Multicast Routing and Forwarding Commands

This module describes the commands used to configure and monitor multicast routing.

For detailed information about multicast routing concepts, configuration tasks, and examples, refer to the Implementing Multicast Routing on Cisco IOS XR Software configuration module in the Multicast Configuration Guide for Cisco ASR 9000 Series Routers.

- accounting per-prefix, on page 3
- accounting per-prefix forward-only, on page 5
- address-family (multicast), on page 7
- boundary, on page 10

- unicast-reachability, on page 136
- vrf (multicast), on page 137
- cef platform lsm frr-holdtime, on page 139
accounting per-prefix

To enable accounting for multicast routing, use the `accounting per-prefix` command in the appropriate configuration mode. To return to the default behavior, use the `no` form of this command.

```
accounting per-prefix
no accounting per-prefix
```

**Syntax Description**
This command has no keywords or arguments.

**Command Default**
This feature is disabled by default.

**Command Modes**
- Multicast routing configuration
- Multicast routing address family IPv4 configuration
- Multicast VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `accounting per-prefix` command is used to enable per-prefix counters only in hardware. Cisco IOS XR Software counters are always present. When enabled, every existing and new (S, G) route is assigned forward, punt, and drop counters on the ingress route and forward and punt counters on the egress route. The (*, G) routes are assigned a single counter.

There are a limited number of counters on all nodes. When a command is enabled, counters are assigned to routes only if they are available.

To display packet statistics, use the `show mfib route` and the `show mfib hardware route statistics` commands. These commands display “N/A” for counters when no hardware statistics are available or when the `accounting per-prefix` command is disabled.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>

</tr>
<tr>
<td></td>
<td>show mfib route, on page 102</td>
<td>Displays route entries in the Multicast Forwarding Information Base (MFIB).</td>
</tr>
</tbody>
</table>
accounting per-prefix forward-only

To reduce hardware statistics resource allocations when enabling accounting, particularly for multicast VPN (MVPN), use the `accounting per-prefix forward-only` command under multicast routing configuration mode. To return to the default mode of accounting per-prefix, on page 3, use the `no` form of this command.

```
accounting per-prefix forward-only
no accounting per-prefix forward-only
```

**Syntax Description**

This command has no keywords or arguments.

**Command Default**

If no counters were configured, there is no default.
If the accounting per-prefix counter was previously configured, it becomes the default.
If no accounting was configured for multicast routing, forwarding-only is the default mode and triggers a data MDT transition in the case of MVPN deployment.

**Command Modes**

Multicast routing configuration
Multicast routing address family IPv4 and IPv6 configuration
Multicast VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.8.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

**Note**

The `accounting per-prefix forward-only` command has only one `fwd-only` counter. In other words, there is no `punt` or `drop` counter allocated.

We recommended this command for configuration of multicast VPN routing or for any line card that has a route-intensive configuration. Each individual router can support up to 150,000 routes.

**Note**

To verify the number of statistics allocated or free on a line card, use the `show mfib hardware resource-counters, on page 62` command in EXEC mode.

There are a limited number of counters on all nodes. When accounting on a prefix is enabled, counters are assigned to routes only if they are available.

To display packet statistics, use the `show mfib route` and the `show mfib hardware route statistics` commands. These commands display “N/A” for counters when no hardware statistics are available or when
neither the `accounting per-prefix, on page 3` command nor the `accounting per-prefix forward-only` command are enabled.

You may switch between `accounting-perprefix` and `accounting per-prefix forward-only` statistics for ipv4 or ipv6 multicast family. However, be aware that only one set of counters is supported on the (*,G) routes (with fwd/punt/drop on ingress and fwd/drop on egress) regardless of whether you enabled the `accounting-perprefix` or `accounting-perprefix fwd-only` command.

Although you can switch accounting modes, this involves freeing the hardware statistics and reallocating them, thereby resulting in a loss of any previously collected data. Therefore, it is preferable to decide which statistics mode you want to use at the start to avoid the resource cost entailed by resetting the statistics counter values with a change in mode.

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to enable accounting per-prefix forward-only for MVPN routing:

```
RP/0/RSP0/CPU0:router(config)# multicast-routing
RP/0/RSP0/CPU0:router(config-mcast)# accounting per-prefix forward-only
```

</tbody>
</table>
address-family (multicast)

To display available IP prefixes to enable multicast routing and forwarding on all router interfaces, use the `address-family` command in multicast-routing configuration mode or multicast VRF configuration submode. To disable use of an IP address prefix for routing, use the `no` form of this command.

```
address-family [vrf vrf-name] {ipv4|ipv6}
no address-family [vrf vrf-name] {ipv4|ipv6}
```

**Syntax Description**

- `vrf vrf-name` (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- `ipv4` Specifies IPv4 address prefixes.
- `ipv6` Specifies IPv6 address prefixes.

**Command Default**

No default behavior or values

**Command Modes**

- Multicast routing configuration
- Multicast VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Release 4.2.0</td>
<td>The <code>ipv6</code> keyword was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the `address-family` command either from multicast routing configuration mode or from multicast VRF configuration sub to enter either the multicast IPv4 or IPv6 address family configuration submode, depending on which keyword was chosen. Use the `address-family` command with the `multicast-routing`, on page 39 command to start the following multicast processes:

- Multicast Routing Information Base (MRIB)
- Multicast Forwarding Engine (MFWD)
- Protocol Independent Multicast Sparse mode (PIM-SM)
- Internet Group Management Protocol (IGMP)
- Multicast Listener Discovery Protocol (MLD)

Basic multicast services start automatically when the multicast PIE is installed, without any explicit configuration required. The following multicast services are started automatically:

- Multicast Routing Information Base (MRIB)
- Multicast Forwarding Engine (MFWD)
- Protocol Independent Multicast Sparse mode (PIM-SM)
- Internet Group Management Protocol (IGMP)
Other multicast services require explicit configuration before they start. For example, to start the Multicast Source Discovery Protocol (MSDP) process, you must enter the `router msdp` command and explicitly configure it.

To enable multicast routing and protocols on interfaces, you must explicitly enable the interfaces using the `interface` command in multicast routing configuration mode. This action can be performed on individual interfaces or by configuring a wildcard interface using the `alias` command.

To enable multicast routing on all interfaces, use the `interface all enable` command in multicast routing configuration mode. For any interface to be fully enabled for multicast routing, it must be enabled specifically (or configured through the `interface all enable` command for all interfaces) in multicast routing configuration mode, and it must not be disabled in the PIM and IGMP configuration modes.

---

### Note

The `enable` and `disable` keywords available under the IGMP and PIM interface configuration modes have no effect unless the interface is enabled in multicast routing configuration mode—either by default or by explicit interface configuration.

To allow multicast forwarding functionality, while turning multicast routing functionality off, `interface-inheritance disable`, on page 25 command on a per interface or `interface all enable` basis in PIM or IGMP configuration mode.

---

### Examples

This example shows how to enter IPv4 and IPv6 multicast routing configuration mode:

```
RP/0/RSP0/CPU0:router (config) # multicast-routing
RP/0/RSP0/CPU0:router (config-mcast) # address-family ipv4
RP/0/RSP0/CPU0:router (config-mcast-default-ipv4) #
RP/0/RSP0/CPU0:router (config-mcast-default-ipv6) #
```

This example shows how to enter IPv4 and IPv6 VRF multicast routing configuration submode:

```
RP/0/RSP0/CPU0:router (config) # multicast-routing
RP/0/RSP0/CPU0:router (config-mcast) # vrf vrf-name address-family ipv4
RP/0/RSP0/CPU0:router (config-mcast-vrf-name-ipv4) #
RP/0/RSP0/CPU0:router (config-mcast-vrf-name-ipv6) #
```

---

<td><code>interface (multicast), on page 21</code></td>
<td>Configures multicast interface properties.</td>
</tr>
</tbody>
</table>
To configure the multicast boundary on an interface for administratively scoped multicast addresses, use the `boundary` command in the appropriate configuration mode. To return to the default behavior, use the `no` form of this command.

```
boundary access-list
no boundary access-list
```

**Syntax Description**

- `access-list`: Access list specifying scoped multicast groups. The name cannot contain a space or quotation mark; it may contain numbers.

**Command Default**

A multicast boundary is not configured.

**Command Modes**

- Multicast routing interface configuration
- Multicast routing VRF interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `boundary` command is used to set up a boundary to keep multicast packets from being forwarded.

The boundary acl can specify a mcast source address in addition to a mcast group address. The keyword "any" can be added before the mcast group range.

**Examples**

The following example shows how to set up a boundary for all administratively scoped addresses:

```
RP/0/RSP0/CPU0:router (config) # ipv4 access-list myboundary2
RP/0/RSP0/CPU0:router (config) # 10 deny ipv4 any 239.0.0.0 0.255.255.255
RP/0/RSP0/CPU0:router (config) # 20 permit ipv4 any 224.0.0.0 15.255.255.255
RP/0/RSP0/CPU0:router (config) # multicast-routing
RP/0/RSP0/CPU0:router (config-mcast) # address-family ipv4
RP/0/RSP0/CPU0:router (config-mcast-default-ipv4)# interface GigE 0/2/0/2
RP/0/RSP0/CPU0:router (config-mcast-default-ipv4-if)# boundary myboundary2
```
**clear mfib counter**

To clear Multicast Forwarding Information Base (MFIB) route packet counters, use the `clear mfib counter` command in the appropriate mode.

```
clear mfib [vrf vrf-name] ipv4 counter [{group-address source-address}] [location {node-id|all}]
```

**Syntax Description**
- `vrf vrf-name` (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- `ipv4` (Optional) Specifies IPv4 address prefixes.
- `group-address` (Optional) IP address of the multicast group.
- `source-address` (Optional) IP address of the source of the multicast route.
- `location node-id` (Optional) Clears route packet counters from the designated node.
- `all` The `all` keyword clears route packet counters on all nodes

**Command Default**
IPv4 addressing is the default.

**Command Modes**
EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

**Note**
This command only clears MFIB route packet software counters. To clear MFIB hardware statistics counters use the `clear mfib hardware route statistics` command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**
The following example shows how to clear MFIB route packet counters on all nodes:

```
RP/0/RSP0/CPU0:router# clear mfib counter location all
```
clear mfib database

To clear the Multicast Forwarding Information Base (MFIB) database, use the `clear mfib database` command in the appropriate mode.

```
clear mfib [{ipv4|ipv6}] database [location {node-id|all}]
```

**Syntax Description**

- `ipv4` (Optional) Specifies IPv4 address prefixes.
- `location node-id` (Optional) Clears global resource counters from the designated node.
- `all` The `all` keyword clears all global resource counters.

**Command Default**
IPv4 addressing is the default.

**Command Modes**
EXEC

**Command History**

```
Release 3.7.2  This command was introduced.
```

**Usage Guidelines**
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

**Task ID**

```
Task ID  Operations
multicast  read, write, execute
```

**Examples**
The following example shows how to clear the Multicast Forwarding Information Base (MFIB) database on all nodes:

```
RP/0/RSP0/CPU0:router# clear mfib database location all
```
clear mfib hardware resource-counters

To clear global resource counters, use the `clear mfib hardware resource-counters` command in EXEC mode.

```
clear mfib [vrf vrf-name] [{ipv4|ipv6}] hardware resource-counters [location {node-id|all}]
```

**Syntax Description**

- `vrf vrf-name` (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- `ipv4` (Optional) Specifies IPv4 address prefixes.
- `ipv6` (Optional) Specifies IPv6 address prefixes.
- `location node-id` (Optional) Clears global resource counters from the designated node.
- `all` The `all` keyword clears all global resource counters.

**Command Default**

IPv4 addressing is the default.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the `clear mfib hardware resource-counters` to estimate resource usage for an operation.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write, execute</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to clear all global resource counters:

```
RP/0/RSP0/CPU0:router# clear mfib hardware resource-counters location all
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show mfib hardware resource-counters</code>, on page 62</td>
<td>Displays the allocated and freed hardware resources for the Multicast Forwarding Information Base (MFIB) process.</td>
</tr>
</tbody>
</table>
clear mfib hardware route statistics

To reset all allocated counter values regardless of the Multicast Forwarding Information Base (MFIB) hardware statistics mode (accounting per-prefix or accounting per-prefix forward-only), use the clear mfib hardware route statistics command in EXEC mode.

```
clear mfib [vrf vrf-name] [{ipv4|ipv6}] hardware route statistics {egress|ingress|ingress-and-egress} [{*source-address}] [group-address [/prefix-length]] [location {node-id|all}]
```

**Syntax Description**

- **vrf vrf-name** (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- **ipv4** (Optional) Specifies IPv4 address prefixes.
- **ipv6** (Optional) Specifies IPv6 address prefixes.
- **ingress-and-egress** (Optional) Clears hardware statistics on both the incoming (ingress) and outgoing (egress) routes.
- ***source-address** (Optional) IP address or hostname of the multicast route source.
- **group-address** (Optional) IP address or hostname of the multicast group.
- **/prefix-length** (Optional) Prefix length of the multicast group. A decimal value that indicates how many of the high-order contiguous bits of the address compose the prefix (the network portion of the address). A slash must precede the decimal value.
- **location** (Optional) Clears route packet counters from the designated node.
- **node-id** The `node-id` argument is entered in the `rack/slot/module` notation.
- **all** The `all` keyword clears route packet counters on all nodes

**Command Default**

If not specified, IPv4 addressing is the default.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes the proper task IDs.

The Multicast Forwarding (MFWD) process exists on each line card and assigns hardware counters to each (S, G) route. Additionally, one global counter is assigned for all (*, G) routes, depending on resource availability.
To clear the set of counters for (*, G) routes, the MFWD process assigns a single set of counters to count packets that match (*, G) routes. Consequently, the **clear mfib hardware route statistics** command must be used in a form that either clears counters on all routes or matches all (*, G) routes.

**Note**
This command only clears MFIB hardware statistics counters. To clear MFIB route packet software counters, use the **clear mfib counter** command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>multicast read, write, execute</td>
</tr>
</tbody>
</table>

**Examples**
The following command shows how to clear counters by route statistics for all multicast routes on both ingress and egress forwarding engines for the line card 0/1/CPU0:

```
RP/0/RSP0/CPU0# clear mfib ipv4 hardware route statistics ingress-and-egress location 0/1/CPU0
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show mfib hardware route statistics, on page 89</td>
<td>Displays platform-specific Multicast Forwarding Information Base (MFIB) information for the packet and byte counters for each route.</td>
</tr>
</tbody>
</table>
disable (multicast)

To disable multicast routing and forwarding on an interface, use the `disable` command in the appropriate configuration mode. To return to the default behavior, use the `no disable` form of this command.

```
disable
no disable
```

**Syntax Description**

This command has no keywords or arguments.

**Command Default**

Multicast routing and forwarding settings are inherited from the global `interface enable all` command. Otherwise, multicast routing and forwarding is disabled.

**Command Modes**

Multicast routing interface configuration

Multicast routing VRF interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `disable` command modifies the behavior of a specific interface to disabled. This command is useful if you want to disable multicast routing on specific interfaces, but leave it enabled on all remaining interfaces.

The following guidelines apply when the `enable` and `disable` commands (and the `no` forms) are used in conjunction with the `interface all enable` command:

- If the `interface all enable` command is configured:
  - The `enable` and `no` forms of the command have no additional effect on a specific interface.
  - The `disable` command disables multicast routing on a specific interface.
  - The `no disable` command enables a previously disabled interface.

- If the `interface all enable` command is not configured:
  - The `enable` command enables multicast routing on a specific interface.
  - The `no enable` command enables the previously disabled interface.
  - The `disable` and `no` forms of the command have no additional effect on a specific interface.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast read, write</td>
</tr>
</tbody>
</table>
The following example shows how to enable multicast routing on all interfaces and disable the feature only on GigabitEthernet interface 0/1/0/0:

```
RP/0/RSP0/CPU0:router (config) # multicast-routing
RP/0/RSP0/CPU0:router (config-mcast) # interface all enable
RP/0/RSP0/CPU0:router (config-mcast-default-ipv4) # interface GigE 0/1/0/0
RP/0/RSP0/CPU0:router (config-mcast-default-ipv4-if) # disable
```
**enable (multicast)**

To enable multicast routing and forwarding on an interface, use the `enable` command in the appropriate configuration mode. To return to the default behavior, use the `no enable` form of this command.

```
enable
no enable
```

**Syntax Description**

This command has no keywords or arguments.

**Command Default**

Multicast routing and forwarding settings are inherited from the global `interface enable all` command. Otherwise, multicast routing and forwarding is disabled.

**Command Modes**

Multicast routing interface configuration

Multicast routing VRF interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `enable` command modifies the behavior of a specific interface to enabled. This command is useful if you want to enable multicast routing on specific interfaces, but leave it disabled on all remaining interfaces.

The following guidelines apply when the `enable` and `disable` commands (and the `no` forms) are used in conjunction with the `interface all enable` command:

- If the `interface all enable` command is configured:
  - The `enable` and `no` forms of the command have no additional effect on a specific interface.
  - The `disable` command disables multicast routing on a specific interface.
  - The `no disable` command enables a previously disabled interface.

- If the `interface all enable` command is not configured:
  - The `enable` command enables multicast routing on a specific interface.
  - The `no enable` command enables a previously enabled interface.
  - The `disable` and `no` forms of the command have no additional effect on a specific interface.

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>
The following example shows how to enable multicast routing on a specific interface only:

```
RP/0/RSP0/CPU0:router(config)# multicast-routing
RP/0/RSP0/CPU0:router(config-mcast)# interface GigE 0/1/0/0
RP/0/RSP0/CPU0:router(config-mcast-default-ipv4-if)# enable
```

</tr>
</tbody>
</table>
forwarding-latency

To delay traffic being forwarded on a route, use the `forwarding-latency` command. To return to the default behavior, use the `no forwarding-latency` command.

```
forwarding-latency [delay milliseconds]
no forwarding-latency
```

**Syntax Description**

- `delay milliseconds` (Optional) Specifies the delay time in milliseconds. Range is 5 - 500.

**Command Default**

The default delay time is 30 milliseconds.

**Command Modes**

Multicast routing configuration

IPv4 and IPv6 multicast routing configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.8.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the `forwarding-latency` command when you expect a receiver to leave and rejoin the same multicast group within a very short period such as 20 or 30 milliseconds. The delay may be required to provide the router sufficient time to update its Multicast Forwarding Information Base (MFIB) table.

When the `forwarding-latency` command is enabled, each interface is allocated a separate table lookup unit (TLU) block in the output interface list (olist), thereby increasing TLU hardware resource usage, and, for this reason, it should be used with caution when many multicast routes are present.

When the `forwarding-latency` command is disabled, up to three interfaces may share a single TLU block in the olist.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to delay traffic from being forwarded for 120 milliseconds:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# multicast-routing
RP/0/RSP0/CPU0:router# forwarding-latency delay 120
```
interface (multicast)

To configure multicast interface properties, use the `interface` command in the appropriate configuration mode. To disable multicast routing for interfaces, use the `no` form of this command.

```
interface type interface-path-id
no interface type interface-path-id
```

**Syntax Description**
- **type** Interface type. For more information, use the question mark (?) online help function.
- **interface-path-id** Physical interface or virtual interface.

**Note**
Use the `show interfaces` command in EXEC mode to see a list of all interfaces currently configured on the router.

For more information about the syntax for the router, use the question mark ( ? ) online help function.

**Command Default**
No default behavior or values

**Command Modes**
- Multicast routing configuration
- IPv4 or multicast routing configuration
- Multicast VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the `interface` command to configure multicast routing properties for specific interfaces.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to enable multicast routing on all interfaces and disable the feature only on GigabitEthernet interface 0/1/0/0:

```
RP/0/RSP0/CPU0:router(config)# multicast-routing
RP/0/RSP0/CPU0:router(config-mcast)# interface all enable
RP/0/RSP0/CPU0:router(config-mcast-default-ipv4-if)# interface GigE 0/1/0/0
```
**Multicast Routing and Forwarding Commands**

```
RP/0/RSP0/CPU0:router(config-mcast-default-ipv4-if)# disable
```

<table>
<thead>
<tr>

interface all enable

To enable multicast routing and forwarding on all new and existing interfaces, use the `interface all enable` command in the appropriate configuration mode. To return to the default behavior, use the `no` form of this command.

```
interface all enable
no interface all enable
```

**Syntax Description**

This command has no keywords or arguments.

**Command Default**

Multicast routing and forwarding is disabled by default.

**Command Modes**

Multicast routing configuration

Multicast VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>

</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

This command modifies the default behavior for all new and existing interfaces to enabled unless overridden by the `enable` or `disable` keywords available in interface configuration mode.

The following guidelines apply when the `enable` and `disable` commands (and the `no` forms) are used in conjunction with the `interface all enable` command:

- If the `interface all enable` command is configured:
  - The `enable` and `no` forms of the command have no additional effect on a specific interface.
  - The `disable` command disables multicast routing on a specific interface.
  - The `no disable` command enables a previously disabled interface.

- If the `interface all enable` command is not configured:
  - The `enable` command enables multicast routing on a specific interface.
  - The `no enable` command enables a previously enabled interface.
  - The `disable` and `no` forms of the command have no additional effect on a specific interface.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>

interface-inheritance disable

To separate PIM and IGMP routing from multicast forwarding on all interfaces, use the **interface-inheritance disable** command under multicast routing address-family IPv4 submode. To restore the default functionality, use the **no** form of the command.

**interface-inheritance disable**

**no interface-inheritance disable**

**Syntax Description**
This command has no keywords or arguments.

**Command Default**
This feature is not enabled by default.

**Command Modes**
Multicast routing configuration

Address-family IPv4 configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use of the **interface-inheritance disable** command together with the **interface type interface-path-id** or **interface all enable** command under multicast routing address-family IPv4 submode separates PIM and IGMP routing functionality from multicast forwarding on specified interfaces. You can nonetheless enable multicast routing functionality explicitly under PIM or IGMP routing configuration mode for individual interfaces.

**Note**
Although you can explicitly configure multicast routing functionality on individual interfaces, you cannot explicitly disable the functionality. You can only disable the functionality on all interfaces.

Used from the address-family ipv4 configuration submode, it prevents IGMP and PIM from inheriting the multicast-routing interface configuration.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**
The following configuration disables PIM and IGMP routing functionality on all the interfaces using the **interface-inheritance disable** command, but multicast forwarding is still enabled on all the interfaces in the example, based on use of the keywords **interface all enable**.
PIM is enabled on Loopback 0 based on its explicit configuration (\texttt{interface Loopback0 enable}) under router pim configuration mode.

IGMP protocol is enabled on GigabitEthernet0/6/0/3, because it too has been configured explicitly under router igmp configuration mode (\texttt{interface GigabitEthernet0/6/0/3 router enable}):

```
RP/0/RSP0/CPU0:router(config)# multicast-routing
RP/0/RSP0/CPU0:router(config-mcast)# address-family ipv4
RP/0/RSP0/CPU0:router(config-mcast-default-ipv4)# interface-inheritance disable
RP/0/RSP0/CPU0:router(config-mcast-default-ipv4)# interface loopback 1 enable
```

With the \texttt{interface-inheritance disable} command in use, IGMP and PIM configuration are enabled in the protocol configuration as follows:

```
router igmp
  interface loopback 0
  router enable

router pim
  interface loopback 0
  enable

router pim vrf default address-family ipv4
  interface Loopback0
  enable
```

```
RP/0/RSP0/CPU0:router(config-mcast-default-ipv4)# show run router igmp
```

```
router igmp
  vrf default
    interface GigabitEthernet0/6/0/3
    router enable
```
log-traps

To enable logging of trap events, use the `log-traps` command in the appropriate configuration mode. To remove this functionality, use the `no` form of this command.

```
log-traps
no  log-traps
```

**Syntax Description**
This command has no keywords or arguments.

**Command Default**
This command is disabled by default.

**Command Modes**
- Multicast routing configuration
- Multicast routing address family IPv4 configuration
- Multicast VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
</table>
| Release 3.7.2 | This command was introduced.

**Usage Guidelines**
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>

</tbody>
</table>

**Examples**

The following example shows how to disable maximum state limits:

```
RP/0/RSP0/CPU0:router# multicast-routing
RP/0/RSP0/CPU0:router(config-mcast)# maximum disable
```
\section*{mdt c-multicast-routing}

To configure customer multicast routing (c-multicast-routing) for multicast distribution trees (MDT) and to enter the c-multicast-routing mode, use the \texttt{mdt c-multicast-routing} command in the appropriate mode. To delete the configuration, use the \texttt{no} form of the command.

\begin{verbatim}
mdt c-multicast-routing [ bgp | pim ]
no mdt c-multicast-routing [ bgp | pim ]
\end{verbatim}

\textbf{Syntax Description}

\begin{itemize}
  \item \texttt{bgp} \quad Enables customer multicast routing for BGP.
  \item \texttt{pim} \quad Enables customer multicast routing for PIM.
\end{itemize}

\textbf{Command Default}

None

\textbf{Command Modes}

PIM VRF address-family configuration mode

\textbf{Command History}

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
</table>
| 4.3     | This command was introduced.

\textbf{Usage Guidelines}

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

\textbf{Task ID}

\begin{itemize}
  \item \texttt{multicast} \quad read, write
\end{itemize}

\textbf{Example}

This example show how to run the \texttt{mdt c-multicast-routing}:

\begin{verbatim}
RP/0/RSP0/CPU0:router(config-pim-v1-ipv4) # mdt c-multicast-routing bgp
\end{verbatim}
To configure multicast data to be part of a multicast distribution tree (MDT) data group for multicast VPN (MVPN), use the `mdt data` command in the appropriate configuration mode. To remove this functionality, use the `no` form of this command.

```
mdt data mdt-group-address [mask] [threshold threshold-value] [acl-name]
no mdt data mdt-group-address [prefix-length] [threshold threshold-value] [acl-name]
```

**Syntax Description**
- `mdt-group-address`: IP address of the MDT group.
- `/mask`: A decimal value that indicates how many of the high-order contiguous bits of the address compose the prefix (the network portion of the address). A slash must precede the decimal value.
- `threshold threshold-value`: Specifies the traffic rate threshold to trigger data MDT. Range is 1 to 4294967295.
- `acl-name`: Access list (ACL) for the customer’s VRF groups allowed to perform data MDT.

**Command Default**
- `threshold`: 1

**Command Modes**
- Multicast routing configuration
- Multicast routing address family IPv4 and IPv6 configuration
- Multicast VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.5.0</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Release 3.7.0</td>
<td>Additional keyword information was added to the command. The bottom of the threshold value range was increased by 1.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

When certain multicast streams exceed a configured bandwidth, the multicast data is moved to an MDT data group that is dynamically chosen from an available pool of multicast addresses. If the traffic bandwidth falls below the threshold, the source is switched back to the default MDT. To avoid transitions between the MDTs, traffic only reverts to the default MDT if traffic below the data MDT threshold is at least one minute old.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>

**Example**

This example shows how to run the `mdt data ingress replication` command:

```
RP/0/RSP0/CPU0:router (config-mcast-v1-ipv4) # mdt data ingress-replication immediate-switch
```
**mdt default**

To configure the default group address of the multicast VPN (MVPN) multicast distribution tree (MDT), use the `mdt default` command in the appropriate configuration mode. To remove this functionality, use the `no` form of this command.

```
mdt default {mdt-default-group-address|ipv4 mdt-default-address}
no mdt default {mdt-default-group-address|ipv4 mdt-default-address}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mdt-default-group-address</td>
<td>IP address of the MDT default group entered in <em>A.B.C.D.</em> format.</td>
</tr>
<tr>
<td>ipv4</td>
<td>Specifies IPv4-encapsulated MDT.</td>
</tr>
<tr>
<td>mdt-default-address</td>
<td>MDT IPv4 default address entered in <em>A.B.C.D.</em> format</td>
</tr>
</tbody>
</table>

**Command Default**

The MDT default group address must be unique.

**Command Modes**

- Multicast routing configuration
- Multicast routing address family IPv4 and IPv6 configuration
- Multicast VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.5.0</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>3.7.0</td>
<td>Additional keyword information was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The default MDT has a unique group address used to create MVPN multicast tunnel interfaces.

Although within the multicast VRF configuration submode, the MDT configuration uses either the `ipv4` or `ipv6` keyword to distinguish the appropriate multicast VPN, the MDT core tree is IPv4.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read,</td>
</tr>
<tr>
<td></td>
<td>write</td>

### mdt mtu

To configure the maximum transmission unit (MTU) configuration of the multicast VPN (MVPN) multicast distribution tree (MDT), use the `mdt mtu` command in multicast VPN configuration mode. To remove this functionality, use the `no` form of this command.

**Syntax**

```
mdt mtu value
no mdt mtu value
```

**Syntax Description**

- `value` Specifies the MTU value and ranges between 401 to 65535. The configured mdt mtu value includes 24 bytes of GRE encapsulation.

**Command Default**

The MDT tunnel default size is 1376.

**Command Modes**

Multicast VRF configuration

**Command History**

<table>
<thead>
<tr>

<td>Configures the default group address of the multicast VPN (MVPN) multicast distribution tree (MDT).</td>
</tr>
<tr>
<td>mdt source, on page 36</td>
<td>Configures the interface used to set the multicast VPN (MVPN) data multicast distribution tree (MDT) source address.</td>
</tr>
</tbody>
</table>
To configure the interface used to set the multicast VPN (MVPN) data multicast distribution tree (MDT) source address, use the `mdt source` command in the appropriate configuration mode. To remove this functionality, use the `no` form of this command.

```
mdt source type interface-path-id
no mdt source type interface-path-id
```

**Syntax Description**

- `type` Interface type. For more information, use the question mark (?) online help function.
- `interface-path-id` Physical interface or virtual interface.

**Note** Use the `show interfaces` command to see a list of all interfaces currently configured on the router.

For more information about the syntax for the router, use the question mark (?) online help function.

**Command Default**

No default behavior or values

**Command Modes**

- Multicast routing configuration
- Multicast routing address family IPv4 configuration
- Multicast VRF configuration

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the `mdt source` command to identify the root of the multicast distribution tree in the service provider network. This address is used to update all MVPN peers through multiprotocol BGP.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to configure the interface used to set the MDT source address:

```
RP/0/RSP0/CPU0:router#  multicast-routing
RP/0/RSP0/CPU0:router(config-mcast)#  mdt source POS 0/1/0/0
```

**Note** Per VRF MDT Source is a new feature introduced in IOS XR Software Release 3.9.0 apart from the existing default MDT source. Each VRF can have its own MDT source interface co-existing with the default MDT source to achieve core diversity.
The following examples show how to configure a per VRF MDT source:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# multicast-routing
RP/0/RSP0/CPU0:router(config-mcast)# address-family ipv4
RP/0/RSP0/CPU0:router(config-mcast-default-ipv4)# mdt source loopback0
RP/0/RSP0/CPU0:router(config-mcast)# vrf foo
RP/0/RSP0/CPU0:router(config-mcast-foo)# address-family ipv4
RP/0/RSP0/CPU0:router(config-mcast-foo-ipv4)# mdt source loopback1
```

<tr>
<td>4.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The policy name is used to match the upstream PE s (nexthop) and send joins through BGP or PIM.

**Task ID**

<table>

</tbody>
</table>

**Example**

This example shows how to use the migration route-policy command:

```
RP/0/RSP0/CPU0:router (config-pim-v1-ipv4-mdt-cmcast) # migration route-policy p1
```
**multicast-routing**

To enter multicast routing configuration mode, use the `multicast-routing` command in global configuration mode. To return to the default behavior, use the `no` form of this command.

```
multicast-routing
no multicast-routing
```

**Syntax Description**
This command has no keywords or arguments.

**Command Default**
No default behavior or values.

**Command Modes**
Global configuration

**Command History**

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
**multipath**

To enable Protocol Independent Multicast (PIM) to divide the multicast load among several equal cost paths, use the **multipath** command in the appropriate configuration mode. To return to the default behavior, use the **no** form of this command.

```
[address-family ipv4] multipath [hash {source|source next-hop}]
no multipath
```

**Syntax Description**

- **hash** (Optional) Enables multipath hashing.
- **source** Enables source-based multipath hashing.
- **source-next-hop** (Optional) Enables source with next-hop hashing.

**Command Default**

This command is disabled by default.

**Command Modes**

- Multicast routing configuration
- Multicast routing address-family ipv4
- Multicast VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

By default, equal-cost multipath (ECMP) paths are not load balanced. A single path from each unicast route is used for all multicast routes (which is the equivalent of the **no** form of the multipath command).

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to enable multipath functionality:

```
RP/0/RSP0/CPU0:router(config)# multicast-routing
RP/0/RSP0/CPU0:router(config-mcast)# multipath hash
```
nsf (multicast)

To turn on the nonstop forwarding (NSF) capability for the multicast routing system, use the `nsf` command in multicast routing configuration mode. To turn off this function, use the `no` form of this command.

```
nsf [lifetime seconds]
no nsf [lifetime]
```

**Syntax Description**

| lifetime seconds | (Optional) Specifies the maximum time (in seconds) for NSF mode. Range is 30 to 3600. |

**Command Default**

This command is disabled by default.

**Command Modes**

- Multicast routing configuration
- Multicast routing address family ipv4 configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `nsf` command does not enable or disable the multicast routing system, but just the NSF capability for all the relevant components. When the `no` form of this command is used, the NSF configuration is returned to its default disabled state.

Enable multicast NSF when you require enhanced availability of multicast forwarding. When enabled, failures of the control-plane multicast routing components Multicast Routing Information Base (MRIB) or Protocol Independent Multicast (PIM) will not cause multicast forwarding to stop. When these components fail or communication with the control plane is otherwise disrupted, existing Multicast Forwarding Information Base (MFIB) entries continue to forward packets until either the control plane recovers or the MFIB NSF timeout expires.

Enable multicast NSF when you upgrade control-plane Cisco IOS XR Software packages so that the live upgrade process does not interrupt forwarding.

When the MFIB partner processes enter NSF mode, forwarding on stale (nonupdated) MFIB entries continues as the control-plane components attempt to recover gracefully. Successful NSF recovery is signaled to the Multicast Forwarding Engine (MFWD) partner processes by MRIB. MRIB remains in NSF mode until Internet Group Management Protocol (IGMP) has recovered state from the network and host stack and until PIM has recovered state from the network and IGMP. When both PIM and IGMP have recovered and fully updated the MRIB, MRIB signals the MFIBs that NSF is ending, and begins updating the stale MFIB entries. When all updates have been sent, the MFWD partner processes delete all remaining stale MFIB entries and returns to normal operation, ending the NSF mode. MFIB NSF timeout prior to the signal from MRIB may cause NSF to end, and thus forwarding to stop.

When forwarding is in NSF mode, multicast flows may continue longer than necessary when network conditions change due to multicast routing protocols, unicast routing protocol reachability information, or local sender and receiver changes. The MFWD partner processes halt forwarding on stale MFIB entries when the potential
for a multicast loop is detected by receipt of incoming data on a forwarding interface for the matching MFIB entry.

**Note**
For NSF to operate successfully in your multicast network, you must also enable NSF for the unicast protocols (such as Intermediate System-to-Intermediate System [IS-IS], Open Shortest Path First [OSPF] and Border Gateway Protocol [BGP]) that PIM relies on for Reverse Path Forwarding (RPF) information. See the appropriate configuration modules to learn how to configure NSF for unicast protocols.

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>

oom-handling

To enable the out-of-memory (OOM) functionality on multicast routing software components, use the oom-handling command in multicast routing configuration mode. To remove this functionality, use the no form of this command.

oom-handling
no oom-handling

Syntax Description
This command has no keywords or arguments.

Command Default
This command is disabled by default.

Command Modes
Multicast routing configuration
Multicast routing address family ipv4 configuration

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

When the oom-handling command is enabled, and the router memory is low or in a warning state, the following states are not created:

- Protocol Independent Multicast (PIM) route states in response to PIM join and prune messages, and register messages
- Internet Group Management Protocol (IGMP) group states
- External Source-Active (SA) states in Multicast Source Discovery Protocol (MSDP)

Multicast routing show commands such as the show pim topology command indicate when the router is running low on memory and that new state creation has stopped.

Task ID

<table>

</table>
shared-tree-prune delay

To set or change the prune installation time, use the `shared-tree-prune-delay` command in the appropriate mode. To disable the set time, use the `no` form of the command.

```
shared-tree-prune-delay  time
noshared-tree-prune-delay  time
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>time</td>
<td>Delay in seconds. Range is 0 to 1800.</td>
</tr>
</tbody>
</table>

**Command Default**

60 seconds (for upstream prune)

**Command Modes**

C-multicast-routing configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

This command is used to change the prune installation time (C-S, C-G, RPT). This is required on PEs connected to the C-RP (under certain conditions), when a Type-5 route is received. This is applicable only to BGP C-multicast Routing.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>

<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Example**

This example shows how to use the `shared-tree-prune-delay` command:

```
RP/0/RSP0/CPU0:router (config-pim-v1-ipv4-mdt-cmcast) # shared-tree-prune-delay 100
```
show mfib bvi

To display the Bridge Virtual Interface (BVI) details in the Multicast Forwarding Information Base (MFIB), use the `show mfib bvi` command EXEC mode.

```
show mfib bvi [interface | route] bvi_number
```

**Syntax Description**

- `interface` MFIB BVI interface.
- `route` BVI route entry.
- `bvi_number` BVI interface number. Range is from 1 to 65535.

**Command Default**

None

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

<tr>
<td>ipv6</td>
<td>(Optional) Specifies IPv6 address prefixes.</td>
</tr>
<tr>
<td>location node-id</td>
<td>(Optional) Specifies MFIB connections associated with an interface of the designated node.</td>
</tr>
</tbody>
</table>

**Command Default**
IPv4 addressing is the default.

**Command Modes**
EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the `show mfib connections` command to display a list of servers connected to the MFIB and the status of the connections.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read</td>
</tr>
</tbody>
</table>

**Examples**
The following is sample output from the `show mfib connections` command:

```
RP/0/RSP0/CP00:router# show mfib connections

</tbody>
</table>
show mfib counter

To display Multicast Forwarding Information Base (MFIB) counter statistics for packets that have dropped, use the `show mfib counter` command in the appropriate mode.

```
show mfib [vrf vrf-name] ipv4 counter [location node-id]
```

**Syntax Description**

- **vrf vrf-name**  
  (Optional) Specifies a VPN routing and forwarding (VRF) instance.

- **ipv4**  
  (Optional) Specifies IPv4 address prefixes.

- **location node-id**  
  (Optional) Specifies MFIB counter statistics associated with an interface of the designated node.

**Command Default**

IPv4 addressing is the default.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>

</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `show mfib counter` command displays packet drop statistics for packets that cannot be accounted for under route counters.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read</td>
</tr>
</tbody>
</table>

**Examples**

The following is sample output from the `show mfib counter` command:

```
RP/0/RSP0/CPU0:router# show mfib counter location 0/1/CPU0
MFIB global counters are:
* Packets [no input idb] : 0
* Packets [failed route lookup] : 0
* Packets [Failed idb lookup] : 0
* Packets [Mcast disabled on input I/F] : 0
* Packets [encap drops due to ratelimit] : 0
* Packets [MC disabled on input I/F (iarm nfn)] : 0
```
This table describes the significant fields shown in the display.

**Table 1: show mfib counter Field Descriptions**

<table>
<thead>
<tr>

**show mfib hardware interface**

To display hardware switching interface information for the Multicast Forwarding Information Base (MFIB) process, use the `show mfib hardware interface` command in EXEC mode.

```
show mfib [vrf vrf-name] [ipv4|ipv6] hardware interface [detail] [type interface-path-id] [location node-id]
```

**Syntax Description**

- **vrf vrf-name**: (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- **ipv4**: (Optional) Specifies IPv4 address prefixes.
- **ipv6**: (Optional) Specifies IPv6 address prefixes.
- **detail**: (Optional) Displays detailed information about the MFIB interface.
- **type**: (Optional) Interface type. For more information, use the question mark (?) online help function.
- **interface-path-id**: (Optional) Physical interface or virtual interface.

**Note**

Use the `show interfaces` command to see a list of all interfaces currently configured on the router. For more information about the syntax for the router, use the question mark (?) online help function.

- **location node-id**: (Optional) Specifies an MFIB-designated node.

**Command Default**

IPv4 addressing is the default.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>

**Table 2: show mfib hardware interface Field Descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>MFIB interface name.</td>
</tr>
<tr>
<td>Handle</td>
<td>A 32-bit system-wide identifier of the MFIB interface.</td>
</tr>
<tr>
<td>RefCnt</td>
<td>Number of times various data structures referred to this MFIB interface structure.</td>
</tr>
<tr>
<td>TTL</td>
<td>Multicast time-to-live threshold that was configured on this MFIB interface.</td>
</tr>
<tr>
<td>Routes</td>
<td>The number of routes that include this interface as a member.</td>
</tr>
<tr>
<td>uIDB</td>
<td>The ucode Interface Descriptor Block index.</td>
</tr>
<tr>
<td>Enbld</td>
<td>If true, multicast is enabled on the MFIB interface.</td>
</tr>
<tr>
<td>Comment</td>
<td>Indicates whether there were problems when reading hardware information.</td>
</tr>

</table>
show mfib hardware ltrace

To display IP Multicast platform specific trace information for the Multicast Forwarding Information Base (MFIB) process, use the `show mfib hardware ltrace` command in EXEC mode.

```
show mfib [vrf vrf-name] [ipv4|ipv6] hardware ltrace [{error|event|frequent-event|hexdump|init|last|netio|reverse|stats|tailf|unique|verbose|wrapping}] file file-name location node-id
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrf vrf-name</td>
<td>(Optional) Specifies a VPN routing and forwarding (VRF) instance.</td>
</tr>
<tr>
<td>ipv4</td>
<td>(Optional) Specifies IPv4 address prefixes.</td>
</tr>
<tr>
<td>ipv6</td>
<td>(Optional) Specifies IPv6 address prefixes.</td>
</tr>
<tr>
<td>error</td>
<td>(Optional) Displays error events.</td>
</tr>
<tr>
<td>event</td>
<td>(Optional) Displays non-frequent events.</td>
</tr>
<tr>
<td>frequent-event</td>
<td>(Optional) Displays frequent events.</td>
</tr>
<tr>
<td>hexdump</td>
<td>(Optional) Displays traces in hexadecimal output.</td>

show mfib hardware resource-counters

To display the allocated and freed hardware resources for the Multicast Forwarding Information Base (MFIB) process, use the `show mfib hardware resource-counters` command in EXEC mode

```
show mfib [vrf vrf-name] [ipv4|ipv6] hardware resource-counters location node-id
```

**Syntax Description**
- `vrf vrf-name` (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- `ipv4` (Optional) Specifies IPv4 address prefixes.
- `ipv6` (Optional) Specifies IPv6 address prefixes.
- `location node-id` Specifies an MFIB-designated node.

**Command Default**
IPv4 addressing is the default.

**Command Modes**
EXEC

**Command History**
- **Release** 3.7.2 This command was introduced.

**Usage Guidelines**
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the `show mfib hardware resource-counters` command to understand the table lookup unit (TLU) resource usage by MFIB.

- Usage for each channel
- Storing of specific data
- Allocation counts for metro statistics
- Failure counts for metro statistics

**Note**
Use the location option in the `show mfib hardware resource-counters` command to indicate for which linecard you need information. The command will not display any useful output if only RSP is specified or if no location is specified.

**Task ID**
- **Task ID** Operations
  - multicast read

show mfib hardware route mofrr

To display the platform-specific Multicast Forwarding Information Base (MFIB) information for the MoFRR (multicast only fast reroute)- enabled list stored in the hardware, use the show mfib hardware route mofrr command in EXEC mode.

```
show mfib hardware route mofrr {[*] [source-address] [group-address [/prefix-length]] [detail]} [location node-id]
```

**Syntax Description**

- `*` (Optional) Displays all the MoFRR routes configured in the platform.
- `source-address` (Optional) IP address or hostname of the multicast route source.
- `group-address` (Optional) IP address or hostname of the multicast group.
- `detail` (Optional) Displays a detailed list of the MoFRR routing database.
- `location node-id` Specifies the Node ID for an MFIB-designated node.

**Command Default**
IPv4 addressing is the default. Currently, MoFRR supports only IPv4 routes.

**Command Modes**
EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.9.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

MoFRR is a mechanism in which two copies of the same multicast stream flow through disjoint paths in the network. At the point in the network (usually the PE closer to the receivers) where the two streams merge, one of the streams is accepted and forwarded on the downstream links, while the other stream is discarded. When a failure is detected in the primary stream due to a link or node failure in the network, MoFRR instructs the forwarding plane to start accepting packets from the backup stream (which now becomes the primary stream).

MoFRR is triggered when the hardware detects traffic loss on the primary path of a given flow or route. Traffic loss is defined as no data packet having been received for 30 ms. When MoFRR is triggered, the primary and secondary reverse-path forwarding (RPF) interfaces are exposed to the forwarding plane and switchover occurs entirely at the hardware level.

The show mfib hardware route mofrr command displays the output MoFRR route list of the platform. If there is no MoFRR route enabled in the platform, then the output result is “There are no MoFRR routes configured”.

The command does not display any useful output if only RSP is specified or if no location is specified.

### Table 4: show mfib hardware route mofrr Field Descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RPFS</td>
<td>Primary and backup RPF of the route.</td>
</tr>
<tr>
<td>A</td>
<td>Currently active RPF for forwarding the traffic to the egress (OLIST). T: means true, F: means false.</td>
</tr>
<tr>
<td>MS</td>
<td>Monitoring state. It has three states. MS=0, indicates that the monitoring state disabled. MS=1, indicates that active RPF is monitoring traffic activity. MS=2, indicates that active RPF is monitoring traffic loss.</td>
</tr>
<tr>
<td>WDI</td>
<td>Watchdog Count Index. Each MoFRR route has two Line card specific watchdog indexes, associated with primary and backup RPF, respectively.</td>
</tr>
<tr>
<td>OIFS</td>
<td>Output Interfaces in the local line card.</td>
</tr>
<tr>
<td>Sequence num</td>
<td>MoFRR specific route sequence number.</td>
</tr>
<tr>
<td>Num of switchovers</td>
<td>Total number of switchovers triggered by traffic loss detection in the data plane.</td>
</tr>
<tr>
<td>Watchdog Counters</td>
<td>Internal Hardware watchdog counters</td>
</tr>
<tr>
<td>MoFRR Statistics</td>
<td>Internal software watchdog counters</td>
</tr>
</tbody>
</table>

If there is no MoFRR route enabled in the platform, the output result will be as follows:

```
RP/0/RSP0/CPU0:router# show mfib hardware route mofrr location 0/0/CPU0
LC Type: Trident
No matching routes in MFIB
There are no MoFRR routes configured.
```

<td>Displays all entries in the Multicast Routing Information Base (MRIB).</td>
</tr>
</tbody>
</table>
**show mfib hardware route olist**

To display platform-specific Multicast Forwarding Information Base (MFIB) information in the output interface list (olist) stored in the hardware, use the `show mfib hardware route olist` command in the appropriate mode.

```
show mfib [vrf vrf-name] [{ipv4|ipv6}] hardware route olist {[*][source-address] [group-address [/ prefix-length]]} [location node-id]
```

**Syntax Description**

- `vrf vrf-name` (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- `ipv4` (Optional) Specifies IPv4 address prefixes.
- `ipv6` (Optional) Specifies IPv6 address prefixes.
- `*` (Optional) Displays shared tree entries.
- `source-address` (Optional) IP address or hostname of the multicast route source.
- `group-address` (Optional) IP address or hostname of the multicast group.
- `/ prefix-length` (Optional) Prefix length of the multicast group. A decimal value that indicates how many of the high-order contiguous bits of the address compose the prefix (the network portion of the address). A slash must precede the decimal value.
- `location node-id` Specifies an MFIB-designated node.

**Command Default**

IPv4 addressing is the default.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `show mfib hardware route olist` command displays the output interface list (olist) for each route. The Multicast Forwarding (MFWD) process stores olist interfaces in a table lookup unit (TLU) block (in groups of three). As such, the command displays each route three times. The command does not display any useful output if only RSP is specified or if no location is specified.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read</td>
</tr>
</tbody>
</table>
The following is sample output from the `show mfib hardware route olist` command. (The output fields are described in the header.)

```plaintext
RP/0/RSP0/CPU0:router# show mfib hardware route olist location 0/0/CPU0

LC Type: Trident

Legend:
Route Information - (Ingress)
 C: Chip ID, IC: BACL check, IP: Punt this packet to LC CPU,
 ID: Directly connected, IS: RPF interface signal, IU: Punt copy to RP,
 IF: Punt to LC CPU if forwarded, IM: Result match, IV: Valid entry,
 IR: RPF IF, IA: Fabric slotmask, IG: Multicast group ID

Route Information - (Egress)
 ET: Table ID to be used for OLIST lookup, EO: OLIST count bit,
 ER: Route MGID to be used for OLIST/NRPF lookup, EM: Result match,
 EV: Valid entry, EC: Count of OLIST members on this chip,
 BS: Base of the statistics pointer

Hardware Information
 C: Chip ID; T: Table ID; M: Member ID; Intf: Interface, U: uIDB index,
 I: HW IC flag, B: HW BACL bit, Base: Base of statistics pointer

show mfib hardware route statistics

To display platform-specific Multicast Forwarding Information Base (MFIB) information for the packet and byte counters for each route, use the `show mfib hardware route statistics` command in EXEC mode.

```
show mfib [vrf vrf-name] [ipv4|ipv6] hardware route statistics [detail] [*] [source-address] [group-address [/prefix-length]] [location node-id]
```

**Syntax Description**

- `vrf vrf-name` (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- `ipv4` (Optional) Specifies IPv4 address prefixes.
- `ipv6` (Optional) Specifies IPv6 address prefixes.
- `*` (Optional) Displays shared tree entries.
- `source-address` (Optional) IP address or hostname of the multicast route source.
- `group-address` (Optional) IP address or hostname of the multicast group.
- `/prefix-length` (Optional) Prefix length of the multicast group. A decimal value that indicates how many of the high-order contiguous bits of the address compose the prefix (the network portion of the address). A slash must precede the decimal value.
- `detail` (Optional) Displays a detailed list of the routing database.
- `location node-id` (Optional) Specifies an MFIB-designated node.

**Command Default**

IPv4 addressing is the default.

**Command Modes**

EXEC

**Command History**

Release 3.7.2 This command was introduced.

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the `show mfib hardware route statistics` command to display the hardware packet and byte counter for a route. Route counters are kept for (S, G) routes only. A single set of counters is provided for all (*, G) routes.

This command displays the hardware packet and bytes count on a per-route basis. Per-route hardware counters are kept for (S, G) routes only. However, counters are managed dynamically and allocated on a priority basis and may not be available for each (S, G) route. There is a single set of counters for all (*, G) routes. For example, interface counters and access list counters have higher priority than route counters.
Note

Route counters are local to each line card.

show mfib hardware route summary

To display summary platform-specific Multicast Forwarding Information Base (MFIB) hardware information for each route entry, use the `show mfib hardware route summary` command in EXEC mode.

```
show mfib [vrf vrf-name] [ipv4|ipv6] hardware route summary location node-id
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrf vrf-name</td>
<td>(Optional) Specifies a VPN routing and forwarding (VRF) instance.</td>
</tr>
<tr>
<td>ipv4</td>
<td>(Optional) Specifies IPv4 address prefixes.</td>
</tr>
<tr>
<td>ipv6</td>
<td>(Optional) Specifies IPv6 address prefixes.</td>
</tr>
<tr>
<td>location node-id</td>
<td>(Optional) Specifies an MFIB-designated node.</td>
</tr>
</tbody>
</table>

**Command Default**

IPv4 addressing is the default.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the `show mfib hardware summary` command to display hardware information for the route of the node.

The hardware information of MoFRR (multicast only fast reroute) enabled routes are also displayed. In IOS XR Software Release 3.9.0, the maximum platform supported MoFRR routes are 1024.

The longest-prefix match route is displayed depending on the provided source and group addresses. The command does not display any useful output if only RSP is specified or if no location is specified.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read</td>
</tr>
</tbody>
</table>

**Examples**

The following is sample output from the `show mfib hardware route summary` command:

```
RP/0/RSP0/CPU0:router# show mfib hardware route summary location 0/1/cpu0

LC Type: Trident
H/W IP Multicast Forwarding Information Base Summary
   No. of (*,G) routes = 5
   No. of (S,G) routes = 10

RP/0/RSP0/CPU0:router# show mfib hardware route summary location 0/0/CPU0
```
LC Type: Trident
H/W IP Multicast Forwarding Information Base Summary
  No. of (*,G) routes = 6
  No. of (S,G) routes = 5
  No. of (S,G) MoFRR routes = 0, Maximum supported MoFRR routes = 1024

RP/0/RSP0/CPU0:router# show mfib hardware route summary location 0/4/cPU0

LC Type: A9K-SIP-700
Hardware IP Multicast Forwarding Information Base Route Summary
  Number of hardware (*, G) routes = 6
  Number of hardware (S, G) routes = 1
  Number of hardware route-interfaces = 4
  Number of hardware Rx adjacencies = 7
  Number of hardware Tx adjacencies = 3
  Number of ref to decap adjacency = 0
  Mvpn master LC status = False

If there is no MoFRR configured in the platform:

RP/0/RSP0/CPU0:router# show mfib hardware route summary location 0/0/CPU0

LC Type: Trident
H/W IP Multicast Forwarding Information Base Summary
  No. of (*,G) routes = 6
  No. of (S,G) routes = 5
  No. of (S,G) MoFRR routes = 0, Maximum supported MoFRR routes = 1024

This table describes the significant fields shown in the display.

Table 6: show mfib hardware route summary Field Descriptions

show mfib hardware table

To display the platform-specific multicast table information for the Multicast Forwarding Information Base (MFIB) in the hardware, use the `show mfib hardware table` command in EXEC mode.

```
show mfib [vrf vrf-name] [ipv4|ipv6] hardware table [detail] [location node-id]
```

**Syntax Description**

- `vrf vrf-name` (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- `ipv4` (Optional) Specifies IPv4 address prefixes.
- `ipv6` (Optional) Specifies IPv6 address prefixes.
- `detail` (Optional) Displays detailed platform-specific multicast table information.
- `location node-id` (Optional) Specifies the MFIB location.

**Command Default**

IPv4 addressing is the default.

**Command Modes**

EXEC

**Command History**

<table>

</tbody>
</table>
show mfib interface

To display interface-related information used during software multicast switching in the Multicast Forwarding Information Base (MFIB) process, use the **show mfib interface** command in EXEC mode.

```
show mfib [vrf vrf-name] ipv4 interface [type interface-path-id] [{detail|route}] [location node-id]
```

### Syntax Description

- **vrf vrf-name** (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- **ipv4** (Optional) Specifies IPv4 address prefixes.
- **type** (Optional) Interface type. For more information, use the question mark (?) online help function.
- **interface-path-id** (Optional) Physical interface or virtual interface.
  
  **Note** Use the **show interfaces** command in EXEC mode to see a list of all interfaces currently configured on the router.

  For more information about the syntax for the router, use the question mark (? ) online help function.

- **detail** (Optional) Specifies detailed information for packet statistics on interfaces.
- **route** (Optional) Specifies a list of routes associated with the interface. This option is available if an interface type and instance are specified.
- **location node-id** (Optional) Specifies packet statistics associated with an interface of the designated node.

### Command Default

IPv4 addressing is the default.

### Command Modes

EXEC

### Command History

**Release**  **Modification**

Release 3.7.2    This command was introduced.

### Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The **show mfib interface** command displays counters for the number of packets and bytes that are handled by software switching. Counters for packets processed by hardware are displayed by the appropriate **show mfib hardware** command.
Examples

The following is sample output from the `show mfib interface` command for the multicast route on node 0/2/CPU0 that is associated with the Gigabit Ethernet interface 0/2/0/2:

```
RP/0/RSP0/CPU0:router# show mfib interface GigE 0/2/0/2 location 0/2/CPU0

Interface: GigE0/2/0/2 (Enabled)
Mcast pkts in: 5839, Mcast pkts out: 0 TTL Threshold: 0 Ref Count: 18
```

The following is sample output from the `show mfib interface` command with the `detail` and `location` keywords specified:

```
RP/0/RSP0/CPU0:router# show mfib interface detail location 0/2/CPU0

Interface: FINT0/2/CPU0 [0x3000000] (Disabled) PHYSICAL Create Unknown Mcast pkts in: 0, Mcast pkts out: 0 TTL Threshold: 0, VRF ID: 0x60000000, Multicast Adjacency Ref Count: 2, Route Count: 0, Handle: 0x3000000 Primary address: 0.0.0.0/32 Secondary address: 0.0.0.0/32

Interface: GigE0/2/0/2 [0x3000900] (Enabled) PHYSICAL Create Rcvd Mcast pkts in: 5844, Mcast pkts out: 0 TTL Threshold: 0, VRF ID: 0x60000000, Multicast Adjacency Ref Count: 18, Route Count: 15, Handle: 0x3000900 Primary address: 112.112.112.203/24 Secondary address: 0.0.0.0/32
```

This table describes the significant fields shown in the display.

show mfib nsf

To display the state of a nonstop forwarding (NSF) operation for the Multicast Forwarding Information Base (MFIB) line cards, use the `show mfib nsf` command in EXEC mode.

```
show mfib [{ipv4}] nsf [location node-id]
```

**Syntax Description**

- `ipv4` (Optional) Specifies IPv4 address prefixes.
- `location node-id` (Optional) Specifies the MFIB NSF designated node.

**Command Default**

IPv4 addressing is the default.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>

</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `show mfib nsf` command displays the current multicast NSF state for the MFIB process contained on all line cards and route processors (RPs) in the router.

For multicast NSF, the state may be one of the following:

- **Normal**—Normal operation: The MFIBs in the card contain only up-to-date MFIB entries.
- **Boot Card Booting**—Card is initializing and has not yet determined its NSF state.
- **Not Forwarding**—Multicast Forwarding Disabled: Multicast routing failed to recover from a failure-induced NSF state prior to the MFIB NSF timeout.
- **Non-stop Forwarding Activated**—Multicast NSF active: The router is operating in NSF mode while attempting to recover from a control-plane failure. In this mode, data is forwarded based on MFIB entries that are either updated by the recovered Multicast Routing Information Base (MRIB), or MFIB entries that were marked stale when NSF mode began. The times remaining until multicast NSF and multicast-unicast NSF expiration are displayed.

**Task ID**

<table>

show mfib route

To display route entries in the Multicast Forwarding Information Base (MFIB), use the `show mfib route` command in EXEC mode.

```
show mfib [vrf vrf-name] ipv4 route
[ [rate] source-IP-address|group-IP-address[/prefix-length] |detail|summary|location node-id]`
```

Syntax Description

- `*` (Optional) Display shared tree entries.
- `source-IP-address` (Optional) IP address or hostname of the multicast route source. Format is: `A.B.C.D`
- `group-IP-address` (Optional) IP address or hostname of the multicast group. Format is: `A.B.C.D`
- `/prefix-length` (Optional) Group IP prefix length of the multicast group. A decimal value that indicates how many of the high-order contiguous bits of the address compose the prefix (the network portion of the address). Format is: `A.B.C.D/length`
- `vrf vrf-name` (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- `ipv4` (Optional) Specifies IPv4 address prefixes.
- `ipv6` (Optional) Specifies IPv6 address prefixes.
- `detail` (Optional) Specifies detailed route information.
- `location node-id` (Optional) Specifies an MFIB-designated node.
- `rate` (Optional) Displays individual (S, G) rates.
- `sources-only` (Optional) Restricts display of any shared-tree entries.
- `summary` (Optional) Displays a brief list of the routing database.
- `tech-support` (Optional) Displays technical support information.

Command Default

IPv4 addressing is the default.

Command Modes

EXEC

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.
All entries in the MFIB table are derived from the Multicast Routing Information Base (MRIB). The flags have the same connotation as in the MRIB. The flags determine the forwarding and signaling behavior according to a set of forwarding rules for multicast packets. In addition to the list of interfaces and flags, each route entry shows various counters. Byte count is the number of total bytes forwarded. Packet count is the number of packets received for this entry.

The `show mfib counter` command displays global counters independent of the routes.

This command displays counters for the number of packets and bytes that are handled by software switching. Counters for packets processed by hardware are displayed by the appropriate `show mfib hardware` command.

The command displays the cumulative rates per route for all line cards in the Multicast Forwarding Information Base (MFIB) table when the `rate` keyword is used with the source and group IP addresses.

The `show mfib route rate` command is not supported on interfaces such as bundle virtual interfaces and Bridge Group virtual interfaces (BVIs).

The command displays the rate per route for one line card in Multicast Forwarding Information Base (MFIB) table when the `statistics` keyword is used.

### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>multicast read</td>
</tr>
</tbody>
</table>

### Examples

The following is sample output from the `show mfib route` command with the `location` keyword specified (the output fields are described in the header):

```
RP/0/RSP0/CPU0:router# show mfib route location 0/1/CPU0

IP Multicast Forwarding Information Base
Entry flags: C - Directly-Connected Check, S - Signal, D - Drop,
   IA - Inherit Accept, IF - Inherit From, MA - MDT Address,
   ME - MDT Encap, MD - MDT Decap, MT - MDT Threshold Crossed,
   MH - MDT interface handle, CD - Conditional Decap,
   DT - MDT Decap True
Interface flags: F - Forward, A - Accept, IC - Internal Copy,
   NS - Negate Signal, DP - Don't Preserve, SP - Signal Present,
   EG - Egress, EI - Encapsulation Interface, MI - MDT Interface
Forwarding Counts: Packets in/Packets out/Bytes out
Failure Counts: RPF / TTL / Empty Olist / Encap RL / Other

(*,224.0.0.0/24), Flags: D

Multicast Routing and Forwarding Commands

show mfib route

Multicast Routing and Forwarding Commands

The following is a sample output for MoFRR enabled route without and with the detail keyword:

RP/0/RSP0/CPU0:router# show mfib route

Multicast Routing and Forwarding Information Base
Entry flags: C - Directly-Connected Check, S - Signal, D - Drop,
IA - Inherit Accept, IF - Inherit From, MA - MDT Address,
ME - MDT Encap, MD - MDT Decap, MT - MDT Threshold Crossed,
MI - MDT interface handle, CD - Conditional Decap,
DT - MDT Decap True, EX - Extranet
MoFE - MoFRR Enabled, MoFS - MoFRR State
Interface flags: F - Forward, A - Accept, IC - Internal Copy,
NS - Negate Signal, DP - Don't Preserve, SP - Signal Present,
EG - Egress, EI - Encapsulation Interface, MI - MDT Interface,
EX - Extranet, A2 - Secondary Accept
Forwarding/Replication Counts: Packets in/Packets out/Bytes out
Failure Counts: RPF / TTL / Empty Olist / Encap RL / Other
(20.20.20.1,225.0.0.1), Flags: MoFE MoFS
Up: 03:22:30
Last Used: never
SW Forwarding Counts: 0/0/0
SW Replication Counts: 0/0/0
SW Failure Counts: 0/0/0/0/0
GigabitEthernet0/0/0/8 Flags: A, Up:03:22:30
GigabitEthernet0/0/0/18 Flags: A2, Up:03:22:30
GigabitEthernet0/0/0/28 Flags: NS, Up:03:22:30

(20.20.20.1,225.0.0.2), Flags: MoFE MoFS
Up: 03:22:30
Last Used: never
SW Forwarding Counts: 0/0/0
SW Replication Counts: 0/0/0
SW Failure Counts: 0/0/0/0/0
GigabitEthernet0/0/0/8 Flags: A, Up:03:22:30
GigabitEthernet0/0/0/18 Flags: A2, Up:03:22:30
GigabitEthernet0/0/0/28 Flags: NS, Up:03:22:30

In the above command, A flag represents the primary RPF of the MoFRR route, and A2 flag represents the backup RPF of the MoFRR route.

RP/0/RSP0/CPU0:router# show mfib route detail

Up: 03:25:31
Last Used: never
SW Forwarding Counts: 0/0/0
SW Replication Counts: 0/0/0
SW Failure Counts: 0/0/0/0/0
Route ver: 0x443e
MVPN Info :-
The detail option illustrates the MoFRR state of each MoFRR route. At any moment, only one RPF forwards the traffic to the egress. The inactive state means the primary RPF forwards the traffic to the egress. The active state means that the backup RPF forwards the traffic to the egress. The sequence number reflects the number of switchovers of the MoFRR route.

**Example**

This example shows how to run the `show mrib bvi` command:

```
RP/0/RSP0/CPU0:router # show mrib bvi route bvi 200
```
show mrib nsf

To display the state of nonstop forwarding (NSF) operation in the Multicast Routing Information Base (MRIB), use the `show mrib nsf` command in the appropriate mode.

`show mrib ipv4 nsf`

**Syntax Description**

`ipv4` (Optional) Specifies IPv4 address prefixes.

**Command Default**

IPv4 addressing is the default.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `show mrib nsf` command displays the current multicast NSF state for the MRIB. The state may be normal or activated for NSF. The activated state indicates that recovery is in progress due to a failure in MRIB or Protocol Independent Multicast (PIM). The total NSF timeout and time remaining are displayed until NSF expiration.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read</td>
</tr>
</tbody>
</table>

**Examples**

The following is sample output from the `show mrib nsf` command:

```
RP/0/RSP0/CPU0:router# show mrib nsf

IP MRIB Non-Stop Forwarding Status:
Multicast routing state: Non-Stop Forwarding Activated
NSF Lifetime: 00:03:00
NSF Time Remaining: 00:01:40
```

This table describes the significant fields shown in the display.

**Table 12: show mrib nsf Field Descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Multicast state</td>
<td>Multicast NSF status of the MRIB (Normal or NSF Activated).</td>
</tr>
<tr>
<td>NSF Lifetime</td>
<td>Timeout for MRIB NSF, computed as the maximum of the PIM and Internet Group Management Protocol (IGMP) NSF lifetimes, plus 60 seconds.</td>
</tr>
</tbody>
</table>
If MRIB NSF state is activated, the time remaining until MRIB reverts to Normal mode displays. Before this timeout, MRIB receives notifications from IGMP and PIM, triggering a successful end of NSF and causing the transition to normal state. If notifications are not received, the timer triggers a transition back to normal mode, causing new routes to download to MFIB and old routes to be deleted.

<table>
<thead>
<tr>

show mrib platform trace location standby

To display platform-specific data for the Multicast Routing Information Base (MRIB) on a standby RP, use the `show mrib platform trace location standby` command in EXEC mode.

```
show mrib [vrf vrf-name] ipv4 platform trace
[ {file|hexdump|last|reverse|stats|tailf|unique|verbose|wrapping} ] location standby[ {allnode-id} ]
```

**Syntax Description**

- `vrf vrf-name` (Optional) Specifies a VPN routing and forwarding (VRF) instance.
- `ipv4` (Optional) Specifies IPv4 address prefixes.
- `file` (Optional) Specifies the filename.
- `hexdump` (Optional) Displays the traces in hexadecimal form.
- `last` (Optional) Displays the last `n` entries.
- `reverse` (Optional) Displays the traces in reverse order.
- `stats` (Optional) Displays statistics.
- `tailf` (Optional) Displays new traces as they are added.
- `unique` (Optional) Displays unique entries with counts.
- `verbose` (Optional) Displays internal debugging information.
- `wrapping` (Optional) Displays wrapping entries.
- `location standby node-id` (Optional) Specifies the location of the trace.
- `location standby all` (Optional) Specifies that the trace be performed for all locations.

**Command Default**
IPv4 addressing is the default.

**Command Modes**
EXEC

**Command History**

Release 3.7.2  This command was introduced.

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Each line card has an individual Multicast Forwarding Information Base (MFIB) table. The MFIB table maintains a subset of entries and flags updated from MRIB. The flags determine the forwarding and signaling behavior according to a set of forwarding rules for multicast packets. In addition to the list of interfaces and flags, each route entry shows various counters. Byte count is the number of total bytes forwarded. Packet count is the number of packets received for this entry.

The **show mfib counter, on page 49** command displays global counters independent of the routes.

<tr>
<td>Forwarding LC node</td>
<td>Autonomous system to which the peer belongs.</td>
</tr>
<tr>
<td>Associated MDT group</td>
<td>Indicates the number of associated MDT groups.</td>
</tr>
</tbody>
</table>
static-rpf

To configure a static Reverse Path Forwarding (RPF) rule for a specified prefix mask, use the `static-rpf` command in an appropriate configuration mode. To return to the default behavior, use the `no` form of this command.

```
static-rpf  prefix-address  prefix-mask  type  path-id  next-hop-address
no  static-rpf
```

**Syntax Description**

- `prefix-address`: IP address of a prefix for an address range.
- `prefix-mask`: Prefix mask for an address range. Range is 0 to 32 for IPv4.
- `type`: Interface type. For more information, use the question mark (?) online help function.
- `interface-path-id`: Physical interface or virtual interface.

**Note**
Use the `show interfaces` command in EXEC mode to see a list of all interfaces currently configured on the router.

For more information about the syntax for the router, use the question mark (??) online help function.

- `next-hop-address`: IP address for an RPF neighbor.

**Command Default**
A static RPF rule for a specified prefix mask is not configured.

**Command Modes**
- Multicast routing address family ipv4 and ipv6 configuration
- Multicast VRF configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `static-rpf` command is used to configure incompatible topologies for unicast and multicast traffic.

Use the `static-rpf` command to configure a static route to be used for RPF checking in Protocol Independent Multicast (PIM) instead of using the unicast routing table.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example configures the static RPF rule for IP address 10.0.0.1:
RP/0/RSP0/CPU0:router(config)# multicast-routing
RP/0/RSP0/CPU0:router(config-mcast)# vrf green
RP/0/RSP0/CPU0:router(config-mcast)# static-rpf 10.0.0.1 32 GigE 0/0/5/0 10.1.1.1

source-tree-prune-delay

To set the delay-time for the (S,G) prune of the ingress-PE (provider edge), use the source-tree-prune-delay command in the appropriate mode. To remove the set delay, use the no form of the command.

source-tree-prune-delay  time
nosource-tree-prune-delay  time

Syntax Description

<table>
<thead>
<tr>
<th>keyword</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>time</td>
<td>Delay in seconds. Range is 0 to 300.</td>
</tr>
</tbody>
</table>

Command Default

60 seconds

Command Modes

C-multicast-routing configuration mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

This command is used to delay (S,G) Prune on the Ingress-PE, when the last Type-7 route is withdrawn.

Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

Example

This example shows how to use the source-tree-prune-delay command:

RP/0/RSP0/CPU0:router (config-pim-v1-ipv4-mdt-cmcast) # source-tree-prune-delay 100
**suppress-pim-data-signaling**

To suppress PIM data signaling, use the `suppress-pim-data-signaling` command in the appropriate mode. To remove the suppressed condition, use the `no` form of the command.

```
suppress-pim-data-signaling
no suppress-pim-data-signaling
```

**Syntax Description**

This command has no keywords or arguments.

**Command Default**

None

**Command Modes**

PIM C-multicast routing configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

This command supports c-anycast RP and can be used only under the PIM c-multicast routing mode.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Example**

This example shows how to use the `suppress-pim-data-signaling` command:

```
RP/0/RSP0/CPU0:router (config-pim-v1-ipv4-mdt-cmcast) # suppress-pim-data-signaling
```
suppress-shared-tree-join

To suppress shared tree joins and support the SPT-only mode, use the suppress-shared-tree-join command in the appropriate mode.

To remove the suppress condition, use the no form of the command.

suppress-shared-tree-join

nosuppress-shared-tree-join

Syntax Description

This command has no keywords or arguments.

Command Default

None

Command Modes

C-multicast-routing configuration mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

This command enables the SPT-only (Shortest Path Tree) mode.

Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

Example

This command shows how to use the suppress-shared-tree-join command:

RP/0/RSP0/CPU0:router(config-pim-v1-ipv4-mdt-cmcast) # suppress-shared-tree-join
ttl-threshold (multicast)

To configure the time-to-live (TTL) threshold for packets being forwarded out an interface, use the `ttl-threshold` command in the appropriate configuration mode. To return to the default behavior, use the `no` form of this command.

```
ttl-threshold ttl
no ttl-threshold ttl
```

**Syntax Description**

- `ttl` Time to live value. Range is 1 to 255.

**Command Default**

- `ttl`: 0

**Command Modes**

- Multicast routing interface configuration
- Multicast routing VRF interface configuration

**Command History**

- **Release** Modification
  - Release 3.7.2 This command was introduced.

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Only multicast packets with a TTL value greater than the threshold are forwarded out of the interface. The TTL threshold is compared to the TTL of the packet after it has been decremented by one and before being forwarded.

Configure the TTL threshold only on border routers.

**Note**

Do not confuse this command with the `ttl-threshold (MSDP)` command in router MSDP configuration mode that is used to confine the multicast data packet TTL to be sent by an Multicast Source Discovery Protocol (MSDP) Source-Active (SA) message.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to configure the TTL threshold to 23, which means that a multicast packet is dropped and not forwarded out of the GigE 0/1/0 interface:

```
RP/0/RSP0/CPU0:router (config) # multicast-routing
RP/0/RSP0/CPU0:router (config-mcast) # interface GigE 0/1/0/CPU0
RP/0/RSP0/CPU0:router (config-mcast-default-ipv4-if) # ttl-threshold 23
```
### Related Commands

</tbody>
</table>
unicast-reachability

To disable VPN-IP attributes, use the **unicast-reachability** command in the appropriate mode. To restore the attributes, use the **no** form of the command.

```
unicast-reachability [ connector-disable | source-as-disable | vrf-route-import-disable ]
```

Syntax Description

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>connector-disable</td>
<td>Disables connector addition.</td>
</tr>
<tr>
<td>source-as-disable</td>
<td>Disables source AS extended community addition.</td>
</tr>
<tr>
<td>vrf-route-import-disable</td>
<td>Disables VRF route import extended community addition.</td>
</tr>
</tbody>
</table>

Command Default

None

Command Modes

C-multicast routing configuration mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

This command controls addition of extended communities to unicast VPN-IP routes. These attributes have specific purposes in PIM and BGP C-multicast Routing.

Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>read, write</td>
</tr>
</tbody>
</table>

Example

This example shows how to use the **unicast-reachability** command:

```
RP/0/RSP0/CPU0:router (config-pim-vl-ipv4-mdt-cmcast) # unicast-reachability connector-disable
```
vrf (multicast)

To configure a virtual routing and forwarding (VRF) instance for a VPN table, use the `vrf` command in multicast routing configuration mode. To remove the VRF instance from the configuration file and restore the system to its default condition, use the `no` form of this command.

```
vrf vrf-name ipv4
no vrf vrf-name ipv4
```

**Syntax Description**

- `vrf-name`: Name of the VRF instance. The following names cannot be used: all, default, and global.
- `ipv4`: (Optional) Configures IPv4 address prefixes.

**Command Default**

No default behavior or values.

**Command Modes**

Multicast routing configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

A VRF instance is a collection of VPN routing and forwarding tables maintained at the provider edge (PE) router.

**Task ID**

- `multicast`: read, write

**Examples**

The following example shows how to configure a VRF instance and enter VRF configuration mode:

```
RP/0/RSP0/CPU0:router(config)# multicast-routing
RP/0/RSP0/CPU0:router(config-mcast)# vrf vrf_1
RP/0/RSP0/CPU0:router(config-mcast-vrf_1-ipv4)# mdt?
```
