Simple Network Management Protocol (SNMP) Server Commands

This chapter describes the Cisco IOS XR software commands used to configure and monitor the Simple Network Management Protocol (SNMP) for network monitoring and management.

For detailed information about SNMP concepts, configuration tasks, and examples, see the Implementing SNMP on Cisco IOS XR Software configuration module in System Management Configuration Guide for Cisco ASR 9000 Series Routers.

The **snmp-server** commands enable SNMP on Management Ethernet interfaces by default. For information about how to enable SNMP server support on other inband interfaces, see the Implementing Management Plane Protection on Cisco IOS XR Software module in System Security Configuration Guide for Cisco ASR 9000 Series Routers.

- add (bulkstat object), on page 5

add (bulkstat object)

To add a MIB object to a Simple Network Management Protocol (SNMP) bulk statistics object list, use the `add` command in bulk statistics object list configuration mode. To remove a MIB object from an SNMP bulk statistics object list, use the `no` form of this command.

```
add  {object-nameOID}
no add {object-nameOID}
```

**Syntax Description**

- `object-name` Name of the MIB object to add to the list. Object names are limited to those with mappings shown in the `show snmp mib object-name` command.
- `OID` Object identifier (OID) of the MIB object to add to the list.

**Command Default**

No MIB objects are configured for an object list.

**Command Modes**

Bulk statistics object list configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.2.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

All object names and OIDs in a single object list should belong to the same MIB index, but the objects need not belong to the same MIB table. For example, it is possible to group ifInOctets and a CISCO-IF-EXTENSION-MIB object in the same schema because the containing tables are indexed by the ifIndex (in the IF-MIB).

The `add` command should be repeated as necessary until all MIB objects have been added to the object list.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

The following example shows how to add various MIB objects to an object list.

```
RP/0/RSP0/CPU0:router(config-bulk-objects)# add 1.3.6.1.2.1.2.1.1
RP/0/RSP0/CPU0:router(config-bulk-objects)# add ifAdminStatus
RP/0/RSP0/CPU0:router(config-bulk-objects)# add ifDescr
```

**Related Topics**

- `show snmp mib`, on page 43
buffer-size

To configure a maximum buffer size for the transfer of bulk statistics files, use the `buffer-size` command in bulk statistics transfer configuration mode. To remove a previously configured buffer size from the configuration, use the `no` form of this command.

```
buffer-size  bytes
no buffer-size [bytes]
```

**Syntax Description**

`bytes` Size of the bulk statistics transfer buffer, in bytes. The valid range is from 1024 to 2147483647. The default is 2048.

**Command Default**

The default bulk statistics transfer buffer is 2048 bytes.

**Command Modes**

Bulk statistics transfer configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.2.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

A configured buffer size limit is available primarily as a safety feature. Normal bulk statistics files should not generally meet or exceed the default value while being transferred.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

This example shows how to set the buffer size to 1024 bytes:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# snmp-server mib bulkstat transfer bulkstat1
RP/0/RSP0/CPU0:router(config-bulk-tr)# buffer-size 1024
```
clear snmp counters

To clear the Simple Network Management Protocol (SNMP) packet statistics shown by the `show snmp` command, use the `clear snmp counters` command in EXEC mode.

**clear snmp counters**

**Syntax Description**

This command has no keywords or arguments.

**Command Default**

None

**Command Modes**

EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Release 3.9.0</td>
<td>No modification.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `clear snmp counters` command provides the ability to clear all SNMP counters used in the `show snmp` command without restarting any processes.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

The following example shows how to clear the SNMP counters:

```
RP/0/RSP0/CPU0:router# clear snmp counters
```

**Related Topics**

`show snmp`, on page 27
enable (bulkstat)

To begin the bulk statistics data collection and transfer process for a specific bulk statistics configuration, use the `enable` command in bulk statistics transfer configuration mode. To disable the bulk statistics data collection and transfer process for a specific bulk statistics configuration, use the `no` form of this command.

```plaintext
enable
no enable
```

### Syntax Description
This command has no keywords or arguments.

### Command Default
Bulk statistics transfer is disabled.

### Command Modes
Bulk statistics transfer configuration

### Command History
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.2.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Specific bulk statistics configurations are identified with a name, as specified in the `snmp-server mib bulkstat transfer-id` command. The `enable` command begins the periodic MIB data collection and transfer process. Collection (and subsequent file transfer) starts only if this command is used. Conversely, the `no enable` command stops the collection process. Subsequently, issuing the `enable` command starts the operations again.

Each time the collection process is started using the `enable` command, data is collected into a new bulk statistics file. When the `no enable` command is used, the transfer process for any collected data immediately begins (in other words, the existing bulk statistics file are transferred to the specified management station).

To successfully enable a bulk statistics configuration, at least one schema with a non-zero number of objects must be configured.

### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

The following example shows the bulk statistics transfer configuration named bulkstat1 as enabled:

```plaintext
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# snmp-server mib bulkstat transfer bulkstat1
RP/0/RSP0/CPU0:router(config-bulk-tr)# schema ATM2/0-IFMIB
RP/0/RSP0/CPU0:router(config-bulk-tr)# url primary ftp://user:pswrd@host/folder/bulkstat1
RP/0/RSP0/CPU0:router(config-bulk-tr)# enable
RP/0/RSP0/CPU0:router(config-bulk-tr)# exit
```
Related Topics

- show snmp mib bulkstat transfer, on page 46
- snmp-server mib bulkstat transfer-id, on page 120
format (bulkstat)

To specify the format to be used for the bulk statistics data file, use the `format` command in bulk statistics transfer configuration mode. To disable a previously configured format specification and return to the default, use the `no` form of this command.

```
format {bulkBinary | bulkASCII | schemaASCII}
no format [{bulkBinary | bulkASCII | schemaASCII}]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bulkBinary</td>
<td>Binary format.</td>
</tr>
<tr>
<td>bulkASCII</td>
<td>ASCII format.</td>
</tr>
<tr>
<td>schemaASCII</td>
<td>A human-readable ASCII format that contains additional bulk statistics schema tags. This is the default.</td>
</tr>
</tbody>
</table>

**Command Default**

The default bulk statistics transfer format is `schemaASCII`.

**Command Modes**

Bulk statistics transfer configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.2.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The bulk statistics data file (`VFile`) contains two types of fields: tags and data. Tags are used to set off data to distinguish fields of the file. All other information is in data fields.

Transfers can only be performed using `schemaASCII` format.

For each transfer/schema pair there is a header with tags for each object collected, followed by the collected data. For example, if the transfer name is `T1` and the schemas in it are `S1` (which collects `ifInOctets` and `ifOutOctets`) and `S2` (which collects `ifInUcastPks` and `ifInDiscards`). Then the output file looks like this:

```
Schema-def cemp1.cempWild "%u, %s, %s, %d" Epochtime instanceoid
1.3.6.1.4.1.9.9.221.1.1.1.1.3 1.3.6.1.4.1.9.9.221.1.1.1.1.2
  cemp1.cempWild: 1339491515, 8695772.1, processor, 2
  cemp1.cempWild: 1339491515, 8695772.2, reserved, 11
  cemp1.cempWild: 1339491515, 8695772.3, image, 12
  cemp1.cempWild: 1339491575, 8695772.1, processor, 2
  cemp1.cempWild: 1339491575, 8695772.2, reserved, 11
  cemp1.cempWild: 1339491575, 8695772.3, image, 12
Schema-def cemp1.cempRepeat "%u, %s, %s, %d" Epochtime instanceoid
1.3.6.1.4.1.9.9.221.1.1.1.1.3 1.3.6.1.4.1.9.9.221.1.1.1.1.2
  cemp1.cempRepeat: 1339491515, 8695772.1, processor, 2
  cemp1.cempRepeat: 1339491515, 8695772.2, reserved, 11
  cemp1.cempRepeat: 1339491515, 8695772.3, image, 12
  cemp1.cempRepeat: 1339491515, 26932192.1, processor, 2
  cemp1.cempRepeat: 1339491515, 26932192.2, reserved, 11
  cemp1.cempRepeat: 1339491515, 26932192.3, image, 12
```
This example shows how to specify the data format:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# snmp-server mib bulkstat transfer bulkstat1
RP/0/RSP0/CPU0:router(config-bulk-tr)# format schemaASCII
```

**Related Topics**
- `show snmp mib bulkstat transfer`, on page 46
- `snmp-server mib bulkstat transfer-id`, on page 120
index persistence

To enable index persistence on an Simple Network Management Protocol (SNMP) interface, use the `index persistence` command in SNMP interface configuration mode. To restore the default conditions with respect to this command, use the `no` form of this command.

```
index persistence
no index persistence
```

**Syntax Description**

This command has no keywords or arguments.

**Command Default**

Index persistence is disabled.

**Command Modes**

SNMP interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Release 3.9.0</td>
<td>No modification.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the `index persistence` command to enable ifIndex persistence for individual entries (corresponding to individual interfaces) in the ifIndex table of the IF-MIB. IfIndex persistence retains the mapping between the ifName object values and the ifIndex object values (generated from the IF-MIB) across reboots, allowing for consistent identification of specific interfaces using SNMP.

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

The following example shows how to assign ifIndex persistence on interface 0/0/1/0:

```
RP/0/RSP0/CPU0:router(config)# snmp-server interface tengige 0/0/1/0
RP/0/RSP0/CPU0:router(config-snmp-if)# index persistence
```

**Related Topics**

- `show snmp interface`, on page 38
- `snmp-server engineid local`, on page 92
- `snmp-server ifindex persist`, on page 102
- `snmp-server interface`, on page 108
instance (bulkstat schema)

To configure the MIB object instances to be used in a Simple Network Management Protocol (SNMP) bulk statistics schema, use the `instance` command in bulk statistics configuration mode. To remove the instance definition, use the `no` form of this command.

```
instance {exact | wild } {interface interface-id [sub-if] | oid oid}
no instance
```

**Syntax Description**

- **exact**: Specifies that the specified interface or object identifier (OID), when appended to the object list, is the complete OID to be used in this schema.
- **wild**: Specifies that all instances that fall within the specified OID or interface are included in this schema.
- **interface**: Specifies an interface to be used to define the schema instance.
- **oid**: Specifies an OID to be used to define the schema instance.
- **sub-if**: (Optional) Specifies that the object instances are polled for all subinterfaces of the specified interface in addition to the object instances for the main interface.

**Command Default**

No instances are configured.

**Command Modes**

Bulk statistics schema configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.2.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `instance` command specifies the instance information for objects in the schema being configured. The specific instances of MIB objects for which data is collected are determined by appending the value of the instance command to the objects specified in the associated object list. In other words, the schema object-list when combined with the schema instance specifies a complete MIB object identifier.

The `instance exact` command indicates that the specified instance, when appended to the object list, is the complete OID.

The `instance wild` command indicates that all subindices of the specified OID belong to this schema. For example, the command `instance wild oid 1` includes all subindices of the instance, such as 1.1, 1.2 and so on. It does not include other instances that start with the number 1, such as 10 and 11.

Instead of specifying an OID, you can specify a specific interface. The `interface interface-id` keyword and argument allow you to specify an interface name and number (for example, gigabitethernet 0/6/5/0) instead of specifying the ifIndex OID for the interface.
The optional sub-if keyword, when added after specifying an interface, includes the ifIndexes for all subinterfaces of the interface you specified.

Only one instance command can be configured per schema. If multiple instance commands are used, the later commands overwrite the earlier ones.

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

The following examples show two different ways to configure an instance.

RP/0/RSP0/CPU0:router(config-bulk-sc)# instance wild oid 1

RP/0/RSP0/CPU0:router(config-bulk-sc)# instance exact interface FastEthernet 0/1.25

Related Topics
- instance range, on page 15
- instance repetition, on page 16
- snmp-server mib bulkstat schema, on page 118
instance range

To specify a range of instances for objects in a schema, use the **instance** command in bulk statistics schema configuration mode. To remove the configured instance information, use the **no** form of this command.

```
instance range start start-oid end end-oid
no instance
```

**Syntax Description**

- **start start-oid**: Specifies the first OID value of a range of values.
- **end end-oid**: Specifies the last OID value of a range of values.

**Command Default**

No instances are configured.

**Command Modes**

Bulk statistics schema configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.2.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Only one **instance** command can be configured per schema. If multiple **instance** commands are used, the later commands overwrite the earlier ones.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

The following example shows how to configure a range of instances.

```
RP/0/RSP0/CPU0:router(config-bulk-sc)# instance range start 1 end 2
```

**Related Topics**

- **instance** *(bulkstat schema)*, on page 13
- **snmp-server mib bulkstat schema**, on page 118
instance repetition

To configure bulk statistics data collection to begin at a particular instance of a MIB object and to repeat for a given number of instances, use the **instance repetition** command in bulk statistics schema configuration mode. To delete a previously configured repetition of instances, use the **no** form of this command.

```
instance repetition oid-instance max repeat-number
no instance
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>oid-instance</td>
<td>Object ID of the instance to be monitored.</td>
</tr>
<tr>
<td>max repeat-number</td>
<td>Specifies the number of times the instance should repeat.</td>
</tr>
</tbody>
</table>

**Command Default**

No instance repetition is configured.

**Command Modes**

Bulk statistics schema configuration

**Command History**

```
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.2.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>
```

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The **instance repetition** command is used to configure data collection to repeat for a certain number of instances of a MIB object.

Only one **instance** command can be configured per schema. If multiple **instance** commands are used, the later commands overwrite the earlier ones.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

The following example configures 4 repetitions of the OID of value 1.

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# snmp-server mib bulkstat object-list ifmib
RP/0/RSP0/CPU0:router(config-bulk-objects)# add ifOutOctets
RP/0/RSP0/CPU0:router(config-bulk-objects)# add ifInOctets
RP/0/RSP0/CPU0:router(config-bulk-objects)# exit
RP/0/RSP0/CPU0:router(config)# snmp mib-server bulkstat schema IFMIB
RP/0/RSP0/CPU0:router(config-bulk-sc)# object-list ifmib
RP/0/RSP0/CPU0:router(config-bulk-sc)# poll-interval 1
```
RP/0/RSP0/CPU0:router(config-bulk-ac)# instance repetition 1 max 4

To enable or disable linkUp and linkDown trap notifications on a Simple Network Management Protocol (SNMP) interface, use the `notification linkupdown` command in SNMP interface configuration mode. To revert to the default setting, use the `no` form of this command.

```
notification linkupdown disable
no notification linkupdown disable
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>disable</td>
<td>Disables linkUp and linkDown trap notifications on an SNMP interface.</td>
</tr>
</tbody>
</table>

**Syntax Description**

This command has no keywords or arguments.

**Command Default**

By default, for all main interfaces the linkUp and linkDown trap notifications are enabled; for all subinterfaces they are disabled.

**Command Modes**

SNMP interface configuration

SNMP interface subset configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Release 3.9.0</td>
<td>This command was supported in the SNMP interface subset configuration mode.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Enabling of linkUp and linkDown notifications is performed globally using the `snmp-server traps snmp` command. Issue the `notification linkupdown` command to disable linkUp and linkDown notifications on an interface.

Use the `no` form of this command to enable linkUp and linkDown notifications on an interface, if linkUp and linkDown notifications have been disabled.

You can also use the `snmp-server interface subset` command to enable or disable groups of interfaces.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

The following example shows how to disable linkUp and linkDown trap notifications on interface 0/0/1/0:
RP/0/RSP0/CPU0:router(config)# snmp-server interface tengige 0/0/1/0
RP/0/RSP0/CPU0:router(config-snmp-if)# notification linkupdown disable

object-list

To specify the bulk statistics object list to be used in the bulk statistics schema, use the **object-list** command in bulk statistics schema configuration mode. To remove an object list from the schema, use the **no** form of this command.

```
object-list  list-name
no object-list  [list-name]
```

**Syntax Description**
- `list-name` Name of a previously configured bulk statistics object list.

**Command Default**
No bulk statistics object list is specified.

**Command Modes**
Bulk statistics schema configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 4.2.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

This command associates a bulk statistics object list with the schema being configured. The object list should contain a list of MIB objects to be monitored. Only one object list can be specified for each schema. Use the `snmp-server mib bulkstat object-list` command to create an object list.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# snmp-server mib bulkstat schema schema1
RP/0/RSP0/CPU0:router(config-bulk-sc)# object-list obj1
```

**Related Topics**
- `show snmp mib bulkstat transfer`, on page 46
- `snmp-server mib bulkstat schema`, on page 118
- `snmp-server mib bulkstat object-list`, on page 117
poll-interval

To configure the polling interval for a bulk statistics schema, use the `poll-interval` command in bulk statistics schema configuration mode. To remove a previously configured polling interval, use the `no` form of this command.

`poll-interval minutes`
`no poll-interval`

**Syntax Description**

- `minutes` Integer in the range from 1 to 20000 that specifies, in minutes, the polling interval of data for this schema. The default is 5.

**Command Default**

Object instances are polled once every five minutes.

**Command Modes**

Bulk statistics schema configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.2.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `poll-interval` command sets how often the MIB instances specified by the schema and associated object list are to be polled. Collected data is stored in the local bulk statistics file for later transfer.

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

In this example, the polling interval for bulk statistics collection is set to once every 3 minutes in the schema called GigE2/1-CAR:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# snmp-server mib bulk schema GigE2/1-CAR
RP/0/RSP0/CPU0:router(config-bulk-sc)# poll-interval 3
```
**retain**

To configure the retention interval for bulk statistics files, use the `retain` command in bulk statistics transfer configuration mode. To remove a previously configured retention interval from the configuration, use the `no` form of this command.

```
retain  minutes
no retain  [minutes]
```

**Syntax Description**

- `minutes` Length of time, in minutes, that the local bulk statistics file should be kept in system memory (the retention interval). The valid range is 0 to 20000. The default is 0.

**Command Default**

The bulk statistics file retention interval is 0 minutes.

**Command Modes**

Bulk statistics transfer configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.2.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `retain` command specifies how long the bulk statistics file should be kept in system memory, in minutes, after the completion of the collection interval and a transmission attempt is made. The default value of zero (0) indicates that the file is deleted immediately from local memory after a successful transfer.

If the `retry` command is used, you should configure a retention interval greater than 0. The interval between retries is the retention interval divided by the retry number. For example, if `retain 10` and `retry 2` are configured, retries are attempted once every 5 minutes. Therefore, if the `retain` command is not configured (retain default is 0), no retries are attempted.

**Note**

Once a successful transmission has occurred the bulk file is not retained regardless of the retain time.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>snmp</td>
</tr>
<tr>
<td></td>
<td>read, write</td>
</tr>
</tbody>
</table>

In the following example, the bulk statistics transfer retention interval is set to 10 minutes:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# snmp-server mib bulkstat transfer bulkstat1
RP/0/RSP0/CPU0:router(config-bulk-tr)# schema ATM2/0-IFMIB
```
Simple Network Management Protocol (SNMP) Server Commands

RP/0/RSP0/CP00:router(config-bulk-tr)# url primary ftp://user:pswrd@host/folder/bulkstat1
RP/0/RSP0/CP00:router(config-bulk-tr)# retry 2
RP/0/RSP0/CP00:router(config-bulk-tr)# retain 10
RP/0/RSP0/CP00:router(config-bulk-tr)# exit

Related Topics
- retry, on page 24
- show snmp mib bulkstat transfer, on page 46
- snmp-server mib bulkstat transfer-id, on page 120
retry

To configure the number of retries that should be attempted for a bulk statistics file transfer, use the retry command in bulk statistics transfer configuration mode. To return the number of bulk statistics retries to the default, use the no form of this command.

retry number
no retry [number]

Syntax Description

number  Number of transmission retries. The valid range is from 0 to 100.

Command Default

No retry attempts are made.

Command Modes

Bulk statistics transfer configuration

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.2.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

If an attempt to send the bulk statistics file fails, the system can be configured to attempt to send the file again using the retry command. One retry includes an attempt first to the primary destination and then, if the transmission fails, to the secondary location; for example, if the retry value is 1, an attempt will be made first to the primary URL, then to the secondary URL, then to the primary URL again, and then to the secondary URL again.

If the retry command is used, you should also use the retain command to configure a retention interval greater than 0. The interval between retries is the retention interval divided by the retry number. For example, if retain 10 and retry 2 are configured, retries are attempted once every 5 minutes. Therefore, if the retain command is not configured (or the retain 0 command is used) no retries are attempted.

Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

In the following example, the number of retries for the bulk statistics transfer is set to 2:

RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# snmp-server mib bulkstat transfer bulkstat1
RP/0/RSP0/CPU0:router(config-bulk-tr)# schema ATM2/0-IFMIB
RP/0/RSP0/CPU0:router(config-bulk-tr)# url primary ftp://user:pswrd@host/folder/bulkstat1
RP/0/RSP0/CPU0:router(config-bulk-tr)# retry 2
RP/0/RSP0/CPU0:router(config-bulk-tr)# retain 10
RP/0/RSP0/CPU0:router(config-bulk-tr)# exit

Related Topics
  retain, on page 22
  show snmp mib bulkstat transfer, on page 46
  snmp-server mib bulkstat transfer-id, on page 120
To specify the bulk statistics schema to be used in a specific bulk statistics transfer configuration, use the `schema` command in bulk statistics transfer configuration mode. To remove a previously configured schema from a specific bulk statistics transfer configuration, use the `no` form of this command.

```
schema  schema-name
no schema  [schema-name]
```

**Syntax Description**
- `schema-name`: Name of a previously configured bulk statistics schema.

**Command Default**
- No bulk statistics schema is specified.

**Command Modes**
- Bulk statistics transfer configuration

**Command History**
- **Release** 4.2.0
  - This command was introduced.

**Usage Guidelines**
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The schema must be previously defined using the `snmp-server mib bulkstat schema` command.

Repeat the `schema` command as desired for a specific bulk statistics transfer configuration. Multiple schemas can be associated with a single transfer configuration; all collected data will be in a single bulk statistics data file (VFile).

**Task ID**
- **Task ID**
  - `snmp`: `read`, `write`

This example adds three different schemas to a bulk statistics transfer configuration:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# snmp-server mib bulkstat transfer-id bulkstat1
RP/0/RSP0/CPU0:router(config-bulk-tr)# schema ATM2/0-IFMIB
RP/0/RSP0/CPU0:router(config-bulk-tr)# schema ATM2/0-CAR
RP/0/RSP0/CPU0:router(config-bulk-tr)# schema Ethernet2/1-IFMIB
```

**Related Topics**
- `show snmp mib bulkstat transfer`, on page 46
- `snmp-server mib bulkstat schema`, on page 118
**show snmp**

To display the status of Simple Network Management Protocol (SNMP) communications, use the `show snmp` command in EXEC mode.

```markdown
show snmp
```

**Syntax Description**

This command has no keywords or arguments.

**Command Default**

None

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Release 3.9.0</td>
<td>No modification.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the `show snmp` command to show counter information for SNMP operations. It also displays the chassis ID string defined with the `snmp-server chassis-id` command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations ID</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>read</td>
</tr>
</tbody>
</table>

This example shows sample output from the `show snmp` command:

```
RP/0/RSP0/CPU0:router# show snmp

Chassis: 01506199
37 SNMP packets input
4 Bad SNMP version errors
0 Unknown community name
0 Illegal operation for community name supplied
0 Encoding errors
24 Number of requested variables
0 Number of altered variables
0 Get-request PDUs
28 Get-next PDUs
0 Set-request PDUs
78 SNMP packets output
0 Too big errors (Maximum packet size 1500)
0 No such name errors
```
0 Bad values errors
0 General errors
24 Response PDUs
13 Trap PDUs
SNMP logging: enabled
Logging to 172.25.58.33, 0/10, 13 sent, 0 dropped.

show snmp context

To display the enhanced SNMP context mappings, use the show snmp context command in EXEC mode.

Syntax Description

This command has no keywords or arguments.

Command Default

None

Command Modes

EXEC

Command History

This command was introduced.

Release 4.2.0

Modification This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the show snmp context command to display the protocol instance, topology and VRF mappings associated with an SNMP context.

Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp</td>
<td>read</td>
</tr>
</tbody>
</table>

This example illustrates sample output from the show snmp context command:

```
RP/0/RSP0/CPU0:router# show snmp context
Tue Dec 21 03:41:08.065 PST
Context-name Vrf-name Topology-Name Instance-Name Feature
con5   vf5   tp5      in5      OSPF
con6   vf6   tp6      in6      OSPF
con7   vf7   tp7      in7      OSPF
con8   vf8   tp8      in8      OSPF
```

Related Topics

snmp-server context mapping, on page 88
show snmp context-mapping

To display the SNMP context mapping table, use the `show snmp context-mapping` command in EXEC mode.

```
show snmp context-mapping
```

**Syntax Description**
This command has no keywords or arguments.

**Command Default**
None

**Command Modes**
EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.8.0</td>
<td>This command was introduced.</td>

show snmp interface notification

To display the linkUp and linkDown notification status for a subset of interfaces, use the **show snmp interface notification** command in EXEC mode.

**Syntax Description**

- **subset subset-number**
  Specifies the identifier of the interface subset. The subset-number argument is configured using the **snmp-server interface subset** command.

- **regular-expression**
  Specifies a subset of interfaces matching a regular expression, for which to display information.

- **type**
  (Optional) Interface type. For more information, use the question mark (?) online help function.

- **interface-path-id**
  (Optional) Physical interface or virtual interface. Use the **show interfaces** command to see a list of all interfaces currently configured on the router.

**Command Default**

None

**Command Modes**

EXEC

**Command History**

- **Release 3.9.0**
  This command was introduced.

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Regular expressions have two constraints:

- Regular expressions must always be entered within double quotes to ensure that the CLI interprets each character correctly.

- All characters that are part of a regular expression are considered regular characters with no special meaning. In order to enter special characters, such as "\" or ", they must be preceded by the backslash character "\". For example, to enter the regular expression ([A-Z][A-Z0-9]*)(b[^>]*>(.*?)(?<!\1), you would enter ([A-Z][A-Z0-9]*)\b[^>]*>(.*?)(?<!\1.

Refer to the Understanding Regular Expressions, Special Characters, and Patterns module in *Cisco ASR 9000 Series Aggregation Services Router Getting Started Guide* for more information regarding regular expressions.
When using the **subset** or **regular-expression** keywords, the actual display might not match the configuration if there are higher priority **subset-number** values that actually apply to the interface. This can happen for a set of interfaces that are included in two or more configured regular expressions or where an individual interface configuration is enabled.

Task ID  
---
<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp</td>
<td>read</td>
</tr>
</tbody>
</table>

The following example illustrates how to display linkUp and linkDown notification status for a subset of interfaces identified by a specific **subset-number**:

```
RP/0/RSP0/CPU0:router# show snmp interface notification subset 3
```

This example illustrates how to display linkUp and linkDown notification status for a subset of interfaces identified by a regular expression:

```
RP/0/RSP0/CPU0:router# show snmp interface notification regular-expression
"^Giga-zA-Z[0-9/]+\"'
```
show snmp interface regular-expression

To display interface names and indices assigned to interfaces that match a regular expression, use the `show snmp interface regular-expression` command in EXEC mode.

```
show snmp interface regular-expression  expression
```

**Syntax Description**

- `expression` Specifies a subset of interfaces matching a regular expression, for which to display information.

**Command Default**

None

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.9.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

All characters that are part of a regular expression are considered regular characters with no special meaning. In order to enter special characters, such as "\" or "?," they must be preceded by the backslash character "\." For example, to enter the regular expression `([A-Z][A-Z0-9]*\b\^[>]*\(.*\)?<\1, you would enter `([A-Z][A-Z0-9]*\b\^[>]*\(.*\)?<\1.`

Refer to the Understanding Regular Expressions, Special Characters, and Patterns module in Cisco ASR 9000 Series Aggregation Services Router Getting Started Guide for more information regarding regular expressions.

**Task ID**

<table>
<thead>
<tr>
<th>Task</th>
<th>Operation ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp</td>
<td>read</td>
</tr>
</tbody>
</table>

This example illustrates how to display information for interfaces that match the given regular expression:

```
RP/0/RSP0/CPU0:router# show snmp interface regular-expression "^Gig[a-zA-Z]+[0-9/]+."
```

<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Release 3.9.0</td>
<td>The <code>detailed</code> keyword was not supported.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the `show snmp mib` command to display a list of the MIB module instance identifiers registered on the system.

Although the `show snmp mib` command can be used to display a list of MIB OIDs registered on the system, the use of a Network Management System (NMS) application is the recommended alternative for gathering this information.

The `show snmp mib` command is intended only for network managers who are familiar with Abstract Syntax Notation One (ASN.1) syntax and the Structure of Management Information (SMI) of Open Systems Interconnection (OSI) Reference Model.

SNMP management information is viewed as a collection of managed objects residing in a virtual information store termed the MIB. Collections of related objects are defined in MIB modules. These modules are written using a subset of ASN.1 termed the SMI.

The definitions for the OIDs displayed by this command can be found in the relevant RFCs and MIB modules. For example, RFC 1907 defines the system.x, sysOREntry.x, snmp.x, and snmpTrap.x OIDs, and this information is supplemented by the extensions defined in the CISCO-SYSTEM-MIB.

Use the `detailed` keyword to display a list of the MIB module instance identifiers registered on the system. The output displays additional details, such as DLL and configuration information.
Use the `dll` keyword to display a list of the MIB modules loaded into the agent. This command can be used to find the supported MIBs.

This command produces a high volume of output if SNMP is enabled on the system. To exit from a "--More--" prompt, press `Ctrl-Z`.

The following example shows sample output from the `show snmp mib` command:

```
RP/0/RSP0/CPU0:router# show snmp mib

1.3.6.1.2.1.47.1.1.1.1.2
1.3.6.1.2.1.47.1.1.1.1.3

`show snmp`, on page 27
show snmp mib bulkstat transfer

To display completed local bulk statistics files, use the `show snmp mib bulkstat transfer` command in EXEC mode.

```
show snmp mib bulkstat transfer  [transfer-name]
```

**Syntax Description**

- `transfer-name`: Specifies a named transfer file to display.

**Syntax Description**

This command has no keywords or arguments.

**Command Default**

None

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.2.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `show snmp mib bulkstat transfer` command lists all bulk statistics virtual files (VFiles) on the system that have finished collecting data. (Data files that are not complete are not displayed.)

The output lists all of the completed local bulk statistics files, the remaining time left before the bulk statistics file is deleted (remaining retention period), and the state of the bulk statistics file. The state of the bulk statistics file should be Retry. Retry indicates that one or more transfer attempts have failed and that the file transfer will be attempted again. The number of retry attempts remaining is displayed in parenthesis. After the successful retry or retry attempts, the local files created by the MIB process in the router are deleted and data collection begins again.

To display only the status of a named transfer (as opposed to all configured transfers), specify the name of the transfer in the `transfer-name` argument. The `transfer-name` argument names a file which is supposed to be created even before the retries.

```
**show snmp statistics pdu**

To show if processing time of any protocol data unit (PDU) is more than threshold limit, use the `show snmp statistics pdu nms` command in EXEC mode.

`show snmp statistics pdu nms[address]`

**Syntax Description**

`nms` Address of Network Management Station from which request has arrived. The PDU statistics is filtered for each NMS.

`[address]`

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 5.2.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The PDU processing time can exceed the threshold limit in these scenarios:

- SNMPD not able to dispatch the request to MIB because of any failures in snmpd.
- MIB response after threshold limit.
- MIB does not respond to SNMPD.

Default threshold limit is 2 seconds. To change the default threshold value, use the command:

`Snmp-server timeouts pdu stats <1-10>`

The maximum number of entries per network management system (NMS) is 500 and the maximum number of NMS is 30.

This command shows these details:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NMS</td>
<td>Address of Network Management Station from which request has arrived.</td>
</tr>
<tr>
<td>Port</td>
<td>Port number of application that requested the SNMP query.</td>
</tr>
<tr>
<td>REQID</td>
<td>Request ID for each PDU.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of PDU.</td>
</tr>
<tr>
<td>SerNum</td>
<td>The unique number generated for every request and sent to all MIBDs.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Timeout</td>
<td>If the request was timeout out set to TRUE, else set to FALSE.</td>
</tr>
<tr>
<td>InputQ-In</td>
<td>Time stamp of the PDU when queued into input Q.</td>
</tr>
<tr>
<td>InputQ-Out</td>
<td>Time stamp of the PDU when queued into input Q. This will be in milliseconds, Offset from INPUT-IN time stamp.</td>
</tr>
<tr>
<td>ProcQ-In</td>
<td>Time stamp of the PDU when queued into Processing Q. This will be in milliseconds, Offset from INPUT-IN time stamp.</td>
</tr>
<tr>
<td>Response</td>
<td>Time stamp in milli seconds of the PDU when response is received from sub agents. Offset from INPUT-IN time stamp.</td>
</tr>
</tbody>
</table>

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>

Mar 13 08:03:15.269 0 0 1056
```
show snmp statistics slow oid

To show the object ID (OID) that has exceeded beyond the threshold time for processing and the number of times that the threshold limit is exceeded with the latest timestamp, use the `show snmp statistics slow oid` command in EXEC mode.

**show snmp statistics slow oid**

This command has no keywords or arguments.

### Command Modes

**Global configuration**

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 5.2.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Default threshold limit for this data as 500 milli seconds. To change the default value, use the command:

```
Snmp-server logging threshold oid-processing < 0-20000>
```

The latest 500 entries for each sub agent is displayed and a total of upto 2000 entries is maintained.

The `show snmp statistics slow oid` command shows these details:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Request type for slow OID.</td>
</tr>
<tr>
<td>Exact OID</td>
<td>Requested OID from NMS.</td>
</tr>
<tr>
<td>Resp OID</td>
<td>Response OID for the Request type and EXACT OID.</td>
</tr>
<tr>
<td>Slow Count</td>
<td>Number of times OID is slow.</td>
</tr>
<tr>
<td>Slow Time</td>
<td>Time taken for processing the OID in milli seconds.</td>
</tr>
<tr>
<td>Time Stamp</td>
<td>Time stamp of the slow OID when MIB responded to MIBD.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

This example shows a slow OIDs that exceeds the specified threshold time.

show snmp statistics poll oid all

To show all object IDs (OIDs) polled from all network management system (NMS) and how many times it has polled, use the `show snmp statistics poll oid all` command in EXEC mode.

For this command to work, the following configuration has to be committed:

```
(config)#snmp-server oid-poll-stats
```

**show snmp statistics poll oid all**

This command has no keywords or arguments.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>

show snmp mib ifmib general

To show how many requests get data from internal cache and how many requests are sent to statsd to get data, use the `show snmp mib ifmib general` command in EXEC mode.

**show snmp mib ifmib general**

This command has no keywords or arguments.

---

**Command Modes**

Global configuration

---

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 5.2.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Default IFMIB internal cache is 15 seconds. To change the duration, use the command:

```
snmp-server ifmib internal cache max-duration <0-60>
```

The default duration is 15 seconds, 0 seconds to disable the IFMIB internal cache.

To service the requests from Stats cache instead of Drivers, use the command:

```
snmp-server ifmib stats cache
```

The `show snmp mib ifmib general` command shows these details:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cache Hit</td>
<td>Number of times the request retrieves data from IFMIB internal cache.</td>
</tr>
<tr>
<td>Cache Miss</td>
<td>Number of times the request processed from statsd, and not from IFMIB internal cache</td>
</tr>
<tr>
<td>Last Access Time</td>
<td>Latest time stamp of corresponding hit or miss.</td>
</tr>
<tr>
<td>Count</td>
<td>Number of times the data is retrieved.</td>
</tr>
</tbody>
</table>

The Cache Hit and Cache Miss are 32 bit counters. The maximum value is $2^{31}$ and reset to 0 if the maximum value is exceeded.

show snmp mib ifmib general
show snmp mib ifmib cache

To show the Ifindex that has exceeded the threshold time for processing, the request type and the time stamp, use the `show snmp mib ifmib cache` command in EXEC mode. The threshold time for the data to create an entry is 500 milli seconds.

**show snmp mib ifmib cache**

This command has no keywords or arguments.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 5.2.2</td>

</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

This command displays the latest 500 entries. An entry will be added when the difference between Cache in and Cache out time is more than 500 milli seconds. The timeout value cannot be changed.

The `show snmp mib ifmib cache` command shows these details:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Index</td>
<td>Interface index.</td>
</tr>
<tr>
<td>MIB IN</td>
<td>Time stamp of the request when IFMIB starts processing.</td>

show snmp users

To display information about the configured characteristics of Simple Network Management Protocol (SNMP) users, use the \texttt{show snmp users} command in EXEC mode.

\texttt{show snmp users}

\textbf{Syntax Description} This command has no keywords or arguments.

\textbf{Command Default} None

\textbf{Command Modes} EXEC

\textbf{Command History} \begin{tabular}{ll}
\textbf{Release} & \textbf{Modification} \\
Release 3.7.2 & This command was introduced. \\
Release 3.9.0 & No modification. \\
\end{tabular}

\textbf{Usage Guidelines} To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

An SNMP user must be part of an SNMP group, as configured using the \texttt{snmp-server user} command.

Use the \texttt{show snmp users} command to display information about all configured users.

When configuring SNMP, you may see the logging message “Configuring snmpv3 USM user.” USM stands for the User-Based Security Model (USM) for SNMP Version 3 (SNMPv3). For further information about USM, see RFC 3414, \textit{User-based Security Model (USM) for version 3 of the Simple Network Management Protocol (SNMPv3)}.

\textbf{Task ID} \begin{tabular}{ll}
\textbf{Task ID} & \textbf{Operations} \\
\texttt{snmp} & \texttt{read} \\
\end{tabular}

This example shows sample output from the \texttt{show snmp users} command:

\begin{verbatim}
RP/0/RSP0/CPU0:router# show snmp users
User name: user1
Engine ID: localSnmpID
storage-type: nonvolatile active
\end{verbatim}
## Table 6: show snmp users Field Descriptions

**snmp-server chassis-id**

To provide a message line identifying the Simple Network Management Protocol (SNMP) server serial number, use the `snmp-server chassis-id` command in global configuration mode. To restore the default value, if any, use the `no` form of this command.

```
snmp-server chassis-id serial-number
no snmp-server chassis-id
```

**Syntax Description**

- `serial-number`: Unique identification string to identify the chassis serial number.

**Command Default**

On hardware platforms, where the serial number can be read by the device, the default is the serial number. For example, some Cisco devices have default chassis ID values of their serial numbers.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Release 3.9.0</td>
<td>No modification.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the `snmp-server chassis-id` command to provide a message line identifying the SNMP server serial number.

The chassis ID message can be displayed with the `show snmp` command.

**Task ID**

```
Task ID
---
snmp  read, write
```

The following example shows how to specify the chassis serial number 1234456:

```
RP/0/RSP0/CPU0:router# snmp-server chassis-id 1234456
```

**Related Topics**

- `show snmp`, on page 27
snmp-server community

To configure the community access string to permit access to the Simple Network Management Protocol (SNMP), use the `snmp-server community` command in global configuration mode. To remove the specified community string, use the `no` form of this command.

```
snmp-server community [{clear | encrypted}] community-string [view view-name] [{RO | RW}]
[{{SDROwner | SystemOwner}}] [access-list-name]
no snmp-server community community-string
```

**Syntax Description**

- `clear` (Optional) Specifies that the entered `community-string` is clear text and should be encrypted when displayed by the `show running` command.
- `encrypted` (Optional) Specifies that the entered `community-string` is encrypted text and should be displayed as such by the `show running` command.
- `community-string` Community string that acts like a password and permits access to the SNMP protocol. The maximum length of the `community-string` argument is 32 alphabetic characters.
  
  If the `clear` keyword was used, `community-string` is assumed to be clear text. If the `encrypted` keyword was used, `community-string` is assumed to be encrypted. If neither was used, `community-string` is assumed to be clear text.

- `view view-name` (Optional) Specifies the name of a previously defined view. The view defines the objects available to the community.
- `RO` (Optional) Specifies read-only access. Authorized management stations are able only to retrieve MIB objects.
- `RW` (Optional) Specifies read-write access. Authorized management stations are able both to retrieve and to modify MIB objects.
- `SDROwner` (Optional) Limits access to the owner service domain router (SDR).
- `SystemOwner` (Optional) Provides system-wide access.
- `access-list-name` (Optional) Name of an access list of IP addresses allowed to use the community string to gain access to the SNMP agent.

**Command Default**

By default, an SNMP community string permits read-only access to all MIB objects.

By default, a community string is assigned to the SDR owner.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>
Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the `snmp-server community` command to configure the community access string to permit access to SNMP.

To remove the specified community string, use the `no` form of this command.

Use the `clear` keyword to specify that the clear text community string you enter is displayed encrypted in the `show running` command output. To enter an encrypted string, use the `encrypted` keyword. To enter a clear text community string that is not encrypted by the system, use neither of these keywords.

When the `snmp-server community` command is entered with the `SDROwner` keyword, SNMP access is granted only to the MIB object instances in the owner SDR.

When the `snmp-server community` command is entered with the `SystemOwner` keyword, SNMP access is granted to the entire system.

Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

This example shows how to assign the string comaccess to SNMP, allowing read-only access, and to specify that IP access list 4 can use the community string:

```
RP/0/RSP0/CPU0:router(config)# snmp-server community comaccess ro 4
```

The following example shows how to assign the string mgr to SNMP, allowing read-write access to the objects in the restricted view:

```
RP/0/RSP0/CPU0:router(config)# snmp-server community mgr view restricted rw
```

This example shows how to remove the community comaccess:

```
RP/0/RSP0/CPU0:router(config)# no snmp-server community comaccess
```

Related Topics

- `snmp-server view`, on page 190
**snmp-server community-map**

To associate a Simple Network Management Protocol (SNMP) community with an SNMP context, security name, or a target-list use the `snmp-server community-map` command in global configuration mode. To change an SNMP community mapping to its default mapping, use the `no` form of this command.

```
snmp-server community-map [{clear | encrypted}] community-string [context context-name] [security-name security-name] [target-list target]
no snmp-server community-map [{clear | encrypted}] community-string
```

### Syntax Description
- **clear** (Optional) Specifies that the `community-string` argument is clear text.
- **encrypted** (Optional) Specifies that the `community-string` argument is encrypted text.
- **community-string** Name of the community.
- **context context-name** (Optional) Name of the SNMP context to which this community name is to be mapped.
- **security-name security-name** (Optional) Security name for this community. By default, the `string` is the security name.
- **target-list target** (Optional) Name of the target list for this community.

### Command Default
The value of the `community-string` argument is also the security name.

### Command Modes
Global configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Release 3.9.0</td>
<td>No modification.</td>
</tr>
</tbody>
</table>

### Usage Guidelines
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the `snmp-server community-map` command to map an SNMPv1 or SNMPv2c community name to one or more of the following:

- **context name**—Maps a community name to a specific SNMP context name. This allows MIB instances in an SNMP context to be accessed through SNMPv1 or SNMPv2c using this community name.
- **security name**—By default, the community name is used to authenticate SNMPv1 and SNMPv2c. Configure a security name for a community name to override the default and authenticate SNMP with the security name.
• **target**—Target list identifies a list of valid hosts from which SNMP access can be made using a specific security name. When such mapping is done for a particular community name, SNMP access is allowed only from hosts included in the target list.

Use the **clear** keyword to specify that the clear text community string you enter is displayed encrypted in the **show running** command output. To enter an encrypted string, use the **encrypted** keyword. To enter a clear text community string that is not encrypted by the system, use neither of these keywords.

This example maps the community name “sample2” to the SNMP context name “sample1”:

```
RP/0/RSP0/CPU0:router(config)# snmp-server community-map sample2 context sample1
```

<tr>
<td>Release 3.9.0</td>
<td>No modification.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **snmp-server contact** command to set the system contact string. Use the **no** form of this command to remove the system contact information.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

This example shows how to specify a system contact string:

```
RP/0/RSP0/CPU0:router(config)# **snmp-server contact** Dial System Operator at beeper # 27345
```

**Related Topics**

- **snmp-server location**, on page 115
snmp-server context

To create a Simple Network Management Protocol (SNMP) context, use the `snmp-server context` command in global configuration mode. To remove an SNMP context, use the `no` form of this command.

```
snmp-server context context-name
no snmp-server context context-name
```

**Syntax Description**

- `context-name` Name of the SNMP context.

**Command Default**

None

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
<tr>

</table>

### Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

A device can support multiple instances of a logical network entity, such as protocol instances or VRFs. Most existing MIBs cannot distinguish between these multiple logical network entities. For example, the original OSPF-MIB assumes a single protocol instance on a device, but you can now configure multiple OSPF instances on a device.

The `snmp-server context mapping` command maps a context to a protocol instance, topology or VRF logical entity.

### Note

The `snmp-server context mapping` command does not work for OSPF and OSPFv3. Refer to the `snmp context` commands.
This example illustrates how to map an snmp context to an OSPF instance:

```
RP/0/RSP0/CPU0:router(config)# snmp-server context mapping con5 feature ospf instance in1
```

**Related Topics**

- snmp context (OSPF)
- snmp context (OSPFv3)
- show snmp context, on page 30
To apply an ACL policy for restricting an SNMPv3 unknown engine-id report to be sent out to NMS, use the `snmp-server drop report acl` command in the configuration mode.

```
    snmp-server drop report acl IPv4IPv4-acl-name IPv6IPv6-acl-name
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>acl</td>
<td>Specifies IP Access Control Lists (ACL) policy</td>
</tr>
<tr>
<td>IPv4</td>
<td>Defines an IPv4 ACL name.</td>
</tr>
<tr>
<td>IPv4-acl-name</td>
<td></td>
</tr>
<tr>
<td>IPv6</td>
<td>Defines an IPv6 ACL name.</td>
</tr>
<tr>
<td>IPv6-acl-name</td>
<td></td>
</tr>
</tbody>
</table>

**Command Default**

Unknown engine-id reports will be sent to all polling stations (even if other ACLs are configured).

**Command Modes**

Configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.2.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To drop an unknown engine-id report, you can either configure IPv4/IPv6 ACL name or both. When router is polled with wrong engine-id or no engine-id during a snmpv3 packet exchange, the unknown engine-id report will be sent based on the ACL policy that is configured.

Unknown engine-id reports will be sent only to polling station addresses that are permitted by ACL.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Example**

This example shows how to configure the SNMP server to drop the unknown engin-id report:

```
RP/0/RSP0/CPU0:router (config) # snmp-server drop report acl IPv4 nms-block IPv6 nms-block-ipv6
```
snmp-server drop unknown-user

To avoid error PDUs being sent out of router when polled with incorrect SNMPv3 user name, use the `snmp-server drop unknown-user` command in the appropriate mode. If the configuration is not set, by default it will respond with error PDUs.

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>drop unknown-user</code></td>
<td>Drop the error PDUs to be sent when router is polled with incorrect SNMPv3 user name.</td>
</tr>
</tbody>
</table>

**Command Default**

Unknown error PDUs will be sent when router is polled with incorrect SNMPv3 user name.

**Command Modes**

- XR config

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.2.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Example**

This example shows how to configure the SNMP server to drop the error PDUs:

```
RP/0/RSP0/CPU0:router (config) # snmp-server drop unknown-user
```
snmp-server engineid local

To specify Simple Network Management Protocol (SNMP) engine ID on the local device, use the **snmp-server engineid local** command in

global configuration

mode. To return the engine ID to the default, use the **no** form of this command.

```
snmp-server engineid local engine-id
no snmp-server engineid local engine-id
```

**Syntax Description**

- **engine-id**: Character string that identifies the engine ID. Consists of up to 24 characters in hexadecimal format. Each hexadecimal number is separated by a colon (:).

**Command Default**

An SNMP engine ID is generated automatically.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Release 3.9.0</td>
<td>No modification.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

This example shows how to configure the SNMP engine ID on the local device:

```
RP/0/RSP0/CPU0:router(config)# snmp-server engineID local 00:00:00:09:00:00:00:a1:61:6c:20:61
```

**Related Topics**

- [show snmp engineid](#), on page 33
snmp-server engineid remote

To specify a Simple Network Management Protocol (SNMP) engine ID on a remote device, use the `snmp-server engineid remote` command in global configuration mode. To return the engine ID to the default, use the `no` form of this command.

```
snmp-server engineid remote ip-address engine-id udp-port port
no snmp-server engineid remote ip-address engine-id udp-port port
```

**Syntax Description**

- `ip-address` IP address of remote SNMP notification host
- `engine-id` Character string that identifies the engine ID. Consists of up to 24 characters in hexadecimal format. Each hexadecimal number is separated by a colon (:).
- `udp-port port` (Optional) Specifies the User Datagram Protocol (UDP) port of the host to use. Range is from 1 to 65535. The default UDP port is 161.

**Command Default**

An SNMP engine ID is generated automatically.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

**Task ID**

- `snmp` read, write

This example shows how to configure the SNMP engine ID on the local device:

```
RP/0/RP0/CPU0:Router(config)# snmp-server engineID remote 172.16.4.1 00:00:00:09:00:00:00:a1:61:6c:20:61
```

**Related Topics**

- `show snmp engineid`, on page 33
- `snmp-server engineid local`, on page 92
**snmp-server entityindex persist**

To enable the persistent storage of ENTITY-MIB data across process restarts, switchovers, and device reloads, use the `snmp-server entityindex persist` command in global configuration mode. To disable the persistent storage of ENTITY-MIB data, use the `no` form of this command.

```
no snmp-server entityindex persist
```

**Syntax Description**

This command has no keywords or arguments.

**Command Default**

None

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.9.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp</td>
<td>read,</td>
</tr>
<tr>
<td></td>
<td>write</td>
</tr>
</tbody>
</table>

**Example**

This example illustrates how to enable persistent storage of ENTITY-MIB indices:

```
RP/0/RSP0/CPU0:router(config)# snmp-server entityindex persist
```

**Related Topics**

- `snmp-server mibscbqosmib persist`, on page 124
snmp-server group

To configure a new Simple Network Management Protocol (SNMP) group, or a table that maps SNMP users to SNMP views, use the **snmp-server group** command in global configuration.

To remove a specified SNMP group, use the **no** form of this command.

```plaintext
snmp-server group name {v1 | v2c | v3 {auth | noauth | priv}} [read view] [write view] [notify view] [context context-name] [access-list-name]
no snmp-server group name
```

### Syntax Description

- **name**: Name of the group.
- **v1**: Specifies a group that uses the SNMPv1 security model. The SNMP v1 security model is the least secure of the possible security models.
- **v2c**: Specifies a group that uses the SNMPv2c security model. The SNMPv2c security model is the second least secure of the possible security models.
- **v3**: Specifies a group that uses the SNMPv3 security model. The SNMP v3 security is the most secure of the possible security models.
- **auth**: Specifies authentication of a packet without encrypting it.
- **noauth**: Specifies no authentication of a packet.
- **priv**: Specifies authentication of a packet with encryption.
- **read view**: (Optional) Specifies a read view string (not to exceed 64 characters) that is the name of the view that allows only the contents of the agent to be viewed.
- **write view**: (Optional) Specifies a write view string (not to exceed 64 characters) that is the name of the view used to enter data and configure the contents of the agent.
- **notify view**: (Optional) Specifies a notify view string (not to exceed 64 characters) that is the name of the view used to specify a notify or trap.
- **context context-name**: (Optional) Specifies the SNMP context to associate with this SNMP group and associated views.
- **access-list-name**: (Optional) Access list string (not to exceed 64 characters) that is the name of the access list.

### Command Default

See Table 7: snmp-server group Default Descriptions, on page 96.

### Command Modes

Global configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>
## Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

This table describes the default values for the different views:

<table>
<thead>
<tr>
<th>Default</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>read view</strong></td>
<td>Assumed to be every object belonging to the Internet (1.3.6.1) object identifier (OID) space, unless the user uses the <code>read</code> option to override this state.</td>
</tr>
<tr>
<td><strong>write view</strong></td>
<td>Nothing is defined for the write view (that is, the null OID). You must configure write access.</td>
</tr>
<tr>
<td><strong>notify view</strong></td>
<td>Nothing is defined for the notify view (that is, the null OID). If a view is specified, any notifications in that view that are generated are sent to all users associated with the group (provided an SNMP server host configuration exists for the user).</td>
</tr>
</tbody>
</table>

### Configuring Notify Views

Do not specify a notify view when configuring an SNMP group for the following reasons:

- The `snmp-server host` command autogenerates a notify view for the user, and then adds it to the group associated with that user.
- Modifying the notify view of the group affects all users associated with that group.

The notify view option is available for two reasons:

- If a group has a notify view that is set using SNMP, you may need to change the notify view.
- The `snmp-server host` command may have been configured before the `snmp-server group` command. In this case, reconfigure the `snmp-server host` command or specify the appropriate notify view.

Instead of specifying the notify view for a group as part of the `snmp-server group` command, use the following commands in global configuration mode:

- `snmp-server user`—Configures an SNMP user.
- `snmp-server group`—Configures an SNMP group, without adding a notify view.
- `snmp-server host`—Autogenerates the notify view by specifying the recipient of a trap operation.

### Working with Passwords and Digests

No default values exist for authentication or privacy algorithms when this command is configured. In addition, no default passwords exist. The minimum length for a password is one character, although we recommend using eight characters for security. A plain-text password or localized Message Digest 5 (MD5) password can be specified. Forgotten passwords cannot be recovered, and the user must be reconfigured.
SNMP Contexts

SNMP contexts provide Virtual Private Network (VPN) users with a secure way of accessing MIB data. When a VPN is associated with a context, that VPN’s specific MIB data exists in that context. Associating a VPN with a context enables service providers to manage networks with multiple VPNs. Creating and associating a context with a VPN enables a provider to prevent the users of one VPN from accessing information about users of other VPNs on the same networking device.

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>snmp read, write</td>
</tr>
</tbody>
</table>

The following example shows how to configure an SNMP version 3 group named group1 that requires the authentication of packets with encryption:

```
RP/0/RSP0/CPU0:router(config)# snmp-server group group1 v3 priv
```

- snmp-server view, on page 190
**snmp-server host**

To specify the recipient of a Simple Network Management Protocol (SNMP) notification operation, use the `snmp-server host` command in global configuration mode. To remove the specified host, use the `no` form of this command.

```
snmp-server host address [{clear | encrypted}] [informs] [traps] [version {1 | 2c | 3} {auth | noauth | priv}] community-string [udp-port port] [notification-type]
```

**Syntax Description**

- **address**
  Name or IP address of the host (the targeted recipient).

- **clear**
  (Optional) Specifies that the `community-string` argument is clear text.

- **encrypted**
  (Optional) Specifies that the `community-string` argument is encrypted text.

- **informs**
  (Optional) Specifies to send inform messages to this host.

- **traps**
  (Optional) Specifies that notifications should be sent as traps. This is the default.

- **version**
  (Optional) Specifies the version of the SNMP used to send the traps.

  - **1**
    Specifies SNMPv1, the default.

  - **2c**
    Specifies SNMPv2C.

  - **3**
    Specifies SNMPv3. Version 3 is the most secure model because it allows packet encryption. If you specify the SNMPv3 keyword, you must specify the security level.

- **auth**
  Enables Message Digest 5 (MD5) algorithm and Secure Hash Algorithm (SHA) packet authentication.

- **noauth**
  Specifies that the noAuthNoPriv security level applies to this host. This is the default security level for SNMPv3.

- **priv**
  Enables Data Encryption Standard (DES) packet encryption (also called “privacy”).

- **community-string**
  Password-like community string sent with the notification operation. We recommend defining this string using the `snmp-server community` command prior to using the `snmp-server host` command.

- **udp-port port**
  (Optional) Specifies the User Datagram Protocol (UDP) port of the host to use. Range is from 1 to 65535. The default UDP port is 161.
notification-type (Optional) Type of notification to be sent to the host. If no type is specified, all available notifications are sent. The notification type can be one or more of these keywords:

- **config** — Controls configuration notifications, as defined in the CISCO-CONFIG-MAN-MIB (enterprise 1.3.6.1.4.1.9.9.43.2). The notification type is (1) ciscoConfigManEvent.
- **copy-complete** — Enables CISCO-CONFIG-COPY-MIB ccCopyCompletion traps.
- **entity** — Controls Entity MIB modification notifications. This notification type is defined in the ENTITY-MIB (enterprise 1.3.6.1.2.1.47.2) as: (1) entConfigChange.
- **fru-ctrl** — Enables SNMP entity field-replaceable unit (FRU) control traps.
- **mpls** — Enables SNMP Multiprotocol Label Switching (MPLS) traps.
- **sensor** — Enables SNMP entity sensor traps.
- **snmp** — Enables SNMP traps.
- **syslog** — Enables SNMP entity sensor traps.

Specify the level of messages to be sent with the `logging history` command.

---

**Command Default**

This command is disabled by default. No notifications are sent.

The default UDP port is 161.

When this command is entered without keywords, the default is to send all trap types to the host.

If no version keyword is entered, the default is version 1.

If version 3 is specified, but the security level is not specified, the default security level is noauth.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Release 3.9.0</td>
<td>No modification.</td>
</tr>
<tr>
<td>Release 4.1.0</td>
<td>The <code>informs</code> keyword was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

SNMP notifications can be sent as traps. Traps are unreliable because the receiver does not send acknowledgments when it receives traps. The sender cannot determine if the traps were received. Traps are discarded as soon as they are sent. Traps are also sent only once.
When the `snmp-server host` command is not entered, no notifications are sent. To configure the device to send SNMP notifications, configure at least one `snmp-server host` command. When the command is entered without keywords, all trap types are enabled for the host.

To enable multiple hosts, issue a separate `snmp-server host` command for each host. You can specify multiple notification types in the command for each host.

When multiple `snmp-server host` commands are given for the same host and kind of notification (trap), each succeeding `snmp-server host` command overwrites the previous command. Only the last `snmp-server host` command is in effect. For example, if an `snmp-server host` command with the `traps` keyword is entered for a host and then another command with the `traps` keyword is entered for the same host, the second command replaces the first.

Either a host name or IP address can be used to specify the host.

The `snmp-server host` command is used with the `snmp-server engineid` command. Use the `snmp-server traps` command to specify which SNMP notifications are sent globally. For a host to receive most notifications, at least one `snmp-server traps` command and the `snmp-server host` command for that host must be enabled.

However, some notification types cannot be controlled with the `snmp-server traps` command. For example, some notification types are always enabled. Other notification types are enabled by a different command.

The availability of a notification-type depends on the device type and Cisco software features supported on the device.

To display which notification types are available on the system, use the question mark (?) online help function at the end of the `snmp-server host` command.

The `no snmp-server host` command used with no keywords disables traps.

Use the `clear` keyword to specify that the clear text community string you enter is displayed encrypted in the `show running` command output. To enter an encrypted string, use the `encrypted` keyword. To enter a clear text community string that is not encrypted by the system, use neither of these keywords.

If the `informs` keyword is used, the SNMP version can be only SNMPv2C or SNMPv3.

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

This example shows how to send RFC 1157 SNMP traps to the host specified by the name `myhost.cisco.com`. Other traps are enabled, but only SNMP traps are sent because only the `snmp` keyword is specified in the `snmp-server host` command. The community string is defined as `comaccess`.

```
RP/0/RSP0/CPU0:router(config)# snmp-server traps
RP/0/RSP0/CPU0:router(config)# snmp-server host myhost.cisco.com comaccess snmp
```

This example shows how to send the SNMP traps to address 172.30.2.160:

```
RP/0/RSP0/CPU0:router(config)# snmp-server traps snmp
RP/0/RSP0/CPU0:router(config)# snmp-server host 172.30.2.160 public snmp
```
This example shows how to enable the router to send all traps to the host, myhost.cisco.com, using the community string public:

```
RP/0/RSP0/CPU0:router(config)# snmp-server traps
RP/0/RSP0/CPU0:router(config)# snmp-server host myhost.cisco.com public
```

This example shows how to prevent traps from being sent to any host. The BGP traps are enabled for all hosts, but only the configuration traps are enabled to be sent to a host.

```
RP/0/RSP0/CPU0:router(config)# snmp-server traps bgp
RP/0/RSP0/CPU0:router(config)# snmp-server host hostabc public config
```

This example shows how to send SNMPv3 informs to a host:

```
RP/0/RSP0/CPU0:router(config)# snmp-server host 172.30.2.160 informs version 3
```

**snmp-server ifindex persist**

To enable ifIndex persistence globally on all Simple Network Management Protocol (SNMP) interfaces, use the `snmp-server ifindex persist` command in global configuration mode. To disable global interface persistence, use the `no` form of this command.

```
snmp-server ifindex persist
no snmp-server ifindex persist
```

**Syntax Description**

This command has no keywords or arguments.

**Command Default**

Global interface persistence is disabled.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Release 3.9.0</td>
<td>No modification.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the `snmp-server ifindex persist` command to enable ifIndex persistence on all interfaces that have entries in the ifIndex table of the IF-MIB. When enabled, this command retains the mapping between the ifName object values and the ifIndex object values (generated from the IF-MIB) persistent during reloads, allowing for consistent identification of specific interfaces using SNMP. Applications such as device inventory, billing, and fault detection depend on this feature.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

This example shows how to enable ifIndex persistence globally:

```
RP/0/RSP0/CPU0:router(config)# snmp-server ifindex persist
```

**Related Topics**

- index persistence, on page 12
- notification linkupdown, on page 18

**snmp-server ifmib ifalias long**

To enable the ifAlias IF-MIB object to accept an interface alias name that exceeds the 64-byte default, use the `snmp-server ifmib ifalias long` command. Use the `no` form of this command to revert to the default length.

```
no snmp-server ifmib ifalias long
```

**Syntax Description**

This command has no keywords or arguments.

**Command Default**

Global interface persistence is disabled.

The alias name is 64 bytes in length.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Release 3.9.0</td>
<td>No modification.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

To enable the IF-MIB object ifAlias to accept an interface alias name that is greater than 64 bytes in length. The default length for the alias name is 64 bytes.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

This example shows how to enable the IF-MIB object ifAlias:

```
RP/0/RSP0/CPU0:router(config)# snmp-server ifmib ifalias long
RP/0/RSP0/CPU0:router(config)# exit

Uncommitted changes found, commit them before exiting(yes/no/cancel)? [cancel]:yes
RP/0/RSP0/CPU0:router# 
```
To configure the refresh interval for the IF-MIB statistics cache, use the `snmp-server ifmib internal cache max-duration` command in global configuration mode. To revert to the default cache interval, use the `no` form of this command.

```
(snmp-server ifmib internal cache max-duration) timeout
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeout</td>
<td>Length of time before the cache is refreshed. Values can range from 0 to 60 seconds. The default is 15.</td>
</tr>
</tbody>
</table>

**Command Default**

`timeout`: 15 seconds

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.2.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `snmp-server ifmib internal cache max-duration` command controls the refresh interval of the cache. If the `timeout` value in the `snmp-server ifmib internal cache max-duration` command is set to zero, the cache is disabled. By default, the counters are cached for 15 secs in the ifmib internal cache, after which it will be discarded.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

This example shows how to change the refresh interval for the IF-MIB statistics cache.

```
RP/0/RSP0/CPU0:router> (config) # snmp-server ifmib internal cache max-duration 60
```

<td>read, write</td>
</tr>
</tbody>
</table>

This example shows how to enable IP subscriber interfaces in the IF-MIB:

```plaintext
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# snmp-server ifmib ipsubscriber
```
snmp-server ifmib stats cache

To enable retrieval of cached statistics instead of real-time statistics, use the `snmp-server ifmib stats cache` command. To revert to the default, use the `no` form of this command.

```
no snmp-server ifmib stats cache
```

**Syntax Description**

This command has no keywords or arguments.

**Command Default**

Cached statistics are not enabled.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Release 3.9.0</td>
<td>No modification.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Cisco IOS XR statistics infrastructure maintains a cache of statistics for all interfaces. This cache is updated every 30 seconds. Use the `snmp-server ifmib stats cache` command to enable the IF-MIB to retrieve these cached statistics rather than real-time statistics. Accessing cached statistics is less CPU-intensive than accessing real-time statistics.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

This example shows how to enable the IF-MIB caches statistics:

```
RP/0/RSP0/CPU0:router(config)# snmp-server ifmib stats cache
RP/0/RSP0/CPU0:router(config)# exit

Uncommitted changes found, commit them before exiting(yes/no/cancel)? [cancel]:yes
RP/0/RSP0/CPU0:router#
```

**Related Topics**

- `snmp-server ifmib internal cache max-duration`, on page 104
snmp-server inform

To configure Simple Network Management Protocol (SNMP) inform message options, use the `snmp-server inform` command in global configuration mode. To revert to the default informs options, use the `no` form of this command.

```
snmp-server inform {pending max-no | retries no-retries | timeout seconds}
no snmp-server inform {pending max-no | retries no-retries | timeout seconds}
```

**Syntax Description**

- `pending max-no` Specifies the maximum number of inform messages to hold in the queue. The default is 25.
- `retries no-retries` Specifies the retry count for inform messages. Values can be from 1 to 100. The default is three.
- `timeout seconds` Specifies the inform message timeout value in seconds. The default is 15.

**Command Default**

None

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 4.2.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

To enable the sending of SNMP inform messages, use the `snmp-server host` command with the `informs` keyword. When SNMP server informs are enabled, the SNMP version can be only SNMPv2C or SNMPv3.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>snmp</code></td>
<td>read, write</td>
</tr>
</tbody>
</table>

This example shows how to configure SNMP inform messages:

```
RP/0/RSP0/CPU0:router(config)# snmp-server host myhost.cisco.com informs comaccess
RP/0/RSP0/CPU0:router(config)# snmp-server inform pending 40
RP/0/RSP0/CPU0:router(config)# snmp-server inform retries 10
```

**Related Topics**

`snmp-server host`, on page 98
snmp-server interface

To enable an interface to send Simple Network Management Protocol (SNMP) trap notifications and enter SNMP interface configuration mode, use the `snmp-server interface` command in global configuration mode. To disable the sending of SNMP trap notifications on an interface, use the `no` form of this command.

```
snmp-server interface type interface-path-id
no snmp-server interface type interface-path-id
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>type</code></td>
<td>Interface type. For more information, use the question mark (?) online help function.</td>
</tr>
<tr>
<td><code>interface-path-id</code></td>
<td>Physical interface or virtual interface.</td>
</tr>
</tbody>
</table>

**Note**

Use the `show interfaces` command to see a list of all interfaces currently configured on the router.

For more information about the syntax for the router, use the question mark (?) online help function.

**Command Default**

Ethernet interfaces are enabled to send SNMP trap notifications. SNMP trap notifications are disabled on all other physical and logical interfaces.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Release 3.9.0</td>
<td>No modification.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `snmp-server interface` command enters SNMP interface configuration mode for you to configure the available SNMP options.

**Note**

In references to a Management Ethernet interface located on a route switch processor card, the physical slot number is numeric (0 through n-1 where n is the number of line card slots in the chassis) and the module is CPU0. Example: interface MgmtEth0/1/CPU0/0.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp</td>
<td>read,</td>
<td>write</td>
</tr>
</tbody>
</table>
This example shows how to assign ifIndex persistence on Packet-over-SONET/SDH (POS) interface 0/0/1/0:

```
RP/0/RSP0/CPU0:router(config)# snmp-server interface pos 0/0/1/0
RP/0/RSP0/CPU0:router(config-snmp-if)#
```

**Related Topics**

- `show snmp interface`, on page 38
- `snmp-server engineid local`, on page 92
- `snmp-server ifindex persist`, on page 102
snmp-server interface subset

To enter snmp-server interface subset configuration mode for a set of interfaces, use the `snmp-server interface subset` command in global configuration mode. To revert to the default interface settings, use the `no` form of this command.

```
snmp-server interface subset subset-number regular-expression expression
no snmp-server interface subset subset-number
```

**Syntax Description**

- **subset-number**
  - Identifying number of the interface subset, which also indicates its relative priority.
- **regular-expression expression**
  - Specifies for which subset of interfaces to enter snmp-server interface subset configuration mode. The `expression` argument must be entered surrounded by double quotes.

**Command Default**

None

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.9.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `subset-number` argument is used to set the priority for an interface that matches more than one configured regular expressions. Lower values of the `subset-number` have a higher priority. If a single interface becomes part of a multiple-interface configured regular expression, the configuration with the lower `subset-number` value is applied.

Regular expressions have two constraints:

- Regular expressions must always be entered within double quotes to ensure that the CLI interprets each character correctly.
- All characters that are part of a regular expression are considered regular characters with no special meaning. In order to enter special characters, such as "" or "?", they must be preceded by the backslash character "." For example, to enter the regular expression `([A-Z][A-Z0-9]*)\b[^>]*>(.*?)</\1`, you would enter `([A-Z][A-Z0-9]*)\b[^>]*>(.*?)</\1`.

Refer to the Understanding Regular Expressions, Special Characters, and Patterns module in Cisco ASR 9000 Series Aggregation Services Router Getting Started Guide for more information regarding regular expressions.

From the snmp-server interface mode of a subset of interfaces, SNMP linkUp and linkDown notifications can be enabled or disabled using the `notification linkupdown disable` command.
This example illustrates how to configure all Gigabit Ethernet interfaces:

```plaintext
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# snmp-server int subset 2
    regular-expression "^Gig[a-zA-Z]+[0-9/]+\.."
RP/0/RSP0/CPU0:router(config-snmp-if-subset)#
```

**Related Topics**
- `notification linkupdown`, on page 18
- `show snmp interface notification`, on page 40
- `show snmp interface regular-expression`, on page 42
snmp-server ipv4 dscp

To mark packets with a specific differentiated services code point (DSCP) value, use the `snmp-server ipv4 dscp` command in global configuration mode. To remove matching criteria, use the `no` form of this command.

```
snmp-server ipv4 dscp value
no snmp-server ipv4 dscp [value]
```

**Syntax Description**

- **value** Value of the DSCP. The DSCP value can be a number from 0 to 63, or it can be one of the following keywords: `default`, `ef`, `af11`, `af12`, `af13`, `af21`, `af22`, `af23`, `af31`, `af32`, `af33`, `af41`, `af42`, `af43`, `cs1`, `cs2`, `cs3`, `cs4`, `cs5`, `cs6`, `cs7`.

**Command Default**

The IP DSCP default value for SNMP traffic is 0.

**Command Modes**

Global configuration

**Command History**

- **Release 3.7.2** This command was introduced.
- **Release 3.9.0** No modification.

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the `snmp-server ipv4 dscp` command to specify an IP DSCP value to give SNMP traffic higher or lower priority in your network.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

This example shows how to configure the DSCP value to `af32`:

```
RP/0/RSP0/CPU0:router(config)# snmp-server ipv4 dscp af32
```
snmp-server ipv4 precedence

To mark packets with a specific precedence level to use for packet matching, use the `snmp-server ipv4 precedence` command in global configuration mode. To restore the system to its default interval values, use the `no` form of this command.

```
snmp-server ipv4 precedence value
no snmp-server ipv4 precedence [value]
```

**Syntax Description**

- **value**: Value of the precedence. The precedence value can be a number from 0 to 7, or it can be one of the following keywords:
  - **critical**: Set packets with critical precedence (5)
  - **flash**: Set packets with flash precedence (3)
  - **flash-override**: Set packets with flash override precedence (4)
  - **immediate**: Set packets with immediate precedence (2)
  - **internet**: Set packets with internetwork control precedence (6)
  - **network**: Set packets with network control precedence (7)
  - **priority**: Set packets with priority precedence (1)
  - **routine**: Set packets with routine precedence (0)

**Command Default**
The IP Precedence default value for SNMP traffic is 0.

**Command Modes**
Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Release 3.9.0</td>
<td>No modification.</td>
</tr>
</tbody>
</table>
Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the `snmp-server ipv4 precedence` command to specify an IP Precedence value to give SNMP traffic higher or lower priority in your network.

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Task</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>snmp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

This example shows how to set the precedence to 2:

```
RP/0/RSP0/CPU0:router(config)# snmp-server ipv4 precedence 2
```
snmp-server location

To specify the system location for Simple Network Management Protocol (SNMP), use the `snmp-server location` command in

global configuration

mode. To remove the location string, use the `no` form of this command.

```
no snmp-server location
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>system-location</td>
<td>String indicating the physical location of this device. The maximum string length is 255 alphanumeric characters.</td>
</tr>
</tbody>
</table>

**Command Default**

No system location string is set.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Release 3.9.0</td>
<td>No modification.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

This example shows how to specify a system location string:

```
RP/0/RSP0/CPU0:router(config)# snmp-server location Building 3/Room 214
```

**Related Topics**

- `snmp-server contact`, on page 86
snmp-server mib bulkstat max-procmem-size

To configure the overall per-process memory size limit used by all bulk statistics files in the process, use the `snmp-server mib bulkstat max-procmem-size` command in global configuration mode. To remove the overall per-process memory size, use the `no` form of this command.

```
size
no snmp mib bulkstat max-procmem-size [size]
```

**Syntax Description**
- `size`: Overall per-process memory size limit in kilobytes. The valid range is from 100 to 200000. The default is 200000.

**Command Default**
The maximum process memory size is 200000 KB.

**Command Modes**
Global configuration

**Command History**
- **Release** 4.2.0
- **Modification** This command was introduced.

**Usage Guidelines**
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Currently 300 MB is the maximum process memory available for MIB and SNMP processes.

**Task ID**

```
Task ID  Operation
snmp    read, write
```

This example sets the maximum process memory size to 100000 KB.

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# snmp-server mib bulkstat max-procmem-size 100000
```
To configure a Simple Network Management Protocol (SNMP) bulk statistics object list and enter bulk statistics objects configuration mode, use the `snmp-server mib bulkstat object-list` in global configuration mode. To remove an SNMP object list configuration, use the `no` form of this command.

```
snmp-server mib bulkstat object-list object-list-name
no snmp-server mib bulkstat object-list object-list-name
```

**Syntax Description**

- `object-list-name` Name or object identifier (OID) of the bulk statistics object list to configure.

**Command Default**

No SNMP bulk statistics object list is configured.

**Command Modes**

Global configuration

**Command History**

- **Release**
  - 4.2.0
  - This command was introduced.

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `snmp-server mib bulkstat object-list` command allows you to name an object list. Bulk statistics object lists are used for the Periodic MIB Data Collection and Transfer Mechanism. Use the `add` command to add objects to the object list configured with the `snmp-server mib bulkstat object-list` command. Bulk statistics object lists can be reused in multiple schemas.

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp</td>
<td>read,</td>
<td>write</td>
</tr>
</tbody>
</table>

In this example, a bulk statistics object list called ifmib is configured to include two objects:

```
RF/0/RSP0/CPU0:router#  config
RF/0/RSP0/CPU0:router(config)#  snmp-server mib bulkstat object-list ifmib
RF/0/RSP0/CPU0:router(config-bulk-objects)#  add ifOutOctets
RF/0/RSP0/CPU0:router(config-bulk-objects)#  add ifInOctets
```

**Related Topics**

- `add (bulkstat object)`, on page 5
- `show snmp mib bulkstat transfer`, on page 46
snmp-server mib bulkstat schema

To configure a Simple Network Management Protocol (SNMP) bulk statistics schema and enter bulk statistics schema configuration mode, use the `snmp-server mib bulkstat schema` command in global configuration mode. To remove the SNMP bulk statistics schema, use the `no` form of this command.

```
snmp-server mib bulkstat schema  schema-name
no snmp-server mib bulkstat schema  schema-name
```

### Syntax Description

- `schema-name` Specifies the name of the schema to configure.

### Command Default

No schemas are configured.

### Command Modes

Global configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.2.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `snmp-server mib bulkstat schema` command names the schema and enters bulk statistics schema configuration mode. Bulk statistics schema configuration mode is used to configure the object list, instance, and polling interval to be used in the schema.

The specific instances of MIB objects for which data should be collected are determined by appending the value of the `instance` command to the objects specified in the object list.

Multiple schemas can be associated with a single bulk statistics file when configuring the bulk statistics transfer options.

### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>snmp</code></td>
<td>read, write</td>
</tr>
</tbody>
</table>

The following example shows how to configure a bulk statistics schema called GigE0/6/5/0:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# snmp-server mib bulkstat schema tengige 0/6/5/0
RP/0/RSP0/CPU0:router(config-bulk-sc)# object-list ifmib
RP/0/RSP0/CPU0:router(config-bulk-sc)# poll-interval 3
RP/0/RSP0/CPU0:router(config-bulk-sc)# instance exact interface tengige 0/6/5/0 subif
```
RP/0/RSP0/CP00:router(config-bulk-ac)# exit

Related Topics
  instance (bulkstat schema), on page 13
  poll-interval, on page 21
snmp-server mib bulkstat transfer-id

To identify the bulk statistics transfer configuration and enter bulk statistics transfer configuration mode, use the `snmp-server mib bulkstat transfer-id` command in global configuration.

To remove a previously configured transfer, use the `no` form of this command:

```
no snmp-server mib bulkstat transfer-id
```

### Syntax Description

| `transfer-id` | Name of the transfer configuration. |

### Command Default

Bulk statistics transfer is not configured.

### Command Modes

Global configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.2.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The name, `transfer-id`, you specify for the bulk statistics transfer configuration is used in the filename of the bulk statistics file when it is generated and is used to identify the transfer configuration in the output of the `show snmp mib bulkstat transfer` command.

### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>snmp</code></td>
<td>read, write</td>
</tr>
</tbody>
</table>

In this example, The bulk statistics transfer is given the name bulkstat1 and contains two schemas:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# snmp-server mib bulkstat transfer-id bulkstat1
RP/0/RSP0/CPU0:router(config-bulk-tr)# schema IFMIB
RP/0/RSP0/CPU0:router(config-bulk-tr)# schema CAR
RP/0/RSP0/CPU0:router(config-bulk-tr)# url primary
  ftp://user1:pswrd@cbin2-host/users/user1/bulkstat1
RP/0/RSP0/CPU0:router(config-bulk-tr)# url secondary
  tftp://user1@10.1.0.1/tftpboot/user1/bulkstat1
RP/0/RSP0/CPU0:router(config-bulk-tr)# format schemaASCII
RP/0/RSP0/CPU0:router(config-bulk-tr)# transfer-interval 30
RP/0/RSP0/CPU0:router(config-bulk-tr)# retry 5
RP/0/RSP0/CPU0:router(config-bulk-tr)# buffer-size 1024
```
RP/0/RSP0/CPU0:router(config-bulk-tr)# retain 30
RP/0/RSP0/CPU0:router(config-bulk-tr)# end

<td>Specifies the upper threshold for which to determine whether an mteTriggerRising SNMP Trap is generated.</td>
</tr>
</tbody>
</table>

### Command Default

None

### Command Modes

Global configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 4.2.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

**Note**

A maximum of 100 interfaces can be monitored for congestion.

Congestion configurations using the `snmp-server mibs eventmib congestion-control` command cannot be modified using SNMP SET and vice versa.
When the congestion between two intervals increases above the upper-threshold argument, an mteTriggerRising SNMP trap is generated. This trap is not generated until the congestion drops below the lower threshold and then rises above the upper threshold.

When the congestion between two intervals falls below the lower-threshold argument, and an SNMP mteTriggerRising trap was generated previously, an SNMP mteTriggerFalling trap is generated. The mteTriggerRising trap is not generated until the congestion goes above the upper threshold and then falls back below the lower threshold.

The lower-threshold value (falling) should be set to a value less than or equal to the upper-threshold value (rising).

The **snmp-server mibs eventmib congestion-control** command is configured on a specific interface and is supported on the following cards:

- 8-port 10 Gigabit Ethernet PLIM
- 16-port OC-48c/STM-16 POS/DPT PLIM
- 1-port OC-768c/STM-256 POS PLIM
- 4-port OC-192c/STM-64 POS/DPT PLIM
- All Ethernet SPAs
- 2-port and 4-port OC-3c/STM-1 POS SPAs
- 2-port, 4-port, and 8-port OC-12c/STM-4 POS SPAs
- 2-port and 4-port OC-48c/STM-16 POS/RPR SPAs
- 1-port OC-192c/STM-64 POS/RPR SPA

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

This example shows how to configure the generation of SNMP traps in response to congestion:

```
RP/0/RSP0/CPU0:router(config)# snmp-server mibs eventmib congestion-control pos 0/1/0/0 falling 1 interval 5 rising 2
```
To configure the generation of SNMP traps when packet loss exceeds configured thresholds, use the `snmp-server mibs eventmib packet-loss` command in global configuration mode. To restore the default values, use the `no` form of this command.

```plaintext
snmp-server mibs eventmib packet-loss type interface-path-id falling lower-threshold interval sampling-interval rising upper-threshold
no snmp-server mibs eventmib packet-loss type interface-path-id
```

**Syntax Description**

<table>
<thead>
<tr>
<th><strong>Field</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>

<table>
<thead>
<tr>
<th><strong>Release</strong></th>
<th><strong>Modification</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.9.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

**Note**

A maximum of 100 interfaces can be monitored for packet loss.

Packet loss configurations using the `snmp-server mibs eventmib packet-loss` command cannot be modified using SNMP SET and vice versa.
When the packet loss between two intervals increases above the upper-threshold argument, an mteTriggerRising SNMP trap is generated. This trap is not generated until the packet loss drops below the lower threshold and then rises above the upper threshold.

When the packet loss between two intervals falls below the lower-threshold argument, and an SNMP mteTriggerRising trap was generated previously, an SNMP mteTriggerFalling trap is generated. The mteTriggerRising trap is not generated until the packet loss goes above the upper threshold and then falls back below the lower threshold.

The lower-threshold value (falling) should be set to a value less than or equal to the upper-threshold value (rising).

The `snmp-server mibs eventmib packet-loss` command is configured on a specific interface and is supported on the following cards:

- 8-port 10 Gigabit Ethernet PLIM
- 16-port OC-48c/STM-16 POS/DPT PLIM
- 1-port OC-768c/STM-256 POS PLIM
- 4-port OC-192c/STM-64 POS/DPT PLIM
- All Ethernet SPAs
- 2-port and 4-port OC-3c/STM-1 POS SPAs
- 2-port, 4-port, and 8-port OC-12c/STM-4 POS SPAs
- 2-port and 4-port OC-48c/STM-16 POS/RPR SPAs
- 1-port OC-192c/STM-64 POS/RPR SPA

<table>
<thead>

Example

RP/0/RSP0/CPU0:router (config) # snmp-server mibs subscriber threshold delta-loss evaluation access-if tengige 0/4/0/0 interval 100
snmp-server mibs subscriber threshold access-if

To disable the per-session access notifications by the session monitoring process, use the `snmp-server mibs subscriber threshold access-if` in the global configuration mode. To enable notifications, use the `no` form of the command.

`snmp-server mibs subscriber threshold access-if subset number regular expression word notification rising-falling disable
nosnmp-server mibs subscriber threshold access-if`

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>subset number</td>
<td>Subset number of the subscriber threshold. Lower the subset value, higher is the priority. Range is 1 to 255.</td>
</tr>
<tr>
<td>regular expression word</td>
<td>Regular expression to match the interface name. Traps on the corresponding access interface(s) are disabled.</td>
</tr>
<tr>
<td>notification</td>
<td>Name of the notification.</td>
</tr>
<tr>
<td>rising-falling</td>
<td>The rising and falling thresholds.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the access interface notifications.</td>
</tr>
</tbody>
</table>

**Command Default**

Session monitoring is enabled by default

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The `regular expression` keyword disables notifications of the access-interface.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp</td>
<td>read, write</td>
</tr>
</tbody>
</table>
Example

RP/0/RSP0/CPU0:router (config) # snmp-server mibs subscriber threshold access-if subset 100
regular expression notification rising-falling disable
snmp-server notification-log-mib

To configure the NOTIFICATION-LOG-MIB, use the `snmp-server notification-log-mib` command in global configuration mode. To remove the specified configuration, use the `no` form of this command.

```
snmp-server notification-log-mib {globalAgeOut time | globalSize size | default | disable | size size}
no snmp-server notification-log-mib {globalAgeOut | globalSize | default | disable | size size}
```

### Syntax Description

- **globalAgeOut time**  
  Specifies how much time, in minutes, a notification remains in the log. Values for the `time` argument can range from 0 to 4294967295; the default is 15.

- **globalSize size**  
  Specifies the maximum number of notifications that can be logged in all logs. The default is 500.

- **default**  
  Specifies to create a default log.

- **disable**  
  Specifies to disable logging to the default log.

- **size size**  
  Specifies the maximum number of notifications that the default log can hold. The default is 500.

### Command Default

NOTIFICATION-LOG-MIB notifications are not logged.

### Command Modes

Global configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Release 3.9.0</td>
<td>No modification.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Logging of NOTIFICATION-LOG-MIB notifications begins when the default log is created. Named logs are not supported, therefore only the default log can be created.

### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

The following example creates a default log for notifications:
RP/0/RSP0/CPU0:router(config)# snmp-server notification-log-mib default

This example removes the default log:

RP/0/RSP0/CPU0:router(config)# no snmp-server notification-log-mib default

This example configures the size of all logs to be 1500:

RP/0/RSP0/CPU0:router(config)# snmp-server notification-log-mib globalSize 1500

**snmp-server packetsize**

To establish control over the largest Simple Network Management Protocol (SNMP) packet size permitted when the SNMP server is receiving a request or generating a reply, use the `snmp-server packetsize` command in global configuration mode. To restore the default value, use the `no` form of this command.

```
snmp-server packetsize size
no snmp-server packetsize
```

**Syntax Description**

- `size` Packet size, in bytes. Range is from 484 to 65500. The default is 1500.

**Command Default**

- `size`: 1500

**Command Modes**

Global configuration

**Command History**

<table>

</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the `snmp-server packetsize` command to establish control over the largest SNMP packet size permitted when the SNMP server is receiving a request or generating a reply.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

This example shows how to set the maximum size of SNMP packets to 1024 bytes:

```
RP/0/RSP0/CPU0:router(config)# snmp-server packetsize 1024
```
snmp-server queue-length

To establish the message queue length for each trap host for Simple Network Management Protocol (SNMP), use the `snmp-server queue-length` command in global configuration mode. To restore the default value, use the `no` form of this command.

```
snmp-server queue-length length
no snmp-server queue-length
```

**Syntax Description**

- `length`: Integer that specifies the number of trap events that can be held before the queue must be emptied. Range is from 1 to 5000.

**Command Default**

`length`: 100

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Release 3.9.0</td>
<td>No modification.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the `snmp-server queue-length` command to define the length of the message queue for each trap host. After a trap message is successfully sent, Cisco IOS XR software continues to empty the queue at a throttled rate to prevent trap flooding.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

This example shows how to set the SNMP notification queue to 20 events:

```
RP/0/RSP0/CPU0:router(config)# snmp-server queue-length 20
```
**snmp-server target list**

To create a Simple Network Management Protocol (SNMP) target list, use the `snmp-server target list` command in global configuration mode. To remove an SNMP target list, use the `no` form of this command.

```
show snmp-server target list
```

**Syntax Description**

- `target-list` Name of the target list.
- `vrf vrf-name` Specifies the name of the VRF hosts included in the target list.
- `host hostname` Assigns a hostname to the target list. The `hostname` variable is a name or IP address.

**Command Default**

None

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Release 3.9.0</td>
<td>No modification.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use this command to create an SNMP target list and assign hosts to the list. When a target list is mapped to a community name using the `snmp-server community-map` command, SNMP access is restricted to the hosts in the target list (for that community name).

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

In this example, a new target list “sample3” is created and assigned to the vrf server “server2:”

```
RP/0/RSP0/CPU0:router# snmp-server target list sample3 vrf server2
```

**Related Topics**

- `snmp-server community-map`, on page 84
snmp-server throttle-time

To specify the throttle time for handling incoming Simple Network Management Protocol (SNMP) messages, use the `snmp-server throttle-time` command in global configuration mode. To restore the throttle time to its default value, use the `no` form of this command.

```
  snmp-server throttle-time time
  no snmp-server throttle-time
```

**Syntax Description**
- `time` Throttle time for the incoming queue, in milliseconds. Values can be from 50 to 1000.

**Command Default**
- `time`: 0

**Command Modes**
- Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Release 3.9.0</td>
<td>No modification.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

**Task ID**

```markdown
<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp</td>
<td>read, write</td>
</tr>
</tbody>
</table>
```

In the following example, the throttle time is set to 500 milliseconds:

```
RP/0/RSP0/CPU0:router(config)# snmp-server throttle-time 500
```

**Related Topics**

- `snmp-server community-map`, on page 84
To change the timeout used by the SNMP agent while it waits for a response from a subagent, use the `snmp-server timeouts subagent` command in global configuration mode. SNMP subagents are feature-specific entities that register with the SNMP agent and implement sets of MIB objects.

```
snmp-server timeouts subagent timeout
no snmp-server timeouts subagent timeout
```

**Syntax Description**

- `timeout` The timeout used by the SNMP agent when waiting for a response from a MIB module, in seconds. The default is 10.

**Command Default**

`timeout`: 10

**Command Modes**

Global configuration

**Command History**

Release 3.8.0  This command was introduced.

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

In the following example, the timeout is set to 8 seconds:

```
RP/0/RSP0/CPU0:router(config)# snmp-server timeouts subagent 8
```
**snmp-server timeouts duplicate**

To set the timeout value for the snmp-server duplicate request feature, use the `snmp-server timeouts duplicate` command in the appropriate mode. To delete the set value, use the `no` form of the command.

```plaintext
snmp-server timeouts duplicate  timeout-value
do snmp-server timeouts duplicate  timeout-value
```

**Syntax Description**

`timeout-value` Timeout value in seconds. Range is 0 to 20 seconds.

- 0- To Remove this feature support. i.e SNMP will process all the packets irrespective of duplicate (retry) Packets.
- 1- This is the default value, i.e if no configuration is present, then, the timeout value is set to 1. If any packet takes more than 1 second for getting processed, then the Duplicate drop feature is enabled.
- 2 to 20 - if the packet processing is done between 2 and 20 seconds, then the Duplicate drop feature is enabled.

**Command Default**

1 second

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>

In the following example, the trap throttle time is set to 500 milliseconds:

```
RP/0/RSP0/CPU0:router(config)# snmp-server trap throttle-time 500
```

**Related Topics**

- `snmp-server throttle-time`, on page 139
To enable Simple Network Management Protocol (SNMP) trap notifications, use the `snmp-server traps` command in global configuration mode. To disable SNMP notifications, use the `no` form of this command.

```
snmp-server traps notification-type
no snmp-server traps [notification-type]
```
snmp-server traps

Syntax Description

notification-type
(Optional) Type of notification (trap) to enable or disable. If no type is specified, all notifications available on the device are enabled or disabled.

The notification type can be one or more of the following keywords:

- **bfd**
  
  Enables Bidirectional Forwarding Detection (BFD) traps.

- **bgp**
  
  Enables BGP4-MIB and CISCO-BGP4-MIB traps.

- **bridgemib**
  
  Enables SNMP traps for the Bridge MIB.

- **config**
  
  Controls configuration notifications, as defined in the CISCO-CONFIG-MAN-MIB (enterprise 1.3.6.1.4.1.9.9.43.2). The notification type is: (1) ciscoConfigManEvent.

- **copy-complete**
  
  Enables CISCO-CONFIG-COPY-MIB ccCopyCompletion traps.

- **ds1**
  
  Enables SNMP Cisco DS1 traps.

- **ds2**
  
  Enables SNMP Cisco DS2 traps.

- **entity**
  
  Controls Entity MIB modification notifications. This notification type is defined in the ENTITY-MIB (enterprise 1.3.6.1.2.1.47.2) as: (1) entConfigChange.

- **ethernet**
  
  Enables Ethernet link OAM and 802.1ag connectivity fault management traps.

- **flash insertion**
  
  Enables ciscoFlashDeviceInsertedNotif.

- **flash removal**
  
  Enables ciscoFlashDeviceRemovedNotif.

- **fru-ctrl**
  
  Enables SNMP entity field-replaceable unit (FRU) control traps.

- **hsrp**
  
  Enables SNMP HSRP traps.

- **ipsec tunnel start**
  
  Enables SNMP IPsec tunnel start traps.

- **ipsec tunnel stop**
  
  Enables SNMP IPsec tunnel stop traps.
isakmp
  Enables ISAKMP traps.

l2vpn all
  Enables all Layer 2 VPN traps.

l2vpn vc-down
  Enables Layer 2 VPN VC down traps.

l2vpn vc-up
  Enables Layer 2 VPN VC up traps.

mpls frr all
  Enables all MPLS fast reroute MIB traps.

mpls frr protected
  Enables MPLS fast reroute tunnel protected traps.

mpls ldp
  Enables SNMP Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP) traps.

mpls traffic-eng
  Enables SNMP MPLS traffic engineering traps.

msdp peer-state-change
  Enables SNMP MSDP Peer state change traps.

ntp
  Enables SNMP Cisco NTP traps.

otn
  Enables SNMP Cisco optical transport network (OTN) traps.

pim
  Enables SNMP PIM traps.

rf
  Enables RF-MIB traps.

sensor
  Enables SNMP entity sensor traps.

snmp
  Enables SNMP traps.

sonet
  Enables SONET traps.
snmp-server traps

syslog
Controls error message notifications (Cisco-syslog-MIB). Specify the level of messages to be sent with the logging history command.

system
Enables SNMP SYSTEMMIB-MIB traps.

vpls
Enables virtual private LAN service (VPLS) traps.

vrrp events
Enables Virtual Router Redundancy Protocol (VRRP) traps.

Note To display the trap notifications supported on a platform, use the online help (?) function.

Command Default
SNMP notifications are disabled by default.

</tbody>
</table>

Usage Guidelines
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the snmp-server traps command to enable trap requests for the specified notification types. To configure the router to send SNMP notifications, specify at least one snmp-server traps command. When the command is entered with no keyword, all notification types are enabled. When a notification type keyword is specified, only the notification type related to that keyword is enabled. To enable multiple types of notifications, issue a separate snmp-server traps command for each notification type.

The snmp-server traps command is used with the snmp-server host command. Use the snmp-server host command to specify which host or hosts receive SNMP notifications.

Task ID

### Usage Guidelines
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

SNMP notifications can be sent as traps.

Use the `snmp-server traps bgp` command to enable or disable BGP server state-change notifications, as defined in the BGP4-MIB (enterprise 1.3.6.1.2.1.15.7). The notifications types are:

- `bgpEstablished`
- `bgpBackwardTransition`

The BGP notifications are defined in the BGP-4 MIB as follows:

```
bgpTraps OBJECT IDENTIFIER ::= { bgp 1 }

bgpEstablished NOTIFICATION-TYPE
OBJECTS { bgpPeerLastError,
bgpPeerState }
STATUS current
DESCRIPTION "The BGP Established event is generated when the BGP FSM enters the ESTABLISHED state."
::= { bgpTraps 1 }

bgpBackwardTransition NOTIFICATION-TYPE
OBJECTS { bgpPeerLastError,
bgpPeerState }
STATUS current
DESCRIPTION "The BGP BackwardTransition Event is generated when the BGP FSM moves from a higher numbered state to a lower numbered state."
::= { bgpTraps 2 }
```
For a complete description of these notifications and additional MIB functions, see the BGP4-MIB in the SNMP Object Navigator, available through cisco.com at http://tools.cisco.com/Support/SNMP/do/BrowseMIB.do?local=en&step=2.

The `snmp-server traps bgp` command is used with the `snmp-server host` command. Use the `snmp-server host` command to specify which host or hosts receive SNMP notifications.

<table>
<thead>
<tr>
<th>Task ID</th>

</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

SNMP notifications can be sent as traps.

Use the `snmp-server traps ospf state-change` command to enable or disable OSPF server state-change notifications, as defined in the MIB. One notification type is ospfNbrStateChange.

For example, the OSPF ospfNbrStateChange notification is defined in the OSPF MIB as follows:

```
! ospfNbrStateChange NOTIFICATION-TYPE
! OBJECTS {
!   ospfRouterId, -- The originator of the trap
!   ospfNbrIpAddr,
!   ospfNbrAddressLessIndex,
!   ospfNbrRtrId,
!   ospfNbrState -- The new state
! }
! STATUS current
```
For a complete description of these notifications and additional MIB functions, see the OSPF-TRAP-MIB in the SNMP Object Navigator, available through cisco.com at http://tools.cisco.com/Support/SNMP/do/BrowseMIB.do?local=en&step=2.

The `snmp-server traps ospf state-change` command is used with the `snmp-server host` command. Use the `snmp-server host` command to specify which host or hosts receive SNMP notifications.

The following example shows how to enable the router to send OSPF state-change notifications to the host at the address myhost.cisco.com using the community string defined as public:

```
RP/0/RSP0/CPU0:router(config)# snmp-server traps ospf state-change neighbor-state-change
RP/0/RSP0/CPU0:router(config)# snmp-server host myhost.cisco.com version 2c public
```

</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Release 3.9.0</td>
<td>No modification.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the `snmp-server host` command to specify which host or hosts receive SNMP notifications.

Use the `snmp-server traps pim interface-state-change` command to send notifications when a PIM interface changes status from up to down. When the status is up, the notification signifies the restoration of a PIM interface. When the status is down, the notification signifies the loss of a PIM interface.

**Task ID**

```
Task ID
snmp read, write
```

This example shows how to use the `snmp-server traps pim interface-state-change` command:

```
RP/0/RSP0/CPU0:router(config)# snmp-server traps pim interface-state-change
RP/0/RSP0/CPU0:router(config)# snmp-server host myhost.cisco.com version 2c public
```

**Related Topics**

snmp-server traps pim invalid-message-received

To enable notifications for monitoring invalid Protocol Independent Multicast (PIM) protocol operations, such as invalid register received and invalid join or prune received, use the `snmp-server traps pim invalid-message-received` command in global configuration mode. To disable this command so that no notification is sent, use the `no` form of this command.

```
no snmp-server traps pim invalid-message-received
```

### Syntax Description
This command has no keywords or arguments.

### Command Default
Simple Network Management Protocol (SNMP) notifications are disabled by default.

### Command Modes
Global configuration

### Usage Guidelines
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the `snmp-server host` command to specify which host or hosts receive SNMP notifications.

A router can receive a join or prune message in which the RP specified in the packet is not the RP for the multicast group. Or a router can receive a register message from a multicast group in which it is not the RP.

### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>

This example illustrates how to enable all SNMP RSVP MIB traps.

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# snmp-server traps rsvp all
```
snmp-server traps selective-vrf-download role-change

To attempt to download only those prefixes and labels to a physical entity required to forward traffic through the physical entity, use the `snmp-server trap selective-vrf-download role-change` command in global configuration mode.

**snmp-server trap selective-vrf-download role-change**

This command has no keywords or arguments.

<table>
<thead>
<tr>
<th>Command Default</th>
<th>Selective VRF downloads are disabled.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command Modes</td>
<td>Global configuration</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.2.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The selective VRF download feature makes a best effort to download only those prefixes and labels to a physical entity required to forward traffic through the physical entity. This is accomplished by characterizing roles for physical entities based on their configuration.

From a network management point of view the CISCO-SELECTIVE-VRF-DOWNLOAD-MIB:

- Lists the state relating to the selective VRF download feature for each physical entity capable of forwarding packets.
- Lists the role change history per address family (ipv4 and ipv6) for each physical entity capable of forwarding packets.
- Lists the VRF tables selectively downloaded to each physical entity capable of forwarding packets.

**Task ID**

<td>This command was introduced.</td>
</tr>
<tr>
<td>Release 3.9.0</td>
<td>The authentication, linkup, linkdown, coldstart, and warmstart keywords were added.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The snmp-server traps snmp command is used with the snmp-server host command. Use the snmp-server host command to specify which host or hosts receive SNMP notifications.

The optional authentication keyword controls the sending of SNMP authentication failure notifications. In order to send notifications, you must configure at least one snmp-server host command. An authentication Failure (4) trap signifies that the sending device is the addressee of a protocol message that is not properly authenticated. The authentication method depends on the version of SNMP being used. For SNMPv1 or SNMPv2, authentication failure occurs for packets with an incorrect community string. For SNMPv3, authentication failure occurs for packets with an incorrect Secure Hash Algorithm (SHA) or Message Digest 5 (MD5) authentication key or for a packet that is outside the authoritative SNMP engine’s window, for
example, the packets that are configured outside access lists or time ranges. In such an instance, only a report Protocol Data Unit (PDU) is generated, and authentication failure traps are not generated.

The optional linkup keyword controls the sending of SNMP linkUp notifications. The linkUp(3) trap signifies that the sending device recognizes one of the communication links represented in the agent's configuration coming up.

The optional linkdown keyword controls the sending of SNMP linkDown notifications. The linkDown(2) trap signifies that the sending device recognizes a failure in one of the communication links represented in the agent's configuration.

The snmp-server traps snmp command with the linkup or linkdown keywords globally enables or disables SNMP linkUp and linkDown traps. After enabling either of these traps globally, you can enable or disable these traps on specific interfaces using the no notification linkup|down disable command in interface configuration mode. According to RFC 2863, linkUp and linkDown traps are enabled for interfaces that do not operate on top of any other interface (as defined in the ifStackTable), and are disabled otherwise. This means that you do not have to enable linkUp and linkDown notifications on such interfaces. However, linkUp and linkDown notifications will not be sent unless you enable them globally using the snmp-server traps snmp command.

The optional coldstart keyword controls the sending of SNMP coldStart notifications. The coldStart(0) trap signifies that the sending device is reinitializing itself such that the agent's configuration or the protocol entity implementation may be altered.

The optional warmstart keyword controls the sending of SNMP coldStart notifications. The warmStart(1) trap signifies that the sending device is reinitializing itself such that neither the agent configuration nor the protocol entity implementation is altered.

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Task Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

This example shows how to enable the device to send all traps to the host myhost.cisco.com using the community string defined as public:

```
RP/0/RSP0/CPU0:router(config)# snmp-server traps snmp
RP/0/RSP0/CPU0:router(config)# snmp-server host myhost.cisco.com public snmp
```

The following example shows how to enable only linkUp and linkDown traps:

```
RP/0/RSP0/CPU0:router(config)# snmp-server traps snmp linkup
RP/0/RSP0/CPU0:router(config)# snmp-server traps snmp linkdown
```

**Related Topics**

- `snmp-server traps snmp`, on page 179
snmp-server trap-source

To specify the interface (and hence the corresponding IP address) from which a Simple Network Management Protocol (SNMP) trap should originate, use the `snmp-server trap-source` command in global configuration mode. To remove the source designation, use the `no` form of this command.

```
snmp-server trap-source type interface-path-id
no snmp-server trap-source
```

**Syntax Description**

- **type** Interface type. For more information, use the question mark (?) online help function.
- **interface-path-id** Physical interface or virtual interface.

**Note** Use the `show interfaces` command to see a list of all interfaces currently configured on the router.

For more information about the syntax for the router, use the question mark (?) online help function.

**Command Default**

No interface is specified.

**Command Modes**

Global configuration

**Command History**

<table>

</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Release 3.9.0</td>
<td>No modification.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

When an SNMP trap is sent from a Cisco SNMP device, it has a notification address of the interface it happened to exit at that time. Use the `snmp-server trap-source` command to monitor notifications from a particular interface.

**Note**

In references to a Management Ethernet interface located on a route switch processor card, the physical slot number is numeric (0 through n-1 where n is the number of line card slots in the chassis) and the module is CPU0. Example: interface MgmtEth0/1/CPU0/0.
The following example shows how to specify that the IP address for interface 0/0/1/0 is the source for all SNMP notifications:

```
RP/0/RSP0/CPU0:router(config)# snmp-server trap-source tengige 0/0/1/0
```

**Related Topics**

</tbody>
</table>

**Command Default**

None

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the `snmp-server traps subscriber session-aggregation` command to enable CISCO-SUBSCRIBER-SESSION-MIB notifications (traps). Notifications will include MIB's asynchronous events.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Example**

```
RP/0/RSP0/CPU0:router (config)# snmp-server traps subscriber session-aggregation node
```
**snmp-server trap-timeout**

To define how often to try resending trap messages on the retransmission queue, use the `snmp-server trap-timeout` command in global configuration mode. To restore the default value, use the `no` form of this command.

```
snmp-server trap-timeout seconds
no snmp-server trap-timeout seconds
```

**Syntax Description**

- `seconds` Integer that sets the interval for resending the messages, in seconds. Value can be from 1 to 1000.

**Command Default**

`seconds : 30`

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Release 3.9.0</td>
<td>No modification.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Before Cisco IOS XR software tries to send a trap, it looks for a route to the destination address. If there is no known route, the trap is saved in a retransmission queue. Use the `snmp-server trap-timeout` command to determine the number of seconds between retransmission attempts.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

The following example shows how to set an interval of 20 seconds to try resending trap messages on the retransmission queue:

```
RP/0/RSP0/CPU0:router(config)# snmp-server trap-timeout 20
```

**Related Topics**

- `snmp-server engineid local`, on page 92
- `snmp-server host`, on page 98
- `snmp-server traps bgp`, on page 152
snmp-server trap-timeout

snmp-server traps snmp, on page 179
snmp-server traps syslog, on page 181
snmp-server user

To configure a new user to a Simple Network Management Protocol (SNMP) group, use the `snmp-server user` command in

global configuration

mode. To remove a user from an SNMP group, use the `no` form of this command.

```
snmp-server user username groupname {v1 | v2c | v3 [auth {md5 | sha} {clear | encrypted] auth-password [priv {3des | aes aes-bit-encryption | des56} {clear | encrypted] priv-password] [SDROwner | SystemOwner]} [access-list-name]}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>username</code></td>
<td>Name of the user on the host that connects to the agent.</td>
</tr>
<tr>
<td><code>groupname</code></td>
<td>Name of the group to which the user belongs.</td>
</tr>
<tr>
<td><code>v1</code></td>
<td>Specifies that the SNMPv1 security model should be used.</td>
</tr>
<tr>
<td><code>v2c</code></td>
<td>Specifies that the SNMPv2c security model should be used.</td>
</tr>
<tr>
<td><code>v3</code></td>
<td>Specifies that the SNMPv3 security model should be used.</td>
</tr>
<tr>
<td><code>auth</code></td>
<td>(Optional) Specifies which authentication level should be used. If this keyword is used, you must specify an authentication level and an authorization password.</td>
</tr>
<tr>
<td><code>md5</code></td>
<td>Specifies the HMAC-MD5-96 authentication level.</td>
</tr>
<tr>
<td><code>sha</code></td>
<td>Specifies the HMAC-SHA-96 authentication level.</td>
</tr>
<tr>
<td><code>clear</code></td>
<td>Specifies that an unencrypted password follows.</td>
</tr>
<tr>
<td><code>encrypted</code></td>
<td>Specifies that an encrypted password follows.</td>
</tr>
<tr>
<td><code>auth-password</code></td>
<td>Authentication password, which is a string (not to exceed 64 characters) that enables the agent to receive packets from the host.</td>
</tr>
<tr>
<td><code>priv</code></td>
<td>(Optional) Specifies that encryption parameters follow.</td>
</tr>
<tr>
<td><code>3des</code></td>
<td>Specifies the 168-bit Triple Data Encryption Standard (3DES) level of encryption for the user.</td>
</tr>
<tr>
<td><code>aes aes-bit-encryption</code></td>
<td>Specifies the Advanced Encryption Standard (AES) level of encryption for the user. Supported options are 128, 192 and 256 bit encryption.</td>
</tr>
<tr>
<td><code>des56</code></td>
<td>Specifies the 56-bit Data Encryption Standard (DES) level of encryption for the user.</td>
</tr>
</tbody>
</table>
**priv-password**
Privacy password, which can be clear or encrypted text, according to what is specified.

**SDROwner**
(Optional) Limits access to the agents for the owner secure domain router (SDR) only.

**SystemOwner**
(Optional) Provides system-wide access to the agents for all SDRs.

**access-list-name**
(Optional) Access list to be associated with this SNMP user. The *access-list-name* argument represents a value from 1 to 99, that is, the identifier of the standard IP access list.

---

**Command Default**
By default, access is limited to agents on the owner SDR only.

See also Table 8: *snmp-server user Default Descriptions*, on page 188.

**Command Modes**
Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Release 3.9.0</td>
<td>AES and 3DES encryption formats were supported.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

To use 3DES and AES encryption standards, you must have installed the security package (k9sec). For information on installing software packages, see *Upgrading and Managing Cisco IOS XR Software* in System Management Configuration Guide for Cisco ASR 9000 Series Routers.

**Note**
Only one remote host can be assigned to the same username for SNMP version 3. If you configure the same username with different remote hosts, only the last username and remote host combination will be accepted and will be seen in the *show running* configuration. In the case of multiple SNMP managers, multiple unique usernames are required.

**Table 8: *snmp-server user Default Descriptions***

<table>
<thead>
<tr>
<th>Characteristic</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>passwords</td>
<td>Text strings are assumed.</td>
</tr>
<tr>
<td>access lists</td>
<td>Access from all IP access lists is permitted.</td>
</tr>
</tbody>
</table>

**SDR and System-wide Access**

When the *snmp-server user* command is entered with the *SDROwner* keyword, SNMP access is granted only to the MIB object instances in the owner SDR.
When the **snmp-server user** command is entered with the **SystemOwner** keyword, SNMP access is granted to the entire system.

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

The following example shows how to enter a plain-text password for the string *abcd* for user2 in group2:

```
RP/0/RSP0/CPU0:router(config)# snmp-server user user2 group2 v3 auth md5 clear abcd
```

To learn if this user has been added to the configuration, use the **show snmp user** command.

If the localized Message Digest 5 (MD5) or Secure Hash Algorithm (SHA) digest is known, specify that string instead of the plain-text password. The digest should be formatted as AA:BB:CC:DD where AA, BB, CC, and DD are hexadecimal values. The digest should also be exactly 16 octets long.

```
```

snmp-server view

To create or update a Simple Network Management Protocol (SNMP) view entry, use the `snmp-server view` command in global configuration mode. To remove the specified server view entry, use the `no` form of this command.

```
snmp-server view view-name oid-tree {excluded | included}
no snmp-server view view-name oid-tree {excluded | included}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>view-name</td>
<td>Label for the view record being updated or created. The name is used to reference the record.</td>
</tr>
<tr>
<td>oid-tree</td>
<td>Object identifier (OID) of the ASN.1 subtree to be included or excluded from the view. To identify the subtree, specify a text string consisting of numbers, such as 1.3.6.2.4, or a word, such as <code>system</code>. Replace a single subidentifier with the asterisk (<em>) wildcard to specify a subtree family; for example 1.3.</em>.4.</td>
</tr>
<tr>
<td>excluded</td>
<td>Excludes the MIB family from the view.</td>
</tr>
<tr>
<td>included</td>
<td>Includes the MIB family in the view.</td>
</tr>
</tbody>
</table>

**Command Default**

No view entry exists.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Release 3.9.0</td>
<td>No modification.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Other SNMP commands require a view as a keyword. Use the `snmp-server view` command to create a view to be used as keywords for other commands that create records including a view.

Instead of defining a view explicitly, you can rely on the following predefined views, which are supported by the SNMP agent:

- **all**
  - Predefined view indicating that a user can see all objects.

- **CfgProt**
  - Predefined view indicating that a user can see all objects except the SNMPv3 configuration tables.

- **vacmViewTreeFamilyEntry**
  - Predefined view indicating that a user can see the default configuration of vacmViewTreeFamilyEntry.
The predefined views supported on Cisco IOS XR software, however, do not match the predefined views specified in RFC 3415.

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

This example creates a view that includes all objects in the MIB-II subtree:

```
RP/0/RSP0/CPU0:router(config)# snmp-server view mib2 1.3.6.1.2.1 included
```

This example shows how to create a view that includes all objects in the MIB-II system group and all objects in the Cisco enterprise MIB:

```
RP/0/RSP0/CPU0:router(config)# snmp-server view view1 1.3.6.1.2.1.1 included
RP/0/RSP0/CPU0:router(config)# snmp-server view view1 1.3.6.1.4.1.9 included
```

This example shows how to create a view that includes all objects in the MIB-II system group except for sysServices (System 7) and all objects for interface 1 in the MIB-II interfaces group:

```
RP/0/RSP0/CPU0:router(config)# snmp-server view view1 1.3.6.1.2.1.1 included
RP/0/RSP0/CPU0:router(config)# snmp-server view view1 1.3.6.1.2.1.1.7 excluded
RP/0/RSP0/CPU0:router(config)# snmp-server view view1 1.3.6.1.2.1.2.2.*.1 included
```

**Related Topics**

**snmp-server vrf**

To configure the VPN routing and forwarding (VRF) properties of Simple Network Management Protocol (SNMP), use the `snmp-server vrf` command in global configuration mode. To remove the configuration, use the `no` form of this command.

```
snmp-server vrf vrf-name[host address | [clear | encrypted]]|traps|version {1 | 2c | 3 security-level}] community-string[udp-port port][context context-name]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>vrf-name</code></td>
<td>Name of the VRF.</td>
</tr>
<tr>
<td><code>host address</code></td>
<td>(Optional) Specifies the name or IP address of the host (the targeted recipient).</td>
</tr>
<tr>
<td><code>clear</code></td>
<td>(Optional) Specifies that the <code>community-string</code> argument is clear text.</td>
</tr>
<tr>
<td><code>encrypted</code></td>
<td>(Optional) Specifies that the <code>community-string</code> argument is encrypted text.</td>
</tr>
<tr>
<td><code>traps</code></td>
<td>(Optional) Specifies that notifications should be sent as traps. This is the default.</td>
</tr>
</tbody>
</table>
| `version {1 | 2c | 3}` | (Optional) Specifies the version of the SNMP used to send the traps. The default is SNMPv1. When the `version` keyword is used, one of these keywords must be specified:  
  • `1`—SNMPv1  
  • `2c`—SNMPv2C  
  • `3`—SNMPv3  |
| `security-level`   | (Optional) Security level for SNMPv3. Options are:                         |
|                    |  • `auth`—authNoPriv                                                       |
|                    |  • `noauth`—noAuthNoPriv                                                   |
|                    |  • `priv`—authPriv                                                        |
| `community-string` | Specifies the community string for SNMPv1 and SNMPv2, or the SNMPv3 user. |
| `udp-port port`    | (Optional) Specifies the UDP port to which notifications should be sent.   |
| `context context-name` | (Optional) Name of the context that must be mapped to VRF identified by value of the `vrf-name` argument. |

### Command Default

None

### Command Modes

Global configuration
Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Release 3.9.0</td>
<td>No modification.</td>
</tr>
</tbody>
</table>

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use this command to enter SNMP VRF configuration mode and configure an SNMP notification recipient on a VRF. You can also map a VRF to an SNMP context.

SNMP notification recipient that is reachable by way of a VRF can be configured. Notification is forwarded to the recipient represented by its address using the routing table instance identified by the VRF name.

The address argument can be either a host name or an IP address.

Use the clear keyword to specify that the clear text community string you enter is displayed encrypted in the show running command output. To enter an encrypted string, use the encrypted keyword. To enter a clear text community string that is not encrypted by the system, use neither of these keywords.

An SNMP context identified by the value of the context-name argument can be mapped to a VRF in this mode. This context must be created using snmp-server context command.

Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

This example shows how to configure a host IP address for a VRF name:

```
RP/0/RSP0/CPU0:router(config)# snmp-server vrf vrfa
RP/0/RSP0/CPU0:router(config-snmp-vrf)# host 12.21.0.1 traps version 2c public udp-port 2525
```

**transfer-interval**

To configure how long bulk statistics should be collected before a bulk statistics transfer is initiated, use the `transfer-interval` command in bulk statistics transfer configuration mode. To remove a previously configured interval from a bulk statistics configuration, use the `no` form of this command.

```
transfer-interval  minutes
no transfer-interval  minutes
```

**Syntax Description**

`minutes` Length of time, in minutes, that the system should collect MIB data before attempting the transfer operation. The valid range is from 1 to 2147483647. The default is 30.

**Command Default**

Bulk statistics file transfer operations start 30 minutes after the `enable (bulkstat)` command is used.

**Command Modes**

Bulk statistics transfer configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.2.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Bulk statistics data is collected into a new file when a transfer attempt begins, which means that this command also configures the collection interval.

If the maximum buffer size for a bulk statistics file is reached before the transfer interval time expires, the transfer operation is still initiated, and bulk statistics MIB data are collected into a new file in the system buffer.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

The following example shows how to configure a transfer interval of 20 minutes for the bulk statistics configuration bulkstat1:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# snmp-server mib bulkstat transfer-id bulkstat1
RP/0/RSP0/CPU0:router(config-bulk-tr)# transfer-interval 20
```

**Related Topics**

- `enable (bulkstat)`, on page 8
- `show snmp mib bulkstat transfer`, on page 46
snmp-server mib bulkstat transfer-id, on page 120
url

To specify the host to which bulk statistics files should be transferred, use the `url` command in bulk statistics transfer configuration mode. To remove a previously configured destination host, use the `no` form of this command.

```
url [primary | secondary] url
no url [primary | secondary] url
```

**Syntax Description**

- `primary`: Specifies the URL to be used first for bulk statistics transfer attempts.
- `secondary`: Specifies the URL to be used for bulk statistics transfer attempts if the transfer to the primary URL is not successful.
- `url`: Destination URL address for the bulk statistics file transfer. Use FTP or TFTP. The syntax for these URLs is as follows:
  - `ftp://[username[:password]@]location/directory/filename`
  - `tftp://location/directory/filename`

The location argument is typically an IP address.

**Command Default**

No host is specified.

**Command Modes**

Bulk statistics transfer configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.2.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

For bulk statistics transfer retry attempts, a single retry consists of an attempt to send first to the primary URL, and then to the secondary URL.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

In the following example, an FTP server is used as the primary destination for the bulk statistics file. If a transfer to that address fails, an attempt is made to send the file to the TFTP server at 192.168.10.5. No retry command is specified, which means that only one attempt to each destination will be made.

```
RP/0/RSP0/CPU0:router# configure
```
