When the l2protocol and ethernet filtering commands are configured on the same interface, L2PT encapsulation occurs before ethernet filtering. This means that L2PT prevents the CDP, STP, and VTP protocol frames from being dropped by ethernet filtering.

• When L2PT is configured with other interface features, L2PT encapsulation occurs before the processing for other interface features.

• L2PT encapsulation and decapsulation is supported for untagged protocol frames, single-tagged, and double-tagged frames. Tag Ethertypes of 0x8100, 0x88A8, and 0x9100 are supported, however, 0x9200 is not.
How to Implement Ethernet Features

Note

For information on configuring Ethernet interfaces, refer to the Cisco ASR 9000 Series Aggregation Services Router Interface and Hardware Component Configuration Guide.

Configuring Policy Based Forwarding

Enabling Policy Based Forwarding

Perform this task to enable policy based forwarding.

SUMMARY STEPS

1. configure
2. interface type interface-path-id.subinterface l2transport
3. Do one of the following:
   • encapsulation dot1q vlan-id ingress source-mac mac-address or
   • encapsulation dot1ad vlan-id ingress source-mac mac-address or
   • encapsulation untagged ingress source-mac mac-address or
   • encapsulation dot1q vlan-id second-dot1q vlan-id ingress source-mac mac-address
4. Do one of the following:
   • rewrite ingress tag translate 1-to-1 dot1q vlan-id symmetric or
   • rewrite tag push dot1q vlan-id symmetric
5. ethernet egress-filter strict
6. Use the commit or end command.

DETAILED STEPS

Step 1 configure

Example:
RP/0/RSP0/CPU0:router# configure

Enters Global Configuration mode.

Step 2 interface type interface-path-id.subinterface l2transport
Example:
RP/0/RSP0/CPU0:router# interface GigabitEthernet 0/2/0/4.10 l2transport

Enters subinterface configuration mode and enables Layer 2 transport mode on a port and enters Layer 2 transport
configuration mode.

Step 3  Do one of the following:
  • encapsulation dot1q vlan-id ingress source-mac mac-address or
  • encapsulation dot1ad vlan-id ingress source-mac mac-address or
  • encapsulation untagged ingress source-mac mac-address or
  • encapsulation dot1q vlan-id second-dot1q vlan-id ingress source-mac mac-address

Example:
RP/0/RSP0/CPU0:router(config-subif)#
encapsulation dot1q 10 ingress source-mac 0.1.2
or
encapsulation dot1ad 10 ingress source-mac 0.1.4
or
encapsulation untagged ingress source-mac 0.1.3
or
encapsulation dot1q 10 dot1q 10 ingress source-mac 0.1.2
or
encapsulation dot1q 10 second-dot1q 20 ingress source-mac 0.1.2

Assigns the matching VLAN ID and Ethertype to the interface.

Step 4  Do one of the following:
  • rewrite ingress tag translate 1-to-1 dot1q vlan-id symmetric or
  • rewrite tag push dot1q vlan-id symmetric

Example:
RP/0/RSP0/CPU0:router(config-subif)# rewrite ingress tag translate 1-to-1 dot1q 100 symmetric
or
rewrite ingress tag push dot1q 101 symmetric

Specifies the encapsulation adjustment that is to be performed on the frame ingress to the service instance.

Step 5  ethernet egress-filter strict

Example:
RP/0/RSP0/CPU0:router(config-subif)# ethernet egress-filter strict

Enables strict egress filtering on all subinterfaces.

Step 6  Use the commit or end command.
commit - Saves the configuration changes and remains within the configuration session.
end - Prompts user to take one of these actions:
• Yes - Saves configuration changes and exits the configuration session.
• No - Exits the configuration session without committing the configuration changes.
• Cancel - Remains in the configuration mode, without committing the configuration changes.

Configuring Source Bypass Filter

Perform this task to add a source bypass filter.

SUMMARY STEPS

1. configure
2. interface type interface-path-id.subinterface l2transport
3. Do one of the following:
   • encapsulation dot1q vlan-id or
   • encapsulation dot1ad vlan-id or
   • encapsulation untagged or
   • encapsulation dot1ad vlan-id dot1q vlan-id or
   • encapsulation dot1q vlan-id second-dot1q vlan-id or
4. rewrite ingress tag translate translate 1-to-1 dot1q vlan-id symmetric
5. ethernet egress-filter disable
6. ethernet source bypass egress-filter
7. Use the commit or end command.

DETAILED STEPS

Step 1 configure

Example:
RP/0/RSP0/CPU0:router# configure

Enters Global Configuration mode.

Step 2 interface type interface-path-id.subinterface l2transport

Example:
RP/0/RSP0/CPU0:router(config)# interface GigabitEthernet 0/2/0/4.1 l2transport

Enters subinterface configuration mode and enables Layer 2 transport mode on a port and enters Layer 2 transport configuration mode.
Step 3  
Do one of the following:
  • encapsulation dot1q vlan-id or
  • encapsulation dot1ad vlan-id or
  • encapsulation untagged or
  • encapsulation dot1ad vlan-id dot1q vlan-id or
  • encapsulation dot1q vlan-id second-dot1q vlan-id or

Example:
RP/0/RSP0/CPU0:router(config-subif)# encapsulation dot1q 10 or
RP/0/RSP0/CPU0:router(config-subif)# encapsulation dot1ad 10 or
RP/0/RSP0/CPU0:router(config-subif)# encapsulation untagged or
RP/0/RSP0/CPU0:router(config-subif)# encapsulation dot1ad 10 dot1q 10 or
RP/0/RSP0/CPU0:router(config-subif)# encapsulation dot1q 10 second-dot1q 20

Assigns the matching VLAN ID and Ethertype to the interface.

Step 4  
rewrite ingress tag translate translate 1-to-1 dot1q vlan-id symmetric

Example:
RP/0/RSP0/CPU0:router(config-subif)# rewrite ingress tag translate 1-to-1 dot1q 100 symmetric

Specifies the encapsulation adjustment that is to be performed on the frame ingress to the service instance.

Step 5  
ethernet egress-filter disable

Example:
RP/0/RSP0/CPU0:router(config-subif)# ethernet egress-filter strict

Disables egress filtering on all subinterfaces.

Step 6  
ethernet source bypass egress-filter

Example:
RP/0/RSP0/CPU0:router(config-subif)# ethernet source bypass egress-filter

Enables source bypass egress filtering on the subinterfaces.

Step 7  
Use the commit or end command.
commit - Saves the configuration changes and remains within the configuration session.
end - Prompts user to take one of these actions:
  • Yes - Saves configuration changes and exits the configuration session.
  • No - Exits the configuration session without committing the configuration changes.
Configuration Examples

Configuring Policy Based Forwarding: Example

This example shows how to configure policy based forwarding:

```
config
  interface GigabitEthernet0/0/0/2.3 l2transport
  encapsulation dot1q 10 ingress source-mac 0000.1111.2222
  rewrite ingress tag translate 1-to-1 dot1q 100 symmetric
  ethernet egress-filter strict
!
  interface GigabitEthernet0/0/0/2.4 l2transport
  encapsulation untagged ingress source-mac 0000.1111.3333
  rewrite ingress tag push dot1q 101 symmetric
  ethernet egress-filter strict
!
  interface GigabitEthernet0/0/0/0/3.1 l2transport
  encapsulation dot1q 1
  rewrite ingress tag translate 1-to-1 dot1q 4094 symmetric
  ethernet egress-filter disabled
  ethernet source-bypass-egress-filter
!
```

Configuring Layer 2 Protocol Tunneling: Example

This section includes configuration examples for L2PT in the forward and reverse modes.

Configuring L2PT in forward mode

This example shows how to configure L2PT in the forward mode:

At the customer facing router (encapsulation end):

```
!
  interface GigabitEthernet0/1/0/1
  negotiation auto
!
  interface GigabitEthernet0/1/0/1.1 l2transport
  encapsulation default
  l2protocol cpsv tunnel
!
  interface GigabitEthernet0/1/0/2
  negotiation auto
!
  interface GigabitEthernet0/1/0/2.1 l2transport
  encapsulation default
  l2vpn
  xconnect group examples
    p2p r1-connect
    interface GigabitEthernet0/1/0/1.1
```
At the customer facing router (decapsulation end):

```conf
interface GigabitEthernet0/5/0/1
    negotiation auto
    interface GigabitEthernet0/5/0/1.1 l2transport
    encapsulation default
    interface GigabitEthernet0/5/0/2
    negotiation auto
    interface GigabitEthernet0/5/0/2.1 l2transport
    encapsulation default
    l2protocol cpsv tunnel
```

```conf
l2vpn
  xconnect group examples
  p2p r2-connect
    interface GigabitEthernet0/5/0/1.1
    interface GigabitEthernet0/5/0/2.1
```

---

**Configuring L2PT in reverse mode**

This example shows how to configure L2PT in the reverse mode:

At the customer facing router (encapsulation end):

```conf
interface GigabitEthernet0/1/0/1
    negotiation auto
    interface GigabitEthernet0/1/0/1.1 l2transport
    encapsulation untagged
    rewrite ingress tag push dot1q 100 symmetric
    ethernet egress-filter strict
    interface GigabitEthernet0/1/0/2
    negotiation auto
    interface GigabitEthernet0/1/0/2.1 l2transport
    encapsulation untagged
    rewrite ingress tag push dot1q 200 symmetric
    ethernet egress-filter strict
    interface GigabitEthernet0/1/0/3
    negotiation auto
    interface GigabitEthernet0/1/0/3.1 l2transport
    encapsulation dot1q 500
    rewrite ingress tag pop 1 symmetric
    l2protocol cpsv reverse-tunnel
    ethernet egress-filter strict
```

```conf
l2vpn
  bridge group examples
  bridge-domain r1-bridge
    interface GigabitEthernet0/1/0/1.1
    interface GigabitEthernet0/1/0/2.1
    interface GigabitEthernet0/1/0/3.1
```
At the customer facing router (decapsulation end):

```conf
! interface GigabitEthernet0/5/0/4
   negotiation auto
   interface GigabitEthernet0/5/0/4.1 l2transport
   encapsulation dot1q 500
   rewrite ingress tag pop 1 symmetric
   l2protocol cpsv reverse-tunnel
   ethernet egress-filter strict
!
interface GigabitEthernet0/5/0/5
   negotiation auto
   interface GigabitEthernet0/5/0/5.1 l2transport
   encapsulation untagged
   rewrite ingress tag push dot1q 100 symmetric
   ethernet egress-filter strict
!
interface GigabitEthernet0/5/0/6
   negotiation auto
   interface GigabitEthernet0/5/0/6.1 l2transport
   encapsulation untagged
   rewrite ingress tag push dot1q 200 symmetric
   ethernet egress-filter strict
!
l2vpn
   bridge group examples
   bridge-domain r2-bridge
   interface GigabitEthernet0/5/0/4.1
!
interface GigabitEthernet0/5/0/5.1
!
interface GigabitEthernet0/5/0/6.1
!
!```
Configuring Link Bundles

A bundle is a group of one or more ports that are aggregated together and treated as a single link. The different links within a single bundle can have varying speeds, where the fastest link can be a maximum of four times greater than the slowest link. Each bundle has a single MAC, a single IP address, and a single configuration set (such as ACLs or QoS).

The router supports bundling for these types of interfaces:

- Ethernet interfaces
- VLAN subinterfaces

Bundles do not have a one-to-one modular services card association.

### Feature History for Configuring Link Bundles

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This feature was introduced on the Cisco ASR 9000 Series Routers.</td>
</tr>
</tbody>
</table>
Prerequisites for Configuring Link Bundles

Before configuring Link Bundling, be sure that these tasks and conditions are met:

- You must be in a user group associated with a task group that includes the proper task IDs. The command reference guides include the task IDs required for each command.

  If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

- You know the interface IP address.

- You know which links should be included in the bundle you are configuring.

- If you are configuring an Ethernet link bundle, you have at least one of these Ethernet line cards installed in the router:
  - 2-port 10-Gigabit Ethernet line card
  - 4-port 10-Gigabit Ethernet line card
  - 8-port 10-Gigabit Ethernet line card
  - 16-port 10-Gigabit Ethernet line card
  - 20-port Gigabit Ethernet line card
  - 40-port Gigabit Ethernet line card

For more information about physical interfaces, PLIMs, and modular services cards, refer to the Cisco ASR 9000 Series Aggregation Services Router Hardware Installation Guide.

Information About Configuring Link Bundles

To implement the Link Bundling feature, you must understand these concepts:

Link Bundling Overview

A link bundle is simply a group of ports that are bundled together and act as a single link. The advantages of link bundles are these:

- Multiple links can span several line cards to form a single interface. Thus, the failure of a single link does not cause a loss of connectivity.

- Bundled interfaces increase bandwidth availability, because traffic is forwarded over all available members of the bundle. Therefore, traffic can flow on the available links if one of the links within a bundle fails. Bandwidth can be added without interrupting packet flow.

Although the individual links within a single bundle can have varying speeds, all links within a bundle must be of the same type.
Cisco IOS XR software supports these methods of forming bundles of Ethernet interfaces:

- **IEEE 802.3ad**—Standard technology that employs a Link Aggregation Control Protocol (LACP) to ensure that all the member links in a bundle are compatible. Links that are incompatible or have failed are automatically removed from a bundle.

- **EtherChannel**—Cisco proprietary technology that allows the user to configure links to join a bundle, but has no mechanisms to check whether the links in a bundle are compatible.

---

**Characteristics of Link Bundles**

This list describes the properties and limitations of link bundles:

- Any type of Ethernet interfaces can be bundled, with or without the use of LACP (Link Aggregation Control Protocol).

- Bundle membership can span across several line cards that are installed in a single router.

- A single bundle supports maximum of 64 physical links.

- Different link speeds are allowed within a single bundle, with a maximum of four times the speed difference between the members of the bundle.

- Physical layer and link layer configuration are performed on individual member links of a bundle.

- Configuration of network layer protocols and higher layer applications is performed on the bundle itself.

- A bundle can be administratively enabled or disabled.

- Each individual link within a bundle can be administratively enabled or disabled.

- Ethernet link bundles are created in the same way as Ethernet channels, where the user enters the same configuration on both end systems.

- The MAC address that is set on the bundle becomes the MAC address of the links within that bundle.

- When LACP configured, each link within a bundle can be configured to allow different keepalive periods on different members.

- Load balancing (the distribution of data between member links) is done by flow instead of by packet. Data is distributed to a link in proportion to the bandwidth of the link in relation to its bundle.

- QoS is supported and is applied proportionally on each bundle member.

- Link layer protocols, such as CDP and HDLC keepalives, work independently on each link within a bundle.

- Upper layer protocols, such as routing updates and hellos, are sent over any member link of an interface bundle.

- Bundled interfaces are point to point.

- A link must be in the up state before it can be in distributing state in a bundle.

- All links within a single bundle must be configured either to run 802.3ad (LACP) or Etherchannel (non-LACP). Mixed links within a single bundle are not supported.

- A bundle interface can contain physical links and VLAN subinterfaces only.
• Access Control List (ACL) configuration on link bundles is identical to ACL configuration on regular interfaces.

• Multicast traffic is load balanced over the members of a bundle. For a given flow, internal processes select the member link and all traffic for that flow is sent over that member.

IEEE 802.3ad Standard

The IEEE 802.3ad standard typically defines a method of forming Ethernet link bundles.

For each link configured as bundle member, this information is exchanged between the systems that host each end of the link bundle:

• A globally unique local system identifier
• An identifier (operational key) for the bundle of which the link is a member
• An identifier (port ID) for the link
• The current aggregation status of the link

This information is used to form the link aggregation group identifier (LAG ID). Links that share a common LAG ID can be aggregated. Individual links have unique LAG IDs.

The system identifier distinguishes one router from another, and its uniqueness is guaranteed through the use of a MAC address from the system. The bundle and link identifiers have significance only to the router assigning them, which must guarantee that no two links have the same identifier, and that no two bundles have the same identifier.

The information from the peer system is combined with the information from the local system to determine the compatibility of the links configured to be members of a bundle.

Bundle MAC addresses in the routers come from a set of reserved MAC addresses in the backplane. This MAC address stays with the bundle as long as the bundle interface exists. The bundle uses this MAC address until the user configures a different MAC address. The bundle MAC address is used by all member links when passing bundle traffic. Any unicast or multicast addresses set on the bundle are also set on all the member links.

We recommend that you avoid modifying the MAC address, because changes in the MAC address can affect packet forwarding.

QoS and Link Bundling

On the ingress direction, QoS is applied to the local instance of a bundle. Each bundle is associated with a set of queues. QoS is applied to the various network layer protocols that are configured on the bundle.

On the egress direction, QoS is applied on the bundle with a reference to the member links. QoS is applied based on the sum of the member bandwidths.

When QoS is applied on the bundle for either the ingress or egress direction, QoS is applied at each member interface.
The Link Bundling feature supports all the QoS features described in the Cisco ASR 9000 Series Aggregation Services Router Modular Quality of Service Configuration Guide.

The Link Bundling feature supports these QoS features:

- **hi priority/lo priority** — Maximum bandwidth is calculated as a percentage of the bundle interface bandwidth. This percentage is then applied to every member link on the egress, or to the local bundle instance on ingress.
- **guaranteed bandwidth** — Provided in percentage and applied to every member link.
- **traffic shaping** — Provided in percentage and applied to every member link.
- **WRED** — Minimum and maximum parameters are converted to the right proportion per member link or bundle instance, and then are applied to the bundle.
- **marking** — Process of changing the packet QoS level according to a policy.
- **tail drop** — Packets are dropped when the queue is full.

### VLANs on an Ethernet Link Bundle

802.1Q VLAN subinterfaces can be configured on 802.3ad Ethernet link bundles. Keep this information in mind when adding VLANs on an Ethernet link bundle:

- The maximum number of VLANs allowed per bundle is 4000.
- The maximum number of bundled VLANs allowed per router is 128000.

---

**Note**

The memory requirement for bundle VLANs is slightly higher than standard physical interfaces.

To create a VLAN subinterface on a bundle, include the VLAN subinterface instance with the `interface Bundle-Ether` command:

```
interface Bundle-Ether instance.subinterface
```

After you create a VLAN on an Ethernet link bundle, all physical VLAN subinterface configuration is supported on that link bundle.

### Link Bundle Configuration Overview

These steps provide a general overview of the link bundle configuration process. Keep in mind that a link must be cleared of all previous network layer configuration before it can be added to a bundle:

1. In global configuration mode, create a link bundle. To create an Ethernet link bundle, enter the `interface Bundle-Ether` command.
2. Assign an IP address and subnet mask to the virtual interface using the `ipv4 address` command.
3. Add interfaces to the bundle you created in Step 1 with the `bundle id` command in the interface configuration submode. You can add up to 32 links to a single bundle.
Nonstop Forwarding During Card Failover

The Cisco IOS XR software supports nonstop forwarding during failover between active and standby paired RSP cards. Nonstop forwarding ensures that there is no change in the state of the link bundles when a failover occurs.

For example, if an active RSP fails, the standby RSP becomes operational. The configuration, node state, and checkpoint data of the failed RSP are replicated to the standby RSP. The bundled interfaces will all be present when the standby RSP becomes the active RSP.

Link Failover

When one member link in a bundle fails, traffic is redirected to the remaining operational member links and traffic flow remains uninterrupted.

Bundle Interfaces: Redundancy, Load Sharing, Aggregation

A bundle is a group of one or more ports that are aggregated together and treated as a single link. The different links within a single bundle can have varying speeds, where the fastest link can be a maximum of four times greater than the slowest link. Each bundle has a single MAC, a single IP address, and a single configuration set (such as ACLs or QoS).

The router supports bundling for these types of interfaces:

- Ethernet interfaces
- VLAN subinterfaces

How to Configure Link Bundling

Configuring Ethernet Link Bundles

This section describes how to configure a Ethernet link bundle.
MAC accounting is not supported on Ethernet link bundles.

In order for an Ethernet bundle to be active, you must perform the same configuration on both connection endpoints of the bundle.

The creation of an Ethernet link bundle involves creating a bundle and adding member interfaces to that bundle, as shown in the steps that follow.

**SUMMARY STEPS**

1. **configure**
2. **interface Bundle-Ether** *bundle-id*
3. **ipv4 address** *ipv4-address* *address mask*
4. **bundle minimum-active bandwidth** *kbps* (optional)
5. **bundle minimum-active links** *links* (optional)
6. **bundle maximum-active links** *links* (optional)
7. **bundle maximum-active links** *links hot-standby*
8. **exit**
9. **interface** {**GigabitEthernet** | **TenGigE**} *instance*
10. **bundle id** *bundle-id* [ **mode** { **active** | **on** | **passive** } ]
11. **no shutdown** (optional)
12. **exit**
13. Repeat Step 8 through Step 11 to add more links to the bundle you created in Step 2.
14. Use the **commit** or **end** command.
15. **exit**
16. **exit**
17. Perform Step 1 through Step 15 on the remote end of the connection.
18. **show bundle** **Bundle-Ether** *bundle-id* [ **reasons** ] (optional)
19. **show lacp** **Bundle-Ether** *bundle-id* (optional)

**DETAILED STEPS**

**Step 1** configure

**Example:**

```
RP/0/RSP0/CPU0:router# configure
```

Enters the Global Configuration mode.

**Step 2** interface Bundle-Ether *bundle-id*
Configuring Ethernet Link Bundles

Example:

RP/0/RSP0/CPU0:router(config)# interface Bundle-Ether 3

Creates and names a new Ethernet link bundle.

This interface Bundle-Ether command enters you into the interface configuration submode, where you can enter interface specific configuration commands are entered. Use the exit command to exit from the interface configuration submode back to the normal Global Configuration mode.

Step 3 ipv4 address ipv4-address-address mask

Example:

RP/0/RSP0/CPU0:router(config-if)# ipv4 address 10.1.2.3 255.0.0.0

Assigns an IP address and subnet mask to the virtual interface using the ipv4 address configuration subcommand.

Step 4 bundle minimum-active bandwidth kbps (optional)

Example:

RP/0/RSP0/CPU0:router(config-if)# bundle minimum-active bandwidth 580000

Sets the minimum amount of bandwidth required before a user can bring up a bundle.

Step 5 bundle minimum-active links links (optional)

Example:

RP/0/RSP0/CPU0:router(config-if)# bundle minimum-active links 2

Sets the number of active links required before you can bring up a specific bundle.

Step 6 bundle maximum-active links links (optional)

Example:

RP/0/RSP0/CPU0:router(config-if)# bundle maximum-active links 1

Designates one active link and one link in standby mode that can take over immediately for a bundle if the active link fails (1:1 protection).

The default number of active links allowed in a single bundle is 8.

Note  If the bundle maximum-active command is issued, then only the highest-priority link within the bundle is active. The priority is based on the value from the bundle port-priority command, where a lower value is a higher priority. Therefore, we recommend that you configure a higher priority on the link that you want to be the active link.

Step 7 bundle maximum-active links links hot-standby

Example:

RP/0/RSP0/CPU0:router(config-if)# bundle maximum-active links 1 hot-standby

The hot-standby keyword helps to avoid bundle flaps on a switchover or switchback event during which the bundle temporarily falls below the minimum links or bandwidth threshold.

It sets default values for the wait-while timer and suppress-flaps timer to achieve this.

Step 8 exit
Example:
RP/0/RSP0/CPU0:router(config-if)# exit

Exits interface configuration submode for the Ethernet link bundle.

**Step 9**

```
interface {GigabitEthernet | TenGigE} instance
```

Example:
RP/0/RSP0/CPU0:router(config)# interface TenGigE 1/0/0/0

Enters the interface configuration mode for the specified interface.

Enter the GigabitEthernet or TenGigE keyword to specify the interface type. Replace the instance argument with the node-id in the rack/slot/module format.

Mixed bandwidth bundle member configuration is only supported when 1:1 redundancy is configured (this means that a 1 GigabitEthernet member can only be configured as the backup of the 10 GigabitEthernet interface.)

**Note** Mixed link bundle mode is supported only when active-standby operation is configured (usually with the lower speed link in standby mode).

**Step 10**

```
bundle id  bundle-id [ mode { active | on | passive } ]
```

Example:
RP/0/RSP0/CPU0:router(config-if)# bundle-id 3

Adds the link to the specified bundle.

To enable active or passive LACP on the bundle, include the optional mode active or mode passive keywords in the command string.

To add the link to the bundle without LACP support, include the optional mode on keywords with the command string.

**Note** If you do not specify the mode keyword, the default mode is on (LACP is not run over the port).

**Step 11**

```
no shutdown (optional)
```

Example:
RP/0/RSP0/CPU0:router(config-if)# no shutdown

If a link is in the down state, bring it up. The no shutdown command returns the link to an up or down state depending on the configuration and state of the link.

**Step 12**

```
exit
```

Example:
RP/0/RSP0/CPU0:router(config-if)# exit

Exits interface configuration submode for the Ethernet link bundle.

**Step 13**

Repeat Step 8 through Step 11 to add more links to the bundle you created in Step 2.

**Step 14**

Use the commit or end command.

**commit** - Saves the configuration changes and remains within the configuration session.

**end** - Prompts user to take one of these actions:

- **Yes** - Saves configuration changes and exits the configuration session.
Configuring VLAN Bundles

This section describes how to configure a VLAN bundle. The creation of a VLAN bundle involves three main tasks:

1. Create an Ethernet bundle.
2. Create VLAN subinterfaces and assign them to the Ethernet bundle.
3. Assign Ethernet links to the Ethernet bundle.

These tasks are describe in detail in the procedure that follows.
In order for a VLAN bundle to be active, you must perform the same configuration on both ends of the bundle connection.

Note

The creation of a VLAN link bundle is described in the steps that follow.

**SUMMARY STEPS**

1. configure
2. interface Bundle-Ether bundle-id
3. ipv4 address ipv4-address mask
4. bundle minimum-active bandwidth kbps (optional)
5. bundle minimum-active links links (optional)
6. bundle maximum-active links links (optional)
7. exit
8. interface Bundle-Ether bundle-id vlan-id
9. encapsulation dot1q vlan-id
10. ipv4 address ip-address mask
11. no shutdown
12. exit
13. Repeat Step 7 through Step 12 to add more VLANs to the bundle you created in Step 2.
14. Use the commit or end command.
15. exit
16. exit
17. show ethernet trunk bundle-Ether instance
18. configure
19. interface {GigabitEthernet | TenGigE} instance
20. bundle id bundle-id [mode {active | on | passive}]
21. no shutdown
22. Repeat Step 19 through Step 21 to add more Ethernet interfaces to the bundle you created in Step 2.
23. Use the commit or end command.
24. Perform Step 1 through Step 23 on the remote end of the connection.
25. show bundle Bundle-Ether bundle-id [ reasons ]
26. show ethernet trunk bundle-Ether instance

**DETAILED STEPS**

**Step 1**
configure

**Example:**
RP/0/RSP0/CPU0:router# configure

Enters Global Configuration mode.
Step 2  
**interface Bundle-Ether bundle-id**

**Example:**
```
RP/0/RSP0/CPU0:router#(config)# interface Bundle-Ether 3
```

Creates and names a new Ethernet link bundle.

This `interface Bundle-Ether` command enters you into the interface configuration submode, where you can enter interface specific configuration commands are entered. Use the **exit** command to exit from the interface configuration submode back to the normal Global Configuration mode.

Step 3  
**ipv4 address ipv4-address mask**

**Example:**
```
RP/0/RSP0/CPU0:router(config-if)# ipv4 address 10.1.2.3 255.0.0.0
```

Assigns an IP address and subnet mask to the virtual interface using the **ipv4 address** configuration subcommand.

Step 4  
**bundle minimum-active bandwidth kbps** *(optional)*

**Example:**
```
RP/0/RSP0/CPU0:router(config-if) # bundle minimum-active bandwidth 580000
```

(Optional) Sets the minimum amount of bandwidth required before a user can bring up a bundle.

Step 5  
**bundle minimum-active links links** *(optional)*

**Example:**
```
RP/0/RSP0/CPU0:router(config-if)# bundle minimum-active links 2
```

(Optional) Sets the number of active links required before you can bring up a specific bundle.

Step 6  
**bundle maximum-active links links** *(optional)*

**Example:**
```
RP/0/RSP0/CPU0:router(config-if)# bundle maximum-active links 1
```

(Optional) Designates one active link and one link in standby mode that can take over immediately for a bundle if the active link fails (1:1 protection).

**Note**  
The default number of active links allowed in a single bundle is 8.

**Note**  
If the **bundle maximum-active** command is issued, then only the highest-priority link within the bundle is active. The priority is based on the value from the **bundle port-priority** command, where a lower value is a higher priority. Therefore, we recommend that you configure a higher priority on the link that you want to be the active link.

Step 7  
**exit**

**Example:**
```
RP/0/RSP0/CPU0:router(config-if)# exit
```

Exits interface configuration submode.

Step 8  
**interface Bundle-Ether bundle-id.vlan-id**
**Example:**
RP/0/RSP0/CPU0:router#(config)#interface Bundle-Ether 3.1

Creates a new VLAN, and assigns the VLAN to the Ethernet bundle you created in Step 2.
Replace the `bundle-id` argument with the `bundle-id` you created in Step 2.
Replace the `vlan-id` with a subinterface identifier. Range is from 1 to 4094 inclusive (0 and 4095 are reserved).

**Note**  When you include the `vlan-id` argument with the `interface Bundle-Ether bundle-id` command, you enter subinterface configuration mode.

**Step 9**  `encapsulation dot1q vlan-id`

**Example:**
RP/0/RSP0/CPU0:router#(config-subif)# encapsulation dot1q 10

Assigns a VLAN to the subinterface.
Replace the `vlan-id` argument with a subinterface identifier. Range is from 1 to 4094 inclusive (0 and 4095 are reserved).

**Step 10**  `ipv4 address ip-address mask`

**Example:**
RP/0/RSP0/CPU0:router#(config-subif)# ipv4 address 10.1.2.3/24

Assigns an IP address and subnet mask to the subinterface.

**Step 11**  `no shutdown`

**Example:**
RP/0/RSP0/CPU0:router(config-subif) # no shutdown

(Optional) If a link is in the down state, bring it up. The `no shutdown` command returns the link to an up or down state depending on the configuration and state of the link.

**Step 12**  `exit`

**Example:**
RP/0/RSP0/CPU0:router(config-subif)#exit

Exits subinterface configuration mode for the VLAN subinterface.

**Step 13**  Repeat Step 7 through Step 12 to add more VLANs to the bundle you created in Step 2.
(Optional) Adds more subinterfaces to the bundle.

**Step 14**  Use the `commit` or `end` command.

- `commit` - Saves the configuration changes and remains within the configuration session.
- `end` - Prompts user to take one of these actions:
  - `Yes` - Saves configuration changes and exits the configuration session.
  - `No` - Exits the configuration session without committing the configuration changes.
  - `Cancel` - Remains in the configuration mode, without committing the configuration changes.

**Step 15**  `exit`
Example:
RP/0/RSP0/CPU0:router (config-subif)# exit
Exits interface configuration mode.

Step 16
exit

Example:
RP/0/RSP0/CPU0:router (config)# exit
Exits Global Configuration mode.

Step 17
show ethernet trunk bundle-Ether instance

Example:
RP/0/RSP0/CPU0:router# show ethernet trunk bundle-ether 5
(Optional) Displays the interface configuration.
The Ethernet bundle instance range is from 1 through 65535.

Step 18
configure

Example:
RP/0/RSP0/CPU0:router# configure
Enters Global Configuration mode.

Step 19
interface {GigabitEthernet | TenGigE} instance

Example:
RP/0/RSP0/CPU0:router(config)# interface TenGigE 1/0/0/0
Enters the interface configuration mode for the specified interface.
Replace the instance argument with the node-id in the rack/slot/module format.

Note A VLAN bundle is not active until you add an Ethernet interface on both ends of the link bundle.

Step 20
bundle id bundle-id [mode {active | on | passive}]

Example:
RP/0/RSP0/CPU0:router(config-if)# bundle-id 3
Adds an Ethernet interface to the bundle you configured in Step 2 through Step 13.
To enable active or passive LACP on the bundle, include the optional mode active or mode passive keywords in the command string.
To add the interface to the bundle without LACP support, include the optional mode on keywords with the command string.

Note If you do not specify the mode keyword, the default mode is on (LACP is not run over the port).

Step 21
no shutdown
Example:
RP/0/RSP0/CPU0:router(config-if)# no shutdown

(Optional) If a link is in the down state, bring it up. The `no shutdown` command returns the link to an up or down state depending on the configuration and state of the link.

Step 22 Repeat Step 19 through Step 21 to add more Ethernet interfaces to the bundle you created in Step 2.

Step 23 Use the `commit` or `end` command.
- `commit` - Saves the configuration changes and remains within the configuration session.
- `end` - Prompts user to take one of these actions:
  - **Yes** - Saves configuration changes and exits the configuration session.
  - **No** - Exits the configuration session without committing the configuration changes.
  - **Cancel** - Remains in the configuration mode, without committing the configuration changes.

Step 24 Perform Step 1 through Step 23 on the remote end of the connection.
Brings up the other end of the link bundle.

Step 25 `show bundle Bundle-Ether bundle-id [ reasons ]`

Example:
RP/0/RSP0/CPU0:router# show bundle Bundle-Ether 3 reasons

(Optional) Shows information about the specified Ethernet link bundle.
The `show bundle Bundle-Ether` command displays information about the specified bundle. If your bundle has been configured properly and is carrying traffic, the State field in the `show bundle Bundle-Ether` command output will show the number “4,” which means the specified VLAN bundle port is “distributing.”

Step 26 `show ethernet trunk bundle-Ether instance`

Example:
RP/0/RSP0/CPU0:router# show ethernet trunk bundle-ether 5

(Optional) Displays the interface configuration.
The Ethernet bundle instance range is from 1 through 65535.

---

**Configuration Examples for Link Bundles**

**EtherChannel Bundle running LACP: Example**

This example shows how to join two ports to form an EtherChannel bundle running LACP:

```plaintext
RP/0/RSP0/CPU0:Router# config
RP/0/RSP0/CPU0:Router(config)# interface Bundle-Ether 3
RP/0/RSP0/CPU0:Router(config-if)# ipv4 address 1.2.3.4/24
RP/0/RSP0/CPU0:Router(config-if)# bundle minimum-active bandwidth 620000
```
Creating VLANs on a Ethernet Bundle: Example

This example shows how to create and bring up two VLANs on an Ethernet bundle:

```
RP/0/RSP0/CPU0:Router# config
RP/0/RSP0/CPU0:Router(config)# interface Bundle-Ether 1
RP/0/RSP0/CPU0:Router(config-if)# ipv4 address 1.2.3.4/24
RP/0/RSP0/CPU0:Router(config-if)# bundle minimum-active bandwidth 620000
RP/0/RSP0/CPU0:Router(config-if)# bundle minimum-active links 1
RP/0/RSP0/CPU0:Router(config-if)# exit
RP/0/RSP0/CPU0:Router(config)# interface Bundle-Ether 1.1
RP/0/RSP0/CPU0:Router(config-subif)# encapsulation dot1q 10
RP/0/RSP0/CPU0:Router(config-subif)# ip addr 10.2.3.4/24
RP/0/RSP0/CPU0:Router(config-subif)# no shutdown
RP/0/RSP0/CPU0:Router(config-subif)# exit
RP/0/RSP0/CPU0:Router(config)# interface Bundle-Ether 1.2
RP/0/RSP0/CPU0:Router(config-subif)# encapsulation dot1q 10
RP/0/RSP0/CPU0:Router(config-subif)# ip addr 20.2.3.4/24
RP/0/RSP0/CPU0:Router(config-subif)# no shutdown
RP/0/RSP0/CPU0:Router(config-subif)# exit
RP/0/RSP0/CPU0:Router(config)# interface tengige 0/1/5/7
RP/0/RSP0/CPU0:Router(config-if)# bundle-id 1 mode act
RP/0/RSP0/CPU0:Router(config-if)# commit
RP/0/RSP0/CPU0:Router(config-if)# exit
RP/0/RSP0/CPU0:Router(config)# exit
RP/0/RSP0/CPU0:Router # show ethernet trunk bundle-ether 1
```

ASR 9000 Link Bundles connected to a Cisco 7600 EtherChannel: Example

This example is an end-to-end example of a bundle between ASR 9000 Series router (ASR-9010) and a Cisco 7600 Series Router (P19_C7609-S) in the Metro Ethernet network that supports both L2 and L3 services.

On the Cisco ASR 9000 Series Routers, the bundle is configured with LACP, 1:1 link protection, two L2 subinterfaces, and two layer 3 subinterfaces.

**IOS XR side:**

```
hostname PE44_IOS-XR_Router

interface Bundle-Ether16
description Connect to P19_C7609-S Port-Ch 16

Implementing Point to Point Layer 2 Services

This module provides conceptual and configuration information for point-to-point Layer 2 (L2) connectivity. These point-to-point services are supported:

- Local Switching—A point-to-point circuit internal to a single Cisco ASR 9000 Series Router, also known as local connect.
- Pseudowires—A virtual point-to-point circuit from a Cisco ASR 9000 Series Router. Pseudowires are implemented over MPLS.

**Note**

Point to Point Layer 2 Services are also called as MPLS Layer 2 VPNs.

**Note**

For more information about Point to Point Layer 2 Services on the Cisco ASR 9000 Series Router and for descriptions of the commands listed in this module, see the "Related Documents" section. To locate documentation for other commands that might appear while executing a configuration task, search online in the Cisco IOS XR software master command index.

Prerequisites for Implementing Point to Point Layer 2 Services

You must be in a user group associated with a task group that includes the proper task IDs. The command reference guides include the task IDs required for each command.

If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Information About Implementing Point to Point Layer 2 Services

To implement Point to Point Layer 2 Services, you should understand these concepts:

Layer 2 Virtual Private Network Overview

Layer 2 Virtual Private Network (L2VPN) emulates the behavior of a LAN across an L2 switched, IP or MPLS-enabled IP network, allowing Ethernet devices to communicate with each other as they would when connected to a common LAN segment. Point-to-point L2 connections are vital when creating L2VPNs.

As Internet service providers (ISPs) look to replace their Frame Relay or Asynchronous Transfer Mode (ATM) infrastructures with an IP infrastructure, there is a need to provide standard methods of using an L2 switched, IP or MPLS-enabled IP infrastructure. These methods provide a serviceable L2 interface to customers; specifically, to provide virtual circuits between pairs of customer sites.

Building a L2VPN system requires coordination between the ISP and the customer. The ISP provides L2 connectivity; the customer builds a network using data link resources obtained from the ISP. In an L2VPN service, the ISP does not require information about the customer's network topology, policies, routing information, point-to-point links, or network point-to-point links from other ISPs.

The ISP requires provider edge (PE) routers with these capabilities:

- Encapsulation of L2 protocol data units (PDU) into Layer 3 (L3) packets.
- Interconnection of any-to-any L2 transports.
- Emulation of L2 quality-of-service (QoS) over a packet switch network.
- Ease of configuration of the L2 service.
- Support for different types of tunneling mechanisms (MPLS, L2TPv3, IPSec, GRE, and others).
- L2VPN process databases include all information related to circuits and their connections.

Layer 2 Local Switching Overview

Local switching allows you to switch L2 data between two interfaces of the same type, (for example, Ethernet to Ethernet) and on the same router. The interfaces can be on the same line card, or on two different line cards. During these types of switching, Layer 2 address is used instead of the Layer 3 address. A local switching connection switches L2 traffic from one attachment circuit (AC) to the other. The two ports configured in a local switching connection are ACs with respect to that local connection. A local switching connection works...
like a bridge domain that has only two bridge ports; traffic enters one port of the local connection and leaves
the other. However, because there is no bridging involved in a local connection, there is neither MAC learning
nor flooding. Also, the ACs in a local connection are not in the UP state if the interface state is DOWN. (This
behavior is also different when compared to that of a bridge domain.)

Local switching ACs utilize a full variety of L2 interfaces, including L2 trunk (main) interfaces, bundle
interfaces, and EFPLs.

Additionally, same-port local switching allows you to switch Layer 2 data between two circuits on the same
interface.

**ATMoMPLS with L2VPN Overview**

ATMoMPLS is a type of Layer 2 point-to-point connection over an MPLS core.

To implement the ATMoMPLS feature, the Cisco ASR 9000 Series Router plays the role of provider edge
(PE) router at the edge of a provider network in which customer edge (CE) devices are connected to the
Cisco ASR 9000 Series Router.

**Virtual Circuit Connection Verification on L2VPN**

Virtual Circuit Connection Verification (VCCV) is an L2VPN Operations, Administration, and Maintenance
(OAM) feature that allows network operators to run IP-based provider edge-to-provider edge (PE-to-PE)
keepalive protocol across a specified pseudowire to ensure that the pseudowire data path forwarding does not
contain any faults. The disposition PE receives VCCV packets on a control channel, which is associated with
the specified pseudowire. The control channel type and connectivity verification type, which are used for
VCCV, are negotiated when the pseudowire is established between the PEs for each direction.

Two types of packets can arrive at the disposition egress:

- Type 1—Specifies normal Ethernet-over-MPLS (EoMPLS) data packets.
- Type 2—Specifies VCCV packets.

Cisco ASR 9000 Series Router supports Label Switched Path (LSP) VCCV Type 1, which uses an inband
control word if enabled during signaling. The VCCV echo reply is sent as IPv4 that is the reply mode in IPv4.
The reply is forwarded as IP, MPLS, or a combination of both.

VCCV ping counters that are counted in MPLS forwarding on the egress side. However, on the ingress side,
they are sourced by the route processor and do not count as MPLS forwarding counters.

**Ethernet over MPLS**

Ethernet-over-MPLS (EoMPLS) provides a tunneling mechanism for Ethernet traffic through an MPLS-enabled
L3 core and encapsulates Ethernet protocol data units (PDUs) inside MPLS packets (using label stacking) to
forward them across the MPLS network.

EoMPLS features are described in these subsections:
**Ethernet Port Mode**

In Ethernet port mode, both ends of a pseudowire are connected to Ethernet ports. In this mode, the port is tunneled over the pseudowire or, using local switching (also known as an attachment circuit-to-attachment circuit cross-connect) switches packets or frames from one attachment circuit (AC) to another AC attached to the same PE node.

The following figure provides an example of Ethernet port mode.

*Figure 6: Ethernet Port Mode Packet Flow*

![Ethernet Port Mode Packet Flow Diagram](image)

**VLAN Mode**

In VLAN mode, each VLAN on a customer-end to provider-end link can be configured as a separate L2VPN connection using virtual connection (VC) type 4 or VC type 5. VC type 5 is the default mode.
As illustrated in the following figure, the Ethernet PE associates an internal VLAN-tag to the Ethernet port for switching the traffic internally from the ingress port to the pseudowire; however, before moving traffic into the pseudowire, it removes the internal VLAN tag.

*Figure 7: VLAN Mode Packet Flow*

![VLAN Mode Packet Flow Diagram]

At the egress VLAN PE, the PE associates a VLAN tag to the frames coming off of the pseudowire and after switching the traffic internally, it sends out the traffic on an Ethernet trunk port.

---

**Note**

Because the port is in trunk mode, the VLAN PE doesn't remove the VLAN tag and forwards the frames through the port with the added tag.

---

**Inter-AS Mode**

Inter-AS is a peer-to-peer type model that allows extension of VPNs through multiple provider or multi-domain networks. This lets service providers peer up with one another to offer end-to-end VPN connectivity over extended geographical locations.

EoMPLS support can assume a single AS topology where the pseudowire connecting the PE routers at the two ends of the point-to-point EoMPLS cross-connects resides in the same autonomous system; or multiple AS topologies in which PE routers can reside on two different ASs using iBGP and eBGP peering.
The following figure illustrates MPLS over Inter-AS with a basic double AS topology with iBGP/LDP in each AS.

**Figure 8: EoMPLS over Inter-AS: Basic Double AS Topology**

---

**QinQ Mode**

QinQ is an extension of 802.1Q for specifying multiple 802.1Q tags (IEEE 802.1QinQ VLAN Tag stacking). Layer 3 VPN service termination and L2VPN service transport are enabled over QinQ sub-interfaces.

The Cisco ASR 9000 Series Routers implement the Layer 2 tunneling or Layer 3 forwarding depending on the subinterface configuration at provider edge routers. This function only supports up to two QinQ tags on the SPA and fixed PLIM:

- Layer 2 QinQ VLANs in L2VPN attachment circuit: QinQ L2VPN attachment circuits are configured under the Layer 2 transport subinterfaces for point-to-point EoMPLS based cross-connects using both virtual circuit type 4 and type 5 pseudowires and point-to-point local-switching-based cross-connects including full interworking support of QinQ with 802.1q VLANs and port mode.

- Layer 3 QinQ VLANs: Used as a Layer 3 termination point, both VLANs are removed at the ingress provider edge and added back at the remote provider edge as the frame is forwarded.

Layer 3 services over QinQ include:

- IPv4 unicast and multicast
- IPv6 unicast and multicast
- MPLS
- Connectionless Network Service (CLNS) for use by Intermediate System-to-Intermediate System (IS-IS) Protocol

In QinQ mode, each CE VLAN is carried into an SP VLAN. QinQ mode should use VC type 5, but VC type 4 is also supported. On each Ethernet PE, you must configure both the inner (CE VLAN) and outer (SP VLAN).
The following figure illustrates QinQ using VC type 4.

*Figure 9: EoMPLS over QinQ Mode*

**QinAny Mode**

In the QinAny mode, the service provider VLAN tag is configured on both the ingress and the egress nodes of the provider edge VLAN. QinAny mode is similar to QinQ mode using a Type 5 VC, except that the customer edge VLAN tag is carried in the packet over the pseudowire, as the customer edge VLAN tag is unknown.

**Quality of Service**

Using L2VPN technology, you can assign a quality of service (QoS) level to both Port and VLAN modes of operation.

L2VPN technology requires that QoS functionality on PE routers be strictly L2-payload-based on the edge-facing interfaces (also known as attachment circuits). The following figure illustrates L2 and L3 QoS service policies in a typical L2VPN network.

*Figure 10: L2VPN QoS Feature Application*
The following figure shows four packet processing paths within a provider edge device where a QoS service policy can be attached. In an L2VPN network, packets are received and transmitted on the edge-facing interfaces as L2 packets and transported on the core-facing interfaces as MPLS (EoMPLS).

**Figure 11: L2VPN QoS Reference Model**

![L2VPN QoS Reference Model Diagram]

**High Availability**

L2VPN uses control planes in both route processors and line cards, as well as forwarding plane elements in the line cards.

The availability of L2VPN meets these requirements:

- A control plane failure in either the route processor or the line card will not affect the circuit forwarding path.
- The router processor control plane supports failover without affecting the line card control and forwarding planes.
- L2VPN integrates with existing Label Distribution Protocol (LDP) graceful restart mechanism.

**Preferred Tunnel Path**

Preferred tunnel path functionality lets you map pseudowires to specific traffic-engineering tunnels. Attachment circuits are cross-connected to specific MPLS traffic engineering tunnel interfaces instead of remote PE router IP addresses (reachable using IGP or LDP). Using preferred tunnel path, it is always assumed that the traffic engineering tunnel that transports the L2 traffic runs between the two PE routers (that is, its head starts at the imposition PE router and its tail terminates on the disposition PE router).

**Note**

- Currently, preferred tunnel path configuration applies only to MPLS encapsulation.
Multisegment Pseudowire

Pseudowires transport Layer 2 protocol data units (PDUs) across a public switched network (PSN). A multisegment pseudowire is a static or dynamically configured set of two or more contiguous pseudowire segments. These segments act as a single pseudowire, allowing you to:

- Manage the end-to-end service by separating administrative or provisioning domains.
- Keep IP addresses of provider edge (PE) nodes private across interautonomous system (inter-AS) boundaries. Use IP address of autonomous system boundary routers (ASBRs) and treat them as pseudowire aggregation routers. The ASBRs join the pseudowires of the two domains.

A multisegment pseudowire can span either an inter-AS boundary or two multiprotocol label switching (MPLS) networks.

![Figure 12: Multisegment Pseudowire: Example](image)

A pseudowire is a tunnel between two PE nodes. There are two types of PE nodes:

- A Switching PE (S-PE) node
  - Terminates PSN tunnels of the preceding and succeeding pseudowire segments in a multisegment pseudowire.
  - Switches control and data planes of the preceding and succeeding pseudowire segments of the multisegment pseudowire.

- A Terminating PE (T-PE) node
  - Located at both the first and last segments of a multisegment pseudowire.
  - Where customer-facing attachment circuits (ACs) are bound to a pseudowire forwarder.

**Note**

Every end of a multisegment pseudowire must terminate at a T-PE.

A multisegment pseudowire is used in two general cases when:
• It is not possible to establish a PW control channel between the source and destination PE nodes. For the PW control channel to be established, the remote PE node must be accessible. Sometimes, the local PE node may not be able to access the remote node due to topology, operational, or security constraints.

A multisegment pseudowire dynamically builds two discrete pseudowire segments and performs a pseudowire switching to establish a PW control channel between the source and destination PE nodes.

• Pseudowire Edge To Edge Emulation (PWE3) signaling and encapsulation protocols are different. The PE nodes are connected to networks employing different PW signaling and encapsulation protocols. Sometimes, it is not possible to use a single segment PW.

A multisegment pseudowire, with the appropriate interworking performed at the PW switching points, enables PW connectivity between the PE nodes in the network.

### Pseudowire Redundancy

Pseudowire redundancy allows you to configure your network to detect a failure in the network and reroute the Layer 2 service to another endpoint that can continue to provide service. This feature provides the ability to recover from a failure of either the remote provider edge (PE) router or the link between the PE and customer edge (CE) routers.

L2VPNs can provide pseudowire resiliency through their routing protocols. When connectivity between end-to-end PE routers fails, an alternative path to the directed LDP session and the user data takes over. However, there are some parts of the network in which this rerouting mechanism does not protect against interruptions in service.

Pseudowire redundancy enables you to set up backup pseudowires. You can configure the network with redundant pseudowires and redundant network elements.

Prior to the failure of the primary pseudowire, the ability to switch traffic to the backup pseudowire is used to handle a planned pseudowire outage, such as router maintenance.

**Note**

Pseudowire redundancy is provided only for point-to-point Virtual Private Wire Service (VPWS) pseudowires.

### Pseudowire Load Balancing

To maximize networks while maintaining redundancy typically requires traffic load balancing over multiple links. To achieve better and more uniformed distribution, load balancing on the traffic flows that are part of the provisioned pipes is desirable. Load balancing can be flow based according to the IP addresses, Mac addresses, or a combination of those. Load balancing can be flow based according to source or destination IP addresses, or source or destination MAC addresses. Traffic falls back to default flow based MAC addresses if the IP header cannot proceed or IPv6 is be flow based.

This feature applies to pseudowires under L2VPN; this includes VPWS and VPLS.
Enabling virtual circuit (VC) label based load balancing for a pseudowire class overrides global flow based load balancing under L2VPN.

**Pseudowire Grouping**

When pseudowires (PWs) are established, each PW is assigned a group ID that is common for all PWs created on the same physical port. When a physical port becomes non-functional or disabled, Automatic Protection Switching (APS) signals the peer router to get activated and L2VPN sends a single message to advertise the status change of all PWs that have the Group ID associated with the physical port. A single L2VPN signal thus avoids a lot of processing and loss in reactivity.

For CEM interfaces, various levels of configuration are permitted for the parent controllers, such as T1 and T3, framed or unframed. To achieve best grouping, the physical controller handle is used as the group ID.

**Note**

Pseudowire grouping is disabled by default.

Network convergence for pseudowires can take longer than the usual two seconds in events such as:

- Manual reload of an active working router
- Interface or controller shutdown
- Reload or shutdown or power disable of a line card on an enabled protect router
- Router Processor fail-over (RPFO) on an enabled protect router
- Simultaneous failure of two controllers or Shared Port Adapters (SPAs)
- Two Automatic Protection Switching (APS) group switchovers

**Ethernet Wire Service**

An Ethernet Wire Service is a service that emulates a point-to-point Ethernet segment. This is similar to Ethernet private line (EPL), a Layer 1 point-to-point service, except the provider edge operates at Layer 2 and typically runs over a Layer 2 network. The EWS encapsulates all frames that are received on a particular UNI and transports these frames to a single-egress UNI without reference to the contents contained within the frame. The operation of this service means that an EWS can be used with VLAN-tagged frames. The VLAN tags are transparent to the EWS (bridge protocol data units [BPDUs])—with some exceptions. These exceptions include IEEE 802.1x, IEEE 802.2ad, and IEEE 802.3x, because these frames have local significance and it benefits both the customer and the Service Provider to terminate them locally.

Since the service provider simply accepts frames on an interface and transmits these without reference to the actual frame (other than verifying that the format and length are legal for the particular interface) the EWS is indifferent to VLAN tags that may be present within the customer Ethernet frames.

EWS subscribes to the concept of all-to-one bundling. That is, an EWS maps a port on one end to a point-to-point circuit and to a port on another end. EWS is a port-to-port service. Therefore, if a customer needs to connect a switch or router to n switches or routers it will need n ports and n pseudowires or logical circuits.
One important point to consider is that, although the EWS broadly emulates an Ethernet Layer 1 connection, the service is provided across a shared infrastructure, and therefore it is unlikely that the full interface bandwidth will be, or needs to be, available at all times. EWS will typically be a sub-line rate service, where many users share a circuit somewhere in their transmission path. As a result, the cost will most likely be less than that of EPL. Unlike a Layer 1 EPL, the SP will need to implement QoS and traffic engineering to meet the specific objectives of a particular contract. However, if the customer’s application requires a true wire rate transparent service, then an EPL service—delivered using optical transmission devices such as DWDM (dense wavelength division multiplexing), CDWM (coarse wavelength division multiplexing), or SONET/SDH—should be considered.

---

**IGMP Snooping**

IGMP snooping provides a way to constrain multicast traffic at Layer 2. By snooping the IGMP membership reports sent by hosts in the bridge domain, the IGMP snooping application can set up Layer 2 multicast forwarding tables to deliver traffic only to ports with at least one interested member, significantly reducing the volume of multicast traffic.

Configured at Layer 3, IGMP provides a means for hosts in an IPv4 multicast network to indicate which multicast traffic they are interested in and for routers to control and limit the flow of multicast traffic in the network (at Layer 3).

IGMP snooping uses the information in IGMP membership report messages to build corresponding information in the forwarding tables to restrict IP multicast traffic at Layer 2. The forwarding table entries are in the form <Route, OIF List>, where:

- Route is a <*, G> route or <S, G> route.
- OIF List comprises all bridge ports that have sent IGMP membership reports for the specified route plus all Multicast Router (mrouter) ports in the bridge domain.

The IGMP snooping feature can provide these benefits to a multicast network:

- Basic IGMP snooping reduces bandwidth consumption by reducing multicast traffic that would otherwise flood an entire VPLS bridge domain.

- With optional configuration options, IGMP snooping can provide security between bridge domains by filtering the IGMP reports received from hosts on one bridge port and preventing leakage towards the hosts on other bridge ports.

- With optional configuration options, IGMP snooping can reduce the traffic impact on upstream IP multicast routers by suppressing IGMP membership reports (IGMPv2) or by acting as an IGMP proxy reporter (IGMPv3) to the upstream IP multicast router.

Refer to the *Implementing Layer 2 Multicast with IGMP Snooping* module in the *Cisco ASR 9000 Series Aggregation Services Router Multicast Configuration Guide* for information on configuring IGMP snooping.

The applicable IGMP snooping commands are described in the *Cisco ASR 9000 Series Aggregation Services Router Multicast Command Reference*.

---

**IP Interworking**

Customer deployments require a solution to support AToM with disparate transport at network ends. This solution must have the capability to translate transport on one customer edge (CE) device to another transport, for example, Frame relay to Ethernet. The Cisco ASR 9000 Series SPA Interface Processor-700 and the Cisco
ASR 9000 Series Ethernet line cards enable the Cisco ASR 9000 Series Routers to support multiple legacy services.

IP Interworking is a solution for transporting Layer 2 traffic over an IP/MPLS backbone. It accommodates many types of Layer 2 frames such as Ethernet and Frame Relay using AToM tunnels. It encapsulates packets at the provider edge (PE) router, transports them over the backbone to the PE router on the other side of the cloud, removes the encapsulation, and transports them to the destination. The transport layer can be Ethernet on one end and Frame relay on the other end. IP interworking occurs between disparate endpoints of the AToM tunnels.

**Note**

Only routed interworking is supported between Ethernet and Frame Relay based networks for MPLS and Local-connect scenarios.

The following figure shows the interoperability between an Ethernet attachment VC and a Frame Relay attachment VC.

*Figure 13: IP Interworking over MPLS Core*

An attachment circuit (AC) is a physical or logical port or circuit that connects a CE device to a PE device. A pseudowire (PW) is a bidirectional virtual connection (VC) connecting two ACs. In an MPLS network, PWs are carried inside an LSP tunnel. The core facing line card on the PE1 and PE2 could be a Cisco ASR 9000 Series SPA Interface Processor-700 or a Cisco ASR 9000 Series Ethernet line card.

In the IP Interworking mode, the Layer 2 (L2) header is removed from the packets received on an ingress PE, and only the IP payload is transmitted to the egress PE. On the egress PE, an L2 header is appended before the packet is transmitted out of the egress port.

In Figure above, CE1 and CE2 could be a Frame Relay (FR) interface or a GigabitEthernet (GigE) interface. Assuming CE1 is a FR and CE2 is either a GigE or dot1q, or QinQ. For packets arriving from an Ethernet CE (CE2), ingress LC on the PE (PE2) facing the CE removes L2 framing and forwards the packet to egress PE (PE1) using IPoMPLS encapsulation over a pseudowire. The core facing line card on egress PE removes the MPLS labels but preserves the control word and transmits it to the egress line card facing FR CE (CE1).

At the FR PE, after label disposition, the Layer 3 (L3) packets are encapsulated over FR.

Similarly, IP packets arriving from the FR CE are translated into IPoMPLS encapsulation over the pseudowire. At the Ethernet PE side, after label disposition, the PE adds L2 Ethernet packet header back to the packet before transmitting it to the CE, as the packets coming out from the core carry only the IP payload.

These modes support IP Interworking on AToM:
• Ethernet to Frame Relay

Packets arriving from the Ethernet CE device have MAC (port-mode, untagged, single, double tag), IPv4 header and data. The Ethernet line card removes the L2 framing and then forwards the L3 packet to the egress line card. The egress line card adds the FR L2 header before transmitting it from the egress port.

• Ethernet to Ethernet

Both the CE devices are Ethernet. Each ethernet interface can be port-mode, untagged, single, or double tag, although this is not a typical scenario for IP interworking.

**AToM iMSG**

This feature enables an interworking layer in the access network(s) to terminate all non-Ethernet functionality and translate these connections to a Ethernet centric service which can be terminated on the Layer 3 edge routers. Currently, the time-division multiplexing (TDM) based services terminate on the Layer 3 edge routers directly. A simplified and more cost optimized model for the L3 networks is enabled by moving the TDM complexity into the access layer.

The Layer 2 encapsulation is removed from an IP packet by the ingress PE’s attachment circuit facing ingress line card. The MPLS encapsulated IP packet payload is then sent across the fabric to the core facing egress line card. The egress line card then transmits the packet through the MPLS core. On the remote PE, the MPLS label is removed, Layer 2 header of the egress AC is added and finally the packet is sent to the connected CE. L2VPN VPWS has been enhanced to support:

- Point-to-Point Protocol (PPP)
- High-level Data Link Control (HDLC)
- Multilink Point-to-Point Protocol (MLPPP)
- QOS support for all the encapsulation types

For more information on QoS, see the *Cisco ASR 9000 Series Aggregation Services Router Modular Quality of Service Configuration*.

The TDM ACs can be configured on these SPAs:

- SPA-8XCHT1/E1
- SPA-4XCT3/DS0
- SPA-1XCHSTM1/OC3
- SPA-2XCHOC12/DS0
- SPA-1XCHOC48/DS3
- SPA-4XT3/E3
- SPA-4XOC3-POS-V2
- SPA-8XOC3-POS
- SPA-8XOC12-POS
- SPA-1XOC48POS/RPR
- SPA-2XOC48POS/RPR
Any Transport over MPLS

Any Transport over MPLS (AToM) transports Layer 2 packets over a Multiprotocol Label Switching (MPLS) backbone. This enables service providers to connect customer sites with existing Layer 2 networks by using a single, integrated, packet-based network infrastructure. Using this feature, service providers can deliver Layer 2 connections over an MPLS backbone, instead of using separate networks.

AToM encapsulates Layer 2 frames at the ingress PE router, and sends them to a corresponding PE router at the other end of a pseudowire, which is a connection between the two PE routers. The egress PE removes the encapsulation and sends out the Layer 2 frame.

The successful transmission of the Layer 2 frames between PE routers is due to the configuration of the PE routers. You set up a connection, called a pseudowire, between the routers. You specify this information on each PE router:

- The type of Layer 2 data that will be transported across the pseudowire, such as Ethernet and Frame Relay
- The IP address of the loopback interface of the peer PE router, which enables the PE routers to communicate.
- A unique combination of peer PE IP address and VC ID that identifies the pseudowire.

Control Word Processing

The control word contains forward explicit congestion notification (FECN), backward explicit congestion notification (BECN) and DE bits in case of frame relay connection.

Control word is mandatory for:

- Frame Relay
- ATM AAL5
- Frame Relay to Ethernet bridged interworking
- eHDLC/PPP IP interworking
- CEM (Circuit Emulation)

The system does not map bits from one transport end point to another across an AToM IP Interworking connection.

Whenever supported, control word is also recommended for pseudowires, as it enables proper load balancing without packet desequencing independent of L2VPN packet content. Without control word the heuristics used to perform load balancing cannot achieve optimal results in all cases.

High-level Data Link Control over MPLS

The attachment circuit (AC) is a main interface configured with HDLC encapsulation. Packets to or from the AC are transported using an AToM pseudowire (PW) of VC type 0x6 to or from the other provider edge (PE) router over the MPLS core network.

With HDLC over MPLS, the entire HDLC packet is transported. The ingress PE router removes only the HDLC flags and FCS bits.
**PPP over MPLS**

The attachment circuit (AC) is a main interface configured with PPP encapsulation. Packets to or from the AC are transported through an AToM PW of VC type 0x7 to or from the other provider edge (PE) routers over the MPLS core network.

With PPP over MPLS, the ingress PE router removes the flags, address, control field, and the FCS bits.

---

**Frame Relay over MPLS**

Frame Relay over MPLS (FRoMPLS) provides leased line type of connectivity between two Frame Relay islands. Frame Relay traffic is transported over the MPLS network.

---

**Note**

The Data Link Connection Identifier (DLCI) DCLI-DLCI mode is supported. A control word (required for DLCI-DLCI mode) is used to carry additional control information.

When a Provider Edge (PE) router receives a Frame Relay protocol packet from a subscriber site, it removes the Frame Relay header and Frame Check Sequence (FCS) and appends the appropriate Virtual Circuit (VC) label. The removed Backward Explicit Congestion Notification (BECN), Forward Explicit Congestion Notification (FECN), Discard Eligible (DE) and Command/Response (C/R) bits are (for DLCI-DLCI mode) sent separately using a control word.

---

**MPLS Transport Profile**

MPLS transport profile (MPLS-TP) tunnels provide the transport network service layer over which IP and MPLS traffic traverse. Within the MPLS-TP environment, pseudowires (PWs) use MPLS-TP tunnels as the transport mechanism. MPLS-TP tunnels help transition from SONET/SDH TDM technologies to packet switching, to support services with high bandwidth utilization and low cost. Transport networks are connection oriented, statically provisioned, and have long-lived connections. Transport networks usually avoid control protocols that change identifiers (like labels). MPLS-TP tunnels provide this functionality through statically provisioned bidirectional label switched paths (LSPs).

For more information on configuring MPLS transport profile, refer to the **Cisco ASR 9000 Series Aggregation Services Router MPLS Configuration Guide**.

MPLS-TP supports these combinations of static and dynamic multisegment pseudowires:

- Static-static
- Static-dynamic
- Dynamic-static
- Dynamic-dynamic

MPLS-TP supports one-to-one L2VPN pseudowire redundancy for these combinations of static and dynamic pseudowires:

- Static pseudowire with a static backup pseudowire
- Static pseudowire with a dynamic backup pseudowire
The existing TE preferred path feature is used to pin down a PW to an MPLS-TP transport tunnel. See Preferred Tunnel Path for more information on configuring preferred tunnel path. For a dynamic pseudowire, PW status is exchanged through LDP whereas for static PW, status is transported in PW OAM message. See Configuring PW Status OAM for more information on configuring PW status OAM. By default, alarms are not generated when the state of a PW changes due to change in the state of MPLS TP tunnel carrying that PW.

## Circuit Emulation Over Packet Switched Network

Circuit Emulation over Packet (CEoP) is a method of carrying TDM circuits over packet switched network. CEoP is similar to a physical connection. The goal of CEoP is to replace leased lines and legacy TDM networks. CEoP operates in two major modes:

- **Unstructured mode is called SAToP (Structure Agnostic TDM over Packet)**
  
  SAToP addresses only structure-agnostic transport, i.e., unframed E1, T1, E3 and T3. It segments all TDM services as bit streams and then encapsulates them for transmission over a PW tunnel. This protocol can transparently transmit TDM traffic data and synchronous timing information. SAToP completely disregards any structure and provider edge routers (PEs) do not need to interpret the TDM data or to participate in the TDM signaling. The protocol is a simple way for transparent transmission of PDH bit-streams.

- **Structured mode is named CESoPSN (Circuit Emulation Service over Packet Switched Network)**

  Compared with SAToP, CESoPSN transmits emulated structured TDM signals. That is, it can identify and process the frame structure and transmit signaling in TDM frames. It may not transmit idle timeslot channels, but only extracts useful timeslots of CE devices from the E1 traffic stream and then encapsulates them into PW packets for transmission. CEoP SPAs are half-height (HH) Shared Port Adapters (SPA)
and the CEoP SPA family consists of 24xT1/E1, 2xT3/E3, and 1xOC3/STM1 unstructured and structured (NxDS0) quarter rate, half height SPAs.

Figure 14: Enterprise Data Convergence using Circuit Emulation over Packet

The CEM functionality is supported only on Engine 5 line cards having CEoP SPAs. CEM is supported on:

- 1-port Channelized OC3 STM1 ATM CEoP SPA (SPA-1CHOC3-CE-ATM)

CESoPSN and SAToP can use MPLS, UDP/IP, and L2TPv3 as the underlying transport mechanism. This release supports only MPLS transport mechanism.

CEoP SPA supports these modes of operation:

- Circuit Emulation Mode (CEM)
- ATM Mode
- IMA Mode

Note

Only CEM mode is supported.

Benefits of Circuit Emulation over Packet Switched Network

CEM offers these benefits to the service provider and end-users:

- Saving cost in installing equipment.
• Saving cost in network operations; as leased lines are expensive, limiting their usage to access only mode saves significant costs.

• Ensuring low maintenance cost because only the core network needs to be maintained.

• Utilizing the core network resources more efficiently with packet switched network, while keeping investment in access network intact.

• Providing cheaper services to the end-user.

L2VPN Nonstop Routing

The L2VPN Nonstop Routing (NSR) feature avoids label distribution path (LDP) sessions from flapping on events such as process failures (crash) and route processor failover (RP FO). NSR on process failure (crash) is supported by performing RP FO, if you have enabled NSR using NSR process failure switchover.

NSR enables the router (where failure has occurred) to maintain the control plane states without a graceful restart (GR). NSR, by definition, does not require any protocol extension and typically uses Stateful Switch Over (SSO) to maintain it’s control plane states.

L2TPv3 over IPv6

A L2TPv3 over IPv6 tunnel is a static L2VPN cross-connect that uses Layer 2 Tunneling Protocol version 3 (L2TPv3) over IPv6, with a unique IPv6 source address for each cross-connect. The L2TPv3 over IPv6 tunnels consists of one L2TPv3 tunnel for each subscriber VLAN. The unique IPv6 address completely identifies the customer, and the service that is delivered.

Note

L2TPv3 over IPv6 tunnels are supported on the ASR 9000 Enhanced Ethernet line cards by a scale of 15000 crossconnects for each router and line card.

Overview

L2TPv3 defines the L2TP protocol for tunneling Layer 2 payloads over an IP core network using Layer 2 virtual private networks (VPNs). Traffic between two customer network sites is encapsulated in IP packets carrying L2TP data messages (payload) and sent across an IP network. The backbone routers of the IP network treat this payload in the same manner as it treats any other IP traffic. Implementing L2TPv3 over IPv6 provides an opportunity to utilize unique source IPv6 addresses to directly identify Ethernet attachment circuits. In this case, processing of the L2TPv3 session ID is bypassed; this is because each tunnel has only one associated session. This local optimization, however, does not hinder the ability to continue supporting circuit multiplexing through the session ID for other L2TPv3 tunnels on the same router.

For more information on:

• Configuration procedures, see Configuring L2TPv3 over IPv6 Tunnels.

• Configuration examples, see Configuring L2TPv3 over IPv6 Tunnels: Example.
Dynamic Single-Segment Pseudowire

A single-segment pseudowire (SS-PW) is a point-to-point pseudowire (PW) where the PW segment is present between two PE routers.

In this feature, a single-segment pseudowire is established between two PE routers of the same autonomous system (AS) dynamically using the FEC 129 information. The objective of this feature is to ensure interoperability of the Cisco routers with the third-party routers.

Active and Passive Signaling

The T-PE on which the SS-PW is initiated and the signaling message is transmitted from is called as the source-terminating PE (ST-PE). The T-PE that waits and responds to the SS-PW signaling message is called the target-terminating PE (TT-PE).

The signaling flow from the ST-PE to TT-PE is referred to as the forward direction signaling or the active signaling. The signaling flow from the TT-PE to ST-PE is referred to as the reverse direction signaling or the passive signaling.

Generally, the PE with the highest prefix address takes the active role and becomes the ST-PE, and the other PE becomes the passive TT-PE.

The following figure illustrates the SS-PW signaling flow between ST-PE and TT-PE:

Figure 15: Single-Segment Pseudowire Between ST-PE and TT-PE

Functionality of Dynamic Single Segment Pseudowire

The dynamic discovery of the pseudowire path from the ST-PE to the T-PE is achieved using the L2 route table. The route table entries, that is, a list of prefix and associated next-hops to the L2VPN are populated by BGP.
In Release 5.1.2, Cisco supports only the routable prefix to reach the TAII on the T-PE. The routable prefix is the neighbor address of the targeted-LDP session. The reachability of packets from the source to the destination is achieved by user configurations (see Configuring L2VPN Single Segment Pseudowire, on page 95) However, BGP supports MS-PW Subsequent Address Family Identifiers (SAFI) that is used to exchange the L2 routes across all the PEs. SS-PW uses the BGP MS-PW address family to function. To ensure interoperability with other third-party routers, Cisco advertises a single BGP MS-PW route per T-PE where the value of AC-ID (attachment circuit-identifier) is a wild-card entry.

The supported pseudowire features are pw-status, pw-grouping, and tag-impose vlan.

The following figure illustrates the E-Line Services Network with SS-PWs:

**Figure 16: E-Line Services Network with SS-PWs**

---

**Prerequisites for Configuring L2VPN Single Segment Pseudowires**

MPLS LDP, IGP, BGP, L2VPN, and interfaces must be configured on the two end points of the PW:

- Configuring MPLS Label Distribution Protocol.
- Configuring Interior Gateway Protocol (IGP).
- Configure Border Gateway Protocol (BGP).
- Configuring an Interface or Connection for L2VPN.

**Restrictions for Configuring L2VPN Single Segment Pseudowires**

- The routed pseudowire can only be enabled on Virtual Private Wire Service (VPWS) cross connects.
- A cross-connect cannot have both ends configured as "neighbor routed" pseudowire.
• SS-PW is not supported as the other member of the cross-connect, that is, at a T-PE, one end of the cross-connect can be the termination of the SS-PW and the other end can either be an attachment circuit (AC) or a PW-HE.

• Source AII and AC-ID (attachment circuit identifier) are unique per router.

• L2TP and MPLS static are not supported.

Configuring L2VPN Single Segment Pseudowire

To configure single segment pseudowire in the network, do the following:

1. (Optional) Configuring the related L2VPN Global Parameters. See Configuring L2VPN Global Parameters
   This procedure is used to overwrite the default BGP Route Distinguisher (RD) auto-generated value and also the Autonomous System Number (ASN) and Route Identifier (RID) of BGP.

2. Configuring L2VPN VPWS SS-PW

3. Configuring L2VPN MS-PW Address Family Under BGP
   The address family is configured under BGP to exchange the dynamic pseudowire routes.

Configuring L2VPN Global Parameters

Perform this task to configure L2VPN global parameters.

SUMMARY STEPS

1. `configure`
2. `l2vpn`
3. `router-id router-id`
4. `pw-routing`
5. `global-id global-id`
6. `bgp`
7. `rd route-distinguisher`
8. Use the `commit` or `end` command.

DETAILED STEPS

Step 1  configure

Example:

RP/0/RSP0/CPU0:router# configure

Enters the Global Configuration mode.

Step 2  l2vpn
Dynamic Single-Segment Pseudowire

Example:

RP/0/RSP0/CPU0:router(config)# l2vpn

Enters Layer 2 VPN configuration mode.

Step 3  
**router-id router-id**

Example:

RP/0/RSP0/CPU0:router(config)# router 2.2.2.2

Specifies the router ID.

Step 4  
**pw-routing**

Example:

RP/0/RSP0/CPU0:router(config-l2vpn)# pw-routing

Enables pseudowire routing capabilities and enters the pseudowire routing configuration submode.

Step 5  
**global-id global-id**

Example:

RP/0/RSP0/CPU0:router(config-l2vpn-pwr)# global-id 1000

Configures the L2VPN global ID value for the router.

Step 6  
**bgp**

Example:

RP/0/RSP0/CPU0:router(config-l2vpn-pwr-bgp)# bgp

Enables the BGP pseudowire routing capabilities and enters the BGP configuration submode.

Step 7  
**rd route-distinguisher**

Example:

RP/0/RSP0/CPU0:router(config-l2vpn-pwr-bgp)# rd 192.168.1.3:10

Configures the BGP route distinguisher.

Step 8  
Use the **commit** or **end** command.

**commit** - Saves the configuration changes and remains within the configuration session.

**end** - Prompts user to take one of these actions:

- **Yes** - Saves configuration changes and exits the configuration session.
- **No** - Exits the configuration session without committing the configuration changes.
- **Cancel** - Remains in the configuration mode, without committing the configuration changes.
Configuring L2VPN VPWS SS-PW

Perform this task to configure L2VPN VPWS SS-PWs.

SUMMARY STEPS

1. configure
2. interface type interface-path-id
3. l2vpn
4. xconnect group group-name
5. p2p xconnect-name
6. interface type interface-path-id
7. neighbor routed global-id: prefix: ac-id source ac-id
8. (optional) pw-class class-name
9. Use the commit or end command.

DETAILED STEPS

Step 1 configure

Example:
RP/0/RSP0/CPU0:router# configure

Enters the Global Configuration mode.

Step 2 interface type interface-path-id

Example:
RP/0/RSP0/CPU0:routerRP/0/RP00RSP0/CPU0:router# interface TenGigE0/1/0/12

Enters interface configuration mode and configures an interface.

Step 3 l2vpn

Example:
RP/0/RSP0/CPU0:router(config)# l2vpn

Enters Layer 2 VPN configuration mode.

Step 4 xconnect group group-name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn)# xconnect group pw-he1
Configures a cross-connect group name using a free-format 32-character string.

**Step 5**

`p2p xconnect-name`

**Example:**

```
RP/0/RSP0/CPU0:router(config-l2vpn-xc)# p2p pw-ss
```

Enters P2P configuration submode.

**Step 6**

`interface type interface-path-id`

**Example:**

```
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# interface gigabitethernet 0/1/0/9
```

Specifies the interface type and instance.

**Step 7**

`neighbor routed global-id: prefix: ac-id source ac-id`

**Example:**

```
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# neighbor routed 100:2.2.2.2:10 source 10
```

Enables pseudowire routing configuration submode for the p2p cross-connect.

**Step 8**

*(optional)* `pw-class class-name`

**Example:**

```
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p-pwr)# pw-class dynamic_sspw
```

Enters pseudowire class submode, allowing you to define a pseudowire class template.

**Step 9**

Use the `commit` or `end` command.

- **commit** - Saves the configuration changes and remains within the configuration session.
- **end** - Prompts user to take one of these actions:
  - **Yes** - Saves configuration changes and exits the configuration session.
  - **No** - Exits the configuration session without committing the configuration changes.
  - **Cancel** - Remains in the configuration mode, without committing the configuration changes.

---

**Configuring L2VPN MS-PW Address Family Under BGP**

Perform this task to configure L2VPN MS-PW address family under BGP:
SUMMARY STEPS

1. configure
2. router bgp **autonomous-system-number**
3. address-family l2vpn mspw
4. neighbor **ip-address**
5. address-family l2vpn mspw
6. Use the **commit** or **end** command.

DETAILED STEPS

Step 1 configure

**Example:**

```
RP/0/RSP0/CPU0:router# configure
```

Enters the Global Configuration mode.

Step 2 router bgp **autonomous-system-number**

**Example:**

```
RP/0/RSP0/CPU0:router(config)# router bgp 100
```

Enters router configuration mode for the specified routing process.

Step 3 address-family l2vpn mspw

**Example:**

```
RP/0/RSP0/CPU0:router(config-bgp)# address-family l2vpn mspw
```

Specifies the L2VPN address family and enters address family configuration mode.

Step 4 neighbor **ip-address**

**Example:**

```
RP/0/RSP0/CPU0:router(config-bgp-nbr-af)# neighbor 10.10.10.1
```

Adds the IP address of the neighbor in the specified autonomous system.

Step 5 address-family l2vpn mspw

**Example:**

```
RP/0/RSP0/CPU0:router(config-bgp-nbr-af)# address-family l2vpn mspw
```

Specifies the L2VPN address family of the neighbor and enters address family configuration mode.

Step 6 Use the **commit** or **end** command.

**commit** - Saves the configuration changes and remains within the configuration session.
end - Prompts user to take one of these actions:
  • Yes - Saves configuration changes and exits the configuration session.
  • No - Exits the configuration session without committing the configuration changes.
  • Cancel - Remains in the configuration mode, without committing the configuration changes.

How to Implement Point to Point Layer 2 Services

This section describes the tasks required to implement Point to Point Layer 2 Services:

Configuring an Interface or Connection for Point to Point Layer 2 Services

Perform this task to configure an interface or a connection for Point to Point Layer 2 Services.

SUMMARY STEPS

1. configure
2. interface type interface-path-id
3. l2transport
4. exit
5. interface type interface-path-id
6. Use the commit or end command.
7. show interface type interface-id

DETAILED STEPS

Step 1 configure

Example:
RP/0/RSP0/CPU0:router# configure
Enters the Global Configuration mode.

Step 2 interface type interface-path-id

Example:
RP/0/RSP0/CPU0:router(config)# interface TenGigE 0/0/0/0
Enters interface configuration mode and configures an interface.

Step 3 l2transport
Configuring Local Switching

Perform this task to configure local switching.
SUMMARY STEPS

1. configure
2. l2vpn
3. xconnect group group-name
4. p2p xconnect-name
5. interface type interface-path-id
6. interface type interface-path-id
7. Use the commit or end command.

DETAILED STEPS

Step 1 configure

Example: RP/0/RSP0/CPU0:router# configure
Enters the Global Configuration mode.

Step 2 l2vpn

Example: RP/0/RSP0/CPU0:router(config-subif)# l2vpn
Enters L2VPN configuration mode.

Step 3 xconnect group group-name

Example: RP/0/RSP0/CPU0:router(config-l2vpn)# xconnect group grp_1
Enters the name of the cross-connect group.

Step 4 p2p xconnect-name

Example: RP/0/RSP0/CPU0:router(config-l2vpn-xc)# p2p vlan1
Enters a name for the point-to-point cross-connect.

Step 5 interface type interface-path-id

Example: RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# interface TenGigE 0/7/0/6.5
Specifies the interface type ID. The choices are:

• GigabitEthernet: Gigabit Ethernet/IEEE 802.3 interfaces
Configuring Local Connection Redundancy

Perform this task to configure local connection redundancy.

SUMMARY STEPS

1. configure
2. l2vpn
3. xconnect group group-name
4. p2p xconnect-name
5. backup interface type interface-path-id
6. interface type interface-path-id
7. interface type interface-path-id
8. Use the commit or end command.

DETAILED STEPS

Step 1 configure

• TenGigE: TenGigabit Ethernet/IEEE 802.3 interfaces
• CEM: Circuit Emulation interface

Step 6 interface type interface-path-id

Example:

RP/0/RSP0/CPU0:router(config-l2vpn-vc-cs-vc-p2p)# interface GigabitEthernet0/4/0/30

Specifies the interface type ID. The choices are:

• GigabitEthernet: Gigabit Ethernet/IEEE 802.3 interfaces
• TenGigE: TenGigabit Ethernet/IEEE 802.3 interfaces

Step 7 Use the commit or end command.

commit - Saves the configuration changes and remains within the configuration session.
end - Prompts user to take one of these actions:

• Yes - Saves configuration changes and exits the configuration session.
• No - Exits the configuration session without committing the configuration changes.
• Cancel - Remains in the configuration mode, without committing the configuration changes.
Example:
RP/0/RSP0/CPU0:router# configure

Enters the Global Configuration mode.

**Step 2**
l2vpn

Example:
RP/0/RSP0/CPU0:router(config-subif)# l2vpn

Enters L2VPN configuration mode.

**Step 3**
xconnect group group-name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn)# xconnect group grp_1

Enters the name of the cross-connect group.

**Step 4**
p2p xconnect-name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc)# p2p vlan1

Enters a name for the point-to-point cross-connect.

**Step 5**
backup interface type interface-path-id

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# backup interface Bundle-Ether 0/7/0/6.5

Configures local connect redundancy.

**Note** The attachment circuit (AC) must be bundle interface that is part of MC-LAG. The backup interfaces can either be bundle or Ethernet port.

**Step 6**
interface type interface-path-id

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# interface Bundle-Ether 0/7/0/6.2

Specifies the interface type ID. The choices are:
- GigabitEthernet: Gigabit Ethernet/IEEE 802.3 interfaces
- TenGigE: TenGigabit Ethernet/IEEE 802.3 interfaces
- CEM: Circuit Emulation interface

**Step 7**
interface type interface-path-id
Example:

```
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# interface Bundle-Ether 0/7/0/6.1
```

Specifies the interface type ID. The choices are:

- GigabitEthernet: Gigabit Ethernet/IEEE 802.3 interfaces
- TenGigE: TenGigabit Ethernet/IEEE 802.3 interfaces

**Step 8**

Use the `commit` or `end` command.

- **commit** - Saves the configuration changes and remains within the configuration session.
- **end** - Prompts user to take one of these actions:
  - **Yes** - Saves configuration changes and exits the configuration session.
  - **No** - Exits the configuration session without committing the configuration changes.
  - **Cancel** - Remains in the configuration mode, without committing the configuration changes.

---

### Configuring Static Point-to-Point Cross-Connects

**Note**

Consider this information about cross-connects when you configure static point-to-point cross-connects:

- An cross-connect is uniquely identified with the pair; the cross-connect name must be unique within a group.
- A segment (an attachment circuit or pseudowire) is unique and can belong only to a single cross-connect.
- A static VC local label is globally unique and can be used in one pseudowire only.
- No more than 16,000 cross-connects can be configured per router.

---

**Note**

Static pseudowire connections do not use LDP for signaling.

Perform this task to configure static point-to-point cross-connects.
SUMMARY STEPS

1. configure
2. l2vpn
3. xconnect group group-name
4. p2p xconnect-name
5. interface type interface-path-id
6. neighbor A.B.C.D pw-id pseudowire-id
7. mpls static label local { value } remote { value }
8. Use the commit or end command.

DETAILED STEPS

Step 1 configure

Example:
RP/0/RSP0/CPU0:router# configure
Enters the Global Configuration mode.

Step 2 l2vpn

Example:
RP/0/RSP0/CPU0:router(config)# l2vpn
Enters L2VPN configuration mode.

Step 3 xconnect group group-name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn)# xconnect group grp_1
Enters the name of the cross-connect group.

Step 4 p2p xconnect-name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc)# p2p vlan1
Enters a name for the point-to-point cross-connect.

Step 5 interface type interface-path-id

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# interface gigabitethernet 0/1/0/9
Specifies the interface type and instance.

**Step 6**  
**neighbor** *A.B.C.D pw-id pseudowire-id*

**Example:**
```
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# neighbor 10.2.2.2 pw-id 2000
```

Configures the pseudowire segment for the cross-connect.

Use the *A.B.C.D* argument to specify the IP address of the cross-connect peer.

**Note**  
*A.B.C.D* can be a recursive or non-recursive prefix.

Optionally, you can disable the control word or set the transport-type to Ethernet or VLAN.

**Step 7**  
mpls static label local { value } remote { value }

**Example:**
```
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p-pw)# mpls static label local 699 remote 890
```

Configures local and remote label ID values.

**Step 8**  
Use the **commit** or **end** command.

**commit** - Saves the configuration changes and remains within the configuration session.

**end** - Prompts user to take one of these actions:

- **Yes** - Saves configuration changes and exits the configuration session.
- **No** - Exits the configuration session without committing the configuration changes.
- **Cancel** - Remains in the configuration mode, without committing the configuration changes.

---

**Configuring Dynamic Point-to-Point Cross-Connects**

Perform this task to configure dynamic point-to-point cross-connects.

**Note**  
For dynamic cross-connects, LDP must be up and running.
SUMMARY STEPS

1. configure
2. l2vpn
3. xconnect group  group-name
4. p2p  xconnect-name
5. interface  type interface-path-id
6. neighbor  A.B.C.D  pw-id  pseudowire-id
7. Use the commit or end command.

DETAILED STEPS

Step 1  configure

Example:
RP/0/RSP0/CPU0:router# configure
Enters the Global Configuration mode.

Step 2  l2vpn

Example:
RP/0/RSP0/CPU0:router(config)# l2vpn
Enters L2VPN configuration mode.

Step 3  xconnect group  group-name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn)# xconnect group grp_1
Enters the name of the cross-connect group.

Step 4  p2p  xconnect-name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc)# p2p vlan1
Enters a name for the point-to-point cross-connect.

Step 5  interface  type interface-path-id

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# interface GigabitEthernet0/0/0/0.1
Specifies the interface type ID. The choices are:

• GigabitEthernet: GigabitEthernet/IEEE 802.3 interfaces.
• TenGigE: TenGigabitEthernet/IEEE 802.3 interfaces.
• CEM: Circuit Emulation interface

Step 6  \textbf{neighbor}  \textit{A.B.C.D}  \textbf{pw-id}  \textit{pseudowire-id}

Example:
\texttt{RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# neighbor 2.2.2.2 pw-id 2000}

Configures the pseudowire segment for the cross-connect.
Optionally, you can disable the control word or set the transport-type to Ethernet or VLAN.

Step 7  Use the \texttt{commit} or \texttt{end} command.
\begin{itemize}
  \item \texttt{commit} - Saves the configuration changes and remains within the configuration session.
  \item \texttt{end} - Prompts user to take one of these actions:
    \begin{itemize}
      \item \texttt{Yes} - Saves configuration changes and exits the configuration session.
      \item \texttt{No} - Exits the configuration session without committing the configuration changes.
      \item \texttt{Cancel} - Remains in the configuration mode, without committing the configuration changes.
    \end{itemize}
\end{itemize}

Configuring Inter-AS

The Inter-AS configuration procedure is identical to the L2VPN cross-connect configuration tasks (see “Configuring Static Point-to-Point Cross-Connects” section and “Configuring Dynamic Point-to-Point Cross-Connects” section) except that the remote PE IP address used by the cross-connect configuration is now reachable through iBGP peering.

\textbf{Note}  You must be knowledgeable about IBGP, EBGP, and ASBR terminology and configurations to complete this configuration.

Configuring L2VPN Quality of Service

This section describes how to configure L2VPN quality of service (QoS) in port mode and mode, VLAN mode, Frame Relay and ATM sub-interfaces.

\textbf{Restrictions}  The \texttt{l2transport} command cannot be used with any IP address, L3, or CDP configuration.
Configuring an L2VPN Quality of Service Policy in Port Mode

This procedure describes how to configure an L2VPN QoS policy in port mode.

In port mode, the interface name format does not include a subinterface number; for example, GigabitEthernet0/1/0/1.

SUMMARY STEPS

1. configure
2. interface type interface-path-id
3. l2transport
4. service-policy [ input | output ] [ policy-map-name ]
5. Use the commit or end command.
6. show qos interface type interface-id service-policy [ input | output ] [ policy-map-name ]

DETAILED STEPS

Step 1 configure

Example:
RP/0/RSP0/CPU0:router# configure
Enters the configuration mode.

Step 2 interface type interface-path-id

Example:
RP/0/RSP0/CPU0:router(config)# interface GigabitEthernet 0/0/0/0
Specifies the interface attachment circuit.

Step 3 l2transport

Example:
RP/0/RSP0/CPU0:router(config-if)# l2transport
Configures an interface or connection for L2 switching.

Step 4 service-policy [ input | output ] [ policy-map-name ]

Example:
RP/0/RSP0/CPU0:router(config-if)# service-policy input servpol1
Attaches a QoS policy to an input or output interface to be used as the service policy for that interface.
Step 5  Use the commit or end command.

commit - Saves the configuration changes and remains within the configuration session.
end - Prompts user to take one of these actions:
  • Yes - Saves configuration changes and exits the configuration session.
  • No  - Exits the configuration session without committing the configuration changes.
  • Cancel - Remains in the configuration mode, without committing the configuration changes.

Step 6  show qos interface type interface-id service-policy [ input | output ] [ policy-map-name ]

Example:
RP/0/RSP0/CPU0:router# show qos interface gigabitethernet 0/0/0/0 input serpol1
(Optional) Displays the QoS service policy you defined.

Configuring an L2VPN Quality of Service Policy in VLAN Mode

This procedure describes how to configure a L2VPN QoS policy in VLAN mode.

Note  In VLAN mode, the interface name must include a subinterface. For example: GigabitEthernet0/1/0/1.1. The l2transport command must follow the interface type on the same CLI line. For example: interface GigabitEthernet 0/0/0/1.1 l2transport*

SUMMARY STEPS

1. configure
2. interface type interface-path-id.subinterface l2transport
3. service-policy [ input | output ] [ policy-map-name ]
4. Use the commit or end command.

DETAILED STEPS

Step 1  configure

Example:
RP/0/RSP0/CPU0:router# configure
Enters the Global Configuration mode.

Step 2  interface type interface-path-id.subinterface l2transport
Example:

```
RP/0/RSP0/CPU0:router(config)# interface GigabitEthernet0/0/0.1 l2transport
```

Configures an interface or connection for L2 switching.

**Note** In VLAN Mode, you must enter the `l2transport` keyword on the same line as the interface.

**Step 3**

```
service-policy [ input | output ] [ policy-map-name ]
```

Example:

```
RP/0/RSP0/CPU0:router(config-if)# service-policy input servpol1
```

Attaches a QoS policy to an input or output interface to be used as the service policy for that interface.

**Step 4**

Use the `commit` or `end` command.

- **commit** - Saves the configuration changes and remains within the configuration session.
- **end** - Prompts user to take one of these actions:
  - **Yes** - Saves configuration changes and exits the configuration session.
  - **No** - Exits the configuration session without committing the configuration changes.
  - **Cancel** - Remains in the configuration mode, without committing the configuration changes.

---

**Configuring Multisegment Pseudowire**

This section describes these tasks:

**Provisioning a Multisegment Pseudowire Configuration**

Configure a multisegment pseudowire as a point-to-point (p2p) cross-connect. For more information on P2P cross-connects, see the "Configuring Static Point-to-Point Cross-Connects".
SUMMARY STEPS

1. configure
2. l2vpn
3. xconnect group group-name
4. p2p xconnect-name
5. neighbor A.B.C.D pw-id value
6. pw-class class-name
7. exit
8. neighbor A.B.C.D pw-id value
9. pw-class class-name
10. commit

DETAILED STEPS

Step 1  configure

Example:
RP/0/RSP0/CPU0:router# configure

Enters the Global Configuration mode.

Step 2  l2vpn

Example:
RP/0/RSP0/CPU0:router# configure

Enters L2VPN configuration mode.

Step 3  xconnect group group-name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn)# xconnect group MS-PW1

Configures a cross-connect group name using a free-format 32-character string.

Step 4  p2p xconnect-name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc)# p2p ms-pw1

Enters P2P configuration submode.

Step 5  neighbor A.B.C.D pw-id value
Example:

RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# neighbor 10.165.200.25 pw-id 100

Configures a pseudowire for a cross-connect.
The IP address is that of the corresponding PE node.
The **pw-id** must match the **pw-id** of the PE node.

Note: For MSPW cross-connect configuration is performed at local PE, S-PE and Remote-PE.

**Step 6**  
**pw-class** *class-name*

**Example:**

RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p-pw)# pw-class dynamic_mpls

Enters pseudowire class submode, allowing you to define a pseudowire class template.

**Step 7**  
**exit**

**Example:**

RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p-pw)# exit

Exits pseudowire class submode and returns the router to the parent configuration mode.

**Step 8**  
**neighbor** *A.B.C.D* **pw-id** *value*

**Example:**

RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# neighbor 10.165.202.158 pw-id 300

Configures a pseudowire for a cross-connect.
The IP address is that of the corresponding PE node.
The **pw-id** must match the **pw-id** of the PE node.

**Step 9**  
**pw-class** *class-name*

**Example:**

RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p-pw)# pw-class dynamic_mpls

Enters pseudowire class submode, allowing you to define a pseudowire class template.

**Step 10**  
**commit**

**Example:**

RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p-pw)# commit

Saves configuration changes to the running configuration file and remains in the configuration session.
Provisioning a Global Multisegment Pseudowire Description

S-PE nodes must have a description in the Pseudowire Switching Point Type-Length-Value (TLV). The TLV records all the switching points the pseudowire traverses, creating a helpful history for troubleshooting.

Each multisegment pseudowire can have its own description. For instructions, see the "Provisioning a Cross-Connect Description". If it does not have one, this global description is used.

SUMMARY STEPS

1. configure
2. l2vpn
3. description value
4. commit

DETAILED STEPS

Step 1 configure

Example:
RP/0/RSP0/CPU0:router# configure
Enters the Global Configuration mode.

Step 2 l2vpn

Example:
RP/0/RSP0/CPU0:router(config)# l2vpn
Enters L2VPN configuration mode.

Step 3 description value

Example:
RP/0/RSP0/CPU0:router(config-l2vpn)# description S-PE1
Populates the Pseudowire Switching Point TLV. This TLV records all the switching points the pseudowire traverses. Each multisegment pseudowire can have its own description. If it does not have one, this global description is used.

Step 4 commit

Example:
RP/0/RSP0/CPU0:router(config-l2vpn)# commit
Saves configuration changes to the running configuration file and remains in the configuration session.
Provisioning a Cross-Connect Description

S-PE nodes must have a description in the Pseudowire Switching Point TLV. The TLV records all the switching points the pseudowire traverses, creating a history that is helpful for troubleshooting.

SUMMARY STEPS

1. configure
2. l2vpn
3. xconnect group group-name
4. p2p xconnect-name
5. description value
6. commit

DETAILED STEPS

Step 1 configure

Example:
RP/0/RSP0/CPU0:router# configure
Enters the Global Configuration mode.

Step 2 l2vpn

Example:
RP/0/RSP0/CPU0:router(config)# l2vpn
Enters L2VPN configuration mode.

Step 3 xconnect group group-name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn)# xconnect group MS-PW1
Configures a cross-connect group name using a free-format 32-character string.

Step 4 p2p xconnect-name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc)# p2p ms-pw1
Enters P2P configuration submode.

Step 5 description value
Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# description MS-PW from T-PE1 to T-PE2

Populates the Pseudowire Switching Point TLV. This TLV records all the switching points the pseudowire traverses.
Each multisegment pseudowire can have its own description. If it does not have one, a global description is used. For
more information, see the "Provisioning a Multisegment Pseudowire Configuration".

Step 6 commit

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# commit

Saves configuration changes to the running configuration file and remains in the configuration session.

---

**Provisioning Switching Point TLV Security**

For security purposes, the TLV can be hidden, preventing someone from viewing all the switching points the
pseudowire traverses.

Virtual Circuit Connection Verification (VCCV) may not work on multisegment pseudowires with the
switching-tlv parameter set to "hide". For more information on VCCV, see the "Virtual Circuit Connection
Verification on L2VPN".

**SUMMARY STEPS**

1. configure
2. l2vpn
3. pw-class class-name
4. encapsulation mpls
5. protocol ldp
6. switching-tlv hide
7. commit

**DETAILED STEPS**

**Step 1** configure

Example:
RP/0/RSP0/CPU0:router# configure

Enters the Global Configuration mode.

**Step 2** l2vpn
Example:
RP/0/RSP0/CPU0:router(config)# l2vpn
Enters L2VPN configuration mode.

Step 3 pw-class class-name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn)# pw-class dynamic_mpls
Enters pseudowire class submode, allowing you to define a pseudowire class template.

Step 4 encapsulation mpls

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-pwc)# encapsulation mpls
Sets pseudowire encapsulation to MPLS.

Step 5 protocol ldp

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-pwc-encap-mpls)# protocol ldp
Sets pseudowire signaling protocol to LDP.

Step 6 switching-tlv hide

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-pwc-encap-mpls)# switching-tlv hide
Sets pseudowire TLV to hide.

Step 7 commit

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-pwc-encap-mpls)#commit
Saves configuration changes to the running configuration file and remains in the configuration session.

Enabling Multisegment Pseudowires

Use the **pw-status** command after you enable the **pw-status** command. The **pw-status** command is disabled by default. Changing the **pw-status** command reprovisions all pseudowires configured under L2VPN.
SUMMARY STEPS

1. configure
2. l2vpn
3. pw-status
4. commit

DETAILED STEPS

Step 1 configure

Example:
RP/0/RSP0/CPU0:router# configure

Enters the Global Configuration mode.

Step 2 l2vpn

Example:
RP/0/RSP0/CPU0:router(config)# l2vpn

Enters Layer 2 VPN configuration mode.

Step 3 pw-status

Example:
RP/0/RSP0/CPU0:router(config-l2vpn)# pw-status

Enables all pseudowires configured on this Layer 2 VPN.

Note Use the pw-status disable command to disable pseudowire status.

Step 4 commit

Example:
RP/0/RSP0/CPU0:router(config-l2vpn)# commit

Saves configuration changes to the running configuration file and remains in the configuration session.

Configuring Pseudowire Redundancy

Pseudowire redundancy allows you to configure a backup pseudowire in case the primary pseudowire fails. When the primary pseudowire fails, the PE router can switch to the backup pseudowire. You can elect to have the primary pseudowire resume operation after it becomes functional.

These topics describe how to configure pseudowire redundancy:
Configuring Point-to-Point Pseudowire Redundancy

Perform this task to configure point-to-point pseudowire redundancy for a backup delay.

SUMMARY STEPS

1. configure
2. l2vpn
3. pw-class class-name
4. backup disable {delay value | never}
5. exit
6. xconnect group group-name
7. p2p {xconnect-name}
8. neighbor A.B.C.D pw-id value
9. pw-class class-name
10. backup {neighbor A.B.C.D} {pw-id value}
11. end or commit

DETAILED STEPS

Step 1 configure

Example:
RP/0/RSP0/CPU0:router# configure

Enters configuration mode.

Step 2 l2vpn

Example:
RP/0/RSP0/CPU0:router(config)# l2vpn
RP/0/RSP0/CPU0:router(config-l2vpn)#

Enters L2VPN configuration mode.

Step 3 pw-class class-name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn)# pw-class path1
RP/0/RSP0/CPU0:router(config-l2vpn-pwc)#

Configures the pseudowire class name.

Step 4 backup disable {delay value | never}

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-pwc)# backup disable delay 20

This command specifies how long the primary pseudowire should wait after it becomes active to take over from the backup pseudowire.
• Use the **delay** keyword to specify the number of seconds that elapse after the primary pseudowire comes up before the secondary pseudowire is deactivated. The range is from 0 to 180.

• Use the **never** keyword to specify that the secondary pseudowire does not fall back to the primary pseudowire if the primary pseudowire becomes available again, unless the secondary pseudowire fails.

### Step 5 exit

**Example:**
```plaintext
RP/0/RSP0/CPU0:router(config-l2vpn-pwc)# exit
RP/0/RSP0/CPU0:router(config-l2vpn)#
```

Exits the current configuration mode.

### Step 6 xconnect group group-name

**Example:**
```plaintext
RP/0/RSP0/CPU0:router(config-l2vpn)## xconnect group A
RP/0/RSP0/CPU0:router(config-l2vpn-xc)#
```

Enters the name of the cross-connect group.

### Step 7 p2p {xconnect-name}

**Example:**
```plaintext
RP/0/RSP0/CPU0:router(config-l2vpn-xc)# p2p xc1
```

Enters a name for the point-to-point cross-connect.

### Step 8 neighbor A.B.C.D pw-id value

**Example:**
```plaintext
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)## neighbor 10.1.1.2 pw-id 2
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p-pw)#
```

Configures the pseudowire segment for the cross-connect.

### Step 9 pw-class class-name

**Example:**
```plaintext
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p-pw)#pw-class path1
```

Configures the pseudowire class name.

### Step 10 backup {neighbor A.B.C.D} {pw-id value}

**Example:**
```plaintext
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p-pw)# backup neighbor 10.2.2.2 pw-id 5
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p-pw-backup)#
```

Configures the backup pseudowire for the cross-connect.

• Use the **neighbor** keyword to specify the peer to the cross-connect. The A.B.C.D argument is the IPv4 address of the peer.

• Use the **pw-id** keyword to configure the pseudowire ID. The range is from 1 to 4294967295.
Step 11  end or commit

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p-pw-backup)#end

or
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p-pw-backup)#commit

Saves configuration changes.

• When you issue the end command, the system prompts you to commit changes:

Uncommitted changes found, commit them before exiting(yes/no/cancel)?
[cancel]:

  * Entering yes saves configuration changes to the running configuration file, exits the configuration session, and returns the router to EXEC mode.

  * Entering no exits the configuration session and returns the router to EXEC mode without committing the configuration changes.

  * Entering cancel leaves the router in the current configuration session without exiting or committing the configuration changes.

• Use the commit command to save the configuration changes to the running configuration file and remain within the configuration session.

Forcing a Manual Switchover to the Backup Pseudowire

To force the router to switch over to the backup or switch back to the primary pseudowire, use the l2vpn switchover command in EXEC mode.

A manual switchover is made only if the peer specified in the command is actually available and the cross-connect moves to the fully active state when the command is entered.

Configuring a Backup Pseudowire

Perform this task to configure a backup pseudowire for a point-to-point neighbor.

SUMMARY STEPS

1. configure
2. l2vpn
3. xconnect group group-name
4. p2p xconnect-name
5. neighbor ip-address pw-id value
6. neighbor { A.B.C.D } { pw-id value }
7. Use the commit or end command.
DETAILED STEPS

Step 1 configure

Example:
RP/0/RSP0/CPU0:router# configure

Enters the Global Configuration mode.

Step 2 l2vpn

Example:
RP/0/RSP0/CPU0:router(config)# l2vpn
RP/0/RSP0/CPU0:router(config-l2vpn)#

Enters L2VPN configuration mode.

Step 3 xconnect group group-name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn)# xconnect group A
RP/0/RSP0/CPU0:router(config-l2vpn-xc)#

Enters the name of the cross-connect group.

Step 4 p2p xconnect-name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc)# p2p rtrX_to_rtrY
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)#

Enters a name for the point-to-point cross-connect.

Step 5 neighbor ip-address pw-id value

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# neighbor 1.1.1.1 pw-id 2
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p-pw)#

Configures the pseudowire segment for the cross-connect.

Step 6 neighbor { A.B.C.D } { pw-id value }

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# neighbor 10.1.1.2 pw-id 11

Configures the backup pseudowire for the cross-connect.

Step 7 Use the commit or end command.
commit - Saves the configuration changes and remains within the configuration session.
end - Prompts user to take one of these actions:
Yes - Saves configuration changes and exits the configuration session.
No - Exits the configuration session without committing the configuration changes.
Cancel - Remains in the configuration mode, without committing the configuration changes.

Configuring Point-to-Point Pseudowire Redundancy

Perform this task to configure point-to-point pseudowire redundancy for a backup delay.

SUMMARY STEPS

1. configure
2. l2vpn
3. pw-class { class-name }
4. backup disable { delay-value | never }
5. exit
6. xconnect group group-name
7. p2p { xconnect-name }
8. neighbor { A.B.C.D } { pw-id value }
9. pw-class { class-name }
10. backup { neighbor A.B.C.D } { pw-id value }
11. Use the commit or end command.

DETAILED STEPS

Step 1 configure

Example:
RP/0/RSP0/CPU0:router# configure
Enters the Global Configuration mode.

Step 2 l2vpn

Example:
RP/0/RSP0/CPU0:router(config)# l2vpn
RP/0/RSP0/CPU0:router(config-l2vpn)#
Enters L2VPN configuration mode.

Step 3 pw-class { class-name }

Example:
RP/0/RSP0/CPU0:router(config-l2vpn)# pw-class path1
RP/0/RSP0/CPU0:router(config-l2vpn-pwc)#

Configures the pseudowire class name.

Step 4 backup disable { delay value | never }

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-pwc)# backup disable delay 20

This command specifies how long the primary pseudowire should wait after it becomes active to take over for the backup pseudowire.

- Use the delay keyword to specify the number of seconds that elapse after the primary pseudowire comes up before the secondary pseudowire is deactivated. The range, in seconds, is from 0 to 180.
- Use the never keyword to specify that the secondary pseudowire does not fall back to the primary pseudowire if the primary pseudowire becomes available again, unless the secondary pseudowire fails.

Step 5 exit

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-pwc)# exit
RP/0/RSP0/CPU0:router(config-l2vpn)#

Exits the current configuration mode.

Step 6 xconnect group group-name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn)# xconnect group A
RP/0/RSP0/CPU0:router(config-l2vpn-xc)#

Enters the name of the cross-connect group.

Step 7 p2p { xconnect-name }

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc)# p2p xc1
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)#

Enters a name for the point-to-point cross-connect.

Step 8 neighbor { A.B.C.D } { pw-id value }

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# neighbor 10.1.1.2 pw-id 2
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p-pw)#

Configures the pseudowire segment for the cross-connect.

Step 9 pw-class { class-name }

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p-pw)#
Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p-pw)# pw-class path1
Configures the pseudowire class name.

Step 10  backup { neighbor A.B.C.D } { pw-id value }

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p-pw)# backup neighbor 10.2.2.2 pw-id 5
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p-pw-backup)#
Configures the backup pseudowire for the cross-connect.

- Use the neighbor keyword to specify the peer to the cross-connect. The A.B.C.D argument is the IPv4 address of the peer.
- Use the pw-id keyword to configure the pseudowire ID. The range is from 1 to 4294967295.

Step 11  Use the commit or end command.

commit - Saves the configuration changes and remains within the configuration session.
end - Prompts user to take one of these actions:
- Yes - Saves configuration changes and exits the configuration session.
- No - Exits the configuration session without committing the configuration changes.
- Cancel - Remains in the configuration mode, without committing the configuration changes.

Forcing a Manual Switchover to the Backup Pseudowire
To force the router to switch over to the backup or primary pseudowire, use the l2vpn switchover command in EXEC mode.
A manual switchover is made only if the peer specified in the command is actually available and the cross-connect moves to the fully active state when the command is entered.

Configuring Preferred Tunnel Path
This procedure describes how to configure a preferred tunnel path.

Note  The tunnel used for the preferred path configuration is an MPLS Traffic Engineering (MPLS-TE) tunnel.
SUMMARY STEPS

1. configure
2. l2vpn
3. pw-class \{name\}
4. encapsulation mpls
5. preferred-path \{interface\} \{tunnel-ip value | tunnel-te value | tunnel-tp value\} \{fallback disable\}
6. Use the commit or end command.

DETAILED STEPS

Step 1 configure

Example:

RP/0/RP0/CPU0:router# configure
Enters the configuration mode.

Step 2 l2vpn

Example:

RP/0/RP0/CPU0:router(config)# l2vpn
Enters L2VPN configuration mode.

Step 3 pw-class \{name\}

Example:

RP/0/RP0/CPU0:router(config-l2vpn)# pw-class path1
Configures the pseudowire class name.

Step 4 encapsulation mpls

Example:

RP/0/RP0/CPU0:router(config-l2vpn-pwc)# encapsulation mpls
Configures the pseudowire encapsulation to MPLS.

Step 5 preferred-path \{interface\} \{tunnel-ip value | tunnel-te value | tunnel-tp value\} \{fallback disable\}

Example:

RP/0/RP0/CPU0:router(config-l2vpn-pwc-encap-mpls)# preferred-path interface tunnel-te 11 fallback disable
Configures preferred path tunnel settings. If the fallback disable configuration is used and once the TE/TP tunnel is configured as the preferred path goes down, the corresponding pseudowire can also go down.

Step 6 Use the commit or end command.

commit - Saves the configuration changes and remains within the configuration session.
end - Prompts user to take one of these actions:
• Yes - Saves configuration changes and exits the configuration session.
• No - Exits the configuration session without committing the configuration changes.
• Cancel - Remains in the configuration mode, without committing the configuration changes.

---

### Configuring PW Status OAM

Perform this task to configure pseudowire status OAM.

**SUMMARY STEPS**

1. configure
2. l2vpn
3. pw-oam refresh transmit seconds
4. end or commit

**DETAILED STEPS**

---

**Step 1**
configure

**Example:**
```
RP/0/RSP0RP0/CPU0:router# configure
```
Enters the configuration mode.

**Step 2**
l2vpn

**Example:**
```
RP/0/RSP0RP0/CPU0:router(config)# l2vpn
```
Enters L2VPN configuration mode.

**Step 3**
pw-oam refresh transmit seconds

**Example:**
```
RP/0/RSP0RP0/CPU0:router(config-l2vpn)# pw-oam refresh transmit 100
```
Enables pseudowire OAM functionality.

**Note**
The refresh transmit interval ranges from 1 to 40 seconds.

**Step 4**
end or commit

**Example:**
```
RP/0/RSP0RP0/CPU0:router(config-l2vpn)# end
```
Saves configuration changes.
• When you issue the end command, the system prompts you to commit changes:
  Uncommitted changes found, commit them before exiting(yes/no/cancel)?[cancel]:
  ◦ Entering yes saves configuration changes to the running configuration file, exits the configuration session, and returns the router to EXEC mode.
  ◦ Entering no exits the configuration session and returns the router to EXEC mode without committing the configuration changes.
  ◦ Entering cancel leaves the router in the current configuration session without exiting or committing the configuration changes.

• Use the commit command to save the configuration changes to the running configuration file and remain within the configuration session.

---

**Enabling Flow-based Load Balancing**

Perform this task to enable flow-based load balancing.

**SUMMARY STEPS**

1. configure
2. l2vpn
3. load-balancing flow {src-dst-mac | src-dst-ip}
4. endorcommit

**DETAILED STEPS**

**Step 1**
configure

*Example:*
RP/0/RSP0RP0/CPU0:router# configure
Enters the configuration mode.

**Step 2**
l2vpn

*Example:*
RP/0/RSP0RP0/CPU0:router(config)# l2vpn
Enters L2VPN configuration mode.

**Step 3**
load-balancing flow {src-dst-mac | src-dst-ip}

*Example:*
RP/0/RSP0RP0/CPU0:router(config-l2vpn)# load-balancing flow src-dst-ip
Enables flow based load balancing for all the pseudowires and bundle EFPs under L2VPN, unless otherwise explicitly specified for pseudowires via pseudowire class and bundles via EFP-hash.
Enabling Flow-based Load Balancing for a Pseudowire Class

Perform this task to enable flow-based load balancing for a pseudowire class.

**SUMMARY STEPS**

1. configure
2. l2vpn
3. pw-class {name}
4. encapsulation mpls
5. load-balancing pw-label
6. endorcommit

**DETAILED STEPS**

**Step 1**

configure

Example:
RP/0/RSP0RP0/CPU0:router# configure
Enables the configuration mode.

**Step 2**

l2vpn

Example:
RP/0/RSP0RP0/CPU0:router# l2vpn
Enters the L2VPN session mode.
Example:
RP/0/RSP0RP0/CPU0:router(config)# l2vpn
Enters L2VPN configuration mode.

Step 3
pw-class {name}

Example:
RP/0/RSP0RP0/CPU0:router(config-l2vpn)# pw-class path1
Configures the pseudowire class name.

Step 4
encapsulation mpls

Example:
RP/0/RSP0RP0/CPU0:router(config-l2vpn-pwc)# encapsulation mpls
Configures the pseudowire encapsulation to MPLS.

Step 5
load-balancing pw-label

Example:
RP/0/RSP0RP0/CPU0:router(config-l2vpn-pwc-encap-mpls)# load-balancing pw-label
Enables all pseudowires using the defined class to use virtual circuit based load balancing.

Step 6
end
or
commit

Example:
RP/0/RSP0RP0/CPU0:router(config-l2vpn-pwc-encap-mpls)# end
or
RP/0/RSP0RP0/CPU0:router(config-l2vpn-pwc-encap-mpls)# commit
Saves configuration changes.

- When you issue the end command, the system prompts you to commit changes:
  Uncommitted changes found, commit them before exiting(yes/no/cancel)?[cancel]:
  - Entering yes saves configuration changes to the running configuration file, exits the configuration session, and returns the router to EXEC mode.
  - Entering no exits the configuration session and returns the router to EXEC mode without committing the configuration changes.
  - Entering cancel leaves the router in the current configuration session without exiting or committing the configuration changes.

- Use the commit command to save the configuration changes to the running configuration file and remain within the configuration session.

---

Enabling Pseudowire Grouping

Perform this task to enable pseudowire grouping.
SUMMARY STEPS

1. configure
2. l2vpn
3. pw-grouping
4. Use the commit or end command.

DETAILED STEPS

Step 1  configure

Example:
RP/0/RSP0/CPU0:router# configure
Enters the Global Configuration mode.

Step 2  l2vpn

Example:
RP/0/RSP0/CPU0:router(config)# l2vpn
RP/0/RSP0/CPU0:router(config-l2vpn)#
Enters L2VPN configuration mode.

Step 3  pw-grouping

Example:
RP/0/RSP0/CPU0:router(config-l2vpn)# pw-grouping
Enables pseudowire grouping

Step 4  Use the commit or end command.

commit - Saves the configuration changes and remains within the configuration session.

end - Prompts user to take one of these actions:

- Yes - Saves configuration changes and exits the configuration session.
- No - Exits the configuration session without committing the configuration changes.
- Cancel - Remains in the configuration mode, without committing the configuration changes.

Setting Up Your Multicast Connections

Refer to the Implementing Multicast Routing on Cisco ASR 9000 Series Aggregation Services Routers module of the Cisco ASR 9000 Series Aggregation Services Router Multicast Configuration Guide and the Multicast Routing and Forwarding Commands on Cisco ASR 9000 Series Aggregation Services Routers module of the Cisco ASR 9000 Series Aggregation Services Router Multicast Command Reference.
SUMMARY STEPS

1. configure
2. multicast-routing [address-family ipv4]
3. interface all enable
4. exit
5. router igmp
6. version {1 | 2 | 3}
7. endorcommit
8. show pim [ipv4] group-map [ip-address-name] [info-source]
9. show pim [vrf vrf-name] [ipv4] topology [source-ip-address [group-ip-address] | entry-flag flag | interface-flag | summary] [route-count]

DETAILED STEPS

Step 1  configure

Example:
RP/0/RSP0/CPU0:router# configure
Enters global configuration mode.

Step 2  multicast-routing [address-family ipv4]

Example:
RP/0/RSP0/CPU0:router(config)# multicast-routing
Enters multicast routing configuration mode.

• These multicast processes are started: MRIB, MFWD, PIM, and IGMP.

• For IPv4, IGMP version 3 is enabled by default.

• For IPv4, use the address-family ipv4 keywords

Step 3  interface all enable

Example:
RP/0/RSP0/CPU0:router(config-mcast-ipv4)# interface all enable
Enables multicast routing and forwarding on all new and existing interfaces.

Step 4  exit

Example:
RP/0/RSP0/CPU0:router(config-mcast-ipv4)# exit
Exits multicast routing configuration mode, and returns the router to the parent configuration mode.

Note  For Leaf PEs, if you intend to enable IGMPSN on the bridge domain, ensure that you configure internal querier inside the IGMPSN profile.

Step 5  router igmp
Example:
RP/0/RSP0/CPU0:router(config)# router igmp
(Optional) Enters router IGMP configuration mode.

Step 6  
version {1 | 2 | 3}

Example:
RP/0/RSP0/CPU0:router(config-igmp)# version 3
(Optional) Selects the IGMP version that the router interface uses.

• The default for IGMP is version 3.
• Host receivers must support IGMPv3 for PIM-SSM operation.
• If this command is configured in router IGMP configuration mode, parameters are inherited by all new and existing interfaces. You can override these parameters on individual interfaces from interface configuration mode.

Step 7  
endorcommit

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# end
or
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# commit
Saves configuration changes.

• When you issue the end command, the system prompts you to commit changes:
  Uncommitted changes found, commit them before exiting(yes/no/cancel)?[cancel]:

  • Entering yes saves configuration changes to the running configuration file, exits the configuration session, and returns the router to EXEC mode.
  • Entering no exits the configuration session and returns the router to EXEC mode without committing the configuration changes.
  • Entering cancel leaves the router in the current configuration session without exiting or committing the configuration changes.

• Use the commit command to save the configuration changes to the running configuration file and remain within the configuration session.

Step 8  
show pim [ipv4] group-map [ip-address-name] [info-source]

Example:
RP/0//CPU0:router# show pim ipv4 group-map
(Optional) Displays group-to-PIM mode mapping.

Step 9  
show pim [vrf vrf-name] [ipv4] topology [source-ip-address [group-ip-address] | entry-flag flag | interface-flag | summary] [route-count]

Example:
RP/0/RSP0/CPU0:router# show pim topology
(Optional) Displays PIM topology table information for a specific group or all groups.
Configuring AToM IP Interworking

Perform this task to configure AToM IP Interworking.

SUMMARY STEPS

1. configure
2. l2vpn
3. xconnect group group-name
4. p2p xconnect-name
5. interworking ipv4
6. Use the commit or end command.

DETAILED STEPS

Step 1 configure

Example:
RP/0/RSP0/CPU0:router# configure
Enters the Global Configuration mode.

Step 2 l2vpn

Example:
RP/0/RSP0/CPU0:router(config)# l2vpn
Enters L2VPN configuration mode.

Step 3 xconnect group group-name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn)# xconnect group grp_1
Enters the name of the cross-connect group.

Step 4 p2p xconnect-name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc)# p2p vlan1
Enters a name for the point-to-point cross-connect.

Step 5 interworking ipv4

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# interworking ipv4
Configures IPv4 interworking under P2P.

Step 6 Use the commit or end command.
commit - Saves the configuration changes and remains within the configuration session.
end - Prompts user to take one of these actions:
  - Yes - Saves configuration changes and exits the configuration session.
  - No - Exits the configuration session without committing the configuration changes.
  - Cancel - Remains in the configuration mode, without committing the configuration changes.

Configuring PPP IP Interworking

Perform this tasks to configure PPP IP Interworking:

**SUMMARY STEPS**

1. configure
2. interface type interface-path-id
3. encapsulation ppp
4. l2transport
5. end
6. l2vpn
7. xconnect group group-name
8. p2p xconnect-name
9. interface type interface-path-id
10. interface type interface-path-id
11. interworking ipv4
12. interface type interface-path-id
13. neighbor A.B.C.D pw-id
14. pw-class interface-path-id
15. exit
16. interworking ipv4
17. endorcommit

**DETAILED STEPS**

**Step 1**
configure

*Example:*
RP/0/0/CPU0:router# configure
Enters global configuration mode.

**Step 2**
interface type interface-path-id
Example:
RP/0/RSP0/CPU0:router(config)# interface Serial0/2/1/0/1/1/1:0
Specifies the interface type and instance.

**Step 3**
encapsulation ppp

Example:
RP/0/RSP0/CPU0:router(config-if)# encapsulation ppp
Sets encapsulation type to PPP.

**Step 4**
l2transport

Example:
RP/0/RSP0/CPU0:router(config-if)# l2transport
Enables Layer 2 transport on the selected interface.

**Step 5**
end

Example:
RP/0/RSP0/CPU0:router(config-if-l2)# end
Returns to global configuration mode.

**Step 6**
l2vpn

Example:
RP/0/RSP0/CPU0:router(config)# l2vpn
Enters L2VPN configuration mode.

**Step 7**
xconnect group group-name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn)# xconnect group grp_1
Enters the name of the cross-connect group.

**Step 8**
p2p xconnect-name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc)# p2p 1
Enters a name for the point-to-point cross-connect.

**Step 9**
interface type interface-path-id

Example:
RP/0/RSP0/CPU0:router(config)# interface Serial0/2/1/0/1/1/1:0
Specifies the interface type and instance.

**Step 10**
interface type interface-path-id

Example:
RP/0/RSP0/CPU0:router(config)# interface GigabitEthernet0/0/0/1.1
Specifies the interface type and instance.

**Step 11**
interworking ipv4
Configuring PPP IP Interworking

**Example:**
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# interworking ipv4
Configures IPv4 interworking under P2P.

**Step 12**
interface type interface-path-id

**Example:**
RP/0/RSP0/CPU0:router(config)# interface GigabitEthernet0/0/0/1.1
Specifies the interface type and instance.

**Step 13**
neighbor A.B.C.D pw-id

**Example:**
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# interface Serial0/0/0/2/1:0
Configures the pseudowire segment for the cross-connect.

Use the A.B.C.D argument to specify the IP address of the cross-connect peer.

**Note**
A.B.C.D can be a recursive or non-recursive prefix

Optionally, you can disable the control word or set the transport-type to Ethernet or VLAN.

**Step 14**
pw-class interface-path-id

**Example:**
RP/0/RSP0/CPU0:router (config-l2vpn-xc-p2p-pw)# pw-class class_c1
Enters pseudowire class submode, allowing you to define a pseudowire class template.

**Step 15**
exit

**Example:**
RP/0/RSP0/CPU0:router (config-l2vpn-xc-p2p-pw)# exit
Exits the current configuration mode.

**Step 16**
interworking ipv4

**Example:**
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# interworking ipv4
Configures IPv4 interworking under P2P.

**Step 17**
endor commit

**Example:**
RP/0/RSP0/CPU0:router(config-l2vpn-bd-bd)# end
or
RP/0/RSP0/CPU0:router(config-l2vpn-bd-bd)#commit
Saves configuration changes.

- When you issue the **end** command, the system prompts you to commit changes:
  Uncommitted changes found, commit them before exiting(yes/no/cancel)?[cancel]:

  * Entering **yes** saves configuration changes to the running configuration file, exits the configuration session, and returns the router to EXEC mode.

---

Cisco ASR 9000 Series Aggregation Services Router L2VPN and Ethernet Services Configuration Guide, Release 5.2.x
Configuring IP Interworking between PPP and Ethernet

Perform this tasks to configure PPP IP Interworking:

**SUMMARY STEPS**

1. configure
2. interface type interface-path-id
3. l2transport
4. end
5. l2vpn
6. xconnect group group-name
7. p2pconnect-name
8. interface type interface-path-id
9. interface type interface-path-id
10. interworking ipv4
11. interface type interface-path-id
12. neighbor A.B.C.D pw-id
13. pw-class class-name
14. pw-class class-name
15. exit
16. interworking ipv4
17. Use the commit or end command.

**DETAILED STEPS**

**Step 1** configure

*Example:*

```
RP/0/RSP0/CPU0:router# configure
```

Enters the Global Configuration mode.
Step 2  
**interface type interface-path-id**

**Example:**
RP/0/RSP0/CPU0:router(config)# interface Serial0/2/1/0/1/1/1/0
Specifies the interface type and instance.

Step 3  
**l2transport**

**Example:**
RP/0/RSP0/CPU0:router(config-if)# l2transport
Enables Layer 2 transport on the selected interface.

Step 4  
**end**

**Example:**
RP/0/RSP0/CPU0:router(config-if-12)# end
Returns to global configuration mode.

Step 5  
**l2vpn**

**Example:**
RP/0/RSP0/CPU0:router(config)# l2vpn
Enters L2VPN configuration mode.

Step 6  
**xconnect group group-name**

**Example:**
RP/0/RSP0/CPU0:router(config-l2vpn)# xconnect group grp_1
Enters the name of the cross-connect group.

Step 7  
**p2p xconnect-name**

**Example:**
RP/0/RSP0/CPU0:router(config-l2vpn-xc)# p2p 1
Enters a name for the point-to-point cross-connect.

Step 8  
**interface type interface-path-id**

**Example:**
RP/0/RSP0/CPU0:router(config)# interface Serial0/2/1/0/1/1/1/0
Specifies the interface type and instance.

Step 9  
**interface type interface-path-id**

**Example:**
RP/0/RSP0/CPU0:router(config)# interface GigabitEthernet0/0/0/1.1
Specifies the interface type and instance.

Step 10  
**interworking ipv4**

**Example:**
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# interworking ipv4
Configures IPv4 interworking under P2P.
Step 11  interface type interface-path-id

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# interface Serial0/0/0/0/2/1/1:0
Specifies the interface type and instance.

Step 12  neighbor A.B.C.D pw-id

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# interface Serial0/0/0/0/2/1/1:0
Configures the pseudowire segment for the cross-connect.
Use the A.B.C.D argument to specify the IP address of the cross-connect peer.

Note  A.B.C.D can be a recursive or non-recursive prefix

Optionally, you can disable the control word or set the transport-type to Ethernet or VLAN.

Step 13  pw-class: class-name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# interface Serial0/0/0/0/2/1/1:0
Configures the pseudowire segment for the cross-connect.
Use the A.B.C.D argument to specify the IP address of the cross-connect peer.

Note  A.B.C.D can be a recursive or non-recursive prefix

Optionally, you can disable the control word or set the transport-type to Ethernet or VLAN.

Step 14  pw-class: class-name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p-pw)# pw-class class_cem
Enters pseudowire class submode, allowing you to define a pseudowire class template.

Step 15  exit

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p-pw)# exit
Exits the current configuration mode.

Step 16  interworking ipv4

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# interworking ipv4
Configures IPv4 interworking under P2P.

Step 17  Use the commit or end command.

commit - Saves the configuration changes and remains within the configuration session.
end - Prompts user to take one of these actions:

• Yes - Saves configuration changes and exits the configuration session.
• No - Exits the configuration session without committing the configuration changes.
• Cancel - Remains in the configuration mode, without committing the configuration changes.
Configuring MLPPP IP Interworking

Perform this tasks to configure cHDLC IP Interworking:

**SUMMARY STEPS**

1. configure
2. interface type interface-path-id
3. multilink [fragment|interleave|ncp]
4. l2transport
5. end
6. l2vpn
7. xconnect group group-name
8. p2p xconnect-name
9. interface type interface-path-id
10. interface type interface-path-id
11. interworking ipv4
12. interface type interface-path-id
13. neighbor {A.B.C.D} {pw-id value}
14. pw-class class-name
15. exit
16. interworking ipv4
17. Use the commit or end command.

**DETAILED STEPS**

**Step 1** configure

Example:

RP/0/RSP0/CPU0:router# configure
Enters the Global Configuration mode.

**Step 2** interface type interface-path-id

Example:

RP/0/RSP0/CPU0:router(config)# interface Multilink0/2/1/0/1
Specifies the interface type and instance.

**Step 3** multilink [fragment|interleave|ncp]

Example:

RP/0/RSP0/CPU0:router(config-if)# multilink
Modifies multilink parameters

Step 4  l2transport

Example:
RP/0/RSP0/CPU0:router(config-if-multilink)# l2transport
Enables Layer 2 transport on the selected interface.

Step 5  end

Example:
RP/0/RSP0/CPU0:router(config-if-l2)# end
Returns to global configuration mode.

Step 6  l2vpn

Example:
RP/0/RSP0/CPU0:router(config)# l2vpn
Enters L2VPN configuration mode.

Step 7  xconnect group group-name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn)# xconnect group grp_1
Enters the name of the cross-connect group.

Step 8  p2p xconnect-name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc)# p2p 1
Enters a name for the point-to-point cross-connect.

Step 9  interface type interface-path-id

Example:
RP/0/RSP0/CPU0:router(config)# interface Serial0/2/0/1/1/1/1:0
Specifies the interface type and instance.

Step 10 interface type interface-path-id

Example:
RP/0/RSP0/CPU0:router(config)# interface GigabitEthernet0/0/0/1.1
Specifies the interface type and instance.

Step 11 interworking ipv4

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# interworking ipv4
Configures IPv4 interworking under P2P.

Step 12 interface type interface-path-id

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# interface Serial0/0/0/2/1/1:0
Step 13 neighbor{A.B.C.D}{pw-id value}

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# neighbor 120.120.120.120 pw-id 3

Configures the pseudowire segment for the cross-connect.

Note:
A.B.C.D can be a recursive or non-recursive prefix
Optionally, you can disable the control word or set the transport-type to Ethernet or VLAN.

Step 14 pw-class class-name

Example:
RP/0/RSP0/CPU0:router (config-l2vpn-xc-p2p-pw)# pw-class class_cem

Enters pseudowire class submode, allowing you to define a pseudowire class template.

Step 15 exit

Example:
RP/0/RSP0/CPU0:router (config-l2vpn-xc-p2p-pw)# exit

Exits the current configuration mode.

Step 16 interworking ipv4

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p-pw)# interworking ipv4

Configures IPv4 interworking under P2P.

Step 17 Use the commit or end command.

commit - Saves the configuration changes and remains within the configuration session.
end - Prompts user to take one of these actions:

- Yes - Saves configuration changes and exits the configuration session.
- No - Exits the configuration session without committing the configuration changes.
- Cancel - Remains in the configuration mode, without committing the configuration changes.

Configuring Circuit Emulation Over Packet Switched Network

Perform these tasks to configure CEoP:

Adding CEM attachment circuit to a Pseudowire

Perform this task to add a CEM attachment circuit to a pseudowire.
SUMMARY STEPS

1. configure
2. l2vpn
3. xconnect group group-name
4. p2p xconnect-name
5. interface type interface-path-id
6. neighbor A.B.C.D pw-id
7. Use the commit or end command.

DETAILED STEPS

Step 1 configure
Example:
RP/0/RSP0/CPU0:router# configure
Enters the Global Configuration mode.

Step 2 l2vpn
Example:
RP/0/RSP0/CPU0:router(config)# l2vpn
Enters L2VPN configuration mode.

Step 3 xconnect group group-name
Example:
RP/0/RSP0/CPU0:router(config-l2vpn)# xconnect group grp_1
Enters the name of the cross-connect group.

Step 4 p2p xconnect-name
Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc)# p2p vlan1
Enters a name for the point-to-point cross-connect.

Step 5 interface type interface-path-id
Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# interface CEM/0/0/9:10
Specifies the interface type and instance.

Step 6 neighbor A.B.C.D pw-id
Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# neighbor 120.120.120.120 pw-id 3
Configures the pseudowire segment for the cross-connect.

Use the A.B.C.D argument to specify the IP address of the cross-connect peer.

**Note**  
A.B.C.D can be a recursive or non-recursive prefix

Optionally, you can disable the control word or set the transport-type to Ethernet or VLAN

**Step 7**  
Use the `commit` or `end` command.

- **commit** - Saves the configuration changes and remains within the configuration session.
- **end** - Prompts user to take one of these actions:
  - **Yes** - Saves configuration changes and exits the configuration session.
  - **No** - Exits the configuration session without committing the configuration changes.
  - **Cancel** - Remains in the configuration mode, without committing the configuration changes.

---

**Associating a Pseudowire Class**

Perform this task to associate the attachment circuit with a pseudowire class.

**SUMMARY STEPS**

1. `configure`
2. `l2vpn`
3. `pw-class class-name`
4. `encapsulation mpls`
5. `protocol ldp`
6. `end`
7. `xconnect group group-name`
8. `p2p xconnect-name`
9. `interface type interface-path-id`
10. `neighbor A.B.C.D pw-id pseudowire-id`
11. `pw-class class-name`
12. Use the `commit` or `end` command.

**DETAILED STEPS**

**Step 1**  
`configure`

**Example:**

```
RP/0/RSP0/CPU0:router# configure
```

Enters Global Configuration mode.
Step 2  l2vpn

Example:

RP/0/RSP0/CPU0:router (config)# l2vpn

Enters Layer 2 VPN configuration mode.

Step 3  pw-class class-name

Example:

RP/0/RSP0/CPU0:router (config-l2vpn)# pw-class class_cem

Enters pseudowire class submode, allowing you to define a pseudowire class template.

Step 4  encapsulation mpls

Example:

RP/0/RSP0/CPU0:router (config-l2vpn-pwc)# encapsulation mpls

Sets pseudowire encapsulation to MPLS.

Step 5  protocol ldp

Example:

RP/0/RSP0/CPU0:router (config-l2vpn-pwc-encap-mpls)# protocol ldp

Sets pseudowire signaling protocol to LDP.

Step 6  end

Example:

RP/0/RSP0/CPU0:router(config-l2vpn-pwc-encap-mpls)# end

System prompts you to commit changes:

Uncommitted changes found, commit them before exiting(yes/no/cancel)?[cancel]:

- Entering yes saves configuration changes to the running configuration file, exits the configuration session, and returns the router to EXEC mode.
- Entering no exits the configuration session and returns the router to EXEC mode without committing the configuration changes.
- Entering cancel leaves the router in the current configuration session without exiting or committing the configuration changes.

Step 7  xconnect group group-name
Example:
RP/0/RSP0/CPU0:router(config-l2vpn)# xconnect group grp_1
Configures a cross-connect group.

**Step 8**

**p2p xconnect-name**

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc)# p2p vlan1
Configures a point-to-point cross-connect.

**Step 9**

**interface type interface-path-id**

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# interface CEM0/1/0/9:20
Specifies the interface type and instance.

**Step 10**

**neighbor A.B.C.D pw-id pseudowire-id**

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# neighbor 10.2.2.2 pw-id 11
Configures the pseudowire segment for the cross-connect.
Use the A.B.C.D argument to specify the IP address of the cross-connect peer.

**Note**

- A.B.C.D can be a recursive or non-recursive prefix.
- Optionally, you can disable the control word or set the transport-type to Ethernet or VLAN.

**Note**
Pseudowire status (pw-status) is enabled by default, use the `pw-status disable` command to disable pseudowire status if required.

**Step 11**

**pw-class class-name**

Example:
RP/0/RSP0/CPU0:router (config-l2vpn-xc-p2p)# pw-class class_cem
Associates the P2P attachment circuit with the specified pseudowire class.

**Step 12**

Use the **commit** or **end** command.

- **commit** - Saves the configuration changes and remains within the configuration session.
- **end** - Prompts user to take one of these actions:
  - **Yes** - Saves configuration changes and exits the configuration session.
  - **No** - Exits the configuration session without committing the configuration changes.
  - **Cancel** - Remains in the configuration mode, without committing the configuration changes.
Enabling Pseudowire Status

Perform this task to enable pseudowire status.

SUMMARY STEPS

1. configure
2. l2vpn
3. pw-status
4. commit

DETAILED STEPS

Step 1 configure

Example:
RP/0/RSP0/CPU0:router# configure
Enters global configuration mode.

Step 2 l2vpn

Example:
RP/0/RSP0/CPU0:router (config)# l2vpn
Enters Layer 2 VPN configuration mode.

Step 3 pw-status

Example:
RP/0/RSP0/CPU0:router (config-l2vpn)# pw-status
Enables all pseudowires configured on this Layer 2 VPN.

Note Use the pw-status disable command to disable pseudowire status.

Step 4 commit

Example:
RP/0/RSP0/CPU0:router (config-l2vpn)# commit
Saves configuration changes to the running configuration file and remains in the configuration session.

Configuring a Backup Pseudowire

Perform this task to configure a backup pseudowire for a point-to-point neighbor.
SUMMARY STEPS

1. configure
2. l2vpn
3. xconnect group group-name
4. p2p xconnect-name
5. neighbor ip-address pw-id value
6. neighbor { A.B.C.D } { pw-id value }
7. Use the commit or end command.

DETAILED STEPS

Step 1 configure

Example:
RP/0/RSP0/CPU0:router# configure
Enters the Global Configuration mode.

Step 2 l2vpn

Example:
RP/0/RSP0/CPU0:router(config)# l2vpn
RP/0/RSP0/CPU0:router(config-l2vpn)#
Enters L2VPN configuration mode.

Step 3 xconnect group group-name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn)# xconnect group A
RP/0/RSP0/CPU0:router(config-l2vpn-xc)#
Enters the name of the cross-connect group.

Step 4 p2p xconnect-name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc)# p2p rtrX_to_rtrY
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)#
Enters a name for the point-to-point cross-connect.

Step 5 neighbor ip-address pw-id value

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# neighbor 1.1.1.1 pw-id 2
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p-pw)#
Step 6

**neighbor** \{ \text{A.B.C.D} \} \{ \text{pw-id} \ \text{value} \}

**Example:**

RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# neighbor 10.1.1.2 pw-id 11

Configures the backup pseudowire for the cross-connect.

Step 7

Use the **commit** or **end** command.

- **commit** - Saves the configuration changes and remains within the configuration session.
- **end** - Prompts user to take one of these actions:
  - **Yes** - Saves configuration changes and exits the configuration session.
  - **No** - Exits the configuration session without committing the configuration changes.
  - **Cancel** - Remains in the configuration mode, without committing the configuration changes.

---

**Configuring L2VPN Nonstop Routing**

Perform this task to configure L2VPN Nonstop Routing.

**SUMMARY STEPS**

1. **configure**
2. **l2vpn**
3. **nsr**
4. **logging nsr**
5. Use the **commit** or **end** command.

**DETAILED STEPS**

Step 1

**configure**

**Example:**

RP/0/RSP0/CPU0:router# configure

Enters Global Configuration mode.

Step 2

**l2vpn**

**Example:**

RP/0/RSP0/CPU0:router(config)# l2vpn
Enters the Global Configuration mode.

**Step 3 nsr**

*Example:*

```
RP/0/RSP0/CPU0:router (config-l2vpn)# nsr
```

Enables L2VPN nonstop routing.

**Step 4 logging nsr**

*Example:*

```
RP/0/RSP0/CPU0:router (config-l2vpn)# logging nsr
```

Enables logging of NSR events.

**Step 5** Use the **commit** or **end** command.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>

---

**Configuring L2TPv3 over IPv6 Tunnels**

Perform these tasks to configure the L2TPv3 over IPv6 tunnels:

**Configuring Neighbor AFI for Pseudowire**

Perform this task to configure the neighbor AFI for pseudowire.

---

**Restriction** L2TPv3 over IPv6 Tunnels is supported only on layer 2 transport sub-interfaces and not physical interfaces.
SUMMARY STEPS

1. configure
2. l2vpn
3. xconnect group group-name
4. p2p xconnect-name
5. interface type interface-path-id
6. neighbor ipv6 X::X pw-id pseudowire-id
7. Use the commit or end command.

DETAILED STEPS

Step 1 configure

Example:
RP/0/RSP0/CPU0:router# configure

Enters the Global Configuration mode.

Step 2 l2vpn

Example:
RP/0/RSP0/CPU0:router (config)# l2vpn

Enters Layer 2 VPN configuration mode.

Step 3 xconnect group group-name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn)# xconnect group grp_1

Configures a cross-connect group and specifies it's name.

Step 4 p2p xconnect-name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc)# p2p vlan1

Configures a point-to-point cross-connect.

Step 5 interface type interface-path-id

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# interface GigabitEthernet0/4/0/30

Specifies the interface type ID. The choices are:

- GigabitEthernet: Gigabit Ethernet/IEEE 802.3 interfaces
TenGigE: TenGigabit Ethernet/IEEE 802.3 interfaces

**Step 6**

`neighbor ipv6 X::X pw-id pseudowire-id`

**Example:**

```
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# neighbor ipv6 1111:2222::cdef pw-id 2000
```

Specifies the peer with which to cross connect, and configures the pseudowire segment for the cross-connect.

**Step 7**

Use the `commit` or `end` command.

- **commit** - Saves the configuration changes and remains within the configuration session.
- **end** - Prompts user to take one of these actions:
  - **Yes** - Saves configuration changes and exits the configuration session.
  - **No** - Exits the configuration session without committing the configuration changes.
  - **Cancel** - Remains in the configuration mode, without committing the configuration changes.

---

**Configuring L2TPv3 encapsulation and protocol**

Perform this task to configure L2TPv3 encapsulation and protocol.

**SUMMARY STEPS**

1. `configure`
2. `l2vpn`
3. `pw-class class-name`
4. `encapsulation l2tpv3`
5. `protocol l2tpv3`
6. Use the `commit` or `end` command.

**DETAILED STEPS**

**Step 1**

`configure`

**Example:**

```
RP/0/RSP0/CPU0:router# configure
```

Enters the Global Configuration mode.

**Step 2**

`l2vpn`
Example:

```
RP/0/RSP0/CPU0:router (config)# l2vpn
```

Enters Layer 2 VPN configuration mode.

**Step 3** \[pw-class \]  \[class-name\]

Example:

```
RP/0/RSP0/CPU0:router (config-l2vpn)# pw-class l2tpv3_class
```

Enters pseudowire class submode, allows a pseudowire class template definition.

These keywords can be configured in the pseudowire class (pw-class) configuration mode; however, the keywords are not applicable for the over L2TPv3 over IPv6 tunnels:

- cookie
- dfbit
- ipv4 source
- pmtu
- sequencing
- transport-mode

**Step 4** \[encapsulation \]  \[l2tpv3\]

Example:

```
RP/0/RSP0/CPU0:router (config-l2vpn-pwc)# encapsulation l2tpv3
```

Sets pseudowire encapsulation to L2TPv3

**Step 5** \[protocol \]  \[l2tpv3\]

Example:

```
RP/0/RSP0/CPU0:router (config-l2vpn-pwc-encap-l2tpv3)# protocol l2tpv3
```

Sets pseudowire signaling protocol to L2TPv3.

**Step 6**

Use the `commit` or `end` command.

- `commit` - Saves the configuration changes and remains within the configuration session.
- `end` - Prompts user to take one of these actions:
  - Yes - Saves configuration changes and exits the configuration session.
  - No - Exits the configuration session without committing the configuration changes.
  - Cancel - Remains in the configuration mode, without committing the configuration changes.
Configuring Source IPv6 address for L2TPv3 over IPv6 tunnel

Perform this task to configure the source IPv6 address for the L2TPv3 over IPv6 tunnel.

**SUMMARY STEPS**

1. configure
2. l2vpn
3. xconnect group group-name
4. p2p xconnect-name
5. interface type interface-path-id
6. neighbor ipv6 peer-address pw-id pseudowire-id
7. source pw-source-address
8. end or commit

**DETAILED STEPS**

**Step 1** configure

Example:
```
RP/0/RSP0/CPU0:router# configure
```
Enters global configuration mode.

**Step 2** l2vpn

Example:
```
RP/0/RSP0/CPU0:router (config)# l2vpn
```
Enters Layer 2 VPN configuration mode.

**Step 3** xconnect group group-name

Example:
```
RP/0/RSP0/CPU0:router (config-l2vpn)# xconnect group g1
```
Configures the cross-connect group.

**Step 4** p2p xconnect-name

Example:
```
RP/0/RSP0/CPU0:router (config-l2vpn-xc)# p2p xc3
```
Configures the point-to-point cross-connect.

**Step 5** interface type interface-path-id

Example:
```
RP/0/RSP0/CPU0:router (config-l2vpn-xc-p2p)# interface GigabitEthernet0/0/0/4.2
```
Specifies the interface type ID.

**Step 6** neighbor ipv6 peer-address pw-id pseudowire-id

Example:
```
```
Example:
RP/0/RSP0/CPU0:router (config-l2vpn-xc-p2p)# neighbor ipv6 1111:2222::cdef pw-id 1
Specifies the peer with which to cross connect, and configures the pseudowire segment for the cross-connect.

Step 7 source pw-source-address

Example:
RP/0/RSP0/CPU0:router (config-l2vpn-xc-p2p-pw)# source 1111:2222::abcd
Configures the source IPv6 address of the pseudowire.

Note The source IPv6 address must be unique and chosen arbitrarily. It should not be configured on any type of interfaces in the router.

Step 8 end or commit

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p-pw)# end
or
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p-pw)# commit
Saves configuration changes.

• When you issue the end command, the system prompts you to commit changes:
  Uncommitted changes found, commit them before exiting(yes/no/cancel)?[cancel]:
  ◦ Entering yes saves configuration changes to the running configuration file, exits the configuration session, and returns the router to EXEC mode.
  ◦ Entering no exits the configuration session and returns the router to EXEC mode without committing the configuration changes.
  ◦ Entering cancel leaves the router in the current configuration session without exiting or committing the configuration changes.

• Use the commit command to save the configuration changes to the running configuration file and remain within the configuration session.

Configuring Local and Remote Sessions

Perform this task to configure local and remote sessions.
SUMMARY STEPS

1. configure
2. l2vpn
3. xconnect group group-name
4. p2p xconnect-name
5. interface type interface-path-id
6. neighbor ipv6 peer-address pw-id pseudowire-id
7. l2tp static local session session-id
8. l2tp static remote session session-id
9. Use the commit or end command.

DETAILED STEPS

Step 1 configure

Example:
RP/0/RSP0/CPU0:router# configure
Enters the Global Configuration mode.

Step 2 l2vpn

Example:
RP/0/RSP0/CPU0:router (config)# l2vpn
Enters Layer 2 VPN configuration mode.

Step 3 xconnect group group-name

Example:
RP/0/RSP0/CPU0:router (config-l2vpn)# xconnect group g1
Configures the cross-connect group.

Step 4 p2p xconnect-name

Example:
RP/0/RSP0/CPU0:router (config-l2vpn-xc)# p2p xc3
Configures the point-to-point cross-connect.

Step 5 interface type interface-path-id

Example:
RP/0/RSP0/CPU0:router (config-l2vpn-xc-p2p)# interface GigabitEthernet0/0/4.2
Specifies the interface type ID.

**Step 6**  
**neighbor ipv6 peer-address pw-id pseudowire-id**

**Example:**
```bash
RP/0/RSP0/CPU0:router (config-l2vpn-xc-p2p)# neighbor ipv6 1111:2222::cdef pw-id 1
```

Specifies the peer with which to cross connect, and configures the pseudowire segment for the cross-connect.

**Step 7**  
**l2tp static local session session-id**

**Example:**
```bash
RP/0/RSP0/CPU0:router (config-l2vpn-xc-p2p-pw)# l2tp static local session 1
```

(Optional) Configures a static local session for the L2TP pseudowire.

**Note**  
If you configure the local session ID, it is ignored for decapsulation-side processing by the ASR9000 Series routers.

**Step 8**  
**l2tp static remote session session-id**

**Example:**
```bash
RP/0/RSP0/CPU0:router (config-l2vpn-xc-p2p-pw)# l2tp static remote session 1
```

(Optional) Configures a static remote session for the L2TP pseudowire.

**Note**  
When configured, remote session value (expected at the decapsulation side) is used for encapsulation-side processing, and the value in the session value field of the L2TPv3 header is programmed.

**Step 9**  
Use the **commit** or **end** command.

**commit** - Saves the configuration changes and remains within the configuration session.

**end** - Prompts user to take one of these actions:

- **Yes** - Saves configuration changes and exits the configuration session.
- **No** - Exits the configuration session without committing the configuration changes.
- **Cancel** - Remains in the configuration mode, without committing the configuration changes.

---

### Configuring Local And Remote Cookies

Perform this task to configure local and remote cookies.
SUMMARY STEPS

1. configure
2. l2vpn
3. xconnect group group-name
4. p2p xconnect-name
5. interface type interface-path-id
6. neighbor ipv6 peer-address pw-id pseudowire-id
7. l2tp static local cookie size bytes
8. l2tp static local cookie size bytes
9. Use the commit or end command.

DETAILED STEPS

Step 1  configure

Example:

RP/0/RSP0/CPU0:router# configure
Enters the Global Configuration mode.

Step 2  l2vpn

Example:

RP/0/RSP0/CPU0:router (config)# l2vpn
Enters Layer 2 VPN configuration mode.

Step 3  xconnect group group-name

Example:

RP/0/RSP0/CPU0:router (config-l2vpn)# xconnect group g1
Configures the cross-connect group.

Step 4  p2p xconnect-name

Example:

RP/0/RSP0/CPU0:router (config-l2vpn-xc)# p2p xc3
Configures the point-to-point cross-connect.

Step 5  interface type interface-path-id

Example:

RP/0/RSP0/CPU0:router (config-l2vpn-xc-p2p)# interface GigabitEthernet0/0/4.2
Specifies the interface type ID.

Step 6  neighbor ipv6 peer-address pw-id pseudowire-id

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# neighbor ipv6 1111:2222::cdef pw-id 1

Step 7  l2tp static local cookie size bytes

Example:
RP/0/RSP0/CPU0:router (config-l2vpn-xc-p2p-pw)# l2tp static local cookie size 0

Configures the static local cookie size settings for the L2TP pseudowire.

Note: In the case of a non-zero cookie size, the value of the cookie is a mandatory argument.

Step 8  l2tp static local cookie size bytes

Example:
RP/0/RSP0/CPU0:router (config-l2vpn-xc-p2p-pw)# l2tp static remote cookie size 0

Configures the static remote cookie size settings for the L2TP pseudowire.

Note: In the case of a non-zero cookie size, the value of the cookie is a mandatory argument.

Step 9  Use the commit or end command.

commit - Saves the configuration changes and remains within the configuration session.

end - Prompts user to take one of these actions:

• Yes - Saves configuration changes and exits the configuration session.

• No - Exits the configuration session without committing the configuration changes.

• Cancel - Remains in the configuration mode, without committing the configuration changes.

---

Enabling L2TP Static Submode

Perform this task to enable L2TP static submode.
SUMMARY STEPS

1. configure
2. l2vpn
3. xconnect group group-name
4. p2p xconnect-name
5. interface type interface-path-id
6. neighbor ipv6 peer-address pw-id pseudowire-id
7. l2tp static
8. Use the commit or end command.

DETAILED STEPS

Step 1  configure
Example:
RP/0/RSP0/CPU0:router # configure
Enters the Global Configuration mode.

Step 2  l2vpn
Example:
RP/0/RSP0/CPU0:router (config)# l2vpn
Enters Layer 2 VPN configuration mode.

Step 3  xconnect group group-name
Example:
RP/0/RSP0/CPU0:router (config-l2vpn)# xconnect group g1
Configures the cross-connect group.

Step 4  p2p xconnect-name
Example:
RP/0/RSP0/CPU0:router (config-l2vpn-xc)# p2p xc3
Configures the point-to-point cross-connect.

Step 5  interface type interface-path-id
Example:
RP/0/RSP0/CPU0:router (config-l2vpn-xc-p2p)# interface GigabitEthernet0/0/0/4.2
Specifies the interface type ID.

Step 6  neighbor ipv6 peer-address pw-id pseudowire-id
Example:
RP/0/RSP0/CPU0:router (config-l2vpn-xc-p2p)# neighbor ipv6 1111:2222::cdef pw-id
Specifies the peer with which to cross connect, and configures the pseudowire segment for the cross-connect.

Step 7  l2tp static
Enabling TOS Reflection in the L2TPv3 Header

Perform this task to enable the type of service (TOS) reflection in the L2TPv3 header.

**SUMMARY STEPS**

1. configure
2. l2vpn
3. pw-class class-name
4. encapsulation l2tpv3
5. protocol l2tpv3
6. neighbor ipv6 peer-address **pw-id** pseudowire-id
7. tos { reflect | value }
8. endor commit

**DETAILED STEPS**

Step 1  
configure

**Example:**

```
RP/0/RSP0/CPU0:router# configure
```

Enters global configuration mode.

Step 2  
l2vpn

**Example:**

```
RP/0/RSP0/CPU0:router (config)# l2vpn
```

Enters Layer 2 VPN configuration mode.

Step 3  
**pw-class class-name**
Step 4

Encapsulation l2tpv3

Example:
RP/0/RSP0/CPU0:router (config-l2vpn)# pw-class l2tpv3_class
Enters pseudowire class submode, and allows a pseudowire class template definition.

Step 5

Protocol l2tpv3

Example:
RP/0/RSP0/CPU0:router (config-l2vpn-pwc)# protocol l2tpv3
Sets pseudowire encapsulation to L2TPv3.

Step 6

Neighbor ipv6 peer-address pw-id pseudowire-id

Example:
RP/0/RSP0/CPU0:router (config-l2vpn-xc-p2p)# neighbor ipv6 1111:2222::cdef pw-id
Specifies the peer with which to cross connect, and configures the pseudowire segment for the cross-connect.

Step 7

tos { reflect | value }

Example:
RP/0/RSP0/CPU0:router (config-l2vpn-pwc-encap-l2tpv3)# tos reflect
or
RP/0/RSP0/CPU0:router (config-l2vpn-pwc-encap-l2tpv3)# tos value 50
Enables type of service (TOS) reflection. As a result, copies TOS from inner IP header to the L2TPv3 header.
Additionally, use this command to set the value of TOS for the L2TPv3 pseudowire class. The range is from 0 to 255.

Step 8

End or commit

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-pwc-encap-l2tpv3)# end
or
RP/0/RSP0/CPU0:router(config-l2vpn-pwc-encap-l2tpv3)# commit
Saves configuration changes.

- When you issue the end command, the system prompts you to commit changes:
  Uncommitted changes found, commit them before exiting(yes/no/cancel)?[cancel]:
  * Entering yes saves configuration changes to the running configuration file, exits the configuration session, and returns the router to EXEC mode.
  * Entering no exits the configuration session and returns the router to EXEC mode without committing the configuration changes.
  * Entering cancel leaves the router in the current configuration session without exiting or committing the configuration changes.
Use the `commit` command to save the configuration changes to the running configuration file and remain within the configuration session.

---

**Configuring TTL for L2TPv3 over IPv6 Tunnels**

Perform this task to configure time to live (TTL) for L2TPv3 over IPv6 tunnels.

**SUMMARY STEPS**

1. `configure`
2. `l2vpn`
3. `pw-class class-name`
4. `encapsulation l2tpv3`
5. `protocol l2tpv3`
6. `ttl value`
7. Use the `commit` or `end` command.

**DETAILED STEPS**

**Step 1** `configure`

*Example:*  
RP/0/RSP0/CPU0:router # configure  
Enters the Global Configuration mode.

**Step 2** `l2vpn`

*Example:*  
RP/0/RSP0/CPU0:router (config)# l2vpn  
Enters Layer 2 VPN configuration mode.

**Step 3** `pw-class class-name`

*Example:*  
RP/0/RSP0/CPU0:router (config-l2vpn)# pw-class l2tpv3_class  
Enters pseudowire class submode, and allows a pseudowire class template definition.

**Step 4** `encapsulation l2tpv3`

*Example:*  
RP/0/RSP0/CPU0:router (config-l2vpn-pwc)# encapsulation l2tpv3  
Sets pseudowire encapsulation to L2TPv3.

**Step 5** `protocol l2tpv3`
Configuring Traffic Mirroring over L2TPv3 over IPv6 Tunnels

Perform this task to configure traffic mirroring over L2TPv3 over IPv6 tunnels.

SUMMARY STEPS

1. configure
2. l2vpn
3. xconnect group group-name
4. p2p xconnect-name
5. monitor-session session-name
6. neighbor ipv6 peer-address pw-id pseudowire-id
7. pw-class class-name
8. source pw-source-address
9. l2tp static local cookie size value bytes
10. l2tp static remote cookie size value bytes
11. Use the commit or end command.

• L2TPv3 over IPv6 concepts, see L2TPv3 over IPv6.
• Configuration examples, see Configuring L2TPv3 over IPv6 Tunnels: Example
DETAILED STEPS

Step 1  configure

Example:
RP/0/RSP0/CPU0:router # configure
Enters the Global Configuration mode.

Step 2  l2vpn

Example:
RP/0/RSP0/CPU0:router (config)# l2vpn
Enters Layer 2 VPN configuration mode.

Step 3  xconnect group group-name

Example:
RP/0/RSP0/CPU0:router (config-l2vpn)# xconnect group span
Configures the cross-connect group.

Step 4  p2p  xconnect-name

Example:
RP/0/RSP0/CPU0:router (config-l2vpn-xc)# p2p span-foo
Configures the point-to-point cross-connect.

Step 5  monitor-session  session-name

Example:
RP/0/RSP0/CPU0:router (config-l2vpn-xc-p2p)# monitor-session customer-foo
Specifies the monitor session.

Step 6  neighbor ipv6  peer-address  pw-id  pseudowire-id

Example:
RP/0/RSP0/CPU0:router (config-l2vpn-xc-p2p)# neighbor ipv6 1111:3333::cdef pw-id 1001
Specifies the peer with which to cross connect, and configures the pseudowire segment for the cross-connect.

Step 7  pw-class  class-name

Example:
RP/0/RSP0/CPU0:router (config-l2vpn-xc-p2p-pw)# pw-class ts
Enters pseudowire class submode, and allows a pseudowire class template definition.

**Step 8**  
`source pw-source-address`

**Example:**
```
RP/0/RSP0/CPU0:router (config-l2vpn-xc-p2p-pw)# source 1111::3333::abcd
```
Configures the source IPv6 address of the pseudowire.

**Step 9**  
`l2tp static local cookie size size value bytes`

**Example:**
```
RP/0/RSP0/CPU0:router (config-l2vpn-xc-p2p-pw)# l2tp static local cookie size 8 value 0xabcd 0x1234
```
Configures the static local cookie size settings for the L2TP pseudowire.

**Step 10**  
`l2tp static remote cookie size size value bytes`

**Example:**
```
RP/0/RSP0/CPU0:router (config-l2vpn-xc-p2p-pw)# l2tp static remote cookie size 8 value 0xcdef 0x5678
```
Configures the static remote cookie size settings for the L2TP pseudowire.

**Step 11**  
Use the `commit` or `end` command.

`commit` - Saves the configuration changes and remains within the configuration session.

`end` - Prompts user to take one of these actions:
- **Yes** - Saves configuration changes and exits the configuration session.
- **No** - Exits the configuration session without committing the configuration changes.
- **Cancel** - Remains in the configuration mode, without committing the configuration changes.

For more information on:
- L2TPv3 over IPv6 concepts, see L2TPv3 over IPv6.
- Configuration examples, see Configuring L2TPv3 over IPv6 Tunnels: Example

---

**Configuring L2VPN Single Segment Pseudowire**

To configure single segment pseudowire in the network, do the following:

1. **(Optional) Configuring the related L2VPN Global Parameters.** See Configuring L2VPN Global Parameters
   
   This procedure is used to overwrite the default BGP Route Distinguisher (RD) auto-generated value and also the Autonomous System Number (ASN) and Route Identifier (RID) of BGP.

2. **Configuring L2VPN VPWS SS-PW**
3 Configuring L2VPN MS-PW Address Family Under BGP

The address family is configured under BGP to exchange the dynamic pseudowire routes.

**Configuring L2VPN Global Parameters**

Perform this task to configure L2VPN global parameters.

**SUMMARY STEPS**

1. `configure`
2. `l2vpn`
3. `router-id router-id`
4. `pw-routing`
5. `global-id global-id`
6. `bgp`
7. `rd route-distinguisher`
8. Use the `commit` or `end` command.

**DETAILED STEPS**

**Step 1**

`configure`

Example:

```
RP/0/RSP0/CPU0:router# configure
```

Enters the Global Configuration mode.

**Step 2**

`l2vpn`

Example:

```
RP/0/RSP0/CPU0:router(config)# l2vpn
```

Enters Layer 2 VPN configuration mode.

**Step 3**

`router-id router-id`

Example:

```
RP/0/RSP0/CPU0:router(config)# router 2.2.2.2
```

Specifies the router ID.

**Step 4**

`pw-routing`

Example:

```
RP/0/RSP0/CPU0:router(config-l2vpn)# pw-routing
```
Enables pseudowire routing capabilities and enters the pseudowire routing configuration submode

**Step 5** `global-id` *global-id*

**Example:**
```
RP/0/RSP0/CPU0:router(config-l2vpn-pwr)# global-id 1000
```
Configures the L2VPN global ID value for the router.

**Step 6** `bgp`

**Example:**
```
RP/0/RSP0/CPU0:router(config-l2vpn-pwr)# bgp
```
Enables the BGP pseudowire routing capabilities and enters the BGP configuration submode.

**Step 7** `rd` *route-distinguisher*

**Example:**
```
RP/0/RSP0/CPU0:router(config-l2vpn-pwr-bgp)# rd 192.168.1.3:10
```
Configures the BGP route distinguisher.

**Step 8** Use the *commit* or *end* command.

- **commit** - Saves the configuration changes and remains within the configuration session.
- **end** - Prompts user to take one of these actions:
  - **Yes** - Saves configuration changes and exits the configuration session.
  - **No** - Exits the configuration session without committing the configuration changes.
  - **Cancel** - Remains in the configuration mode, without committing the configuration changes.

---

**Configuring L2VPN VPWS SS-PW**

Perform this task to configure L2VPN VPWS SS-PWs.
SUMMARY STEPS

1. configure
2. interface type interface-path-id
3. l2vpn
4. xconnect group group-name
5. p2p xconnect-name
6. interface type interface-path-id
7. neighbor routed global-id: prefix: ac-id source ac-id
8. (optional) pw-class class-name
9. Use the commit or end command.

DETAILED STEPS

Step 1 configure

Example:

RP/0/RSP0/CPU0:router# configure

Enters the Global Configuration mode.

Step 2 interface type interface-path-id

Example:

RP/0/RSP0/CPU0:router# interface TenGigE0/1/0/12

Enters interface configuration mode and configures an interface.

Step 3 l2vpn

Example:

RP/0/RSP0/CPU0:router(config)# l2vpn

Enters Layer 2 VPN configuration mode.

Step 4 xconnect group group-name

Example:

RP/0/RSP0/CPU0:router(config-l2vpn)# xconnect group pw-he1

Configures a cross-connect group name using a free-format 32-character string.

Step 5 p2p xconnect-name

Example:

RP/0/RSP0/CPU0:router(config-l2vpn-xc)# p2p pw-ss
Enters P2P configuration submode.

**Step 6**  
**interface** type interface-path-id  

**Example:**  
```
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# interface gigabitethernet 0/1/0/9
```

Specifies the interface type and instance.

**Step 7**  
**neighbor routed** global-id: prefix: ac-id source ac-id  

**Example:**  
```
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# neighbor routed 100:2.2.2.2:10 source 10
```

Enables pseudowire routing configuration submode for the p2p cross-connect.

**Step 8**  
(Optional) **pw-class** class-name  

**Example:**  
```
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p-pwr)# pw-class dynamic_sspw
```

Enters pseudowire class submode, allowing you to define a pseudowire class template.

**Step 9**  
Use the **commit** or **end** command.  

- **commit** - Saves the configuration changes and remains within the configuration session.  
- **end** - Prompts user to take one of these actions:  
  - **Yes** - Saves configuration changes and exits the configuration session.  
  - **No** - Exits the configuration session without committing the configuration changes.  
  - **Cancel** - Remains in the configuration mode, without committing the configuration changes.

### Configuring L2VPN MS-PW Address Family Under BGP

Perform this task to configure L2VPN MS-PW address family under BGP:

**SUMMARY STEPS**

1. **configure**  
2. **router bgp** autonomous-system-number  
3. **address-family l2vpn mspw**  
4. **neighbor ip-address**  
5. **address-family l2vpn mspw**  
6. Use the **commit** or **end** command.
DETAILED STEPS

Step 1  configure

Example:
```
RP/0/RSP0/CPU0:router# configure
```
Enters the Global Configuration mode.

Step 2  router bgp autonomous-system-number

Example:
```
RP/0/RSP0/CPU0:router(config)# router bgp 100
```
Enters router configuration mode for the specified routing process.

Step 3  address-family l2vpn mspw

Example:
```
RP/0/RSP0/CPU0:router(config-bgp)# address-family l2vpn mspw
```
Specifies the L2VPN address family and enters address family configuration mode.

Step 4  neighbor ip-address

Example:
```
RP/0/RSP0/CPU0:router(config-bgp)# neighbor 10.10.10.1
```
Adds the IP address of the neighbor in the specified autonomous system.

Step 5  address-family l2vpn mspw

Example:
```
RP/0/RSP0/CPU0:router(config-bgp-nbr-af)# address-family l2vpn mspw
```
Specifies the L2VPN address family of the neighbor and enters address family configuration mode.

Step 6  Use the commit or end command.
- commit - Saves the configuration changes and remains within the configuration session.
- end - Prompts user to take one of these actions:
  - Yes - Saves configuration changes and exits the configuration session.
  - No - Exits the configuration session without committing the configuration changes.
  - Cancel - Remains in the configuration mode, without committing the configuration changes.
Verifying Single-Segment Pseudowires

To verify the connectivity in SS-PWs, use the ping mpls pseudowire command.

Displaying Information about the L2VPN Single-Segment Pseudowires

The show commands are used to display information about L2VPN Single Segment Pseudowires

- show bgp l2vpn mspw
- show l2vpn pwr summary
- show l2vpn xc

Configuration Examples for Point to Point Layer 2 Services

This section includes these configuration examples:

L2VPN Interface Configuration: Example

The following example shows how to configure an L2VPN interface:

```
configure
interface GigabitEthernet0/0/0/0.1 l2transport
encapsulation dot1q 1
rewrite ingress tag pop 1 symmetric
end
```

Local Switching Configuration: Example

This example shows how to configure Layer 2 local switching:

```
configure
l2vpn
xconnect group examples
p2p example1
interface TenGigE0/7/0/6.5
interface GigabitEthernet0/4/0/30
commit
end
```

```
show l2vpn xconnect group examples
Legend: ST = State, UP = Up, DN = Down, AD = Admin Down, UR = Unresolved, SB = Standby, SR = Standby Ready

<table>
<thead>
<tr>
<th>XConnect Group</th>
<th>Name</th>
<th>ST</th>
<th>Description</th>
<th>ST</th>
<th>Description</th>
<th>ST</th>
</tr>
</thead>
<tbody>
<tr>
<td>examples</td>
<td>example1</td>
<td>UP</td>
<td>Te0/7/0/6.5</td>
<td>UP</td>
<td>Gi0/4/0/30</td>
<td>UP</td>
</tr>
</tbody>
</table>
```

Local Connection Redundancy Configuration: Example

The following example shows how to configure the LCR on PoA1:

```
! LCR - CE1
   group 107
```
Point-to-Point Cross-connect Configuration: Examples

This section includes configuration examples for both static and dynamic p2p cross-connects.

Static Configuration

This example shows how to configure a static point-to-point cross-connect:

```cisco
configure
12vpn
  xconnect group vlan_grp_1
  p2p vlan1
  interface GigabitEthernet0/0/0/0.1
    neighbor 102.2.12.1 2
    pw-id 1
  mpls static label local 699 remote 890
  commit
```

Dynamic Configuration

This example shows how to configure a dynamic point-to-point cross-connect:

```plaintext
configure
  l2vpn
  xconnect group vlangrp_1
  p2p vlan
  interface TenGigE 0/0/0/0.1
  neighbor 2.2.1.1 pw-id 1

commit
```

Inter-AS: Example

This example shows how to set up an AC to AC cross-connect from AC1 to AC2:

```plaintext
router-id Loopback0

interface Loopback0
ipv4 address 10.0.0.5 255.255.255.255
!
interface GigabitEthernet0/1/0/0.1 l2transport
  encapsulation dot1q 1
!
interface GigabitEthernet0/0/0/3
ipv4 address 10.45.0.5 255.255.255.0
keepalive disable
!
interface GigabitEthernet0/0/0/4
ipv4 address 10.5.0.5 255.255.255.0
keepalive disable
!
router ospf 100
log adjacency changes detail
area 0
interface Loopback0
!
interface GigabitEthernet0/0/0/3
!
interface GigabitEthernet0/0/0/4
!
!
router bgp 100
address-family ipv4 unicast
allocate-label all
!
neighbor 10.2.0.5
remote-as 100
update-source Loopback0
address-family ipv4 unicast
  address-family ipv4 labeled-unicast
!
!
l2vpn
xconnect group cisco
p2p cisco1
interface GigabitEthernet0/1/0/0.1
neighbor 10.0.1.5 pw-id 101
!
p2p cisco2
interface GigabitEthernet0/1/0/0.2
neighbor 10.0.1.5 pw-id 102
!
p2p cisco3
interface GigabitEthernet0/1/0/0.3
neighbor 10.0.1.5 pw-id 103
```
L2VPN Quality of Service: Example

This example shows how to attach a service-policy to an L2 interface in port mode:

```plaintext
configure
    interface GigabitEthernet 0/0/0/0
    l2transport
    service-policy input pmap_1
commit
```

Pseudowires: Examples

The examples include these devices and connections:

- T-PE1 node has:
  - Cross-connect with an AC interface (facing CE1)
  - Pseudowire to S-PE1 node
  - IP address 209.165.200.225
• T-PE2 node
  * Cross-connect with an AC interface (facing CE2)
  * Pseudowire to S-PE1 node
  * IP address 209.165.200.254

• S-PE1 node
  * Multisegment pseudowire cross-connect with a pseudowire segment to T-PE1 node
  * Pseudowire segment to T-PE2 node
  * IP address 209.165.202.158

Configuring Dynamic Pseudowires at T-PE1 Node: Example

```
RP/0/RSP0/CPU0:T-PE1# configure
RP/0/RSP0/CPU0:T-PE1(config)# l2vpn
RP/0/RSP0/CPU0:T-PE1 (config-l2vpn)# pw-class dynamic_mpls
RP/0/RSP0/CPU0:T-PE1(config-l2vpn-pwc)# encapsulation mpls
RP/0/RSP0/CPU0:T-PE1(config-l2vpn-pwc-encap-mpls)# protocol ldp
RP/0/RSP0/CPU0:T-PE1(config-l2vpn-pwc-encap-mpls)# control-word disable
RP/0/RSP0/CPU0:T-PE1(config-l2vpn-pwc)# exit
RP/0/RSP0/CPU0:T-PE1(config-l2vpn)# xconnect group XCON1
RP/0/RSP0/CPU0:T-PE1(config-l2vpn-xc)# p2p xc1
RP/0/RSP0/CPU0:T-PE1(config-l2vpn-xc-p2p)# description T-PE1 MS-PW to 10.165.202.158 via 10.165.200.254
RP/0/RSP0/CPU0:T-PE1(config-l2vpn-xc-p2p)# interface gigabitethernet 0/1/0/0.1
RP/0/RSP0/CPU0:T-PE1(config-l2vpn-xc-p2p)# neighbor 10.165.200.254 pw-id 100
RP/0/RSP0/CPU0:T-PE1(config-l2vpn-xc-p2p-pw)# pw-class dynamic_mpls
RP/0/RSP0/CPU0:T-PE1(config-l2vpn-xc-p2p-pw)# commit
```

Configuring Dynamic Pseudowires at S-PE1 Node: Example

```
RP/0/RSP0/CPU0:S-PE1# configure
RP/0/RSP0/CPU0:S-PE1(config)# l2vpn
RP/0/RSP0/CPU0:S-PE1 (config-l2vpn)# pw-class dynamic_mpls
RP/0/RSP0/CPU0:S-PE1(config-l2vpn-pwc)# encapsulation mpls
RP/0/RSP0/CPU0:S-PE1(config-l2vpn-pwc-encap-mpls)# protocol ldp
RP/0/RSP0/CPU0:S-PE1(config-l2vpn-pwc-encap-mpls)# control-word disable
RP/0/RSP0/CPU0:S-PE1(config-l2vpn-pwc)# exit
RP/0/RSP0/CPU0:S-PE1(config-l2vpn)# xconnect group MS-PW1
RP/0/RSP0/CPU0:S-PE1(config-l2vpn-xc)# p2p ms-pw1
RP/0/RSP0/CPU0:S-PE1(config-l2vpn-xc-p2p)# interface gigabitethernet 0/0/0.1
RP/0/RSP0/CPU0:S-PE1(config-l2vpn-xc-p2p)# neighbor 10.165.200.225 pw-id 100
RP/0/RSP0/CPU0:S-PE1(config-l2vpn-xc-p2p-pw)# pw-class dynamic_mpls

Preferred Path: Example

This example shows how to configure preferred tunnel path:

```
configure
l2vpn
pw-class path1
encapsulation mpls
preferred-path interface tunnel tp 50 fallback disable
```

MPLS Transport Profile: Example

This section provides examples for:

- Configuring Preferred Tunnel Path: Example
- Configuring PW Status OAM: Example

Configuring Preferred Tunnel Path: Example

This sample configuration shows how to configure preferred tunnel path:

```
l2vpn
pw-class foo
encapsulation mpls
preferred-path interface tunnel-tp 100 fallback disable
commit
```

Configuring PW Status OAM: Example

This sample configuration shows how to configure PW status OAM functionality:

```
l2vpn
pw-oam refresh transmit 100
commit
```

Viewing Pseudowire Status: Example

```
show l2vpn xconnect
```

```
RP/0/RSP0/CPU0:router# show l2vpn xconnect
Legend: ST = State, UP = Up, DN = Down, AD = Admin Down, UR = Unresolved,
LU = Local Up, RU = Remote Up, CO = Connected

Configuring Any Transport over MPLS: Example

This example shows you how to configure Any Transport over MPLS (AToM):

```
config
l2vpn
xconnect group test
p2p test
interface POS 0/1/0/1
    neighbor 10.1.1.1 pw-id 100
```

Configuring AToM IP Interworking: Example

This example shows you how to configure IP interworking:

```
config
l2vpn
xconnect group test
p2p test
interworking ipv4
```

Configuring PPP IP Interworking: Example

This example shows you how to configure PPP IP interworking:

```
interface Serial0/2/1/0/1/1:0
    encapsulation ppp
    l2transport

interface Serial0/0/0/0/2/1/1:0
    encapsulation ppp
    l2transport

!! Local Switching Configuration
l2vpn
xconnect group ppp_ip_ls
    p2p 1

Configuring L2VPN Nonstop Routing: Example

This example shows how to configure L2VPN Nonstop Routing.

cfg
l2vpn
nsr
nsr
logging nsr
Enabling Pseudowire Grouping: Example

This example shows how to enable pseudowire grouping.

```
config
l2vpn
pw-grouping
```

Configuring L2TPv3 over IPv6 Tunnels: Example

This section provides examples for:

### Configuring Neighbor AFI for Pseudowire: Example

To support IPv6 pseudowire neighbors, an AFI needs to be configured as follows:

```
l2vpn
xconnect group g1
p2p xc3
interface GigabitEthernet0/0/0/4.2
neighbor ipv6 1111:2222::cdef pw-id 1
```

### Configuring L2TPv3 encapsulation and protocol: Example

For L2TPv3 tunnels, the encapsulation and protocol has to be set to l2tpv3.

**Note**

The default encapsulation and protocol is MPLS.

```
l2vpn
pw-class ts
encapsulation l2tpv3
protocol l2tpv3
```

### Configuring Source IPv6 address for L2TPv3 over IPv6 tunnel: Example

This example shows how to configure source IPv6 address for the L2TPv3 over IPv6 tunnel:

```
l2vpn
xconnect group g1
p2p xc3
interface GigabitEthernet0/0/0/4.2
neighbor ipv6 1111:2222::cdef pw-id 1
source 1111:2222::abcd
```

### Configuring Local and Remote Sessions: Example

For L2TPv3 over IPv6 tunnels, the local and remote session ID is configured under the pseudowire; however, this configuration is optional.

```
l2vpn
xconnect group g1
p2p xc3
interface GigabitEthernet0/0/0/4.2
neighbor ipv6 1111:2222::cdef pw-id 1
```
l2tp static local session 1
l2tp static remote session 1

Configuring Local and Remote Cookies: Example

For L2TPv3 over IPv6 tunnels, the local and remote cookies are configured under the pseudowire. Support has been extended for cookie roll-over that provides the ability to configure a secondary local cookie. This example shows how to configure a cookie with size 0:

```
l2vpn
xconnect group g1
p2p xc3
interface GigabitEthernet0/0/0/4.2
neighbor ipv6 1111:2222::cdef pw-id 1
l2tp static local cookie size 0
l2tp static remote cookie size 0
```

This example shows how to configure a cookie with size 4:

```
l2vpn
xconnect group g1
p2p xc3
interface GigabitEthernet0/0/0/4.2
neighbor ipv6 1111:2222::cdef pw-id 1
l2tp static local cookie size 4 value <0x0-0xffffffff>
l2tp static remote cookie size 4 value <0x0-0xffffffff>
```

This example shows how to configure a cookie with size 8 (the lower 4 bytes are entered first; followed by the higher 4 bytes):

```
l2vpn
xconnect group g1
p2p xc3
interface GigabitEthernet0/0/0/4.2
neighbor ipv6 1111:2222::cdef pw-id 1
l2tp static local cookie size 8 value <0x0-0xffffffff> <0x0-0xffffffff>
l2tp static remote cookie size 8 value <0x0-0xffffffff> <0x0-0xffffffff>
```

To support cookie roll-over on L2TPv3 over IPv6 tunnels, configure a secondary local cookie. The local cookie secondary command specifies the secondary cookie value on the local router.

---

**Note**

The primary and secondary cookies must be of the same size. Primary or secondary local cookies must match the cookie value being received from the remote end, otherwise, packets are dropped.

```
l2vpn
xconnect group g1
p2p xc3
interface GigabitEthernet0/0/0/4.2
neighbor ipv6 1111:2222::cdef pw-id 1
l2tp static local cookie secondary size 8 value <0x0-0xffffffff> <0x0-0xffffffff>
```

Enabling L2TP Static Submode: Example

This example shows you how to enable the L2TP static submode:

```
l2vpn
xconnect group g1
p2p xc3
interface GigabitEthernet0/0/0/4.2
neighbor ipv6 1111:2222::cdef pw-id 1
l2tp static local cookie <>
```

Implementing Point to Point Layer 2 Services
Enabling TOS Reflection in the L2TPv3 Header: Example

For L2TPv3 over IPv6 tunnels, configurations are supported for each pseudowire class to enable type of service (TOS) reflection, or to set a specific TOS value in the L2TPv3 header.

By default, the TOS is copied over from the class of service (COS) fields of the VLAN header. If the underlying packet is not an IPv4 or IPv6 packet, the COS fields are copied from the VLAN header, even if a TOS reflection is configured.

This example shows how to configure a TOS reflection in the L2TPv3 header:

```
l2vpn
pw-class ts
encapsulation l2tpv3
protocol l2tpv3
tos reflect
```

This example shows how to set a TOS value in the L2TPv3 header:

```
l2vpn
pw-class ts
encapsulation l2tpv3
protocol l2tpv3
tos value 64
```

Configuring TTL for L2TPv3 over IPv6 Tunnels: Example

For L2TPv3 over IPv6 tunnels, TTL configuration is supported in the pseudowire class.

```
l2vpn
pw-class ts
encapsulation l2tpv3
protocol l2tpv3
ttl <1-255>
```

Configuring Traffic Mirroring over L2TPv3 over IPv6 Tunnels: Example

This example associates an EFP to a monitor-session:

```
interface GigabitEthernet0/0/0/4.2 l2transport
monitor-session customer-foo
```

Layer 2 SPAN is supported on L3 interfaces; however, the Layer 2 frame is mirrored:

```
interface GigabitEthernet0/0/4.2
ipv6 address <>
monitor-session customer-foo
```

SPAN is also supported on main interfaces.

```
interface GigabitEthernet0/4/0/3
l2transport
monitor-session customer-foo
```

This example creates the monitor-session globally:

```
monitor-session customer-foo
destination pseudowire
```

This example creates a cross-connect between the monitor-session and a L2TPv3 over IPv6 tunnel:

```
l2vpn
xconnect group span
p2p span-foo
monitor-session customer-foo
```
neighbor ipv6 1111:3333::cdef pw-id 1001
pw-class ts
source 1111:3333::abcd
l2tp static local cookie size 8 value 0xabcd 0x1234
l2tp static remote cookie size 8 value 0xcdef 0x5678

Implementing Multipoint Layer 2 Services

This module provides the conceptual and configuration information for Multipoint Layer 2 Bridging Services, also called Virtual Private LAN Services (VPLS).

VPLS supports Layer 2 VPN technology and provides transparent multipoint Layer 2 connectivity for customers. This approach enables service providers to host a multitude of new services such as broadcast TV and Layer 2 VPNs.

For Point to Point Layer 2 Services, see Implementing Point to Point Layer 2 Services chapter.

For descriptions of the commands listed in this module, see the "Related Documents" section. To locate documentation for other commands that might appear while executing a configuration task, search online in the Cisco IOS XR software master command index.

Feature History for Implementing Multipoint Layer 2 Services

Prerequisites for Implementing Multipoint Layer 2 Services

Before configuring Multipoint Layer 2 Services, ensure that these tasks and conditions are met:

- You must be in a user group associated with a task group that includes the proper task IDs. The command reference guides include the task IDs required for each command.

  If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

- Configure IP routing in the core so that the provider edge (PE) routers can reach each other through IP.

- Configure a loopback interface to originate and terminate Layer 2 traffic. Make sure that the PE routers can access the other router's loopback interface.

  Note
  The loopback interface is not needed in all cases. For example, tunnel selection does not need a loopback interface when Multipoint Layer 2 Services are directly mapped to a TE tunnel.

- Configure MPLS and Label Distribution Protocol (LDP) in the core so that a label switched path (LSP) exists between the PE routers.

Information About Implementing Multipoint Layer 2 Services

To implement Multipoint Layer 2 Services, you should understand these concepts:

Multipoint Layer 2 Services Overview

Multipoint Layer 2 Services enable geographically separated local-area network (LAN) segments to be interconnected as a single bridged domain over an MPLS network. The full functions of the traditional LAN such as MAC address learning, aging, and switching are emulated across all the remotely connected LAN segments that are part of a single bridged domain.

Some of the components present in a Multipoint Layer 2 Services network are described in these sections.

  Note
  Multipoint Layer 2 services are also called as Virtual Private LAN Services.

Bridge Domain

The native bridge domain refers to a Layer 2 broadcast domain consisting of a set of physical or virtual ports (including VFI). Data frames are switched within a bridge domain based on the destination MAC address. Multicast, broadcast, and unknown destination unicast frames are flooded within the bridge domain. In addition, the source MAC address learning is performed on all incoming frames on a bridge domain. A learned address
is aged out. Incoming frames are mapped to a bridge domain, based on either the ingress port or a combination of both an ingress port and a MAC header field.

By default, split horizon is enabled for pseudowires under the same VFI. However, in the default configuration, split horizon is not enabled on the attachment circuits (interfaces or pseudowires).

Flood Optimization

A Cisco ASR 9000 Series Router, while bridging traffic in a bridge domain, minimizes the amount of traffic that floods unnecessarily. The Flood Optimization feature accomplishes this functionality. However, in certain failure recovery scenarios, extra flooding is actually desirable in order to prevent traffic loss. Traffic loss occurs during a temporary interval when one of the bridge port links becomes inactive, and a standby link replaces it.

In some configurations, optimizations to minimize traffic flooding is achieved at the expense of traffic loss during the short interval in which one of the bridge's links fails, and a standby link replaces it. Therefore, Flood Optimization can be configured in different modes to specify a particular flooding behavior suitable for your configuration.

These flood optimization modes can be configured:

**Bandwidth Optimization Mode**

Flooded traffic is sent only to the line cards on which a bridge port or pseudowire that is attached to the bridge domain resides. This is the default mode.

**Convergence Mode**

Flooded traffic is sent to all line cards in the system. Traffic is flooded regardless of whether they have a bridge port or a pseudowire that is attached to the bridge domain. If there are multiple Equal Cost MPLS Paths (ECMPs) attached to that bridge domain, traffic is flooded to all ECMPs.

The purpose of Convergence Mode is to ensure that an absolute minimum amount of traffic is lost during the short interval of a bridge link change due to a failure.

**TE FRR Optimized Mode**

The Traffic Engineering Fast Reroute (TE FRR) Optimized Mode is similar to the Bandwidth Optimized Mode, except for the flooding behavior with respect to any TE FRR pseudowires attached to the bridge domain. In TE FRR Optimized Mode, traffic is flooded to both the primary and backup FRR interfaces. This mode is used to minimize traffic loss during an FRR failover, thus ensuring that the bridge traffic complies with the FRR recovery time constraints.

**Dynamic ARP Inspection**

Dynamic ARP Inspection (DAI) is a method of providing protection against address resolution protocol (ARP) spoofing attacks. It intercepts, logs, and discards ARP packets with invalid IP-to-MAC address bindings. This capability protects the network from certain man-in-the-middle attacks. The DAI feature is disabled by default.

ARP enables IP communication within a Layer 2 broadcast domain by mapping an IP address to a MAC address. Spoofing attacks occur because ARP allows a response from a host even when an ARP request is not actually received. After an attack occurs, all traffic, from the device under attack, first flows through the attacker's system, and then to the router, switch, or the host. An ARP spoofing attack affects the devices connected to your Layer 2 network by sending false information to the ARP caches of the devices connected to the subnet. The sending of false information to an ARP cache is known as ARP cache poisoning.
The Dynamic ARP Inspection feature ensures that only valid ARP requests and responses are relayed. There are two types of ARP inspection:

- Mandatory inspection—The sender’s MAC address, IPv4 address, receiving bridge port XID and bridge are checked.

- Optional inspection—The following items are validated:
  - Source MAC: The sender’s and source MACs are checked. The check is performed on all ARP or RARP packets.
  - Destination MAC: The target and destination MACs are checked. The check is performed on all Reply or Reply Reverse packets.
  - IPv4 Address: For ARP requests, a check is performed to verify if the sender's IPv4 address is 0.0.0.0, a multicast address or a broadcast address. For ARP Reply and ARP Reply Reverse, a check is performed to verify if the target IPv4 address is 0.0.0.0, a multicast address or a broadcast address. This check is performed on Request, Reply and Reply Reverse packets.

The DAI feature is supported on attachment circuits and EFPs. Currently, the DAI feature is not supported on pseudowires.

**Note**
The DAI feature is supported on attachment circuits and EFPs. Currently, the DAI feature is not supported on pseudowires.

**IP Source Guard**

IP source guard (IPSG) is a security feature that filters traffic based on the DHCP snooping binding database and on manually configured IP source bindings in order to restrict IP traffic on non-routed Layer 2 interfaces. The IPSG feature provides source IP address filtering on a Layer 2 port, to prevent a malicious hosts from manipulating a legitimate host by assuming the legitimate host's IP address. This feature uses dynamic DHCP snooping and static IP source binding to match IP addresses to hosts.

Initially, all IP traffic, except for DHCP packets, on the EFP configured for IPSG is blocked. After a client receives an IP address from the DHCP server, or after static IP source binding is configured by the administrator, all traffic with that IP source address is permitted from that client. Traffic from other hosts is denied. This filtering limits a host's ability to attack the network by claiming a neighbor host's IP address.

**Note**
The IPSG feature is supported on attachment circuits and EFPs. Currently, the IPSG feature is not supported on pseudowires.

**Pseudowires**

A pseudowire is a point-to-point connection between pairs of PE routers. Its primary function is to emulate services like Ethernet over an underlying core MPLS network through encapsulation into a common MPLS format. By encapsulating services into a common MPLS format, a pseudowire allows carriers to converge their services to an MPLS network.

The following scale enhancements are applicable to ASR 9000 Enhanced Ethernet line card:

- Support for 128000 pseudowires within VPWS and VPLS
- Support for 128000 pseudowires across VPLS and VPWS instances
- Support for up to 512 pseudowires in a bridge

This scale enhancement is supported in hardware configurations where RSP3 and ASR 9000 Enhanced Ethernet line cards are used. However, these enhancements are not applicable to the RSP2, ASR 9000 Ethernet Line Card and Cisco ASR 9000 Series SPA Interface Processor-700 line cards.

DHCP Snooping over Pseudowire

The Cisco ASR 9000 Series Routers provide the ability to perform DHCP snooping, where the DHCP server is reachable on a pseudowire. The Pseudowire is considered as a trusted interface.

The `dhcp ipv4 snoop profile {dhcp-snooping-profile1}` command is provided under the bridge domain to enable DHCP snooping on a bridge and to attach a DHCP snooping profile to the bridge.

Virtual Forwarding Instance

VPLS is based on the characteristic of virtual forwarding instance (VFI). A VFI is a virtual bridge port that is capable of performing native bridging functions, such as forwarding, based on the destination MAC address, source MAC address learning and aging, and so forth.

A VFI is created on the PE router for each VPLS instance. The PE routers make packet-forwarding decisions by looking up the VFI of a particular VPLS instance. The VFI acts like a virtual bridge for a given VPLS instance. More than one attachment circuit belonging to a given VPLS are connected to the VFI. The PE router establishes emulated VCs to all the other PE routers in that VPLS instance and attaches these emulated VCs to the VFI. Packet forwarding decisions are based on the data structures maintained in the VFI.

VPLS for an MPLS-based Provider Core

VPLS is a multipoint Layer 2 VPN technology that connects two or more customer devices using bridging techniques. A bridge domain, which is the building block for multipoint bridging, is present on each of the PE routers. The access connections to the bridge domain on a PE router are called attachment circuits. The attachment circuits can be a set of physical ports, virtual ports, or both that are connected to the bridge at each PE device in the network.

After provisioning attachment circuits, neighbor relationships across the MPLS network for this specific instance are established through a set of manual commands identifying the end PEs. When the neighbor association is complete, a full mesh of pseudowires is established among the network-facing provider edge devices, which is a gateway between the MPLS core and the customer domain.

The MPLS/IP provider core simulates a virtual bridge that connects the multiple attachment circuits on each of the PE devices together to form a single broadcast domain. This also requires all of the PE routers that are participating in a VPLS instance to form emulated virtual circuits (VCs) among them.

Now, the service provider network starts switching the packets within the bridged domain specific to the customer by looking at destination MAC addresses. All traffic with unknown, broadcast, and multicast destination MAC addresses is flooded to all the connected customer edge devices, which connect to the service provider network. The network-facing provider edge devices learn the source MAC addresses as the packets are flooded. The traffic is unicasted to the customer edge device for all the learned MAC addresses.
In the MPLS provider core, the VPLS pseudowire traffic can be dynamically routed over any interface that supports LDP protocol.

**VPLS Architecture**

The basic or flat VPLS architecture allows for the end-to-end connection between the provider edge (PE) routers to provide multipoint ethernet services. Following figure shows a flat VPLS architecture illustrating the interconnection between the network provider edge (N-PE) nodes over an IP/MPLS network.

*Figure 17: Basic VPLS Architecture*

The VPLS network requires the creation of a **Bridge Domain** (Layer 2 broadcast domain) on each of the PE routers. The VPLS provider edge device holds all the VPLS forwarding MAC tables and bridge domain information. In addition, it is responsible for all flooding broadcast frames and multicast replications.

The PEs in the VPLS architecture are connected with a full mesh of **Pseudowires (PWs)**. A **Virtual Forwarding Instance** (VFI) is used to interconnect the mesh of pseudowires. A bridge domain is connected to a VFI to create a **Virtual Switching Instance** (VSI), that provides Ethernet multipoint bridging over a PW mesh. VPLS network links the VSIs using the MPLS pseudowires to create an emulated Ethernet Switch.

With VPLS, all customer equipment (CE) devices participating in a single VPLS instance appear to be on the same LAN and, therefore, can communicate directly with one another in a multipoint topology, without requiring a full mesh of point-to-point circuits at the CE device. A service provider can offer VPLS service to multiple customers over the MPLS network by defining different bridged domains for different customers. Packets from one bridged domain are never carried over or delivered to another bridged domain, thus ensuring the privacy of the LAN service.

VPLS transports Ethernet IEEE 802.3, VLAN IEEE 802.1q, and VLAN-in-VLAN (q-in-q) traffic across multiple sites that belong to the same Layer 2 broadcast domain. VPLS offers simple VLAN services that include flooding broadcast, multicast, and unknown unicast frames that are received on a bridge. The VPLS solution requires a full mesh of pseudowires that are established among PE routers. The VPLS implementation is based on Label Distribution Protocol (LDP)-based pseudowire signaling.
VPLS for Layer 2 Switching

VPLS technology includes the capability of configuring the Cisco ASR 9000 Series Routers to perform Layer 2 bridging. In this mode, the Cisco ASR 9000 Series Routers can be configured to operate like other Cisco switches.

These features are supported:

- Bridging IOS XR Trunk Interfaces
- Bridging on EFPs

Refer to the Configuration Examples for Multipoint Layer 2 Services section for examples on these bridging features.

VPLS Discovery and Signaling

VPLS is a Layer 2 multipoint service and it emulates LAN service across a WAN service. VPLS enables service providers to interconnect several LAN segments over a packet-switched network and make it behave as one single LAN. Service provider can provide a native Ethernet access connection to customers using VPLS.

The VPLS control plane consists of two important components, autodiscovery and signaling:

- VPLS Autodiscovery eliminates the need to manually provision VPLS neighbors. VPLS Autodiscovery enables each VPLS PE router to discover the other provider edge (PE) routers that are part of the same VPLS domain.
- Once the PEs are discovered, pseudowires (PWs) are signaled and established across each pair of PE routers forming a full mesh of PWs across PE routers in a VPLS domain.

BGP-based VPLS Autodiscovery

An important aspect of VPN technologies, including VPLS, is the ability of network devices to automatically signal to other devices about an association with a particular VPN. Autodiscovery requires this information to be distributed to all members of a VPN. VPLS is a multipoint mechanism for which BGP is well suited.

BGP-based VPLS autodiscovery eliminates the need to manually provision VPLS neighbors. VPLS autodiscovery enables each VPLS PE router to discover the other provider edge (PE) routers that are part of the same VPLS domain. VPLS Autodiscovery also tracks when PE routers are added to or removed from the...
VPLS domain. When the discovery process is complete, each PE router has the information required to setup VPLS pseudowires (PWs).

Even when BGP autodiscovery is enabled, pseudowires can be manually configured for VPLS PE routers that are not participating in the autodiscovery process.

**BGP Auto Discovery With BGP Signaling**

The implementation of VPLS in a network requires the establishment of a full mesh of PWs between the provider edge (PE) routers. The PWs can be signaled using BGP signaling.

*Figure 19: Discovery and Signaling Attributes*

The BGP signaling and autodiscovery scheme has the following components:

1. A means for a PE to learn which remote PEs are members of a given VPLS. This process is known as autodiscovery.
2. A means for a PE to learn the pseudowire label expected by a given remote PE for a given VPLS. This process is known as signaling.

The BGP Network Layer Reachability Information (NLRI) takes care of the above two components simultaneously. The NLRI generated by a given PE contains the necessary information required by any other PE. These components enable the automatic setting up of a full mesh of pseudowires for each VPLS without having to manually configure those pseudowires on each PE.
**NLRI Format for VPLS with BGP AD and Signaling**

The following figure shows the NLRI format for VPLS with BGP AD and Signaling.

*Figure 20: NLRI Format*

**BGP Auto Discovery With LDP Signaling**

Signaling of pseudowires requires exchange of information between two endpoints. Label Distribution Protocol (LDP) is better suited for point-to-point signaling. The signaling of pseudowires between provider edge devices, uses targeted LDP sessions to exchange label values and attributes and to configure the pseudowires.

*Figure 21: Discovery and Signaling Attributes*

A PE router advertises an identifier through BGP for each VPLS. This identifier is unique within the VPLS instance and acts like a VPLS ID. The identifier enables the PE router receiving the BGP advertisement to identify the VPLS associated with the advertisement and import it to the correct VPLS instance. In this manner, for each VPLS, a PE router learns the other PE routers that are members of the VPLS.

The LDP protocol is used to configure a pseudowire to all the other PE routers. FEC 129 is used for the signaling. The information carried by FEC 129 includes the VPLS ID, the Target Attachment Individual Identifier (TAII) and the Source Attachment Individual Identifier (SAII).
The LDP advertisement also contains the inner label or VPLS label that is expected for the incoming traffic over the pseudowire. This enables the LDP peer to identify the VPLS instance with which the pseudowire is to be associated and the label value that it is expected to use when sending traffic on that pseudowire.

**NLRI and Extended Communities**

### Interoperability Between Cisco IOS XR and Cisco IOS on VPLS LDP Signaling

The Cisco IOS Software encodes the NLRI length in the first byte in bits format in the BGP Update message. However, the Cisco IOS XR Software interprets the NLRI length in 2 bytes. Therefore, when the BGP neighbor with VPLS-VPWS address family is configured between the IOS and the IOS XR, NLRI mismatch can happen, leading to flapping between neighbors. To avoid this conflict, IOS supports `prefix-length-size 2` command that needs to be enabled for IOS to work with IOS XR. When the `prefix-length-size 2` command is configured in IOS, the NLRI length is encoded in bytes. This configuration is mandatory for IOS to work with IOS XR.

This is a sample IOS configuration with the `prefix-length-size 2` command:

```
router bgp 1
  address-family l2vpn vpls
  neighbor 5.5.5.2 activate
  neighbor 5.5.5.2 prefix-length-size 2 --------> NLRI length = 2 bytes
  exit-address-family
```

### MAC Address-related Parameters

The MAC address table contains a list of the known MAC addresses and their forwarding information. In the current VPLS design, the MAC address table and its management are maintained on the route processor (RP) card.

These topics provide information about the MAC address-related parameters:
After you modify the MAC limit or action at the bridge domain level, ensure that you shut and unshut the bridge domain for the action to take effect. If you modify the MAC limit or action on an attachment circuit (through which traffic is passing), the attachment circuit must be shut and unshut for the action to take effect.

**Note**

MAC Address Flooding

Ethernet services require that frames that are sent to broadcast addresses and to unknown destination addresses be flooded to all ports. To obtain flooding within VPLS broadcast models, all unknown unicast, broadcast, and multicast frames are flooded over the corresponding pseudowires and to all attachment circuits. Therefore, a PE must replicate packets across both attachment circuits and pseudowires.

**MAC Address-based Forwarding**

To forward a frame, a PE must associate a destination MAC address with a pseudowire or attachment circuit. This type of association is provided through a static configuration on each PE or through dynamic learning, which is flooded to all bridge ports.

**Note**

Split horizon forwarding applies in this case, for example, frames that are coming in on an attachment circuit or pseudowire are sent out of the same pseudowire. The pseudowire frames, which are received on one pseudowire, are not replicated on other pseudowires in the same virtual forwarding instance (VFI).

**MAC Address Source-based Learning**

When a frame arrives on a bridge port (for example, pseudowire or attachment circuit) and the source MAC address is unknown to the receiving PE router, the source MAC address is associated with the pseudowire or attachment circuit. Outbound frames to the MAC address are forwarded to the appropriate pseudowire or attachment circuit.

MAC address source-based learning uses the MAC address information that is learned in the hardware forwarding path. The updated MAC tables are propagated and programs the hardware for the router. The number of learned MAC addresses is limited through configurable per-port and per-bridge domain MAC address limits.

**MAC Address Aging**

A MAC address in the MAC table is considered valid only for the duration of the MAC address aging time. When the time expires, the relevant MAC entries are repopulated. When the MAC aging time is configured only under a bridge domain, all the pseudowires and attachment circuits in the bridge domain use that configured MAC aging time.

A bridge forwards, floods, or drops packets based on the bridge table. The bridge table maintains both static entries and dynamic entries. Static entries are entered by the network manager or by the bridge itself. Dynamic entries are entered by the bridge learning process. A dynamic entry is automatically removed after a specified length of time, known as aging time, from the time the entry was created or last updated.
If hosts on a bridged network are likely to move, decrease the aging-time to enable the bridge to adapt to the change quickly. If hosts do not transmit continuously, increase the aging time to record the dynamic entries for a longer time, thus reducing the possibility of flooding when the hosts transmit again.

**MAC Address Limit**

The MAC address limit is used to limit the number of learned MAC addresses. The default value for the MAC address limit is 32000 for Cisco NCS 5001 and Cisco NCS 5002 and it is 8000 for Cisco NCS 5011. The bridge domain level limit is always configured and cannot be disabled. The default value of the bridge domain level limit is 4000 and can be changed in the range of 1-512000.

When a limit is exceeded, the system is configured to perform these notifications:

- Syslog (default)
- Simple Network Management Protocol (SNMP) trap
- Syslog and SNMP trap
- None (no notification)

**MAC Address Withdrawal**

For faster VPLS convergence, you can remove or unlearn the MAC addresses that are learned dynamically. The Label Distribution Protocol (LDP) Address Withdrawal message is sent with the list of MAC addresses, which need to be withdrawn to all other PEs that are participating in the corresponding VPLS service.

For the Cisco IOS XR VPLS implementation, a portion of the dynamically learned MAC addresses are cleared by using the MAC addresses aging mechanism by default. The MAC address withdrawal feature is added through the LDP Address Withdrawal message. To enable the MAC address withdrawal feature, use the `withdrawal` command in `l2vpn bridge group bridge domain MAC configuration mode`. To verify that the MAC address withdrawal is enabled, use the `show l2vpn bridge-domain` command with the `detail` keyword.

By default, the LDP MAC Withdrawal feature is enabled on Cisco IOS XR.

The LDP MAC Withdrawal feature is generated due to these events:

- Attachment circuit goes down. You can remove or add the attachment circuit through the CLI.
- MAC withdrawal messages are received over a VFI pseudowire. RFC 4762 specifies that both wildcards (by means of an empty Type, Length and Value [TLV]) and a specific MAC address withdrawal. Cisco IOS XR software supports only a wildcard MAC address withdrawal.

**MAC Address Security**

You can configure MAC address security at the interfaces and at the bridge access ports (subinterfaces) levels. However, MAC security configured under an interface takes precedence to MAC security configured at the bridge domain level. When a MAC address is first learned, on an EFP that is configured with MAC security and then, the same MAC address is learned on another EFP, these events occur:

- the packet is dropped
• the second EFP is shutdown
• the packet is learned and the MAC from the original EFP is flushed

**LSP Ping over VPWS and VPLS**

For Cisco IOS XR software, the existing support for the Label Switched Path (LSP) ping and traceroute verification mechanisms for point-to-point pseudowires (signaled using LDP FEC128) is extended to cover the pseudowires that are associated with the VFI (VPLS). Currently, the support for the LSP ping and traceroute for LDP signalled FEC128 pseudowires is limited to manually configured VPLS pseudowires. In addition, Cisco IOS XR software supports LSP ping for point-to-point single-segment pseudowires that are signalled using LDP FEC129 ALL-type 2 applicable to VPWS. For information about Virtual Circuit Connection Verification (VCCV) support and the `ping mpls pseudowire` command, see the *Cisco ASR 9000 Series Aggregation Services Router MPLS Command Reference*.

**Split Horizon Groups**

An IOS XR bridge domain aggregates attachment circuits (ACs) and pseudowires (PWs) in one of three groups called Split Horizon Groups. When applied to bridge domains, Split Horizon refers to the flooding and forwarding behavior between members of a Split Horizon group. In general, frames received on one member of a split horizon group are not flooded out to the other members of the same group.

Bridge Domain traffic is either unicast or multicast.

Flooding traffic consists of unknown unicast destination MAC address frames; frames sent to Ethernet multicast addresses (Spanning Tree BPDUs, etc.); Ethernet broadcast frames (MAC address FF-FF-FF-FF-FF-FF).

Known Unicast traffic consists of frames sent to bridge ports that were learned from that port using MAC learning.

Traffic flooding is performed for broadcast, multicast and unknown unicast destination address.

**Table 2: Split Horizon Groups Supported in Cisco IOS-XR**

<table>
<thead>
<tr>
<th>Split Horizon Group</th>
<th>Who belongs to this Group?</th>
<th>Multicast within Group</th>
<th>Unicast within Group</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Default—any member not covered by groups 1 or 2.</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>1</td>
<td>Any PW configured under VFI.</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>2</td>
<td>Any AC or PW configured with split-horizon keyword.</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Important notes on Split Horizon Groups:

• All bridge ports or PWs that are members of a bridge domain must belong to one of the three groups.
• By default, all bridge ports or PWs are members of group 0.
• The VFI configuration submode under a bridge domain configuration indicates that members under this domain are included in group 1.
• A PW that is configured in group 0 is called an Access Pseudowire.
• The split-horizon group command is used to designate bridge ports or PWs as members of group 2.
• The ASR9000 only supports one VFI group.

Layer 2 Security

These topics describe the Layer 2 VPN extensions to support Layer 2 security:

Port Security

Use port security with dynamically learned and static MAC addresses to restrict a port’s ingress traffic by limiting the MAC addresses that are allowed to send traffic into the port. When secure MAC addresses are assigned to a secure port, the port does not forward ingress traffic that has source addresses outside the group of defined addresses. If the number of secure MAC addresses is limited to one and assigned a single secure MAC address, the device attached to that port has the full bandwidth of the port.

These port security features are supported:

• Limits the MAC table size on a bridge or a port.
• Facilitates actions and notifications for a MAC address.
• Enables the MAC aging time and mode for a bridge or a port.
• Filters static MAC addresses on a bridge or a port.
• Marks ports as either secure or nonsecure.
• Enables or disables flooding on a bridge or a port.

After you have set the maximum number of secure MAC addresses on a port, you can configure port security to include the secure addresses in the address table in one of these ways:

• Statically configure all secure MAC addresses by using the static-address command.
• Allow the port to dynamically configure secure MAC addresses with the MAC addresses of connected devices.
• Statically configure a number of addresses and allow the rest to be dynamically configured.

Dynamic Host Configuration Protocol Snooping

Dynamic Host Configuration Protocol (DHCP) snooping is a security feature that acts like a firewall between untrusted hosts and trusted DHCP servers. The DHCP snooping feature performs these activities:

• Validates DHCP messages received from untrusted sources and filters out invalid messages.
• Rate-limits DHCP traffic from trusted and untrusted sources.
• Builds and maintains the binding database of DHCP snooping, which contains information about untrusted hosts with leased IP addresses.
• Utilizes the binding database of DHCP snooping to validate subsequent requests from untrusted hosts.
For additional information regarding DHCP, see the Cisco ASR 9000 Series Aggregation Services Router IP Addresses and Services Configuration Guide.

**G.8032 Ethernet Ring Protection**

Ethernet Ring Protection (ERP) protocol, defined in ITU-T G.8032, provides protection for Ethernet traffic in a ring topology, while ensuring that there are no loops within the ring at the Ethernet layer. The loops are prevented by blocking either a pre-determined link or a failed link.

**Overview**

Each Ethernet ring node is connected to adjacent Ethernet ring nodes participating in the Ethernet ring using two independent links. A ring link never allows formation of loops that affect the network. The Ethernet ring uses a specific link to protect the entire Ethernet ring. This specific link is called the ring protection link (RPL). A ring link is bound by two adjacent Ethernet ring nodes and a port for a ring link (also known as a ring port).

---

**Note**

The minimum number of Ethernet ring nodes in an Ethernet ring is two.

The fundamentals of ring protection switching are:

- the principle of loop avoidance
- the utilization of learning, forwarding, and Filtering Database (FDB) mechanisms

Loop avoidance in an Ethernet ring is achieved by ensuring that, at any time, traffic flows on all but one of the ring links which is the RPL. Multiple nodes are used to form a ring:

- **RPL owner**—It is responsible for blocking traffic over the RPL so that no loops are formed in the Ethernet traffic. There can be only one RPL owner in a ring.

- **RPL neighbor node**—The RPL neighbor node is an Ethernet ring node adjacent to the RPL. It is responsible for blocking its end of the RPL under normal conditions. This node type is optional and prevents RPL usage when protected.

- **RPL next-neighbor node**—The RPL next-neighbor node is an Ethernet ring node adjacent to RPL owner node or RPL neighbor node. It is mainly used for FDB flush optimization on the ring. This node is also optional.
The following figure illustrates the G.8032 Ethernet ring.

**Figure 23: G.8032 Ethernet Ring**

Nodes on the ring use control messages called RAPS to coordinate the activities of switching on or off the RPL link. Any failure along the ring triggers a RAPS signal fail (RAPS SF) message along both directions, from the nodes adjacent to the failed link, after the nodes have blocked the port facing the failed link. On obtaining this message, the RPL owner unblocks the RPL port.

**Note**

A single link failure in the ring ensures a loop-free topology.

Line status and Connectivity Fault Management protocols are used to detect ring link and node failure. During the recovery phase, when the failed link is restored, the nodes adjacent to the restored link send RAPS no request (RAPS NR) messages. On obtaining this message, the RPL owner blocks the RPL port and sends RAPS no request, root blocked (RAPS NR, RB) messages. This causes all other nodes, other than the RPL owner in the ring, to unblock all blocked ports. The ERP protocol is robust enough to work for both unidirectional failure and multiple link failure scenarios in a ring topology.

A G.8032 ring supports these basic operator administrative commands:

- **Force switch (FS)**—Allows operator to forcefully block a particular ring-port.
  - Effective even if there is an existing SF condition
  - Multiple FS commands for ring supported
  - May be used to allow immediate maintenance operations

- **Manual switch (MS)**—Allows operator to manually block a particular ring-port.
  - Ineffective in an existing FS or SF condition
  - Overridden by new FS or SF conditions
  - Multiple MS commands cancel all MS commands

- **Clear**— Cancels an existing FS or MS command on the ring-port
Used (at RPL Owner) to clear non-revertive mode

A G.8032 ring can support multiple instances. An instance is a logical ring running over a physical ring. Such instances are used for various reasons, such as load balancing VLANs over a ring. For example, odd VLANs may go in one direction of the ring, and even VLANs may go in the other direction. Specific VLANs can be configured under only one instance. They cannot overlap multiple instances. Otherwise, data traffic or RAPS packet can cross logical rings, and that is not desirable.

G.8032 ERP provides a new technology that relies on line status and Connectivity Fault Management (CFM) to detect link failure. By running CFM Continuity Check Messages (CCM) messages at an interval of 100ms, it is possible to achieve SONET-like switching time performance and loop free traffic.

For more information about Ethernet Connectivity Fault Management (CFM) and Ethernet Fault Detection (EFD) configuration, refer to the Configuring Ethernet OAM on the Cisco ASR 9000 Series Router module in the Cisco ASR 9000 Series Aggregation Services Router Interface and Hardware Component Configuration Guide.

Timers

G.8032 ERP specifies the use of different timers to avoid race conditions and unnecessary switching operations:

• Delay Timers—used by the RPL Owner to verify that the network has stabilized before blocking the RPL

  • After SF condition, Wait-to-Restore (WTR) timer is used to verify that SF is not intermittent. The WTR timer can be configured by the operator, and the default time interval is 5 minutes. The time interval ranges from 1 to 12 minutes.

  • After FS/MS command, Wait-to-Block timer is used to verify that no background condition exists.

  **Note**

  Wait-to-Block timer may be shorter than the Wait-to-Restore timer

  • Guard Timer—used by all nodes when changing state; it blocks latent outdated messages from causing unnecessary state changes. The Guard timer can be configured and the default time interval is 500 ms. The time interval ranges from 10 to 2000 ms.

  • Hold-off timers—used by underlying Ethernet layer to filter out intermittent link faults. The hold-off timer can be configured and the default time interval is 0 seconds. The time interval ranges from 0 to 10 seconds.

    • Faults are reported to the ring protection mechanism, only if this timer expires.
**Single Link Failure**

The following figure represents protection switching in case of a single link failure.

*Figure 24: G.8032 Single Link Failure*

![Diagram of G.8032 Single Link Failure]

The following figure represents an Ethernet ring composed of seven Ethernet ring nodes. The RPL is the ring link between Ethernet ring nodes A and G. In these scenarios, both ends of the RPL are blocked. Ethernet ring node G is the RPL owner node, and Ethernet ring node A is the RPL neighbor node.

These symbols are used:

- **Message source**
- **R-APS channel blocking**
- **Client channel blocking**
- **Node ID**

This sequence describes the steps in the single link failure, represented in Figure 8:

1. Link operates in the normal condition.
2. A failure occurs.
3. Ethernet ring nodes C and D detect a local Signal Failure condition and after the holdoff time interval, block the failed ring port and perform the FDB flush.
4. Ethernet ring nodes C and D start sending RAPS (SF) messages periodically along with the (Node ID, BPR) pair on both ring ports, while the SF condition persists.
5. All Ethernet ring nodes receiving an RAPS (SF) message perform FDB flush. When the RPL owner node G and RPL neighbor node A receive an RAPS (SF) message, the Ethernet ring node unblocks it’s end of the RPL and performs the FDB flush.
All Ethernet ring nodes receiving a second RAPS (SF) message perform the FDB flush again; this is because of the Node ID and BPR-based mechanism.

Stable SF condition—RAPS (SF) messages on the Ethernet Ring. Further RAPS (SF) messages trigger no further action.

The following figure represents reversion in case of a single link failure.

**Figure 25: Single link failure Recovery (Revertive operation)**

This sequence describes the steps in the single link failure recovery, as represented in Figure 9:

1. Link operates in the stable SF condition.
2. Recovery of link failure occurs.
3. Ethernet ring nodes C and D detect clearing of signal failure (SF) condition, start the guard timer and initiate periodical transmission of RAPS (NR) messages on both ring ports. (The guard timer prevents the reception of RAPS messages).
4. When the Ethernet ring nodes receive an RAPS (NR) message, the Node ID and BPR pair of a receiving ring port is deleted and the RPL owner node starts the WTR timer.
5. When the guard timer expires on Ethernet ring nodes C and D, they may accept the new RAPS messages that they receive. Ethernet ring node D receives an RAPS (NR) message with higher Node ID from Ethernet ring node C, and unblocks its non-failed ring port.
6. When WTR timer expires, the RPL owner node blocks its end of the RPL, sends RAPS (NR, RB) message with the (Node ID, BPR) pair, and performs the FDB flush.
7. When Ethernet ring node C receives an RAPS (NR, RB) message, it removes the block on its blocked ring ports, and stops sending RAPS (NR) messages. On the other hand, when the RPL neighbor node A receives an RAPS (NR, RB) message, it blocks its end of the RPL. In addition to this, Ethernet ring nodes A to F
perform the FDB flush when receiving an RAPS (NR, RB) message, due to the existence of the Node ID and BPR based mechanism.

**Flow Aware Transport Pseudowire (FAT PW)**

Routers typically loadbalance traffic based on the lower most label in the label stack which is the same label for all flows on a given pseudowire. This can lead to asymmetric loadbalancing. The flow, in this context, refers to a sequence of packets that have the same source and destination pair. The packets are transported from a source provider edge (PE) to a destination PE.

Flow-Aware Transport Pseudowires (FAT PW) provide the capability to identify individual flows within a pseudowire and provide routers the ability to use these flows to loadbalance traffic. FAT PWs are used to loadbalance traffic in the core when equal cost multipaths (ECMP) are used. A flow label is created based on indivisible packet flows entering a pseudowire; and is inserted as the lower most label in the packet. Routers can use the flow label for loadbalancing which provides a better traffic distribution across ECMP paths or link-bundled paths in the core.

The following figure shows a FAT PW with two flows distributing over ECMPs and bundle links.

*Figure 26: FAT PW with two flows distributing over ECMPs and Bundle-Links*

An additional label is added to the stack, called the flow label, which contains the flow information of a virtual circuit (VC). A flow label is a unique identifier that distinguishes a flow within the PW, and is derived from source and destination MAC addresses, and source and destination IP addresses. The flow label contains the end of label stack (EOS) bit set and inserted after the VC label and before the control word (if any). The ingress PE calculates and forwards the flow label. The FAT PW configuration enables the flow label. The egress PE discards the flow label such that no decisions are made.

All core routers perform load balancing based on the flow-label in the FAT PW. Therefore, it is possible to distribute flows over ECMPs and link bundles.
Pseudowire Headend

Pseudowires (PWs) enable payloads to be transparently carried across IP/MPLS packet-switched networks (PSNs). PWs are regarded as simple and manageable lightweight tunnels for returning customer traffic into core networks. Service providers are now extending PW connectivity into the access and aggregation regions of their networks.

Pseudowire Headend (PWHE) is a technology that allows termination of access pseudowires (PWs) into a Layer 3 (VRF or global) domain or into a Layer 2 domain. PWs provide an easy and scalable mechanism for tunneling customer traffic into a common IP/MPLS network infrastructure. PWHE allows customers to provision features such as QOS access lists (ACL), L3VPN on a per PWHE interface basis, on a service Provider Edge (PE) router.

For all practical purposes, the PWHE interface is treated like any other existing L3 interface. PWs operate in one of the following modes:

• Bridged interworking (VC type 5 or VC type 4)
• IP interworking mode (VC type 11)

With VC type 4 and VC type 5, PWs carry customer Ethernet frames (tagged or untagged) with IP payload. Thus, an S-PE device must perform ARP resolution for customer IP addresses learned over the PWHE. With VC type 4 (VLAN tagged) and VC type 5 (Ethernet port/raw), PWHE acts as a broadcast interface. Whereas with VC type 11 (IP Interworking), PWHE acts as a point-to-point interface. Therefore there are two types of PWHE interface—PW-Ether (for VC type 4 and 5) and PW-IW (for VC type 11). These PWs can terminate into a VRF or the IP global table on S-PE.

Benefits of PWHE

Some of the benefits of implementing PWHE are:

• dissociates the customer facing interface (CFI) of the service PE from the underlying physical transport media of the access or aggregation network
• reduces capex in the access or aggregation network and service PE
• distributes and scales the customer facing Layer 2 UNI interface set
• implements a uniform method of OAM functionality
• providers can extend or expand the Layer 3 service footprints
• provides a method of terminating customer traffic into a next generation network (NGN)

Restrictions

• For the PWHE, the cross-connecting pseudowire neighbour is reachable only through non-recursive prefix.
• FAT (flow-aware transport) labels or entropy labels are not supported on PWHE.
• The system load balances PWHE based on PWID on the originating PE router over the interfaces in the generic interface list, and also on PWID on subsequent P routers.
• PWHE is not supported over 2nd level BGP Labeled Unicast (LU) recursion.

Generic Interface List
A generic interface list contains is a list of physical or bundle interfaces that is used in a PW-HE connection. The generic interface list supports only main interfaces, and not sub-interfaces. The generic interface list is bi-directional and restricts both receive and transmit interfaces on access-facing line cards. The generic interface list has no impact on the core-facing side.

A generic interface list is used to limit the resources allocated for a PWHE interface to the set of interfaces specified in the list.

Only the S-PE is aware of the generic interface list and expects that the PWHE packets arrive on only line cards with generic interface list members on it. If packets arrive at the line card without generic interface list members on it, they are dropped.

LFA over Pseudowire Headend
From Release 5.1.1, PW-HE is supported on loop free alternate (LFA) routes.

For LFA to be effective on a PW-HE interface, all the routing paths (protected and backup) must be included in the generic interface list of that PW-HE interface. If all the routing paths are not included in the generic interface list, then there may be loss of traffic even if LFA is enabled. This is because the LFA route could be the one that was not included in the generic interface list.

To configure LFA on PW-HE interface, do the following:
1. Configuring Generic Interface List
2. Configuring IP/LDP Fast Reroute

For more information about configuring the IP Fast Reroute Loop-free alternate, see Implementing IS-IS on Cisco IOS XR Software module of the Cisco ASR 9000 Series Aggregation Services Router Routing Configuration Guide.

PW-HE Multicast
Multicast support for Pseudowire Head-end (PW-HE) interfaces is available only on the enhanced ethernet cards.

For more information about PW-HE multicast feature, see the Implementing Layer 3 Multicast Routing chapter in the Cisco ASR 9000 Series Aggregation Services Router Multicast Configuration Guide, Release 5.1.x.

PW-HE over MPLS-TE Tunnels
The PW-HE over MPLS-TE Tunnels feature supports forwarding of pseudowire traffic (with pseudowire headend) over TE tunnels.

For more information about PW-HE over MPLS TE Tunnels, see the Implementing MPLS Traffic Engineering chapter in the Cisco ASR 9000 Series Aggregation Services Router MPLS Configuration Guide, Release 5.1.x.
L2VPN over GRE

To transport an IP packet over a generic routing encapsulation (GRE) tunnel, the system first encapsulates the original IP packet with a GRE header. The encapsulated GRE packet is encapsulated once again by an outer transport header that is used to forward the packet to its destination. The following figure captures how GRE encapsulation over an IP transport network takes place.

**Figure 27: GRE Encapsulation**

<table>
<thead>
<tr>
<th>Original IP Packet</th>
</tr>
</thead>
<tbody>
<tr>
<td>Original IP Hdr</td>
</tr>
<tr>
<td>Original Payload</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>New IP Packet after Encapsulation</th>
</tr>
</thead>
<tbody>
<tr>
<td>New IP Hdr</td>
</tr>
</tbody>
</table>

**Note**

In the new IP packet, new payload is similar to the original IP packet. Additionally, the new IP header (New IP Hdr) is similar to the tunnel IP header which in turn is similar to the transport header.

When a GRE tunnel endpoint decapsulates a GRE packet, it further forwards the packet based on the payload type. For example, if the payload is a labeled packet then the packet is forwarded based on the virtual circuit (VC) label or the VPN label for L2VPN and L3VPN respectively.

L2VPN over GRE Restrictions

Some of the restrictions that you must consider while configuring L2VPN over GRE:

- For VPLS flow-based load balancing scenario, the GRE tunnel is pinned down to outgoing path based on tunnel source or destination cyclic redundancy check (CRC). Unicast and flood traffic always takes the same physical path for a given GRE tunnel.

- Ingress attachment circuit must be an ASR 9000 Enhanced Ethernet Line Card for L2VPN over GRE. Additionally, GRE tunnel destination should be reachable only on an ASR 9000 Enhanced Ethernet Line Card.

- The L2VPN over GRE feature is not supported on the ASR 9000 Ethernet Line Card or Cisco ASR 9000 Series SPA Interface Processor-700 line cards as the ingress attachment circuit and GRE destination is reachable over GRE.

- Pseudowire over TE over GRE scenario is not supported.

- Preferred Path Limitations:
  - When you configure GRE as a preferred path, egress features are not supported under the GRE tunnel (Egress ACL).
  - VCCV ping or traceroute are not supported for preferred path.
  - Preferred path is supported only for pseudowires configured in a provider edge (PE) to PE topology.
GRE Deployment Scenarios

In an L2VPN network, you can deploy GRE in the following scenarios:

- Configuring GRE tunnel between provider edge (PE) to PE routers
- Configuring GRE tunnel between P to P routers
- Configuring GRE tunnel between P to PE routers
The following diagrams depict the various scenarios:

**Figure 28: GRE tunnel configured between PE to PE routers**

**Figure 29: GRE tunnel configured between P to P routers**

**Figure 30: GRE tunnel configured between P to PE routers**
These deployment scenarios are applicable to VPWS and VPLS.

**Note**

**GRE Tunnel as Preferred Path**

Preferred tunnel path feature allows you to map pseudowires to specific GRE tunnels. Attachment circuits are cross-connected to GRE tunnel interfaces instead of remote PE router IP addresses (reachable using IGP or LDP). Using preferred tunnel path, it is always assumed that the GRE tunnel that transports the L2 traffic runs between the two PE routers (that is, its head starts at the imposition PE router and terminates on the disposition PE router).

**Multipoint Layer 2 Services Label Switched Multicast**

Multipoint Layer 2 Services Label Switched Multicast (LSM) is a Layer 2 based solution that sends multicast traffic over a multiprotocol label switching (MPLS) network. In Multipoint Layer 2 Services, point-to-point (P2P) pseudowires (PWs) are setup at PE routers participating in a Multipoint Layer 2 Services domain, to provide Ethernet LAN emulation. Broadcast, multicast and unknown unicast traffic can be sent through ingress replication or label switched multicast in the Multipoint Layer 2 Services domain.

**Ingress Replication and its Limitations**

In ingress replication, broadcast, multicast and unknown unicast traffic are replicated at the ingress PE router. Individual copies of the same packets are sent to remote PE routers that participate in the same VPLS domain. However, ingress replication has these limitations:

- Results in significant waste of link bandwidth when there is heavy broadcast and multicast VPLS traffic
- Is resource intensive because the ingress PE router is most impacted by the replication
VPLS LSM as a Solution

VPLS Label Switched Multicast (LSM) is an effective multicast solution for overcoming the limitations of ingress replication. This solution employs point-to-multipoint (P2MP) label switched path (LSP) in the MPLS network to transport multicast traffic over a VPLS domain.

Note

Only broadcast, multicast or unknown unicast traffic is sent over P2MP LSPs

The VPLS LSM solution supports BGP based P2MP PW signaling. As a result, remote PEs participating in the VPLS domain are discovered automatically using the BGP autodiscovery mechanism. Creating a P2MP PW for each VPLS domain allows emulating VPLS P2MP service for PWs in the VPLS domain.

Multicast trees used for VPLS can be of two types:

- Inclusive trees
- Selective trees

Inclusive trees—This option supports the use of a single multicast distribution tree in the SP network to carry all the multicast traffic from a specified set of VPLS sites connected to a given PE. A particular multicast tree can be set up to carry the traffic originated by sites belonging to a single VPLS instance, or belonging to different VPLS instances. The ability to carry the traffic of more than one VPLS instance on the same tree is called Aggregate Inclusive. The tree needs to include every PE that is a member of any of the VPLS instances that are using the tree. A PE may receive multicast traffic for a multicast stream even if it doesn't have any receivers that are interested in receiving traffic for that stream. An Inclusive multicast tree in VPLS LSM is a P2MP tree.

Selective trees—A Selective multicast tree is used by a PE to send IP multicast traffic for one or more specific IP multicast streams, received by the PE over PE-CE interfaces that belong to the same or different VPLS instances, to a subset of the PEs that belong to those VPLS instances. This is to provide a PE the ability to create separate SP multicast trees for specific multicast streams, e.g. high bandwidth multicast streams. This allows traffic for these multicast streams to reach only those PE routers that have receivers for these streams. This avoids flooding other PE routers in the VPLS instance.

VPLS LSM Limitations

VPLS LSM has these limitations:

- Only BGP-AD signaling with RSVP-TE multicast trees are supported.
- Statically configured PWs are not supported.
- Only Inclusive trees are supported.
- Selective multicast trees are not supported.
- LDP signalled P2P PW is not supported. Only BGP signalled PWs are supported.
- Only RSVP-TE multicast trees are supported.
- If IGMP snooping is enabled in a bridge domain participating in the P2MP multicast tree root, IGMP snooping traffic is forwarded using ingress replication. P2MP multicast trees are not used.
• P2MP PW signaling is initiated when P2MP is enabled in a VPLS domain. Therefore, it is possible that one or more Leaf PEs are unable to join the multicast tree. In this scenario, the leaf PEs do not receive traffic sent over the P2MP tree.

• Traffic is blackholed until Leaf PEs successfully join the multicast tree. Automatic recovery is not supported.

• MAC learning occurs when unknown unicast traffic is sent on a P2MP multicast tree. As a result, traffic is switched to a P2P PW. Packet reordering may occur as P2P and P2MP PWs potentially take different paths through the network. Traffic, which is already in transit over P2MP, may arrive later than newer traffic on P2P PW for the same flow.

How to Implement Multipoint Layer 2 Services

This section describes the tasks that are required to implement Multipoint Layer 2 Services:

Configuring a Bridge Domain

These topics describe how to configure a bridge domain:

Creating a Bridge Domain

Perform this task to create a bridge domain.

SUMMARY STEPS

1. `configure`
2. `l2vpn`
3. `bridge group bridge-group-name`
4. `bridge-domain bridge-domain-name`
5. Use the `commit` or `end` command.

DETAILED STEPS

Step 1 `configure`

Example:

```
RP/0/RSP0/CPU0:router# configure
```

Enters the Global Configuration mode.

Step 2 `l2vpn`

Example:

```
RP/0/RSP0/CPU0:router(config)# l2vpn
RP/0/RSP0/CPU0:router(config-l2vpn)#
```

Enters L2VPN configuration mode.
Step 3  
**bridge group bridge-group-name**

*Example:*

```
RP/0/RSP0/CPU0:router(config-l2vpn)# bridge group cisco
RP/0/RSP0/CPU0:router(config-l2vpn-bg)#
```

Creates a bridge group that can contain bridge domains, and then assigns network interfaces to the bridge domain.

Step 4  
**bridge-domain bridge-domain-name**

*Example:*

```
RP/0/RSP0/CPU0:router(config-l2vpn-bg)# bridge-domain abc
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)#
```

Establishes a bridge domain and enters L2VPN bridge group bridge domain configuration mode.

Step 5  
Use the **commit** or **end** command.

- **commit** - Saves the configuration changes and remains within the configuration session.
- **end** - Prompts user to take one of these actions:
  - **Yes** - Saves configuration changes and exits the configuration session.
  - **No** - Exits the configuration session without committing the configuration changes.
  - **Cancel** - Remains in the configuration mode, without committing the configuration changes.

---

**Configuring a Pseudowire**

Perform this task to configure a pseudowire under a bridge domain.

**SUMMARY STEPS**

1. **configure**
2. **l2vpn**
3. **bridge group** *bridge group name*
4. **bridge-domain** *bridge-domain name*
5. **vfi** \{ **vfi-name** \}
6. **exit**
7. **neighbor** \{ **A.B.C.D** \} \{ **pw-id** **value** \}
8. **dhcp ipv4 snoop profile** \{ **dhcp_snoop_profile_name** \}
9. Use the **commit** or **end** command.

**DETAILED STEPS**

Step 1  
**configure**
Configuring a Bridge Domain

**Example:**
```
RP/0/RSP0/CPU0:router# configure
```
Enters the Global Configuration mode.

**Step 2**  
**l2vpn**

**Example:**
```
RP/0/RSP0/CPU0:router(config)# l2vpn
RP/0/RSP0/CPU0:router(config-l2vpn)#
```
Enters L2VPN configuration mode.

**Step 3**  
**bridge group bridge group name**

**Example:**
```
RP/0/RSP0/CPU0:router(config-l2vpn)# bridge group csco
RP/0/RSP0/CPU0:router(config-l2vpn-bg)#
```
Creates a bridge group so that it can contain bridge domains and then assigns network interfaces to the bridge domain.

**Step 4**  
**bridge-domain bridge-domain name**

**Example:**
```
RP/0/RSP0/CPU0:router(config-l2vpn-bg)# bridge-domain abc
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)#
```
Establishes a bridge domain and enters L2VPN bridge group bridge domain configuration mode.

**Step 5**  
**vfi { vfi-name }**

**Example:**
```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# vfi v1
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-vfi)#
```
Configures the virtual forwarding interface (VFI) parameters and enters L2VPN bridge group bridge domain VFI configuration mode.

- Use the `vfi-name` argument to configure the name of the specified virtual forwarding interface.

**Step 6**  
**exit**

**Example:**
```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-vfi)# exit
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)#
```
Exits the current configuration mode.

**Step 7**  
**neighbor { A.B.C.D } { pw-id value }**
Example:

RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# neighbor 10.1.1.2 pw-id 1000
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-pw)#

Adds an access pseudowire port to a bridge domain or a pseudowire to a bridge virtual forwarding interface (VFI).

- Use the A.B.C.D argument to specify the IP address of the cross-connect peer.
- Use the pw-id keyword to configure the pseudowire ID and ID value. The range is 1 to 4294967295.

Step 8 dhcp ipv4 snoop profile { dhcp_snoop_profile_name }

Example:

RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-pw)# dhcp ipv4 snoop profile profile1

Enables DHCP snooping on the bridge, and attaches a DHCP snooping profile.

Step 9 Use the commit or end command.

commit - Saves the configuration changes and remains within the configuration session.
end - Prompts user to take one of these actions:

- Yes - Saves configuration changes and exits the configuration session.
- No - Exits the configuration session without committing the configuration changes.
- Cancel - Remains in the configuration mode, without committing the configuration changes.

Associating Members with a Bridge Domain

After a bridge domain is created, perform this task to assign interfaces to the bridge domain. These types of bridge ports are associated with a bridge domain:

- Ethernet and VLAN
- VFI
- BVI
### SUMMARY STEPS

1. `configure`
2. `l2vpn`
3. `bridge group bridge group name`
4. `bridge-domain bridge-domain name`
5. `interface type interface-path-id`
6. `(Optional) static-mac-address { MAC-address }`
7. `routed interface BVI-id`
8. Use the `commit` or `end` command.

### DETAILED STEPS

---

**Step 1** configure

**Example:**

```
RP/0/RSP0/CPU0:router# configure
```

Enters the Global Configuration mode.

**Step 2** l2vpn

**Example:**

```
RP/0/RSP0/CPU0:router(config)# l2vpn
```

Enters L2VPN configuration mode.

**Step 3** bridge group *bridge group name*

**Example:**

```
RP/0/RSP0/CPU0:router(config-l2vpn)# bridge group csco
```

```
RP/0/RSP0/CPU0:router(config-l2vpn-bg)#
```

Creates a bridge group so that it can contain bridge domains and then assigns network interfaces to the bridge domain.

**Step 4** bridge-domain *bridge-domain name*

**Example:**

```
RP/0/RSP0/CPU0:router(config-l2vpn-bg)# bridge-domain abc
```

```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)#
```

Establishes a bridge domain and enters L2VPN bridge group bridge domain configuration mode.

**Step 5** interface *type interface-path-id*

**Example:**

```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# interface GigabitEthernet 0/4/0/0
```

```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-ac)#
```

Cisco ASR 9000 Series Aggregation Services Router L2VPN and Ethernet Services Configuration Guide, Release 5.2.x
Enters interface configuration mode and adds an interface to a bridge domain that allows packets to be forwarded and received from other interfaces that are part of the same bridge domain.

**Step 6**

*(Optional)* static-mac-address { MAC-address }

**Example:**

```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-ac)# static-mac-address 1.1.1
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-ac)# exit
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)#
```

Configures the static MAC address to associate a remote MAC address with a pseudowire or any other bridge interface.

**Step 7**

routed interface BVI-id

**Example:**

```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# routed interface BVI100
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-ac)#
```

Perform this step if you need the VPLS pseudowire traffic routed over an Integrated Routing and Bridging (IRB). This command enters bridge-group virtual interface configuration mode and adds a bridge-group virtual interface (BVI) to the bridge domain that allows packets to be forwarded and received from other interfaces that are part of the same bridge domain. This step is essential to bring the BVI's status up.

**Step 8**

Use the **commit** or **end** command.

- **commit** - Saves the configuration changes and remains within the configuration session.
- **end** - Prompts user to take one of these actions:
  - **Yes** - Saves configuration changes and exits the configuration session.
  - **No** - Exits the configuration session without committing the configuration changes.
  - **Cancel** - Remains in the configuration mode, without committing the configuration changes.

---

### Configuring Bridge Domain Parameters

To configure bridge domain parameters, associate these parameters with a bridge domain:

- **Maximum transmission unit (MTU)**—Specifies that all members of a bridge domain have the same MTU. The bridge domain member with a different MTU size is not used by the bridge domain even though it is still associated with a bridge domain.
- **Flooding**—Flooding is enabled always. You cannot disable it.
- **Dynamic ARP Inspection (DAI)**—Ensures only valid ARP requests and responses are relayed.
- **IP SourceGuard (IPSG)**—Enables source IP address filtering on a Layer 2 port.
To verify if the DAI and IPSG features are working correctly, look up the packets dropped statistics for DAI and IPSG violation. The packet drops statistics can be viewed in the output of the `show l2vpn bridge-domain bd-name <> detail` command.

**SUMMARY STEPS**

1. `configure`
2. `l2vpn`
3. `bridge group bridge-group-name`
4. `bridge-domain bridge-domain-name`
5. `mtu bytes`
6. `dynamic-arp-inspection { address-validation | disable | logging }
7. `ip-source-guard logging`
8. Use the `commit` or `end` command.

**DETAILED STEPS**

**Step 1** `configure`

**Example:**
```
RP/0/RSP0/CPU0:router# configure
```
Enters the Global Configuration mode.

**Step 2** `l2vpn`

**Example:**
```
RP/0/RSP0/CPU0:router(config)# l2vpn
```
```
RP/0/RSP0/CPU0:router(config-l2vpn)#
```
Enters the l2vpn configuration mode.

**Step 3** `bridge group bridge-group-name`

**Example:**
```
RP/0/RSP0/CPU0:router(config-l2vpn)# bridge group csco
```
```
RP/0/RSP0/CPU0:router(config-l2vpn-bg)#
```
Creates a bridge group so that it can contain bridge domains and then assigns network interfaces to the bridge domain.

**Step 4** `bridge-domain bridge-domain-name`

**Example:**
```
RP/0/RSP0/CPU0:router(config-l2vpn-bg)# bridge-domain abc
```
```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)#
```
Establishes a bridge domain and enters l2vpn bridge group bridge domain configuration mode.
Step 5  \texttt{mtu bytes}

\textbf{Example:}

\begin{verbatim}
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# mtu 1000
\end{verbatim}

Adjusts the maximum packet size or maximum transmission unit (MTU) size for the bridge domain.

- Use the \texttt{bytes} argument to specify the MTU size, in bytes. The range is from 64 to 65535.

Step 6  \texttt{dynamic-arp-inspection \{ address-validation | disable | logging \}}

\textbf{Example:}

\begin{verbatim}
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# dynamic-arp-inspection
\end{verbatim}

Enters the dynamic ARP inspection configuration submode. Ensures only valid ARP requests and responses are relayed.

\textbf{Note} You can configure dynamic ARP inspection under the bridge domain or the bridge port.

Step 7  \texttt{ip-source-guard logging}

\textbf{Example:}

\begin{verbatim}
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# ip-source-guard logging
\end{verbatim}

Enters the IP source guard configuration submode and enables source IP address filtering on a Layer 2 port.

You can enable IP source guard under the bridge domain or the bridge port. By default, bridge ports under a bridge inherit the IP source guard configuration from the parent bridge.

By default, IP source guard is disabled on the bridges.

Step 8  Use the \texttt{commit} or \texttt{end} command.

\texttt{commit} - Saves the configuration changes and remains within the configuration session.

\texttt{end} - Prompts user to take one of these actions:

- \texttt{Yes} - Saves configuration changes and exits the configuration session.
- \texttt{No} - Exits the configuration session without committing the configuration changes.
- \texttt{Cancel} - Remains in the configuration mode, without committing the configuration changes.

\section*{Disabling a Bridge Domain}

Perform this task to disable a bridge domain. When a bridge domain is disabled, all VFIs that are associated with the bridge domain are disabled. You are still able to attach or detach members to the bridge domain and the VFIs that are associated with the bridge domain.
SUMMARY STEPS

1. configure
2. l2vpn
3. bridge group *bridge group name*
4. bridge-domain *bridge-domain name*
5. shutdown
6. Use the commit or end command.

DETAILED STEPS

Step 1  configure

Example:

```
RP/0/RSP0/CPU0:router# configure
```

Enters the Global Configuration mode.

Step 2  l2vpn

Example:

```
RP/0/RSP0/CPU0:router(config)# l2vpn
RP/0/RSP0/CPU0:router(config-l2vpn)#
```

Enters L2VPN configuration mode.

Step 3  bridge group *bridge group name*

Example:

```
RP/0/RSP0/CPU0:router(config-l2vpn)# bridge group cisco
RP/0/RSP0/CPU0:router(config-l2vpn-bg)#
```

Creates a bridge group so that it can contain bridge domains and then assigns network interfaces to the bridge domain.

Step 4  bridge-domain *bridge-domain name*

Example:

```
RP/0/RSP0/CPU0:router(config-l2vpn-bg)# bridge-domain abc
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)#
```

Establishes a bridge domain and enters l2vpn bridge group bridge domain configuration mode.

Step 5  shutdown

Example:

```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)#
```

Shuts down a bridge domain to bring the bridge and all attachment circuits and pseudowires under it to admin down state.
Step 6

Use the **commit** or **end** command.

- **commit** - Saves the configuration changes and remains within the configuration session.
- **end** - Prompts user to take one of these actions:
  - **Yes** - Saves configuration changes and exits the configuration session.
  - **No** - Exits the configuration session without committing the configuration changes.
  - **Cancel** - Remains in the configuration mode, without committing the configuration changes.

---

**Blocking Unknown Unicast Flooding**

Perform this task to disable flooding of unknown unicast traffic at the bridge domain level.

You can disable flooding of unknown unicast traffic at the bridge domain, bridge port or access pseudowire levels. By default, unknown unicast traffic is flooded to all ports in the bridge domain.

*Note*

If you disable flooding of unknown unicast traffic on the bridge domain, all ports within the bridge domain inherit this configuration. You can configure the bridge ports to override the bridge domain configuration.

---

**SUMMARY STEPS**

1. configure
2. l2vpn
3. bridge group *bridge-group-name*
4. bridge-domain *bridge-domain-name*
5. flooding unknown-unicast disable
6. Use the **commit** or **end** command.

---

**DETAILED STEPS**

**Step 1**

configure

*Example:*

```
RP/0/RSP0/CPU0:router# configure
Enters the Global Configuration mode.
```

**Step 2**

l2vpn

*Example:*

```
RP/0/RSP0/CPU0:router(config)# l2vpn
RP/0/RSP0/CPU0:router(config-l2vpn)#
Enters L2VPN configuration mode.
```
Step 3  
**bridge group**  *bridge-group-name*

**Example:**
RP/0/RSP0/CPU0:router(config-l2vpn)# bridge group cisco
RP/0/RSP0/CPU0:router(config-l2vpn-bg)#

Creates a bridge group so that it can contain bridge domains and then assigns network interfaces to the bridge domain.

Step 4  
**bridge-domain**  *bridge-domain-name*

**Example:**
RP/0/RSP0/CPU0:router(config-l2vpn-bg)# bridge-domain abc
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)#

Establishes a bridge domain and enters l2vpn bridge group bridge domain configuration mode.

Step 5  
**flooding unknown-unicast disable**

**Example:**
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)#
flooding unknown-unicast disable

Disables flooding of unknown unicast traffic at the bridge domain level.

Step 6  
Use the **commit** or **end** command.

**commit** - Saves the configuration changes and remains within the configuration session.

**end** - Prompts user to take one of these actions:

- **Yes** - Saves configuration changes and exits the configuration session.
- **No** - Exits the configuration session without committing the configuration changes.
- **Cancel** - Remains in the configuration mode, without committing the configuration changes.

---

### Changing the Flood Optimization Mode

Perform this task to change the flood optimization mode under the bridge domain:

**SUMMARY STEPS**

1. configure
2. l2vpn
3. **bridge group**  *bridge-group-name*
4. **bridge-domain**  *bridge-domain-name*
5. **flood mode convergence-optimized**
6. Use the **commit** or **end** command.

**DETAILED STEPS**

Step 1  
**configure**
Step 2  l2vpn

Example:
RP/0/RSP0/CPU0:router# configure
Enters the Global Configuration mode.

Step 3  bridge group  bridge-group-name

Example:
RP/0/RSP0/CPU0:router(config)# l2vpn
Enters L2VPN configuration mode.

Step 4  bridge-domain  bridge-domain-name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn)# bridge group csco
RP/0/RSP0/CPU0:router(config-l2vpn-bg)#
Creates a bridge group so that it can contain bridge domains and then assigns network interfaces to the bridge domain.

Step 5  flood mode convergence-optimized

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bg)# bridge-domain abc
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)#
Establishes a bridge domain and enters l2vpn bridge group bridge domain configuration mode.

Step 6  Use the commit or end command.
commit - Saves the configuration changes and remains within the configuration session.
end - Prompts user to take one of these actions:
  • Yes - Saves configuration changes and exits the configuration session.
  • No - Exits the configuration session without committing the configuration changes.
  • Cancel - Remains in the configuration mode, without committing the configuration changes.

Configuring Layer 2 Security

These topics describe how to configure Layer 2 security:
Enabling Layer 2 Security

Perform this task to enable Layer 2 port security on a bridge.

SUMMARY STEPS

1. configure
2. l2vpn
3. bridge group bridge-group-name
4. bridge domain bridge-domain-name
5. security
6. Use the commit or end command.

DETAILED STEPS

Step 1 configure

Example:
RP/0/RSP0/CPU0:router# configure
Enters the Global Configuration mode.

Step 2 l2vpn

Example:
RP/0/RSP0/CPU0:router(config)# l2vpn
Enters L2VPN configuration mode.

Step 3 bridge group bridge-group-name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn)# bridge group cisco
Assigns each network interface to a bridge group and enters L2VPN bridge group configuration mode.

Step 4 bridge domain bridge-domain-name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bg)# bridge-domain abc
Establishes a bridge domain and enters L2VPN bridge group bridge domain configuration mode.

Step 5 security
Example:

`RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# security`

Enables Layer 2 port security on a bridge.

### Step 6

Use the `commit` or `end` command.

- **commit** - Saves the configuration changes and remains within the configuration session.
- **end** - Prompts user to take one of these actions:
  - **Yes** - Saves configuration changes and exits the configuration session.
  - **No** - Exits the configuration session without committing the configuration changes.
  - **Cancel** - Remains in the configuration mode, without committing the configuration changes.

---

### Attaching a Dynamic Host Configuration Protocol Profile

Perform this task to enable DHCP snooping on a bridge and to attach a DHCP snooping profile to a bridge.

**SUMMARY STEPS**

1. **configure**
2. **l2vpn**
3. **bridge group** `bridge-group-name`
4. **bridge-domain** `bridge-domain-name`
5. **dhcp ipv4 snoop** `{ profile profile-name }`
6. Use the **commit** or **end** command.

**DETAILED STEPS**

#### Step 1

**configure**

**Example:**

`RP/0/RSP0/CPU0:router# configure`

Enters the Global Configuration mode.

#### Step 2

**l2vpn**

**Example:**

```
RP/0/RSP0/CPU0:router(config)# l2vpn
RP/0/RSP0/CPU0:router(config-l2vpn)#
```

Enters L2VPN configuration mode.
Configuring a Layer 2 Virtual Forwarding Instance

These topics describe how to configure a Layer 2 virtual forwarding instance (VFI):

Creating the Virtual Forwarding Instance

Perform this task to create a Layer 2 Virtual Forwarding Instance (VFI) on all provider edge devices under the bridge domain.
SUMMARY STEPS

1. configure
2. l2vpn
3. bridge group bridge group name
4. bridge-domain bridge-domain name
5. vfi {vfi-name}
6. Use the commit or end command.

DETAILED STEPS

Step 1 configure

Example:
RP/0/RSP0/CPU0:router# configure
Enters the Global Configuration mode.

Step 2 l2vpn

Example:
RP/0/RSP0/CPU0:router(config)# l2vpn
RP/0/RSP0/CPU0:router(config-l2vpn)#
Enters L2VPN configuration mode.

Step 3 bridge group bridge group name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn)# bridge group cisco
RP/0/RSP0/CPU0:router(config-l2vpn-bg)#
Creates a bridge group so that it can contain bridge domains and then assigns network interfaces to the bridge domain.

Step 4 bridge-domain bridge-domain name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bg)# bridge-domain abc
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)#
Establishes a bridge domain and enters L2VPN bridge group bridge domain configuration mode.

Step 5 vfi {vfi-name}

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# vfi v1
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-vfi)#
Configures virtual forwarding interface (VFI) parameters and enters L2VPN bridge group bridge domain VFI configuration mode.

Step 6 Use the commit or end command.

commit - Saves the configuration changes and remains within the configuration session.
end - Prompts user to take one of these actions:

- **Yes** - Saves configuration changes and exits the configuration session.
- **No** - Exits the configuration session without committing the configuration changes.
- **Cancel** - Remains in the configuration mode, without committing the configuration changes.

---

### Associating Pseudowires with the Virtual Forwarding Instance

After a VFI is created, perform this task to associate one or more pseudowires with the VFI.

#### SUMMARY STEPS

1. `configure`
2. `l2vpn`
3. `bridge group bridge-group-name`
4. `bridge-domain bridge-domain-name`
5. `vfi { vfi-name }`
6. `neighbor { A.B.C.D } { pw-id value }`
7. Use the `commit` or `end` command.

#### DETAILED STEPS

**Step 1**

**configure**

*Example:*

```
RP/0/RSP0/CPU0:router# configure
```

Enters the Global Configuration mode.

**Step 2**

**l2vpn**

*Example:*

```
RP/0/RSP0/CPU0:router(config)# l2vpn
RP/0/RSP0/CPU0:router(config-l2vpn)#
```

Enters L2VPN configuration mode.

**Step 3**

**bridge group bridge-group-name**

*Example:*

```
RP/0/RSP0/CPU0:router(config-l2vpn)# bridge group csco
RP/0/RSP0/CPU0:router(config-l2vpn-bg)#
```

Creates a bridge group so that it can contain bridge domains and then assigns network interfaces to the bridge domain.
Step 4  bridge-domain bridge-domain-name

Example:

RP/0/RSP0/CPU0:router(config-l2vpn-bg)# bridge-domain abc
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)#

Establishes a bridge domain and enters L2VPN bridge group bridge domain configuration mode.

Step 5  vfi { vfi name }

Example:

RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# vfi v1
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-vfi)#

Configures virtual forwarding interface (VFI) parameters and enters L2VPN bridge group bridge domain VFI configuration mode.

Step 6  neighbor { A.B.C.D } { pw-id value }

Example:

RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-vfi)# neighbor 10.1.1.2 pw-id 1000
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-vfi-pw)#

 Adds a pseudowire port to a bridge domain or a pseudowire to a bridge virtual forwarding interface (VFI).
  • Use the A.B.C.D argument to specify the IP address of the cross-connect peer.
  • Use the pw-id keyword to configure the pseudowire ID and ID value. The range is 1 to 4294967295.

Step 7  Use the commit or end command.
commit - Saves the configuration changes and remains within the configuration session.
end - Prompts user to take one of these actions:
  • Yes - Saves configuration changes and exits the configuration session.
  • No - Exits the configuration session without committing the configuration changes.
  • Cancel - Remains in the configuration mode, without committing the configuration changes.

Associating a Virtual Forwarding Instance to a Bridge Domain

Perform this task to associate a VFI to be a member of a bridge domain.
SUMMARY STEPS

1. configure
2. l2vpn
3. bridge group bridge group name
4. bridge-domain bridge-domain name
5. vfi \{ vfi name \}
6. neighbor \{ A.B.C.D \} \{ pw-id value \}
7. static-mac-address \{ MAC-address \}
8. Use the commit or end command.

DETAILED STEPS

Step 1 configure

Example:

RP/0/RSP0/CPU0:router# configure

Enters the Global Configuration mode.

Step 2 l2vpn

Example:

RP/0/RSP0/CPU0:router(config)# l2vpn
RP/0/RSP0/CPU0:router(config-l2vpn)#

Enters the L2VPN configuration mode.

Step 3 bridge group bridge group name

Example:

RP/0/RSP0/CPU0:router(config-l2vpn)# bridge group csco
RP/0/RSP0/CPU0:router(config-l2vpn-bg)#

Creates a bridge group so that it can contain bridge domains and then assigns network interfaces to the bridge domain.

Step 4 bridge-domain bridge-domain name

Example:

RP/0/RSP0/CPU0:router(config-l2vpn-bg)# bridge-domain abc
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)#

Establishes a bridge domain and enters L2VPN bridge group bridge domain configuration mode.

Step 5 vfi \{ vfi name \}

Example:

RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# vfi v1
Configures virtual forwarding interface (VFI) parameters and enters L2VPN bridge group bridge domain VFI configuration mode.

**Step 6**

```plaintext
neighbor { A.B.C.D } { pw-id value }
```

**Example:**

```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-vfi)# neighbor 10.1.1.2 pw-id 1000
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-vfi-pw)#
```

Adds a pseudowire port to a bridge domain or a pseudowire to a bridge virtual forwarding interface (VFI).

- Use the *A.B.C.D* argument to specify the IP address of the cross-connect peer.
- Use the *pw-id* keyword to configure the pseudowire ID and ID value. The range is 1 to 4294967295.

**Step 7**

```plaintext
static-mac-address { MAC-address }
```

**Example:**

```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-vfi-pw)# static-mac-address 1.1.1
```

Configures the static MAC address to associate a remote MAC address with a pseudowire or any other bridge interface.

**Step 8**

Use the *commit* or *end* command.

- **commit** - Saves the configuration changes and remains within the configuration session.
- **end** - Prompts user to take one of these actions:
  - **Yes** - Saves configuration changes and exits the configuration session.
  - **No** - Exits the configuration session without committing the configuration changes.
  - **Cancel** - Remains in the configuration mode, without committing the configuration changes.

---

### Attaching Pseudowire Classes to Pseudowires

Perform this task to attach a pseudowire class to a pseudowire.

**SUMMARY STEPS**

1. `configure`
2. `l2vpn`
3. `bridge group bridge group name`
4. `bridge-domain bridge-domain name`
5. `vfi { vfi-name }
6. `neighbor { A.B.C.D } { pw-id value }
7. `pw-class { class-name }
8. Use the *commit* or *end* command.
DETAILED STEPS

Step 1  configure

Example:
RP/0/RSP0/CPU0:router# configure
Enters the Global Configuration mode.

Step 2  l2vpn

Example:
RP/0/RSP0/CPU0:router(config)# l2vpn
RP/0/RSP0/CPU0:router(config-l2vpn)#
Enters the L2VPN configuration mode.

Step 3  bridge group bridge group name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn)# bridge group csco
RP/0/RSP0/CPU0:router(config-l2vpn-bg)#
Creates a bridge group so that it can contain bridge domains and then assigns network interfaces to the bridge domain.

Step 4  bridge-domain bridge-domain name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bg)# bridge-domain abc
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)#
Establishes a bridge domain and enters L2VPN bridge group bridge domain configuration mode.

Step 5  vfi { vfi-name }

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# vfi v1
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-vfi)#
Configures virtual forwarding interface (VFI) parameters and enters L2VPN bridge group bridge domain VFI configuration mode.

Step 6  neighbor { A.B.C.D } { pw-id value }

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-vfi)# neighbor 10.1.1.2 pw-id 1000
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-vfi-pw)#
Adds a pseudowire port to a bridge domain or a pseudowire to a bridge virtual forwarding interface (VFI).

- Use the A.B.C.D argument to specify the IP address of the cross-connect peer.
• Use the **pw-id** keyword to configure the pseudowire ID and ID value. The range is 1 to 4294967295.

**Step 7**

```
Step 7  pw-class { class-name }
```

*Example:*

```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-vfi-pw)# pw-class canada
```

Configures the pseudowire class template name to use for the pseudowire.

**Step 8** Use the **commit** or **end** command.

- **commit** - Saves the configuration changes and remains within the configuration session.
- **end** - Prompts user to take one of these actions:
  - **Yes** - Saves configuration changes and exits the configuration session.
  - **No** - Exits the configuration session without committing the configuration changes.
  - **Cancel** - Remains in the configuration mode, without committing the configuration changes.

---

### Configuring Pseudowires Using Static Labels

Perform this task to configure the Any Transport over Multiprotocol (AToM) pseudowires by using the static labels. A pseudowire becomes a static AToM pseudowire by setting the MPLS static labels to local and remote.

**SUMMARY STEPS**

1. `configure`
2. `l2vpn`
3. `bridge group bridge-group-name`
4. `bridge-domain bridge-domain-name`
5. `vfi { vfi-name }
6. `neighbor { A.B.C.D } { pw-id value }
7. `mpls static label { local value } { remote value }
8. Use the **commit** or **end** command.

**DETAILED STEPS**

**Step 1** `configure`

*Example:*

```
RP/0/RSP0/CPU0:router# configure
```

Enters the Global Configuration mode.

**Step 2** `l2vpn`
Example:

```
RP/0/RSP0/CPU0:router(config)# l2vpn
RP/0/RSP0/CPU0:router(config-l2vpn)#
```

Enters the L2VPN configuration mode.

**Step 3**

```
bridge group bridge-group-name
```

Example:

```
RP/0/RSP0/CPU0:router(config-l2vpn)# bridge group csco
RP/0/RSP0/CPU0:router(config-l2vpn-bg)#
```

Creates a bridge group so that it can contain bridge domains and then assigns network interfaces to the bridge domain.

**Step 4**

```
bridge-domain bridge-domain-name
```

Example:

```
RP/0/RSP0/CPU0:router(config-l2vpn-bg)# bridge-domain abc
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)#
```

Establishes a bridge domain and enters L2VPN bridge group bridge domain configuration mode.

**Step 5**

```
vfi { vfi-name }
```

Example:

```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# vfi v1
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-vfi)#
```

Configures virtual forwarding interface (VFI) parameters and enters L2VPN bridge group bridge domain VFI configuration mode.

**Step 6**

```
neighbor { A.B.C.D } { pw-id value }
```

Example:

```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-vfi)# neighbor 10.1.1.2 pw-id 1000
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-vfi-pw)#
```

Adds a pseudowire port to a bridge domain or a pseudowire to a bridge virtual forwarding interface (VFI).

- Use the `A.B.C.D` argument to specify the IP address of the cross-connect peer.
- Use the `pw-id` keyword to configure the pseudowire ID and ID value. The range is 1 to 4294967295.

**Step 7**

```
mpls static label { local value } { remote value }
```

Example:

```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-vfi-pw)# mpls static label local 800 remote 500
```

Configures the MPLS static labels and the static labels for the pseudowire configuration. You can set the local and remote pseudowire labels.
Step 8
Use the **commit** or **end** command.

**commit** - Saves the configuration changes and remains within the configuration session.

**end** - Prompts user to take one of these actions:

- **Yes** - Saves configuration changes and exits the configuration session.
- **No** - Exits the configuration session without committing the configuration changes.
- **Cancel** - Remains in the configuration mode, without committing the configuration changes.

---

**Disabling a Virtual Forwarding Instance**

Perform this task to disable a VFI. When a VFI is disabled, all the previously established pseudowires that are associated with the VFI are disconnected. LDP advertisements are sent to withdraw the MAC addresses that are associated with the VFI. However, you can still attach or detach attachment circuits with a VFI after a shutdown.

**SUMMARY STEPS**

1. **configure**
2. **l2vpn**
3. **bridge group** *bridge group name*
4. **bridge-domain** *bridge-domain name*
5. **vfi** { *vfi-name* }
6. **shutdown**
7. Use the **commit** or **end** command.
8. **show l2vpn bridge-domain [ detail ]**

**DETAILED STEPS**

**Step 1**
**configure**

**Example:**
```
RP/0/RSP0/CPU0:router# configure
```
Enters the Global Configuration mode.

**Step 2**
**l2vpn**

**Example:**
```
RP/0/RSP0/CPU0:router(config)# l2vpn
RP/0/RSP0/CPU0:router(config-l2vpn)#
```
Enters the L2VPN configuration mode.

**Step 3**
**bridge group** *bridge group name*
Example:

RP/0/RSP0/CPU0:router(config-l2vpn)# bridge group cisco
RP/0/RSP0/CPU0:router(config-l2vpn-bg)#

Creates a bridge group so that it can contain bridge domains and then assigns network interfaces to the bridge domain.

**Step 4**

`bridge-domain bridge-domain name`

Example:

RP/0/RSP0/CPU0:router(config-l2vpn-bg)# bridge-domain abc
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)#

Establishes a bridge domain and enters L2VPN bridge group bridge domain configuration mode.

**Step 5**

`vfi { vfi-name }`

Example:

RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# vfi v1
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-vfi)#

Configures virtual forwarding interface (VFI) parameters and enters L2VPN bridge group bridge domain VFI configuration mode.

**Step 6**

`shutdown`

Example:

RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-vfi)# shutdown

Disables the virtual forwarding interface (VFI).

**Step 7**

Use the **commit** or **end** command.

- **commit** - Saves the configuration changes and remains within the configuration session.
- **end** - Prompts user to take one of these actions:
  - **Yes** - Saves configuration changes and exits the configuration session.
  - **No** - Exits the configuration session without committing the configuration changes.
  - **Cancel** - Remains in the configuration mode, without committing the configuration changes.

**Step 8**

`show l2vpn bridge-domain [ detail ]`

Example:

RP/0/RSP0/CPU0:router# show l2vpn bridge-domain detail

Displays the state of the VFI. For example, if you shut down the VFI, the VFI is shown as shut down under the bridge domain.
Configuring the MAC Address-related Parameters

These topics describe how to configure the MAC address-related parameters:
The MAC table attributes are set for the bridge domains.

Configuring the MAC Address Source-based Learning

Perform this task to configure the MAC address source-based learning.

SUMMARY STEPS

1. `configure`
2. `l2vpn`
3. `bridge group bridge group name`
4. `bridge-domain bridge-domainname`
5. `mac`
6. `learning disable`
7. Use the `commit` or `end` command.
8. `show l2vpn bridge-domain [ detail ]`

DETAILED STEPS

**Step 1**  
`configure`

*Example:*  
`RP/0/RSP0/CPU0:router# configure`

Enters the Global Configuration mode.

**Step 2**  
`l2vpn`

*Example:*  
`RP/0/RSP0/CPU0:router(config)# l2vpn`

Enters the L2VPN configuration mode.

**Step 3**  
`bridge group bridge group name`

*Example:*  
`RP/0/RSP0/CPU0:router(config-l2vpn)# bridge group csco`

Creates a bridge group so that it can contain bridge domains and then assigns network interfaces to the bridge domain.

**Step 4**  
`bridge-domain bridge-domainname`
Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bg)# bridge-domain abc
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)#

Establishes a bridge domain and enters L2VPN bridge group bridge domain configuration mode.

Step 5  mac

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# mac
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-mac)#

Enters L2VPN bridge group bridge domain MAC configuration mode.

Step 6  learning disable

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-mac)# learning disable

Disables MAC learning at the bridge domain level.

Step 7  Use the commit or end command.

commit - Saves the configuration changes and remains within the configuration session.

end - Prompts user to take one of these actions:

• Yes - Saves configuration changes and exits the configuration session.
• No - Exits the configuration session without committing the configuration changes.
• Cancel - Remains in the configuration mode, without committing the configuration changes.

Step 8  show l2vpn bridge-domain [ detail ]

Example:
RP/0/RSP0/CPU0:router# show l2vpn bridge-domain detail

Displays the details that the MAC address source-based learning is disabled on the bridge.

Enabling the MAC Address Withdrawal

Perform this task to enable the MAC address withdrawal for a specified bridge domain.
SUMMARY STEPS

1. configure
2. l2vpn
3. bridge group *bridge-group-name*
4. bridge-domain *bridge-domain-name*
5. mac
6. withdrawal
7. Use the **commit** or **end** command.
8. show l2vpn bridge-domain [detail]

DETAILED STEPS

---

**Step 1**  
configure

**Example:**  
RP/0/RSP0/CPU0:router# configure

Enters the Global Configuration mode.

**Step 2**  
l2vpn

**Example:**  
RP/0/RSP0/CPU0:router(config)# l2vpn  
RP/0/RSP0/CPU0:router(config-l2vpn)#

Enters L2VPN configuration mode.

**Step 3**  
bridge group *bridge-group-name*

**Example:**  
RP/0/RSP0/CPU0:router(config-l2vpn)# bridge group cisco  
RP/0/RSP0/CPU0:router(config-l2vpn-bg)#

Creates a bridge group so that it can contain bridge domains and then assigns network interfaces to the bridge domain.

**Step 4**  
bridge-domain *bridge-domain-name*

**Example:**  
RP/0/RSP0/CPU0:router(config-l2vpn-bg)# bridge-domain abc  
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)#

Establishes a bridge domain and enters L2VPN l2vpn bridge group bridge domain configuration mode.

**Step 5**  
mac

**Example:**  
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# mac
Enters L2VPN 12vpn bridge group bridge domain MAC configuration mode.

**Step 6**  withdrawal

*Example:*

```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-mac)# withdrawal
```

Enables the MAC address withdrawal for a specified bridge domain.

**Step 7**  Use the **commit** or **end** command.

**commit** - Saves the configuration changes and remains within the configuration session.

**end** - Prompts user to take one of these actions:

- **Yes** - Saves configuration changes and exits the configuration session.
- **No** - Exits the configuration session without committing the configuration changes.
- **Cancel** - Remains in the configuration mode, without committing the configuration changes.

**Step 8**  show l2vpn bridge-domain [detail]

*Example:*

```
RP/0/RSP0/CPU0:router# show l2vpn bridge-domain detail
```

Displays detailed sample output to specify that the MAC address withdrawal is enabled. In addition, the sample output displays the number of MAC withdrawal messages that are sent over or received from the pseudowire.

---

**Configuring the MAC Address Limit**

Perform this task to configure the parameters for the MAC address limit.
SUMMARY STEPS

1. configure
2. l2vpn
3. bridge group *bridge group name*
4. bridge-domain *bridge-domain name*
5. (Optional) interface *type interface_id*
6. mac
7. limit
8. maximum { value }
9. action { flood | no-flood | shutdown }
10. notification { both | none | trap }
11. Use the commit or end command.
12. show l2vpn bridge-domain [ detail ]

DETAILED STEPS

---

Step 1 configure

Example:

```
RP/0/RSP0/CPU0:router# configure
```

Enters the Global Configuration mode.

Step 2 l2vpn

Example:

```
RP/0/RSP0/CPU0:router(config)# l2vpn
RP/0/RSP0/CPU0:router(config-l2vpn)#
```

Enters the L2VPN configuration mode.

Step 3 bridge group *bridge group name*

Example:

```
RP/0/RSP0/CPU0:router(config-l2vpn)# bridge group cisco
RP/0/RSP0/CPU0:router(config-l2vpn-bg)#
```

Creates a bridge group so that it can contain bridge domains and then assigns network interfaces to the bridge domain.

Step 4 bridge-domain *bridge-domain name*

Example:

```
RP/0/RSP0/CPU0:router(config-l2vpn-bg)# bridge-domain abc
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)#
```

Establishes a bridge domain and enters L2VPN bridge group bridge domain configuration mode.
Implementing Multipoint Layer 2 Services

Configuring the MAC Address-related Parameters

**Step 5** *(Optional)* interface type interface_id

**Example:**
```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# interface gigabitEthernet 0/2/0/1
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-ac)#
```
Enters the interface configuration mode of the specified interface and adds this interface as the bridge domain member interface.

**Note** Run this step if you want to configure the MAC address limit only for a specific interface. The further steps show the router prompt displayed when you have skipped this step to configure the MAC address limit at the bridge domain level.

**Step 6** mac

**Example:**
```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# mac
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-mac)#
```
Enters L2VPN bridge group bridge domain MAC configuration mode.

**Step 7** limit

**Example:**
```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-mac)# limit
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-mac-limit)#
```
Sets the MAC address limit for action, maximum, and notification and enters L2VPN bridge group bridge domain MAC limit configuration mode.

**Step 8** maximum { value }

**Example:**
```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-mac-limit)# maximum 5000
```
Configures the specified action when the number of MAC addresses learned on a bridge is reached.

**Step 9** action { flood | no-flood | shutdown }

**Example:**
```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-mac-limit)# action flood
```
Configures the bridge behavior when the number of learned MAC addresses exceed the MAC limit configured.

**Step 10** notification { both | none | trap }

**Example:**
```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-mac-limit)# notification both
```
Specifies the type of notification that is sent when the number of learned MAC addresses exceeds the configured limit.

**Step 11** Use the commit or end command.
commit - Saves the configuration changes and remains within the configuration session.
end - Prompts user to take one of these actions:
- Yes - Saves configuration changes and exits the configuration session.
- No - Exits the configuration session without committing the configuration changes.
- Cancel - Remains in the configuration mode, without committing the configuration changes.

Step 12 show l2vpn bridge-domain [ detail ]

Example:
RP/0/RSP0/CPU0:router# show l2vpn bridge-domain detail
Displays the details about the MAC address limit.

Configuring the MAC Address Aging

Perform this task to configure the parameters for MAC address aging.

SUMMARY STEPS
1. configure
2. l2vpn
3. bridge group bridge-group-name
4. bridge-domain bridge-domain-name
5. mac
6. aging
7. time { seconds }
8. Use the commit or end command.
9. show l2vpn bridge-domain [ detail ]

DETAILED STEPS

Step 1 configure

Example:
RP/0/RSP0/CPU0:router# configure
Enters the Global Configuration mode.

Step 2 l2vpn
Example:

RP/0/RSP0/CPU0:router(config)# l2vpn
RP/0/RSP0/CPU0:router(config-l2vpn)#

Enters the L2VPN configuration mode.

**Step 3** bridge group bridge-group-name

Example:

RP/0/RSP0/CPU0:router(config-l2vpn)# bridge group csco
RP/0/RSP0/CPU0:router(config-l2vpn-bg)#

Creates a bridge group so that it can contain bridge domains and then assigns network interfaces to the bridge domain.

**Step 4** bridge-domain bridge-domain-name

Example:

RP/0/RSP0/CPU0:router(config-l2vpn-bg)# bridge-domain abc
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)#

Establishes a bridge domain and enters L2VPN bridge group bridge domain configuration mode.

**Step 5** mac

Example:

RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# mac
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-mac)#

Enters L2VPN bridge group bridge domain MAC configuration mode.

**Step 6** aging

Example:

RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-mac)# aging
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-mac-aging)#

Enters the MAC aging configuration submode to set the aging parameters such as time and type.

The maximum MAC age for ASR 9000 Ethernet and ASR 9000 Enhanced Ethernet line cards is two hours.

**Step 7** time { seconds }

Example:

RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-mac-aging)# time 300

Configures the maximum aging time.

- Use the *seconds* argument to specify the maximum age of the MAC address table entry. The range is from 300 to 30000 seconds. Aging time is counted from the last time that the switch saw the MAC address. The default value is 300 seconds.
Step 8  Use the **commit** or **end** command.
**commit** - Saves the configuration changes and remains within the configuration session.
**end** - Prompts user to take one of these actions:
- **Yes** - Saves configuration changes and exits the configuration session.
- **No** - Exits the configuration session without committing the configuration changes.
- **Cancel** - Remains in the configuration mode, without committing the configuration changes.

Step 9  show l2vpn bridge-domain [ detail ]

**Example:**
RP/0/RSP0/CPU0:router# show l2vpn bridge-domain detail
Displays the details about the aging fields.

---

**Disabling MAC Flush at the Bridge Port Level**

Perform this task to disable the MAC flush at the bridge domain level.

You can disable the MAC flush at the bridge domain or bridge port level. By default, the MACs learned on a specific port are immediately flushed, when that port becomes nonfunctional.

**SUMMARY STEPS**

1. configure
2. l2vpn
3. bridge group *bridge-group-name*
4. bridge-domain *bridge-domain-name*
5. mac
6. port-down flush disable
7. Use the **commit** or **end** command.

**DETAILED STEPS**

**Step 1**  configure

**Example:**
RP/0/RSP0/CPU0:router# configure
Enters the Global Configuration mode.

**Step 2**  l2vpn
Configuring the MAC Address-related Parameters

Example:

RP/0/RSP0/CPU0:router(config)# l2vpn
RP/0/RSP0/CPU0:router(config-l2vpn) #
Enters L2VPN configuration mode.

Step 3 bridge group bridge-group-name

Example:

RP/0/RSP0/CPU0:router(config-l2vpn)# bridge group csco
RP/0/RSP0/CPU0:router(config-l2vpn-bg)#
Creates a bridge group so that it can contain bridge domains and then assigns network interfaces to the bridge domain.

Step 4 bridge-domain bridge-domain-name

Example:

RP/0/RSP0/CPU0:router(config-l2vpn-bg)# bridge-domain abc
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)#
Establishes a bridge domain and enters l2vpn bridge group bridge domain configuration mode.

Step 5 mac

Example:

RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# mac
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-mac)#
Enters l2vpn bridge group bridge domain MAC configuration mode.

Step 6 port-down flush disable

Example:

RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-mac)# port-down flush disable
Disables MAC flush when the bridge port becomes nonfunctional.

Step 7 Use the commit or end command.

commit - Saves the configuration changes and remains within the configuration session.
end - Prompts user to take one of these actions:

- Yes - Saves configuration changes and exits the configuration session.
- No - Exits the configuration session without committing the configuration changes.
- Cancel - Remains in the configuration mode, without committing the configuration changes.

Configuring MAC Address Security

Perform this task to configure MAC address security.
SUMMARY STEPS

1. configure
2. l2vpn
3. bridge group bridge-group-name
4. bridge-domain bridge-domain-name
5. neighbor { A.B.C.D } { pw-id value }
6. mac
7. secure [action | disable | logging]
8. Use the commit or end command.

DETAILED STEPS

Step 1 configure

Example:
RP/0/RSP0/CPU0:router# configure

Enters the Global Configuration mode.

Step 2 l2vpn

Example:
RP/0/RSP0/CPU0:router(config)# l2vpn
RP/0/RSP0/CPU0:router(config-l2vpn)#

Enters L2VPN configuration mode.

Step 3 bridge group bridge-group-name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn)# bridge group cisco
RP/0/RSP0/CPU0:router(config-l2vpn-bg)#

Creates a bridge group so that it can contain bridge domains and then assigns network interfaces to the bridge domain.

Step 4 bridge-domain bridge-domain-name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bg)# bridge-domain abc
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)#

Establishes a bridge domain and enters L2VPN l2vpn bridge group bridge domain configuration mode.

Step 5 neighbor { A.B.C.D } { pw-id value }

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# neighbor 10.1.1.2 pw-id 1000
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-pw) #

Adds an access pseudowire port to a bridge domain, or a pseudowire to a bridge virtual forwarding interface (VFI).

- Use the A.B.C.D argument to specify the IP address of the cross-connect peer.
- Use the pw-id keyword to configure the pseudowire ID and ID value. The range is 1 to 4294967295.

**Step 6**  
mac

**Example:**
```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-pw) # mac
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-pw-mac)#
```

Enables L2VPN l2vpn bridge group bridge domain MAC configuration mode.

**Step 7** secure [action | disable | logging]

**Example:**
```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-pw-mac)# secure
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-pw-mac-secure)#
```

Enters MAC secure configuration mode.

By default, bridge ports (interfaces and access pseudowires) under a bridge inherit the security configuration from the parent bridge.

**Note** Once a bridge port goes down, a clear command must be issued to bring the bridge port up.

**Step 8** Use the commit or end command.

- **commit** - Saves the configuration changes and remains within the configuration session.
- **end** - Prompts user to take one of these actions:
  - **Yes** - Saves configuration changes and exits the configuration session.
  - **No** - Exits the configuration session without committing the configuration changes.
  - **Cancel** - Remains in the configuration mode, without committing the configuration changes.

---

**Configuring an Attachment Circuit to the AC Split Horizon Group**

These steps show how to add an interface to the split horizon group for attachment circuits (ACs) under a bridge domain.
SUMMARY STEPS

1. configure
2. l2vpn
3. bridge group bridge-group-name
4. bridge-domain bridge-domain-name
5. interface type instance
6. split-horizon group
7. commit
8. end
9. show l2vpn bridge-domain detail

DETAILED STEPS

Step 1 configure

Example:
RP/0/RSP0/CPU0:router# configure

Enters the Global Configuration mode.

Step 2 l2vpn

Example:
RP/0/RSP0/CPU0:router(config)# l2vpn

Enters L2VPN configuration mode.

Step 3 bridge group bridge-group-name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn)# bridge group metroA

Enters configuration mode for the named bridge group.

Step 4 bridge-domain bridge-domain-name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bd)# bridge-domain east

Enters configuration mode for the named bridge domain.

Step 5 interface type instance

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bd-bd)# interface GigabitEthernet0/1/0/6

Enters configuration mode for the named interface.

Step 6 split-horizon group
Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-ac)# split-horizon group

Enters configuration mode for the named interface.

Step 7
commit

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-ac)# commit

Saves configuration changes

Step 8
end

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-ac)# end

Returns to EXEC mode.

Step 9
show l2vpn bridge-domain detail

Example:
RP/0/RSP0/CPU0:router show l2vpn bridge-domain detail

Displays information about bridges, including whether each AC is in the AC split horizon group or not.

---

Adding an Access Pseudowire to the AC Split Horizon Group

These steps show how to add an access pseudowire as a member to the split horizon group for attachment circuits (ACs) under a bridge domain.

SUMMARY STEPS

1. configure
2. l2vpn
3. bridge group bridge-group-name
4. bridge-domain bridge-domain-name
5. neighbor A.B.C.D pw-id pseudowire-id
6. split-horizon group
7. commit
8. end
9. show l2vpn bridge-domain detail
DETAILED STEPS

Step 1 configure

Example:
RP/0/RSP0/CPU0:router# configure

Enters the Global Configuration mode.

Step 2 l2vpn

Example:
RP/0/RSP0/CPU0:router(config)# l2vpn

Enters L2VPN configuration mode.

Step 3 bridge group bridge-group-name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn)# bridge group metroA

Enters configuration mode for the named bridge group.

Step 4 bridge-domain bridge-domain-name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bg)# bridge-domain east

Enters configuration mode for the named bridge domain.

Step 5 neighbor A.B.C.D pw-id pseudowire-id

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# neighbor 10.2.2.2 pw-id 2000

Configures the pseudowire segment.

Step 6 split-horizon group

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-ac)# split-horizon group

Adds this interface to the split horizon group for ACs. Only one split horizon group for ACs

Note Only one split horizon group for ACs and access pseudowires per bridge domain is supported.

Step 7 commit

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-pw) commit

Saves configuration changes

Step 8 end
Configuring VPLS with BGP Autodiscovery and Signaling

Perform this task to configure BGP-based autodiscovery and signaling.

**SUMMARY STEPS**

1. configure
2. l2vpn
3. bridge group bridge group name
4. bridge-domain bridge-domain name
5. vfi { vfi-name }
6. vpn-id vpn-id
7. autodiscovery bgp
8. rd { as-number:nn | ip-address:nn | auto }
9. route-target { as-number:nn | ip-address:nn | export | import }
10. route-target import { as-number:nn | ip-address:nn }
11. route-target export { as-number:nn | ip-address:nn }
12. signaling-protocol bgp
13. ve-id { number }
14. ve-range { number }
15. Use the commit or end command.

**DETAILED STEPS**

**Step 1** configure

*Example:*
RP/0/RSP/0/CPU0:router# configure

Enters the Global Configuration mode.
Step 2  l2vpn

Example:
RP/0/RSP0/CPU0:router(config)# l2vpn
Enters L2VPN configuration mode.

Step 3  bridge group *bridge group name*

Example:
RP/0/RSP0/CPU0:router(config-l2vpn)# bridge group metroA
Enters configuration mode for the named bridge group.

Step 4  bridge-domain *bridge-domain name*

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bg)# bridge-domain east
Enters configuration mode for the named bridge domain.

Step 5  vfi { vfi-name }

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# vfi vfi-east
Enters virtual forwarding instance (VFI) configuration mode.

Step 6  vpn-id *vpn-id*

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-vfi)# vpn-id 100
Specifies the identifier for the VPLS service. The VPN ID has to be globally unique within a PE router. i.e., the same VPN ID cannot exist in multiple VFIs on the same PE router. In addition, a VFI can have only one VPN ID.

Step 7  autodiscovery bgp

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-vfi)# autodiscovery bgp
Enters BGP autodiscovery configuration mode where all BGP autodiscovery parameters are configured. This command is not provisioned to BGP until at least the VPN ID and the signaling protocol is configured.

Step 8  rd { as-number:nn | ip-address:nn | auto }

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-vfi-ad)# rd auto
Specifies the route distinguisher (RD) under the VFI.
The RD is used in the BGP NLRI to identify VFI. Only one RD can be configured per VFI, and except for \texttt{rd auto} the same RD cannot be configured in multiple VFIs on the same PE.
When \texttt{rd auto} is configured, the RD value is as follows: \{BGP Router ID\}:\{16 bits auto-generated unique index\}.

**Step 9**
\texttt{route-target \{ as-number:nn | ip-address:nn | export | import \}}

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-vfi-ad)# route-target 500:99

Specifies the route target (RT) for the VFI.
At least one import and one export route targets (or just one route target with both roles) need to be configured in each PE in order to establish BGP autodiscovery between PEs.
If no export or import keyword is specified, it means that the RT is both import and export. A VFI can have multiple export or import RTs. However, the same RT is not allowed in multiple VFIs in the same PE.

**Step 10**
\texttt{route-target import \{ as-number:nn | ip-address:nn \}}

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-vfi-ad)# route-target import 200:20

Specifies the import route target for the VFI.
Import route target is what the PE compares with the RT in the received NLRI: the RT in the received NLRI must match the import RT to determine that the RTs belong to the same VPLS service.

**Step 11**
\texttt{route-target export \{ as-number:nn | ip-address:nn \}}

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-vfi-ad)# route-target export 100:10

Specifies the export route target for the VFI.
Export route target is the RT that is going to be in the NLRI advertised to other PEs.

**Step 12**
\texttt{signaling-protocol bgp}

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-vfi-ad)# signaling-protocol bgp

Enables BGP signaling, and enters the BGP signaling configuration submode where BGP signaling parameters are configured.
This command is not provisioned to BGP until VE ID and VE ID range is configured.

**Step 13**
\texttt{ve-id \{ number \}}

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-vfi-ad-sig)# ve-id 10
Specifies the local PE identifier for the VFI for VPLS configuration.

The VE ID identifies a VFI within a VPLS service. This means that VFIs in the same VPLS service cannot share the same VE ID. The scope of the VE ID is only within a bridge domain. Therefore, VFIs in different bridge domains within a PE can use the same VE ID.

**Step 14**

```
ve-range { number }
```

**Example:**

```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-vfi-ad-sig)# ve-range 40
```

Overrides the minimum size of VPLS edge (VE) blocks.

The default minimum size is 10. Any configured VE range must be higher than 10.

**Step 15**

Use the **commit** or **end** command.

- **commit** - Saves the configuration changes and remains within the configuration session.
- **end** - Prompts user to take one of these actions:
  - **Yes** - Saves configuration changes and exits the configuration session.
  - **No** - Exits the configuration session without committing the configuration changes.
  - **Cancel** - Remains in the configuration mode, without committing the configuration changes.

---

**Configuring VPLS with BGP Autodiscovery and LDP Signaling**

Perform this task to configure BGP-based Autodiscovery and signaling:
SUMMARY STEPS

1. configure
2. l2vpn
3. router-id ip-address
4. bridge group bridge-group-name
5. bridge-domain bridge-domain-name
6. transport-mode vlan passthrough
7. vfi {vfi-name}
8. autodiscovery bgp
9. vpn-id vpn-id
10. rd {as-number:nn | ip-address:nn | auto}
11. route-target {as-number:nn | ip-address:nn | export | import }
12. route-target import {as-number:nn | ip-address:nn}
13. route-target export {as-number:nn | ip-address:nn}
14. signaling-protocol ldp
15. vpls-id {as-number:nn | ip-address:nn}
16. Use the commit or end command.

DETAILED STEPS

Step 1 configure

Example:
RP/0/RSP0/CPU0:router# configure
Enters the Global Configuration mode.

Step 2 l2vpn

Example:
RP/0/RSP0/CPU0:router(config)# l2vpn
Enters L2VPN configuration mode.

Step 3 router-id ip-address

Example:
RP/0/RSP0/CPU0:router(config-l2vpn)# router-id 1.1.1.1

Specifies a unique Layer 2 (L2) router ID for the provider edge (PE) router.
The router ID must be configured for LDP signaling, and is used as the L2 router ID in the BGP NLRI, SAII (local L2 Router ID) and TAI (remote L2 Router ID). Any arbitrary value in the IPv4 address format is acceptable.

Note Each PE must have a unique L2 router ID. This CLI is optional, as a PE automatically generates a L2 router ID using the LDP router ID.

Step 4 bridge group bridge-group-name
Example:
```
RP/0/RSP0/CPU0:router(config-l2vpn)# bridge group metroA
```
Enters configuration mode for the named bridge group.

**Step 5**
`bridge-domain bridge-domain-name`

Example:
```
RP/0/RSP0/CPU0:router(config-l2vpn-bg)# bridge-domain east
```
Enters configuration mode for the named bridge domain.

**Step 6**
`transport-mode vlan passthrough`

Example:
```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# transport-mode vlan passthrough
```
Enables VC type 4 for BGP autodiscovery.

**Step 7**
`vfi {vfi-name}`

Example:
```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# vfi vfi-east
```
Enters virtual forwarding instance (VFI) configuration mode.

**Step 8**
`autodiscovery bgp`

Example:
```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-vfi)# autodiscovery bgp
```
Enters BGP autodiscovery configuration mode where all BGP autodiscovery parameters are configured.
This command is not provisioned to BGP until at least the VPN ID and the signaling protocol is configured.

**Step 9**
`vpn-id vpn-id`

Example:
```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-vfi)# vpn-id 100
```
Specifies the identifier for the VPLS service. The VPN ID has to be globally unique within a PE router, i.e., the same VPN ID cannot exist in multiple VFIs on the same PE router. In addition, a VFI can have only one VPN ID.

**Step 10**
`rd {as-number:nn | ip-address:nn | auto}`

Example:
```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-vfi-ad)# rd auto
```
Specifies the route distinguisher (RD) under the VFI.
The RD is used in the BGP NLRI to identify VFI. Only one RD can be configured per VFI, and except for rd auto the same RD cannot be configured in multiple VFIs on the same PE.

When rd auto is configured, the RD value is as follows: {BGP Router ID}:{16 bits auto-generated unique index}.

**Step 11** route-target \{as-number:nn | ip-address:nn | export | import \}

**Example:**

```
RP/0/RSP0/CPU0:router(config-l2vpn-bd-vfi-ad)# route-target 500:99
```

Specifies the route target (RT) for the VFI.

At least one import and one export route targets (or just one route target with both roles) need to be configured in each PE in order to establish BGP autodiscovery between PEs.

If no export or import keyword is specified, it means that the RT is both import and export. A VFI can have multiple export or import RTs. However, the same RT is not allowed in multiple VFIs in the same PE.

**Step 12** route-target import \{as-number:nn | ip-address:nn\}

**Example:**

```
RP/0/RSP0/CPU0:router(config-l2vpn-bd-vfi-ad)# route-target import 200:20
```

Specifies the import route target for the VFI.

Import route target is what the PE compares with the RT in the received NLRI: the RT in the received NLRI must match the import RT to determine that the RTs belong to the same VPLS service.

**Step 13** route-target export \{as-number:nn | ip-address:nn\}

**Example:**

```
RP/0/RSP0/CPU0:router(config-l2vpn-bd-vfi-ad)# route-target export 100:10
```

Specifies the export route target for the VFI.

Export route target is the RT that is going to be in the NLRI advertised to other PEs.

**Step 14** signaling-protocol ldp

**Example:**

```
RP/0/RSP0/CPU0:router(config-l2vpn-bd-vfi-ad)# signaling-protocol ldp
```

Enables LDP signaling.

**Step 15** vpls-id \{as-number:nn | ip-address:nn\}

**Example:**

```
RP/0/RSP0/CPU0:router(config-l2vpn-bd-vfi-ad-sig)# vpls-id 10:20
```

Specifies VPLS ID which identifies the VPLS domain during signaling.

This command is optional in all PEs that are in the same Autonomous System (share the same ASN) because a default VPLS ID is automatically generated using BGP's ASN and the configured VPN ID (i.e., the default VPLS ID equals ASN:VPN-ID). If an ASN of 4 bytes is used, the lower two bytes of the ASN are used to build the VPLS ID. In case of
InterAS, the VPLS ID must be explicitly configured. Only one VPLS ID can be configured per VFI, and the same VPLS ID cannot be used for multiple VFIs.

**Step 16**

Use the **commit** or **end** command.

**commit** - Saves the configuration changes and remains within the configuration session.

**end** - Prompts user to take one of these actions:

- **Yes** - Saves configuration changes and exits the configuration session.
- **No** - Exits the configuration session without committing the configuration changes.
- **Cancel** - Remains in the configuration mode, without committing the configuration changes.

---

**Configuring G.8032 Ethernet Ring Protection**

To configure the G.8032 operation, separately configure:

- An ERP instance to indicate:
  - which (sub)interface is used as the APS channel
  - which (sub)interface is monitored by CFM
  - whether the interface is an RPL link, and, if it is, the RPL node type
- CFM with EFD to monitor the ring links

**Note**

 MEP for each monitor link needs to be configured with different Maintenance Association.

- The bridge domains to create the Layer 2 topology. The RAPS channel is configured in a dedicated management bridge domain separated from the data bridge domains.
- Behavior characteristics, that apply to ERP instance, if different from default values. This is optional.

This section provides information on:

**Configuring ERP Profile**

Perform this task to configure Ethernet ring protection (ERP) profile.
SUMMARY STEPS

1. configure
2. Ethernet ring g8032 profile profile-name
3. timer { wtr | guard | hold-off } seconds
4. non-revertive
5. Use the commit or end command.

DETAILED STEPS

Step 1 configure

Example:
RP/0/RSP0/CPU0:router# configure
Enters the Global Configuration mode.

Step 2 Ethernet ring g8032 profile profile-name

Example:
RP/0/RSP0/CPU0:router(config)# Ethernet ring g8032 profile p1
Enables G.8032 ring mode, and enters G.8032 configuration submode.

Step 3 timer { wtr | guard | hold-off } seconds

Example:
RP/0/RSP0/CPU0:router(config-g8032-ring-profile)# timer hold-off 5
Specifies time interval (in seconds) for the guard, hold-off and wait-to-restore timers.

Step 4 non-revertive

Example:
RP/0/RSP0/CPU0:router(config-g8032-ring-profile)# non-revertive
Specifies a non-revertive ring instance.

Step 5 Use the commit or end command.
commit - Saves the configuration changes and remains within the configuration session.
end - Prompts user to take one of these actions:
  • Yes - Saves configuration changes and exits the configuration session.
  • No - Exits the configuration session without committing the configuration changes.
  • Cancel - Remains in the configuration mode, without committing the configuration changes.
Configuring CFM MEP

For more information about Ethernet Connectivity Fault Management (CFM), refer to the Configuring Ethernet OAM on the Cisco ASR 9000 Series Router module in the Cisco ASR 9000 Series Aggregation Services Router Interface and Hardware Component Configuration Guide.

Configuring an ERP Instance

Perform this task to configure an ERP instance.

SUMMARY STEPS

1. configure
2. l2vpn
3. bridge group bridge-group-name
4. bridge-domain domain-name
5. interface type port0-interface-path-id.subinterface
6. interface type port1-interface-path-id.subinterface
7. bridge-domain domain-name
8. interface type interface-path-id.subinterface
9. ethernet ring g8032 ring-name
10. instance number
11. description string
12. profile profile-name
13. rpl { port0 | port1 } { owner | neighbor | next-neighbor }
14. inclusion-list vlan-ids vlan-id
15. aps-channel
16. level number
17. port0 interface type path-id
18. port1 { interface type interface-path-id | bridge-domain bridge-domain-name | xconnect xconnect-name | none }
19. Use the commit or end command.

DETAILED STEPS

Step 1 configure

Example:
RP/0/RSP0/CPU0:router# configure
Enters the Global Configuration mode.

Step 2 l2vpn
Example:

RP/0/RSP0/CPU0:router(config)# l2vpn

Enters L2VPN configuration mode.

Step 3

bridge group bridge-group-name

Example:

RP/0/RSP0/CPU0:router(config-l2vpn)# bridge group csco
RP/0/RSP0/CPU0:router(config-l2vpn-bg)#

Creates a bridge group that can contain bridge domains, and then assigns network interfaces to the bridge domain.

Step 4

bridge-domain domain-name

Example:

RP/0/RSP0/CPU0:router(config-l2vpn-bg)# bridge-domain bd1
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)#

Establishes a bridge domain for R-APS channels, and enters L2VPN bridge group bridge domain configuration mode.

Step 5

interface type port0-interface-path-id.subinterface

Example:

RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# interface GigabitEthernet 0/0/0/0.1
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-ac)#

Enters interface configuration mode and adds an interface to a bridge domain that allows packets to be forwarded and received from other interfaces that are part of the same bridge domain.

Step 6

interface type port1-interface-path-id.subinterface

Example:

RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# interface GigabitEthernet 0/0/0/1.1
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-ac)#

Enters interface configuration mode and adds an interface to a bridge domain that allows packets to be forwarded and received from other interfaces that are part of the same bridge domain.

Step 7

bridge-domain domain-name

Example:

RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# bridge-domain bd2
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)#

Establishes a bridge domain for data traffic, and enters L2VPN bridge group bridge domain configuration mode.

Step 8

interface type interface-path-id.subinterface
Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bd-bd-ac)# interface GigabitEthernet 0/0/0.10
RP/0/RSP0/CPU0:router(config-l2vpn-bd-bd-ac)#
Enters interface configuration mode and adds an interface to a bridge domain that allows packets to be forwarded and received from other interfaces that are part of the same bridge domain.

**Step 9**

ethernet ring g8032 *ring-name*

Example:
RP/0/RSP0/CPU0:router(config-l2vpn)# ethernet ring g8032 r1
Enables G.8032 ring mode, and enters G.8032 configuration submode.

**Step 10**

instance *number*

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-erp)# instance 1
Enters the Ethernet ring G.8032 instance configuration submode.

**Step 11**

description *string*

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-erp-instance)# description test
Specifies a string that serves as description for that instance.

**Step 12**

profile *profile-name*

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-erp-instance)# profile pl
Specifies associated Ethernet ring G.8032 profile.

**Step 13**

rpl \{ port0 | port1 \} \{ owner | neighbor | next-neighbor \}

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-erp-instance)#rpl port0 neighbor
Specifies one ring port on local node as RPL owner, neighbor or next-neighbor.

**Step 14**

inclusion-list vlan-ids *vlan-id*

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-erp-instance)# inclusion-list vlan-ids e-g
Associates a set of VLAN IDs with the current instance.
Step 15  
**aps-channel**

**Example:**

```
RP/0/RSP0/CPU0:router(config-l2vpn-erp-instance)# aps-channel
```

Enters the Ethernet ring G.8032 instance aps-channel configuration submode.

Step 16 
**level number**

**Example:**

```
RP/0/RSP0/CPU0:router(config-l2vpn-erp-instance-aps)# level 5
```

Specifies the APS message level. The range is from 0 to 7.

Step 17  
**port0 interface type path-id**

**Example:**

```
RP/0/RSP0/CPU0:router(configl2vpn-erp-instance-aps)# port0 interface GigabitEthernet 0/0/0/0.1
```

Associates G.8032 APS channel interface to port0.

Step 18  
**port1 { interface type interface-path-id | bridge-domain bridge-domain-name | xconnect xconnect-name | none**

**Example:**

```
RP/0/RSP0/CPU0:router(config-l2vpn-erp-instance-aps)# port1 interface GigabitEthernet 0/0/0/1.1
```

Associates G.8032 APS channel interface to port1.

Step 19  
Use the **commit** or **end** command.

**commit** - Saves the configuration changes and remains within the configuration session.

**end** - Prompts user to take one of these actions:

- **Yes** - Saves configuration changes and exits the configuration session.
- **No** - Exits the configuration session without committing the configuration changes.
- **Cancel** - Remains in the configuration mode, without committing the configuration changes.

---

### Configuring ERP Parameters

Perform this task to configure ERP parameters.
**SUMMARY STEPS**

1. configure
2. l2vpn
3. ethernet ring g8032 ring-name
4. port0 interface type interface-path-id
5. monitor port0 interface type interface-path-id
6. exit
7. port1 { interface type interface-path-id | virtual | none}
8. monitor port1 interface type interface-path-id
9. exit
10. exclusion-list vlan-ids vlan-id
11. open-ring
12. Use the commit or end command.

**DETAILED STEPS**

**Step 1** configure

Example:
```
RP/0/RSP0/CPU0:router# configure
```
Enters the Global Configuration mode.

**Step 2** l2vpn

Example:
```
RP/0/RSP0/CPU0:router(config)# l2vpn
```
Enters L2VPN configuration mode.

**Step 3** ethernet ring g8032 ring-name

Example:
```
RP/0/RSP0/CPU0:router(config-l2vpn)# ethernet ring g8032 r1
```
Enables G.8032 ring mode, and enters G.8032 configuration submode.

**Step 4** port0 interface type interface-path-id

Example:
```
RP/0/RSP0/CPU0:router(config-l2vpn-erp)# port0 interface GigabitEthernet 0/1/0/6
```
Enables G.8032 ERP for the specified port (ring port).

**Step 5** monitor port0 interface type interface-path-id

Example:
```
RP/0/RSP0/CPU0:router(config-l2vpn-erp-port0)# monitor port0 interface 0/1/0/2
```
Specifies the port that is monitored to detect ring link failure per ring port. The monitored interface must be a sub-interface of the main interface.

**Step 6** exit
Example:
RP/0/RSP0/CPU0:router(config-l2vpn-erp-port0)# exit
Exits port0 configuration submode.

Step 7  port1 { interface type interface-path-id | virtual | none}

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-erp)# port1 interface GigabitEthernet 0/1/0/8
Enables G.8032 ERP for the specified port (ring port).

Step 8  monitor port1 interface type interface-path-id

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-erp-port1)# monitor port1 interface 0/1/0/3
Specifies the port that is monitored to detect ring link failure per ring port. The monitored interface must be a sub-interface of the main interface.

Step 9  exit

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-erp-port1)# exit
Exits port1 configuration submode.

Step 10  exclusion-list vlan-ids vlan-id

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-erp)# exclusion-list vlan-ids a-d
Specifies a set of VLAN IDs that is not protected by Ethernet ring protection mechanism.

Step 11  open-ring

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-erp)# open-ring
Specifies Ethernet ring G.8032 as open ring.

Step 12  Use the commit or end command.

commit - Saves the configuration changes and remains within the configuration session.

end - Prompts user to take one of these actions:

  • Yes - Saves configuration changes and exits the configuration session.
  • No - Exits the configuration session without committing the configuration changes.
  • Cancel - Remains in the configuration mode, without committing the configuration changes.

---

**Configuring TCN Propagation**

Perform this task to configure topology change notification (TCN) propagation.
SUMMARY STEPS

1. configure
2. l2vpn
3. tcn-propagation
4. Use the commit or end command.

DETAILED STEPS

Step 1  configure

Example:
RP/0/RSP0/CPU0:router# configure

Enters the Global Configuration mode.

Step 2  l2vpn

Example:
RP/0/RSP0/CPU0:router(config)# l2vpn

Enters L2VPN configuration mode.

Step 3  tcn-propagation

Example:
RP/0/RSP0/CPU0:router(config-l2vpn)# tcn-propagation

Allows TCN propagation from minor ring to major ring and from MSTP to G.8032.

Step 4  Use the commit or end command.

commit - Saves the configuration changes and remains within the configuration session.
end - Prompts user to take one of these actions:

• Yes - Saves configuration changes and exits the configuration session.
• No - Exits the configuration session without committing the configuration changes.
• Cancel - Remains in the configuration mode, without committing the configuration changes.

Configuring Flow Aware Transport Pseudowire

This section provides information on
Enabling Load Balancing with ECMP and FAT PW for VPWS

Perform this task to enable load balancing with ECMP and FAT PW for VPWS. Creating a PW-Class in L2VPN configuration leads to load-balancing.

SUMMARY STEPS

1. configure
2. l2vpn
3. pw-class { name }
4. encapsulation mpls
5. load-balancing flow-label { both | code | receive | transmit } [ static ]
6. exit
7. exit
8. xconnect group group-name
9. p2p xconnect-name
10. interface type interface-path-id
11. neighbor A.B.C.D pw-id pseudowire-id
12. pw-class class-name
13. Use the commit or end command.

DETAILED STEPS

**Step 1** configure

Example:
RP/0/RSP0/CPU0:router# configure

Enters the Global Configuration mode.

**Step 2** l2vpn

Example:
RP/0/RSP0/CPU0:router(config)# l2vpn

Enters L2VPN configuration mode.

**Step 3** pw-class { name }

Example:
RP/0/RSP0/CPU0:router(config-l2vpn)# pw-class path1

Configures the pseudowire class template name to use for the pseudowire.

**Step 4** encapsulation mpls
Example:
RP/0/RSP0/CPU0:router(config-l2vpn-pwc)# encapsulation mpls

Configures the pseudowire encapsulation to MPLS.

Step 5
load-balancing flow-label { both | code | receive | transmit } [ static ]

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-pwc-mpls)# load-balancing flow-label both

Enables load-balancing on ECMPs. Also, enables the imposition and disposition of flow labels for the pseudowire.

Note  If the static keyword is not specified, end to end negotiation of the FAT PW is enabled.

Step 6
exit

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-pwc-mpls)#exit
RP/0/RSP0/CPU0:router(config-l2vpn-pwc)#

Exits the pseudowire encapsulation submode and returns the router to the parent configuration mode.

Step 7
exit

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-pwc)#exit
RP/0/RSP0/CPU0:router(config-l2vpn)#

Exits the pseudowire submode and returns the router to the l2vpn configuration mode.

Step 8
xconnect group group-name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-pwc)# xconnect group grp1
RP/0/RSP0/CPU0:router(config-l2vpn-xc)#

Specifies the name of the cross-connect group.

Step 9
p2p xconnect-name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc)# p2p vlan1
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)#

Specifies the name of the point-to-point cross-connect.

Step 10
interface type interface-path-id

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# interface TenGigE 0/0/0/0.1
Specifies the interface type and instance.

**Step 11**  `neighbor A.B.C.D pw-id pseudowire-id`

**Example:**

```
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# neighbor 10.2.2.2 pw-id 2000
```

Configures the pseudowire segment for the cross-connect.

**Note**  A.B.C.D can be a recursive or non-recursive prefix.

**Step 12**  `pw-class class-name`

**Example:**

```
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p-pw)# pw-class path1
```

Associates the pseudowire class with this pseudowire.

**Step 13**  Use the `commit` or `end` command.

**commit**  Saves the configuration changes and remains within the configuration session.

**end**  Prompts user to take one of these actions:

- **Yes**  Saves configuration changes and exits the configuration session.
- **No**  Exits the configuration session without committing the configuration changes.
- **Cancel**  Remains in the configuration mode, without committing the configuration changes.

---

**Enabling Load Balancing with ECMP and FAT PW for VPLS**

Perform this task to enable load balancing with ECMP and FAT PW for VPLS.
SUMMARY STEPS

1. configure
2. l2vpn
3. load-balancing flow {src-dst-mac | src-dst-ip}
4. pw-class { class - name }
5. encapsulation mpls
6. load-balancing flow-label { both | code | receive | transmit } [ static ]
7. exit
8. bridge group bridge-group-name
9. bridge-domain bridge-domain-name
10. vfi { vfi-name }
11. autodiscovery bgp
12. signaling-protocol bgp
13. load-balancing flow-label { both | code | receive | transmit } [ static ]
14. Use the commit or end command.

DETAILED STEPS

Step 1  configure

Example:
RP/0/RSP0/CPU0:router# configure
Enters the Global Configuration mode.

Step 2  l2vpn

Example:
RP/0/RSP0/CPU0:router(config)# l2vpn
Enters L2VPN configuration mode.

Step 3  load-balancing flow {src-dst-mac | src-dst-ip}

Example:
RP/0/RSP0/CPU0:router(config-l2vpn)# load-balancing flow src-dst-ip
Enables flow based load balancing.

- src-dst-mac—Uses source and destination MAC addresses for hashing.
- src-dst-ip—Uses source and destination IP addresses for hashing.

Note  It is recommended to use the load-balancing flow command with the src-dst-ip keyword.

Step 4  pw-class { class - name }
Example:
RP/0/RSP0/CPU0:router(config-l2vpn)# pw-class class1
Associates the pseudowire class with this pseudowire.

**Step 5**

**encapsulation mpls**

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-pwc)# encapsulation mpls
Configures the pseudowire encapsulation to MPLS.

**Step 6**

**load-balancing flow-label { both | code | receive | transmit } [ static ]**

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-pwc-mpls)# load-balancing flow-label both
Enables load-balancing on ECMPs. Also, enables the imposition and disposition of flow labels for the pseudowire.

**Note** If the **static** keyword is not specified, end to end negotiation of the **FAT PW** is enabled.

**Step 7**

**exit**

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-pwc-mpls)# exit
Exits the pseudowire encapsulation submode and returns the router to the parent configuration mode.

**Step 8**

**bridge group** *bridge-group-name*

Example:
RP/0/RSP0/CPU0:router(config-l2vpn)# bridge group group1
Creates a bridge group so that it can contain bridge domains and then assigns network interfaces to the bridge domain.

**Step 9**

**bridge-domain** *bridge-domain-name*

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bg)# bridge-domain domain1
Establishes a bridge domain and enters L2VPN bridge group bridge domain configuration mode.

**Step 10**

**vfi { vfi-name }**

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# vfi my_vfi
Enters virtual forwarding instance (VFI) configuration mode.
Step 11  autodiscovery bgp

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-vfi)# autodiscovery bgp

Enters BGP autodiscovery configuration mode where all BGP autodiscovery parameters are configured.

Step 12 signaling-protocol bgp

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-vfi-ad)# signaling-protocol bgp

Enables BGP signaling, and enters the BGP signaling configuration submode where BGP signaling parameters are configured.

Step 13 load-balancing flow-label { both | code | receive | transmit } [ static ]

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-vfi-ad-sig)# load-balancing flow-label both static

Enables load-balancing on ECMPs. Also, enables the imposition and disposition of flow labels for the pseudowire.

Step 14 Use the commit or end command.
commit - Saves the configuration changes and remains within the configuration session.
end - Prompts user to take one of these actions:
  • Yes - Saves configuration changes and exits the configuration session.
  • No - Exits the configuration session without committing the configuration changes.
  • Cancel - Remains in the configuration mode, without committing the configuration changes.

Configuring Pseudowire Headend

The Pseudowire Headend (PWHE) is created by configuring the pw-ether main interface, pw-ether subinterface, or pw-iw interface. The available PWHE types are pw-ether main interfaces, subinterfaces, and pw-iw interfaces. Unless specified otherwise, the term interface is applicable for pw-ether main interfaces, subinterfaces, and pw-iw interfaces.

Note
The PWHE-Ethernet subinterfaces and interworking interfaces are supported from Release 5.1.1 onwards.

For the PWHE to be functional, the crossconnect has to be configured completely. Configuring other Layer 3 (L3) parameters, such as VRF and IP addresses, are optional for the PWHE to be functional. However, the L3 features are required for the Layer 3 services to be operational; that is, for PW L3 termination.

PWHE supports both IPv4 and IPv6 addresses.
This section describes these topics:

**PWHE Configuration Restrictions**

These configuration restrictions are applicable for PWHE:

1. The generic interface list members should be the superset of the ECMP path list to the A-PE.
2. Only eight generic interface lists are supported per A-PE neighbor address.
3. Eight Layer 3 links per generic interface list are supported.
4. Only PW-Ether interfaces can be configured as PWHE L2 or L3 subinterfaces.
5. Cross-connects that contain PW-Ether main interfaces can be configured as either VC-type 5 or VC-type 4. By default, the cross-connects are configured as VC-type 5; else by using the command—pw-class transport-mode ethernet. To configure the cross-connects as VC-type 4, use the `p2p neighbor tag-impose vlan id` and the `pw-class transport-mode vlan` commands.
6. Cross-connects that contain PW-Ether main interfaces that have L3 PW-Ether subinterfaces associated with them, are supported with only VC-type 5.
7. Cross-connects that contain PW-IW interfaces are only supported with IPv4 and VC-type 11. PW-IW interfaces are the L3 virtual interfaces used for IP interworking. To configure the cross-connect as VC-type 11, use the interworking ipv4 command.
8. PW-Ether interfaces and subinterfaces can be configured with both IPv4 and IPv6.
9. PW-IW interfaces can be configured only with IPv4.
10. Pseudowire redundancy, preferred path, local switching or L2TP are not supported for crossconnects configured with PWHE.
11. Applications such as TE and LDP have checks for interface type and therefore do not allow PWHE to be configured.
12. Address family, CDP and MPLS configurations are not allowed on PWHE interfaces.
13. Only eBGP and Static routes are supported.
14. MAC address is not supported for a pw-iw interface.

### Configuring Generic Interface List

Perform this task to configure a generic interface list.

**Note**

Only eight generic interface lists are supported per A-PE neighbor address. Eight Layer 3 links per generic interface list are supported. Repeat Step 3 or Step 4 to add the interfaces to the generic interface list.

**SUMMARY STEPS**

1. `configure`
2. `generic-interface-list list-name`
3. `interface type interface-path-id`
4. `interface type interface-path-id`
5. Use the `commit` or `end` command.
DETAILED STEPS

Step 1 configure

Example:
RP/0/RSP0/CPU0:router# configure

Enters the Global Configuration mode.

Step 2 generic-interface-list list-name

Example:
RP/0/RSP0/CPU0:router(config)# generic-interface-list list1

Configures a generic interface list.

To remove the generic interface list, use the no form of the command, that is, no generic-interface-list list-name.

Step 3 interface type interface-path-id

Example:
RP/0/RSP0/CPU0:router(config-if-list)# interface Bundle-Ether 100

Configures the specified interface.

Step 4 interface type interface-path-id

Example:
RP/0/RSP0/CPU0:router(config-if-list)# interface Bundle-Ether 200

Configures the specified interface.

Step 5 Use the commit or end command.
commit - Saves the configuration changes and remains within the configuration session.
end - Prompts user to take one of these actions:
  • Yes - Saves configuration changes and exits the configuration session.
  • No - Exits the configuration session without committing the configuration changes.
  • Cancel - Remains in the configuration mode, without committing the configuration changes.

Configuring PWHE Interfaces

Perform this task to configure PWHE Ethernet and interworking interfaces, that is, to attach the generic interface list with a PWHE Ethernet and interworking interfaces.
SUMMARY STEPS

1. configure
2. interface pw-ether id or interface pw-iw id
3. attach generic-interface-list interface_list_name
4. Use the commit or end command.

DETAILED STEPS

Step 1 configure

Example:
RP/0/RSP0/CPU0:router# configure

Enters the Global Configuration mode.

Step 2 interface pw-ether id or interface pw-iw id

Example:
RP/0/RSP0/CPU0:router(config)# interface pw-ether <id>
or
RP/0/RSP0/CPU0:router(config)# interface pw-iw <id>

(interface pw-ether id) Configures the PWHE pseudowire main or subinterface and enters the interface configuration mode.

(interface pw-iw id) Configures the PWHE pseudowire interworking interface and enters the interface configuration mode.

Step 3 attach generic-interface-list interface_list_name

Example:
RP/0/RSP0/CPU0:router(config-if)# attach generic-interface-list interfacelist1

Attaches the generic interface list to the PW-Ether or PW-IW interface. To remove the generic interface list from the PW-Ether or PW-IW interface, use the no form of the command, that is, no generic-interface-list list-name

Step 4 Use the commit or end command.

commit - Saves the configuration changes and remains within the configuration session.

end - Prompts user to take one of these actions:

- Yes - Saves configuration changes and exits the configuration session.
- No - Exits the configuration session without committing the configuration changes.
- Cancel - Remains in the configuration mode, without committing the configuration changes.
Configuring PWHE Crossconnect

Perform this task to configure PWHE crossconnects.

SUMMARY STEPS

1. configure
2. l2vpn
3. xconnect group group-name
4. p2p xconnect-name
5. interface pw-ether id or interface pw-iw id
6. neighbor ip-address pw-id value
7. pw-class class-name
8. (Only PW-IW) interworking ipv4
9. Use the commit or end command.

DETAILED STEPS

---

Step 1 configure

**Example:**
RP/0/RSP0/CPU0:router# configure

Enters the Global Configuration mode.

---

Step 2 l2vpn

**Example:**
RP/0/RSP0/CPU0:router(config)# l2vpn

Enters Layer 2 VPN configuration mode.

---

Step 3 xconnect group group-name

**Example:**
RP/0/RSP0/CPU0:router(config-l2vpn)# xconnect group pw-he1

Configures a cross-connect group name using a free-format 32-character string.

---

Step 4 p2p xconnect-name

**Example:**
RP/0/RSP0/CPU0:router(config-l2vpn-xc)# p2p pw-hexconnect

Enters P2P configuration submode.

---

Step 5 interface pw-ether id or interface pw-iw id
Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# interface pw-ether 100
or
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# interface pw-iw 100

Configures the PWHE interface.

Step 6
neighbor ip-address pw-id value

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# neighbor 10.165.200.25 pw-id 100

Configures a pseudowire for a cross-connect.
The IP address is that of the corresponding PE node.
The pw-id must match the pw-id of the PE node.

Step 7
pw-class class-name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p-pw)# pw-class dynamic_mpls

Enters pseudowire class submode, allowing you to define a pseudowire class template.

Note The pseudowire class should be defined under l2vpn for VC4 and VC5 as follows:

```
pw-class vc_type_4
  encapsulation mpls
  transport-mode vlan
  !
  pw-class vc_type_5
  encapsulation mpls
  transport-mode ethernet
  !
```

Step 8 (Only PW-IW) interworking ipv4

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p-pw)# interworking ipv4

Configures the cross-connect p2p entity to use VC-type 11 or the IP interworking mode in the establishment of the pseudowire.

Step 9
Use the commit or end command.

commit - Saves the configuration changes and remains within the configuration session.

end - Prompts user to take one of these actions:

- Yes - Saves configuration changes and exits the configuration session.
- No - Exits the configuration session without committing the configuration changes.
- Cancel - Remains in the configuration mode, without committing the configuration changes.
Configuring the Source Address

Perform this task to configure the local source address

Note
Only IPv4 is supported as pw-class source address.

SUMMARY STEPS

1. `configure`
2. `l2vpn`
3. `pw-class class-name`
4. `encapsulation mpls`
5. `ipv4 source source-address`
6. Use the `commit` or `end` command.

DETAILED STEPS

Step 1 `configure`

Example:
```
RP/0/RSP0/CPU0:router# configure
```
Enters the Global Configuration mode.

Step 2 `l2vpn`

Example:
```
RP/0/RSP0/CPU0:router(config)# l2vpn
```
Enters Layer 2 VPN configuration mode.

Step 3 `pw-class class-name`

Example:
```
RP/0/RSP0/CPU0:router(config-l2vpn)# pw-class class1
```
Enters pseudowire class submode, allowing you to define a pseudowire class template.

Step 4 `encapsulation mpls`

Example:
```
RP/0/RSP0/CPU0:router(config-l2vpn-pwc)# encapsulation mpls
```
Configuring Pseudowire Headend

Configures the pseudowire encapsulation to MPLS.

**Step 5**  
**ipv4 source** source-address

**Example:**

```
RP/0/RSP0/CPU0:router(config-l2vpn-pwc-mpls)# ipv4 source 10.1.1.1
```

Sets the local source IPv4 address.

**Step 6**  
Use the **commit** or **end** command.

- **commit** - Saves the configuration changes and remains within the configuration session.
- **end** - Prompts user to take one of these actions:
  - **Yes** - Saves configuration changes and exits the configuration session.
  - **No** - Exits the configuration session without committing the configuration changes.
  - **Cancel** - Remains in the configuration mode, without committing the configuration changes.

---

**Configuring PWHE Interface Parameters**

Perform this task to configure PWHE interface parameters.

**SUMMARY STEPS**

1. configure
2. interface pw-ether id (or) interface pw-iw id
3. ipv4 address ip-address subnet-mask (or) (Only PW-Ether) ipv6 address ipv6-prefix/prefix-length
4. attach generic-interface-list interface_list_name
5. l2overhead bytes
6. load-interval seconds
7. dampening decay-life
8. logging events link-status
9. (Only PW-Ether main interfaces) mac-address MAC address
10. mtu interface_MTU
11. bandwidth kbps
12. Use the **commit** or **end** command.

**DETAILED STEPS**

**Step 1**  
configure
Example:
RP/0/RSP0/CPU0:router# configure

Enters the Global Configuration mode.

Step 2  interface pw-ether id (or) interface pw-iw id

Example:
RP/0/RSP0/CPU0:router(config)# interface pw-ether <id>
or
RP/0/RSP0/CPU0:router(config)# interface pw-iw <id>

(interface pw-ether id) Configures the PWHE interface and enters the interface configuration mode.
(interface pw-iw id) Configures the PWHE interface and enters the interface configuration mode.

Step 3  ipv4 address ip-address subnet-mask (or) (Only PW-Ether) ipv6 address ipv6-prefix/prefix-length

Example:
RP/0/RSP0/CPU0:router(config-if)# ipv4 address 40.1.1.2 255.255.255.0

Sets the IPv4 or IPv6 address of the interface.

Step 4  attach generic-interface-list interface_list_name

Example:
RP/0/RSP0/CPU0:router(config-if)# attach generic-interface-list interfacelist1

Attaches the generic interface list to the PW-Ether or PW-IW interface.

Step 5  l2overhead bytes

Example:
RP/0/RSP0/CPU0:router(config-if)# l2overhead 20

Sets layer 2 overhead size.

Step 6  load-interval seconds

Example:
RP/0/RSP0/CPU0:router(config-if)# load-interval 90

Specifies interval, in seconds, for load calculation for an interface.
The interval:
  • Can be set to 0 [0 disables load calculation]
  • If not 0, must be specified in multiples of 30 between 30 and 600.

Step 7  dampening decay-life

Example:
RP/0/RSP0/CPU0:router(config-if)# dampening 10

Configures state dampening on the given interface (in minutes).
Step 8 logging events link-status

Example:
RP/0/RSP0/CPU0:router(config-if)# logging events link-status

Configures per interface logging.

Step 9 (Only PW-Ether main interfaces) mac-address MAC address

Example:
RP/0/RSP0/CPU0:router(config-if)# mac-address aaaa.bbbb.cccc

Sets the MAC address (xxxx.xxxx.xxxx) on an interface.

Step 10 mtu interface_MTU

Example:
RP/0/RSP0/CPU0:router(config-if)# mtu 128

Sets the MTU on an interface.

Step 11 bandwidth kbps

Example:
RP/0/RSP0/CPU0:router(config-if)# bandwidth 200

Configures the bandwidth. The range is from 0 to 4294967295.

Step 12 Use the commit or end command.

commit - Saves the configuration changes and remains within the configuration session.

end - Prompts user to take one of these actions:
  • Yes - Saves configuration changes and exits the configuration session.
  • No - Exits the configuration session without committing the configuration changes.
  • Cancel - Remains in the configuration mode, without committing the configuration changes.

Configuring PWHE Layer 2 Subinterfaces and Adding it to the Bridge-domain

Perform this task to configure PWHE layer 2 subinterfaces and add it to the bridge-domain.

Note A Layer 2 subinterface does not contain an IP address and must be configured to operate in the Layer 2 transport mode.
SUMMARY STEPS

1. configure
2. interface pw-ether id
3. ipv4 address ip-address subnet-mask (or) ipv6 address ipv6-prefix/prefix-length
4. attach generic-interface-list interface_list_name
5. interface pw-ether id.subintfid l2transport
6. encapsulation dot1q value
7. l2vpn
8. xconnect group group-name
9. p2p xconnect-name
10. interface pw-ether id
11. neighbor ipv4 ip-address pw-id value
12. bridge group bridge-group-name
13. bridge-domain bridge-domain-name
14. interface pw-ether id.subintfid
15. interface type interface-path-id
16. neighbor ip-address pw-id value
17. Use the commit or end command.

DETAILED STEPS

Step 1 configure

Example:
RP/0/RSP0/CPU0:router# configure

Enters the Global Configuration mode.

Step 2 interface pw-ether id

Example:
RP/0/RSP0/CPU0:router(config)# interface PW-Ether1

Configures the PWHE interface and enters the interface configuration mode.

Step 3 ipv4 address ip-address subnet-mask (or) ipv6 address ipv6-prefix/prefix-length

Example:
RP/0/RSP0/CPU0:router(config-if)# ipv4 address 40.1.1.2 255.255.255.0

Sets the IPv4 or IPv6 address of the main interface.

Step 4 attach generic-interface-list interface_list_name
Example:
```
RP/0/RSP0/CPU0:router(config-if)# attach generic-interface-list pw_he
```
Attaches the generic interface list to the interface.

**Step 5**  
**interface pw-ether id.sub intf id l2transport**

Example:
```
RP/0/RSP0/CPU0:router(config-if)# interface PW-Ether1.1 l2transport
```
Configures the PWHE sub-interface and enters the sub-interface configuration mode.

**Step 6**  
**encapsulation dot1q value**

Example:
```
RP/0/RSP0/CPU0:router(config-subif)# encapsulation dot1q 1
```
Defines the matching criteria to map 802.1Q frames ingress on an interface to the appropriate service instance.

**Step 7**  
**l2vpn**

Example:
```
RP/0/RSP0/CPU0:router(config-subif)# l2vpn
```
Enters Layer 2 VPN configuration mode.

**Step 8**  
**xconnect group group-name**

Example:
```
RP/0/RSP0/CPU0:router(config-l2vpn)# xconnect group xg
```
Configures a cross-connect group name using a free-format 32-character string.

**Step 9**  
**p2p xconnect-name**

Example:
```
RP/0/RSP0/CPU0:router(config-l2vpn-xc)# p2p1
```
Enters P2P configuration submode.

**Step 10**  
**interface pw-ether id**

Example:
```
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# interface PW-Ether1
```
Configures the PWHE interface.

**Step 11**  
**neighbor ipv4 ip-address pw-id value**
Example:

RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# neighbor ipv4 1.1.1.1 pw-id 1

Configures a pseudowire for a cross-connect.
The IP address is that of the corresponding A-PE node.
The pw-id must match the pw-id of the A-PE node.

Step 12 bridge group bridge-group-name

Example:

RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p-pw)# bridge group bg

Creates a bridge group that can contain bridge domains, and then assigns network interfaces to the bridge domain.

Step 13 bridge-domain bridge-domain-name

Example:

RP/0/RSP0/CPU0:router(config-l2vpn-bg)# bridge-domain bd1

Establishes a bridge domain and enters L2VPN bridge group bridge domain configuration mode.

Step 14 interface pw-ether id.subintfid

Example:

RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# interface PW-Ether1.1

Adds the subinterface to the bridge domain.

Step 15 interface type interface-path-id

Example:

RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-ac)# interface GigabitEthernet0/1/11.1

Enters interface configuration mode and adds a subinterface to a bridge domain that allows packets to be forwarded and received from other interfaces that are part of the same bridge domain.

Step 16 neighbor ip-address pw-id value

Example:

RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-ac)# neighbor 3.3.3.3 pw-id 101

Configures a pseudowire for a bridge-domain.

Step 17 Use the commit or end command.
commit - Saves the configuration changes and remains within the configuration session.
end - Prompts user to take one of these actions:

• Yes - Saves configuration changes and exits the configuration session.
• **No** - Exits the configuration session without committing the configuration changes.

• **Cancel** - Remains in the configuration mode, without committing the configuration changes.

### Configuring PWHE Layer 3 Subinterfaces

Perform this task to configure PWHE layer 3 subinterfaces.

**Note**

A layer 3 subinterface must have an IPv4 or IPv6 address and cannot be configured in the layer 2 transport mode.

### SUMMARY STEPS

1. `configure`
2. `interface pw-ether id`
3. `ipv4 address ip-address subnet-mask (or) ipv6 address ipv6-prefix/prefix-length`
4. `attach generic-interface-list interface_list_name`
5. `interface pw-ether id.subintfid`
6. `ipv4 address ip-address subnet-mask (or) ipv6 address ipv6-prefix/prefix-length`
7. `encapsulation dot1q value`
8. `l2vpn`
9. `xconnect group group-name`
10. `p2p group-name`
11. `interface pw-ether id`
12. `neighbor ipv4 ip-address pw-id value`

### DETAILED STEPS

**Step 1**  
Configure

**Example:**

```
RP/0/RSP0/CPU0:router# configure
```

Enters the Global Configuration mode.

**Step 2**  
Interface `pw-ether id`

**Example:**

```
RP/0/RSP0/CPU0:router(config)# interface PW-Ether1
```

Configures the PWHE interface and enters the interface configuration mode.
Step 3 \textbf{ipv4 address} \textit{ip-address subnet-mask} (or) \textbf{ipv6 address} \textit{ipv6-prefix/prefix-length}

Example:

```
RP/0/RSP0/CPU0:router(config-if)# ipv4 address 40.1.1.2 255.255.255.0
```

Sets the IPv4 or the IPv6 address of the main interface.

Step 4 \textbf{attach generic-interface-list} \textit{interface_list_name}

Example:

```
RP/0/RSP0/CPU0:router(config-if)# attach generic-interface-list pw_he
```

Attaches the generic interface list to the interface.

Step 5 \textbf{interface} \textit{pw-ether id.subintfid}

Example:

```
RP/0/RSP0/CPU0:router(config-if)# interface PW-Ether1.1
```

Configures the PWHE sub-interface and enters the sub-interface configuration mode.

Step 6 \textbf{ipv4 address} \textit{ip-address subnet-mask} (or) \textbf{ipv6 address} \textit{ipv6-prefix/prefix-length}

Example:

```
RP/0/RSP0/CPU0:router(config-if)# ipv4 address 40.1.1.2 255.255.255.0
```

Sets the IPv4 or the IPv6 address of the subinterface.

Step 7 \textbf{encapsulation dot1q} \textit{value}

Example:

```
RP/0/RSP0/CPU0:router(config-subif)# encapsulation dot1q 1
```

Defines the matching criteria to map 802.1Q frames ingress on an interface to the appropriate service instance.

Step 8 \textbf{l2vpn}

Example:

```
RP/0/RSP0/CPU0:router(config-subif)# l2vpn
```

Enters Layer 2 VPN configuration mode.

Step 9 \textbf{xconnect group} \textit{group-name}

Example:

```
RP/0/RSP0/CPU0:router(config-l2vpn)# xconnect group xg
```

Configures a cross-connect group name using a free-format 32-character string.

Step 10 \textbf{p2p} \textit{group-name}
Example:

```
RP/0/RSP0/CPU0:router(config-l2vpn-xc)# p2p 1
```

Enters P2P configuration submode.

**Step 11**  
`interface pw-ether id`

Example:

```
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# interface PW-Ether1
```

Configures the PWHE interface.

**Step 12**  
`neighbor ipv4 ip-address pw-id value`

Example:

```
RP/0/RSP0/CPU0:router(config-l2vpn-xc-p2p)# neighbor ipv4 1.1.1.1 pw-id 1
```

Configures a pseudowire for a cross-connect.  
The IP address is that of the corresponding A-PE node.  
The **pw-id** must match the **pw-id** of the A-PE node.

---

**Configuring L2VPN over GRE**

Perform these tasks to configure L2VPN over GRE.
SUMMARY STEPS

1. configure
2. interface type interface-path-id
3. l2transport
4. exit
5. interface loopback instance
6. ipv4 address ip-address
7. exit
8. interface loopback instance
9. ipv4 address ip-address
10. router ospf process-name
11. area area-id
12. interface loopback instance
13. interface tunnel-ip number
14. exit
15. interface tunnel-ip number
16. ipv4 address ipv4-address subnet-mask
17. tunnel source type path-id
18. tunnel destination ip-address
19. end
20. l2vpn
21. bridge group bridge-group-name
22. bridge-domain bridge-domain-name
23. interface type interface-path-id
24. neighbor { A.B.C.D } { pw-id value }
25. mpls ldp
26. router-id { router-id }
27. interface tunnel-ip number
28. Use the commit or end command.

DETAILED STEPS

Step 1 configure

Example:

RP/0/RSP0/CPU0:router# configure

Enters the Global Configuration mode.

Step 2 interface type interface-path-id
Configuring L2VPN over GRE

Example:
RP/0/RSP0/CPU0:router# interface TenGigE0/1/0/12
Enters interface configuration mode and configures an interface.

Step 3

l2transport

Example:
RP/0/RSP0/CPU0:router# l2transport
Enables Layer 2 transport on the selected interface.

Step 4

exit

Example:
RP/0/RSP0/CPU0:router# exit
Exits the current configuration mode.

Step 5

interface loopback instance

Example:
RP/0/RSP0/CPU0:router# interface Loopback0
Enters interface configuration mode and names the new loopback interface.

Step 6

ipv4 address ip-address

Example:
RP/0/RSP0/CPU0:router# ipv4 address 100.100.100.100 255.255.255.255
Assigns an IP address and subnet mask to the virtual loopback interface.

Step 7

exit

Example:
RP/0/RSP0/CPU0:router# exit
Exits the current configuration mode.

Step 8

interface loopback instance

Example:
RP/0/RSP0/CPU0:router# interface Loopback1
Enters interface configuration mode and names the new loopback interface.

Step 9

ipv4 address ip-address
Example:
RP/0/RSP0/CPU0:router# ipv4 address 10.0.1.1 255.255.255.255
Assigns an IP address and subnet mask to the virtual loopback interface.

Step 10  
**router ospf** *process-name*

Example:
RP/0/RSP0/CPU0:router# router ospf 1
Enables OSPF routing for the specified routing process and places the router in router configuration mode.

Step 11  
**area** *area-id*

Example:
RP/0/RSP0/CPU0:router# area 0
Enters area configuration mode and configures an area for the OSPF process.

Step 12  
**interface loopback** *instance*

Example:
RP/0/RSP0/CPU0:router# interface Loopback0
Enters interface configuration mode and names the new loopback interface.

Step 13  
**interface tunnel-ip** *number*

Example:
RP/0/RSP0/CPU0:router# interface tunnel-ip1
Enters tunnel interface configuration mode.

Step 14  
**exit**

Example:
RP/0/RSP0/CPU0:router# exit
Exits the current configuration mode.

Step 15  
**interface tunnel-ip** *number*

Example:
RP/0/RSP0/CPU0:router(config)# interface tunnel-ip1
Enters tunnel interface configuration mode.

- number is the number associated with the tunnel interface.
Step 16 ipv4 address *ipv4-address subnet-mask*

**Example:**

```bash
RP/0/RSP0/CPU0:router(config-if)# ipv4 address 12.0.0.1 255.255.255.0
```

Specifies the IPv4 address and subnet mask for the interface.

- *ipv4-address* specifies the IP address of the interface.
- *subnet-mask* specifies the subnet mask of the interface.

Step 17 tunnel source *type path-id*

**Example:**

```bash
RP/0/RSP0/CPU0:router(config-if)# tunnel source Loopback1
```

Specifies the source of the tunnel interface.

Step 18 tunnel destination *ip-address*

**Example:**

```bash
RP/0/RSP0/CPU0:router(config-if)# tunnel destination 100.100.100.20
```

Defines the tunnel destination.

Step 19 end

**Example:**

```bash
RP/0/RSP0/CPU0:router(config-if)# end
```

Saves configuration changes.

- When you issue the **end** command, the system prompts you to commit changes:
  ```bash
  Uncommitted changes found, commit them before exiting(yes/no/cancel)?[cancel]:
  ```

  * Entering **yes** saves configuration changes to the running configuration file, exits the configuration session, and returns the router to **EXEC** mode.
  * Entering **no** exits the configuration session and returns the router to **EXEC** mode without committing the configuration changes.
  * Entering **cancel** leaves the router in the current configuration session without exiting or committing the configuration changes.

Step 20 l2vpn

**Example:**

```bash
RP/0/RSP0/CPU0:router# l2vpn
```

Enters L2VPN configuration mode.
Step 21  bridge group bridge-group-name

Example:
RP/0/RSP0/CPU0:router# bridge group access-pw

Creates a bridge group that can contain bridge domains, and then assigns network interfaces to the bridge domain.

Step 22  bridge-domain bridge-domain-name

Example:
RP/0/RSP0/CPU0:router# bridge-domain test

Establishes a bridge domain and enters L2VPN bridge group bridge domain configuration mode.

Step 23  interface type interface-path-id

Example:
RP/0/RSP0/CPU0:router# interface TenGigE0/1/0/12

Enters interface configuration mode and adds an interface to a bridge domain that allows packets to be forwarded and received from other interfaces that are part of the same bridge domain.

Step 24  neighbor { A.B.C.D } { pw-id value }

Example:
RP/0/RSP0/CPU0:router# neighbor 125.125.125.125 pw-id 100

Adds an access pseudowire port to a bridge domain or a pseudowire to a bridge virtual forwarding interface (VFI).

- Use the A.B.C.D argument to specify the IP address of the cross-connect peer
  
  Note  A.B.C.D can be a recursive or non-recursive prefix.
- Use the pw-id keyword to configure the pseudowire ID and ID value. The range is 1 to 4294967295.

Step 25  mpls ldp

Example:
RP/0/RSP0/CPU0:router# mpls ldp

Enables MPLS LDP configuration mode.

Step 26  router-id { router-id }

Example:
RP/0/RSP0/CPU0:router# router-id 100.100.100.100

Configures a router ID for the OSPF process.

Note  We recommend using a stable IP address as the router ID.
**Configuring a GRE Tunnel as Preferred Path for Pseudowire**

Perform this task to configure a GRE tunnel as the preferred path for pseudowires.

**SUMMARY STEPS**

1. configure
2. l2vpn
3. pw-class \{ name \}
4. encapsulation mpls
5. preferred-path \{ interface \} \{ tunnel-ip value | tunnel-te value | tunnel-tp value \} \[ fallback disable \]
6. Use the commit or end command.

**DETAILED STEPS**

**Step 1** configure

Example:

```
RP/0/RSP0/CPU0:router# configure
```

Enters the Global Configuration mode.

**Step 2** l2vpn
Example:

```
RP/0/RSP0/CPU0:router(config)# l2vpn
```

Enters L2VPN configuration mode.

**Step 3**  
**pw-class** 

```
RP/0/RSP0/CPU0:router(config-l2vpn)# pw-class gre
```

Configures the pseudowire class name.

**Step 4**  
**encapsulation mpls**

```
RP/0/RSP0/CPU0:router(config-l2vpn-pwc)# encapsulation mpls
```

Configures the pseudowire encapsulation to MPLS.

**Step 5**  
**preferred-path** 

```
RP/0/RSP0/CPU0:router(config-l2vpn-pwc-encap-mpls)# preferred-path interface tunnel-ip 1 fallback disable
```

Configures preferred path tunnel settings. If the fallback disable configuration is used and once the TE/TP tunnel is configured as the preferred path goes down, the corresponding pseudowire can also go down.

**Note** Ensure that fallback is supported.

**Step 6**  
Use the **commit** or **end** command.

- **commit** - Saves the configuration changes and remains within the configuration session.
- **end** - Prompts user to take one of these actions:
  - **Yes** - Saves configuration changes and exits the configuration session.
  - **No** - Exits the configuration session without committing the configuration changes.
  - **Cancel** - Remains in the configuration mode, without committing the configuration changes.

---

**Configuring VPLS LSM: Examples**

This section provides examples on how to configure the VPLS LSM solution:
Enabling P2MP PW with RSVP-TE on a VFI

Perform this task to enable a P2MP pseudowire with RSVP-TE on a VFI.

**SUMMARY STEPS**

1. configure
2. l2vpn
3. bridge group *bridge-group-name*
4. bridge-domain *bridge-domain-name*
5. vfi { *vfi-name* }  
6. multicast p2mp
7. signaling protocol bgp
8. Use the commit or end command.

**DETAILED STEPS**

**Step 1** configure

*Example:*

RP/0/RSP0/CPU0:router# configure

Enters the Global Configuration mode.

**Step 2** l2vpn

*Example:*

RP/0/RSP0/CPU0:router(config)# l2vpn  
RP/0/RSP0/CPU0:router(config-l2vpn)#

Enters L2VPN configuration mode.

**Step 3** bridge group *bridge-group-name*

*Example:*

RP/0/RSP0/CPU0:router(config-l2vpn)# bridge group bg1

Enters Layer 2 VPN VPLS bridge group configuration mode.

**Step 4** bridge-domain *bridge-domain-name*

*Example:*

RP/0/RSP0/CPU0:router(config-l2vpn-bg)# bridge-domain bd1

Enters Layer 2 VPN VPLS bridge group bridge domain configuration mode.

**Step 5** vfi { *vfi-name* }
Example:

RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# vfi v1

Configures the virtual forwarding interface (VFI) parameters and enters L2VPN bridge group bridge domain VFI configuration mode.

- Use the `vfi-name` argument to configure the name of the specified virtual forwarding interface.

**Step 6** multicast p2mp

Example:

RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-vfi)# multicast p2mp

Configures a point to multipoint pseudowire, and enables the pseudowire in this VFI.

**Step 7** signaling protocol bgp

Example:

RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-vfi-p2mp)# signaling protocol bgp

Enables BGP as the signaling protocol.

**Step 8** Use the **commit** or **end** command.

**commit** - Saves the configuration changes and remains within the configuration session.

**end** - Prompts user to take one of these actions:

- **Yes** - Saves configuration changes and exits the configuration session.
- **No** - Exits the configuration session without committing the configuration changes.
- **Cancel** - Remains in the configuration mode, without committing the configuration changes.

---

**Enabling BGP Autodiscover Signaling for P2MP PW on a VFI**

Perform this task to enable BGP autodiscovery signaling for P2MP pseudowire on a VFI.
SUMMARY STEPS

1. configure
2. l2vpn
3. bridge group bridge-group-name
4. bridge-domain bridge-domain-name
5. vfi { vfi-name }
6. multicast p2mp
7. signaling protocol bgp
8. Use the commit or end command.

DETAILED STEPS

Step 1 configure

Example:
RP/0/RSP0/CPU0:router# configure

Enters the Global Configuration mode.

Step 2 l2vpn

Example:
RP/0/RSP0/CPU0:router(config)# l2vpn
RP/0/RSP0/CPU0:router(config-l2vpn)#

Enters L2VPN configuration mode.

Step 3 bridge group bridge-group-name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn)# bridge group bg1

Enters Layer 2 VPN VPLS bridge group configuration mode.

Step 4 bridge-domain bridge-domain-name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bg)# bridge-domain bd1

Enters Layer 2 VPN VPLS bridge group bridge domain configuration mode.

Step 5 vfi { vfi-name }

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# vfi v1
Configures the virtual forwarding interface (VFI) parameters and enters L2VPN bridge group bridge domain VFI configuration mode.

- Use the vfi-name argument to configure the name of the specified virtual forwarding interface.

**Step 6**  multicast p2mp

**Example:**

```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-vfi)# multicast p2mp
```

Configures a point to multipoint pseudowire and enables the pseudowire in this VFI.

**Step 7**  signaling protocol bgp

**Example:**

```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-vfi-p2mp)# signaling protocol bgp
```

Enables BGP as the signaling protocol.

**Step 8**  Use the commit or end command.

- **commit** - Saves the configuration changes and remains within the configuration session.
- **end** - Prompts user to take one of these actions:
  - **Yes** - Saves configuration changes and exits the configuration session.
  - **No** - Exits the configuration session without committing the configuration changes.
  - **Cancel** - Remains in the configuration mode, without committing the configuration changes.

---

**Configuring VPN ID**

Perform this task to configure a VPN ID.
SUMMARY STEPS

1. configure
2. l2vpn
3. bridge group bridge-group-name
4. bridge-domain bridge-domain-name
5. vfi { vfi-name }
6. vpn-id vpn-id
7. autodiscovery bgp
8. rd { as-number:nn | ip-address:nn | auto }
9. route-target export { as-number:nn | ip-address:nn }
10. signaling-protocol bgp
11. ve-id { number }
12. Use the commit or end command.

DETAILED STEPS

Step 1 configure

Example:
RP/0/RSP0/CPU0:router# configure

Enters the Global Configuration mode.

Step 2 l2vpn

Example:
RP/0/RSP0/CPU0:router(config)# l2vpn

Enters L2VPN configuration mode.

Step 3 bridge group bridge-group-name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn)# bridge group metroA

Enters Layer 2 VPN VPLS bridge group configuration mode.

Step 4 bridge-domain bridge-domain-name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bg)# bridge-domain east

Enters Layer 2 VPN VPLS bridge group bridge domain configuration mode.

Step 5 vfi { vfi-name }

Cisco ASR 9000 Series Aggregation Services Router L2VPN and Ethernet Services Configuration Guide, Release 5.2.x
Example:

```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# vfi vfi-east
```

Enters virtual forwarding instance (VFI) configuration mode.

**Step 6**

```
vpn-id vpn-id
```

Example:

```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-vfi)# vpn-id 100
```

Specifies the identifier for the VPLS service. The VPN ID has to be globally unique within a PE router. i.e., the same VPN ID cannot exist in multiple VFIs on the same PE router. In addition, a VFI can have only one VPN ID. The range is from 1 to 65535.

**Step 7**

```
autodiscovery bgp
```

Example:

```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-vfi)# autodiscovery bgp
```

Enters BGP autodiscovery configuration mode where all BGP autodiscovery parameters are configured. This command is not provisioned to BGP until at least the VPN ID and the signaling protocol is configured.

**Step 8**

```
rd { as-number:nn | ip-address:nn | auto }
```

Example:

```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-vfi-ad)# rd auto
```

Specifies the route distinguisher (RD) under the VFI. The RD is used in the BGP NLRI to identify VFI. Only one RD can be configured per VFI, and except for rd auto the same RD cannot be configured in multiple VFIs on the same PE. When rd auto is configured, the RD value is as follows: {BGP Router ID}:{16 bits auto-generated unique index}.

**Step 9**

```
route-target export { as-number:nn | ip-address:nn }
```

Example:

```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-vfi-ad)# route-target export 100:10
```

Specifies the export route target for the VFI. Export route target is the RT that is going to be in the NLRI advertised to other PEs.

**Step 10**

```
signaling-protocol bgp
```

Example:

```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-vfi-ad)# signaling-protocol bgp
```

Enables BGP signaling, and enters the BGP signaling configuration submode where BGP signaling parameters are configured.
This command is not provisioned to BGP until VE ID and VE ID range is configured.

**Step 11**

ve-id \{ number \}

**Example:**

RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-vfi-ad-sig)# ve-id 10

Specifies the local PE identifier for the VFI for VPLS configuration.

The VE ID identifies a VFI within a VPLS service. This means that VFIs in the same VPLS service cannot share the same VE ID. The scope of the VE ID is only within a bridge domain. Therefore, VFIs in different bridge domains within a PE can use the same VE ID.

**Step 12**

Use the **commit** or **end** command.

- **commit** - Saves the configuration changes and remains within the configuration session.
- **end** - Prompts user to take one of these actions:
  - **Yes** - Saves configuration changes and exits the configuration session.
  - **No** - Exits the configuration session without committing the configuration changes.
  - **Cancel** - Remains in the configuration mode, without committing the configuration changes.

---

**Configuring IGMP Snooping**

Perform this task to configure IGMP snooping.

**SUMMARY STEPS**

1. configure
2. igmp snooping profile *profile_name*
3. system-ip-address *ip-address*
4. internal-querier
5. exit
6. l2vpn
7. bridge group *bridge-group-name*
8. bridge-domain *bridge-domain-name*
9. igmp snooping disable
10. Use the **commit** or **end** command.

**DETAILED STEPS**

**Step 1**

configure
**Example:**
RP/0/RSP0/CPU0:router# configure

Enters the Global Configuration mode.

**Step 2**  
`igmp snooping profile profile_name`

**Example:**
RP/0/RSP0/CPU0:router(config)# igmp snooping profile default-bd-profile

Enters IGMP snooping profile configuration mode and creates a named profile.

**Step 3**  
`system-ip-address ip-address`

**Example:**
RP/0/RSP0/CPU0:router(config-igmp-snooping-profile)# system-ip-address 1.1.1.1

Configures the source address for generated IGMP messages.

**Step 4**  
`internal-querier`

**Example:**
RP/0/RSP0/CPU0:router(config-igmp-snooping-profile)#

Configures the IGMP internal-querier.

**Note**  
For Leaf PEs, if you intend to enable IGMPSN on the bridge domain, ensure that you configure internal querier inside the IGMPSN profile.

**Step 5**  
`exit`

**Example:**
RP/0/RSP0/CPU0:router(config-igmp-snooping-profile)# exit

Returns to the global configuration mode.

**Step 6**  
`l2vpn`

**Example:**
RP/0/RSP0/CPU0:router(config)# l2vpn

Enters L2VPN configuration mode.

**Step 7**  
`bridge group bridge-group-name`

**Example:**
RP/0/RSP0/CPU0:router(config-l2vpn)# bridge group bg1

Enters Layer 2 VPN VPLS bridge group configuration mode for the named bridge group.
Step 8  
**bridge-domain bridge-domain-name**

**Example:**
RP/0/RSP0/CPU0:router(config-l2vpn-bg)# bridge-domain bd1
Enters Layer 2 VPN VPLS bridge group bridge domain configuration mode for the named bridge domain.

Step 9  
**igmp snooping disable**

**Example:**
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# igmp snooping disable
Disables IGMP snooping for the current bridge domain.

Step 10  
Use the **commit** or **end** command.

**commit** - Saves the configuration changes and remains within the configuration session.

**end** - Prompts user to take one of these actions:

- **Yes** - Saves configuration changes and exits the configuration session.
- **No** - Exits the configuration session without committing the configuration changes.
- **Cancel** - Remains in the configuration mode, without committing the configuration changes.

---

**Configuration Examples for Multipoint Layer 2 Services**

This section includes these configuration examples:

**Multipoint Layer 2 Services Configuration for Provider Edge-to-Provider Edge:**

*Example*

These configuration examples show how to create a Layer 2 VFI with a full-mesh of participating Multipoint Layer 2 Services provider edge (PE) nodes.

This configuration example shows how to configure PE 1:

```
configure
l2vpn
  bridge-group 1
  bridge-domain PE1-VPLS-A
  interface TenGigE0/0/0/0
  vfi 1
  neighbor 10.2.2.2 pw-id 1
  neighbor 10.3.3.3 pw-id 1
!
interface loopback 0
ipv4 address 10.1.1.1 255.255.255.25
```
This configuration example shows how to configure PE 2:

```conf
configure
l2vpn
bridge group 1
  bridge-domain PE2-VPLS-A
    interface TenGigE0/0/0/1
      vfi 1
        neighbor 10.1.1.1 pw-id 1
        neighbor 10.3.3.3 pw-id 1
    !
    interface loopback 0
      ipv4 address 10.2.2.2 255.255.255.25
```

This configuration example shows how to configure PE 3:

```conf
configure
l2vpn
bridge group 1
  bridge-domain PE3-VPLS-A
    interface TenGigE0/0/0/2
      vfi 1
        neighbor 10.1.1.1 pw-id 1
        neighbor 10.2.2.2 pw-id 1
    !
    interface loopback 0
      ipv4 address 10.3.3.3 255.255.255.25
```

### Multipoint Layer 2 Services Configuration for Provider Edge-to-Customer Edge: Example

This configuration shows how to configure Multipoint Layer 2 Services for a PE-to-CE nodes:

```conf
configure
interface TenGigE0/0/0/0
  l2transport-VC interface
  no ipv4 address
  no ipv4 directed-broadcast
  negotiation auto
  no cdp enable
```

### Displaying MAC Address Withdrawal Fields: Example

This sample output shows the MAC address withdrawal fields:

```
RP/0/RSP0/CPU0:router# show l2vpn bridge-domain detail
```

Legend: pp = Partially Programmed.

Split Horizon Group: Example

This example configures interfaces for Layer 2 transport, adds them to a bridge domain, and assigns them to split horizon groups.

```
RP/0/RSP0/CPU0:router(config)#l2vpn
RP/0/RSP0/CPU0:router(config-l2vpn)#bridge group examples
RP/0/RSP0/CPU0:router(config-l2vpn)#bridge-domain all_three
RP/0/RSP0/CPU0:router(config-l2vpn-bd)#interface GigabitEthernet 0/0/0/0.99
RP/0/RSP0/CPU0:router(config-l2vpn-bd-ac)#interface GigabitEthernet 0/0/0/0.101
RP/0/RSP0/CPU0:router(config-l2vpn-bd-bd-ac)#split-horizon group
RP/0/RSP0/CPU0:router(config-l2vpn-bd-bd-ac)#neighbor 192.168.99.1 pw-id 1
RP/0/RSP0/CPU0:router(config-l2vpn-bd-bd-ac)#neighbor 192.168.99.9 pw-id 1
RP/0/RSP0/CPU0:router(config-l2vpn-bd-bd-ac)#vfi abc
RP/0/RSP0/CPU0:router(config-l2vpn-bd-bd-ac)#show

Mon Oct 18 13:51:05.831 EDT
l2vpn
bridge group examples
bridge-domain all_three
! interface GigabitEthernet0/0/0/0.99
! interface GigabitEthernet0/0/0/0.101
! split-horizon group
! neighbor 192.168.99.1 pw-id 1
! neighbor 192.168.99.9 pw-id 1
! split-horizon group
! vfi abc
! neighbor 192.168.99.17 pw-id 1
```
According to this example, the Split Horizon group assignments for bridge domain all_three are:

<table>
<thead>
<tr>
<th>Bridge Port/Pseudowire</th>
<th>Split Horizon Group</th>
</tr>
</thead>
<tbody>
<tr>
<td>bridge port: gig0/0/0/0.99</td>
<td>0</td>
</tr>
<tr>
<td>bridge port: gig0/0/0/0.101</td>
<td>2</td>
</tr>
<tr>
<td>PW: 192.168.99.1 pw-id 1</td>
<td>0</td>
</tr>
<tr>
<td>PW: 192.168.99.9 pw-id 1</td>
<td>2</td>
</tr>
<tr>
<td>PW: 192.168.99.17 pw-id 1</td>
<td>1</td>
</tr>
</tbody>
</table>

### Blocking Unknown Unicast Flooding: Example

Unknown-unicast flooding can be blocked at these levels:

- bridge domain
- bridge port (attachment circuit (AC))
- access pseudowire (PW)

This example shows how to block unknown-unicast flooding at the bridge domain level:

```bash
configure
l2vpn
  bridge-group group1
  bridge-domain domain1
  flooding unknown-unicast disable
end
```

This example shows how to block unknown-unicast flooding at the bridge port level:

```bash
configure
l2vpn
  bridge-group group1
  bridge-domain domain1
  interface GigabitEthernet 0/1/0/1
  flooding unknown-unicast disable
end
```

This example shows how to block unknown-unicast flooding at the access pseudowire level:

```bash
configure
l2vpn
  bridge-group group1
  bridge-domain domain1
  neighbor 10.1.1.1 pw-id 1000
  flooding unknown-unicast disable
end
```
Disabling MAC Flush: Examples

You can disable the MAC flush at these levels:

- bridge domain
- bridge port (attachment circuit (AC))
- access pseudowire (PW)

The following example shows how to disable the MAC flush at the bridge domain level:

```conf
configure
l2vpn
 bridge-group group1
 bridge-domain domain1
 mac
 port-down flush disable
end
```

The following example shows how to disable the MAC flush at the bridge port level:

```conf
configure
l2vpn
 bridge-group group1
 bridge-domain domain1
 interface TenGigE 0/0/0/0
 mac
 port-down flush disable
end
```

Bridging on IOS XR Trunk Interfaces: Example

This example shows how to configure a Cisco NCS 5000 Series Router as a simple L2 switch.

**Important notes:**

Create a bridge domain that has four attachment circuits (AC). Each AC is an IOS XR trunk interface (i.e. not a subinterface/EFP).

- This example assumes that the running config is empty, and that all the components are created.
- This example provides all the necessary steps to configure the Cisco NCS 5000 Series Router to perform switching between the interfaces. However, the commands to prepare the interfaces such as no shut, negotiation auto, etc., have been excluded.
- The bridge domain is in a no shut state, immediately after being created.
- Only trunk (i.e. main) interfaces are used in this example.
- The trunk interfaces are capable of handling tagged (i.e. IEEE 802.1Q) or untagged (i.e. no VLAN header) frames.
- The bridge domain learns, floods, and forwards based on MAC address. This functionality works for frames regardless of tag configuration.
- The bridge domain entity spans the entire system. It is not necessary to place all the bridge domain ACs on a single LC. This applies to any bridge domain configuration.
The show bundle and the show l2vpn bridge-domain commands are used to verify that the router was configured as expected, and that the commands show the status of the new configurations.

The ACs in this example use interfaces that are in the admin down state.

**Configuration Example**

```plaintext
RP/0/RSP0/CPU0:router#config
RP/0/RSP0/CPU0:router(config)#interface Bundle-ether10
RP/0/RSP0/CPU0:router(config-if)#l2transport
RP/0/RSP0/CPU0:router(config-if-l2)#interface GigabitEthernet0/2/0/5
RP/0/RSP0/CPU0:router(config-if)#bundle id 10 mode active

Cisco ASR 9000 Series Aggregation Services Router L2VPN and Ethernet Services Configuration Guide, Release 5.2.x

318
This table lists the configuration steps (actions) and the corresponding purpose for this example:

**SUMMARY STEPS**

1. configure
2. interface Bundle-ether10
3. l2transport
4. interface GigabitEthernet0/2/0/5
5. bundle id 10 mode active
6. interface GigabitEthernet0/2/0/6
7. bundle id 10 mode active
8. interface GigabitEthernet0/2/0/0
9. l2transport
10. interface GigabitEthernet0/2/0/1
11. l2transport
12. interface TenGigE0/1/0/2
13. l2transport
14. l2vpn
15. bridge group examples
16. bridge-domain test-switch
17. interface Bundle-ether10
18. exit
19. interface GigabitEthernet0/2/0/0
20. exit
21. interface GigabitEthernet0/2/0/1
22. exit
23. interface TenGigE0/1/0/2
24. Use the commit or end command.

**DETAILED STEPS**

**Step 1**
configure
Enters global configuration mode.

**Step 2**
interface Bundle-ether10
Creates a new bundle trunk interface.

**Step 3**
l2transport
Changes Bundle-ether10 from an L3 interface to an L2 interface.

**Step 4**
interface GigabitEthernet0/2/0/5
Enters interface configuration mode. Changes configuration mode to act on GigabitEthernet0/2/0/5.

**Step 5**
bundle id 10 mode active
Steps 6 to 23 demonstrate the configuration process for bridging on IOS XR trunk interfaces. The script illustrates the use of LACP (Link Aggregate Control Protocol) for trunking and the transition from L3 (Layer 3) to L2 (Layer 2) interfaces.

**Step 6**
```
interface GigabitEthernet0/2/0/6
```
Enter interface configuration mode. Changes configuration mode to act on GigabitEthernet0/2/0/6.

**Step 7**
```
bundle id 10 mode active
```
Establishes GigabitEthernet0/2/0/6 as a member of Bundle-ether10. The **mode active** keywords specify LACP protocol.

**Step 8**
```
interface GigabitEthernet0/2/0/0
```
Enter interface configuration mode. Changes configuration mode to act on GigabitEthernet0/2/0/0.

**Step 9**
```
l2transport
```
Change GigabitEthernet0/2/0/0 from an L3 interface to an L2 interface.

**Step 10**
```
interface GigabitEthernet0/2/0/1
```
Enter interface configuration mode. Changes configuration mode to act on GigabitEthernet0/2/0/1.

**Step 11**
```
l2transport
```
Change GigabitEthernet0/2/0/1 from an L3 interface to an L2 interface.

**Step 12**
```
interface TenGigE0/1/0/2
```
Enter interface configuration mode. Changes configuration mode to act on TenGigE0/1/0/2.

**Step 13**
```
l2transport
```
Changes TenGigE0/1/0/2 from an L3 interface to an L2 interface.

**Step 14**
```
l2vpn
```
Enter L2VPN configuration mode.

**Step 15**
```
bridge group examples
```
Creates the bridge group **examples**.

**Step 16**
```
bridge-domain test-switch
```
Creates the bridge domain **test-switch**, that is a member of bridge group **examples**.

**Step 17**
```
interface Bundle-ether10
```
Establishes Bundle-ether10 as an AC of bridge domain **test-switch**.

**Step 18**
```
exit
```
Exits bridge domain AC configuration submode, allowing next AC to be configured.

**Step 19**
```
interface GigabitEthernet0/2/0/0
```
Establishes GigabitEthernet0/2/0/0 as an AC of bridge domain **test-switch**.

**Step 20**
```
exit
```
Exits bridge domain AC configuration submode, allowing next AC to be configured.

**Step 21**
```
interface GigabitEthernet0/2/0/1
```
Establishes GigabitEthernet0/2/0/1 as an AC of bridge domain **test-switch**.

**Step 22**
```
exit
```
Exits bridge domain AC configuration submode, allowing next AC to be configured.

**Step 23**
```
interface TenGigE0/1/0/2
```
Establishes interface TenGigE0/1/0/2 as an AC of bridge domain **test-switch**.
Step 24 Use the commit or end command.

commit - Saves the configuration changes and remains within the configuration session.

end - Prompts user to take one of these actions:

- Yes - Saves configuration changes and exits the configuration session.
- No - Exits the configuration session without committing the configuration changes.
- Cancel - Remains in the configuration mode, without committing the configuration changes.

Bridging on Ethernet Flow Points: Example

This example shows how to configure a Cisco NCS 5000 Series Router to perform Layer 2 switching on traffic that passes through Ethernet Flow Points (EFPs). EFP traffic typically has one or more VLAN headers. Although both IOS XR trunks and IOS XR EFPs can be combined as attachment circuits in bridge domains, this example uses EFPs exclusively.

Important notes:

- An EFP is a Layer 2 subinterface. It is always created under a trunk interface. The trunk interface must exist before the EFP is created.

- In an empty configuration, the bundle interface trunk does not exist, but the physical trunk interfaces are automatically configured. Therefore, only the bundle trunk is created.

- In this example the subinterface number and the VLAN IDs are identical, but this is out of convenience, and is not a necessity. They do not need to be the same values.

- The bridge domain test-efp has three attachment circuits (ACs). All the ACs are EFPs.

- Only frames with a VLAN ID of 999 enter the EFPs. This ensures that all the traffic in this bridge domain has the same VLAN encapsulation.

- The ACs in this example use interfaces that are in the admin down state (unresolved state). Bridge domains that use nonexistent interfaces as ACs are legal, and the commit for such configurations does not fail. In this case, the status of the bridge domain shows unresolved until you configure the missing interface.

Configuration Example

```
RP/0/RSP1/CPU0:router#configure
RP/0/RSP1/CPU0:router(config)#interface Bundle-ether10
RP/0/RSP1/CPU0:router(config-if)#interface Bundle-ether10.999 l2transport
RP/0/RSP1/CPU0:router(config-subif)#encapsulation dot1q 999

19. exit
20. interface TenGigE0/1/0/2.999
21. Use the **commit** or **end** command.

### DETAILED STEPS

**Step 1**

configure
Enters global configuration mode.

Step 2  `interface Bundle-ether10`
Creates a new bundle trunk interface.

Step 3  `interface Bundle-ether10.999 l2transport`
Creates an EFP under the new bundle trunk.

Step 4  `encapsulation dot1q 999`
Assigns VLAN ID of 999 to this EFP.

Step 5  `interface GigabitEthernet0/6/0/5`
Enters interface configuration mode. Changes configuration mode to act on GigabitEthernet0/6/0/5.

Step 6  `bundle id 10 mode active`
Establishes GigabitEthernet0/6/0/5 as a member of Bundle-ether10. The `mode active` keywords specify LACP protocol.

Step 7  `interface GigabitEthernet0/6/0/6`
Enters interface configuration mode. Changes configuration mode to act on GigabitEthernet0/6/0/6.

Step 8  `bundle id 10 mode active`
Establishes GigabitEthernet0/6/0/6 as a member of Bundle-ether10. The `mode active` keywords specify LACP protocol.

Step 9  `interface GigabitEthernet0/6/0/7.999 l2transport`
Creates an EFP under GigabitEthernet0/6/0/7.

Step 10  `encapsulation dot1q 999`
Assigns VLAN ID of 999 to this EFP.

Step 11  `interface TenGigE0/1/0/2.999 l2transport`
Creates an EFP under TenGigE0/1/0/2.

Step 12  `encapsulation dot1q 999`
Assigns VLAN ID of 999 to this EFP.

Step 13  `l2vpn`
Enters L2VPN configuration mode.

Step 14  `bridge group examples`
Creates the bridge group named `examples`.

Step 15  `bridge-domain test-efp`
Creates the bridge domain named `test-efp`, that is a member of bridge group `examples`.

Step 16  `interface Bundle-ether10.9999`
Establishes Bundle-ether10.999 as an AC of the bridge domain named `test-efp`.

Step 17  `exit`
Exits bridge domain AC configuration submode, allowing next AC to be configured.

Step 18  `interface GigabitEthernet0/6/0/7.9999`
Establishes GigabitEthernet0/6/0/7.999 as an AC of the bridge domain named `test-efp`.

Step 19  `exit`
Exits bridge domain AC configuration submode, allowing next AC to be configured.
Step 20  
interface TenGigE0/1/0/2.999  
Establishes interface TenGigE0/1/0/2.999 as an AC of bridge domain named test-efp.

Step 21  
Use the **commit** or **end** command.  
**commit** - Saves the configuration changes and remains within the configuration session.  
**end** - Prompts user to take one of these actions:  
  - **Yes** - Saves configuration changes and exits the configuration session.  
  - **No** - Exits the configuration session without committing the configuration changes.  
  - **Cancel** - Remains in the configuration mode, without committing the configuration changes.

---

### Changing the Flood Optimization Mode

Perform this task to change the flood optimization mode under the bridge domain:

**SUMMARY STEPS**

1. **configure**
2. **l2vpn**
3. **bridge group** _bridge-group-name_
4. **bridge-domain** _bridge-domain-name_
5. **flood mode convergence-optimized**
6. Use the **commit** or **end** command.

**DETAILED STEPS**

Step 1  
**configure**

**Example:**  
RP/0/RSP0/CPU0:router# configure  
Enters the Global Configuration mode.

Step 2  
**l2vpn**

**Example:**  
RP/0/RSP0/CPU0:router(config)# l2vpn  
Enters L2VPN configuration mode.

Step 3  
**bridge group** _bridge-group-name_

**Example:**  
RP/0/RSP0/CPU0:router(config-l2vpn)# bridge group caco
RP/0/RSP0/CPU0:router(config-l2vpn-bg)#

Creates a bridge group so that it can contain bridge domains and then assigns network interfaces to the bridge domain.

**Step 4**

**bridge-domain**  *bridge-domain-name*

**Example:**

RP/0/RSP0/CPU0:router(config-l2vpn-bg)# bridge-domain abc
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)#

Establishes a bridge domain and enters l2vpn bridge group bridge domain configuration mode.

**Step 5**

**flood mode convergence-optimized**

**Example:**

RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# flood mode convergence-optimized

Changes the default flood optimization mode from Bandwidth Optimization Mode to Convergence Mode.

**Step 6**

Use the **commit** or **end** command.

- **commit** - Saves the configuration changes and remains within the configuration session.
- **end** - Prompts user to take one of these actions:
  
  - **Yes** - Saves configuration changes and exits the configuration session.
  - **No** - Exits the configuration session without committing the configuration changes.
  - **Cancel** - Remains in the configuration mode, without committing the configuration changes.

---

**Configuring VPLS with BGP Autodiscovery and Signaling: Example**

This section contains these configuration examples for configuring the BGP autodiscovery and signaling feature:

**LDP and BGP Configuration**

The following figure illustrates an example of LDP and BGP configuration.

*Figure 31: LDP and BGP Configuration*
## Configuration at PE1:

```plaintext
interface Loopback0
 ipv4 address 1.1.1.100 255.255.255.255
!
interface Loopback1
 ipv4 address 1.1.1.10 255.255.255.255
!
mls ldp
 router-id 1.1.1.1
 interface GigabitEthernt0/0/0
 router bgp 120
 address-family l2vpn vpls-vpws
 neighbor 2.2.2.20
 remote-as 120
 update-source Loopback1
 address-family l2vpn vpls-vpws
 signaling bgp disable
```

## Configuration at PE2:

```plaintext
interface Loopback0
 ipv4 address 2.2.2.200 255.255.255.255
!
interface Loopback1
 ipv4 address 2.2.2.20 255.255.255.255
!
mls ldp
 router-id 2.2.2.2
 interface GigabitEthernt0/0/0
 router bgp 120
 address-family l2vpn vpls-vpws
 neighbor 1.1.1.10
 remote-as 120
 update-source Loopback1
 address-family l2vpn vpls-vpws
```

## Minimum L2VPN Configuration for BGP Autodiscovery with BGP Signaling

This example illustrates the minimum L2VPN configuration required for BGP Autodiscovery with BGP Signaling, where any parameter that has a default value is not configured.

```plaintext
{config)# l2vpn
{config-l2vpn)# bridge group {bridge group name}
{config-l2vpn-bg)# bridge-domain {bridge domain name}
{config-l2vpn-bg-bd)# vfi {vfi name}
{config-l2vpn-bg-bd-vfi)# autodiscovery bgp
{config-l2vpn-bg-bd-vfi-ad)# vpn-id 10
{config-l2vpn-bg-bd-vfi-ad)# rd auto
{config-l2vpn-bg-bd-vfi-ad)# route-target 1.1.1.1:100
{config-l2vpn-bg-bd-vfi-ad-sig)# signaling-protocol bgp
{config-l2vpn-bg-bd-vfi-ad-sig)# ve-id 1
{config-l2vpn-bg-bd-vfi-ad-sig)# commit
```
VPLS with BGP Autodiscovery and BGP Signaling

The following figure illustrates an example of configuring VPLS with BGP autodiscovery (AD) and BGP Signaling.

**Figure 32: VPLS with BGP autodiscovery and BGP signaling**

Configuration at PE1:

```
12vpn
  bridge group gr1
  bridge-domain bd1
  interface GigabitEthernet0/1/0/1.1
    vfi vf1
      ! AD independent VFI attributes
      vpn-id 100
      ! Auto-discovery attributes
      autodiscovery bgp
      rd auto
      route-target 2.2.2.2:100
      ! Signaling attributes
      signaling-protocol bgp
      ve-id 3
```

Configuration at PE2:

```
12vpn
  bridge group gr1
  bridge-domain bd1
  interface GigabitEthernet0/1/0/2.1
    vfi vf1
      ! AD independent VFI attributes
      vpn-id 100
      ! Auto-discovery attributes
      autodiscovery bgp
      rd auto
      route-target 2.2.2.2:100
      ! Signaling attributes
      signaling-protocol bgp
      ve-id 5
```

This is an example of NLRI for VPLS with BGP AD and signaling:
**Discovery Attributes**

**NLRI sent at PE1:**

- Length = 19
- Router Distinguisher = 3.3.3.3:32770
- VE ID = 3
- VE Block Offset = 1
- VE Block Size = 10
- Label Base = 16015

**NLRI sent at PE2:**

- Length = 19
- Router Distinguisher = 1.1.1.1:32775
- VE ID = 5
- VE Block Offset = 1
- VE Block Size = 10
- Label Base = 16120

**Minimum Configuration for BGP Autodiscovery with LDP Signaling**

This example illustrates the minimum L2VPN configuration required for BGP Autodiscovery with LDP Signaling, where any parameter that has a default value is not configured.

```
(config)# l2vpn
(config-l2vpn)# bridge group {bridge group name}
(config-l2vpn-bg)# bridge-domain {bridge domain name}
(config-l2vpn-bg-bd)# vfi {vfi name}
(config-l2vpn-bg-bd-vfi)# autodiscovery bgp
(config-l2vpn-bg-bd-vfi-ad)# vpn-id 10
(config-l2vpn-bg-bd-vfi-ad)# rd auto
(config-l2vpn-bg-bd-vfi-ad)# route-target 1.1.1.1:100
(config-l2vpn-bg-bd-vfi-ad)# commit
```

**VPLS with BGP Autodiscovery and LDP Signaling**

The following figure illustrates an example of configuring VPLS with BGP autodiscovery (AD) and LDP Signaling.

**Figure 33: VPLS with BGP autodiscovery and LDP signaling**

![Diagram](image_url)

**Configuration at PE1:**

```
l2vpn
  router-id 10.10.10.10
  bridge group bg1
  bridge-domain bd1
  vfi vf1
  vpn-id 100
  autodiscovery bgp
```
Configuration at PE2:

```
rd 1:100
router-target 12:12
```

Discovery and Signaling Attributes

![Diagram](image)

Configuration at PE1:

```
l2vpn
  router-id 20.20.20.20
  bridge group bg1
  bridge-domain bd1
  vfi vfi1
  vpn-id 100
  autodiscovery bgp
  rd 2:200
  router-target 12:12
  signaling-protocol ldp
  vpla-id 120:100
```

Configuration at PE2:

```
rd 2:200
router-target 12:12
signaling-protocol ldp
vpla-id 120:100
```

Common Configuration between PE1 and PE2:

```
ASN       120
VPN-ID    100
VPLS-ID   120:100
RT        12:12
```

Configuration at PE1:

```
LDP Router ID - 1.1.1.1
BGP Router ID - 1.1.1.100
Peer Address - 1.1.1.10
L2VPN Router ID - 10.10.10.10
Route Distinguisher - 1:100
```

Configuration at PE2:

```
LDP Router ID - 2.2.2.2
BGP Router ID - 2.2.2.200
Peer Address - 2.2.2.20
L2VPN Router ID - 20.20.20.20
Route Distinguisher - 2:200
```
Discovery Attributes

NLRI sent at PE1:

Source Address - 1.1.1.10  
Destination Address - 2.2.2.20  
Length - 14  
Route Distinguisher - 1:100  
L2VPN Router ID - 10.10.10.10  
VPLS ID - 120:100  
Route Target - 12:12

NLRI sent at PE2:

Source Address - 2.2.2.20  
Destination Address - 1.1.1.10  
Length - 14  
Route Distinguisher - 2:200  
L2VPN Router ID - 20.20.20.20  
VPLS ID - 120:100  
Route Target - 12:12

Enabling VC type 4 for BGP Autodiscovery

This example shows how to configure virtual connection type 4 in VPLS with BGP autodiscovery:

```
l2vpn  
brIDGE group bg1  
bridge-domain bd1  
transport-mode vlan passthrough  
interface GigabitEthernet0/0/0/1.1  
neighbor 2.2.2.2 pw-id 1  
  vfi vf1  
  vpn-id 100  
  autodiscovery bgp  
  rd auto  
  route-target 1:1  
  signaling-protocol ldp  
!  
!```

VPLS with both BGP Autodiscovery and Manual Provisioning of VPLS Peers

This example shows VPLS configuration with BGP autodiscovery as well as manual provisioning of VPLS peers that are not participating in the BGP autodiscovery process.

```
l2vpn  
brIDGE group bg1  
bridge-domain bd1

Configuring Dynamic ARP Inspection: Example

This example shows how to configure basic dynamic ARP inspection under a bridge domain:

```
config
l2vpn
bridge group MyGroup
bridge-domain MyDomain
dynamic-arp-inspection logging
```

This example shows how to configure basic dynamic ARP inspection under a bridge port:

```
config
l2vpn
bridge group MyGroup
bridge-domain MyDomain
interface gigabitEthernet 0/1/0/0.1
dynamic-arp-inspection logging
```

This example shows how to configure optional dynamic ARP inspection under a bridge domain:

```
l2vpn
bridge group SECURE
bridge-domain SECURE-DAI
dynamic-arp-inspection
logging
address-validation
src-mac
dst-mac
ipv4
```

This example shows how to configure optional dynamic ARP inspection under a bridge port:

```
l2vpn
bridge group SECURE
bridge-domain SECURE-DAI
interface GigabitEthernet0/0/0/1.10
dynamic-arp-inspection
logging
address-validation
src-mac
dst-mac
ipv4
```

This example shows the output of the `show l2vpn bridge-domain bd-name` command:

```
#show l2vpn bridge-domain bd-name SECURE-DAI detail
Bridge group: SECURE, bridge-domain: SECURE-DAI, id: 2, state: up,
...
Dynamic ARP Inspection: enabled, Logging: enabled
Dynamic ARP Inspection Address Validation: IPv4 verification: enabled
  Source MAC verification: enabled
  Destination MAC verification: enabled
...
List of ACs:
AC: GigabitEthernet0/0/0/1.10, state is up
...
  Dynamic ARP Inspection: enabled, Logging: enabled
  Dynamic ARP Inspection Address Validation:
    IPv4 verification: enabled
    Source MAC verification: enabled
    Destination MAC verification: enabled
...
  IP Source Guard: enabled, Logging: enabled
...
  Dynamic ARP inspection drop counters:
    packets: 1000, bytes: 64000
```
This example shows the output of the `show l2vpn forwarding interface interface-name detail location location-name` command:

```
#show l2vpn forwarding interface g0/0/0/1.10 det location 0/0/CPU0
Local interface: GigabitEthernet0/0/0/1.10, Xconnect id: 0x40001, Status: up

... Dynamic ARP Inspection: enabled, Logging: enabled Dynamic ARP Inspection Address Validation: IPv4 verification: enabled Source MAC verification: enabled Destination MAC verification: enabled IP Source Guard: enabled, Logging: enabled
```

This example shows the logging display:

```
LC/0/0/CPU0:Jun 16 13:28:28.697 : l2fib[188]: %L2-L2FIB-5-SECURITY_DAI_VIOLATION_AC: Dynamic ARP inspection in AC GigabitEthernet0_0_0_7.1000 detected violated packet - source MAC: 0000.0000.0065, destination MAC: 0000.0040.0000, sender MAC: 0000.0000.0064, target MAC: 0000.0000.0000, sender IP: 5.6.6.6, target IP: 130.10.3.2

```

Configuring IP Source Guard: Example

This example shows how to configure basic IP source guard under a bridge domain:

```
config
l2vpn
bridge group MyGroup
bridge-domain MyDomain
ip-source-guard logging
```

This example shows how to configure basic IP source guard under a bridge port:

```
config
l2vpn
bridge group MyGroup
bridge-domain MyDomain
interface gigabitEthernet 0/1/0/0.1
ip-source-guard logging
```

This example shows how to configure optional IP source guard under a bridge domain:

```
l2vpn
bridge group SECURE
bridge-domain SECURE-IPSG
ip-source-guard
```

This example shows how to configure optional IP source guard under a bridge port:

```
l2vpn
bridge group SECURE
bridge-domain SECURE-IPSG
interface GigabitEthernet0/0/0/1.10
ip-source-guard
```

This example shows the output of the `show l2vpn bridge-domain bd-name ipsg-name detail` command:

```
# show l2vpn bridge-domain bd-name SECURE-IPSG detail
Bridge group: SECURE, bridge-domain: SECURE-IPSG, id: 2, state: up,
```
Implementing Multipoint Layer 2 Services

Configuring G.8032 Ethernet Ring Protection: Example

This example shows the output of the `show l2vpn forwarding interface interface-name detail location location-name` command:

```
# show l2vpn forwarding interface g0/0/0/1.10 detail location 0/0/CPU0
Local interface: GigabitEthernet0/0/0/1.10, Xconnect id: 0x40001, Status: up

... IP Source Guard: enabled, Logging: enabled

This example shows the logging display:

LC/0/0/CPU0:Jun 16 13:32:25.334 : l2fib[188]: %L2-L2FIB-5-SECURITY_IPSG_VIOLATION_AC : IP source guard in AC GigabitEthernet0_0_0_7.1001 detected violated packet - source MAC: 0000.0000.0200, destination MAC: 0000.0003.0000, source IP: 130.0.0.1, destination IP: 125.34.2.5

Configuring Flow Aware Transport Pseudowire: Example

This sample configuration shows how to enable load balancing with FAT PW for VPWS.

```
l2vpn
pw-class class1
  encapsulation mpls
  load-balancing flow-label transmit
!
pw-class class2
  encapsulation mpls
  load-balancing flow-label both
!
xconnect group group1
  p2p p1
    interface TenGigE 0/0/0/0.1
    neighbor 1.1.1.1 pw-id 1
      pw-class class1
  !
  !
```

This sample configuration shows how to enable load balancing with FAT PW for VPLS.

**Note**

For VPLS, the configuration at the bridge-domain level is applied to all PWs (access and VFI PWs). Pseudowire classes are defined to override the configuration for manual PWs.

```
l2vpn
pw-class class1
  encapsulation mpls
  load-balancing flow-label both
  bridge group group1
    bridge-domain domain1
      vfi vfi2-auto-bgp
        autodiscovery bgp
          signaling-protocol bgp
            load-balancing flow-label both static
          !
    !
  !
  !
  bridge-domain domain2
    vfi vfi2-auto-ldp
      autodiscovery bgp
        signaling-protocol ldp
          load-balancing flow-label both static
        !
    !
  !
```

Configuring Pseudowire Headend: Example

This example shows how to configure pseudowire headend.
Consider the topology in the following figure.

**Figure 36: Pseudowire Headend Example**

There are multiple CEs connected to A-PE (each CE is connected by one link). There are two P routers between A-PE an S-PE in the access network. The S-PE is connected using two links to P1. These links L1 and L2 (on two different line cards on P1 and S-PE), e.g. Gig0/1/0/0 and Gig0/2/0/0 respectively.

The S-PE is connected by two links to P2, links L3 and L4 (on two different line cards on P2 and S-PE), e.g. Gig0/1/0/1 and Gig0/2/0/1 respectively. For each CE-APE link, a xconnect (AC-PW) is configured on the A-PE. A-PE uses router-id 100.100.100.100 for routing and PW signaling. Two router-ids on S-PE used for PW signaling, e.g. 111.111.111.111 and 112.112.112.112 (for rx pin-down), 110.110.110.110 is the router-id for routing.

**CE Configuration**

Consider two CEs that are connected through Ge0/3/0/0 (CE1 and A-PE) and Ge0/3/0/1 (CE2 and A-PE).

**CE1**

```
interface Gig0/3/0/0
ipv4 address 10.1.1.1/24
router static
  address-family ipv4 unicast
  110.110.110.110 Gig0/3/0/0
  A.B.C.D/N 110.110.110.110
```

**CE2**

```
interface Gig0/3/0/1
ipv4 address 10.1.2.1/24
router static
  address-family ipv4 unicast
  110.110.110.110 Gig0/3/0/1
  A.B.C.D/N 110.110.110.110
```
A-PE Configuration

At A-PE we have 1 xconnect for each CE connection. Here we give the configuration for the 2 CE connections above: both connections are L2 links which are in xconnects. Each xconnect has a PW destined to S-PE but we use a different neighbor address depending of where we want to pin-down the PW: [L1, L4] or [L2, L3]

```plaintext
interface Gig0/3/0/0
l2transport
interface Gig0/3/0/1
l2transport
l2vpn
xconnect group pwhe
   p2p pwhe_spe_1
     interface Gig0/3/0/0
     neighbor 111.111.111.111 pw-id 1
   p2p pwhe_spe_2
     interface Gig0/3/0/1
     neighbor 112.112.112.112 pw-id 2
```

P Router Configuration

We need static routes on P routers for rx pindown on S-PE, i.e. to force PWs destined to a specific address to be transported over certain links.

```
P1

router static
   address-family ipv4 unicast
      111.111.111.111 Gig0/1/0/0
      112.112.112.112 Gig0/2/0/0

P2

router static
   address-family ipv4 unicast
      111.111.111.111 Gig0/2/0/1
      112.112.112.112 Gig0/1/0/1
```

S-PE Configuration

At S-PE we have 2 PW-HE interfaces (1 for each PW) and each uses a different interface list for tx pin-down (has to match the static config at P routers for rx pin-down). Each PW-HE has its PW going to A-PE (pw-id has to match what's at A-PE).

```
generic-interface-list ill
   interface gig0/1/0/0
   interface gig0/2/0/0
   generic-interface-list ill2
   interface gig0/1/0/1
   interface gig0/2/0/1

interface pw-ether1
   ipv4 address 10.1.1.2/24
   attach generic-interface-list ill
   interface pw-ether2
   ipv4 address 10.1.2.2/24
   attach generic-interface-list ill2

l2vpn
   xconnect group pwhe
   p2p pwhe1
     interface pw-ether1
```

Cisco ASR 9000 Series Aggregation Services Router L2VPN and Ethernet Services Configuration Guide, Release 5.2.x
Configuring L2VPN over GRE: Example

Configure the PW core interfaces under IGP and ensure that the loopback is reachable. Configure the tunnel source such that the tunnel is the current loopback as well as destination of the peer PE loopback. Now, configure the GRE tunnel in IGP (OSPF or ISIS), and also under mpls ldp and ensure that the LDP neighbor is established between the PEs for the PW. This ensures that the PW is Up through the tunnel.

Configuration on PE1:
router ospf 1
router-id 1.1.1.1
area 0
    interface Loopback0
    interface TenGigE0/0/0/1
router ospf 2
router-id 200.200.200.200
area 0
    interface Loopback1000
    interface tunnel-ip1
mpls ldp
router-id 200.200.200.200
interface tunnel-ip1

Configuration on PE2:
router ospf 1
router-id 3.3.3.3
area 0
    interface Loopback0
    interface TenGigE0/2/0/3
router ospf 2
router-id 201.201.201.201
area 0
    interface Loopback1000
    interface tunnel-ip1
mpls ldp
router-id 201.201.201.201
interface tunnel-ip1

Configuring a GRE Tunnel as the Preferred Path for Pseudowire: Example

This example shows how to configure a GRE tunnel as the preferred path for a pseudowire.

l2vpn
pw-class gre
encapsulation mpls
preferred-path interface tunnel-ip 1 fallback disable

Configuring a GRE Tunnel as Preferred Path for Pseudowire

Perform this task to configure a GRE tunnel as the preferred path for pseudowires.
SUMMARY STEPS

1. configure
2. l2vpn
3. pw-class { name }
4. encapsulation mpls
5. preferred-path { interface } { tunnel-ip value | tunnel-te value | tunnel-tp value } [ fallback disable ]
6. Use the commit or end command.

DETAILED STEPS

Step 1 configure

Example:
RP/0/RSP0/CPU0:router# configure
Enters the Global Configuration mode.

Step 2 l2vpn

Example:
RP/0/RSP0/CPU0:router(config)# l2vpn
Enters L2VPN configuration mode.

Step 3 pw-class { name }

Example:
RP/0/RSP0/CPU0:router(config-l2vpn)# pw-class gre
Configures the pseudowire class name.

Step 4 encapsulation mpls

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-pwc)# encapsulation mpls
Configures the pseudowire encapsulation to MPLS.

Step 5 preferred-path { interface } { tunnel-ip value | tunnel-te value | tunnel-tp value } [ fallback disable ]

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-pwc-encap-mpls)# preferred-path interface tunnel-ip 1 fallback disable
Configures preferred path tunnel settings. If the fallback disable configuration is used and once the TE/TP tunnel is configured as the preferred path goes down, the corresponding pseudowire can also go down.
Ensure that fallback is supported.

**Step 6**

Use the `commit` or `end` command.

- **commit** - Saves the configuration changes and remains within the configuration session.
- **end** - Prompts user to take one of these actions:
  - **Yes** - Saves configuration changes and exits the configuration session.
  - **No** - Exits the configuration session without committing the configuration changes.
  - **Cancel** - Remains in the configuration mode, without committing the configuration changes.

---

**Configuring VPLS LSM: Examples**

This section provides examples on how to configure the VPLS LSM solution:

### Enabling P2MP PW with RSVP-TE on a VFI: Example

This example shows how to enable P2MP PW with RSVP-TE on a VFI:

```conf
configure
l2vpn
bridge-group {bridge group name}
bridge-domain {bridge domain name}
vfi {vfi name}
multicast p2mp
transport rsvp-te
attribute-set p2mp-te set1
commit
```

### Enabling BGP Autodiscover Signaling for P2MP PW on a VFI: Example

This example shows how to enable BGP Autodiscover Signaling for P2MP PW on a VFI:

```conf
configure
l2vpn
bridge-group bg1
bridge-domain bd1
vfi vfi1
multicast p2mp
signaling protocol bgp
commit
```

### Configuring VPN ID: Example

This example shows how to configure a VPN ID:

```conf
l2vpn
bridge-group bg1
bridge-domain bd1
interface GigabitEthernet0/1/0/1
```
! interface GigabitEthernet0/1/0/0.2
! vfi 1
  vpn-id 1001
  autodiscovery bgp
    rd auto
    route-target 1.1.1.1
    signaling protocol bgp

Configuring IGMP Snooping: Example

This example shows how to configure IGMP snooping:

igmp snooping profile profile1
  [no] default-bridge-domain all enable
!
l2vpn
  bridge group bg1
  bridge domain bd1
    [no] igmp snooping disable
  !
!
!
Implementing IEEE 802.1ah Provider Backbone Bridge

This module provides conceptual and configuration information for IEEE 802.1ah Provider Backbone Bridge on Cisco ASR 9000 Series Routers. The IEEE 802.1ah standard (Ref [4]) provides a means for interconnecting multiple provider bridged networks to build a large scale end-to-end Layer 2 provider bridged network.

The Cisco ASR 9000 Series Aggregation Services Routers now supports a scenario when the provider backbone bridge is a VPLS network. You can now configure pseudowires in the PBB edge bridge domain and core bridge domain. In either type of bridge domain, the pseudowire functionality remains the same as in the native bridge domain.

Prerequisites for Implementing 802.1ah Provider Backbone Bridge

This prerequisite applies to implementing 802.1ah Provider Backbone Bridge:

- You must be in a user group associated with a task group that includes the proper task IDs. The command reference guides include the task IDs required for each command. If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.
- You must be familiar with the multipoint bridging concepts. Refer to the Implementing Multipoint Layer 2 Services module.

Information About Implementing 802.1ah Provider Backbone Bridge

To implement 802.1ah, you must understand these concepts:

Benefits of IEEE 802.1ah standard

The benefits of IEEE 802.1ah provider backbone bridges are as follows:

- Increased service instance scalability—Enables a service provider to scale the number of services (service VLANs or service instances) in a Provider Bridged Network (PBN).
• MAC address scalability—Encapsulates the customer packet, including MAC addresses, into a new ethernet frame with new MAC addresses (the backbone bridge MAC addresses). This eliminates the need for backbone core bridges to learn all MAC addresses of every customer and also eases the load on backbone edge bridges.

• VPLS pseudowire reduction and mesh scalability—The number of pseudowires in an IP/MPLS core can be significantly reduced. This is because a single VPLS service can now transport several customer service instances thereby allowing a fewer number of pseudowires in the IP/MPLS core to transport a large number of customer services.

• Layer 2 backbone traffic engineering—Enables explicit controls for Layer 2 traffic engineering by separating service discrimination function and moving it to the I-tags thereby leaving the backbone VLAN to be available for Layer 2 traffic engineering functions.

• Point-to-point service scalability and optimization—enables point-to-point service implementation that includes multiple options for service multiplexing as well as end point discovery.

• Backbone flood traffic reduction—Since there are fewer MAC addresses in the core of the network, the amount of flood traffic in the core network is reduced as there are fewer MAC addresses to be relearnt when MAC tables get flushed due to topology changes.

**IEEE 802.1ah Standard for Provider Backbone Bridging Overview**

The IEEE 802.1ah Provider Backbone Bridge feature encapsulates or decapsulates end-user traffic on a Backbone Edge Bridge (BEB) at the edge of the Provider Backbone Bridged Network (PBBN). A Backbone Core Bridge (BCB) based network provides internal transport of the IEEE 802.1ah encapsulated frames within the PBBN. The following figure shows a typical 802.1ah PBB network.

*Figure 37: IEEE 802.1ah Provider Backbone Bridge*

PB - provider bridge
The following figure shows a typical provider backbone network topology.

**Figure 38: Provider Back Bone Network Topology**

Backbone Edge Bridges (BEBs) can contain either an I-Component or a B-Component. The I-Component maps service VLAN identifiers (S-VIDs) to service instance identifiers (I-SIDs) and adds a provider backbone bridge (PBB) header without a backbone VLAN tag (B-Tag). The B-Component maps I-SIDs to backbone VIDs (B-VIDs) and adds a PBB header with a B-Tag.

The IEEE 802.1ah standard specifies these three types of BEBs:
• The B-BEB contains the B-Component of the MAC-in-MAC bridge. It validates the I-SIDs and maps the frames onto the backbone VLAN (B-VLAN). It also switches traffic based on the B-VLANS within the core bridge.

• The I-BEB contains the I-Component of the MAC-in-MAC bridge. It performs B-MAC encapsulation and inserts the I-SIDs based on the provider VLAN tags (S-tags), customer VLAN tags (C-tags), or S-tag/C-tag pairs.

• The IB-BEB contains one or more I-Components and a single B-Component interconnected through a LAN segment.

**Note**

Only IB-BEBs are supported on Cisco ASR 9000 Series Routers. Cisco IOS XR supports IB-BEB bridge type at the Edge node.

**IB-BEB**

The IB-BEB contains both the I-Component and the B-Component. The bridge selects the B-MAC and inserts the I-SID based on the provider VLAN tag (S-tag), the customer VLAN tag (C-tag), or both the S-tag and the C-tag. It validates the I-SIDs and it transmits and receives frames on the B-VLAN.

The IEEE 802.1ah on Provider Backbone Bridges feature supports all services mandated by the IEEE 802.1ah standard and extends the services to provides these additional functionalities:

• S-Tagged Service:
  ◦ In multiplexed environments each S-tag maps to an I-SID and may be retained or removed.
  ◦ In bundled environments multiple S-tags map to the same I-SID and the S-tags must be retained.

• C-Tagged Service:
  ◦ In multiplexed environments each C-tag maps to an I-SID and may be retained or removed.
  ◦ In bundled environments multiple C-tags map to the same I-SID and the C-tags must be retained.

• S/C-Tagged Service:
  ◦ In multiplexed environments each S-tag/C-tag pair maps to an I-SID. The S-tag or the S-tag/C-tag pair may be retained or removed.
  ◦ In bundled environments multiple S-tag/C-tags pairs map to the same I-SID and the S-tag/C-tag pair must be retained.

• Port-based Service
  ◦ A port-based service interface is delivered on a Customer Network Port (CNP). A port-based service interface may attach to a C-VLAN Bridge, 802.1d bridge, router or end-station. The service provided by this interface forwards all frames without an S-Tag over the backbone on a single backbone service instance. A port-based interface discards all frames with an S-Tag that have non-null VLAN IDs.
This example shows how to configure a port-based service:

```plaintext
interface GigabitEthernet0/0/0/10.100 l2transport
encapsulation untagged
--> Creates an EFP for untagged frames.

interface GigabitEthernet0/0/0/10.101 l2transport
encapsulation dot1ad priority-tagged
--> Creates an EFP for null S-tagged frames.

interface GigabitEthernet0/0/0/10.102 l2transport
encapsulation dot1q priority-tagged
--> Creates an EFP for null C-tagged frames:

interface GigabitEthernet0/0/0/10.103 l2transport
encapsulation dot1q any
--> Creates an EFP for C-tagged frames:
```

**Note** To configure a port-based service, all the above EFPs must be added to the same edge bridge domain.
The following figure shows the PBB bridge component topology on the Cisco ASR 9000 Series Routers.

**Figure 39: PBB Bridge Component Topology on Cisco ASR 9000 Series Routers**

---

**Multiple I-SID Registration Protocol Lite**

The 802.1Qbe—Multiple I-SID Registration Protocol (MIRP) standard provides the ability to flush learned MAC address registration entries held in the filtering database of an I-component on a per I-SID basis. The backbone service instance identifier (I-SID) is a field in the backbone service instance tag which identifies the backbone service instance of a frame. MIRP defines mechanisms for I-SID flushing, and has the required capabilities to handle topology changes that occur in networks attached to a provider backbone bridged network. A backbone edge bridge (BEB) signals to other potentially affected BEBs, the need to alter certain learned associations between customer MAC addresses and backbone MAC addresses. In the absence of MIRP, customer connections across a provider backbone network can take several minutes to restore connectivity after a topology change in an access network.

In prior releases, PBB traffic was dropped for a MAC aging cycle when bridge forwarding topology changes occurred (due to unavailable ports or spanning tree topology changes) in a PBB edge bridge domain. This resulted in severe limitations for the use of PBB bridges.

Cisco ASR 9000 Series Aggregation Services Routers now support a simplified implementation of the MIRP protocol known as the Multiple I-SID Registration Protocol Lite (MIRP-Lite). The MIRP-Lite feature enables detection of a topology change at a site. A specially defined packet is flooded to all remote edge sites of the PBB network when a site detects a topology change. At the sender site, I-SID of the I-component is placed
in the I-TAG of the frame header to specify the I-SID that needs a MAC flush. At the receiver site, each PBB edge switch performs I-SID checking. If the I-SID matches one of the I-components, the MAC in the I-component is flushed.

The use of MIRP in 802.1ah networks is illustrated in the following figure.

**Figure 40: MIRP in 802.1ah Networks**

Device DHD1 is dual-homed to two 802.1ah backbone edge bridges (BEB1 and BEB2). Assume that initially the primary path is through BEB1. In this configuration BEB3 learns that the host behind DHD1 (with MAC address CM1) is reachable via the destination B-MAC M1. If the link between DHD1 and BEB1 fails and the host behind DHD1 remains inactive, the MAC cache tables on BEB3 still refer to the BEB1 MAC address even though the new path is now via BEB2 with B-MAC address M2. Any bridged traffic destined from the host behind DHD2 to the host behind DHD1 is wrongly encapsulated with B-MAC M1 and sent over the MAC tunnel to BEB1, where the traffic drops.

To circumvent the dropping of traffic when the link between DHD1 and BEB1 fails, BEB2 performs two tasks:

- Flushes its own MAC address table for the service or services.
- Requests the remote PE that receives the MIRP packet to clear its own MAC table. The MIRP message is transparent to the backbone core bridges (BCBs). The MIRP message is processed on a BEB because only BCBs learn and forward, based on B-MAC addresses and they are transparent to C-MAC addresses.

**Note**

MIRP triggers C-MAC address flushing for both native 802.1ah and PBB over VPLS.
The following figure shows the operation of the MIRP.

**Figure 41: MIRP Operation**

---

**Provider Backbone Bridging Ethernet VPN**

The Provider Backbone Bridging Ethernet VPN (PBB-EVPN) is a next generation L2VPN solution that addresses resiliency and forwarding policy requirements. This feature also introduces advanced multihoming options, support for multipath and user-defined BGP policy capabilities to Ethernet L2VPNs. PBB-EVPN uses BGP for MAC address distribution and learning over the packet-switched network (PSN). PBB-EVPN is a combination of the capabilities of PBB and Ethernet VPN that addresses these Carrier Ethernet and data center interconnect requirements:

- All-active Redundancy and Load Balancing
- Simplified Provisioning and Operation
• Optimal Forwarding
• Fast Convergence
• MAC Address Scalability

Ethernet VPN

Ethernet Virtual Private Network (EVPN) is a solution for secure and private connectivity of multiple sites within an organization. The EVPN service extends the benefits of Ethernet technology to the Wide Area Network (WAN). This service is delivered over MPLS networks.

EVPN allows you to manage routing over a virtual private network, providing complete control and security. EVPN introduces a solution for multipoint L2VPN services, with advanced multi-homing capabilities, using BGP for distributing customer or client MAC address reachability information over the MPLS/IP network. EVPN advertises each customer MAC address as BGP routes, therefore allowing BGP policy control over MAC addresses.

Figure 42: MAC Distribution in BGP (EVPN)

In the above figure, the provider edge (PE) routers run multi-protocol BGP to advertise and learn MAC addresses over MPLS. The customer MAC addresses are learnt in the data plane over attachment circuits (links connecting customer devices to the PEs). Then, the MAC addresses are distributed over MPLS using BGP with an MPLS label identifying the EVPN instance.
PBB-EVPN Overview

The PBB-EVPN solution combines Ethernet Provider Backbone Bridging (PBB - IEEE 802.1ah) with Ethernet VPN where, PEs perform as PBB Backbone Edge Bridge (BEB). The PEs receive 802.1Q Ethernet frames from their attachment circuits. These frames are encapsulated in the PBB header and forwarded over the IP/MPLS core. On the egress side (EVPN PE), the PBB header is removed after MPLS disposition, and the original 802.1Q Ethernet frame is delivered to the customer equipment.

Figure 43: PBB-EVPN Network

Data plane address learning from Core Local C-MAC to local B-MAC binding

Data plane address learning from Core Local C-MAC to local B-MAC binding

The PE routers perform these functions:

- Learns customer or client MAC addresses (C-MACs) over the attachment circuits in the data-plane, per normal bridge operation.

- Learns remote C-MAC to backbone MAC (B-MAC) bindings in the data-plane from traffic ingress from the core.

- Advertises local B-MAC address reachability information in BGP to all other PE nodes in the same set of service instances. Note that every PE has a set of local B-MAC addresses that uniquely identify the device.

- Builds a forwarding table from the received remote BGP advertisements, associating remote B-MAC addresses with remote PE IP addresses.

PBB-EVPN scales well for large network with millions of customer MAC addresses by constraining customer MAC address in access. Only B-MAC addresses are advertised in core, making the number of BGP routes exchanged manageable.

For PBB EVPN, the B-MAC flush is per I-SID per Ethernet VPN Instance (EVI).
**EVPN Instance**

E-VPN Instance (EVI) identifies a VPN in the MPLS/IP network. There can only be one EVI per core bridge.

**Ethernet Segment**

Ethernet Segment is a site connected to one or more PEs. The Ethernet Segment could be a single device (i.e. Customer Edge (CE)) or an entire network, such as:

- Single-Homed Device (SHD)
- Multi-Homed Device (MHD) using Ethernet Multi-chassis Link Aggregation Group
- Single-Homed Network (SHN)
- Multi-Homed Network (MHN)

The Ethernet segment is uniquely identified by a 10-byte global Ethernet Segment Identifier (ESI).

The following figure illustrates an example of Ethernet segment and ESI.

**Figure 44: Ethernet Segment**

![Ethernet Segment Diagram]

**PBB-EVPN BGP Routes**

PBB-EVPN defines a single new BGP network layer reachability information (NLRI) used to advertise different types of routes along with new attributes.

**Designated Forwarder Election**

The Designated Forwarder (DF) election mechanism is used to determine a designated forwarder in dual-homed or multi-homed devices or networks. The election is performed on a per service basis. The DF filtering function for MHN differs from that for MHD in:

- **Directionality**—DF filtering for MHN is applied for traffic both ingress and egress on the access-facing Ethernet interfaces; whereas, DF filtering for MHD is applied only to traffic that egress the access-facing interfaces.
- **Traffic Type**—DF filtering for MHN impacts both unicast as well as flooded multi-destination traffic; whereas, DF filtering for MHD only applies to flooded multi-destination traffic.
The following figure shows the various DF filtering rules for MHN and MHD.

**Figure 45: DF Filtering Comparison for MHN/MHD**

**Access Auto-Sensing**

PEs connected to a multi-homed or dual-homed device may support active-active per flow also known as flow-based load balancing. PE services CEs via physical or bundle ports. An Ethernet segment identifier is assigned per port. This value is calculated from the connected CE using information such as, CE system priority, CE system ID and CE port key. The PE must auto-detect the access topology to determine the type of load balancing. The load balancing could be active-active per flow load-balancing, per service load-balancing or simply no load balancing.

**MMRP for PBB VPLS Flood Optimization**

In a PBB network, traffic (unknown unicast, multicast, or broadcast) is flooded to all the PE devices in the network even if the devices do not host the service instance to which the traffic is destined.

The Multiple MAC Registration Protocol (MMRP) for PBB VPLS Flood Optimization feature optimizes the impact of the flooded traffic on PE devices by sending the traffic only to the PE devices interested in a particular service instance.

In a PBB over VPLS network, traffic between the PE devices flows over MPLS pseudo-wires that connect all the PE devices in a full mesh network topology.

Provider Back Bone Network Topology figure illustrates a typical 802.1ah PBB network.
For every I-SID (Service Instance VLAN ID) there is a corresponding multicast MAC address called the group B-MAC address, which is derived based on the I-SID. The group B-MAC address is used as the destination address in the outer MAC header when propagating flooded traffic across the provider backbone.

The MMRP is used by the PE devices to inform each other about the set of group B-MAC addresses corresponding to the I-SIDs of the service instances they host. This enables each device to determine which set of pseudo-wires flooded traffic should be forwarded on, that is, those pseudo-wires on which an MMRP registration has been received for the group B-MAC address corresponding to the I-SID.

**Note**
The PBB-VPLS flood optimization feature is enabled only on PBB-VPLS network and not on PBB over Ethernet network.

### Configuring PBB-VPLS Flood Optimization

To configure the PBB-VPLS flood optimization feature, do the following:

#### Enabling PBB-VPLS Flood Optimization on PBB Core Bridge

Perform this task to enable PBB-VPLS flood optimization on PBB core bridge.

**SUMMARY STEPS**

1. `configure`
2. `l2vpn`
3. `bridge group bridge-group-name`
4. `bridge-domain domain-name`
5. `pbb core`
6. `mmrp-flood-optimization`
7. Use the `commit` or `end` command.

**DETAILED STEPS**

**Step 1**

`configure`

**Example:**

```
RP/0/RSP0/CPU0# configure
```

Enters Global Configuration mode.

**Step 2**

`l2vpn`

**Example:**

```
RP/0/RSP0/CPU0# configure l2vpn
```

Enters L2VPN configuration mode.
Step 3  bridge group bridge-group-name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn)# bridge group pbb

Enters configuration mode for the named bridge group. This command creates a new bridge group or modifies the existing bridge group if it already exists. A bridge group organizes bridge domains.

Step 4  bridge-domain domain-name

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bg)# bridge-domain pbb-core

Enters configuration mode for the named bridge domain. This command creates a new bridge domain or modifies the existing bridge domain if it already exists.

Step 5  pbb core

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# pbb core

Configures the bridge domain as PBB core and enters the PBB core configuration submode. This command also creates an internal port known as Customer bridge port (CBP). All the interfaces (bridge ports) under this bridge domain are treated as the provider network ports (PNP).

Step 6  mmrp-flood-optimization

Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-pbb-core)# mmrp-flood-optimization

Enables the flood optimization for PBB over VPLS feature on the core bridge.

Step 7  Use the commit or end command.
commit - Saves the configuration changes and remains within the configuration session.
end - Prompts user to take one of these actions:
• Yes - Saves configuration changes and exits the configuration session.
• No - Exits the configuration session without committing the configuration changes.
• Cancel - Remains in the configuration mode, without committing the configuration changes.

---

Configuring Generic MRP Protocol Parameters

Perform this task to configure the generic MRP protocol parameters for PBB-VPLS flood optimization.
SUMMARY STEPS

1. configure
2. mmrp-flood-optimization
3. (Optional) periodic transmit interval seconds
4. (Optional) join-time milliseconds
5. (Optional) leaveall-time seconds
6. (Optional) leave-time seconds
7. (Optional) flood-time seconds
8. Use the commit or end command.

DETAILED STEPS

Step 1 configure

Example:
RP/0/RSP0/CPU0:router# configure

Enters the Global Configuration mode.

Step 2 mmrp-flood-optimization

Example:
RP/0/RSP0/CPU0:router(config)# mmrp-flood-optimization

Enables the flood optimization for PBB over VPLS feature on the core bridge.

Step 3 (Optional) periodic transmit interval seconds

Example:
RP/0/RSP0/CPU0:router(config-mmrp-flood-opt)# periodic transmit interval 3

Enables periodic Multiple MAC Registration Protocol Data Units (MMRPDUs).

Step 4 (Optional) join-time milliseconds

Example:
RP/0/RSP0/CPU0:router(config-mmrp-flood-opt)# join time interval 300

Sets the join time for all active ports.

Step 5 (Optional) leaveall-time seconds

Example:
RP/0/RSP0/CPU0:router(config-mmrp-flood-opt)# leaveall-time 10

Sets the leave all time for all active ports.
Step 6  (Optional) leave-time seconds

Example:
RP/0/RSP0/CPU0:router(config-mmrp-flood-opt)# leave-time 40
Sets the leave time for all active ports.

Step 7  (Optional) flood-time seconds

Example:
RP/0/RSP0/CPU0:router(config-mmrp-flood-opt)# flood-time 1000
Enables flooding of traffic to the entire core bridge when the PBB-VPLS Flood Optimization feature is enabled on the core bridge.

Step 8  Use the commit or end command.
commit - Saves the configuration changes and remains within the configuration session.
end - Prompts user to take one of these actions:
  • Yes - Saves configuration changes and exits the configuration session.
  • No - Exits the configuration session without committing the configuration changes.
  • Cancel - Remains in the configuration mode, without committing the configuration changes.

How to Implement 802.1ah Provider Backbone Bridge

This section contains these procedures:

Restrictions for Implementing 802.1ah Provider Backbone Bridge

The following features are not supported:
  • Cross-connect based point to point services over MAC-in-MAC
  • One Edge bridge to multiple Core bridge mapping
  • I type backbone edge bridge (I-BEB) and B type backbone edge bridge (B-BEB)
  • IEEE 802.1ah over VPLS
  • Multiple source B-MAC addresses per chassis
  • Direct encapsulation of 802.1ah formatted packets natively over an MPLS LSP encapsulation

The following additional restriction applies when implementing Provider Backbone Bridge Ethernet VPN (PBB-EVPN):
• The Provider Edge and Route Reflector routers must run software supporting the same IETF draft version of L2VPN Ethernet VPN (EVPN). Due to the differences in BGP Network Layer Reachability Information (NLRI) encoding, later draft versions are not backward compatible with earlier ones. The following table shows the supported draft for various Cisco IOS XR software releases.

<table>
<thead>
<tr>
<th>Cisco IOS XR software release</th>
<th>Supported L2VPN EVPN draft version</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>draft-ietf-l2vpn-evpn-04</td>
</tr>
<tr>
<td>5.1.1 and older releases</td>
<td>✓</td>
</tr>
<tr>
<td>5.2.0</td>
<td>✓</td>
</tr>
<tr>
<td>5.1.2 and later releases except 5.2.0</td>
<td>—</td>
</tr>
</tbody>
</table>

### Configuring Ethernet Flow Points on CNP and PNP Ports

Perform this task to configure an Ethernet flow point (EFP) on the customer network port (CNP) or the provider network port (PNP).

#### SUMMARY STEPS

1. `configure`
2. `interface type interface-path-id.subinterface l2transport`
3. `encapsulation dot1q vlan-id` or `encapsulation dot1ad vlan-id` or `encapsulation dot1ad vlan-id dot1q vlan-id`
4. Use the `commit` or `end` command.

#### DETAILED STEPS

**Step 1**
`configure`

**Example:**

```bash
RP/0/RSP0/CPU0:router# configure
```

Enters the Global Configuration mode.

**Step 2**
`interface type interface-path-id.subinterface l2transport`

**Example:**

```bash
RP/0/RSP0/CPU0:router(config)# interface GigabitEthernet0/0/0/10 l2transport
```

Configures an interface for L2 switching.

**Step 3**
`encapsulation dot1q vlan-id` or `encapsulation dot1ad vlan-id` or `encapsulation dot1ad vlan-id dot1q vlan-id`
Example:

RP/0/RSP0/CPU0:router(config-subif)# encapsulation dot1q 100
or
encapsulation dot1ad 100
or
encapsulation dot1ad 100 dot1q 101

Assigns the matching VLAN ID and Ethertype to the interface

Step 4

Use the commit or end command.

commit - Saves the configuration changes and remains within the configuration session.
end - Prompts user to take one of these actions:

• Yes - Saves configuration changes and exits the configuration session.
• No - Exits the configuration session without committing the configuration changes.
• Cancel - Remains in the configuration mode, without committing the configuration changes.

Configuring PBB Edge Bridge Domain and Service Instance ID

Perform this task to configure a PBB edge domain and the service ID.

To configure the PBB feature, login with admin user privileges and issue the hw-module profile feature l2 command to select an ASR 9000 Ethernet line card ucode version that supports the PBB feature. The PBB feature will not be supported on the ASR 9000 Ethernet line card unless you make this configuration. For more information on configuring the feature profile, refer to the Cisco ASR 9000 Series Aggregation Services Router System Management Configuration Guide.

SUMMARY STEPS

1. configure
2. l2vpn
3. bridge group bridge-group-name
4. bridge-domain domain-name
5. interface type interface-path-id.subinterface
6. pbb edge i-sid service-id core-bridge core-bridge-name
7. Use the commit or end command.

DETAILED STEPS

Step 1 configure
Configuring PBB Edge Bridge Domain and Service Instance ID

Example:
RP/0/RSP0/CPU0:router# configure

Enters the Global Configuration mode.

Step 2 l2vpn
Example:
RP/0/RSP0/CPU0:router(config)# l2vpn

Enters L2VPN configuration mode.

Step 3 bridge group bridge-group-name
Example:
RP/0/RSP0/CPU0:router(config-l2vpn)# bridge group pbb

Enters configuration mode for the named bridge group. This command creates a new bridge group or modifies the existing bridge group if it already exists. A bridge group organizes bridge domains.

Step 4 bridge-domain domain-name
Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bg)# bridge-domain pbb-edge

Enters configuration mode for the named bridge domain. This command creates a new bridge domain or modifies the existing bridge domain, if it already exists.

Step 5 interface type interface-path-id.subinterface
Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# interface GigabitEthernet0/5/0/0.20

Assigns the matching VLAN ID and Ethertype to the interface. This EFP is considered as the CNP for the Edge bridge.

Step 6 pbb edge i-sid service-id core-bridge core-bridge-name
Example:
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# pbb edge i-sid 1000 core-bridge pbb-core

Configures the bridge domain as PBB edge with the service identifier and the assigned core bridge domain, and enters the PBB edge configuration submode.

This command also creates the Virtual instance port (VIP) that associates the PBB Edge bridge domain to the specified Core bridge domain.

All the interfaces (bridge ports) under this bridge domain are treated as the customer network ports (CNP).

Step 7 Use the commit or end command.
commit - Saves the configuration changes and remains within the configuration session.
end - Prompts user to take one of these actions:
**SUMMARY STEPS**

1. `configure`
2. `l2vpn`
3. `bridge group group-name`
4. `bridge-domain domain-name`
5. `interface type interface-path-id.subinterface`
6. `pbb core`
7. Use the `commit` or `end` command.

**DETAILED STEPS**

**Step 1**
`configure`

**Example:**
```
RP/0/RSP0/CPU0:Router# configure
```
Enters Global Configuration mode.

**Step 2**
`l2vpn`

**Example:**
```
RP/0/RSP0/CPU0:Router(config)# l2vpn
```
Enters L2VPN configuration mode.

**Step 3**
`bridge group group-name`

**Example:**
```
RP/0/RSP0/CPU0:Router(config-l2vpn)# bridge group pbb
```
Enters configuration mode for the named bridge group. This command creates a new bridge group or modifies the existing bridge group, if it already exists. A bridge group organizes bridge domains.

**Step 4**
`bridge-domain domain-name`
Example:

RP/0/RSP0/CPU0:router(config-l2vpn-bg)# bridge-domain pbb-core

Enters configuration mode for the named bridge domain. This command creates a new bridge domain or modifies the existing bridge domain if it already exists.

Step 5

interface type interface-path-id.subinterface

Example:

RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# interface GigabitEthernet0/5/0/0.20

Assigns the matching VLAN ID and Ethertype to the interface.

Step 6

pbb core

Example:

RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# pbb core

Configures the bridge domain as PBB core and enters the PBB core configuration submode. This command also creates an internal port known as Customer bridge port (CBP). All the interfaces (bridge ports) under this bridge domain are treated as the provider network ports (PNP).

Step 7

Use the commit or end command.

commit - Saves the configuration changes and remains within the configuration session.

dead - Prompts user to take one of these actions:

• Yes - Saves configuration changes and exits the configuration session.

• No - Exits the configuration session without committing the configuration changes.

• Cancel - Remains in the configuration mode, without committing the configuration changes.

Configuring Backbone VLAN Tag under the PBB Core Bridge Domain

Perform this task to configure the backbone VLAN tag under the PBB core bridge domain.
SUMMARY STEPS

1. configure
2. l2vpn
3. bridge group bridge-group-name
4. bridge-domain domain-name
5. interface type interface-path-id.subinterface
6. interface type interface-path-id.subinterface
7. pbb core
8. rewrite ingress tag push dot1ad vlan-id symmetric
9. Use the commit or end command.

DETAILED STEPS

Step 1  configure

Example:

RP/0/RSP0/CPU0:router# configure

Enters the Global Configuration mode.

Step 2  l2vpn

Example:

RP/0/RSP0/CPU0:router(config)# l2vpn

Enters L2VPN configuration mode.

Step 3  bridge group bridge-group-name

Example:

RP/0/RSP0/CPU0:router(config-l2vpn)# bridge group pbb

Enters configuration mode for the named bridge group. This command creates a new bridge group or modifies the existing bridge group if it already exists. A bridge group organizes bridge domains.

Step 4  bridge-domain domain-name

Example:

RP/0/RSP0/CPU0:router(config-l2vpn-bg)# bridge-domain pbb-core

Enters configuration mode for the named bridge domain. This command creates a new bridge domain or modifies the existing bridge domain if it already exists.

Step 5  interface type interface-path-id.subinterface
Example:

RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# interface GigabitEthernet0/5/0/0.20

Assigns the matching VLAN ID and Ethertype to the interface.

**Step 6**

**interface** type interface-path-id. subinterface  
Example:

RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-ac)# interface GigabitEthernet0/5/0/1.15

Adds an interface to a bridge domain that allows packets to be forwarded and received from other interfaces that are part of the same bridge domain. The interface now becomes an attachment circuit on this bridge domain.

**Step 7**

**pbb core**  
Example:

RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# pbb core

Configures the bridge domain as PBB core and enters the PBB core configuration submode.  
This command also creates an internal port known as Customer bridge port (CBP).  
All the interfaces (bridge ports) under this bridge domain are treated as the provider network ports (PNP).

**Step 8**

**rewrite ingress tag push dot1ad vlan-id symmetric**  
Example:

RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-pbb-core)# end

Configures the backbone VLAN tag in the Mac-in-MAC frame and also, sets the tag rewriting policy.

**Note** All PNPs in a Core bridge domain use the same backbone VLAN.

**Step 9**

Use the **commit** or **end** command.  
**commit** - Saves the configuration changes and remains within the configuration session.  
**end** - Prompts user to take one of these actions:

- **Yes** - Saves configuration changes and exits the configuration session.
- **No** - Exits the configuration session without committing the configuration changes.
- **Cancel** - Remains in the configuration mode, without committing the configuration changes.

---

**Configuring Backbone Source MAC Address**

The backbone source MAC address (B-SA) is a unique address for a backbone network. Each Cisco ASR 9000 Series Router has one backbone source MAC address. If B-SA is not configured, then the largest MAC in the EEPROM is used as the PBB B-SA.
The backbone source MAC address configuration is optional. If you do not configure the backbone source MAC address, the Cisco ASR 9000 Series Routers allocate a default backbone source MAC address from the chassis backplane MAC pool.

Perform this task to configure the backbone source MAC address.

**SUMMARY STEPS**

1. `configure`
2. `l2vpn`
3. `pbb`
4. `backbone-source-address mac-address`
5. Use the `commit` or `end` command.

**DETAILED STEPS**

**Step 1** `configure`

Example:

```
RP/0/RSP0/CPU0:router# configure
```

Enters the Global Configuration mode.

**Step 2** `l2vpn`

Example:

```
RP/0/RSP0/CPU0:router(config)# l2vpn
```

Enters L2VPN configuration mode.

**Step 3** `pbb`

Example:

```
RP/0/RSP0/CPU0:router(config-l2vpn)# pbb
```

Enters PBB configuration mode.

**Step 4** `backbone-source-address mac-address`

Example:

```
RP/0/RSP0/CPU0:router(config-l2vpn-pbb)# backbone-source-address 0045.1200.04
```

Configures the backbone source MAC address.

**Step 5** Use the `commit` or `end` command.

`commit` - Saves the configuration changes and remains within the configuration session.

`end` - Prompts user to take one of these actions:
• **Yes** - Saves configuration changes and exits the configuration session.
• **No** - Exits the configuration session without committing the configuration changes.
• **Cancel** - Remains in the configuration mode, without committing the configuration changes.

---

## Configuring Unknown Unicast Backbone MAC under PBB Edge Bridge Domain

Perform this task to configure the unknown unicast backbone MAC under the PBB edge bridge domain.

### SUMMARY STEPS

1. `configure`
2. `l2vpn`
3. `bridge group bridge-group-name`
4. `bridge-domain domain-name`
5. `interface type interface-path-id.subinterface`
6. `pbb edge i-sid service-id core-bridge core-bridge-name`
7. `unknown-unicast-bmac mac-address`
8. Use the `commit` or `end` command.

### DETAILED STEPS

**Step 1**
`configure`

**Example:**
```
RP/0/RSP0/CPU0:router# configure
```
Enters the Global Configuration mode.

**Step 2**
`l2vpn`

**Example:**
```
RP/0/RSP0/CPU0:router(config)# l2vpn
```
Enters L2VPN configuration mode.

**Step 3**
`bridge group bridge-group-name`

**Example:**
```
RRP/0/RSP0/CPU0:router(config-l2vpn)# bridge group pbb
```
Enters configuration mode for the named bridge group. This command creates a new bridge group or modifies the existing bridge group if it already exists. A bridge group organizes bridge domains.
Step 4  bridge-domain domain-name
Example:

RP/0/RSP0/CPU0:router(config-l2vpn-bg)# bridge-domain pbb-edge

Enters configuration mode for the named bridge domain. This command creates a new bridge domain or modifies the existing bridge domain if it already exists.

Step 5  interface type interface-path-id.subinterface
Example:

RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# interface GigabitEthernet0/5/0/0.20

Assigns the matching VLAN ID and Ethertype to the interface.

Step 6  pbb edge i-sid service-id  core-bridge core-bridge-name
Example:

RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# pbb edge i-sid 1000 core-bridge pbb-core

Configures the bridge domain as PBB edge with the service identifier and the assigned core bridge domain and enters the PBB edge configuration submode.

This command also creates the Virtual instance port (VIP) that associates the PBB Edge bridge domain to the specified Core bridge domain.

All the interfaces (bridge ports) under this bridge domain are treated as the customer network ports (CNP).

Step 7  unknown-unicast-bmac mac-address
Example:

RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-pbb-edge)# unknown-unicast-bmac 1.1.1

Configures unknown unicast backbone MAC address.

Note  On Trident line cards, once you configure the unknown unicast BMAC, the BMAC is used to forward customer traffic with multicast, broadcast and unknown unicast destination MAC address.

Step 8  Use the commit or end command.
commit - Saves the configuration changes and remains within the configuration session.
end  - Prompts user to take one of these actions:

- Yes - Saves configuration changes and exits the configuration session.
- No  - Exits the configuration session without committing the configuration changes.
- Cancel - Remains in the configuration mode, without committing the configuration changes.
Configuring Static MAC addresses under PBB Edge Bridge Domain

Perform this task to configure the static MAC addresses under the PBB edge bridge domain.

SUMMARY STEPS

1. `configure`
2. `l2vpn`
3. `bridge group bridge-group-name`
4. `bridge-domain domain-name`
5. `interface type interface-path-id.subinterface`
6. `interface type interface-path-id.subinterface`
7. `pbb edge i-sid service-id core-bridge core-bridge-name`
8. `static-mac-address cda-mac-address bmac bda-mac-address`
9. Use the `commit` or `end` command.

DETAILED STEPS

Step 1 `configure`

Example:
```
RP/0/RSP0/CPU0:router# configure
```
Enters the Global Configuration mode.

Step 2 `l2vpn`

Example:
```
RP/0/RSP0/CPU0:router(config)# l2vpn
```
Enters L2VPN configuration mode.

Step 3 `bridge group bridge-group-name`

Example:
```
RP/0/RSP0/CPU0:router(config-l2vpn)#bridge group pbb
```
Enters configuration mode for the named bridge group. This command creates a new bridge group or modifies the existing bridge group if it already exists. A bridge group organizes bridge domains.

Step 4 `bridge-domain domain-name`

Example:
```
RP/0/RSP0/CPU0:router(config-l2vpn-bg)#bridge-domain pbb-edge
```
Enters configuration mode for the named bridge domain. This command creates a new bridge domain or modifies the existing bridge domain if it already exists.
Step 5  interface type interface-path-id.subinterface  
Example:  

RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)#interface GigabitEthernet0/5/0/0.20

Assigns the matching VLAN ID and Ethertype to the interface.

Step 6  interface type interface-path-id.subinterface  
Example:  

RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-ac)#interface GigabitEthernet0/5/0/1.15

Adds an interface to a bridge domain that allows packets to be forwarded and received from other interfaces that are part of the same bridge domain. The interface now becomes an attachment circuit on this bridge domain.

Step 7  pbb edge i-sid service-id core-bridge core-bridge-name  
Example:  

RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)#pbb edge i-sid 1000 core-bridge pbb-core

Configures the bridge domain as PBB edge with the service identifier and the assigned core bridge domain and enters the PBB edge configuration submode.  
This command also creates the Virtual instance port (VIP) that associates the PBB Edge bridge domain to the specified Core bridge domain.  
All the interfaces (bridge ports) under this bridge domain are treated as the customer network ports (CNP).

Step 8  static-mac-address cda-mac-address bmac bda-mac-address  
Example:  

RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-pbb-edge)#static-mac-address 0033.3333.3333 bmac 0044.4444.4444

Configures the static CMAC to BMAC mapping under the PBB Edge submode.

Step 9  Use the commit or end command.  
commit - Saves the configuration changes and remains within the configuration session.  
end - Prompts user to take one of these actions:  
  • Yes - Saves configuration changes and exits the configuration session.  
  • No - Exits the configuration session without committing the configuration changes.  
  • Cancel - Remains in the configuration mode, without committing the configuration changes.

Configuring PBB VPLS  
Perform these tasks to configure PBB VPLS:

Implementing IEEE 802.1ah Provider Backbone Bridge  
Configuring PBB VPLS
Configuring Access Pseudowire in I-Component

Perform this task to configure the static MAC addresses under the PBB edge bridge domain.

SUMMARY STEPS

1. `configure`
2. `l2vpn`
3. `bridge group bridge-group-name`
4. `bridge-domain domain-name`
5. `mac withdraw state-down`
6. `exit`
7. `interface type interface-path-id.subinterface`
8. `interface type interface-path-id.subinterface`
9. `neighbor { A.B.C.D } pw-id value`
10. `exit`
11. `pbb edge i-sid service-id core-bridge core-bridge-name`
12. Use the `commit` or `end` command.

DETAILED STEPS

Step 1  `configure`

Example:

```
RP/0/RSP0/CPU0:router# configure
```

Enters the Global Configuration mode.

Step 2  `l2vpn`

Example:

```
RP/0/RSP0/CPU0:router(config)# l2vpn
```

Enters L2VPN configuration mode.

Step 3  `bridge group bridge-group-name`

Example:

```
RP/0/RSP0/CPU0:router(config-l2vpn)# bridge group pbb
```

Enters bridge group configuration mode. This command creates a new bridge group or modifies the existing bridge group if it already exists. A bridge group organizes bridge domains.

Step 4  `bridge-domain domain-name`

Example:

```
RP/0/RSP0/CPU0:router(config-l2vpn-bg)# bridge-domain pbb-edge
```

Enters bridge domain configuration mode. This command creates a new bridge domain or modifies the existing bridge domain if it already exists.
Step 5  `mac withdraw state-down`
Example:
```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# mac withdraw state-down
```
(Optional) Enables MAC withdrawal.

Step 6  `exit`
Example:
```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-mac)# exit
```
Exits the current configuration mode.

Step 7  `interface type interface-path-id.subinterface`
Example:
```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# interface GigabitEthernet0/5/0/0.20
```
Assigns the matching VLAN ID and Ethertype to the interface.

Step 8  `interface type interface-path-id.subinterface`
Example:
```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-ac)# interface GigabitEthernet0/5/0/1.15
```
Adds an interface to a bridge domain that allows packets to be forwarded and received from other interfaces that are part of the same bridge domain. The interface now becomes an attachment circuit on this bridge domain.

Step 9  `neighbor { A.B.C.D } pw-id value`
Example:
```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# neighbor 10.1.1.2 pw-id 1000
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-pw)#
```
Adds an access pseudowire port to a bridge domain.
- Use the `A.B.C.D` argument to specify the IP address of the cross-connect peer.  
  **Note** `A.B.C.D` can be a recursive or non-recursive prefix.
- Use the `pw-id` keyword to configure the pseudowire ID and ID value. The range is 1 to 4294967295.

Step 10  `exit`
Example:
```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-pw)# exit
```
Exits the current configuration mode.

Step 11  `pbb edge i-sid service-id core-bridge core-bridge-name`
Example:
```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# pbb edge i-sid 1000 core-bridge pbb-core
```
Configures the bridge domain as PBB edge with the service identifier and the assigned core bridge domain and enters the PBB edge configuration submode.
All the interfaces (bridge ports) under this bridge domain are treated as the customer network ports (CNP).

**Step 12**

Use the **commit** or **end** command.

- **commit** - Saves the configuration changes and remains within the configuration session.
- **end** - Prompts user to take one of these actions:
  - **Yes** - Saves configuration changes and exits the configuration session.
  - **No** - Exits the configuration session without committing the configuration changes.
  - **Cancel** - Remains in the configuration mode, without committing the configuration changes.

### Configuring Core Pseudowire in B-Component

Perform this task to configure the static MAC addresses under the PBB edge bridge domain.

**SUMMARY STEPS**

1. **configure**
2. **l2vpn**
3. **bridge group** `bridge-group-name`
4. **bridge-domain** `domain-name`
5. **vfi** `{ vfi-name }`
6. **neighbor** `{ A.B.C.D } { pw-id value }`
7. Use the **commit** or **end** command.

**DETAILED STEPS**

**Step 1**

**configure**

Example:

```
RP/0/RSP0/CPU0:router# configure
```

Enters the Global Configuration mode.

**Step 2**

**l2vpn**

Example:

```
RP/0/RSP0/CPU0:router(config)# l2vpn
```

Enters L2VPN configuration mode.

**Step 3**

**bridge group** `bridge-group-name`
Example:

```
RP/0/RSP0/CPU0:router(config-l2vpn)#bridge group pbb
```

Enters configuration mode for the named bridge group. This command creates a new bridge group or modifies the existing bridge group if it already exists. A bridge group organizes bridge domains.

**Step 4**  
**bridge-domain**  
*domain-name*

Example:

```
RP/0/RSP0/CPU0:router(config-l2vpn-bg)#bridge-domain pbb-core
```

Enters configuration mode for the named bridge domain. This command creates a new bridge domain or modifies the existing bridge domain if it already exists.

**Step 5**  
**vfi**  
*{ vfi-name }*

Example:

```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# vfi PBB-core-vfi
```

Configures the virtual forwarding interface (VFI) parameters and enters L2VPN bridge group bridge domain VFI configuration mode.

- Use the *vfi-name* argument to configure the name of the specified virtual forwarding interface.

**Step 6**  
**neighbor**  
*{ A.B.C.D }*  
*{ pw-id }*

Example:

```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# neighbor 10.1.1.2 pw-id 1000
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-pw)#
```

Adds an access pseudowire port to a bridge domain or a pseudowire to a bridge virtual forwarding interface (VFI).

- Use the *A.B.C.D* argument to specify the IP address of the cross-connect peer.
  
  **Note**  
  *A.B.C.D* can be a recursive or non-recursive prefix.

- Use the *pw-id* keyword to configure the pseudowire ID and ID value. The range is 1 to 4294967295.

**Step 7**  
Use the **commit** or **end** command.

- **commit** - Saves the configuration changes and remains within the configuration session.
- **end** - Prompts user to take one of these actions:
  - **Yes** - Saves configuration changes and exits the configuration session.
  - **No** - Exits the configuration session without committing the configuration changes.
  - **Cancel** - Remains in the configuration mode, without committing the configuration changes.
Configuring PBB-EVPN

This section provides information on:

Configuring PBB Core Bridge Domains

Perform this task to create the PBB Core bridge domain and assign it’s corresponding EVPN EVI ID.

SUMMARY STEPS

1. configure
2. l2vpn
3. bridge group group_name
4. bridge-domain bridge_domain_name
5. pbb core
6. evpn evi evi_id
7. Use the commit or end command.

DETAILED STEPS

Step 1 configure

Example:
RP/0/RSP0/CPU0:router# configure

Enters the Global Configuration mode.

Step 2 l2vpn

Example:

RP/0/RSP0/CPU0:router(config)# l2vpn

Enters L2VPN configuration mode.

Step 3 bridge group group_name

Example:

RP/0/RSP0/CPU0:router(config-l2vpn)# bridge group group1

Enters bridge group configuration mode. This command creates a new bridge group. A bridge group organizes bridge domains.

Step 4 bridge-domain bridge_domain_name

Example:

RP/0/RSP0/CPU0:router(config-l2vpn-bg)#bridge-domain sample-pbb-core#
Enters bridge group domain configuration mode. This command creates a new bridge domain.

**Step 5**  
`pbb core`  
Example:

```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# pbb core
```

Configures the bridge domain as PBB core and enters the PBB core configuration submode. This command also creates an internal port known as Customer bridge port (CBP). All the interfaces (bridge ports) under this bridge domain are treated as the provider network ports (PNP).

**Step 6**  
`evpn evi evi_id`  
Example:

```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-pbb-core)# evpn evi 100
```

Enters EVPN configuration mode and configures the Ethernet VPN ID. The EVI ID range is from 1 to 65534.

**Step 7**  
Use the `commit` or `end` command.  
- `commit` - Saves the configuration changes and remains within the configuration session.  
- `end` - Prompts user to take one of these actions:  
  - `Yes` - Saves configuration changes and exits the configuration session.  
  - `No` - Exits the configuration session without committing the configuration changes.  
  - `Cancel` - Remains in the configuration mode, without committing the configuration changes.

---

**Configuring PBB Edge Bridge Domains**

As a pre-requisite, a PBB-EVPN provider edge (PE) must be configured with PBB Edge Bridge Domains which in one side are associated to ethernet flow points matching traffic from access interfaces and on the other side are linked to PBB Core Bridge Domains for traffic forwarding through the core.

For more information on configuring Edge Bridge Domains, see Configuring PBB Edge Bridge Domain and Service Instance ID.

**Configuring EVPN Ethernet Segment**

Explicit configuration of Ethernet Segment parameters such as ESI and service carving behaviors (manual or dynamic) is required only for Dual Homed scenarios with Active/Active per Service load-balancing.

---

**Note**  
By default, Dual Homed scenarios with Active/Active per Flow load-balancing auto-sense ESI values from CE’s LACP information.
PBB-EVPN configuration allows to create only 24 ICCP-groups.

Perform this task to configure the EVPN Ethernet segment.

SUMMARY STEPS

1. configure
2. evpn
3. interface type interface-path-id
4. ethernet-segment
5. backbone-source-mac mac_address
6. force single-homed
7. identifier system-priority priority-value system-id system-id port-key port_key
8. load-balancing-mode per-service
9. service-carving manual primary {isid} secondary {isid}
10. Use the commit or end command.

DETAILED STEPS

Step 1 configure

Example:
RP/0/RSP0/CPU0:router# configure
Enters the Global Configuration mode.

Step 2 evpn

Example:
RP/0/RSP0/CPU0:router(config)# evpn
Enters EVPN configuration mode.

Step 3 interface type interface-path-id

Example:
RP/0/RSP0/CPU0:router(config-evpn)# interface gigabitEthernet 0/1/0/4
Enters the physical port interface or the bundle interface configuration mode.

Step 4 ethernet-segment

Example:
RP/0/RSP0/CPU0:router(config-evpn-ac)# ethernet-segment
Enters the EVPN ethernet-segment configuration mode.

**Step 5**  
**backbone-source-mac** *mac_address*

**Example:**

RP/0/RSP0/CPU0:router(config-evpn-ac-es)# backbone-source-mac 0045.1200.04

Configures the backbone source MAC address.

**Step 6**  
**force single-homed**

**Example:**

RP/0/RSP0/CPU0:router(config-evpn-ac-es)# force single-homed

Specifies forced attributes for this Ethernet Segment.

**Step 7**  
**identifier** *system-priority* *priority-value*  *system-id*  *system-id*  *port-key*  *port_key*

**Example:**

RP/0/RSP0/CPU0:router(config-evpn-ac-es)# identifier system-priority 2 system-id 0301.1.1 port-key ffff

Configures the Ethernet segment identifier (ESI) of an interface.  
**Note**  
The ESI system ID requires that the multicast and admin bits are set.

**Step 8**  
**load-balancing-mode** *per-service*

**Example:**

RP/0/RSP0/CPU0:router(config-evpn-ac-es)# load-balancing-mode per-service

Specifies the load balancing mode.

**Step 9**  
**service-carving** *manual*  *primary*  *{isid}*  *secondary*  *{isid}*

**Example:**

RP/0/RSP0/CPU0:router(config-evpn-ac-es)# service-carving manual primary 100 secondary 200

Specifies a list of service identifiers (isid) as active and standby services. The isid range is from 256 to 16777216.

**Step 10**  
Use the **commit** or **end** command.  
**commit**  - Saves the configuration changes and remains within the configuration session.  
**end**  - Prompts user to take one of these actions:  
  
  • **Yes**  - Saves configuration changes and exits the configuration session.  
  • **No**  - Exits the configuration session without committing the configuration changes.  
  • **Cancel**  - Remains in the configuration mode, without committing the configuration changes.
Configuring BGP Route Target

By default, these parameters are auto-derived from the PE’s configuration:

- Route Distinguisher (RD) for global Ethernet Segment table
  Default: Auto-generated RD based on loopback IP address

- EVI’s BGP Route Distinguisher (RD)
  Default: Auto-generated RD based on loopback IP address

- EVI’s BGP Route Target. Default: Auto-generated RT based on EVI ID

Perform this task to overwrite the auto-generated BGP RD/RT values.

**SUMMARY STEPS**

1. configure
2. evpn
3. bgp
4. rd \{ 2-byte as_number | 4-byte as_number | IP_address | none \} : \{ nn \}
5. exit
6. evpn
7. evi evi_id
8. bgp
9. route-target [ import | export ] \{ 2-byte as_number | 4-byte as_number | IP_address | none \} : \{ nn \}
10. rd \{ 2-byte as_number | 4-byte as_number | IP_address | none \} : \{ nn \}
11. Use the commit or end command.

**DETAILED STEPS**

**Step 1** configure

**Example:**
```
RP/0/RSP0/CPU0:router# configure
```

Enters the Global Configuration mode.

**Step 2** evpn

**Example:**
```
RP/0/RSP0/CPU0:router(config)# evpn
```

Enters EVPN configuration mode.

**Step 3** bgp
Example:
```
RP/0/RSP0/CPU0:router(config-evpn)# bgp
```
Enters EVPN BGP configuration mode and configures static BGP settings for the Ethernet Segment ES:GLOBAL EVI, which is used for handling ES routes.

**Step 4**
```
rd { 2-byte as_number | 4-byte as_number | IP_address | none } : { nn }
```

Example:
```
RP/0/RSP0/CPU0:router(config-evpn-bgp)# rd 200:50
```
Configures the route distinguisher.

**Step 5**
```
exit
```

Example:
```
RP/0/RSP0/CPU0:router(config-evpn-bgp)# exit
```
Returns to the global configuration mode.

**Step 6**
```
evpn
```

Example:
```
RP/0/RSP0/CPU0:router(config)# evpn
```
Enters EVPN configuration mode.

**Step 7**
```
evi evi_id
```

Example:
```
RP/0/RSP0/CPU0:router(config-evpn)# evi 100
```
Configures Ethernet VPN ID.
The EVI ID range is from 1 to 65534.

**Step 8**
```
bgp
```

Example:
```
RP/0/RSP0/CPU0:router(config-evpn-evi)# bgp
```
Enters the BGP configuration mode for the specific EVI.

**Step 9**
```
route-target [ import | export ] { 2-byte as_number | 4-byte as_number | IP_address | none } : { nn }
```

Example:
```
RP/0/RSP0/CPU0:router(config-evpn-evi-bgp)# route-target 10:20
```
Creates a route-target extended community.
• The import keyword imports routing information from the target VPN extended community.
• The export keyword exports routing information to the target VPN extended community.

**Step 10**
```
rd { 2-byte as_number | 4-byte as_number | IP_address | none } : { nn }
```

**Example:**
```
RP/0/RSP0/CPU0:router(config-evpn-evi-bgp)# rd 25:30
```
Configures the route distinguisher.

**Step 11**
Use the **commit** or **end** command.
- **commit** - Saves the configuration changes and remains within the configuration session.
- **end** - Prompts user to take one of these actions:
  - **Yes** - Saves configuration changes and exits the configuration session.
  - **No** - Exits the configuration session without committing the configuration changes.
  - **Cancel** - Remains in the configuration mode, without committing the configuration changes.

---

**Configuring Global EVPN Timers**

Perform this task to configure global EVPN timers.

**SUMMARY STEPS**

1. configure  
2. evpn  
3. timers [flushagain | peering | programming | recovery]  
4. Use the **commit** or **end** command.

**DETAILED STEPS**

**Step 1**
```
configure
```

**Example:**
```
RP/0/RSP0/CPU0:router# configure
```
Enters the Global Configuration mode.

**Step 2**
```
evpn
```

---
Example:
RP/0/RSP0/CPU0:router evpn
Enters EVPN configuration mode.

Step 3  timers [flushagain | peering | programming | recovery]

Example:
RP/0/RSP0/CPU0:router(config-evpn)# timers flushagain 40

Configures global EVPN timers.

• Flush-again timer (for AApS only): When a MAC flush is sent, usually at the end of the programming timer expiration, a flush-again timer is started for the flush-again timer value. When it expires, another MAC flush message (MVRP or STP-TCN) is sent to the CE. This timer can be configured per segment-interface.
  Range: 0 to 120 seconds, 0 means disabled
  Default: 60 seconds

• Peering timer: Once all conditions are met to advertise to BGP, the PE waits for the peering timer value before advertising its RT, ESI and, Local MAC if it is Single-Home.
  Range: 0 to 300 seconds, 0 means disabled
  Default: 45 seconds

• Programming timer: Indicated time required by the HW to apply the carving results. At the end of the programming timer expiration, the next Ethernet Segment route object will be processed.
  Range: 0 to 100000 microseconds
  Default: 1500 microseconds

• Recovery timer (for AApS only): Once the interface is up, the PE waits for the recovery timer value in order to allow the CE running STP protocol to converge. This timer can be configured per segment-interface.
  Range: 20 to 3600 seconds
  Default: 20 seconds

Note  Changing timers is only useful for scale configurations.

Step 4  Use the commit or end command.
commit - Saves the configuration changes and remains within the configuration session.
end - Prompts user to take one of these actions:
  • Yes - Saves configuration changes and exits the configuration session.
  • No - Exits the configuration session without committing the configuration changes.
  • Cancel - Remains in the configuration mode, without committing the configuration changes.
Configuring EVPN Timers Per Ethernet Segment and CE flushing mechanism

Perform this task to configure per Ethernet segment timers.

SUMMARY STEPS

1. configure
2. evpn
3. interface type interface-path-id
4. ethernet-segment
5. mac-flush mvrp
6. timers [flushagain | recovery]
7. Use the commit or end command.

DETAILED STEPS

Step 1 configure

Example:
RP/0/RSP0/CPU0:router# configure

Enters the Global Configuration mode.

Step 2 evpn

Example:
RP/0/RSP0/CPU0:router(config)# evpn

Enters EVPN configuration mode.

Step 3 interface type interface-path-id

Example:
RP/0/RSP0/CPU0:router(config-evpn)# interface gigabitEthernet 0/1/0/4

Enters the physical port interface or the bundle interface configuration mode.

Step 4 ethernet-segment

Example:
RP/0/RSP0/CPU0:router(config-evpn-ac)# ethernet-segment

Enters the EVPN ethernet-segment configuration mode.

Step 5 mac-flush mvrp

Example:
RP/0/RSP0/CPU0:router(config-evpn-ac)#

Specifies MAC flush mode for this Ethernet Segment.
Step 6  timers [flushagain | recovery]

Example:
RP/0/RSP0/CPU0:router(config-evpn-ac)# timers flushagain 40
Configures per Ethernet segment timers.

- Flush-again timer (for AAPS only): When a MAC flush is sent, usually at the end of the programming timer expiration, a flush-again timer is started for the flush-again timer value. When it expires, another MAC flush message (MVRP or STP-TCN) is sent to the CE. This timer can be configured per segment-interface.
  Range: 0 to 120 seconds, 0 means disabled
  Default: 60 seconds

- Recovery timer (for AAPS only): Once the interface is up, the PE waits for the recovery timer value in order to allow the CE running STP protocol to converge. This timer can be configured per segment-interface.
  Range: 20 to 3600 seconds
  Default: 20 seconds

Note  Changing timers is only useful for scale configurations.

Step 7  Use the commit or end command.

commit - Saves the configuration changes and remains within the configuration session.

end - Prompts user to take one of these actions:

- Yes - Saves configuration changes and exits the configuration session.
- No - Exits the configuration session without committing the configuration changes.
- Cancel - Remains in the configuration mode, without committing the configuration changes.

Configuring Multichassis Link Aggregation

Multichassis Link Aggregation (MCLAG) is used in scenarios involving Multi Homed Devices. You must create an ICCP redundancy group in order to specify relevant MLACP parameters, such as, mlacp system mac, mlacp system priority, mlacp node id and backbone interfaces.

Note  Even though the redundancy group is created under the redundancy-iccp-group sub-mode, the solution does not rely on an actual ICCP session between PEs connected to the same site. The mode singleton command has been introduced to alert ICCP module.

For more information on configuring MCLAG, refer to the Configuring Link Bundling on the Cisco ASR 9000 Series Router module in the Cisco ASR 9000 Series Aggregation Services Router Interface and Hardware Component Configuration Guide.
Configuring BGP Routing Process

A prerequisite of PBB-EVPN involves enabling the new EVPN address family under the BGP routing process and under BGP neighbor submode. For more information on BGP, refer to the Implementing BGP module in the Cisco ASR 9000 Series Aggregation Services Router Routing Configuration Guide.

Perform this task to enable EVPN address family under BGP routing process and BGP neighbor submode.

SUMMARY STEPS

1. `configure`
2. `router bgp asn_id`
3. `address-family l2vpn evp`
4. `exit`
5. `neighbor peer_ip_add`
6. `address-family l2vpn evpn`
7. `address-family l2vpn evpn`
8. Use the `commit` or `end` command.

DETAILED STEPS

Step 1 `configure`

Example:

```
RP/0/RSP0/CPU0:router# configure
```

Enters the Global Configuration mode.

Step 2 `router bgp asn_id`

Example:

```
RP/0/RSP0/CPU0:router(config)# router bgp 100
```

Specifies the BGP AS number and enters the BGP configuration mode, allowing you to configure the BGP routing process.

Step 3 `address-family l2vpn evp`

Example:

```
RP/0/RSP0/CPU0:router(config-bgp)# address-family l2vpn evpn
```

Enables EVPN address family under BGP routing process and enters EVPN address family configuration submode.

Step 4 `exit`

Example:

```
RP/0/RSP0/CPU0:router(config-bgp)# exit
```
Exits the current configuration mode.

**Step 5**

`neighbor peer_ip_add`

**Example:**

```
RP/0/RSP0/CPU0:router(config-bgp)# neighbor 10.1.1.1
```

Places the router in neighbor configuration mode for BGP routing and configures the neighbor IP address as a BGP peer.

**Step 6**

`address-family l2vpn evpn`

**Example:**

```
RP/0/RSP0/CPU0:router(config-bgp)# exit
```

Enables EVPN address family under BGP routing process and enters EVPN address family configuration submode.

**Step 7**

`address-family l2vpn evpn`

**Example:**

```
RP/0/RSP0/CPU0:router(config-bgp-neighbor)# address-family l2vpn evpn
```

Enables EVPN address family under BGP routing process and enters EVPN address family configuration submode.

**Step 8**

Use the `commit` or `end` command.

- **commit** - Saves the configuration changes and remains within the configuration session.
- **end** - Prompts user to take one of these actions:
  - **Yes** - Saves configuration changes and exits the configuration session.
  - **No** - Exits the configuration session without committing the configuration changes.
  - **Cancel** - Remains in the configuration mode, without committing the configuration changes.

---

### Configuration Examples for Implementing 802.1ah Provider Backbone Bridge

This section provides these configuration examples:

#### Configuring Ethernet Flow Points: Example

This example shows how to configure Ethernet flow points:

```
config
interface GigabitEthernet0/0/0/10.100 l2transport
  encapsulation dot1q 100
or
  encapsulation dot1ad 100
```
Configuring PBB Edge Bridge Domain and Service Instance ID: Example

This example shows how to configure the PBB edge bridge domain:

```conf
cfg l2vpn
bridge group PBB
  bridge-domain PBB-EDGE
  interface GigabitEthernet0/0/0/38.100
  !
  interface GigabitEthernet0/2/0/30.150
  !
  pbb edge i-sid 1000 core-bridge PBB-CORE
  !
```

Configuring PBB Core Bridge Domain: Example

This example shows how to configure the PBB core bridge domain:

```conf
cfg l2vpn
bridge group PBB
  bridge-domain PBB-CORE
  interface G0/5/0/10.100
  !
  interface G0/2/0/20.200
  !
  pbb core
  !
```

Configuring Backbone VLAN Tag: Example

This example shows how to configure the backbone VLAN tag:

```conf
cfg l2vpn
bridge group PBB
  bridge-domain PBB-CORE
  interface G0/5/0/10.100
  !
  interface G0/2/0/20.200
  !
  pbb core
  !
  rewrite ingress tag push dot1ad 100 symmetric
  !
```

Configuring Backbone Source MAC Address: Example

This example shows how to configure the backbone source MAC address:

```conf
cfg l2vpn
pbb
```

or

```
encapsulation dot1ad 100 dot1q 101
```
Configuring Static Mapping and Unknown Unicast MAC Address under the PBB Edge Bridge Domain

This example shows how to configure static mapping and unknown unicast MAC address under the PBB edge bridge domain:

```
config
l2vpn
bridge group PBB
  bridge-domain PBB-EDGE
  interface GigabitEthernet0/0/0/38.100
  ! interface GigabitEthernet0/2/0/30.150
  ! pbb edge i-sid 1000 core-bridge PBB-CORE
  static-mac-address 0033.3333.3333 bmac 0044.4444.4444
  unknown-unicast-bmac 0123.8888.8888
  !
  !
```

Configuring PBB-VPLS: Example

This example shows you how to configure PBB VPLS.

**Configuring Access Pseudowire in I-component**

```
12vpn
  bridge group PBB
  bridge-domain PBB-EDGE
  interface GigabitEthernet0/0/0/38.100
  !
  interface GigabitEthernet0/2/0/30.150
  !
  pbb edge i-sid 1200 core-bridge PBB-CORE
  neighbor 10.10.10.1 pw-id 1010 ------- configures access PW
  !
  !
```

**Configuring Core Pseudowire in B-component**

```
12vpn
  bridge group PBB
  bridge-domain PBB-CORE
  interface G0/5/0/10.100
  !
  vfi PBB-CORE-vfi
  neighbor 1.1.1.1 pw-id 1004 ------- configures core PW
  !
  !
```
Configuring MIRP Lite: Example

The MIRP feature is enabled by default. However, MIRP packets are sent when the attachment circuit is not functional and you have configured `mac withdraw state-down` as shown:

```
  l2vpn
    bridge group PBB
    bridge-domain PBB-EDGE
  mac withdraw state-down
```

However, if you have not configured `mac withdraw state-down`, then MIRP packets are sent when the attachment circuit is functional.
Implementing Multiple Spanning Tree Protocol

This module provides conceptual and configuration information for Multiple Spanning Tree Protocol on Cisco ASR 9000 Series Routers. Multiple Spanning Tree Protocol (MSTP) is a spanning-tree protocol used to prevent loops in bridge configurations. Unlike other types of STPs, MSTP can block ports selectively by VLAN.

Prerequisites for Implementing Multiple Spanning Tree Protocol

This prerequisite applies to implementing MSTP:

You must be in a user group associated with a task group that includes the proper task IDs. The command reference guides include the task IDs required for each command.
If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Information About Implementing Multiple Spanning Tree Protocol

To implement Ethernet services access lists, you must understand these concepts:

Spanning Tree Protocol Overview

Ethernet is no longer just a link-layer technology used to interconnect network vehicles and hosts. Its low cost and wide spectrum of bandwidth capabilities coupled with a simple plug and play provisioning philosophy have transformed Ethernet into a legitimate technique for building networks, particularly in the access and aggregation regions of service provider networks.

Ethernet networks lacking a TTL field in the Layer 2 (L2) header and, encouraging or requiring multicast traffic network-wide, are susceptible to broadcast storms if loops are introduced. However, loops are a desirable property as they provide redundant paths. Spanning tree protocols (STP) are used to provide a loop free topology within Ethernet networks, allowing redundancy within the network to deal with link failures.

There are many variants of STP; however, they work on the same basic principle. Within a network that may contain loops, a sufficient number of interfaces are disabled by STP so as to ensure that there is a loop-free spanning tree, that is, there is exactly one path between any two devices in the network. If there is a fault in the network that affects one of the active links, the protocol recalculates the spanning tree so as to ensure that all devices continue to be reachable. STP is transparent to end stations which cannot detect whether they are connected to a single LAN segment or to a switched LAN containing multiple segments and using STP to ensure there are no loops.

STP Protocol Operation

All variants of STP operate in a similar fashion: STP frames (known as bridge protocol data units (BPDUs)) are exchanged at regular intervals over Layer 2 LAN segments, between network devices participating in STP. Such network devices do not forward these frames, but use the information to construct a loop free spanning tree.

The spanning tree is constructed by first selecting a device which is the root of the spanning tree (known as the root bridge), and then by determining a loop free path from the root bridge to every other device in the network. Redundant paths are disabled by setting the appropriate ports into a blocked state, where STP frames can still be exchanged but data traffic is never forwarded. If a network segment fails and a redundant path exists, the STP protocol recalculates the spanning tree topology and activates the redundant path, by unblocking the appropriate ports.

The selection of the root bridge within a STP network is determined by the lowest Bridge ID which is a combination of configured bridge priority and embedded mac address of each device. The device with the lowest priority, or with equal lowest priority but the lowest MAC address is selected as the root bridge.

The selection of the active path among a set of redundant paths is determined primarily by the port path cost. The port path cost represents the cost of transiting between that port and the root bridge - the further the port is from the root bridge, the higher the cost. The cost is incremented for each link in the path, by an amount that is (by default) dependent on the media speed. Where two paths from a given LAN segment have an equal
cost, the selection is further determined by the lowest bridge ID of the attached devices, and in the case of two attachments to the same device, by the configured port priority and port ID of the neighboring attached ports.

Once the active paths have been selected, any ports that do not form part of the active topology are moved to the blocking state.

**Topology Changes**

Network devices in a switched LAN perform MAC learning; that is, they use received data traffic to associate unicast MAC addresses with the interface out of which frames destined for that MAC address should be sent. If STP is used, then a recalculation of the spanning tree (for example, following a failure in the network) can invalidate this learned information. The protocol therefore includes a mechanism to notify topology changes around the network, so that the stale information can be removed (flushed) and new information can be learned based on the new topology.

A *Topology Change* notification is sent whenever STP moves a port from the blocking state to the forwarding state. When it is received, the receiving device flushes the MAC learning entries for all ports that are not blocked other than the one where the notification was received, and also sends its own topology change notification out of those ports. In this way, it is guaranteed that stale information is removed from all the devices in the network.

**Variants of STP**

There are many variants of the Spanning Tree Protocol:

- **Legacy STP (STP)**—The original STP protocol was defined in IEEE 802.1D-1998. This creates a single spanning tree which is used for all VLANs and most of the convergence is timer-based.

- **Rapid STP (RSTP)**—This is an enhancement defined in IEEE 802.1D-2004 to provide more event-based, and hence faster, convergence. However, it still creates a single spanning tree for all VLANs.

- **Multiple STP (MSTP)**—A further enhancement was defined in IEEE 802.1Q-2005. This allows multiple spanning tree instances to be created over the same physical topology. By assigning different VLANs to the different spanning tree instances, data traffic can be load-balanced over different physical links. The number of different spanning tree instances that can be created is restricted to a much smaller number than the number of possible VLANs; however, multiple VLANs can be assigned to the same spanning tree instance. The BPDUs used to exchange MSTP information are always sent untagged; the VLAN and spanning tree instance data is encoded inside the BPDU.

- **Per-Vlan STP (PVST)**—This is an alternative mechanism for creating multiple spanning trees; it was developed by Cisco before the standardization of MSTP. Using PVST, a separate spanning tree is created for each VLAN. There are two variants: PVST+ (based on legacy STP), and PVRST (based on RSTP). At a packet level, the separation of the spanning trees is achieved by sending standard STP or RSTP BPDUs, tagged with the appropriate VLAN tag.

- **Per-Vlan Rapid Spanning Tree (PVRST)**—This feature is the IEEE 802.1w (RSTP) standard implemented per VLAN, and is also known as Rapid PVST or PVST+. A single instance of STP runs on each configured VLAN (if you do not manually disable STP). Each Rapid PVST+ instance on a VLAN has a single root switch. You can enable and disable STP on a per-VLAN basis when you are running Rapid PVST+. 
• PVRST uses point-to-point wiring to provide rapid convergence of the spanning tree. The spanning tree reconfiguration can occur in less than one second with PVRST (in contrast to 50 seconds with the default settings in the 802.1D STP).

• REP (Cisco-proprietary ring-redundancy protocol)—This is a Cisco-proprietary protocol for providing resiliency in rings. It is included for completeness, as it provides MSTP compatibility mode, using which, it interoperates with an MSTP peer.

**Multiple Spanning Tree Protocol Overview**

The Multiple Spanning Tree Protocol (MSTP) is an STP variant that allows multiple and independent spanning trees to be created over the same physical network. The parameters for each spanning tree can be configured separately, so as to cause a different network devices to be selected as the root bridge or different paths to be selected to form the loop-free topology. Consequently, a given physical interface can be blocked for some of the spanning trees and unblocked for others.

Having set up multiple spanning tree instances, the set of VLANs in use can be partitioned among them; for example, VLANs 1 - 100 can be assigned to spanning tree instance 1, VLANs 101 - 200 can be assigned to spanning tree instance 2, VLANs 201 - 300 can be assigned to spanning tree instance 3, and so on. Since each spanning tree has a different active topology with different active links, this has the effect of dividing the data traffic among the available redundant links based on the VLAN—a form of load balancing.

**MSTP Regions**

Along with supporting multiple spanning trees, MSTP also introduces the concept of regions. A region is a group of devices under the same administrative control and have similar configuration. In particular, the configuration for the region name, revision, and the mapping of VLANs to spanning tree instances must be identical on all the network devices in the region. A digest of this information is included in the BPDUs sent by each device, so as to allow other devices to verify whether they are in the same region.
The following figure shows the operation of MST regions when bridges running MSTP are connected to bridges running legacy STP or RSTP. In this example, switches SW1, SW2, SW3, SW4 support MSTP, while switches SW5 and SW6 do not.

**Figure 46: MST Interaction with Non-MST Regions**

To handle this situation, an Internal Spanning Tree (IST) is used. This is always spanning tree instance 0 (zero). When communicating with non-MSTP-aware devices, the entire MSTP region is represented as a single switch. The logical IST topology in this case is shown in the following figure.

**Figure 47: Logical Topology in MST Region Interacting with Non-MST Bridges**

The same mechanism is used when communicating with MSTP devices in a different region. For example, SW5 in the above figure could represent a number of MSTP devices, all in a different region compared to SW1, SW2, SW3 and SW4.
MSTP Port Fast

MSTP includes a Port Fast feature for handling ports at the edge of the switched Ethernet network. For devices that only have one link to the switched network (typically host devices), there is no need to run MSTP, as there is only one available path. Furthermore, it is undesirable to trigger topology changes (and resultant MAC flushes) when the single link fails or is restored, as there is no alternative path.

By default, MSTP monitors ports where no BPDUs are received, and after a timeout, places them into edge mode whereby they do not participate in MSTP. However, this process can be speeded up (and convergence of the whole network thereby improved) by explicitly configuring edge ports as port fast.

Note

- You must disable and re-enable the port for Port Fast configuration to take effect. Use shutdown and no shutdown command (in interface configuration mode) to disable and re-enable the port.

- Port Fast is implemented as a Cisco-proprietary extension in Cisco implementations of legacy STP. However, it is encompassed in the standards for RSTP and MSTP, where it is known as Edge Port.

MSTP Root Guard

In networks with shared administrative control, it may be desirable for the network administrator to enforce aspects of the network topology and in particular, the location of the root bridge. By default, any device can become the root bridge for a spanning tree, if it has a lower priority or bridge ID. However, a more optimal forwarding topology can be achieved by placing the root bridge at a specific location in the centre of the network.

Note

The administrator can set the root bridge priority to 0 in an effort to secure the root bridge position; however, this is no guarantee against another bridge which also has a priority of 0 and has a lower bridge ID.

The root guard feature provides a mechanism that allows the administrator to enforce the location of the root bridge. When root guard is configured on an interface, it prevents that interface from becoming a root port (that is, a port via which the root can be reached). If superior information is received via BPDUs on the interface that would normally cause it to become a root port, it instead becomes a backup or alternate port. In this case, it is placed in the blocking state and no data traffic is forwarded.

The root bridge itself has no root ports. Thus, by configuring root guard on every interface on a device, the administrator forces the device to become the root, and interfaces receiving conflicting information are blocked.

Note

Root Guard is implemented as a Cisco-proprietary extension in Cisco implementations of legacy STP and RSTP. However, it is encompassed in the standard for MSTP, where it is known as Restricted Role.

MSTP Topology Change Guard

In certain situations, it may be desirable to prevent topology changes originating at or received at a given port from being propagated to the rest of the network. This may be the case, for example, when the network is not...
under a single administrative control and it is desirable to prevent devices external to the core of the network from causing MAC address flushing in the core. This behavior can be enabled by configuring Topology Change Guard on the port.

---

**Note**

Topology Change Guard is known as *Restricted TCN* in the MSTP standard.

---

**MSTP Supported Features**

Cisco ASR 9000 Series Routers support MSTP, as defined in IEEE 802.1Q-2005, on physical Ethernet interfaces and Ethernet Bundle interfaces. Note that this includes the Port Fast, Backbone Fast, Uplink Fast and Root Guard features found in Cisco implementations of legacy STP, RSTP and PVST, as these are encompassed by the standard MSTP protocol. Cisco ASR 9000 Series Routers can operate in either standard 802.1Q mode, or in Provide Edge (802.1ad) mode. In provider edge mode, a different MAC address is used for BPDUs, and any BPDUs received with the 802.1Q MAC address are forwarded transparently.

In addition, these additional Cisco features are supported:

- **BPDU Guard**—This Cisco feature protects against misconfiguration of edge ports.

- **Flush Containment**—This Cisco feature helps prevent unnecessary MAC flushes that would otherwise occur following a topology change.

- **Bringup Delay**—This Cisco feature prevents an interface from being added to the active topology before it is ready to forward traffic.

---

**Note**

Interoperation with RSTP is supported, as described in the 802.1Q standard; however, interoperation with legacy STP is not supported.

---

**BPDU Guard**

BPDU Guard is a Cisco feature that protects against misconfiguration of edge ports. It is an enhancement to the MSTP port fast feature. When port fast is configured on an interface, MSTP considers that interface to be an edge port and removes it from consideration when calculating the spanning tree. When BPDU Guard is configured, MSTP additionally shuts down the interface using error-disable if an MSTP BPDU is received.

---

**Flush Containment**

Flush containment is a Cisco feature that helps prevent unnecessary MAC flushes due to unrelated topology changes in other areas of a network. This is best illustrated by example. The following figure shows a network...
containing four devices. Two VLANs are in use: VLAN 1 is only used on device D, while VLAN 2 spans devices A, B and C. The two VLANs are in the same spanning tree instance, but do not share any links.

Figure 48: Flush Containment

If the link AB goes down, then in normal operation, as C brings up its blocked port, it sends out a topology change notification on all other interfaces, including towards D. This causes a MAC flush to occur for VLAN 1, even though the topology change which has taken place only affects VLAN 2.

Flush containment helps deal with this problem by preventing topology change notifications from being sent on interfaces on which no VLANs are configured for the MSTI in question. In the example network this would mean no topology change notifications would be sent from C to D, and the MAC flushes which take place would be confined to the right hand side of the network.

Flush containment is enabled by default, but can be disabled by configuration, thus restoring the behavior described in the IEEE 802.1Q standard.

Bringup Delay

Bringup delay is a Cisco feature that stops MSTP from considering an interface when calculating the spanning tree, if the interface is not yet ready to forward traffic. This is useful when a line card first boots up, as the system may declare that the interfaces on that card are Up before the dataplane is fully ready to forward traffic. According to the standard, MSTP considers the interfaces as soon as they are declared Up, and this may cause it to move other interfaces into the blocking state if the new interfaces are selected instead.

Bringup delay solves this problem by adding a configurable delay period which occurs as interfaces that are configured with MSTP first come into existence. Until this delay period ends, the interfaces remain in blocking state, and are not considered when calculating the spanning tree.

Bringup delay only takes place when interfaces which are already configured with MSTP are created, for example, on a card reload. No delay takes place if an interface which already exists is later configured with MSTP.

Restrictions for configuring MSTP

These restrictions apply when using MSTP:

- MSTP must only be enabled on interfaces where the interface itself (if it is in L2 mode) or all of the subinterfaces have a simple encapsulation configured. These encapsulation matching criteria are considered simple:
Single-tagged 802.1Q frames
- Double-tagged Q-in-Q frames (only the outermost tag is examined)
- 802.1ad frames (if MSTP is operating in Provider Bridge mode)
- Ranges or lists of tags (any of the above)

- If an L2 interface or subinterface is configured with an encapsulation that matches multiple VLANs, then all of those VLANs must be mapped to the same spanning tree instance. There is therefore a single spanning tree instance associated with each L2 interface or subinterface.
- All the interfaces or subinterfaces in a given bridge domain must be associated with the same spanning tree instance.
- Multiple subinterfaces on the same interface must not be associated with the same spanning tree instance, unless those subinterfaces are in the same split horizon group. In other words, hair-pinning is not possible.
- Across the network, L2 interfaces or subinterfaces must be configured on all redundant paths for all the VLANs mapped to each spanning tree instance. This is to avoid inadvertent loss of connectivity due to STP blocking of a port.

⚠️ Caution
A subinterface with a default or untagged encapsulation will lead to an MSTP state machine failure.

Access Gateway

One common deployment scenario for Cisco ASR 9000 Series Routers is as an nPE gateway device situated between a network of uPE access devices and a core or aggregation network. Each gateway device may provide connectivity for many access networks, as shown in following figure. The access networks (typically rings)
have redundant links to the core or aggregation network, and therefore must use some variant of STP or a similar protocol to ensure the network remains loopfree.

**Figure 49: Core or Aggregation Network**

It is possible for the gateway devices to also participate in the STP protocol. However, since each gateway device may be connected to many access networks, this would result in one of two solutions:

- A single topology is maintained covering all of the access networks. This is undesirable as it means topology changes in one access network could impact all the other access networks.
- The gateway devices run multiple instances of the STP protocol, one for each access network. This means a separate protocol database and separate protocol state machines are maintained for each access network, which is undesirable due to the memory and CPU resource that would be required on the gateway device.

It can be seen that both of these options have significant disadvantages.

Another alternative is for the gateway devices to tunnel protocol BPDUs between the legs of each access network, but not to participate in the protocol themselves. While this results in correct loopfree topologies, it also has significant downsides:

- Since there is no direct connection between the legs of the access ring, a failure in one of the leg links is not immediately detected by the access device connected to the other leg. Therefore, recovery from the failure must wait for protocol timeouts, which leads to a traffic loss of at least six seconds.
- As the gateway devices do not participate in the protocol, they are not aware of any topology changes in the access network. The aggregation network may therefore direct traffic destined for the access network over the wrong leg, following a topology change. This can lead to traffic loss on the order of the MAC learning timeout (5 minutes by default).

Access gateway is a Cisco feature intended to address this deployment scenario, without incurring the disadvantages of the solutions described above.
Overview of Access Gateway

Access gateway is based on two assumptions:

- Both gateway devices provide connectivity to the core or aggregation network at all times. Generally, resiliency mechanisms used within the core or aggregation network are sufficient to ensure this is the case. In many deployments, VPLS is used in the core or aggregation network to provide this resiliency.

- The desired root of all of the spanning trees for each access network is one of the gateway devices. This will be the case if (as is typical) the majority of the traffic is between an access device and the core or aggregation network, and there is little if any traffic between the access devices.

With these assumptions, an STP topology can be envisaged where for every spanning tree, there is a virtual root bridge behind (that is, on the core side of) the gateway devices, and both gateway devices have a zero cost path to the virtual root bridge. In this case, the ports that connect the gateway devices to the access network would never be blocked by the spanning tree protocol, but would always be in the forwarding state. This is illustrated in the following figure.

*Figure 50: Access Network*

With this topology, it can be observed that the BPDUs sent by the gateway devices are constant: since the root bridge never changes (as we assume the aggregation or core network always provides connectivity) and the ports are always forwarding, the information sent in the BPDUs never changes.

Access gateway makes use of this by removing the need to run the full STP protocol and associated state machines on the gateway devices, and instead just sends statically configured BPDUs towards the access network. The BPDUs are configured so as to mimic the behavior above, so that they contain the same information that would be sent if the full protocol was running. To the access devices, it appears that the gateway devices are fully participating in the protocol; however, since in fact the gateway devices are just sending static BPDUs, very little memory or CPU resource is needed on the gateway devices, and many access networks can be supported simultaneously.
For the most part, the gateway devices can ignore any BPDUs received from the access network; however, one exception is when the access network signals a topology change. The gateway devices can act on this appropriately, for example by triggering an LDP MAC withdrawal in the case where the core or aggregation network uses VPLS.

In many cases, it is not necessary to have direct connectivity between the gateway devices; since the gateway devices statically send configured BPDUs over the access links, they can each be configured independently (so long as the configuration on each is consistent). This also means that different access networks can use different pairs of gateway devices, as shown in the following figure.

*Figure 51: Access Networks*

![Access Networks Diagram](image)

Although the above figure shows access rings, in general there are no restrictions on the access network topology or the number or location of links to the gateway devices.

**Note**

Although the above figure shows access rings, in general there are no restrictions on the access network topology or the number or location of links to the gateway devices.

Access gateway ensures loop-free connectivity in the event of these failure cases:

- Failure of a link in the access network.
- Failure of a link between the access network and the gateway device.
- Failure of an access device.
- Failure of a gateway device.

**Topology Change Propagation**

There is one case where the two gateway devices need to exchange BPDUs between each other, and this is to handle topology changes in the access network. If a failure in the access network results in a topology change that causes a previously blocked port to move to forwarding, the access device sends a topology change notification out on that port, so as to notify the rest of the network about the change and trigger the necessary...
MAC learning flushes. Typically, the topology change notification is sent towards the root bridge, in the case of access gateway, that means it is sent to one of the gateway devices.

As described above, this causes the gateway device itself to take any necessary action; however, if the failure caused the access network to become partitioned, it may also be necessary to propagate the topology change notification to the rest of the access network, that is, the portion connected to the other gateway device. This can be achieved by ensuring there is connectivity between the gateway devices, so that each gateway device can propagate any topology change notifications it receives from the access network to the other device. When a gateway device receives a BPDU from the other gateway device that indicates a topology change, it signals this in the static BPDUs (that it is sending towards the access network).

Topology Change Propagation is only necessary when these two conditions are met:

- The access network contains three or more access devices. If there are fewer than three devices, then any possible failure must be detected by all the devices.
- The access devices send traffic to each other, and not just to or from the core or aggregation network. If all the traffic is to or from the core or aggregation network, then all the access devices must either already be sending traffic in the right direction, or will learn about the topology change from the access device that originates it.

**Preempt Delay**

One of the assumptions underpinning access gateway is that the gateway devices are always available to provide connectivity to the core or aggregation network. However, there is one situation where this assumption may not hold, which is at bringup time. At bringup, it may be the case that the access facing interface is available before all of the necessary signaling and convergence has completed that means traffic can successfully be forwarded into the core or aggregation network. Since access gateway starts sending BPDUs as soon as the interface comes up, this could result in the access devices sending traffic to the gateway device before it is ready to receive it. To avoid this problem, the preempt delay feature is used.

The preempt delay feature causes access gateway to send out inferior BPDUs for some period of time after the interface comes up, before reverting to the normal values. These inferior BPDUs can be configured such that the access network directs all traffic to the other gateway device, unless the other gateway device is also down. If the other gateway device is unavailable, it is desirable for the traffic to be sent to this device, even if it is only partially available, rather than being dropped completely. For this reason, inferior BPDUs are sent during the preempt delay time, rather than sending no BPDUs at all.

**Supported Access Gateway Protocols**

Access Gateway is supported on Cisco ASR 9000 Series Routers when the following protocols are used in the access network

**Table 3: Protocols**

<table>
<thead>
<tr>
<th>Access Network Protocol</th>
<th>Access Gateway Variant</th>
</tr>
</thead>
<tbody>
<tr>
<td>MSTP</td>
<td>MST Access Gateway (MSTAG)</td>
</tr>
</tbody>
</table>
| REP                     | REP Access gateway (REPAG)
| PVST+                   | PVST+ Access Gateway (PVSTAG) |
1 REP Access Gateway is supported when the access device interfaces that connect to the gateway devices are configured with REP MSTP Compatibility mode.

2 Topology Change Propagation is not supported for PVSTAG.

3 Topology Change Propagation is not supported for PVRSTAG.

### MSTAG Edge Mode

An access gateway is used in a Layer 2 (L2) environment to ensure that for each Multiple Spanning Tree Instance (MSTI), each access device has one path to the core or aggregation network. The core or aggregation network provides L2 (Ethernet) connectivity between two gateway devices. Therefore, when there are no failures, there must be at least one blocked port in the access network for each MSTI. In the case of an access ring, there should be one blocked port in the access ring. For each MSTI – this is typically one of the uplink ports that connects to one of the gateway devices. This is achieved by configuring MSTAG in such a way that the gateway devices appear to have the best path to the best possible Multiple Spanning Tree Protocol (MSTP) root node. Thus, the access devices always use the gateway devices to reach the root, and the ports on the gateway devices are always in the designated forwarding state.

In a mixed Layer 2-Layer 3 environment, the L2 access network is used to provide a Layer 2 service on certain VLANs and a Layer 3 (L3) service on other VLANs. In the access network, a different MSTI is used for the L2 service and the L3 service. For the L2 VLANs, the core or aggregation network provides L2 connectivity between the gateway devices. However, for the L3 service, the gateway devices terminate the L2 network and perform L3 routing. Typically, an L3 redundancy mechanism such as HSRP or VRRP is used to allow the end hosts to route to the correct gateway.

In this scenario, the use of MSTAG alone does not achieve the desired behavior for the L3 MSTI. This is because it results in one of the ports in the access network being blocked, even though there is actually no loop. (This, in turn, is because there is no L2 connectivity between the gateway devices for the L3 VLANs.) In fact, because the gateway devices terminate the L2 network for the L3 VLANs, the desirable behavior is for the MSTP root to be located in the access network, and for the gateway devices to appear as leaf nodes with a single connection. This can be achieved by reversing the MSTAG configuration; that is, setting the gateway devices to advertise the worst possible path to the worst possible root. This forces the access devices to elect one of the access devices as the root, and therefore, no ports are blocked. In this case, the ports on the gateway devices are always in root forwarding state. The MSTAG Edge mode feature enables this scenario.
by changing the role advertised by the gateway devices from designated to root. The following figure illustrates this scenario.

**Figure 52: MSTAG Edge Mode scenario**

- D - Designated port (forwarding)
- R - Root port (forwarding)
- A - Alternate port (blocked)

For normal MSTAG, and for the L2 MSTIs, topology change notifications are propagated from one gateway device to the other, and re-advertised into the access network. However, for the L3 MSTI, this is not desirable. As there is no block for the L3 MSTI in the access network, the topology change notification could loop forever. To avoid that situation, MSTAG Edge mode completely disables handling of topology change notifications in the gateway devices.

**PVSTAG on Bundle Interfaces**

Per-VLAN Spanning Tree Access Gateway (PVSTAG) support has been extended on bundle interfaces, along with physical interfaces, to cater to an increasing number of customers that support PVST access networks.

For physical interfaces, bridge protocol data units (BPDUs) are sent from the line card that hosts the interfaces. However, for bundle interfaces BPDUs are sent from the route processor (RP). When an RP failover occurs,
the data traffic flowing over the bundle interface is not affected; as a result, no BPDUs are sent until the failover is complete and the newly active RP takes over. If there is a delay, the peer device times out the BPDU information. This leads to a forwarding loop, which results in disruption in Ethernet networks. It is therefore important to ensure that, upon RP failover, the peer device does not time out the BPDU information.

**Per-VLAN Rapid Spanning Tree**

Per-VLAN Rapid Spanning Tree (PVRST) or Rapid PVST or PVST+ is the IEEE 802.1w (RSTP) standard implemented per VLAN. A single instance of STP runs on each configured VLAN (if you do not manually disable STP). Each Rapid PVST+ instance on a VLAN has a single root switch. You can enable and disable STP on a per-VLAN basis when you are running Rapid PVST+.

PVRST uses point-to-point wiring to provide rapid convergence of the spanning tree. The spanning tree reconfiguration can occur in less than 1 second with PVRST (in contrast to 50 seconds with the default settings in the 802.1D STP).

**Note**

PVRST supports one STP instance for each VLAN.

Using PVRST, STP convergence occurs rapidly. Each designated or root port in the STP sends out a BPDU every 2 seconds by default. On a designated or root port in the topology, if hello messages are missed three consecutive times, or if the maximum age expires, the port immediately flushes all protocol information in the table. A port considers that it loses connectivity to its direct neighbor root or designated port if it misses three BPDUs or if the maximum age expires. This rapid aging of the protocol information allows quick failure detection.

PVRST achieves rapid transition to the forwarding state only on edge ports and point-to-point links. Although the link type is configurable, the system automatically derives the link type information from the duplex setting of the port. Full-duplex ports are assumed to be point-to-point ports, while half-duplex ports are assumed to be shared ports.

**Disadvantages**

- Increased load in terms of increased packet rate.
- Greater CPU and memory utilization due to one STP instance for every LAN.

**Implementation of PVRST in IOS-XR**

The implementation of PVRST in IOS-XR has the following characteristics:

- Configuration of the Forward Delay and Max Age timers is only supported globally and not per VLAN.
- Configuration of the Hello timer is supported per port and not per VLAN. The Hello timer configured on a port applies to all VLANs on that specific port.
- The cost of a spanning tree bundle port is always 10000. It is not affected by any of the following:
  - Number or speed of the bundle members
  - Logical or administrative operational status of the bundle member ports
  - Addition or deletion of bundle members
- Receiving BPDU on an interface configured with the BPDU Guard error-disables the physical interface as well as any layer-2 or layer-3 sub-interfaces configured on the physical interface.
Only Ethernet Flow-points (EFPs) that are untagged or have a single VLAN tag can be protected by PVRST.

If any one EFP in a bridge-domain is protected by PVRST, then all EFPs in that bridge domain must belong to the same VLAN.

If any one EFP on a port is protected by PVRST, then all EFPs on that port must be protected by PVRST.

Multiple VLAN Registration Protocol

The Multiple VLAN Registration Protocol is defined in IEEE 802.1ak and is used in MSTP based networks to optimize the propagation of multicast and broadcast frames.

By default, multicast and broadcast frames are propagated to every point in the network, according to the spanning tree, and hence to every edge (host) device that is attached to the network. However, for a given VLAN, it may be the case that only certain hosts are interested in receiving the traffic for that VLAN. Furthermore, it may be the case that a given network device, or even an entire segment of the network, has no attached hosts that are interested in receiving traffic for that VLAN. In this case, an optimization is possible by avoiding propagating traffic for that VLAN to those devices that have no stake in it. MVRP provides the necessary protocol signaling that allows each host and device to indicate to its attached peers which VLANs it is interested in.

MVRP-enabled devices can operate in two modes:

- Static mode—In this mode, the device initiates MVRP messages declaring interest in a statically configured set of VLANs. Note that the protocol is still dynamic with respect to the MSTP topology; it is the set of VLANs that is static.

- Dynamic mode—In this mode, the device processes MVRP messages received on different ports, and aggregates them dynamically to determine the set of VLANs it is interested in. It sends MVRP messages declaring interest in this set. In dynamic mode, the device also uses the received MVRP messages to prune the traffic sent out of each port so that traffic is only sent for the VLANs that the attached device has indicated it is interested in.

Cisco ASR 9000 Series Routers support operating in static mode. This is known as MVRP-lite.

How to Implement Multiple Spanning Tree Protocol

This section contains these procedures:

Configuring MSTP

This section describes the procedure for configuring MSTP:

Note

This section does not describe how to configure data switching. Refer to the Implementing Multipoint Layer 2 Services module for more information.
Enabling MSTP

By default, STP is disabled on all interfaces. MSTP should be explicitly enabled by configuration on each physical or Ethernet Bundle interface. When MSTP is configured on an interface, all the subinterfaces of that interface are automatically MSTP-enabled.

Configuring MSTP parameters

The MSTP Standard defines a number of configurable parameters. The global parameters are:

- Region Name and Revision
- Bringup Delay
- Forward Delay
- Max Age or Hops
- Transmit Hold Count
- Provider Bridge mode
- Flush Containment
- VLAN IDs (per spanning-tree instance)
- Bridge Priority (per spanning-tree instance)

The per-interface parameters are:

- External port path cost
- Hello Time
- Link Type
- Port Fast and BPDU Guard
- Root Guard and Topology Change Guard
- Port priority (per spanning-tree instance)
- Internal port path cost (per spanning-tree instance)

Per-interface configuration takes place in an interface submode within the MST configuration submode.

Note

The configuration steps listed in the following sections show all of the configurable parameters. However, in general, most of these can be retained with the default value.
SUMMARY STEPS

1. configure
2. spanning-tree mst protocol instance identifier
3. bringup delay for interval { minutes | seconds }
4. flush containment disable
5. name name
6. revision revision -number
7. forward-delay seconds
8. maximum { age seconds | hops hops }
9. transmit hold-count count
10. provider-bridge
11. instance id
12. priority priority
13. vlan-id vlan-range [ ,vlan-range ] [ ,vlan-range ] [ ,vlan-range ]
14. interface { Bundle-Ether | GigabitEthernet | TenGigE | FastEthernet } instance
15. instance id port-priority priority
16. instance id cost cost
17. external-cost cost
18. link-type { point-to-point | multipoint }
19. hello-time seconds
20. portfast [ bpdu-guard ]
21. guard root
22. guard topology-change
23. Use the commit or end command.

DETAILED STEPS

Step 1  configure

Example:  
RP/0/RSP0/CPU0:router# configure

Enters the Global Configuration mode.

Step 2  spanning-tree mst protocol instance identifier

Example:  
RP/0/RSP0/CPU0:router(config)# spanning-tree mst a  
RP/0/RSP0/CPU0:router(config-mstp)#

Enters the MSTP configuration submode.

Step 3  bringup delay for interval { minutes | seconds }

Example:

RP/0/RSP0/CPU0:router(config-mstp)#bringup delay for 10 minutes

Configures the time interval to delay bringup for.

Step 4 flush containment disable

Example:

RP/0/RSP0/CPU0:router(config-mstp)#flush containment disable

Disable flush containment.
This command performs MAC flush on all instances regardless of the their state.

Step 5 name name

Example:

RP/0/RSP0/CPU0:router(config-mstp)# name m1

Sets the name of the MSTP region.
The default value is the MAC address of the switch, formatted as a text string by means of the hexadecimal representation specified in IEEE Std 802.

Step 6 revision revision -number

Example:

RP/0/RSP0/CPU0:router(config-mstp)# revision 10

Sets the revision level of the MSTP region.
Allowed values are from 0 through 65535.

Step 7 forward-delay seconds

Example:

RP/0/RSP0/CPU0:router(config-mstp)# forward-delay 20

Sets the forward-delay parameter for the bridge.
Allowed values for bridge forward-delay time in seconds are from 4 through 30.

Step 8 maximum { age seconds | hops hops }

Example:

RP/0/RSP0/CPU0:router(config-mstp)# max age 40
RP/0/RSP0/CPU0:router(config-mstp)# max hops 30

Sets the maximum age and maximum hops performance parameters for the bridge.
Allowed values for maximum age time for the bridge in seconds are from 6 through 40.
Allowed values for maximum number of hops for the bridge in seconds are from 6 through 40.
Step 9  transmit hold-count count

Example:
RP/0/RSP0/CPU0:router(config-mstp)# transmit hold-count 8

Sets the transmit hold count performance parameter.
Allowed values are from 1 through 10.

Step 10  provider-bridge

Example:
RP/0/RSP0/CPU0:router(config-mstp)# provider-bridge

Places the current instance of the protocol in 802.1ad mode.

Step 11  instance id

Example:
RP/0/RSP0/CPU0:router(config-mstp)# instance 101
RP/0/RSP0/CPU0:router(config-mstp-inst)#

Enters the MSTI configuration submode.
Allowed values for the MSTI ID are from 0 through 4094.

Step 12  priority priority

Example:
RP/0/RSP0/CPU0:router(config-mstp-inst)# priority 8192

Sets the bridge priority for the current MSTI.
Allowed values are from 0 through 61440 in multiples of 4096.

Step 13  vlan-id vlan-range [ , vlan-range ] [ , vlan-range ] [ , vlan-range ]

Example:
RP/0/RSP0/CPU0:router(config-mstp-inst)# vlan-id 2-1005

Associates a set of VLAN IDs with the current MSTI.
List of VLAN ranges in the form a-b, c, d-e-f, g, and so on.

Note  Repeat steps 11 to 13 for each MSTI.

Step 14  interface { Bundle-Ether | GigabitEthernet | TenGigE | FastEthernet } instance

Example:
RP/0/RSP0/CPU0:router(config-mstp)# interface FastEthernet 0/0/0/1
RP/0/RSP0/CPU0:router(config-mstp-if)#

Enters the MSTP interface configuration submode, and enables STP for the specified port.
Forward interface in Rack/Slot/Instance/Port format.

**Step 15**  
instance id port-priority priority  

**Example:**  
```
RP/0/RSP0/CPU0:router(config-mstp-if)# instance 101 port-priority 160
```
Sets the port priority performance parameter for the MSTI.  
Allowed values for the MSTI ID are from 0 through 4094.  
Allowed values for port priority are from 0 through 240 in multiples of 16.

**Step 16**  
instance id cost cost  

**Example:**  
```
RP/0/RSP0/CPU0:router(config-mstp-if)# instance 101 cost 10000
```
Sets the internal path cost for a given instance on the current port.  
Allowed values for the MSTI ID are from 0 through 4094.  
Allowed values for port cost are from 1 through 200000000.  
Repeat steps 15 and 16 for each MSTI for each interface.

**Step 17**  
external-cost cost  

**Example:**  
```
RP/0/RSP0/CPU0:router(config-mstp-if)# external-cost 10000
```
Sets the external path cost on the current port.  
Allowed values for port cost are from 1 through 200000000.

**Step 18**  
link-type { point-to-point | multipoint }  

**Example:**  
```
RP/0/RSP0/CPU0:router(config-mstp-if)# link-type point-to-point
```
Sets the link type of the port to point-to-point or multipoint.

**Step 19**  
hello-time seconds  

**Example:**  
```
RP/0/RSP0/CPU0:router(config-mstp-if)# hello-time 1
```
Sets the port hello time in seconds.  
Allowed values are 1 and 2.

**Step 20**  
portfast [ bpdu-guard ]
Example:

```
RP/0/RSP0/CPU0:router(config-mstp-if)# portfast
RP/0/RSP0/CPU0:router(config-mstp-if)# portfast bpdu-guard
```

Enables PortFast on the port, and optionally enables BPDU guard.

**Step 21**

```
guard root
```

Example:

```
RP/0/RSP0/CPU0:router(config-mstp-if)# guard root
```

Enables RootGuard on the port.

**Step 22**

```
guard topology-change
```

Example:

```
RP/0/RSP0/CPU0:router(config-mstp-if)# guard topology-change
```

Enables TopologyChangeGuard on the port.

**Note** Repeat steps 14 to 22 for each interface.

**Step 23**

Use the `commit` or `end` command.

- **commit** - Saves the configuration changes and remains within the configuration session.
- **end** - Prompts user to take one of these actions:
  - **Yes** - Saves configuration changes and exits the configuration session.
  - **No** - Exits the configuration session without committing the configuration changes.
  - **Cancel** - Remains in the configuration mode, without committing the configuration changes.

---

**Verifying MSTP**

These show commands allow you to verify the operation of MSTP:

- `show spanning-tree mst mst-name`
- `show spanning-tree mst mst-name interface interface-name`
- `show spanning-tree mst mst-name errors`
- `show spanning-tree mst mst-name configuration`
- `show spanning-tree mst mst-name bpdu interface interface-name`
- `show spanning-tree mst mst-name topology-change flushes`
Configuring MSTAG or REPAG

This section describes the procedures for configuring MSTAG:

The procedures for configuring REPAG are identical.

This section does not describe how to configure data switching. Refer to the Implementing Multipoint Layer 2 Services for more information.

Configuring an untagged subinterface

In order to enable MSTAG on a physical or Bundle Ethernet interface, an L2 subinterface must first be configured which matches untagged packets, using the encapsulation untagged command. Refer to The Cisco ASR 9000 Series Routers Carrier Ethernet Model module for more information about configuring L2 subinterfaces.

Enabling MSTAG

MSTAG is enabled on a physical or Bundle Ethernet interface by explicitly configuring it on the corresponding untagged subinterface. When MSTAG is configured on the untagged subinterface, it is automatically enabled on the physical or Bundle Ethernet interface and on all other subinterfaces on that physical or Bundle Ethernet subinterface.

Configuring MSTAG parameters

MSTAG parameters are configured separately on each interface, and MSTAG runs completely independently on each interface. There is no interaction between the MSTAG parameters on different interfaces (unless they are connected to the same access network).

These parameters are configurable for each interface:

- Region Name and Revision
- Bridge ID
- Port ID
- External port path cost
- Max Age
- Provide Bridge mode
- Hello Time

The following MSTAG parameters are configurable for each interface, for each spanning tree instance:

- VLAN IDs
- Root Bridge Priority and ID
- Bridge Priority
• Port Priority
• Internal Port Path Cost

To ensure consistent operation across the access network, these guidelines should be used when configuring:

• Both gateway devices should be configured with a Root Bridge Priority and ID (for each spanning tree instance) that is better (lower) than the Bridge Priority and Bridge ID of any device in the access network. It is recommended to set the Root Bridge Priority and ID to 0 on the gateway devices.

  To avoid an STP dispute being detected by the access devices, the same root priority and ID should be configured on both gateway devices.

• Both gateway devices should be configured with a Port Path Cost of 0.

• For each spanning tree instance, one gateway device should be configured with the bridge priority and ID that is higher than the root bridge priority and ID, but lower than the bridge priority and ID of any other device in the network (including the other gateway device). It is recommended to set the bridge priority to 0.

• For each spanning tree instance, the second gateway device should be configured with a bridge priority and ID that is higher than the root bridge priority and ID and the first gateway device bridge priority and ID, but lower than the bridge priority and ID of any device in the access network. It is recommended to set the bridge priority to 4096 (this is the lowest allowable value greater than 0).

• All of the access devices should be configured with a higher bridge priority than the gateway devices. It is recommended to use values of 8192 or higher.

• For each spanning tree instance, the port path cost and other parameters may be configured on the access devices so as to ensure the desired port is put into the blocked state when all links are up.

  There are no checks on MSTAG configuration—misconfiguration may result in incorrect operation of the MSTP protocol in the access devices (for example, an STP dispute being detected).

  The guidelines above are illustrated in the following figure.
These guidelines do not apply to REPAG, as in that case the access devices ignore the information received from the gateway devices apart from when a topology change is signalled.

Figure 53: MSTAG Guidelines

The configuration steps listed in the following sections show all of the configurable parameters. However, in general, most of these can be retained with the default values.
SUMMARY STEPS

1. configure
2. spanning-tree mstag protocol instance identifier
3. preempt delay for interval { seconds | minutes | hours }
4. interface { Bundle-Ether | GigabitEthernet | TenGigE | FastEthernet } instance.subinterface
5. name name
6. revision revision -number
7. max age seconds
8. provider-bridge
9. bridge-id id
10. port-id id
11. external-cost cost
12. hello-time seconds
13. instance id
14. edge mode
15. vlan-id vlan-range [ , vlan-range ] [ ,vlan-range ] [ ,vlan-range ]
16. priority priority
17. port-priority priority
18. cost cost
19. root-bridge id
20. root-priority priority
21. Use the commit or end command.

DETAILED STEPS

Step 1  configure
Example:
RP/0/RSP0/CPU0:router# configure
Enters the Global Configuration mode.

Step 2  spanning-tree mstag protocol instance identifier
Example:
RP/0/RSP0/CPU0:router(config)# spanning-tree mstag a
RP/0/RSP0/CPU0:router(config-mstag)#
Enters the MSTAG configuration submode.

Step 3  preempt delay for interval { seconds | minutes | hours }

Example:

```
RP/0/RSP0/CPU0:router(config-mstag)# preempt delay for 10 seconds
```

Specifies the delay period during which startup BPDUs should be sent, before preempting.

**Step 4**

```
interface { Bundle-Ether | GigabitEthernet | TenGigE | FastEthernet } instance.subinterface
```

Example:

```
RP/0/RSP0/CPU0:router(config-mstag)# interface GigabitEthernet0/2/0/30.1
RP/0/RSP0/CPU0:router(config-mstag-if)#
```

Enters the MSTAG interface configuration submode, and enables MSTAG for the specified port.

**Step 5**

```
name name
```

Example:

```
RP/0/RSP0/CPU0:router(config-mstag-if)# name leo
```

Sets the name of the MSTP region.
The default value is the MAC address of the switch, formatted as a text string using the hexadecimal representation specified in IEEE Standard 802.

**Step 6**

```
revision revision -number
```

Example:

```
RP/0/RSP0/CPU0:router(config-mstag-if)# revision 1
```

Sets the revision level of the MSTP region.
Allowed values are from 0 through 65535.

**Step 7**

```
max age seconds
```

Example:

```
RP/0/RSP0/CPU0:router(config-mstag-if)# max age 20
```

Sets the maximum age performance parameters for the bridge.
Allowed values for the maximum age time for the bridge in seconds are from 6 through 40.

**Step 8**

```
provider-bridge
```

Example:

```
RP/0/RSP0/CPU0:router(config-mstag-if)# provider-bridge
```

Places the current instance of the protocol in 802.1ad mode.

**Step 9**

```
bridge-id id
```

Example:

```
RP/0/RSP0/CPU0:router(config-mstag-if)# bridge-id 001c.0000.0011
```

Sets the bridge ID for the current switch.

**Step 10**

```
port-id id
```

Example:

```
RP/0/RSP0/CPU0:router(config-mstag-if)# port-id 111
```

Sets the port ID for the current switch.

**Step 11**

```
external-cost cost
```

Example:

```
RP/0/RSP0/CPU0:router(config-mstag-if)# external-cost 10000
```

Sets the external path cost on the current port.

Allowed values for port cost are from 1 through 200000000.

**Step 12**

```
hello-time seconds
```

Example:

```
RP/0/RSP0/CPU0:router(config-mstag-if)# hello-time 1
```

Sets the port hello time in seconds.

Allowed values are from 1 through 2.

**Step 13**

```
instance id
```

Example:

```
RP/0/RSP0/CPU0:router(config-mstag-if)# instance 1
```

Enters the MSTI configuration submode.

Allowed values for the MSTI ID are from 0 through 4094.

**Step 14**

```
edge mode
```

Example:

```
RP/0/RSP0/CPU0:router(config-mstag-if-inst)# edge mode
```

Enables access gateway edge mode for this MSTI.

**Step 15**

```
vlan-id vlan-range [ , vlan-range ] [ , vlan-range ] [ , vlan-range ]
```

Example:

```
RP/0/RSP0/CPU0:router(config-mstag-if-inst)# vlan-id 2-1005
```
Associates a set of VLAN IDs with the current MSTI.
List of VLAN ranges in the form a-b, c, d, e-f, g, and so on.

**Step 16**  
**priority**  
Example:  
```
RP/0/RSP0/CPU0:router(config-mstag-if-inst)# priority 4096
```
Sets the bridge priority for the current MSTI.  
Allowed values are from 0 through 61440 in multiples of 4096.

**Step 17**  
**port-priority**  
Example:  
```
RP/0/RSP0/CPU0:router(config-mstag-if-inst)# port-priority 160
```
Sets the port priority performance parameter for the MSTI.  
Allowed values for port priority are from 0 through 240 in multiples of 16.

**Step 18**  
**cost**  
Example:  
```
RP/0/RSP0/CPU0:router(config-mstag-if-inst)# cost 10000
```
Sets the internal path cost for a given instance on the current port.  
Allowed values for port cost are from 1 through 20000000.

**Step 19**  
**root-bridge**  
Example:  
```
RP/0/RSP0/CPU0:router(config-mstag-if-inst)# root-id 001c.0000.0011
```
Sets the root bridge ID for the BPDUs sent from the current port.

**Step 20**  
**root-priority**  
Example:  
```
RP/0/RSP0/CPU0:router(config-mstag-if-inst)# root-priority 4096
```
Sets the root bridge priority for the BPDUs sent from this port.

**Note**  
Repeat steps 4 to 19 to configure each interface, and repeat steps 13 to 19 to configure each MSTI for each interface.

**Step 21**  
Use the **commit** or **end** command.  
**commit** - Saves the configuration changes and remains within the configuration session.  
**end** - Prompts user to take one of these actions:  
- **Yes** - Saves configuration changes and exits the configuration session.
• **No** - Exits the configuration session without committing the configuration changes.
• **Cancel** - Remains in the configuration mode, without committing the configuration changes.

---

**Configuring MSTAG Topology Change Propagation**

MSTAG Topology Change Propagation is configured simply by configuring connectivity between the MSTAG-enabled interfaces on the two gateway devices:

1. Configure MSTAG as described above. Take note of the untagged subinterface that is used.
2. Configure connectivity between the gateway devices. This may be via an MPLS Pseudowire, or may be a VLAN subinterface if there is a direct physical link.
3. Configure a point-to-point (P2P) cross-connect on each gateway device that contains the untagged subinterface and the link (PW or subinterface) to the other gateway device.

Once the untagged subinterface that is configured for MSTAG is added to the P2P cross-connect, MSTAG Topology Change Propagation is automatically enabled. MSTAG forwards BDPUs via the cross-connect to the other gateway device, so as to signal when a topology change has been detected.

For more information on configuring MPLS pseudowire or P2P cross-connects, refer to the [Implementing Point to Point Layer 2 Services](#) module.

**Verifying MSTAG**

These show commands allow you to verify the operation of MSTAG:

• `show spanning-tree mstag mst-name`
• `show spanning-tree mstag mst-name bpdu interface interface-name`
• `show spanning-tree mstag mst-name topology-change flushes`

Analogous commands are available for REPAG.

**Configuring PVSTAG or PVRSTAG**

This section describes the procedures for configuring PVSTAG:

The procedures for configuring PVRSTAG are identical.

---

**Note**

This section does not describe how to configure data switching. Refer to the [Implementing Multipoint Layer 2 Services](#) module for more information.
Enabling PVSTAG

PVSTAG is enabled for a particular VLAN, on a physical interface, by explicit configuration of that physical interface and VLAN for PVSTAG.

Configuring PVSTAG parameters

The configurable PVSTAG parameters for each interface on each VLAN are:

- Root Priority and ID
- Root cost
- Bridge Priority and ID
- Port priority and ID
- Max Age
- Hello Time

For correct operation, these guidelines must be followed when configuring PVSTAG.

- Both gateway devices should be configured with a root bridge priority and ID that is better (lower) than the bridge priority and Bridge ID of any device in the access network. It is recommended that you set the root bridge priority and ID to 0 on the gateway devices.
- Both gateway devices should be configured with a root cost of 0.
- One gateway device should be configured with the bridge priority and ID that is higher than the root bridge priority and ID, but lower than the bridge priority and ID of any other device in the network (including the other gateway device). It is recommended that you set the bridge priority to 0.
- The second gateway device should be configured with a bridge priority and ID that is higher than the root bridge priority and ID and the first gateway device bridge priority and ID, but lower than the bridge priority and ID of any device in the access network. It is recommended that you set the bridge priority to 1 for PVSTAG or 4096 for PVRSTAG. (For PVRSTAG, this is the lowest allowable value greater than 0.)
- All access devices must be configured with a higher bridge priority than the gateway devices. It is recommended that you use values of 2 or higher for PVSTAG, or 8192 or higher for PVRSTAG.
- For each spanning tree instance, the port path cost and other parameters may be configured on the access devices, so as to ensure the desired port is placed into the blocked state when all links are up.

Caution

There are no checks on PVSTAG configuration—misconfiguration may result in incorrect operation of the PVST protocol in the access devices (for example, an STP dispute being detected).
These guidelines are illustrated in the following figure:

**Figure 54: PVSTAG Guidelines**

![Diagram of PVSTAG Guidelines]

*Note*

The configuration steps listed in the following sections show all of the configurable parameters. However, in general, most of these can be retained with the default values.

**PVSTAG Topology Restrictions**

These restrictions are applicable to PVSTAG topology:

- Only a single access device can be attached to the gateway devices.
- Topology change notifications on a single VLAN affect all VLANs and bridge domains on that physical interface.
SUMMARY STEPS

1. configure
2. spanning-tree mstag pvstag protocol instance identifier
3. preempt delay for interval { seconds | minutes | hours }
4. interface type interface-path-id or interface Bundle-Ether bundle-id
5. vlan vlan-id
6. root-priority priority
7. root-id id
8. root-cost cost
9. priority priority
10. bridge-id id
11. port-priority priority
12. port-id id
13. hello-time seconds
14. max age seconds
15. Use the commit or end command.

DETAILED STEPS

Step 1  configure

Example:
RP/0/RSP0/CPU0:router# configure
Enters the Global Configuration mode.

Step 2  spanning-tree mstag pvstag protocol instance identifier

Example:
RP/0/RSP0/CPU0:router(config)# spanning-tree pvstag a
RP/0/RSP0/CPU0:router(config-pvstag)#
Enters the PVSTAG configuration submode.

Step 3  preempt delay for interval { seconds | minutes | hours }

Example:
RP/0/RSP0/CPU0:router(config-pvstag)# preempt delay for 10 seconds
Specifies the delay period during which startup BPDUs should be sent, before preempting.

Step 4  interface type interface-path-id or interface Bundle-Ether bundle-id
Example:

RP/0/RSP0/CPU0:router(config-pvstag)# interface GigabitEthernet0/2/0/30.1
RP/0/RSP0/CPU0:router(config-pvstag-if)#

or

RP/0/RSP0/CPU0:router(config-pvstag)# interface Bundle-Ether 100
RP/0/RSP0/CPU0:router(config-pvstag-if)#

Enters the PVSTAG interface configuration submode, and enables PVSTAG for the specified port.

Step 5  `vlan vlan-id`

Example:

RP/0/RSP0/CPU0:router(config-pvstag-if)# vlan 200

Enables and configures a VLAN on this interface.

Step 6  `root-priority priority`

Example:

RP/0/RSP0/CPU0:router(config-pvstag-if-vlan)# root-priority 4096

Sets the root bridge priority for the BPDUs sent from this port.

Step 7  `root-id id`

Example:

RP/0/RSP0/CPU0:router(config-pvstag-if-vlan)# root-id 0000.0000.0000

Sets the identifier of the root bridge for BPDUs sent from a port.

Step 8  `root-cost cost`

Example:

RP/0/RSP0/CPU0:router(config-pvstag-if-vlan)# root-cost 10000

Set the root path cost to sent in BPDUs from this interface.

Step 9  `priority priority`

Example:

RP/0/RSP0/CPU0:router(config-pvstag-if-vlan)# priority 4096

Sets the bridge priority for the current MSTI.

For PVSTAG, allowed values are from are 0 through 65535; for PVRSTAG, the allowed values are from 0 through 61440 in multiples of 4096.

Step 10  `bridge-id id`
Example:

RP/0/RSP0/CPU0:router(config-pvstag-if-vlan)# bridge-id 001c.0000.0011

Sets the bridge ID for the current switch.

Step 11  port-priority priority

Example:

RP/0/RSP0/CPU0:router(config-pvstag-if-vlan)# port-priority 160

Sets the port priority performance parameter for the MSTI.
For PVSTAG, allowed values for port priority are from 0 through 255; for PVRSTAG, the allowed values are from 0 through 240 in multiples of 16.

Step 12  port-id id

Example:

RP/0/RSP0/CPU0:router(config-pvstag-if-vlan)# port-id 111

Sets the port ID for the current switch.

Step 13  hello-time seconds

Example:

RP/0/RSP0/CPU0:router(config-pvstag-if-vlan)# hello-time 1

Sets the port hello time in seconds.
Allowed values are from 1 through 2.

Step 14  max age seconds

Example:

RP/0/RSP0/CPU0:router(config-pvstag-if-vlan)# max age 20

Sets the maximum age performance parameters for the bridge.
Allowed values for the maximum age time for the bridge in seconds are from 6 through 40.

Note  Repeat steps 4 to 14 to configure each interface; repeat steps 5 to 14 to configure each VLAN on each interface.

Step 15  Use the commit or end command.
commit - Saves the configuration changes and remains within the configuration session.
end - Prompts user to take one of these actions:
  • Yes - Saves configuration changes and exits the configuration session.
  • No - Exits the configuration session without committing the configuration changes.
  • Cancel - Remains in the configuration mode, without committing the configuration changes.
Configuring Subinterfaces

For each VLAN that is enabled for PVSTAG on an interface, a corresponding subinterface that matches traffic for that VLAN must be configured. This is used both for data switching and for PVST BPDUs. Follow these guidelines when configuring subinterfaces:

- VLAN 1 is treated as the native VLAN in PVST. Therefore, for VLAN 1, a subinterface that matches untagged packets (encapsulation untagged) must be configured. It may also be necessary to configure a subinterface that matches packets tagged explicitly with VLAN 1 (encapsulation dot1q 1).

- Only dot1q packets are allowed in PVST; Q-in-Q and dot1ad packets are not supported by the protocol, and therefore subinterfaces configured with these encapsulation will not work correctly with PVSTAG.

- Subinterfaces that match a range of VLANs are supported by PVSTAG; it is not necessary to configure a separate subinterface for each VLAN, unless it is desirable for provisioning the data switching.

- PVSTAG does not support:
  - Physical interfaces configured in L2 mode
  - Subinterface configured with a default encapsulation (encapsulation default)
  - Subinterfaces configured to match any VLAN (encapsulation dot1q any)

For more information about configuring L2 subinterfaces, refer to the Implementing Point to Point Layer 2 Services module.

Verifying PVSTAG

These show commands allow you to verify the operation of PVSTAG or PVRSTAG:

- show spanning-tree pvstag mst-name
- show spanning-tree pvstag mst-name

In particular, these commands display the subinterface that is being used for each VLAN.

Configuring PVRST

Before You Begin

Ensure that:

- L2transport subinterfaces with VLAN encapsulation are defined.
- L2VPN bridge domains under bridge group for every VLAN running spanning tree are configured, and corresponding l2transport subinterfaces are configured in the bridge-domain.
SUMMARY STEPS

1. configure
2. spanning-tree pvrst protocol-instance-name
3. apply-group group_name group_name
4. forward-delay seconds
5. maximum age seconds
6. transmit hold-count count
7. vlan vlan_id
8. Use the commit or end command.

DETAILED STEPS

Step 1 configure

Example:
RP/0/RSP0/CPU0:router# configure
Enters the Global Configuration mode.

Step 2 spanning-tree pvrst protocol-instance-name

Example:
RP/0/RSP0/CPU0:router(config)# spanning-tree pvrst stp
Enters the PVRST configuration submode.

Step 3 apply-group group_name group_name

Example:
RP/0/RSP0/CPU0:router(config-pvrst)# apply-group groupA groupB
Allows you to apply configuration from one group to another.

Step 4 forward-delay seconds

Example:
RP/0/RSP0/CPU0:router(config-pvrst)# forward-delay 10
Allows you to configure bridge forward delay time in seconds.
The forward delay is the number of seconds a port waits before changing from its spanning-tree learning and listening states to the forwarding state. The delay time range is from 4 to 30.

Step 5 maximum age seconds
Example:

RP/0/RSP0/CPU0:router(config-pvrst)# maximum age 10

Specifies maximum age for the bridge in seconds. The maximum-aging time is the number of seconds a switch waits without receiving spanning-tree configuration messages before attempting a reconfiguration. The maximum age range is from 6 to 40 seconds.

Step 6 transmit hold-count count

Example:

RP/0/RSP0/CPU0:router(config-pvrst)# transmit hold-count 4

Allows you to configure bridge transmit hold count. The hold count range is from 1 to 10.

Step 7 vlan vlan_id

Example:

RP/0/RSP0/CPU0:router(config-pvrst)#

Allows you to configure PVRST on a VLAN. The VLAN ID range is from 1 to 4094.

Step 8 Use the commit or end command.

commit - Saves the configuration changes and remains within the configuration session.

end - Prompts user to take one of these actions:

- **Yes** - Saves configuration changes and exits the configuration session.
- **No** - Exits the configuration session without committing the configuration changes.
- **Cancel** - Remains in the configuration mode, without committing the configuration changes.

---

### Configuring MVRP-lite

This section describes the procedure for configuring MVRP-lite:

**Enabling MVRP-lite**

When MVRP-lite is configured, it is automatically enabled on all interfaces where MSTP is enabled. MSTP must be configured before MVRP can be enabled. For more information on configuring MSTP, see Configuring MSTP.

**Configuring MVRP-lite parameters**

The configurable MVRP-lite parameters are:
SUMMARY STEPS

1. configure
2. spanning-tree mst protocol instance identifier
3. mvrp static
4. periodic transmit [ interval seconds ]
5. join-time milliseconds
6. leave-time seconds
7. leaveall-time seconds
8. Use the commit or end command.

DETAILED STEPS

Step 1 configure

Example:
RP/0/RSP0/CPU0:router# configure
Enters Global Configuration mode.

Step 2 spanning-tree mst protocol instance identifier

Example:
RP/0/RSP0/CPU0:router(config)# spanning-tree mst a
RP/0/RSP0/CPU0:router(config-mstp)#
Enters the MSTP configuration submode.

Step 3 mvrp static

Example:
RP/0/RSP0/CPU0:router(config-mstp)#mvrp static
Configures MVRP to run over this MSTP protocol instance.

Step 4 periodic transmit [ interval seconds ]

Example:
RP/0/RSP0/CPU0:router(config-mvrp)#
periodic transmit
Sends periodic Multiple VLAN Registration Protocol Data Unit (MVRPDU) on all active ports.
Step 5  join-time milliseconds

Example:
RP/0/RSP0/CPU0:router(config-mvrp)#
   hello-time 1

Sets the join time for all active ports.

Step 6  leave-time seconds

Example:
RP/0/RSP0/CPU0:router(config-mvrp)# leave-time 20

Sets the leave time for all active ports.

Step 7  leaveall-time seconds

Example:
RP/0/RSP0/CPU0:router(config-mvrp)# leaveall-time 20

Sets the leave all time for all active ports.

Step 8  Use the commit or end command.
commit - Saves the configuration changes and remains within the configuration session.
end - Prompts user to take one of these actions:
   • Yes - Saves configuration changes and exits the configuration session.
   • No - Exits the configuration session without committing the configuration changes.
   • Cancel - Remains in the configuration mode, without committing the configuration changes.

Verifying MVRP-lite

These show commands allow you to verify the operation of MVRP-lite:
   • show ethernet mvrp mad
   • show ethernet mvrp status
   • show ethernet mvrp statistics

Configuration Examples for Implementing MSTP

This section provides configuration examples for the following:
Configuring MSTP: Examples

This example shows MSTP configuration for a single spanning-tree instance with MSTP enabled on a single interface:

```
config
spanning-tree mst example
  name m1
  revision 10
  forward-delay 20
  maximum hops 40
  maximum age 40
  transmit hold-count 8
  provider-bridge
  bringup delay for 60 seconds
  flush containment disable
  instance 101
    vlans-id 101-110
    priority 8192
  !
  interface GigabitEthernet0/0/0/0
    hello-time 1
    external-cost 10000
    link-type point-to-point
    portfast
    guard root
    guard topology-change
    instance 101 cost 10000
    instance 101 port-priority 160
  !
```

This example shows the output from the `show spanning-tree mst` command, which produces an overview of the spanning tree protocol state:

```
# show spanning-tree mst example
Role: ROOT=Root, DSGN=Designated, ALT=Alternate, BKP=Backup, MSTR=Master
State: FWD=Forwarding, LRN=Learning, BLK=Blocked, DLY=Bringup Delayed

Operating in dot1q mode

MSTI 0 (CIST):
  VLANS Mapped: 1-9,11-4094
  CIST Root  Priority 4096
    Address 6262.6262.6262
    This bridge is the CIST root
    Ext Cost 0
  Root ID  Priority 4096

</tbody>
</table>

In the show spanning-tree mst example output, the first line indicates whether MSTP is operating in dot1q or the Provider Bridge mode, and this information is followed by details for each MSTI.

For each MSTI, the following information is displayed:

- The list of VLANs for the MSTI.
- For the CIST, the priority and bridge ID of the CIST root, and the external path cost to reach the CIST root. The output also indicates if this bridge is the CIST root.
- The priority and bridge ID of the root bridge for this MSTI, and the internal path cost to reach the root. The output also indicates if this bridge is the root for the MSTI.
- The max age and forward delay times received from the root bridge for the MSTI.
- The priority and bridge ID of this bridge, for this MSTI.
- The maximum age, forward delay, max hops and transmit hold-count for this bridge (which is the same for every MSTI).
- A list of MSTP-enabled interfaces. For each interface, the following information is displayed:
  - The interface name
  - The port priority and port ID for this interface for this MSTI.
  - The port cost for this interface for this MSTI.
  - The current port role:
    - DSGN—Designated: This is the designated port on this LAN, for this MSTI
    - ROOT—Root: This is the root port for the bridge for this MSTI.
    - ALT—Alternate: This is an alternate port for this MSTI.
    - BKP—Backup: This is a backup port for this MSTI
    - MSTR—Master: This is a boundary port that is a root or alternate port for the CIST.

The interface is down, or the bringup delay timer is running and no role has been assigned yet.
• The current port state:
  * BLK—The port is blocked.
  * LRN—The port is learning.
  * FWD—The port is forwarding.
  * DLY—The bringup-delay timer is running.

• If the port is a boundary port, and not CIST and the port is not designated, then only the BOUNDARY PORT is displayed and the remaining information is not displayed.

• If the port is not up, or the bringup delay timer is running, no information is displayed for the remaining fields. Otherwise, the bridge priority and bridge ID of the designated bridge on the LAN that the interface connects to is displayed, followed by the port priority and port ID of the designated port on the LAN. If the port role is Designated, then the information for this bridge or port is displayed.

The following example shows the output from the `show spanning-tree mst` command, which produces more detailed information regarding interface state than the standard command as described above:

```bash
# show spanning-tree mst a interface GigabitEthernet0/1/2/1
GigabitEthernet0/1/2/1
Cost: 20000
link-type: point-to-point
hello-time 1
Portfast: no
BPDU Guard: no
Guard root: no
Guard topology change: no
BPDUs sent 492, received 3

MST 3:
  Edge port:
  Boundary : internal
  Designated forwarding
  Vlans mapped to MST 3: 1-2,4-2999,4000-4094
  Port info port id 128.193 cost 200000
  Designated root address 0050.3e66.d000 priority 8193 cost 20004
  Designated bridge address 0002.172c.f400 priority 49152 port id 128.193
  Timers: message expires in 0 sec, forward delay 0, forward transitions 1
  Transitions to reach this state: 12
```

The output includes interface information about the interface which applies to all MSTIs:

• Cost
• link-type
• hello-time
• portfast (including whether BPDU guard is enabled)
• guard root
• guard topology change
• BPDUs sent, received.

It also includes information specific to each MSTI:

• Port ID, priority, cost
• BPDU information from root (bridge ID, cost, and priority)
• BPDU information being sent on this port (Bridge ID, cost, priority)
• State transitions to reach this state.
• Topology changes to reach this state.
• Flush containment status for this MSTI.

This example shows the output of `show spanning-tree mst errors`, which produces information about interfaces that are configured for MSTP but where MSTP is not operational. Primarily this shows information about interfaces which do not exist:

```bash
# show spanning-tree mst a errors
Interface Error
-------------------------------
GigabitEthernet1/2/3/4 Interface does not exist.
```

This example shows the output of `show spanning-tree mst configuration`, which displays the VLAN ID to MSTI mapping table. It also displays the configuration digest which is included in the transmitted BPDUs—this must match the digest received from other bridges in the same MSTP region:

```bash
# show spanning-tree mst a configuration
Name leo
Revision 2702
Config Digest 9D-14-5C-26-7D-8E-9F-B5-D8-93-0A-1B-E3-BA-08-CE
Instance Vlans mapped
-------- -------------------------------
0 1-9,11-19,21-29,31-39,41-4094
1 10,20,30,40
------------------------------------------
```

This example shows the output of `show spanning-tree mst`, which produces details on the BPDUs being output and received on a given local interface:

```bash
# show spanning-tree mst a bpdu interface GigabitEthernet0/1/2/2 direction transmit
MSTI 0 (CIST):
  Root ID : 0004.9b78.0800
  Path Cost : 83
  Bridge ID : 0004.9b78.0800
  Port ID : 12
  Hello Time : 2
  ...
```

This example shows the output of `show spanning-tree mst`, which displays details about the topology changes that have occurred for each MSTI on each interface:

```bash
# show spanning-tree mst M topology-change flushes instance$
MSTI 1:
Interface Last TC Reason Count
---------- ------------------------------- ------
Te0/0/0/1 04:16:05 Mar 16 2010 Role change: DSGN to ---- 10
```

```
# show spanning-tree mst M topology-change flushes instance$
MSTI 0 (CIST):
Interface Last TC Reason Count
---------- ------------------------------- ------
Te0/0/0/1 04:16:05 Mar 16 2010 Role change: DSGN to ---- 10
```

---

Note
Several received packets can be stored in case of MSTP operating on a shared LAN.

```bash
# show spanning-tree mst a bpdu interface GigabitEthernet0/1/2/2 direction transmit
MSTI 0 (CIST):
  Root ID : 0004.9b78.0800
  Path Cost : 83
  Bridge ID : 0004.9b78.0800
  Port ID : 12
  Hello Time : 2
  ...
```

This example shows the output of `show spanning-tree mst`, which displays details about the topology changes that have occurred for each MSTI on each interface:

```bash
# show spanning-tree mst M topology-change flushes instance$
MSTI 1:
Interface Last TC Reason Count
---------- ------------------------------- ------
Te0/0/0/1 04:16:05 Mar 16 2010 Role change: DSGN to ---- 10
```

```
# show spanning-tree mst M topology-change flushes instance$
MSTI 0 (CIST):
Interface Last TC Reason Count
---------- ------------------------------- ------
Te0/0/0/1 04:16:05 Mar 16 2010 Role change: DSGN to ---- 10
```
Configuring MSTAG: Examples

This example shows MSTAG configuration for a single spanning-tree instance on a single interface:

```
config
interface GigabitEthernet0/0/0/0.1 l2transport
   encapsulation untagged
!
spanning-tree mstag example
preempt delay for 60 seconds
interface GigabitEthernet0/0/0/0.1
   name m1
   revision 10
   external-cost 0
   bridge-id 0.0.1
   port-id 1
   maximum age 40
   provider-bridge
   hello-time 1
   instance 101
      edge-mode
      vlans-id 101-110
      root-priority 0
      root-id 0.0.0
      cost 0
      priority 0
      port-priority 0
!
```

This example shows additional configuration for MSTAG Topology Change Propagation:

```
l2vpn
   xconnect group example
      p2p mstag-example
         interface GigabitEthernet0/0/0/0.1
         neighbor 123.123.123.1 pw-id 100
!
```

This example shows the output of `show spanning-tree mstag`:

```
# show spanning-tree mstag
GigabitEthernet0/0/0/1
   Preempt delay is disabled.
   Name: 6161:6161:6161
   Revision: 0
   Max Age: 20
   Provider Bridge: no
   Bridge ID: 6161.6161.6161
   Port ID: 1
   External Cost: 0
   Hello Time: 2
   Active: no
   BPDUs sent: 0
   MSTI 0 (CIST):

  Hello Time: 2
  Active: no
  BPDUs sent: 0
  Topology Changes: 123
  VLAN 20
```

Configuring PVSTAG on a Cluster with a Satellite: Example

This example shows application of PVSTAG in a cluster illustrated in the following network topology diagram. For higher scale fanout, the cluster has satellite switches. The cluster provides L3 termination through a routed interface (BVI). There is no VPLS in the core. PVSTAG is configured in this scenario with the single purpose of eliminating full spanning tree from the cluster.
To simplify this PVSTAG example, there is only one access switch in the network topology. In a real scenario, you can replace this with a ring of access switches.

*Figure 55: PVSTAG on a Cluster with a Satellite*

**Cluster Configuration:**

```bash

Configuring PVRST: Example

This example shows a sample PVRST configuration.

```
(config)# spanning-tree pvrst stp1
(config-pvrst)# forward-delay 6
(config-pvrst)# interface GigabitEthernet 0/1/0/2 hello-time 2
(config-pvrst)# maximum age 35
(config-pvrst)# transmit hold-count 9
(config-pvrst)# vlan 666 priority 4096
(config-pvrst)# commit
```

Configuring MVRP-Lite: Examples

This example shows MVRP-lite configuration:

```
config
spanning-tree mst example
mvrp static
   periodic transmit
   join-time 200
   leave-time 30
   leave-all-time 10
!
```

This example shows the output of `show ethernet mvrp mad`:

```
RP/0/RSP0/CPU0:router# show ethernet mvrp mad interface GigabitEthernet 0/1/0/1
GigabitEthernet0/1/0/1
   Participant Type: Full; Point-to-Point: Yes
   Admin Control: Applicant Normal; Registrar Normal
   LeaveAll Passive (next in 5.92s); periodic disabled
   Leave in 25.70s; Join not running
   Last peer 0293.6926.9585; failed registrations: 0
   VID   Applicant Registrar
   ----  --------------  ---------
          Very Anxious Observer Leaving
          283 Quiet Passive Empty
```

This example shows the output of `show ethernet mvrp status`:

```
RP/0/RSP0/CPU0:router# show ethernet mvrp status interface GigabitEthernet 0/1/0/1
GigabitEthernet0/1/0/1
   Statically declared: 1-512,768,980-1034
   Dynamically declared: 2048-3084
```
This example shows the output of `show ethernet mvrp statistics`:

```
RP/0/RSP0/CPU0:router# show ethernet mvrp statistics interface GigabitEthernet 0/1/0/1
GigabitEthernet0/1/0/1
MVRPDU s TX: 1245
MVRPDU s RX: 7
Dropped TX: 0
Dropped RX: 42
Invalid RX: 12
```
Implementing of Layer 2 Access Lists

An Ethernet services access control list (ACL) consists of one or more access control entries (ACE) that collectively define the Layer 2 network traffic profile. This profile can then be referenced by Cisco IOS XR software features. Each Ethernet services ACL includes an action element (permit or deny) based on criteria such as source and destination address, Class of Service (CoS), or VLAN ID.

This module describes tasks required to implement Ethernet services access lists on your Cisco ASR 9000 Series Aggregation Services Router.

For a complete description of the Ethernet services access list commands listed in this module, refer to the Ethernet Services (Layer 2) Access List Commands on Cisco ASR 9000 Series Routers module in the Cisco ASR 9000 Series Aggregation Services Router IP Addresses and Services Command Reference publication. To locate documentation of other commands that appear in this chapter, use the command reference master index, or search online.

Feature History for Implementing Ethernet Services Access Lists on Cisco ASR 9000 Series Routers

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This feature was introduced on Cisco ASR 9000 Series Routers.</td>
</tr>
</tbody>
</table>

- Prerequisites for Implementing Layer 2 Access Lists, page 445
- Information About Implementing Layer 2 Access Lists, page 446
- How to Implement Layer 2 Access Lists, page 448
- Configuration Examples for Implementing Layer 2 Access Lists, page 453

Prerequisites for Implementing Layer 2 Access Lists

This prerequisite applies to implement access lists and prefix lists:

You must be in a user group associated with a task group that includes the proper task IDs. The command reference guides include the task IDs required for each command.
If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Information About Implementing Layer 2 Access Lists

Ethernet Services Access Lists Feature Highlights

Ethernet services access lists have these feature highlights:

- The ability to clear counters for an access list using a specific sequence number.
- The ability to copy the contents of an existing access list to another access list.
- Allows users to apply sequence numbers to permit or deny statements and to resequence, add, or remove such statements from a named access list.
- Provides packet filtering on interfaces to forward packets.
- Ethernet services ACLs can be applied on interfaces, VLAN subinterfaces, bundle-Ethernet interfaces, EFPs, and EFPs over bundle-Ethernet interfaces. Atomic replacement of Ethernet services ACLs is supported on these physical interfaces.

Purpose of Ethernet Services Access Lists

Using ACL-based forwarding (ABF), Ethernet services access lists perform packet filtering to control which packets move through the network and where. Such controls help to limit incoming and outgoing network traffic and restrict the access of users and devices to the network at the port level.

How an Ethernet Services Access List Works

An Ethernet services access list is a sequential list consisting of permit and deny statements that apply to Layer 2 configurations. The access list has a name by which it is referenced.

An access list can be configured and named, but it is not in effect until the access list is referenced by a command that accepts an access list. Multiple commands can reference the same access list. An access list can control Layer 2 traffic arriving at the router or leaving the router, but not traffic originating at the router.

Ethernet Services Access List Process and Rules

Use this process and rules when configuring an Ethernet services access list:

- The software tests the source or destination address of each packet being filtered against the conditions in the access list, one condition (permit or deny statement) at a time.
- If a packet does not match an access list statement, the packet is then tested against the next statement in the list.
- If a packet and an access list statement match, the remaining statements in the list are skipped and the packet is permitted or denied as specified in the matched statement. The first entry that the packet matches
determines whether the software permits or denies the packet. That is, after the first match, no subsequent entries are considered.

- If the access list denies the address or protocol, the software discards the packet.
- If no conditions match, the software drops the packet because each access list ends with an unwritten or implicit deny statement. That is, if the packet has not been permitted or denied by the time it was tested against each statement, it is denied.
- The access list should contain at least one permit statement or else all packets are denied.
- Because the software stops testing conditions after the first match, the order of the conditions is critical. The same permit or deny statements specified in a different order could result in a packet being passed under one circumstance and denied in another circumstance.
- Inbound access lists process packets arriving at the router. Incoming packets are processed before being routed to an outbound interface. An inbound access list is efficient because it saves the overhead of routing lookups if the packet is to be discarded because it is denied by the filtering tests. If the packet is permitted by the tests, it is then processed for routing. For inbound lists, permit means continue to process the packet after receiving it on an inbound interface; deny means discard the packet.
- Outbound access lists process packets before they leave the router. Incoming packets are routed to the outbound interface and then processed through the outbound access list. For outbound lists, permit means send it to the output buffer; deny means discard the packet.
- An access list can not be removed if that access list is being applied by an access group in use. To remove an access list, remove the access group that is referencing the access list and then remove the access list.
- An access list must exist before you can use the `ethernet-services access-group` command.

Helpful Hints for Creating Ethernet Services Access Lists

Consider these when creating an Ethernet services access list:

- Create the access list before applying it to an interface.
- Organize your access list so that more specific references appear before more general ones.

Source and Destination Addresses

Source MAC address and destination MAC address are two of the most typical fields on which to base an access list. Specify source MAC addresses to control packets from certain networking devices or hosts. Specify destination MAC addresses to control packets being sent to certain networking devices or hosts.

Ethernet Services Access List Entry Sequence Numbering

The ability to apply sequence numbers to Ethernet services access-list entries simplifies access list changes. The access list entry sequence numbering feature allows you to add sequence numbers to access-list entries and resequence them. When you add a new entry, you choose the sequence number so that it is in a desired position in the access list. If necessary, entries currently in the access list can be resequenced to create room to insert the new entry.
Sequence Numbering Behavior

These details the sequence numbering behavior:

- If entries with no sequence numbers are applied, the first entry is assigned a sequence number of 10, and successive entries are incremented by 10. The maximum sequence number is 2,147,483,646. If the generated sequence number exceeds this maximum number, this message is displayed:
  
  Exceeded maximum sequence number.

- If you provide an entry without a sequence number, it is assigned a sequence number that is 10 greater than the last sequence number in that access list and is placed at the end of the list.

- ACL entries can be added without affecting traffic flow and hardware performance.

How to Implement Layer 2 Access Lists

Restrictions for Implementing Layer 2 Access Lists

These restrictions apply for implementing Ethernet services access lists:

- Ethernet services access lists are not supported over management interfaces.

- NetIO (software slow path) is not supported for Ethernet services access lists.

Configuring Ethernet Services Access Lists

This task configures an Ethernet services access list.

SUMMARY STEPS

1. configure
2. ethernet-service access-list name
3. [sequence-number] { permit | deny } { src-mac-address src-mac-mask | any | host } [ { ethertype-number } | vlan min-vlan-ID [max-vlan-ID] ] [ cos cos-value ] [ dei ] [ inner-vlan min-vlan-ID [max-vlan-ID] ] [ inner-cos cos-value ] [ inner-dei ]
4. Repeat Step 3 as necessary, adding statements by sequence number where you planned. Use the no sequence-number command to delete an entry.
5. Use the commit or end command.

DETAILED STEPS

Step 1 configure
Example:

RP/0/RSP0/CPU0:router# configure

Enters the Global Configuration mode.

Step 2  
**ethernet-service access-list name**

Example:

RP/0/RSP0/CPU0:router(config)# ethernet-service access-list L2ACL2

Enters Ethernet services access list configuration mode and configures access list L2ACL2.

Step 3  
[sequence-number] {permit | deny} {src-mac-address src-mac-mask | any | host} [{ethertype-number} | vlan min-vlan-ID [max-vlan-ID]] [{cos cos-value} {dei} {inner-vlan min-vlan-ID [max-vlan-ID]} {inner-cos cos-value} {inner-dei}]

Example:

RP/0/RSP0/CPU0:router(config-es-al)# 0 permit 1.2.3 3.2.1
or
RP/0/RSP0/CPU0:router(config-es-al)# 30 deny any dei

Specifies one or more conditions allowed or denied, which determines whether the packet is passed or dropped.

Step 4  
Repeat Step 3 as necessary, adding statements by sequence number where you planned. Use the **no** sequence-number command to delete an entry.

Allows you to revise an access list.

Step 5  
Use the **commit** or **end** command.

**commit** - Saves the configuration changes and remains within the configuration session.

**end** - Prompts user to take one of these actions:

- **Yes** - Saves configuration changes and exits the configuration session.
- **No** - Exits the configuration session without committing the configuration changes.
- **Cancel** - Remains in the configuration mode, without committing the configuration changes.

---

**What to Do Next**

After creating an Ethernet services access list, you must apply it to an interface. See the Applying Ethernet Services Access Lists section for information about how to apply an access list.
Applying Ethernet Services Access Lists

After you create an access list, you must reference the access list to make it work. Access lists can be applied on either outbound or inbound interfaces. This section describes guidelines on how to accomplish this task for both terminal lines and network interfaces.

For inbound access lists, after receiving a packet, Cisco IOS XR software checks the source MAC address of the packet against the access list. If the access list permits the address, the software continues to process the packet. If the access list rejects the address, the software discards the packet.

For outbound access lists, after receiving and routing a packet to a controlled interface, the software checks the source MAC address of the packet against the access list. If the access list permits the address, the software sends the packet. If the access list rejects the address, the software discards the packet.

Note
An empty access-list (containing no access control elements) cannot be applied on an interface.

Controlling Access to an Interface

This task applies an access list to an interface to restrict access to that interface. Access lists can be applied on either outbound or inbound interfaces.

SUMMARY STEPS

1. **configure**
2. **interface type instance**
3. **ethernet-services access-group access-list-name** { ingress | egress }
4. Use the **commit** or **end** command.

DETAILED STEPS

**Step 1**

**configure**

Example:
```
RP/0/RSP0/CPU0:router# configure
```
Enters the Global Configuration mode.

**Step 2**

**interface type instance**

Example:
```
RP/0/RSP0/CPU0:router(config)# interface gigabitethernet 0/2/0/
```
Configures an interface and enters interface configuration mode.

- The **type** argument specifies an interface type. For more information on interface types, use the question mark (?) online help function.
• The instance argument specifies either a physical interface instance or a virtual instance.
  ◦ The naming notation for a physical interface instance is rack/slot/module/port. The slash (/) between values is required as part of the notation.
  ◦ The number range for a virtual interface instance varies depending on the interface type.

**Step 3**

ethernet-services access-group access-list-name \{ ingress | egress \}

*Example:*

RP/0/RSP0/CPU0:router(config-if)# ethernet-services access-group p-in-filter ingress
RP/0/RSP0/CPU0:router(config-if)# ethernet-services access-group p-out-filter egress

Controls access to an interface.

• Use the access-list-name argument to specify a particular Ethernet services access list.
• Use the ingress keyword to filter on inbound packets or the egress keyword to filter on outbound packets.

This example applies filters on packets inbound and outbound from GigabitEthernet interface 0/2/0/2.

**Step 4**

Use the commit or end command.

- commit - Saves the configuration changes and remains within the configuration session.
- end - Prompts user to take one of these actions:
  • Yes - Saves configuration changes and exits the configuration session.
  • No - Exits the configuration session without committing the configuration changes.
  • Cancel - Remains in the configuration mode, without committing the configuration changes.

---

**Copying Ethernet Services Access Lists**

This task copies an Ethernet services access list.

**SUMMARY STEPS**

1. copy access-list ethernet-service source-acl destination-acl
2. show access-lists ethernet-services \[ access-list-name | maximum | standby | summary \]

**DETAILED STEPS**

**Step 1**

copy access-list ethernet-service source-acl destination-acl

*Example:*

RP/0/RSP0/CPU0:router# copy access-list ethernet-service list-1 list-2
Creates a copy of an existing Ethernet services access list.

- Use the `source-acl` argument to specify the name of the access list to be copied.
- Use the `destination-acl` argument to specify where to copy the contents of the source access list.
  - The `destination-acl` argument must be a unique name; if the destination-acl argument name exists for an access list, the access list is not copied.

**Step 2**

```
show access-lists ethernet-services [ access-list-name | maximum | standby | summary ]
```

**Example:**

```
RP/0/RSP0/CPU0:router# show access-lists ethernet-services list-2
```

(Optional) Displays the contents of a named Ethernet services access list. For example, you can verify the output to see that the destination access list list-2 contains all the information from the source access list list-1.

---

### Resequencing Access-List Entries

This task shows how to reassign sequence numbers to entries in a named access list. Resequencing an access list is optional.

**SUMMARY STEPS**

1. `resequence access-list ethernet-service access-list-name [ starting-sequence-number [ increment ] ]`
2. Use the `commit` or `end` command.
3. `show access-lists ethernet-services [ access-list-name | maximum | standby | summary ]`

**DETAILED STEPS**

**Step 1**

```
resequence access-list ethernet-service access-list-name [ starting-sequence-number [ increment ] ]
```

**Example:**

```
RP/0/RSP0/CPU0:router# resequence access-list ethernet-service L2ACL2 20 10
```

(Optional) Resequences the specified Ethernet services access list using the desired starting sequence number and the increment of sequence numbers.

- This example resequences an Ethernet services access list named L2ACL2. The starting sequence number is 20 and the increment is 10. If you do not select an increment, the default increment 10 is used.

**Note**

If during the resequencing process it is determined that the ending number will exceed the maximum sequence number allowed, the configuration will not take effect and will be rejected. The sequence numbers will not be changed.

**Step 2**

Use the `commit` or `end` command.

- `commit` - Saves the configuration changes and remains within the configuration session.
end - Prompts user to take one of these actions:

- Yes - Saves configuration changes and exits the configuration session.
- No - Exits the configuration session without committing the configuration changes.
- Cancel - Remains in the configuration mode, without committing the configuration changes.

Step 3

show access-lists ethernet-services [ access-list-name | maximum | standby | summary ]

Example:

RP/0/RSP0/CPU0:router# show access-lists ethernet-services L2ACL2

(Optional) Displays the contents of a named Ethernet services access list.

- Review the output to see that the access list includes the updated information.

## Configuration Examples for Implementing Layer 2 Access Lists

### Resequencing Entries in an Access List: Example

This example shows access-list resequencing. The starting value in the resequenced access list is 1, and the increment value is 2. The subsequent entries are ordered based on the increment values that users provide, and the range is from 1 to 2147483646.

When an entry with no sequence number is entered, by default, it has a sequence number of 10 more than the last entry in the access list.

```
ethernet service access-list acl_1
10 permit 1.2.3 4.5.6
20 deny 2.3.4 5.4.3
30 permit 3.1.2 5.3.4 cos 5

resequence access-list ethernet service acl_1 10 20

show access-list ethernet-service acl1_1
```

```
ipv4 access-list acl_1
10 permit 1.2.3 4.5.6
30 deny 2.3.4 5.4.3
50 permit 3.1.2 5.3.4 cos 5
```

### Adding Entries with Sequence Numbers: Example

In this example, a new entry is added to Ethernet services access list acl_5.

```
ethernet-service access-list acl_5
2 permit 1.2.3 5.4.3
5 permit 2.3.4 6.5.4 cos 3
10 permit any dei
20 permit 6.5.4 1.3.5 VLAN vlan3
```
configure
  ethernet-service access-list acl_5
  15 permit 1.5.7 7.5.1
  end

ethernet-service access-list acl_5
  2 permit 1.2.3 5.4.3
  5 permit 2.3.4 6.5.4 cos 3
  10 permit any dei
  15 permit 1.5.7 7.5.1
  20 permit 6.5.4 1.3.5 VLAN vlan3
Implementing VXLAN

This module provides conceptual information for VXLAN in general and configuration information for layer 2 VXLAN on Cisco ASR 9000 Series Router. For configuration information of layer 3 VXLAN, see Implementing L3 VXLAN chapter in the Cisco ASR 9000 Series Aggregation Services Router MPLS Layer 3 VPN Configuration Guide. VXLAN provides the same Ethernet Layer 2 network services as VLAN, but with greater extensibility and flexibility.

Table 4: Feature History for VXLAN

- Information about Implementing VXLAN, page 455
- Configuring a Layer 2 VXLAN gateway, page 457
- Configuration Example for Implementing Layer 2 VXLAN Gateway, page 463

Prerequisites for implementing VXLANs

This prerequisite applies to implementing VXLANs:

You must be in a user group associated with a task group that includes the proper task IDs. The command reference guides include the task IDs required for each command.

If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Information about Implementing VXLAN

To implement VXLAN, you must understand these concepts:
VXLAN

VXLAN provides the same Ethernet Layer 2 network services as VLAN does today, but with greater extensibility and flexibility. It is a Layer 2 overlay scheme over a Layer 3 network. It uses MAC Address-in-User Datagram Protocol (MAC-in-UDP) encapsulation to provide a means to extend Layer 2 segments across the core network. VXLAN is a solution to support a flexible, large-scale multitenant environment over a shared common physical infrastructure. The transport protocol over the core network is IP plus UDP. Compared to VLAN, VXLAN offers the following benefits:

- Flexible placement of multitenant segments throughout the data center: It provides a solution to extend Layer 2 segments over the underlying shared network infrastructure so that tenant workload can be placed across physical pods in the data center.

- Higher scalability to address more Layer 2 segments: VLANs use a 12-bit VLAN ID to address Layer 2 segments, which results in limiting scalability of only 4094 VLANs. VXLAN uses a 24-bit segment ID known as the VXLAN network identifier (VNID), which enables up to 16 million VXLAN segments to co-exist in the same administrative domain.

- Better utilization of available network paths in the underlying infrastructure: VLAN uses the Spanning Tree Protocol for loop prevention, which ends up not using half of the network links in a network by blocking redundant paths. In contrast, VXLAN packets are transferred through the underlying network based on its Layer 3 header and can take complete advantage of Layer 3 routing, equal-cost multipath (ECMP) routing, and link aggregation protocols to use all available paths.

VXLAN Packet Format

VXLAN defines a MAC-in-UDP encapsulation scheme where the original Layer 2 frame has a VXLAN header added and is then placed in a UDP-IP packet. With this MAC-in-UDP encapsulation, VXLAN tunnels Layer 2 network over Layer 3 network. The VXLAN packet format is shown in the following figure.

![Figure 56: VXLAN Packet Format](image)

As shown in the above figure, VXLAN introduces an 8-byte VXLAN header that consists of a 24-bit VNID and a few reserved bits. The VXLAN header together with the original Ethernet frame goes in the UDP
payload. The 24-bit VNID is used to identify Layer 2 segments and to maintain Layer 2 isolation between the segments. With all 24 bits in VNID, VXLAN can support approx 16 million LAN segments.

**VXLAN Tunnel Endpoint**

VXLAN uses VXLAN tunnel endpoint (VTEP) devices to map tenants’ end devices to VXLAN segments and to perform VXLAN encapsulation and de-encapsulation. Each VTEP function has two interfaces: One is a switch interface on the local LAN segment to support local endpoint communication through bridging, and the other is an IP interface to the transport IP network.

The IP interface has a unique IP address that identifies the VTEP device on the transport IP network known as the infrastructure VLAN. The VTEP device uses this IP address to encapsulate Ethernet frames and transmits the encapsulated packets to the transport network through the IP interface. A VTEP device also discovers the remote VTEPs for its VXLAN segments and learns remote MAC Address-to-VTEP mappings through its IP interface. The functional components of VTEPs and the logical topology that is created for Layer 2 connectivity across the transport IP network is shown in the following figure.

*Figure 57: VTEP*

The VXLAN segments are independent of the underlying network topology; conversely, the underlying IP network between VTEPs is independent of the VXLAN overlay. It routes the encapsulated packets based on the outer IP address header, which has the initiating VTEP as the source IP address and the terminating VTEP as the destination IP address.

**Configuring a Layer 2 VXLAN gateway**

A Layer 2 VXLAN gateway bridges traffic between VXLAN and non-VXLAN segments (such as VLAN or VPLS) within the same layer 2 network. The operation of a VXLAN Layer 2 gateway is based on the data plane MAC address learning and flooding of multi-destination traffic such as unknown unicast, multicast, or broadcast frames, using IP multicast. The following sections show how to configure an ASR 9000 series router as a Layer 2 VXLAN gateway between a VLAN and a VXLAN segment in the same L2 domain.
Prerequisites

The following are the prerequisites to configuring a Cisco ASR 9000 series router as a VXLAN Layer 2 gateway:

- Configure a loopback interface. It serves as a source interface for the local VTEP.
- Configure unicast reachability to remote VTEPs.
- Configure Bidirectional Protocol Independent Multicast (Bidir PIM) or PIM Sparse Mode. For more information, see the Cisco ASR 9000 Series Aggregation Services Router Multicast Configuration Guide.

Restrictions

Consider the following restrictions while configuring VXLAN:

- You configure VXLAN only on Overlay Transport Virtualization (OTV) and VXLAN UDP ports.
- The source interface can only be a loopback interface.
- You cannot share a VNI or a multicast group or a source interface across multiple NVE interfaces.
- The VNI range and the multicast range both can only be specified contiguously. A non-contiguous range with comma separated values is not supported.
- The VNI to multicast group mapping can be only either 1:1 or N:1. For example,
  - The "member vni 5000 mcast-group 239.1.1.1" command configures a valid 1:1 mapping.
  - The "member vni 5000-5005 mcast-group 239.1.1.1" command configures a valid N:1 mapping.
- When a VNI is configured as a part of a VNI range, it can be modified or deleted only as part of the same range. For example, if the "member vni 5000-5002 mcast-group 239.1.1.1" command is configured, you cannot disassociate just the VNI 5001 from the NVE interface with a "no member vni 5001" command.
- Static MAC configuration is not supported.
- You can configure a maximum of 128k Layer 2 and Layer 3 sub-interfaces per system. The configuration can be a combination of both Layer 2 sub-interfaces and Layer 3 sub-interfaces; or either fully Layer 2 sub-interfaces or Layer 3 sub-interfaces.
  Though the system allows you to configure more than 128k sub-interfaces per system, you cannot use this configuration for services. Though the system displays a warning message on reaching the threshold of 128k sub-interfaces, the configuration is still applied. However, you cannot use this configuration for services.

Creating and Configuring the Network Virtualization Endpoint (NVE) interface

Perform this task to create an NVE interface and configure it as a VXLAN Tunnel EndPoint (VTEP) for VXLAN.
SUMMARY STEPS

1. interface nve nve-identifier
2. (Optional) overlay-encapsulation vxlan
3. source-interface loopback loopback-interface-identifier
4. member vni vni_number [-end_vni_range] mcast-group ip_address [ end_ip_address_range ]
5. (Optional) anycast source-interface loopback loopback-interface-identifier sync-group ip_address
6. Use the commit or end command.

DETAILED STEPS

Step 1  interface nve nve-identifier

Example:
RP/0/RSP0/CPU0:router(config)# interface nve 1
Creates the NVE interface and enters the NVE interface configuration sub-mode.

Step 2  (Optional) overlay-encapsulation vxlan

Example:
RP/0/RSP0/CPU0:router(config-if)# overlay-encapsulation vxlan
Sets VXLAN encapsulation for the NVE interface. VXLAN is the default encapsulation for an NVE interface. This step is optional if you have not changed the encapsulation.

Step 3  source-interface loopback loopback-interface-identifier

Example:
RP/0/RSP0/CPU0:router(config-if)# source-interface loopback 1
Sets a loopback interface as the source interface for the VTEP.

Step 4  member vni vni_number [-end_vni_range] mcast-group ip_address [ end_ip_address_range ]

Example:
RP/0/RSP0/CPU0:router(config-if)# member vni 1-10 mcast-group 224.2.2.2 224.2.2.10
 Associates a single VXLAN or a contiguous range of VXLANs with the NVE interface using their VXLAN Network Identifiers (VNIs) and specifies a multicast address or a contiguous multicast address range associated with these VNIs.

Note
• The mapping between the VNIs and the multicast groups is either one-to-one or many-to-one.
• To associate discontiguous VXLANs or VXLAN ranges with the NVE interface, perform this step for each VXLAN or VXLAN range. For instance,
  RP/0/RSP0/CPU0:router(config-if)# member vni 10 mcast-group 224.2.2.2 224.2.2.10
  RP/0/RSP0/CPU0:router(config-if)# member vni 23 mcast-group 224.2.2.23
  RP/0/RSP0/CPU0:router(config-if)# member vni 50-59 mcast-group 224.2.2.250 224.2.2.2.59
  RP/0/RSP0/CPU0:router(config-if)# member vni 100-120 mcast-group 224.2.2.100 224.2.2.120

Step 5  (Optional) anycast source-interface loopback loopback-interface-identifier sync-group ip_address

Example:
RP/0/RSP0/CPU0:router(config-if)# anycast source-interface loopback 1 sync-group 192.23.2.20
Configures anycast mode parameters for this VTEP.

Step 6  Use the commit or end command.
commit - Saves the configuration changes and remains within the configuration session.
end - Prompts user to take one of these actions:
• Yes - Saves configuration changes and exits the configuration session.
• No - Exits the configuration session without committing the configuration changes.
• Cancel - Remains in the configuration mode, without committing the configuration changes.

What to Do Next

Use the show nve interface command to display the configured NVE interface information.

Creating and configuring a layer 2 sub-interface

Perform this task to create a layer 2 sub-interface associated with a VLAN segment.

SUMMARY STEPS

1. interface gigabitEthernet interface-identifier l2transport
2. dot1q vlan vlan-identifier
3. Use the commit or end command.

DETAILED STEPS

Step 1 interface gigabitEthernet interface-identifier l2transport

Example:
RP/0/RSP0/CPU0:router(config)# interface gigabitEthernet 0/0/0.100 l2transport
Creates a layer 2 sub-interface and enters the sub-interface configuration mode.

Step 2 dot1q vlan vlan-identifier

Example:
RP/0/RSP0/CPU0:router(config-if)# dot1q vlan 100
Sets the VLAN for the interface.

Step 3 Use the commit or end command.

commit - Saves the configuration changes and remains within the configuration session.
end - Prompts user to take one of these actions:
• Yes - Saves configuration changes and exits the configuration session.
• No - Exits the configuration session without committing the configuration changes.
• Cancel - Remains in the configuration mode, without committing the configuration changes.
Associating VLAN and VXLAN with a bridge domain

Perform this task to associate a VLAN and a VXLAN with a bridge domain.

**SUMMARY STEPS**

1. `l2vpn`
2. `bridge group bridge-group-name`
3. `bridge-domain bridge-domain-name`
4. `member vni vxlan-identifier`
5. `interface gigabitEthernet sub-interface-identifier`
6. Use the `commit` or `end` command.

**DETAILED STEPS**

**Step 1**  
`l2vpn`  

*Example:*  
RP/0/RSP0/CPU0:router(config)# l2vpn  
Enters the l2vpn configuration mode.

**Step 2**  
`bridge group bridge-group-name`

*Example:*  
RP/0/RSP0/CPU0:router(config-l2vpn)# bridge group bridgegroup1  
Enters the bridge group configuration mode.

**Step 3**  
`bridge-domain bridge-domain-name`

*Example:*  
RP/0/RSP0/CPU0:router(config-l2vpn-bg)# bridge-domain bdomain1  
Enters the bridge domain configuration mode.

**Step 4**  
`member vni vxlan-identifier`

*Example:*  
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# member vni 100  
 Associates a VXLAN with the bridge domain.

**Step 5**  
`interface gigabitEthernet sub-interface-identifier`

*Example:*  
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd)# interface gigabitEthernet 0/0/0/0.200  
Associates a VLAN with the bridge domain using the VLAN sub-interface.

**Step 6**  
Use the `commit` or `end` command.  
`commit` - Saves the configuration changes and remains within the configuration session.
end - Prompts user to take one of these actions:

- **Yes** - Saves configuration changes and exits the configuration session.
- **No** - Exits the configuration session without committing the configuration changes.
- **Cancel** - Remains in the configuration mode, without committing the configuration changes.

---

### Configuring VXLAN source UDP port

This is an optional task. By default, the source UDP port of the encapsulating VXLAN segment is calculated via hash functions on the layer 2 address fields of the inner payload. Perform this task to configure the hash functions to be performed on either the layer 2 or the layer 3 address fields of the inner payload.

**SUMMARY STEPS**

1. l2vpn
2. load-balancing flow \[ src-dst-mac | src-dst-ip \]

**DETAILED STEPS**

**Step 1** l2vpn

**Example:**

RP/0/RSP0/CPU0:router(config)# l2vpn
Enters the l2vpn configuration mode.

**Step 2** load-balancing flow \[ src-dst-mac | src-dst-ip \]

**Example:**

RP/0/RSP0/CPU0:router(config-l2vpn)# load-balancing flow src-dst-mac
Selects either the layer 2 or layer 3 address fields of the inner payload for hash function.

### Configuring VXLAN destination UDP port

The UDP port numbers 4789 and 8472 are assigned to VXLAN and OTV respectively. Perform this task to configure the destination UDP port number of the encapsulating VXLAN segment. This is an optional task because, by default, the destination UDP port number of the encapsulating VXLAN datagram is set to 4789. The destination UDP port number should be set to 8472 if the destination VTEP provides VXLAN support using an OTV port.
SUMMARY STEPS

1. `vxlan udp port port-number`

DETAILED STEPS

`vxlan udp port port-number`

Example:

```
RP/0/RSP0/CPU0:router(config)# vxlan udp port 4789
```

Sets the destination UDP port number of the encapsulating VXLAN segment.

---

Configuration Example for Implementing Layer 2 VXLAN Gateway

The following example shows layer 2 VXLAN gateway configuration on two Provider Edge (PE) routers, R1 and R2, from a sample network topology that has the core network simplified as a bundle link connection between the PE routers.

**Figure 58: Network with Layer 2 VXLAN Gateways**

Configuration at R1:

```
interface Bundle-Ether10
  ipv4 address 192.168.1.1/24
!
interface Loopback0
  ipv4 address 1.1.1.1/32
