CHAPTER 1

Access List Commands 1

- atomic-disable 3
- clear access-list ipv4 4
- clear access-list ipv6 7
- copy access-list ipv4 10
- copy access-list ipv6 12
- deny (IPv4) 14
- deny (IPv6) 23
- hardware access-list atomic disable 28
- hardware access-list l3-compression-optimisation 29
- ipv4 access-group 30
- ipv4 access-list 33
- ipv4 access-list log-update rate 34
- ipv4 access-list log-update threshold 35
- ipv6 access-group 37
- ipv6 access-list 39
- ipv6 access-list log-update rate 42
- ipv6 access-list log-update threshold 43
- ipv6 access-list maximum ace threshold 44
- ipv6 access-list maximum acl threshold 45
- interface ipv4/ipv6 access-group 46
- object-group network 48
- object-group port 50

packet-length	52
permit (IPv4)	54
permit (IPv6)	69
remark (IPv4)	78
remark (IPv6)	80
resequence access-list ipv4	82
resequence access-list ipv6	84
show access-lists afi-all	86
show access-lists ipv4	87
show access-lists ipv6	93
show object-group network	98
show object-group port	100

CHAPTER 2**ARP Commands 101**

arp	102
arp cache-limit	104
arp dagr	105
arp gratuitous ignore	106
arp learning	107
arp purge-delay	109
arp timeout	110
clear arp-cache	112
local-proxy-arp	114
peer (DAGR)	115
priority-timeout	116
proxy-arp	118
route distance	119
route metric	120
show arp	122
show arp idb	126
show arp dagr	128
show arp traffic	130
timers (DAGR)	133

CHAPTER 3

Cisco Express Forwarding Commands	135
cef adjacency route override rib	137
cef load-balancing algorithm adjust	139
cef load-balancing fields	140
clear adjacency statistics	143
clear cef ipv4 drops	145
clear cef ipv4 exceptions	147
clear cef ipv4 interface bgp-policy-statistics	149
clear cef ipv4 interface rpf-statistics	150
clear cef ipv6 drops	152
clear cef ipv6 exceptions	154
clear cef ipv6 interface bgp-policy-statistics	156
interface tunnel forwarding adjacency	157
interface tunnel ipv6 enable	159
ipv4 bgp policy accounting	160
ipv4 bgp policy propagation	162
ipv4 verify unicast source reachable-via	164
ipv6 verify unicast source reachable-via	166
rp mgmtethernet forwarding	168
show adjacency	169
show cef	173
show cef bgp-attribute	175
show cef external	177
show cef recursive-nextthop	180
show cef summary	181
show cef ipv4	183
show cef ipv4 adjacency	185
show cef ipv4 adjacency hardware	187
show cef ipv4 drops	189
show cef ipv4 exact-route	191
show cef ipv4 exceptions	193
show cef ipv4 hardware	195
show cef ipv4 interface	196

show cef ipv4 interface bgp-policy-statistics	198
show cef ipv4 non-recursive	200
show cef ipv4 resource	203
show cef ipv4 summary	205
show cef ipv4 unresolved	207
show cef ipv6	209
show cef ipv6 adjacency	212
show cef ipv6 adjacency hardware	215
show cef ipv6 drops	217
show cef ipv6 exact-route	220
show cef ipv6 exceptions	222
show cef ipv6 hardware	224
show cef ipv6 interface	226
show cef ipv6 non-recursive	228
show cef ipv6 resource	230
show cef ipv6 summary	232
show cef ipv6 unresolved	234
show cef mpls adjacency	236
show cef mpls adjacency hardware	238
show cef mpls drops	240
show cef mpls interface	242
show cef mpls unresolved	244
show cef vrf	246

CHAPTER 4
DHCP Commands 247

bootfile	249
clear dhcp ipv4 server binding	250
clear dhcp ipv4 server statistics	252
clear dhcp ipv4 snoop binding	253
clear dhcp ipv6 proxy binding	254
client-mac-mismatch	255
database (DHCPv6 Binding)	256
default-router	258
destination (DHCP IPv6)	259

dhcp ipv4	261
show dhcp ipv4 client	262
show dhcp ipv4 client statistics	264
clear dhcp ipv4 client	266
clear dhcp ipv4 client statistics	267
show tech support dhcp ipv4 client	269
dhcp ipv6	271
dhcp ipv4 none	272
dns-server	273
domain-name	274
duplicate-mac-allowed	275
giaddr policy	277
helper-address	278
helper-address (ipv6)	280
iana-route-add	282
interface (DHCP)	283
lease (DHCPv4 Server)	286
limit lease	287
netbios-name-server	288
netbios-node-type	289
option	290
pool (DHCP)	292
profile (DHCP)	293
quiet-on-unspec-fail	299
relay information authenticate	300
relay information check	302
relay information option	304
relay information option allow-untrusted	306
relay information policy	308
requested-ip-address-check	310
subnet-mask	311
secure-arp	312
sessions mac throttle	313
show dhcp ipv4 proxy interface	315

show dhcp ipv4 relay profile	317
show dhcp ipv4 relay profile name	318
show dhcp ipv4 relay statistics	319
show dhcp ipv4 server binding	321
show dhcp ipv4 server profile	323
show dhcp ipv4 server statistics	324
show dhcp ipv4 snoop binding	325
show dhcp ipv6 database	327
show dhcp ipv6 interface	329
show dhcp ipv4 snoop statistics	331
show dhcp ipv6 proxy binding	333
show dhcp ipv6 relay binding	335
show dhcp ipv6 relay statistics	337
clear dhcp ipv6 relay binding	339
clear dhcp ipv6 relay statistics	341
show dhcp ipv6 proxy interface	342
show dhcp vrf ipv4 server statistics	344
time-server	345
trust relay-reply	346
trusted	347
vrf (relay profile)	348

CHAPTER 5 **Host Services and Applications Commands** 351

cinetd rate-limit	353
clear host	354
destination address(ipsla)	355
domain ipv4 host	356
domain ipv6 host	357
domain list	358
domain lookup disable	360
domain name (IPAddr)	361
domain name-server	362
ftp client anonymous-password	363
ftp client passive	364

ftp client password	366
ftp client source-interface	368
ftp client username	370
logging source-interface vrf	371
ping (network)	372
ping bulk (network)	375
rep client source-interface	377
rep client username	378
scp	380
show cinetd services	382
show hosts	384
source address(ipsla)	386
telnet	387
telnet client source-interface	390
telnet dscp	392
telnet server	394
telnet transparent	396
tftp client source-interface	397
tftp server	398
traceroute	400

CHAPTER 6

HSRP Commands	403
address (hsrp)	405
address global (HSRP)	407
address global subordinate (HSRP)	408
address linklocal (HSRP)	409
address secondary (hsrp)	411
authentication (hsrp)	413
bfd fast-detect (hsrp)	415
clear hsrp statistics	417
hsrp authentication	418
hsrp bfd fast-detect	420
hsrp bfd minimum-interval	421
hsrp bfd multiplier	422

hsrp delay	423
hsrp ipv4	424
hsrp mac-address	426
hsrp preempt	428
hsrp priority	430
hsrp redirects	432
hsrp timers	433
hsrp track	435
hsrp use-bia	437
interface (HSRP)	438
preempt (hsrp)	439
priority (hsrp)	441
router hsrp	443
session name	444
show hsrp	446
show hsrp bfd	449
show hsrp mgo	451
show hsrp statistics	453
show hsrp summary	455
hsrp slave follow	456
subordinate primary virtual IPv4 address	457
subordinate secondary virtual IPv4 address	458
subordinate virtual mac address	459
timers (hsrp)	460
track (hsrp)	462
track(object)	464

CHAPTER 7**LPTS Commands 467**

clear lpts ifib statistics	468
clear lpts pifib hardware statistics	469
clear lpts pifib statistics	472
flow (LPTS)	473
lpts pifib hardware police	482
show lpts bindings	485

show lpts clients	489
show lpts flows	491
show lpts ifib	494
show lpts ifib slices	497
show lpts ifib statistics	500
show lpts ifib times	502
show lpts mpa groups	504
show lpts pifib	506
show lpts pifib hardware context	511
show lpts pifib hardware entry	513
show lpts pifib hardware police	519
show lpts pifib hardware static-police	535
show lpts pifib hardware usage	545
show lpts pifib statistics	547
show lpts port-arbitrator statistics	549
show lpts vrf	550
show operational LptsIfib	551
show operational LptsPifib	556

CHAPTER 8**Network Stack IPv4 and IPv6 Commands 561**

clear ipv6 neighbors	563
clear ipv6 path-mtu	564
icmp ipv4 rate-limit unreachable	565
ipv4 address (network)	566
ipv4 assembler max-packets	569
ipv4 assembler timeout	570
ipv4 conflict-policy	571
ipv4 directed-broadcast	572
ipv4 helper-address	573
ipv4 mask-reply	575
ipv4 mtu	576
ipv4 redirects	578
ipv4 source-route	579
ipv4 tcp-mss-adjust	580

ipv4 unnumbered (point-to-point)	582
ipv4 unreachable disable	584
ipv4 virtual address	586
ipv6 address	588
ipv6 address link-local	590
ipv6 assembler	592
ipv6 conflict-policy	593
ipv6 enable	594
ipv6 hop-limit	596
ipv6 icmp error-interval	597
ipv6 mtu	599
ipv6 nd	601
ipv6 nd dad attempts	602
ipv6 nd managed-config-flag	605
ipv6 nd ns-interval	607
ipv6 nd other-config-flag	609
ipv6 nd prefix	611
ipv6 nd ra-interval	613
ipv6 nd ra-lifetime	615
ipv6 nd ra dns server	617
ipv6 nd ra dns search list	619
ipv6 nd ra specific route	621
ipv6 nd reachable-time	623
ipv6 nd redirects	625
ipv6 nd router-preference	626
ipv6 nd suppress-ra	628
ipv6 neighbor	630
ipv6 path-mtu enable	632
ipv6 path-mtu timeout	633
ipv6 source-route	634
ipv6 tcp-mss-adjust	635
ipv6 unreachable disable	637
ipv6 virtual address	639
local pool	641

show arm conflicts	644
show arm database	646
show arm router-ids	649
show arm registrations producers	650
show arm summary	652
show arm vrf-summary	653
show clns statistics	654
show ipv4 interface	656
show local pool	659
show ipv4 traffic	661
show ipv6 interface	663
show ipv6 neighbors	667
show ipv6 neighbors summary	671
show ipv6 path-mtu	672
show ipv6 traffic	674
show mpa client	677
show mpa groups	678
show mpa ipv4	680
show mpa ipv6	682
show vrf	684
vrf	686
vrf(address-family)	687
vrf (description)	688
vrf(fallback-vrf)	689
vrf (mhost)	691
vrf mode	692

CHAPTER 9 **NSH Based Service Chaining Commands** 693

service-function-path	694
service-function-chaining path id	695
service-function-chaining sf	696
service-function-chaining sff	697

CHAPTER 10 **Proxy Mobile IPv6 Local Mobility Anchor Commands** 699

aaa accounting (pmipv6-lma)	701
address (pmipv6)	702
address (pmipv6-lma-ml-cust-tpt)	703
auth-option	704
auth-option (pmipv6-lma-ml-cust)	705
bce	706
bce (pmipv6-lma-ml-cust)	707
bri	708
customer (pmipv6-domain-nai)	709
customer (pmipv6-lma-ml)	710
clear ipv6 mobile pmipv6 lma binding	711
clear ipv6 mobile pmipv6 lma statistics	712
default profile	713
dscp control-plane (pmipv6-lma)	714
dscp control-plane (pmipv6-lma-mag)	716
dynamic mag learning	718
enforce heartbeat-to-mag (pmipv6-lma)	719
heartbeat (pmipv6-lma)	720
heartbeat (pmipv6-lma-ml-cust)	721
hnp	722
ipv6 mobile pmipv6-domain	723
ipv6 mobile pmipv6-lma	724
ipv4-address	725
ipv6-address	726
lma	727
mag	728
mnp (pmipv6-lma-ml)	729
mnp (pmipv6-lma-ml-cust)	730
mobility-service mobile-local-loop	731
network	732
network (pmipv6-lma-ml-cust)	733
nai (pmipv6-domain)	734
pool (pmipv6)	735
pool (pmipv6-ml-cust-network)	737

redistribute home-address (pmipv6-lma)	739
replay-protection	740
show ipv6 mobile pmipv6 lma binding	741
show ipv6 mobile pmipv6 lma globals	742
show ipv6 mobile pmipv6 lma stats	744
transport (pmipv6-lma-ml-cust)	747

CHAPTER 11**Prefix List Commands 749**

clear prefix-list ipv4	750
clear prefix-list ipv6	752
copy prefix-list ipv4	754
copy prefix-list ipv6	756
deny (prefix-list)	758
ipv4 prefix-list	761
ipv6 prefix-list	763
permit (prefix-list)	765
remark (prefix-list)	768
resequence prefix-list ipv4	770
resequence prefix-list ipv6	772
show prefix-list	774
show prefix-list afi-all	775
show prefix-list ipv4	776
show prefix-list ipv4 standby	778
show prefix-list ipv6	779

CHAPTER 12**Transport Stack Commands 781**

clear nsr ncd client	783
clear nsr ncd queue	785
clear raw statistics pcb	787
clear tcp nsr client	789
clear tcp nsr pcb	791
clear tcp nsr session-set	794
clear tcp nsr statistics client	796
clear tcp nsr statistics pcb	798

clear tcp nsr statistics session-set	800
clear tcp nsr statistics summary	802
clear tcp pcb	803
clear tcp statistics	804
clear udp statistics	805
forward-protocol udp	806
nsr process-failures switchover	808
service tcp-small-servers	809
service udp-small-servers	811
show nsr ncd client	813
show nsr ncd queue	815
show raw brief	817
show raw detail pcb	819

tcp timestamp	864
tcp window-size	865

CHAPTER 13

VRRP Commands	867
accept-mode	869
accept-mode (subordinate)	871
address-family	872
address (VRRP)	873
address global	875
address linklocal	877
address secondary	879
bfd minimum-interval (VRRP)	881
bfd multiplier (VRRP)	882
clear vrrp statistics	883
delay (VRRP)	885
interface (VRRP)	886
message state disable	888
router vrrp	889
session name(vrrp)	890
show vrrp	891
vrrp slave follow	896
subordinate primary virtual IPv4 address(vrrp)	897
subordinate secondary virtual IPv4 address(vrrp)	898
snmp-server traps vrrp events	899
track object(vrrp)	900
vrrp	901
vrrp assume-ownership disable	903
vrrp bfd fast-detect	905
vrrp bfd minimum-interval	907
vrrp bfd multiplier	908
vrrp delay	909

vrrp ipv4	911
vrrp preempt	913
vrrp priority	915
vrrp text-authentication	916
vrrp timer	917
vrrp track interface	918

CHAPTER 14**Video Monitoring Commands 921**

clear performance traffic clone profile	922
clear performance traffic statistics	923
show performance traffic alerts	924
show performance traffic clone profile	926
show policy-map type performance-traffic	928

Preface

From Release 6.1.2 onwards, Cisco introduces support for the 64-bit Linux-based IOS XR operating system. Extensive feature parity is maintained between the 32-bit and 64-bit environments. Unless explicitly marked otherwise, the contents of this document are applicable for both the environments. For more details on Cisco IOS XR 64 bit, refer to the [Release Notes](#) for Cisco ASR 9000 Series Routers, Release 6.1.2 document.

The *IP Addresses and Services Command Reference for Cisco ASR 9000 Series Routers* contains commands related to IP addresses and services features.

The preface contains the following sections:

- [Communications, Services, and Additional Information, on page xix](#)

Communications, Services, and Additional Information

- To receive timely, relevant information from Cisco, sign up at [Cisco Profile Manager](#).
- To get the business impact you're looking for with the technologies that matter, visit [Cisco Services](#).
- To submit a service request, visit [Cisco Support](#).
- To discover and browse secure, validated enterprise-class apps, products, solutions and services, visit [Cisco Marketplace](#).
- To obtain general networking, training, and certification titles, visit [Cisco Press](#).
- To find warranty information for a specific product or product family, access [Cisco Warranty Finder](#).

Cisco Bug Search Tool

[Cisco Bug Search Tool](#) (BST) is a web-based tool that acts as a gateway to the Cisco bug tracking system that maintains a comprehensive list of defects and vulnerabilities in Cisco products and software. BST provides you with detailed defect information about your products and software.

Access List Commands

This module describes the Cisco IOS XR software commands used to configure IP Version 4 (IPv4) and IP Version 6 (IPv6) access lists on Cisco ASR 9000 Series Aggregation Services Routers .

An access control list (ACL) consists of one or more access control entries (ACEs) that collectively define the network traffic profile. This profile can then be referenced by Cisco IOS XR Software software features such as traffic filtering, priority or custom queueing, and dynamic access control. Each ACL includes an action element (permit or deny) and a filter element based on criteria such as source address, destination address, protocol, and protocol-specific parameters.

For detailed information about ACL concepts, configuration tasks, and examples, refer to the *IP Addresses and Services Configuration Guide for Cisco ASR 9000 Series Routers*.

- [atomic-disable, on page 3](#)
- [clear access-list ipv4, on page 4](#)
- [clear access-list ipv6, on page 7](#)
- [copy access-list ipv4 , on page 10](#)
- [copy access-list ipv6, on page 12](#)
- [deny \(IPv4\) , on page 14](#)
- [deny \(IPv6\) , on page 23](#)

- [show object-group port](#) , on page 100

atomic-disable

Allows all traffic on the interface that matches the ACL rule, while the ACL is being modified.

hardware access-list atomic-disable

Syntax Description	<none> Allows all traffic on the interface that matches the ACL rule, while the ACL is being modified.
---------------------------	--------------------------------------------------------------------------------------------------------

Command Default	None
------------------------	------

Command Modes	Privileged Executive mode
----------------------	---------------------------

Command History	Release	Modification
	Release 6.2.1	This command was introduced.

Usage Guidelines	When atomic ACL updates are disabled, the ACL is detached, and the ACL rules are not applied during the ACE modification process. Hence, it is recommended to configure to either permit or deny all traffic until the modification is complete.
-------------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

For more information, see the Atomic ACL Updates By Using the Disable Option section in the *IP Addresses and Services Configuration Guide for Cisco NCS 5000 Series Routers*.

Example

To disable atomic updates on the hardware, by permitting all packets, use the following configuration.

```
RP/0/RSP0/CPU0:router# hardware access-list atomic-disable
```

clear access-list ipv4

To clear IPv4 access list counters, use the **clear access-list ipv4** command in EXEC mode .

```
clear access-list ipv4 access-list name [ sequence-number | hardware { ingress | egress } ] [ interface type interface-path-id ] [ location node-id | sequence number ]
```

Syntax Description

access-list-name	Name of a particular IPv4 access list. The name cannot contain a spaces or quotation marks, but can include numbers.
sequence-number	(Optional) Specific sequence number with which counters are cleared for an access list. Range is 1 to 2147483644 .
hardware	Identifies the access list as an access group for an interface.
ingress	Specifies an inbound direction.
egress	Specifies an outbound direction.
interface	(Optional) Clears the interface statistics.
type	Interface type. For more information, use the question mark (?) online help function.
interface-path-id	Physical interface or virtual interface. Note Use the show interfaces command to see a list of all interfaces currently configured on the router. For more information about the syntax for the router, use the question mark (?) online help function.
location node-id	(Optional) Clears hardware resource counters from the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
sequence number	(Optional) Clears counters for an access list with a specific sequence number. Range is 1 to 2147483644 .

Command Default

The default clears the specified IPv4 access list.

Command Modes

EXEC mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

Use the **clear access-list ipv4** command to clear counters for a specified configured access list. Use a sequence number to clear counters for an access list with a specific sequence number.

Use the **hardware** keyword to clear counters for an access list that was enabled using the **ipv4 access-group** command.

Use an asterisk (*) in place of the *access-list-name* argument to clear all access lists.

Note An access list can be shared among multiple interfaces. Clearing hardware counters clears all counters for all interfaces that use the specified access list in a given direction (ingress or egress).

Task ID	Task ID	Operations
	basic-services	read, write
	acl	read, write
	bgp	read, write, execute

Examples

In the following example, counters for an access list named *marketing* are cleared:

```
RP/0/RSP0/CPU0:router# show access-lists ipv4 marketing

ipv4 access-list marketing
 10 permit ip 192.168.34.0 0.0.0.255 any (51 matches)
 20 permit ip 172.16.0.0 0.0.255.255 any (26 matches)
 30 deny tcp host 172.16.0.0 eq bgp host 192.168.202.203 30 (5 matches)

RP/0/RSP0/CPU0:router# clear access-list ipv4 marketing

RP/0/RSP0/CPU0:router# show access-lists ipv4 marketing

ipv4 access-list marketing
 10 permit ip 192.168.34.0 0.0.0.255 any
 20 permit ip 172.16.0.0 0.0.255.255 any
 30 deny tcp host 172.16.0.0 eq bgp host 192.168.202.203 30
```

In the following example, counters for an access list named *acl_hw_1* in the outbound direction are cleared:

```
RP/0/RSP0/CPU0:router# show access-lists ipv4 acl_hw_1 hardware egress location 0/2/cp0

ipv4 access-list acl_hw_1
 10 permit icmp 192.168.36.0 0.0.0.255 any (251 hw matches)
 20 permit ip 172.16.3.0 0.0.255.255 any (29 hw matches)
 30 deny tcp any any (58 hw matches)

RP/0/RSP0/CPU0:router# clear access-list ipv4 acl_hw_1 hardware egress location 0/2/cp0

RP/0/RSP0/CPU0:router# show access-lists ipv4 acl_hw_1 hardware egress location 0/2/cp0

ipv4 access-list acl_hw_1
 10 permit icmp 192.168.36.0 0.0.0.255 any
 20 permit ip 172.16.3.0 0.0.255.255 any
 30 deny tcp any any
```

Related Commands

Command	Description
ipv4 access-group, on page 30	Filters incoming or outgoing IPv4 traffic on an interface.
ipv4 access-list, on page 33	Defines an IPv4 access list and enters IPv4 access list configuration mode.
resequence access-list ipv4 , on page 82	Renumbers an existing statement and increments subsequent statements to allow a new IPv4 access list statements.

clear access-list ipv6

To clear IPv6 access list counters, use the **clear access-list ipv6** command in EXEC mode.

```
clear access-list ipv6 access-list-name [{sequence-number | hardware {ingress | egress}}] [interface
type interface-path-id] [{location node-id | sequence number}]
```

Syntax Description

<i>access-list-name</i>	Name of a particular IPv6 access list. The name cannot contain a spaces or quotation marks, but can include numbers.
<i>sequence-number</i>	(Optional) Specific sequence number for a particular access control entry (ACE) with which counters are cleared for an access list. Range is 1 to 2147483644.
hardware	(Optional) Identifies the access list as an access group for an interface.
ingress	(Optional) Specifies an inbound direction.
egress	(Optional) Specifies an outbound direction.
interface	(Optional) Clears the interface statistics.
<i>type</i>	(Optional) Interface type. For more information, use the question mark (?) online help function.
<i>instance</i>	Physical interface or virtual interface.
<i>interface-path-id</i>	Note Use the show interfaces command to see a list of all interfaces currently configured on the router. For more information about the syntax for the router, use the question mark (?) online help function.
location <i>node-id</i>	(Optional) Clears counters for an access list enabled on a card interface. The <i>node-id</i> argument is entered in the rack/slot/module notation.
sequence <i>number</i>	(Optional) Specifies a specific sequence number that clears access list counters. Range is 1 to 2147483644.

Command Default

The default clears the specified IPv6 access list.

Command Modes

EXEC mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

The **clear access-list ipv6** command is similar to the **clear access-list ipv4** command, except that it is IPv6-specific.

Use the **clear access-list ipv6** command to clear counters for a specified configured access list. Use a sequence number to clear counters for an access list with a specific sequence number

Use the **hardware** keyword to clear counters for an access list that was enabled using the **ipv6 access-group** command.

Use an asterisk (*) in place of the *access-list-name* argument to clear all access lists.

Note An access list can be shared among multiple interfaces. Clearing hardware counters clears all counters for all interfaces that use the specified access list in a given direction (ingress or egress).

Task ID	Task ID	Operations
	basic-services	read, write
	acl	read, write
	network	read, write

Examples

In the following example, counters for an access list named *marketing* are cleared:

```
RP/0/RSP0/CPU0:router# show access-lists ipv6 marketing
ipv6 access-list marketing
 10 permit ipv6 3333:1:2:3::/64 any (51 matches)
 20 permit ipv6 4444:1:2:3::/64 any (26 matches)
 30 permit ipv6 5555:1:2:3::/64 any (5 matches)
RP/0/RSP0/CPU0:router# clear access-list ipv6 marketing
RP/0/RSP0/CPU0:router# show access-lists ipv6 marketing
ipv6 access-list marketing
 10 permit ipv6 3333:1:2:3::/64 any
 20 permit ipv6 4444:1:2:3::/64 any
 30 permit ipv6 5555:1:2:3::/64 any
```

In the following example, counters for an access list named *acl_hw_1* in the outbound direction are cleared:

```
RP/0/RSP0/CPU0:router# show access-lists ipv6 acl_hw_1 hardware egress location 0/2/cp0
ipv6 access-list acl_hw_1
 10 permit ipv6 3333:1:2:3::/64 any (251 hw matches)
 20 permit ipv6 4444:1:2:3::/64 any (29 hw matches)
 30 deny tcp any any (58 hw matches)
RP/0/RSP0/CPU0:router# clear access-list ipv6 acl_hw_1 hardware egress location 0/2/cp0
RP/0/RSP0/CPU0:router# show access-lists ipv6 acl_hw_1 hardware egress location 0/2/cp0
ipv6 access-list acl_hw_1
 10 permit ipv6 3333:1:2:3::/64 any
 20 permit ipv6 4444:1:2:3::/64 any
 30 deny tcp any any
```

Related Commands

Command	Description
ipv6 access-list, on page 39	Defines an IPv6 access list and enters IPv6 access list configuration mode.

copy access-list ipv4

To create a copy of an existing IPv4 access list, use the **copy access-list ipv4** command in EXEC mode.

```
copy access-list ipv4 source-acl destination-acl
```

Syntax Description

source-acl Name of the access list to be copied.

destination-acl Name of the destination access list where the contents of the *source-acl* argument is copied.

Command Default

No default behavior or values

Command Modes

EXEC mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

Use the **copy access-list ipv4** command to copy a configured access list. Use the *source-acl* argument to specify the access list to be copied and the *destination-acl* argument to specify where to copy the contents of the source access list. The *destination-acl* argument must be a unique name; if the *destination-acl* argument name exists for an access list or prefix list, the access list is not copied. The **copy access-list ipv4** command checks that the source access list exists then checks the existing list names to prevent overwriting existing access lists or prefix lists.

Task ID

Task ID	Operations
acl	read, write
filesystem	execute

Examples

In the following example, a copy of access list list-1 is created:

```
RP/0/RSP0/CPU0:router# show access-lists ipv4 list-1

ipv4 access-list list-1
 10 permit tcp any any log
 20 permit ip any any
RP/0/RSP0/CPU0:router# copy access-list ipv4 list-1 list-2
RP/0/RSP0/CPU0:router# show access-lists ipv4 list-2

ipv4 access-list list-2
 10 permit tcp any any log
 20 permit ip any any
```

In the following example, copying the access list list-1 to list-3 is denied because a list-3 access list already exists:

```
RP/0/RSP0/CPU0:router# copy access-list ipv4 list-1 list-3
```

```
list-3 exists in access-list
```

```
RP/0/RSP0/CPU0:router# show access-lists ipv4 list-3
```

```
ipv4 access-list list-3
 10 permit ip any any
 20 deny tcp any any log
```

Related Commands

Command	Description

show access-lists ipv4 , on page 87	Displays the contents of all current IPv4 access lists.

copy access-list ipv6

To create a copy of an existing IPv6 access list, use the **copy access-list ipv6** command in EXEC mode .

```
copy access-list ipv6 source-acl destination-acl
```

Syntax Description

source-acl Name of the access list to be copied.

destination-acl Destination access list where the contents of the *source-acl* argument is copied.

Command Default

No default behavior or value

Command Modes

EXEC mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

Use the **copy access-list ipv6** command to copy a configured access list. Use the *source-acl* argument to specify the access list to be copied and the *destination-acl* argument to specify where to copy the contents of the source access list. The *destination-acl* argument must be a unique name; if the *destination-acl* argument name exists for an access list or prefix list, the access list is not copied. The **copy access-list ipv6** command checks that the source access list exists then checks the existing list names to prevent overwriting existing access lists or prefix lists.

Task ID

Task ID	Operations
acl	read, write
filesystem	execute

Examples

In this example, a copy of access list list-1 is created:

```
RP/0/RSP0/CPU0:router# show access-lists ipv6 list-1

ipv6 access-list list-1
 10 permit tcp any any log
 20 permit ipv6 any any

RP/0/RSP0/CPU0:router# copy access-list ipv6 list-1 list-2

RP/0/RSP0/CPU0:router# show access-lists ipv6 list-2

ipv6 access-list list-2
 10 permit tcp any any log
 20 permit ipv6 any any
```

In this example, copying access list list-1 to list-3 is denied because a list-3 access list already exists:

```
RP/0/RSP0/CPU0:router# copy access-list ipv6 list-1 list-3

list-3 exists in access-list

RP/0/RSP0/CPU0:router# show access-lists ipv6 list-3
ipv6 access-list list-3
 10 permit ipv6 any any
 20 deny tcp any any log
```

ipv6 access-list, on page 39	Defines an IPv6 access list and enters IPv6 access list configuration mode.
show access-lists ipv6, on page 93	Displays the contents of all current IPv6 access lists.

deny (IPv4)

To set conditions for an IPv4 access list, use the **deny** command in access list configuration mode. There are two versions of the **deny** command: **deny** (source), and **deny** (protocol). To remove a condition from an access list, use the **no** form of this command.

```
[sequence-number] deny source [source-wildcard] counter counter-name [{log | log-input}]
[sequence-number] deny protocol source source-wildcard destination destination-wildcard
[precedence precedence] [dscp dscp] [fragments] [ packet-length operator packet-length value] [
log | log-input] [ttl ttl value [value1...value2]] [counter counter-name]
no sequence-number
```

Internet Control Message Protocol (ICMP)

```
[sequence-number] deny icmp source source-wildcard destination destination-wildcard [icmp-type]
[icmp-code] [precedence precedence] [dscp dscp] [fragments] [{log | log-input}] [counter
counter-name] [icmp-off]
```

Internet Group Management Protocol (IGMP)

```
[sequence-number] deny igmp source source-wildcard destination destination-wildcard [igmp-type]
[precedence precedence] [dscp value] [fragments] [{log | log-input}] [counter counter-name]
```

User Datagram Protocol (UDP)

```
[sequence-number] deny udp source source-wildcard [operator {portprotocol-port}] destination
destination-wildcard [operator {portprotocol-port}] [precedence precedence] [dscp dscp] [fragments]
[{log | log-input}] [counter counter-name]
```

Syntax Description

sequence-number	(Optional) Number of the deny statement in the access list. This number determines the order of the statements in the access list. The number can be from 1 to 2147483644. (By default, the first statement is number 10, and the subsequent statements are incremented by 10.) Use the resequence access-list command to change the number of the first statement and increment subsequent statements of a configured access list.
source	Number of the network or host from which the packet is being sent. There are three alternative ways to specify the source: <ul style="list-style-type: none"> • Use a 32-bit quantity in four-part dotted-decimal format. • Use the any keyword as an abbreviation for a <i>source</i> and <i>source-wildcard</i> of 0.0.0.0 255.255.255.255. • Use the host source combination as an abbreviation for a <i>source</i> and <i>source-wildcard</i> of <i>source</i> 0.0.0.0.
source-wildcard	Wildcard bits to be applied to the source. There are three alternative ways to specify the source wildcard: <ul style="list-style-type: none"> • Use a 32-bit quantity in four-part dotted-decimal format. Place ones in the bit positions you want to ignore. • Use the any keyword as an abbreviation for a <i>source</i> and <i>source-wildcard</i> of 0.0.0.0 255.255.255.255. • Use the host source combination as an abbreviation for a <i>source</i> and <i>source-wildcard</i> of <i>source</i> 0.0.0.0.

protocol	Name or number of an IP protocol. It can be one of the keywords ahp , esp , eigrp , gre , icmp , igmp , igrp , ip , ipinip , nos , ospf , pim , pcp , tcp , or udp , or an integer from 0 to 255 representing an IP protocol number. To match any Internet protocol (including ICMP, TCP, and UDP), use the ip keyword. ICMP, and TCP allow further qualifiers, which are described later in this table.
destination	Number of the network or host to which the packet is being sent. There are three alternative ways to specify the destination: <ul style="list-style-type: none"> • Use a 32-bit quantity in four-part dotted-decimal format. • Use the any keyword as an abbreviation for the <i>destination</i> and <i>destination-wildcard</i> of 0.0.0.0 255.255.255.255. • Use the host destination combination as an abbreviation for a <i>destination</i> and <i>destination-wildcard</i> of <i>destination</i> 0.0.0.0.
destination-wildcard	Wildcard bits to be applied to the destination. There are three alternative ways to specify the destination wildcard: <ul style="list-style-type: none"> • Use a 32-bit quantity in four-part dotted-decimal format. Place ones in the bit positions you want to ignore. • Use the any keyword as an abbreviation for a <i>destination</i> and <i>destination-wildcard</i> of 0.0.0.0 255.255.255.255. • Use the host destination combination as an abbreviation for a <i>destination</i> and <i>destination-wildcard</i> of <i>destination</i> 0.0.0.0.
precedence <i>precedence</i>	(Optional) Packets can be filtered by precedence level (as specified by a number from 0 to 7) or by the following names: <ul style="list-style-type: none"> • routine —Match packets with routine precedence (0) • priority —Match packets with priority precedence (1) • immediate —Match packets with immediate precedence (2) • flash —Match packets with flash precedence (3) • flash-override —Match packets with flash override precedence (4) • critical —Match packets with critical precedence (5) • internet —Match packets with internetwork control precedence (6) • network —Match packets with network control precedence (7)

dscp <i>dscp</i>	<p>(Optional) Differentiated services code point (DSCP) provides quality of service control. The values for <i>dscp</i> are as follows:</p> <ul style="list-style-type: none"> • 0–63—Differentiated services codepoint value • af11—Match packets with AF11 dscp (001010) • af12—Match packets with AF12 dscp (001100) • af13—Match packets with AF13 dscp (001110) • af21—Match packets with AF21 dscp (010010) • af22—Match packets with AF22 dscp (010100) • af23—Match packets with AF23 dscp (010110) • af31—Match packets with AF31 dscp (011010) • af32—Match packets with AF32 dscp (011100) • af33—Match packets with AF33 dscp (011110) • af41—Match packets with AF41 dscp (100010) • af42—Match packets with AF42 dscp (100100) • af43—Match packets with AF43 dscp (100110) • cs1—Match packets with CS1 (precedence 1) dscp (001000) • cs2—Match packets with CS2 (precedence 2) dscp (010000) • cs3—Match packets with CS3 (precedence 3) dscp (011000) • cs4—Match packets with CS4 (precedence 4) dscp (100000) • cs5—Match packets with CS5 (precedence 5) dscp (101000) • cs6—Match packets with CS6 (precedence 6) dscp (110000) • cs7—Match packets with CS7 (precedence 7) dscp (111000) • default—Default DSCP (000000) • ef—Match packets with EF dscp (101110)
fragments	<p>(Optional) Causes the software to examine fragments of IPv4 packets when applying this access list entry. When this keyword is specified, fragments are subject to the access list entry.</p>
log	<p>(Optional) Causes an informational logging message about the packet that matches the entry to be sent to the console. (The level of messages logged to the console is controlled by the logging console command.)</p> <p>The message includes the access list number, whether the packet was permitted or denied; the protocol, whether it was TCP, UDP, ICMP, or a number; and, if appropriate, the source and destination addresses and source and destination port numbers. The message is generated for the first packet that matches a flow, and then at 5-minute intervals, including the number of packets permitted or denied in the prior 5-minute interval.</p>
log-input	<p>(Optional) Provides the same function as the log keyword, except that the logging message also includes the input interface.</p>
ttl	<p>(Optional) Turns on matching against time-to-life (TTL) value.</p>

<i>ttl value</i> [<i>value1</i> . . <i>value2</i>]	(Optional) TTL value used for filtering. Range is 1 to 255. If only <i>value</i> is specified, the match is against this value. If both <i>value1</i> and <i>value2</i> are specified, the packet TTL is matched against the range of TTLs between <i>value1</i> and <i>value2</i> .
icmp-off	(Optional) Turns off ICMP generation for denied packets.
icmp-type	(Optional) ICMP message type for filtering ICMP packets. Range is from 0 to 255.
icmp-code	(Optional) ICMP message code for filtering ICMP packets. Range is from 0 to 255.
igmp-type	(Optional) IGMP message type (0 to 15) or message name for filtering IGMP packets, as follows: <ul style="list-style-type: none"> • dvmrp • host-query • host-report • mtrace • mtrace-response • pim • precedence • trace • v2-leave • v2-report • v3-report
operator	(Optional) Operator is used to compare source or destination ports. Possible operands are lt (less than), gt (greater than), eq (equal), neq (not equal), and range (inclusive range). If the operator is positioned after the <i>source</i> and <i>source-wildcard</i> values, it must match the source port. If the operator is positioned after the <i>destination</i> and <i>destination-wildcard</i> values, it must match the destination port. If the operator is positioned after the ttl keyword, it matches the TTL value. The range operator requires two port numbers. All other operators require one port number.
port	Decimal number of a TCP or UDP port. A port number is a number from 0 to 65535. TCP ports can be used only when filtering TCP. UDP ports can be used only when filtering UDP.
protocol-port	Name of a TCP or UDP port. TCP and UDP port names are listed in the “Usage Guidelines” section. TCP port names can be used only when filtering TCP. UDP port names can be used only when filtering UDP.
established	(Optional) For the TCP protocol only: Indicates an established connection.

<code>match-any</code>	(Optional) For the TCP protocol only: Filters on any combination of TCP flags.
<code>match-all</code>	(Optional) For the TCP protocol only: Filters on all TCP flags.
<code>+ -</code>	(Required) For the TCP protocol match-any , match-all : Prefix <i>flag-name</i> with + or - . Use the + <i>flag-name</i> argument to match packets with the TCP flag set. Use the - <i>flag-name</i> argument to match packets when the TCP flag is not set.
<code>flag-name</code>	(Optional) For the TCP protocol match-any , match-all . Flag names are: ack , fin , psh , rst , syn .
counter	(Optional) Enables accessing ACL counters using SNMP query. The counter <i>counter-name</i> keyword is available on Cisco ASR 9000 Enhanced Ethernet Line Cards only.
<i>counter-name</i>	Defines an ACL counter name.

Command Default

There is no specific condition under which a packet is denied passing the IPv4 access list. ICMP message generation is enabled by default.

Command Modes

IPv4 access list configuration

Command History

Release	Modification
Release 3.7.2	This command was introduced.
Release 5.1.1	The optional keyword counter and the associated argument <i>counter-name</i> were added to the command.
Release 5.3.0	The ABF feature can be configured along with object-groups while defining an ACEs (Access Control Entry).

Usage Guidelines

Use the **deny** command following the **ipv4 access-list** command to specify conditions under which a packet cannot pass the access list.

By default, the first statement in an access list is number 10, and the subsequent statements are incremented by 10.

You can add **permit**, **deny**, or **remark** statements to an existing access list without retyping the entire list. To add a new statement anywhere other than at the end of the list, create a new statement with an appropriate entry number that falls between two existing entry numbers to indicate where it belongs.

If you want to add a statement between two consecutively numbered statements (for example, between lines 10 and 11), first use the **resequence access-list** command to renumber the first statement and increment the entry number of each subsequent statement. The *increment* argument causes new, unused line numbers between statements. Then add a new statement with the *entry-number* argument, specifying where it belongs in the access list.

The following is a list of precedence names:

- critical
- flash
- flash-override
- immediate
- internet
- network
- priority
- routine

The following is a list of ICMP message type names:

- administratively-prohibited
- alternate-address
- conversion-error
- dod-host-prohibited
- dod-net-prohibited
- echo
- echo-reply
- general-parameter-problem
- host-isolated

- timestamp-request
- traceroute
- ttl-exceeded
- unreachable

The following is a list of TCP port names that can be used instead of port numbers. Refer to the current *Assigned Numbers* RFC to find a reference to these protocols. You can find port numbers corresponding to these protocols by typing a ? in the place of a port number.

- bgp
- chargen
- cmd
- daytime
- discard
- domain
- echo
- exec
- finger
- ftp
- ftp-data
- gopher
- hostname
- ident
- irc
- klogin
- kshell
- login
- lpd
- nntp
- pim-auto-rp
- pop2
- pop3
- smtp
- sunrpc
- tacacs
- talk
- telnet
- time
- uucp
- whois
- www

The following UDP port names can be used instead of port numbers. Refer to the current *Assigned Numbers* RFC to find a reference to these protocols. You can find port numbers corresponding to these protocols by typing a ? in the place of a port number.

- biff
- bootpc
- bootps
- discard
- dnsix
- domain
- echo
- isakmp
- mobile-ip
- nameserver
- netbios-dgm
- netbios-ns
- netbios-ss
- ntp
- pim-auto-rp
- rip
- snmp
- snmptrap
- sunrpc
- syslog
- tacacs
- talk
- tftp
- time
- who
- xdmcp

Use the following flags in conjunction with the **match-any** and **match-all** keywords and the + and - signs to select the flags to display:

- ack
- fin
- psh
- rst
- syn

For example, **match-all** + *ack* + *syn* displays TCP packets with both the *ack* and *syn* flags set, or **match-any** + *ack* - *syn* displays the TCP packets with the *ack* set or the *syn* not set.

Note If any ACE in an ACL contains ABF clause, this ACL cannot be applied at any non-zero compression level.

Task ID	Task ID	Operations
	ipv4	read, write
	acl	read, write

Examples

This example shows how to set a deny condition for an access list named Internet filter:

```
RP/0/RSP0/CPU0:router(config)# ipv4 access-list Internetfilter
RP/0/RSP0/CPU0:router(config-ipv4-acl)# 10 deny 192.168.34.0 0.0.0.255
RP/0/RSP0/CPU0:router(config-ipv4-acl)# 20 deny 172.16.0.0 0.0.255.255
RP/0/RSP0/CPU0:router(config-ipv4-acl)# 25 deny tcp host 172.16.0.0 eq bgp host
192.168.202.203 range 1300 1400
RP/0/RSP0/CPU0:router(config-ipv4-acl)# permit 10.0.0.0 0.255.255.255
```

Command	Description
ipv4 access-group, on page 30	Filters incoming or outgoing IPv4 traffic on an interface.
ipv4 access-list, on page 33	Defines an IPv4 access list and enters IPv4 access list configuration mode.
permit (IPv4) , on page 54	Sets the permit conditions for an IPv4 access list.
remark (IPv4) , on page 78	Inserts a helpful remark about an IPv4 access list entry.
resequence access-list ipv4 , on page 82	Changes the starting entry number of the first statement in an existing IPv4 access list, and the number by which subsequent statements are incremented.
show access-lists ipv4 , on page 87	Displays the contents of all current IPv4 access lists.

deny (IPv6)

To set deny conditions for an IPv6 access list, use the **deny** command in IPv6 access list configuration mode. To remove the deny conditions, use the **no** form of this command.

```
[sequence-number] deny protocol {source-ipv6-prefix/prefix-length / any / host source-ipv6-address
ipv6-wildcard-mask/prefix-length} [operator {port / protocol-port}] [dscpvalue] [routing] [authen]
[destopts] [ fragments] [packet-length operator packet-length value ] [ log | log-input ] [ttl
operator ttl value ]
no sequence-number
```

Internet Control Message Protocol (ICMP)

```
[ sequence-number]deny icmp {source-ipv6-prefix/prefix-length / any / host source-ipv6-address
ipv6-wildcard-mask/prefix-length} {destination-ipv6-prefix/prefix-length / any / host destination-ipv6-address
ipv6-wildcard-mask/prefix-length} [icmp-type] [ icmp-code] [dscp value] [ routing] [authen]
[destopts] [ fragments] [ log] [log-input] [icmp-off]
```

Transmission Control Protocol (TCP)

```
[sequence-number]deny tcp {source-ipv6-prefix/prefix-length / any / host source-ipv6-address
ipv6-wildcard-mask/prefix-length} [operator {port / protocol-port}] {destination-ipv6-prefix/prefix-length
/ any / host destination-ipv6-address ipv6-wildcard-mask/prefix-length} [operator {port / protocol / port}]
[dscpvalue] [routing] [authen] [destopts] [fragments] [established] {match-any | match-all |
+ | -} [flag-name] [log] [log-input]
```

User Datagram Protocol (UDP)

```
[sequence-number]deny tcp {source-ipv6-prefix/prefix-length / any / host source-ipv6-address
ipv6-wildcard-mask/prefix-length} [operator {port / protocol-port}] {destination-ipv6-prefix/prefix-length
/ any / host destination-ipv6-address ipv6-wildcard-mask/prefix-length} [operator {port / protocol / port}]
[dscpvalue] [routing] [authen] [destopts] [fragments] [established] [flag-name] [log]
[log-input]
```

Syntax Description	
sequence-number	(Optional) Number of the deny statement in the access list. This number determines the order of the statements in the access list. Range is 1 to 2147483644. (By default, the first statement is number 10, and the subsequent statements are incremented by 10.) Use the resequence access-list command to change the number of the first statement and increment subsequent statements of a configured access list.
protocol	Name or number of an Internet protocol. It can be one of the keywords ahp , eigrp , esp , gre , icmp , igmp , igrp , ipinip , ipv6 , nos , ospf , pcp , tcp , or udp , or an integer in the range from 0 to 255 representing an IPv6 protocol number.
source-ipv6-prefix / prefix-length	The source IPv6 network or class of networks about which to set deny conditions. This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.
any	An abbreviation for the IPv6 prefix ::/0 .

host <i>source-ipv6-address</i>	Source IPv6 host address about which to set deny conditions. This <i>source-ipv6-address</i> argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.
<i>ipv6-wildcard-mask</i>	IPv6 wildcard mask. The IPv6 wildcard mask can take any IPv6 address value which is used instead of prefix length.
<i>operator</i> { <i>port</i> / <i>protocol-port</i> }	(Optional) Operand that compares the source or destination ports of the specified protocol. Operands are lt (less than), gt (greater than), eq (equal), neq (not equal), and range (inclusive range). If the operator is positioned after the <i>source-ipv6-prefix / prefix-length</i> argument, it must match the source port. If the operator is positioned after the <i>destination-ipv6-prefix / prefix-length</i> argument, it must match the destination port. The range operator requires two port numbers. All other operators require one port number. The <i>port</i> argument is the decimal number of a TCP or UDP port. Range is 0 to 65535. The <i>protocol-port</i> argument is the name of a TCP or UDP port. TCP port names can be used only when filtering TCP. UDP port names can be used only when filtering UDP.
<i>destination-ipv6-prefix</i> <i>/ prefix-length</i>	Destination IPv6 network or class of networks about which to set deny conditions. This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.
host <i>destination-ipv6-address</i>	Destination IPv6 host address about which to set deny conditions. This <i>destination-ipv6-address</i> argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.
dscp <i>value</i>	(Optional) Matches a differentiated services code point DSCP value against the traffic class value in the Traffic Class field of each IPv6 packet header. Range is 0 to 63.
routing	(Optional) Matches source-routed packets against the routing extension header within each IPv6 packet header.
authen	(Optional) Matches if the IPv6 authentication header is present.
destopts	(Optional) Matches if the IPv6 destination options header is present.
fragments	(Optional) Matches noninitial fragmented packets where the fragment extension header contains a nonzero fragment offset. The fragments keyword is an option only if the <i>operator</i> [<i>port-number</i>] arguments are not specified.

log	(Optional) Causes an informational logging message about the packet that matches the entry to be sent to the console. (The level of messages logged to the console is controlled by the logging console command.) The message includes the access list name and sequence number, whether the packet was denied; the protocol, whether it was TCP, UDP, ICMP, or a number; and, if appropriate, the source and destination addresses and source and destination port numbers. The message is generated for the first packet that matches, and then at 5-minute intervals, including the number of packets denied in the prior 5-minute interval.
log-input	(Optional) Provides the same function as the log keyword, except that the logging message also includes the input interface.
ttl	(Optional) Turns on matching against time-to-life (TTL) value.
operator	(Optional) Operand that compares the source or destination ports of the specified protocol. Operands are lt (less than), gt (greater than), eq (equal), neq (not equal), and range (inclusive range).
ttl value [value1 ... value2]	(Optional) TTL value used for filtering. Range is 1 to 255. If only <i>value</i> is specified, the match is against this value. If both <i>value1</i> and <i>value2</i> are specified, the packet TTL is matched against the range of TTLs between <i>value1</i> and <i>value2</i> .
icmp-off	(Optional) Turns off ICMP generation for denied packets
icmp-type	(Optional) ICMP message type for filtering ICMP packets. ICMP packets can be filtered by ICMP message type. Range is 0 to 255.
icmp-code	(Optional) ICMP message code for filtering ICMP packets. ICMP packets that are filtered by ICMP message type can also be filtered by the ICMP message code. Range is 0 to 255.
established	(Optional) For the TCP protocol only: Indicates an established connection.
match-any	(Optional) For the TCP protocol only: Filters on any combination of TCP flags.
match-all	(Optional) For the TCP protocol only: Filters on all TCP flags.
+ -	(Required) For the TCP protocol match-any , match-all : Prefix <i>flag-name</i> with + or -. Use the + <i>flag-name</i> argument to match packets with the TCP flag set. Use the - <i>flag-name</i> argument to match packets when the TCP flag is not set.
flag-name	(Optional) For the TCP protocol match-any , match-all . Flag names are: ack , fin , psh , rst , syn .

Command Default

No IPv6 access list is defined.
ICMP message generation is enabled by default.

Command Modes

IPv6 access list configuration

Command History	Release	Modification
	Release 3.7.2	This command was introduced.
	Release 5.2.2	The support for IPv6 wildcard mask with a source and destination address was added.
	Release 5.3.0	The ABF feature can be configured along with object-groups while defining an ACEs (Access Control Entry).

Usage Guidelines The **deny** (IPv6) command is similar to the **deny** (IPv4) command, except that it is IPv6-specific. Use the **deny** (IPv6) command following the **ipv6 access-list** command to define the conditions under which a packet passes the access list.

Note If any ACE in an ACL contains ABF clause, this ACL cannot be applied at any non-zero compression level.

Specifying **ipv6** for the *protocol* argument matches against the IPv6 header of the packet.

By default, the first statement in an access list is number 10, and the subsequent statements are numbered in increments of 10.

You can add permit, deny, or remark statements to an existing access list without retyping the entire list. To add a new statement anywhere other than at the end of the list, create a new statement with an appropriate entry number that falls between two existing entry numbers to indicate where it belongs.

Both the *source-ipv6-prefix/prefix-length* and *destination-ipv6-prefix/prefix-length* arguments are used for traffic filtering (the source prefix filters traffic based upon the traffic source; the destination prefix filters traffic based upon the traffic destination).

Note IPv6 prefix lists, not access lists, should be used for filtering routing protocol prefixes.

The **fragments** keyword is an option only if the *operator* [*port* | *protocol-port*] arguments are not specified.

Task ID	Task ID	Operations
	acl	read, write

Examples

The following example shows how to configure the IPv6 access list named toCISCO and applies the access list to outbound traffic on GigabitEthernet interface 0/2/0/2. Specifically, the first deny entry in the list keeps all packets that have a destination TCP port number greater than 5000 from exiting out of GigabitEthernet interface 0/2/0/2. The second deny entry in the list keeps all packets that have a source UDPo port number less than 5000 from exiting out of GigabitEthernet interface 0/2/0/2. The second deny entry also logs all matches to the console. The first permit entry in the list permits all ICMP packets to exit out of GigabitEthernet interface 0/2/0/2. The second permit entry in the

list permits all other traffic to exit out of GigabitEthernet interface 0/2/0/2. The second permit entry is necessary because an implicit deny all condition is at the end of each IPv6 access list.

```
RP/0/RSP0/CPU0:router(config)# ipv6 access-list toCISCO
RP/0/RSP0/CPU0:router(config-ipv6-acl)# deny tcp any any gt 5000
RP/0/RSP0/CPU0:router(config-ipv6-acl)# deny ipv6 any lt 5000 any log
RP/0/RSP0/CPU0:router(config-ipv6-acl)# permit icmp any any
RP/0/RSP0/CPU0:router(config-ipv6-acl)# permit any any
RP/0/RSP0/CPU0:router(config)# interface gigabitethernet 0/2/0/2
RP/0/RSP0/CPU0:router(config-if)# ipv6 access-group toCISCO out
```

Related Commands

Command	Description
ipv6 access-list , on page 39	Defines an IPv6 access list and enters IPv6 access list configuration mode.
permit (IPv6) , on page 69	Sets permit conditions for an IPv6 access list.
remark (IPv6) , on page 80	Inserts a helpful remark about an IPv6 access list entry.
resequence access-list ipv6 , on page 84	Changes the starting entry number of the first statement in an existing IPv6 access list, and the number by which subsequent statements are incremented.

hardware access-list atomic disable

To disable atomic access-control list (ACL) updates, use the **hardware access-list atomic disable** command in global configuration mode. To enable atomic ACL updates, enter the **no** form of this command.

hardware access-list atomic disable
no hardware access-list atomic disable

Syntax Description	atomic	Specifies that the device performs atomic updates, which do not disrupt traffic during the update. By default, a device performs atomic ACL updates.
	disable	Specifies that atomic ACL updates should be disabled.

Command Default None.

Command Modes Global configuration

Command History	Release	Modification
	Release 6.0.1	This command was introduced.

Usage Guidelines If a NP lacks the TCAM resources required for an atomic update, you can disable atomic updates by using the **hardware access-list atomic disable** command.

Note When atomicity is disabled, during an ACL edit there will be a duration (in milli-seconds) wherein the ACL is detached for performing this operation.

Task ID	Task ID	Operations
	acl	read, write

Examples

This example shows how to disable atomic ACL updates:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router# (config) #hardware access-list atomic disable
```

hardware access-list l3-compression-optimisation

To increase the TCAM space allocated for compression fields in ACL Layer 3 compression from 70 to 76 bytes, use the **hardware access-list l3-compression-optimisation** command. Use the **no** form of this command to reverse the TCAM allocation.

hardware access-list l3-compression-optimisation

Command Default

If you do not configure the **hardware access-list l3-compression-optimisation** command, the TCAM space allocated for ACL Layer 3 compression is 70 bytes.

Command Modes

Global configuration

Command History

Release	Modification
Release 7.5.3	This command was introduced.

Usage Guidelines

By default, the TCAM space allotted in ACL for compression fields is 70 bytes and non-compression fields is 10 bytes. If you enable this command, then the TCAM space for compression field will increase to 76 bytes by assigning addition 6 bytes from non-compression fields and the TCAM space for non-compression fields will reduce to 4 bytes.

Task ID

Task ID	Operations
acl	read, write

Examples

The following example shows you how to use hardware access-list l3-compression-optimisation command:

```
Router# config
Router(config)# hardware access-list l3-compression-optimisation
Router(config)# commit
```

ipv4 access-group

To control access to an interface, use the **ipv4 access-group** command in interface configuration mode. To remove the specified access group, use the **no** form of this command.

```

ipv4 access-group [common acl-name ] access-list-name {ingress | egress} [hardware-count]
[interface-statistics]
[compress level level]
no ipv4 access-group [common acl-name ] access-list-name {ingress | egress} [hardware-count]
[interface-statistics]
[compress level level]

```

Syntax Description		
	<i>access-list-name</i>	Name of an IPv4 access list as specified by an ipv4 access-list command.
	common <i>acl-name</i>	Specifies the common access-list name.
	ingress	Filters on inbound packets.
	egress	Filters on outbound packets.
	hardware-count	(Optional) Specifies to access a group's hardware counters.
	interface-statistics	(Optional) Specifies per-interface statistics in the hardware.
	compress level <i>level</i>	Specifies ACL compression in the hardware. The available compression levels are 0, 1, and 3.

Command Default The interface does not have an IPv4 access list applied to it.

Command Modes Interface configuration

Command History	Release	Modification
	Release 3.7.2	This command was introduced.
	Release 4.3.1	The common keyword was added.
	Release 4.3.1	The compress level keyword was added.

Usage Guidelines Use the **ipv4 access-group** command to control access to an interface. To remove the specified access group, use the **no** form of the command. Use the *access-list-name* argument to specify a particular IPv4 access list.

Use the **ingress** keyword to filter on inbound packets or the **egress** keyword to filter on outbound packets. Use the *hardware-count* argument to enable hardware counters for the access group.

Permitted packets are counted only when hardware counters are enabled using the *hardware-count* argument. Denied packets are counted whether hardware counters are enabled, or not.

Filtering of MPLS packets through common ACL and interface ACL is not supported.

Restrictions for common ACLs are:

- Common ACL is supported in only ingress direction and for L3 interfaces only.
- The **interface-statistics** option is not available for common ACLs.
- The **hardware-count** option is available for only IPv4 ACLs.
- Only one common IPv4 and IPv6 ACL is supported on each line card.
- The common ACL option is not available for Ethernet Service (ES) ACLs.
- The IPv4 and IPv6 common ACL is limited to 200 Ternary Content Addressable Memory (TCAM) entries for the ASR 9000 Enhanced Ethernet line card and A9K-SIP-700 line card. Although, A9K-SIP-700 line card may support more.
- Common ACL is not supported on ASR 9000 Ethernet line card and ASR 9000 Enhanced Ethernet-TR line card.
- You can specify only common ACL or only interface ACL or both common and interface ACL in this command.
- The **compress** option is not supported for common ACLs.
- Object-groups are not supported with common ACLs.
- The **interface-statistics** and **hardware-count** options are not supported for ACLs on the A9K-SIP-700 line card.

Note For packet filtering applications using the **ipv4 access-group** command, packet counters are maintained in hardware for each direction. If an access group is used on multiple interfaces in the same direction, then packets are counted for each interface that has the *hardware-count* argument enabled.

If the access list permits the addresses, the software continues to process the packet. If the access list denies the address, the software discards the packet and returns an Internet Control Message Protocol (ICMP) host unreachable message.

If the specified access list does not exist, all packets are passed.

By default, the unique or per-interface ACL statistics are disabled.

Task ID

Task ID Operations

network	read, write
---------	----------------

Examples

The following example shows how to apply filters on packets inbound and outbound from GigabitEthernet interface 0/2/0/2:

```
RP/0/RSP0/CPU0:router(config)# interface GigabitEthernet 0/2/0/2
RP/0/RSP0/CPU0:router(config-if)# ipv4 access-group p-ingress-filter ingress
RP/0/RSP0/CPU0:router(config-if)# ipv4 access-group p-egress-filter egress
```

The following example shows how to apply per-interface statistics in the hardware:

```
RP/0/RSP0/CPU0:router(config)# interface gigabitethernet 0/2/0/2
RP/0/RSP0/CPU0:router(config-if)# ipv4 access-group p-ingress-filter ingress
interface-statistics
```

This example shows how to configure common ACL:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# interface gigabitethernet 0/1/0/4
RP/0/RSP0/CPU0:router(config-if)# ipv4 access-group common common-acl interface-acl ingress
```

This example shows how to configure the number of fields to be compressed in hardware:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# interface gigabitethernet 0/1/0/4
RP/0/RSP0/CPU0:router(config-if)# ipv4 access-group acl1 ingress compress level 1
```

Related Commands

Command	Description
clear access-list ipv4 , on page 4	Resets the IPv4 access list match counters.
deny (IPv4) , on page 14	Sets the deny conditions for an ACE of an IPv4 access list.
ipv4 access-list , on page 33	Defines an IPv4 access list and enters IPv4 access list configuration mode.
permit (IPv4) , on page 54	Sets the permit conditions for an ACE of an IPv4 access list.
show access-lists ipv4 , on page 87	Displays the contents of all current IPv4 access lists.
show ipv4 interface	Displays the usability status of interfaces configured for IPv4.

ipv4 access-list

To define an IPv4 access list by name, use the **ipv4 access-list** command in Global Configuration mode. To remove all entries in an IPv4 access list, use the **no** form of this command.

ipv4 access-list *name*

Syntax Description	name Name of the access list. Names cannot contain a space or quotation marks.
---------------------------	---------------------------------------------------------------------------------------

Command Default	No IPv4 access list is defined.
------------------------	---------------------------------

Command Modes	Global Configuration mode
----------------------	---------------------------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines Use the **ipv4 access-list** command to configure an IPv4 access list. This command places the router in access list configuration mode, in which the denied or permitted access conditions must be defined with the **deny** or **permit** command.

Use the **resequence access-list ipv4** command if you want to add a **permit**, **deny**, or **remark** statement between consecutive entries in an existing IPv4 access list. Specify the first entry number (the *base*) and the increment by which to separate the entry numbers of the statements. The software renumbers the existing statements, thereby making room to add new statements with the unused entry numbers.

Use the **ipv4 access-group** command to apply the access list to an interface.

Task ID	Task ID	Operations
	acl	read, write

Examples

The following example shows how to define a standard access list named Internetfilter:

```
Router(config)# ipv4 access-list Internetfilter
Router(config-if)# 10 permit 192.168.34.0 0.0.0.255
Router(config-if)# 20 permit 172.16.0.0 0.0.255.255
Router(config-if)# 30 permit 10.0.0.0 0.255.255.255
Router(config-if)# 39 remark Block BGP traffic from 172.16 net.
Router(config-if)# 40 deny tcp host 172.16.0.0 eq bgp host 192.168.202.203 range 1300 1400
```

Related Commands	Command	Description
	show access-lists ipv4	Displays the contents of all current IPv4 access lists.

ipv4 access-list log-update rate

To specify the rate at which IPv4 access lists are logged, use the **ipv4 access-list log-update rate** command in Global Configuration mode. To return the update rate to the default setting, use the **no** form of this command.

```
ipv4 access-list log-update rate rate-number
no ipv4 access-list log-update rate rate-number
```

Syntax Description	<i>rate-number</i> Rate at which IPv4 access hit logs are generated per second on the router. Range is 1 to 1000.
---------------------------	-------------------------------------------------------------------------------------------------------------------

Command Default	Default is 1.
------------------------	---------------

Command Modes	Global Configuration mode
----------------------	---------------------------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	The <i>rate-number</i> argument applies to all the IPv4 access-lists configured on the interfaces. That is, at any given time there can be between 1 and 1000 log entries for the system.
-------------------------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Task ID	Task ID	Operations
	ipv4	read, write
	acl	read, write

Examples	The following example shows how to configure a IPv4 access hit logging rate for the system:
-----------------	---------------------------------------------------------------------------------------------

```
RP/0/RSP0/CPU0:router(config)# ipv4 access-list log-update rate 10
```

ipv4 access-list log-update threshold

To specify the number of updates that are logged for IPv4 access lists, use the **ipv4 access-list log-update threshold** command in Global Configuration mode. To return the number of logged updates to the default setting, use the **no** form of this command.

```
ipv4 access-list log-update threshold update-number
no ipv4 access-list log-update threshold update-number
```

Syntax Description	<code>update-number</code> Number of updates that are logged for every IPv4 access list configured on the router. Range is 0 to 2147483647.
---------------------------	---------------------------------------------------------------------------------------------------------------------------------------------

Command Default	For IPv4 access lists, 2147483647 updates are logged.
------------------------	-------------------------------------------------------

Command Modes	Global Configuration mode
----------------------	---------------------------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	IPv4 access list updates are logged at 5-minute intervals, following the first logged update. Configuring a lower number of updates (a number lower than the default) is useful when more frequent update logging is desired.
-------------------------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Task ID	Task ID	Operations
	basic-services	read, write
	acl	read, write

Examples	This example shows how to configure a log threshold of ten updates for every IPv4 access list configured on the router:
-----------------	-------------------------------------------------------------------------------------------------------------------------

```
RP/0/RSP0/CPU0:router(config)# ipv4 access-list log-update threshold 10
```

ipv6 access-group

To control access to an interface, use the **ipv6 access-group** command in interface configuration mode. To remove the specified access group, use the **no** form of this command.

ipv6 access-group *access-list-name* {**ingress** | **egress**} [**interface-statistics**]

Syntax Description	
access-list-name	Name of an IPv6 access list as specified by an ipv6 access-list command.
ingress	Filters on inbound packets.
egress	Filters on outbound packets.
interface-statistics	(Optional) Specifies per-interface statistics in the hardware.

Command Default The interface does not have an IPv6 access list applied to it.

Command Modes Interface configuration

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines The **ipv6 access-group** command is similar to the **ipv4 access-group** command, except that it is IPv6-specific.

Use the **ipv6 access-group** command to control access to an interface. To remove the specified access group, use the **no** form of the command. Use the *access-list-name* to specify a particular IPv6 access list. Use the **ingress** keyword to filter on inbound packets or the **egress** keyword to filter on outbound packets.

Note For packet filtering applications using the **ipv6 access-group** command, packet counters are maintained in hardware for each direction. If an access group is used on multiple interfaces in the same direction, then packets are counted for each interface.

If the access list permits the addresses, the software continues to process the packet. If the access list denies the address, the software discards the packet and returns a rate-limited Internet Control Message Protocol (ICMP) host unreachable message.

If the specified access list does not exist, all packets are passed.

By default, the unique or per-interface ACL statistics are disabled.

ipv6 access-list

To define an IPv6 access list and to place the router in IPv6 access list configuration mode, use the **ipv6 access-list** command in Global Configuration mode. To remove the access list, use the **no** form of this command.

ipv6 access-list *name*

Syntax Description

name Name of the IPv6 access list. Names cannot contain a space or quotation mark, or begin with a numeric.

Command Default

No IPv6 access list is defined.

Command Modes

Global Configuration mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

The **ipv6 access-list** command is similar to the **ipv4 access-list** command, except that it is IPv6-specific.

The IPv6 access lists are used for traffic filtering based on source and destination addresses, IPv6 option headers, and optional, upper-layer protocol type information for finer granularity of control. IPv6 access lists are defined by using the **ipv6 access-list** command in global configuration mode and their permit and deny conditions are set by using the **deny** and **permit** commands in IPv6 access list configuration mode.

Configuring the **ipv6 access-list** command places the router in IPv6 access list configuration mode—the router prompt changes to router (config-ipv6-acl)#. From IPv6 access list configuration mode, permit and deny conditions can be set for the defined IPv6 access list.

Note No more than one IPv6 access list can be applied to an interface per direction.

Note Every IPv6 access list has an implicit **deny ipv6 any any** statement as its last match condition. An IPv6 access list must contain at least one entry for the implicit **deny ipv6 any any** statement to take effect.

Note IPv6 prefix lists, not access lists, should be used for filtering routing protocol prefixes.

Use the **ipv6 access-group** interface configuration command with the *access-list-name* argument to apply an IPv6 access list to an IPv6 interface.

Note Every IPv6 ACL has implicit **permit icmp any any nd-na** , **permit icmp any any nd-ns** , and **deny ipv6 any any** statements as its last match conditions. (The former two match conditions allow for ICMPv6 neighbor discovery.) An IPv6 ACL must contain at least one entry for the implicit **deny ipv6 any any** statement to take effect. **permit icmp any any nd-na permit icmp any any nd-ns deny ipv6 any any deny ipv6 any any**

The IPv6 neighbor discovery process makes use of the IPv6 network layer service; therefore, by default, IPv6 ACLs implicitly allow IPv6 neighbor discovery packets to be sent and received on an interface. In IPv4, the Address Resolution Protocol (ARP), which is equivalent to the IPv6 neighbor discovery process, makes use of a separate data link layer protocol; therefore, by default, IPv4 ACLs implicitly allow ARP packets to be sent and received on an interface.

Task ID

Task ID	Operations
acl	read, write
ipv6	read, write

Examples

The following example shows how to configure the IPv6 access list named list2 and applies the ACL to outbound traffic on interface GigabitEthernet 0/2/0/2. Specifically, the first ACL entry keeps all packets from the network fec0:0:0:2::/64 (packets that have the site-local prefix fec0:0:0:2 as the first 64 bits of their source IPv6 address) from exiting out of interface GigabitEthernet 0/2/0/2. The second entry in the ACL permits all other traffic to exit out of interface GigabitEthernet 0/2/0/2. The second entry is necessary because an implicit deny all condition is at the end of each IPv6 ACL.

```
RP/0/RSP0

/CPU0:router(config)# ipv6 access-list list2
RP/0/RSP0

/CPU0:router(config-ipv6-acl)# 10 deny fec0:0:0:2::/64 any
RP/0/RSP0

/CPU0:router(config-ipv6-acl)# 20 permit any any

RP/0/RSP0

/CPU0:router# show ipv6 access-lists list2

ipv6 access-list list2
 10 deny ipv6 fec0:0:0:2::/64 any
 20 permit ipv6 any any

RP/0/RSP0

/CPU0:router(config)# interface gigabitethernet 0/2/0/2
RP/0/RSP0

/CPU0:router(config-if)# ipv6 access-group list2 out
```

Note IPv6 is automatically configured as the protocol type in **permit any any** and **deny any any** statements that are translated from global configuration mode to IPv6 access list configuration mode.

Note An IPv6 router does not forward to another network an IPv6 packet that has a link-local address as either its source or destination address (and the source interface for the packet is different from the destination interface for the packet).

ipv6 access-list log-update rate

To specify the rate at which IPv6 access lists are logged, use the **ipv6 access-list log-update rate** command in Global Configuration mode. To return the update rate to the default setting, use the **no** form of this command.

```
ipv6 access-list log-update rate rate-number
no ipv6 access-list log-update rate rate-number
```

Syntax Description	<i>rate-number</i> Rate at which IPv6 access hit logs are generated per second on the router. Range is 1 to 1000.
---------------------------	-------------------------------------------------------------------------------------------------------------------

Command Default	Default is 1.
------------------------	---------------

Command Modes	Global Configuration mode
----------------------	---------------------------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	The <i>rate-number</i> argument applies to all the IPv6 access-lists configured on the interfaces. That is, at any given time there can be between 1 and 1000 log entries for the system.
-------------------------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Task ID	Task ID	Operations
	ipv6	read, write
	acl	read, write

Examples	This example shows how to configure a IPv6 access hit logging rate for the system:
-----------------	------------------------------------------------------------------------------------

```
RP/0/RSP0/CPU0:router (config) # ipv6 access-list log-update rate 10
```

ipv6 access-list log-update threshold

To specify the number of updates that are logged for IPv6 access lists (ACLs), use the **ipv6 access-list log-update threshold** command in Global Configuration mode. To return the number of logged updates to the default setting, use the **no** form of this command.

```
ipv6 access-list log-update threshold update-number
no ipv6 access-list log-update threshold update-number
```

Syntax Description	<code>update-number</code> Number of updates that are logged for every IPv6 access list configured on the router. Range is 0 to 2147483647.
---------------------------	---------------------------------------------------------------------------------------------------------------------------------------------

Command Default	For IPv6 access lists, 350000 updates are logged.
------------------------	---------------------------------------------------

Command Modes	Global Configuration mode
----------------------	---------------------------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	The ipv6 access-list log-update threshold command is similar to the ipv4 access-list log-update threshold command, except that it is IPv6-specific.
-------------------------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------

IPv6 access list updates are logged at 5-minute intervals, following the first logged update. Configuring a lower number of updates (a number lower than the default) is useful when more frequent update logging is desired.

Task ID	Task ID	Operations
	acl	read, write
	ipv6	read, write

Examples	This example shows how to configure a log threshold of ten updates for every IPv6 access list configured on the router:
-----------------	-------------------------------------------------------------------------------------------------------------------------

```
RP/0/RSP0/CPU0:router(config)# ipv6 access-list log-update threshold 10
```

ipv6 access-list maximum ace threshold

To set the maximum number of access control entries (ACEs) for IPv6 access lists, use the **ipv6 access-list maximum ace threshold** command in Global Configuration mode. To reset the ACE limit for IPv6 access lists, use the **no** form of this command.

```
ipv6 access-list maximum ace threshold ace-number
no ipv6 access-list maximum ace threshold ace-number
```

Syntax Description	<i>ace-number</i> Maximum number of configurable ACEs allowed. Range is 50000 to 350000.
---------------------------	------------------------------------------------------------------------------------------

Command Default	50,000 ACEs are allowed for IPv6 access lists.
------------------------	------------------------------------------------

Command Modes	Global Configuration mode
----------------------	---------------------------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	Use the ipv6 access-list maximum ace threshold command to set the maximum number of configurable ACEs for IPv6 access lists. Out of resource (OOR) limits the number of ACEs that can be configured in the system. When the maximum number of configurable ACEs is reached, configuration of new ACEs is rejected.
-------------------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Task ID	Task ID	Operations
	acl	read, write
	ipv6	read, write

Examples	This example shows how to set the maximum number of ACEs for IPv6 access lists to 75000:
-----------------	------------------------------------------------------------------------------------------

```
RP/0/RSP0/CPU0:router (config) # ipv6 access-list maximum ace threshold 75000
```

Related Commands	Command	Description
	show access-lists ipv6, on page 93	Displays the contents of all current IPv6 access lists.

ipv6 access-list maximum acl threshold

To set the maximum number of configurable IPv6 access control lists (ACLs), use the **ipv6 access-list maximum acl threshold** command in Global Configuration mode. To reset the IPv6 ACL limit, use the **no** form of this command.

ipv6 access-list maximum acl threshold *acl-number*
no ipv6 access-list maximum ace threshold *acl-number*

Syntax Description	<i>acl-number</i> Maximum number of configurable ACLs allowed. Range is 1000 to 16000.
---------------------------	----------------------------------------------------------------------------------------

Command Default	1000 IPv6 ACLs can be configured.
------------------------	-----------------------------------

Command Modes	Global Configuration mode
----------------------	---------------------------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	Use the ipv6 access-list maximum acl threshold command to set the maximum number of configurable IPv6 ACLs. Out of resource (OOR) limits the number of ACLs that can be configured in the system. When the limit is reached, configuration of new ACLs is rejected.
-------------------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Task ID	Task ID	Operations
	acl	read, write
	ipv6	read, write

Examples	This example shows how to set the maximum number of configurable IPv6 ACLs to 1500:
-----------------	-------------------------------------------------------------------------------------

```
RP/0/RSP0/CPU0:router(config)# ipv6 access-list maximum acl threshold 1500
```

Related Commands	Command	Description
	show access-lists ipv6, on page 93	Displays the contents of all current IPv6 access lists.

interface ipv4/ipv6 access-group

To configure an interface to accept multiple IPv4 or IPv6 ACLs, use the **interface ipv4/ipv6 access-group** command in Global Configuration mode.

interface *type interface-path-id* [**ipv4 | ipv6**] **access-group common** *acl-c1* **common** *acl-c2* *acl-i2* *acl-i4* *acl-i5* **ingress**

Syntax Description		
<i>type</i>	Interface type. For more information, use the question mark (?) online help function.	
<i>interface -path-id</i>	Physical interface or virtual interface.	
	Use the show interfaces command to see a list of all interfaces currently configured on the router.	
common <i>acl-c1</i>	Common ACLs, each preceded by the keyword common .	
common <i>acl-c2</i>	Common ACLs are only supported in the ingress direction.	
<i>acl-i2</i> <i>acl-i4</i> <i>acl-i5</i>	Interface ACLs.	
ingress	Specifies an inbound direction.	

Command Default The interface does not have an IPv4/IPv6 access list applied to it.

Command Modes Global Configuration mode

Command History	Release	Modification
	Release 5.3.2	This command was introduced.

Usage Guidelines Use the **interface ipv4/ipv6 access-group** command to configure an interface on Cisco ASR 9000 High Density 100GE Ethernet line cards (such as A9K-8x100G-LB-SE and A9K-8x100G-LB-TR) to accept up to five IPv4 and/or IPv6 ACLs in the ingress direction only. There can be any combination of common and/or interface ACLs up to a total of five ACLs.

Task ID	Task ID	Operation
	acl	read, write
	network	read, write
	config-services	read, write

The following example shows how to apply filters on packets inbound from GigabitEthernet interface 0/1/0/0:

```
RP/0/RSP0/CPU0:router# interface GigabitEthernet 0/1/0/0
```

```
ipv4 access-group common acl_c1 common acl_c2 acl_i2 acl_i4 acl_i5 ingress
```

The following example shows a sample configuration of multiple ACLs:

```
RP/0/RSP0/CPU0:router# show running-config interface tenGigE 0/1/0/0/0 interface
TenGigE0/1/0/0/0
  ipv4 address 10.1.1.2 255.255.255.0
  ipv6 address 2001::33/64
  ipv4 access-group common acl_c1 common acl_c2 acl_i2 acl_i4 acl_i5 ingress
!
```

object-group network

To configure a network object group, and to enter the network object group configuration mode, use the **object-group network** command in the global configuration mode. To de-configure the network object group, use the **no** form of this command.

object-group network { **ipv4** | **ipv6** } *object-group-name*
no object-group network { **ipv4** | **ipv6** } *object-group-name*

Syntax Description	ipv4	Configures the operation state of an IPV4 network object group.
	ipv6	Configures the operation state of an IPV6 network object group.
	<i>object-group-name</i>	Name of the object-group.
Command Default	None	
Command Modes	Global configuration	
Command History	Release	Modification
	Release 4.3.1	This command was introduced.
	Release 5.3.0	The object-group feature can be configured along with ABF while defining an ACEs (Access Control Entry).
Usage Guidelines	Object-group is only supported on ASR 9000 Enhanced Ethernet Line Card.	
	Inherited object-groups up to four levels are supported in this release.	
	If an ACL is applied on an interface with non-zero compression level (implying it contains no ABF ACEs), a user cannot add an ACE with object-group.	
Task ID	Task ID	Operation
	system	read, write

Example

This example shows how to configure a network object-group, and to enter the network object-group configuration mode:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# object-group network ipv4 ipv4_type5_obj1
RP/0/RSP0/CPU0:router(config-object-group-ipv4)#
```

Related Commands

Command	Description
show object-group network, on page 98	Displays the operation state of a network object group.

object-group port

To configure a port object group, and to enter the port object group configuration mode, use the **object-group port** command in the global configuration mode. To de-configure the port object group, use the **no** form of this command.

object-group port *object-group-name*
no object-group port *object-group-name*

Syntax Description	<i>object-group-name</i> Name of the object-group.						
Command Default	None						
Command Modes	Global configuration						
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 4.3.1</td> <td>This command was introduced.</td> </tr> <tr> <td>Release 5.3.0</td> <td>The ABF feature can be configured along with object-groups while defining an ACEs (Access Control Entry).</td> </tr> </tbody> </table>	Release	Modification	Release 4.3.1	This command was introduced.	Release 5.3.0	The ABF feature can be configured along with object-groups while defining an ACEs (Access Control Entry).
Release	Modification						
Release 4.3.1	This command was introduced.						
Release 5.3.0	The ABF feature can be configured along with object-groups while defining an ACEs (Access Control Entry).						

Usage Guidelines Object-group is only supported on ASR 9000 Enhanced Ethernet Line Card.
 Inherited object-groups upto four levels are supported in this release.

Note If any ACE in an ACL contains ABF clause, this ACL cannot be applied at any non-zero compression level.

Task ID	Task	Operation
	system	read, write

Example

This example show how to configure a port object-group, and to enter the port object-group configuration mode:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# object-group port ipv4_type5_obj1
RP/0/RSP0/CPU0:router(config-object-group-port)#
```

Related Commands

Command	Description
show object-group port , on page 100	Displays the operation state of a port object group.

packet-length

Enables filtering of packets at an ingress/egress interface by specifying the packet length as a match condition in a IPv4/IPv6 ACL.

By using the **packet-length** condition in an ACL, IPv4 and IPv6 packets are either processed (permit statement) or dropped (deny statement).

To remove this configuration, use the **no** prefix for the command.

packet-length { **eq** *value* | **gt** *value* | **lt** *value* | **neq** *value* | **range** *lower-limit upper-limit* }

Syntax Description		
packet-length eq <i>value</i>		Filters packets that have a packet length equal to the specified limit.
packet-length gt <i>value</i>		Filters packets that have a packet length greater than the specified limit.
packet-length lt <i>value</i>		Filters packets that have a packet length less than the specified limit.
packet-length neq <i>value</i>		Filters packets that have a packet length that does not match the specified limit.
packet-length range <i>lower-limit upper-limit</i>		Filters packets that have a packet length within the specified range. The IPv4/IPv6 packet length ranges from 0 to 65535.

Command Default None

Command Modes Access List Configuration mode

Release	Modification
Release 6.2.1	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Example

The following example shows how you can configure an IPv4 access list with the **packet-length** condition.

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# ipv4 access-list pktlen-v4
RP/0/RSP0/CPU0:router(config-ipv4-acl)# 10 permit tcp any any packet-length eq 1482
RP/0/RSP0/CPU0:router(config-ipv4-acl)# 20 permit udp any any packet-length range 1400 1500
RP/0/RSP0/CPU0:router(config-ipv4-acl)# 30 deny ipv4 any any
```

The following example shows how you can configure an IPv6 access list with the **packet-length** condition.

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# ipv6 access-list pktlen-v6
RP/0/RSP0/CPU0:router(config-ipv6-acl)# 10 permit tcp any any packet-length eq 1500
```

```
RP/0/RSP0/CPU0:router(config-ipv6-acl)# 20 permit udp any any packet-length range 1500 1600
RP/0/RSP0/CPU0:router(config-ipv6-acl)# 30 deny ipv6 any any
```

For a complete configuration example, see the Configure an ACL to Filter By Packet Length section in the *Cisco ASR 9000 Series Aggregation Services Router IP Addresses and Services Configuration Guide*.

permit (IPv4)

To set conditions for an IPv4 access list, use the **permit** command in access list configuration mode. There are two versions of the **permit** command: **permit** (source), and **permit** (protocol). To remove a condition from an access list, use the **no** form of this command.

```
[sequence-number] permit source [source-wildcard] [{log | log-input}]
[sequence-number] permit protocol source source-wildcard destination destination-wildcard [capture]
[precedence precedence] [default nexthop [ipv4-address1] [ipv4-address2] [ipv4-address3]] [dscp
dscp] [fragments] [{log | log-input}] [nexthop [track track-name] [ipv4-address1] [ipv4-address2]
[ipv4-address3]] [ttl ttl value [value1 ... value2]][counter counter-name]
[sequence-number] permit protocol net-group source-net-object-group-name port-group
source-port-object-group-name net-group destination-net-object-group-name port-group
destination-port-object-group-name [capture] [precedence precedence] [default nexthop1 [vrf
vrf-name][ipv4 ipv4-address1] nexthop2[vrf vrf-name][ipv4 ipv4-address2] nexthop3 [vrf
vrf-name][ipv4 ipv4-address3]] [dscp range dscp dscp] [fragments] [{log | log-input}] [nexthop
[track track-name] ] [ttl ttl value [value1 ... value2]][counter counter-name]
no sequence-number
```

Internet Control Message Protocol (ICMP)

```
[sequence-number] permit icmp source source-wildcard destination destination-wildcard [icmp-type]
[icmp-code] [precedence precedence] [dscp dscp] [fragments] [{log | log-input}] [icmp-off][counter
counter-name]
```

Internet Group Management Protocol (IGMP)

```
[sequence-number] permit igmp source source-wildcard destination destination-wildcard [igmp-type]
[precedence precedence] [dscp value] [fragments] [{log | log-input}][counter counter-name]
```

User Datagram Protocol (UDP)

```
[sequence-number] permit udp source source-wildcard [operator {portprotocol-port}] destination
destination-wildcard [operator {portprotocol-port}] [precedence precedence] [dscp dscp] [fragments]
[{log | log-input}][counter counter-name]
```

Syntax Description

sequence-number	(Optional) Number of the permit statement in the access list. This number determines the order of the statements in the access list. Range is 1 to 2147483644. (By default, the first statement is number 10, and the subsequent statements are incremented by 10.) Use the resequence access-list command to change the number of the first statement and increment subsequent statements of a configured access list.
-----------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

source	<p>Number of the network or host from which the packet is being sent. There are three alternative ways to specify the source:</p> <ul style="list-style-type: none"> • Use a 32-bit quantity in four-part dotted-decimal format. • Use the any keyword as an abbreviation for a <i>source</i> and <i>source-wildcard</i> of 0.0.0.0 255.255.255.255. • Use the host source combination as an abbreviation for a <i>source</i> and <i>source-wildcard</i> of <i>source</i> 0.0.0.0.
source-wildcard	<p>Wildcard bits to be applied to the source. There are three alternative ways to specify the source wildcard:</p> <ul style="list-style-type: none"> • Use a 32-bit quantity in four-part dotted-decimal format. Place ones in the bit positions you want to ignore. • Use the any keyword as an abbreviation for a <i>source</i> and <i>source-wildcard</i> of 0.0.0.0 255.255.255.255. • Use the host source combination as an abbreviation for a <i>source</i> and <i>source-wildcard</i> of <i>source</i> 0.0.0.0.
protocol	<p>Name or number of an IP protocol. It can be one of the keywords ahp, esp, eigrp, gre, icmp, igmp, igrp, ip, ipinip, nos, ospf, pim, pcp, tcp, or udp, or an integer from 0 to 255 representing an IP protocol number. To match any Internet protocol (including ICMP, TCP, and UDP), use the ip keyword. ICMP, and TCP allow further qualifiers, which are described later in this table.</p>

destination	<p>Number of the network or host to which the packet is being sent. There are three alternative ways to specify the destination:</p> <ul style="list-style-type: none"> • Use a 32-bit quantity in four-part dotted-decimal format. • Use the any keyword as an abbreviation for the <i>destination</i> and <i>destination-wildcard</i> of 0.0.0.0 255.255.255.255. • Use the host destination combination as an abbreviation for a <i>destination</i> and <i>destination-wildcard</i> of <i>destination</i> 0.0.0.0.
destination-wildcard	<p>Wildcard bits to be applied to the destination. There are three alternative ways to specify the destination wildcard:</p> <ul style="list-style-type: none"> • Use a 32-bit quantity in four-part dotted-decimal format. Place ones in the bit positions you want to ignore. • Use the any keyword as an abbreviation for a <i>destination</i> and <i>destination-wildcard</i> of 0.0.0.0 255.255.255.255. • Use the host destination combination as an abbreviation for a <i>destination</i> and <i>destination-wildcard</i> of <i>destination</i> 0.0.0.0.
net-group <i>source-net-object-group-name</i>	IPv4 source network object group and group name.
port-group <i>source-port-object-group-name</i>	Source port object group and group name.
net-group <i>destination-net-object-group-name</i>	IPv4 destination network object group and group name.
port-group <i>destination-port-object-group-name</i>	Destination port object group and group name.

precedence *precedence*

(Optional) Packets can be filtered by precedence level (as specified by a number from 0 to 7) or by the following names:

- **Routine** —Match packets with routine precedence (0)
- **priority** —Match packets with priority precedence (1)
- **immediate** —Match packets with immediate precedence (2)
- **flash** —Match packets with flash precedence (3)
- **flash-override** —Match packets with flash override precedence (4)
- **critical** —Match packets with critical precedence (5)
- **internet** —Match packets with internetwork control precedence (6)
- **network** —Match packets with network control precedence (7)

default

(Optional) Specifies the default next hop for this entry.

If the **default** keyword is configured, ACL-based forwarding action is taken only if the results of the PLU lookup for the destination of the packets determine a default route; that is, no specified route is determined to the destination of the packet.

capture

Captures matching traffic.

When the **acl** command is configured on the source mirroring port, if the ACL configuration command does not use the **capture** keyword, no traffic gets mirrored. If the ACL configuration uses the **capture** keyword, but the **acl** command is not configured on the source port, then the whole port traffic is mirrored and the **capture** action does not have any affect.

ipv4-address1 ipv4-address2 ipv4-address3

(Optional) Uses one to three next-hop addresses. The IP address types are defined as follows:

- **Default IP addresses**—Specifies the next-hop router in the path toward the destination in which the packets must be forwarded, if there is no explicit route for the destination address of the packet in the routing table. The first IP address that is associated with a connected interface that is currently up is used to route the packets.
 - **Specified IP addresses**—Specifies the next-hop router in the path toward the destination in which the packets must be forwarded. The first IP address that is associated with a connected interface that is currently up is used to route the packets.
-

dscp *dscp*

(Optional) Differentiated services code point (DSCP) provides quality of service control. The values for *dscp* are as follows:

- 0–63—Differentiated services codepoint value
 - af11—Match packets with AF11 dscp (001010)
 - af12—Match packets with AF12 dscp (001100)
 - af13—Match packets with AF13 dscp (001110)
 - af21—Match packets with AF21 dscp (010010)
 - af22—Match packets with AF22 dscp (010100)
 - af23—Match packets with AF23 dscp (010110)
 - af31—Match packets with AF31 dscp (011010)
 - af32—Match packets with AF32 dscp (011100)
 - af33—Match packets with AF33 dscp (011110)
 - af41—Match packets with AF41 dscp (100010)
 - af42—Match packets with AF42 dscp (100100)
 - af43—Match packets with AF43 dscp (100110)
 - cs1—Match packets with CS1 (precedence 1) dscp (001000)
 - cs2—Match packets with CS2 (precedence 2) dscp (010000)
 - cs3—Match packets with CS3 (precedence 3) dscp (011000)
 - cs4—Match packets with CS4 (precedence 4) dscp (100000)
 - cs5—Match packets with CS5 (precedence 5) dscp (101000)
 - cs6—Match packets with CS6 (precedence 6) dscp (110000)
 - cs7—Match packets with CS7 (precedence 7) dscp (111000)
 - default—Default DSCP (000000)
 - ef—Match packets with EF dscp (101110)
-

dscp range *dscp dscp*

(Optional) Differentiated services code point (DSCP) provides quality of service control. The values for *dscp* are as follows:

- 0–63—Differentiated services codepoint value
 - af11—Match packets with AF11 dscp (001010)
 - af12—Match packets with AF12 dscp (001100)
 - af13—Match packets with AF13 dscp (001110)
 - af21—Match packets with AF21 dscp (010010)
 - af22—Match packets with AF22 dscp (010100)
 - af23—Match packets with AF23 dscp (010110)
 - af31—Match packets with AF31 dscp (011010)
 - af32—Match packets with AF32 dscp (011100)
 - af33—Match packets with AF33 dscp (011110)
 - af41—Match packets with AF41 dscp (100010)
 - af42—Match packets with AF42 dscp (100100)

-

fragments	(Optional) Causes the software to examine noninitial fragments of IPv4 packets when applying this access list entry. When this keyword is specified, fragments are subject to the access list entry.
log	(Optional) Causes an informational logging message about the packet that matches the entry to be sent to the console. (The level of messages logged to the console is controlled by the logging console command.) The message includes the access list number, whether the packet was permitted or denied; the protocol, whether it was TCP, UDP, ICMP, or a number; and, if appropriate, the source and destination addresses and source and destination port numbers. The message is generated for the first packet that matches a flow, and then at 5-minute intervals, including the number of packets permitted or denied in the prior 5-minute interval.
log-input	(Optional) Provides the same function as the log keyword, except that the logging message also includes the input interface.
nexthop1, nexthop2, nexthop3	(Optional) Forwards the specified next hop for this entry.
track <i>track-name</i>	Specifies the TRACK Name for this nexthop.
ttl	(Optional) Turns on matching against time-to-life (TTL) value.
<i>ttl value</i> [<i>value1</i> ... <i>value2</i>]	(Optional) TTL value used for filtering. Range is 1 to 255. If only <i>value</i> is specified, the match is against this value. If both <i>value1</i> and <i>value2</i> are specified, the packet TTL is matched against the range of TTLs between <i>value1</i> and <i>value2</i> .

icmp-off	(Optional) Turns off ICMP generation for denied packets
icmp-type	(Optional) ICMP message type for filtering ICMP packets. Range is from 0 to 255.
icmp-code	(Optional) ICMP message code for filtering ICMP packets. Range is from 0 to 255.
igmp-type	(Optional) IGMP message type (0 to 15) or message name for filtering IGMP packets, as follows: <ul style="list-style-type: none"> • dvmrp • host-query • host-report • mtrace • mtrace-response • pim • precedence • trace • v2-leave • v2-report • v3-report
operator	<p>(Optional) Operator is used to compare source or destination ports. Possible operands are lt (less than), gt (greater than), eq (equal), neq (not equal), and range (inclusive range).</p> <p>If the operator is positioned after the <i>source</i> and <i>source-wildcard</i> values, it must match the source port.</p> <p>If the operator is positioned after the <i>destination</i> and <i>destination-wildcard</i> values, it must match the destination port.</p> <p>If the operator is positioned after the tll keyword, it matches the TTL value.</p> <p>The range operator requires two port numbers. All other operators require one port number.</p>

port	Decimal number a TCP or UDP port. Range is 0 to 65535. TCP ports can be used only when filtering TCP. UDP ports can be used only when filtering UDP.
protocol-port	Name of a TCP or UDP port. TCP and UDP port names are listed in the “Usage Guidelines” section. TCP port names can be used only when filtering TCP. UDP port names can be used only when filtering UDP.
established	(Optional) For the TCP protocol only: Indicates an established connection.
match-any	(Optional) For the TCP protocol only: Filters on any combination of TCP flags.
match-all	(Optional) For the TCP protocol only: Filters on all TCP flags.
+ -	(Required) For the TCP protocol match-any , match-all : Prefix <i>flag-name</i> with + or - . Use the + <i>flag-name</i> argument to match packets with the TCP flag set. Use the - <i>flag-name</i> argument to match packets when the TCP flag is not set.
flag-name	(Optional) For the TCP protocol match-any , match-all . Flag names are: ack , fin , psh , rst , syn .
counter	(Optional) Enables accessing ACL counters using SNMP query. The counter <i>counter-name</i> keyword is available on Cisco ASR 9000 Enhanced Ethernet Line Cards only.
<i>counter-name</i>	Defines an ACL counter name.

Command Default

There is no specific condition under which a packet is denied passing the IPv4 access list.
ICMP message generation is enabled by default.

Command Modes IPv4 access list configuration

Command History	Release	Modification
	Release 3.7.2	This command was introduced.
	Release 4.0.1	The capture keyword was added.
	Release 4.3.1	The range keyword for dscp and net-group and port-group keywords were added.
	Release 5.1.1	The optional keyword counter and the associated argument <i>counter-name</i> were added to the command.
	Release 5.3.0	The ABF feature can be configured along with object-groups while defining an ACEs (Access Control Entry).

Usage Guidelines Use the **permit** command following the **ipv4 access-list** command to specify conditions under which a packet can pass the access list.

By default, the first statement in an access list is number 10, and the subsequent statements are incremented by 10.

You can add **permit**, **deny**, or **remark** statements to an existing access list without retyping the entire list. To add a new statement anywhere other than at the end of the list, create a new statement with an appropriate entry number that falls between two existing entry numbers to indicate where it belongs.

If you want to add a statement between two consecutively numbered statements (for example, between lines 10 and 11), first use the **resequence access-list** command to renumber the first statement and increment the entry number of each subsequent statement. The *increment* argument causes new, unused line numbers between statements. Then add a new statement with the *entry-number* specifying where it belongs in the access list.

Note If any ACE in an ACL contains ABF clause, this ACL cannot be applied at any non-zero compression level.

The following is a list of precedence names:

- critical
- flash
- flash-override
- immediate
- internet
- network
- priority
- routine

- uucp
- whois
- www

The following UDP port names can be used instead of port numbers. Refer to the current *Assigned Numbers* RFC to find a reference to these protocols. You can find port numbers corresponding to these protocols by typing a ? in the place of a port number.

- biff
- bootpc
- bootps
- discard
- dnsix
- domain
- echo
- isakmp
- mobile-ip
- nameserver
- netbios-dgm
- netbios-ns
- netbios-ss

- ntp
- pim-auto-rp
- rip
- snmp
- snmptrap
- sunrpc
- syslog
- tacacs
- talk
- tftp
- time
- who
- xdmcp

Use the following flags in conjunction with the **match-any** and **match-all** keywords and the + and - signs to select the flags to display:

- ack
- fin
- psh
- rst
- syn

For example, **match-all +ack +syn** displays TCP packets with both the ack *and* syn flags set, or **match-any +ack - syn** displays the TCP packets with the ack set *or* the syn not set.

Options such as nexthop1, nexthop2, nexthop3 are not supported with net-group configurations in an ACE.

Task ID	Task ID	Operations
	ipv4	read, write
	acl	read, write

Examples

The following example shows how to set a permit condition for an access list named Internetfilter:

```
RP/0/RSP0/CPU0:router(config)# ipv4 access-list Internetfilter
RP/0/RSP0/CPU0:router(config-ipv4-acl)# 10 permit 192.168.34.0 0.0.0.255
RP/0/RSP0/CPU0:router(config-ipv4-acl)# 20 permit 172.16.0.0 0.0.255.255
RP/0/RSP0/CPU0:router(config-ipv4-acl)# 25 permit tcp host 172.16.0.0 eq bgp host
192.168.202.203 range 1300 1400
RP/0/RSP0/CPU0:router(config-ipv4-acl)# deny 10.0.0.0 0.255.255.255
```

This example shows how to configure source and destination net-groups and port-groups in an ACL:

```
RP/0/RSP0/CPU0:router#configure
```

```

RP/0/RSP0/CPU0:router(config)#ipv4 access-list acl1
RP/0/RSP0/CPU0:router(config-ipv4-acl)#10 permit tcp net-group n1 port-group p1 net-group
n2 port-group p2

```

any | host destination-ipv6-address ipv6-wildcard-mask/prefix-length} [operator {port | protocol | port} ]
[dscp value] [routing] [authen] [destopts] [fragments] [established] [flag-name] [log]
[log-input] [counter counter-name]
```

Syntax Description	sequence-number	(Optional) Number of the permit statement in the access list. This number determines the order of the statements in the access list. Range is from 1 to 2147483644. (By default, the first statement is number 10, and the subsequent statements are incremented by 10.) Use the resequence access-list command to change the number of the first statement and increment subsequent statements of a configured access list.
	protocol	Name or number of an Internet protocol. It can be one of the keywords ahp , eigrp , esp , gre , icmp , igmp , igrp , isinp , ipv6 , nos , ospf , pcp , sctp , tcp , or udp , or an integer that ranges from 0 to 255, representing an IPv6 protocol number.
	<i>source-ipv6-prefix / prefix-length</i>	Source IPv6 network or class of networks about which permit conditions are to be set. This argument must be in the form documented in RFC 2373, where the address is specified in hexadecimal using 16-bit values between colons.
	any	An abbreviation for the IPv6 prefix ::/0.
	capture	Captures matching traffic. When the acl command is configured on the source mirroring port, if the ACL configuration command does not use the capture keyword, no traffic gets mirrored. If the ACL configuration uses the capture keyword, but the acl command is not configured on the source port, then the whole port traffic is mirrored and the capture action does not have any effect.

host <i>source-ipv6-address</i>	<p>Source IPv6 host address about which to set permit conditions.</p> <p>This <i>source-ipv6-address</i> argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.</p>
<i>ipv6-wildcard-mask</i>	<p>IPv6 wildcard mask. The IPv6 wildcard mask can take any IPv6 address value which is used instead of prefix length.</p>
vrf <i>vrf-name</i>	<p>Specifies VPN routing and forwarding (VRF) instance.</p>
nexthop1, nexthop2, nexthop3	<p>(Optional) Specifies the next hop for this entry.</p>
track <i>track-name</i>	<p>Specifies object tracking name for the corresponding next hop.</p>
<i>operator</i> { <i>port</i> <i>protocol-port</i> }	<p>(Optional) Operand that compares the source or destination ports of the specified protocol. Operands are lt (less than), gt (greater than), eq (equal), neq (not equal), and range (inclusive range).</p> <p>If the operator is positioned after the <i>source-ipv6-prefix</i> / <i>prefix-length</i> argument, it must match the source port.</p> <p>If the operator is positioned after the <i>destination-ipv6-prefix</i> / <i>prefix-length</i> argument, it must match the destination port.</p> <p>The range operator requires two port numbers. All other operators require one port number.</p> <p>The <i>port</i> argument is the decimal number of a TCP or UDP port. A port number is a number whose range is from 0 to 65535. The <i>protocol-port</i> argument is the name of a TCP or UDP port. TCP port names can be used only when filtering TCP. UDP port names can be used only when filtering UDP.</p>

<i>destination-ipv6-prefix / prefix-length</i>	<p>Destination IPv6 network or class of networks about which permit conditions are to be set.</p> <p>This argument must be in the form documented in RFC 2373, where the address is specified in hexadecimal using 16-bit values between colons.</p>
host <i>destination-ipv6-address</i>	<p>Specifies the destination IPv6 host address about which permit conditions are to be set.</p> <p>This <i>destination-ipv6-address</i> argument must be in the form documented in RFC 2373, where the address is specified in hexadecimal using 16-bit values between colons.</p>
dscp <i>value</i>	<p>(Optional) Matches a differentiated services code point (DSCP) value against the traffic class value in the Traffic Class field of each IPv6 packet header. Range is from 0 to 63.</p>
routing	<p>(Optional) Matches source-routed packets against the routing extension header within each IPv6 packet header.</p>
authen	<p>(Optional) Matches if the IPv6 authentication header is present.</p>
destopts	<p>(Optional) Matches if the IPv6 destination options header is present.</p>
fragments	<p>(Optional) Matches noninitial fragmented packets where the fragment extension header contains a nonzero fragment offset. The fragments keyword is an option available only if the <i>operator</i> [<i>port-number</i>] arguments are not specified.</p>

log	<p>(Optional) Causes an informational logging message about the packet that matches the entry to be sent to the console. (The level of messages logged to the console is controlled by the logging console command.)</p> <p>The message includes the access list name and sequence number, and whether the packet is permitted; the protocol, and whether it is TCP, UDP, ICMP, or a number; and, if appropriate, the source and destination addresses and source and destination port numbers. The message is generated for the first matching packet, and then at 5-minute intervals, including the number of packets permitted in the prior 5-minute interval.</p>
log-input	<p>(Optional) Provides the same function as the log keyword, however, the logging message also includes the input interface.</p>
ttl	<p>(Optional) Turns on matching against time-to-live (TTL) value.</p>
operator	<p>(Optional) Operand that compares the source or destination ports of the specified protocol. Operands are lt (less than), gt (greater than), eq (equal), neq (not equal), and range (inclusive range).</p>
<i>ttl value [value1 value2]</i>	<p>(Optional) TTL value used for filtering. Range is from 1 to 255.</p> <p>If only <i>value</i> is specified, the match is against this value.</p> <p>If both <i>value1</i> and <i>value2</i> are specified, the packet TTL is matched against the range of TTLs between <i>value1</i> and <i>value2</i>.</p>
icmp-off	<p>(Optional) Turns off ICMP generation for denied packets.</p>
icmp-type	<p>(Optional) ICMP message type for filtering ICMP packets. Range is from 0 to 255.</p>

icmp-code	(Optional) ICMP message code for filtering ICMP packets. Range is from 0 to 255.
established	(Optional) For the TCP protocol only: Indicates an established connection.
match-any	(Optional) For the TCP protocol only: Filters on any combination of TCP flags.
match-all	(Optional) For the TCP protocol only: Filters on all TCP flags.
+ -	(Required) For the TCP protocol match-any , match-all : Prefix <i>flag-name</i> with + or - . Use the + <i>flag-name</i> argument to match packets with the TCP flag set. Use the - <i>flag-name</i> argument to match packets when the TCP flag is not set.
flag-name	(Required) For the TCP protocol match-any , match-all . Flag names are: ack , fin , psh , rst , syn .
counter	(Optional) Enables accessing ACL counters using SNMP query. The counter <i>counter-name</i> keyword is available on Cisco ASR 9000 Enhanced Ethernet Line Cards only.
<i>counter-name</i>	Defines an ACL counter name.

Command Default

No IPv6 access list is defined.
ICMP message generation is enabled by default.

Command Modes

IPv6 access list configuration

Command History

Release	Modification
Release 3.7.2	This command was introduced.
Release 4.0.1	The capture keyword was added.
Release 4.2.0	IPv6 support has been enabled for VRF Aware ABF.
Release 4.2.1	ACL Based Forwarding (ABF) has been enabled for Generic Routing Encapsulation (GRE) tunnel interfaces.

Release	Modification
Release 5.1	The track keyword was added.
Release 5.1.1	The optional keyword counter and the associated argument <i>counter-name</i> were added to the command.
Release 5.2.2	The support for IPv6 wildcard mask with a source and destination address was added.
Release 5.3.0	The ABF feature can be configured along with object-groups while defining an ACEs (Access Control Entry).

Usage Guidelines

The **permit** (IPv6) command is similar to the **permit** (IPv4) command, except that it is IPv6-specific.

Use the **permit** (IPv6) command following the **ipv6 access-list** command to define the conditions under which a packet passes the access list.

Specifying **ipv6** for the *protocol* argument matches against the IPv6 header of the packet.

By default, the first statement in an access list is number 10, and the subsequent statements are numbered in increments of 10.

You can add **permit**, **deny**, or **remark** statements to an existing access list without retyping the entire list. To add a new statement anywhere other than the end of the list, create a new statement with an appropriate entry number that falls between two existing entry numbers to indicate where it belongs.

Both the *source-ipv6-prefix/prefix-length* and *destination-ipv6-prefix/prefix-length* arguments are used for traffic filtering (the source prefix filters traffic based upon the traffic source; the destination prefix filters traffic based upon the traffic destination).

Note IPv6 prefix lists, and not access lists, should be used for filtering routing protocol prefixes.

The **fragments** keyword is an option available only if the *operator [port | protocol-port]* arguments are not specified.

ABFv4/ABFv6 for GRE tunnel interface is supported for the A9K-SIP-700 and ASR 9000 Enhanced Ethernet linecards. When ACL is configured under GRE tunnel, the incoming IPv4/IPv6 traffic will be subjected to egress ACL on the encap router. On the decap router de-capsulated packet will be processed using ingress ACL.

For the ASR 9000 Ethernet LC, ABFv4 is supported; ABFv6 is not supported.

About two thousand ACLs per box are supported for GRE tunnels.

Note If any ACE in an ACL contains ABF clause, this ACL cannot be applied at any non-zero compression level.

Task ID

Task ID	Operations
acl	read, write

Examples

This example shows how to configure the IPv6 access list named toCISCO and applies the access list to outbound traffic on GigabitEthernet interface 0/2/0/2. Specifically, the first deny entry in the list keeps all packets that have a destination TCP port number greater than 5000 from exiting out of GigabitEthernet interface 0/2/0/2. The second deny entry in the list keeps all packets that have a source UDP port number less than 5000 from exiting out of GigabitEthernet interface 0/2/0/2. The second deny entry also logs all matches to the console. The first permit entry in the list permits all ICMP packets to exit out of GigabitEthernet interface 0/2/0/2. The second permit entry in the list permits all other traffic to exit out of GigabitEthernet interface 0/2/0/2. The second permit entry is necessary because an implicit deny all condition is at the end of each IPv6 access list.

```
RP/0/RSP0/CPU0:router(config)# ipv6 access-list toCISCO
RP/0/RSP0/CPU0:router(config-ipv6-acl)# deny tcp any any gt 5000
RP/0/RSP0/CPU0:router(config-ipv6-acl)# deny ipv6 any lt 5000 any log
RP/0/RSP0/CPU0:router(config-ipv6-acl)# permit icmp any any
RP/0/RSP0/CPU0:router(config-ipv6-acl)# permit any any
RP/0/RSP0/CPU0:router(config)# interface GigabitEthernet 0/2/0/2
RP/0/RSP0/CPU0:router(config-if)# ipv6 access-group toCISCO out
```

This example shows how to configure the IPv6 access list named v6-abf-acl and applies the access list to inbound traffic on GigabitEthernet interface 0/0/2/0.

```
RP/0/RSP0/CPU0:router(config)# ipv6 access-list v6-abf-acl
RP/0/RSP0/CPU0:router(config-ipv6-acl)# 10 permit ipv6 any any default nexthop1 vrf vrf_A
ipv6 11:::1 nexthop2 vrf vrf_B ipv6 22:::2 nexthop3 vrf vrf_C ipv6 33:::3
RP/0/RSP0/CPU0:router(config-ipv6-acl)# 20 permit ipv4 any any
RP/0/RSP0/CPU0:router(config)# interface GigabitEthernet 0/0/2/0
RP/0/RSP0/CPU0:router(config-if)# ipv6 access-group v6-abf-acl ingress
```

This example shows how to configure the IPv6 access list named v6-abf-acl and applies the access list to inbound traffic on GRE tunnel interface:

```
RP/0/RSP0/CPU0:router(config)# ipv6 access-list v6-abf-acl
RP/0/RSP0/CPU0:router(config-ipv6-acl)# 10 permit ipv6 any any default nexthop1 vrf vrf_A
ipv6 11:::1 nexthop2 vrf vrf_B ipv6 22:::2 nexthop3 vrf vrf_C ipv6 33:::3
RP/0/RSP0/CPU0:router(config-ipv6-acl)# 20 permit ipv4 any any
RP/0/RSP0/CPU0:router(config)# interface tunnel-ip 25
RP/0/RSP0/CPU0:router(config-if)# ipv6 access-group v6-abf-acl ingress
```

This example shows how to configure the IPv6 access list named v6-abf-acl and apply track options:

```
RP/0/RSP0/CPU0:router(config)# ipv6 access-list v6-abf-acl
RP/0/RSP0/CPU0:router(config-ipv6-acl)# 10 permit ipv6 11:::1/10 any nexthop1 track track1
ipv6 1:::1 nexthop2 track track2 ipv6 2:::2 nexthop3 track track3 ipv6 3:::3
```

Related Commands

Command	Description
deny (IPv6) , on page 23	Sets deny conditions for an IPv6 access list.

Command	Description
ipv6 access-list , on page 39	Defines an IPv6 access list and enters IPv6 access list configuration mode.
remark (IPv6) , on page 80	Inserts a helpful remark about an IPv6 access list entry.
resequence access-list ipv6 , on page 84	Changes the starting entry number of the first statement in an existing IPv6 access list, and the number by which subsequent statements are incremented.

remark (IPv4)

To write a helpful comment (remark) for an entry in an IPv4 access list, use the **remark** command in IPv4 access list configuration mode. To remove the remark, use the **no** form of this command.

```
[sequence-number] remark remark
no sequence-number
```

Syntax Description

sequence-number	(Optional) Number of the remark statement in the access list. This number determines the order of the statements in the access list. Range is 1 to 2147483646. (By default, the first statement is number 10; subsequent statements are incremented by 10.)
remark	Comment that describes the entry in the access list, up to 255 characters long.

Command Default

The IPv4 access list entries have no remarks.

Command Modes

IPv4 access list configuration

Release 3.7.2	This command was introduced.

Usage Guidelines

Use the **remark** command to write a helpful comment for an entry in an IPv4 access list. To remove the remark, use the **no** form of this command.

The remark can be up to 255 characters; anything longer is truncated.

If you know the sequence number of the remark you want to delete, you can remove it by entering the **no sequence-number** command.

Use the **resequence access-list ipv4** command if you want to add statements to an existing access list and the sequence numbers of consecutive entries do not permit additional statements.

Task ID

Task ID	Operations
ipv4	read, write
acl	read, write

Examples

In the following example, the user1 subnet is not allowed to use outbound Telnet:

```
RP/0/RSP0/CPU0:router(config)# ipv4 access-list telnetting
RP/0/RSP0/CPU0:router(config-ipv4-acl)# 10 remark Do not allow user1 to telnet out
RP/0/RSP0/CPU0:router(config-ipv4-acl)# 20 deny tcp host 172.16.2.88 255.255.0.0 any eq telnet
```

```
RP/0/RSP0/CPU0:router(config-ipv4-acl)# 30 permit icmp any any
RP/0/RSP0/CPU0:router# show ipv4 access-list telnetting
```

```
ipv4 access-list telnetting
 0 remark Do not allow user1 to telnet out
 20 deny tcp 172.16.2.88 255.255.0.0 any eq telnet out
 30 permit icmp any any
```

Related Commands

Command	Description
deny (IPv4) , on page 14	Sets the deny conditions for an IPv4 access list.
ipv4 access-list, on page 33	Defines an IPv4 access list and enters IPv4 access list configuration mode.
permit (IPv4) , on page 54	Sets the permit conditions for an IPv4 access list
resequence access-list ipv4 , on page 82	Changes the starting entry number of the first statement in an existing IPv4 access list, and the number by which subsequent statements are incremented.
show access-lists ipv4 , on page 87	Displays the contents of all current IPv4 access lists.

remark (IPv6)

To write a helpful comment (remark) for an entry in an IPv6 access list, use the **remark** command in IPv6 access list configuration mode. To remove the remark, use the **no** form of this command.

```
[sequence-number] remark remark
no sequence-number
```

Syntax Description

sequence-number	(Optional) Number of the remark statement in the access list. This number determines the order of the statements in the access list. Range is 1 to 2147483646. (By default, the first statement is number 10, and the subsequent statements are incremented by 10.)
remark	Comment that describes the entry in the access list, up to 255 characters long.

Command Default

The IPv6 access list entries have no remarks.

Command Modes

IPv6 access list configuration

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

The **remark (IPv6)** command is similar to the **remark (IPv4)** command, except that it is IPv6-specific.

Use the **remark** command to write a helpful comment for an entry in an IPv6 access list. To remove the remark, use the **no** form of this command.

The remark can be up to 255 characters; anything longer is truncated.

If you know the sequence number of the remark you want to delete, you can remove it by entering the **no sequence-number** command.

Use the **resequence access-list ipv6** command if you want to add statements to an existing access list and the sequence numbers of consecutive entries do not permit additional statements.

Task ID

Task ID	Operations
acl	read, write

Examples

In this example, a remark is added:

```
RP/0/RSP0/CPU0:router(config)# ipv6 access-list Internetfilter
RP/0/RSP0/CPU0:router(config-ipv6-acl)# 10 permit ipv6 3333:1:2:3::/64 any
RP/0/RSP0/CPU0:router(config-ipv6-acl)# 20 permit ipv6 4444:1:2:3::/64 any
RP/0/RSP0/CPU0:router(config-ipv6-acl)# 30 permit ipv6 5555:1:2:3::/64 any
RP/0/RSP0/CPU0:router(config-ipv6-acl)# 39 remark Block BGP traffic from a given host
RP/0/RSP0/CPU0:router(config-ipv6-acl)# 40 deny tcp host 6666:1:2:3::10 eq bgp host
```

```

7777:1:2:3::20 range 1300 1400
RP/0/RSP0/CPU0:router# show ipv6 access-list Internetfilter

ipv6 access-list Internetfilter
 10 permit ipv6 3333:1:2:3::/64 any
 20 permit ipv6 4444:1:2:3::/64 any
 30 permit ipv6 5555:1:2:3::/64 any
 39 remark Block BGP traffic from a given host
 40 deny tcp host 6666:1:2:3::10 eq bgp host 7777:1:2:3::20 range host 6666:1:2:3::10 eq
bgp host 7777:1:2:3::20 range 1300 1400

```

Related Commands

Command	Description
deny (IPv6) , on page 23	Sets the deny conditions for an IPv6 access list.
ipv6 access-list, on page 39	Defines an IPv6 access list and enters IPv6 access list configuration mode.
permit (IPv6) , on page 69	Sets permit conditions for an IPv6 access list
resequence access-list ipv6 , on page 84	Changes the starting entry number of the first statement in an existing IPv6 access list, and the number by which subsequent statements are incremented.

resequence access-list ipv4

To renumber existing statements and increment subsequent statements to allow a new IPv4 access list statement (**permit**, **deny**, or **remark**) to be added, use the **resequence access-list ipv4** command in EXEC mode.

```
resequence access-list ipv4 name [base [increment]]
```

Syntax Description

name	Name of an IPv4 access list.
base	(Optional) Number of the first statement in the specified access list, which determines its order in the access list. Maximum value is 2147483644. Default is 10.
increment	(Optional) Number by which the base sequence number is incremented for subsequent statements. Maximum value is 2147483644. Default is 10.

Command Default

base: 10

increment: 10

Command Modes

EXEC mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

Use the **resequence access-list ipv4** command to add a **permit**, **deny**, or **remark** statement between consecutive entries in an existing IPv4 access list. Specify the first entry number (the *base*) and the increment by which to separate the entry numbers of the statements. The software renumbers the existing statements, thereby making room to add new statements with the unused entry numbers.

Task ID

Task ID	Operations
acl	read, write

Examples

In this example, suppose you have an existing access list:

```
ipv4 access-list marketing
 1 permit 10.1.1.1
 2 permit 10.2.0.0 0.0.255.255
 3 permit tcp host 10.2.2.2 255.255.0.0 any eq telnet
```

You want to add additional entries in the access list. First you resequence the entries, renumbering the statements starting with number 20 and an increment of 5, and then you have room for four additional statements between each of the existing statements:

```
RP/0/RSP0/CPU0:router# resequence access-list ipv4 marketing 20 5
```

```
RP/0/RSP0/CPU0:router# show access-lists ipv4 marketing

ipv4 access-list marketing
 20 permit 10.1.1.1
 25 permit 10.2.0.0
 30 permit tcp host 10.2.2.2 255.255.0.0 any eq telnet
```

Now you add your new entries.

```
RP/0/RSP0/CPU0:router(config)# ipv4 access-list marketing
RP/0/RSP0/CPU0:router(config-ipv4-acl)# 3 remark Do not allow user1 to telnet out
RP/0/RSP0/CPU0:router(config-ipv4-acl)# 4 deny tcp host 172.16.2.88 255.255.0.0 any eq
telnet
RP/0/RSP0/CPU0:router(config-ipv4-acl)# 29 remark Allow user2 to telnet out
RP/0/RSP0/CPU0:router# show access-lists ipv4 marketing

ipv4 access-list marketing
 3 remark Do not allow user1 to telnet out
 4 deny tcp host 171.69.2.88 255.255.0.0 any eq telnet
 20 permit 10.1.1.1
 25 permit 10.2.0.0
 29 remark Allow user2 to telnet out
 30 permit tcp host 10.2.2.2 255.255.0.0 any eq telnet
```

Related Commands

Command	Description
deny (IPv4) , on page 14	Sets the deny conditions for an IPv4 access list.
ipv4 access-list, on page 33	Defines an IPv4 access list and enters IPv4 access list configuration mode.

remark (IPv4) , on page 78	Inserts a helpful remark about an IPv4 access list.
show access-lists ipv4 , on page 87	Displays the contents of all current IPv4 access lists.

resequence access-list ipv6

To renumber existing statements and increment subsequent statements to allow a new IPv6 access list statement (**permit**, **deny**, or **remark**) to be added, use the **resequence access-list ipv6** command in EXEC mode.

```
resequence access-list ipv6 name [base [increment]]
```

Syntax Description

name	Name of an IPv6 access list.
base	(Optional) Number of the first statement in the specified access list, which determines its order in the access list. Maximum value is 2147483646. Default is 10.
increment	(Optional) Number by which the base sequence number is incremented for subsequent statements. Maximum value is 2147483644. Default is 10.

Command Default

base: 10

increment: 10

Command Modes

EXEC mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

The **resequence access-list ipv6** command is similar to the **resequence access-list ipv4** command, except that it is IPv6 specific.

Use the **resequence access-list ipv6** command to add a **permit**, **deny**, or **remark** statement between consecutive entries in an existing IPv6 access list. Specify the first entry number (the *base*) and the increment by which to separate the entry numbers of the statements. The software renumbers the existing statements, thereby making room to add new statements with the unused entry numbers.

Task ID

Task ID	Operations
acl	read, write

Examples

In the following example, suppose you have an existing access list:

```
ipv6 access-list Internetfilter
 10 permit ipv6 3333:1:2:3::/64 any
 20 permit ipv6 4444:1:2:3::/64 any
 30 permit ipv6 5555:1:2:3::/64 any
```

You want to add additional entries in the access list. First, you resequence the entries, renumbering the statements starting with number 20 and an increment of 5, and then you have room for four additional statements between each of the existing statements:

```
RP/0/RSP0/CPU0:router# resequence access-list ipv6 Internetfilter 20 5
RP/0/RSP0/CPU0:router# show access-lists ipv6 Internetfilter

ipv6 access-list Internetfilter
 20 permit ipv6 3333:1:2:3::/64 any
 25 permit ipv6 4444:1:2:3::/64 any
 30 permit ipv6 5555:1:2:3::/64 any
```

Now you add your new entries.

```
RP/0/RSP0/CPU0:router(config)# ipv6 access-list Internetfilter
RP/0/RSP0/CPU0:router(config-ipv6-acl)# 3 remark Block BGP traffic from a given host
RP/0/RSP0/CPU0:router(config-ipv6-acl)# 4 deny tcp host 6666:1:2:3::10 eq bgp host
7777:1:2:3::20 range 1300 1400
RP/0/RSP0/CPU0:router# show access-lists ipv6 Internetfilter

ipv6 access-list Internetfilter
 3 remark Block BGP traffic from a given host
 4 deny tcp host 6666:1:2:3::10 eq bgp host 7777:1:2:3::20 range 1300 1404 deny tcp host
171.69.2.88 255.255.0.0 any eq telnet
 20 permit ipv6 3333:1:2:3::/64 any
 25 permit ipv6 4444:1:2:3::/64 any
 30 permit ipv6 5555:1:2:3::/64 any
```

Related Commands

Command	Description
deny (IPv6) , on page 23	Sets the deny conditions for an IPv6 access list.
ipv6 access-list, on page 39	Defines an IPv6 access list and enters IPv6 access list configuration mode.
permit (IPv6) , on page 69	Set permit conditions for an IPv6 access list.
remark (IPv6) , on page 80	Inserts a helpful remark about an IPv6 access list entry.

show access-lists afi-all

To display the contents of current IPv4 and IPv6 access lists, use the **show access-lists afi-all** command in EXEC mode.

show access-lists afi-all

Syntax Description This command has no keywords or arguments.

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operations
	acl	read

Examples

This sample output is from the **show access-lists afi-all** command:

```
RP/0/RSP0/CPU0:router# show access-lists afi-all

ipv4 access-list crypto-1
 10 permit ipv4 65.21.21.0 0.0.0.255 65.6.6.0 0.0.0.255
 20 permit ipv4 192.168.241.0 0.0.0.255 192.168.65.0 0.0.0.255
```

show access-lists ipv4

To display the contents of current IPv4 access lists, use the **show access-lists ipv4** command in EXEC mode.

```
show access-lists ipv4 [{access-list-name hardware {ingress|egress} [interface type interface-path-id]
{sequence number|location node-id}|summary [access-list-name]|access-list-name [sequence-number]
|maximum [detail interface type interface-path-id] [usage pfilter {resource-usage location node-id
|all}]]]
```

Syntax Description		
access-list-name		(Optional) Name of a particular IPv4 access list. The name cannot contain spaces or quotation marks, but can include numbers.
hardware		(Optional) Identifies the access list as an access list for an interface.
ingress		(Optional) Specifies an inbound interface.
egress		(Optional) Specifies an outbound interface.
interface		(Optional) Displays interface statistics.
type		(Optional) Interface type. For more information, use the question mark (?) online help function.
interface-path-id		Physical interface or virtual interface. Note Use the show interfaces command to see a list of all interfaces currently configured on the router. For more information about the syntax for the router, use the question mark (?) online help function.
sequence <i>number</i>		(Optional) Sequence number of a particular IPv4 access list. Range is 1 to 2147483644.
resource-usage		Displays the TCAM resource usage with compression level.

location <i>node-id</i>	(Optional) Location of a particular IPv4 access list. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
summary	(Optional) Displays a summary of all current IPv4 access lists.
sequence-number	(Optional) Sequence number of a particular IPv4 access list. Range is 1 to 2147483644.
maximum	(Optional) Displays the current maximum number of configurable IPv4 access control lists (ACLs) and access control entries (ACEs).
detail interface <i>type interface-path-id</i>	(Optional) Displays detailed configuration of the ternary content addressable memory (TCAM) manager module of this ACL on the specified interface.
usage	(Optional) Displays the usage of the access list on a given line card.
pfilter	(Optional) Displays the packet filtering usage for the specified line card.
all	(Optional) Displays the location of all the line cards.

Command Default The default displays all IPv4 access lists.

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.
	Release 4.3.1	The resource-usage keyword was added.
	Release 5.3.2	The detail keyword requires an interface to be specified.

Usage Guidelines Use the **show access-lists ipv4** command to display the contents of all IPv4 access lists. To display the contents of a specific IPv4 access list, use the *name* argument. Use the *sequence-number* argument to specify the sequence number of the access list.

Use the **hardware**, **ingress** or **egress**, and **location** keywords to display the access list hardware contents and counters for all interfaces that use the specified access list in a given direction (ingress or egress). To display the contents of a specific access list entry, use the **sequence number** keyword and argument. The access group for an interface must be configured using the **ipv4 access-group** command for access list hardware counters to be enabled.

Use the **show access-lists ipv4 summary** command to display a summary of all current IPv4 access lists. To display a summary of a specific IPv4 access list, use the *name* argument.

Use the **show access-lists ipv4 maximum detail** command to display the OOR details for IPv4 access lists. OOR limits the number of ACLs and ACEs that can be configured in the system. When the limit is reached, configuration of new ACLs or ACEs is rejected.

Use the **show access-list ipv4 usage** command to display a summary of all interfaces and access lists programmed on the specified line card.

Task ID	Task ID	Operations
	acl	read

Examples

In the following example, the contents of all IPv4 access lists are displayed:

```
RP/0/RSP0/CPU0:router# show access-lists ipv4

ipv4 access-list 101
 10 deny udp any any eq ntp
 20 permit tcp any any
 30 permit udp any any eq tftp
 40 permit icmp any any
 50 permit udp any any eq domain
ipv4 access-list Internetfilter
 10 permit tcp any 172.16.0.0 0.0.255.255 eq telnet
 20 deny tcp any any
 30 deny udp any 172.18.0.0 0.0.255.255 lt 1024
 40 deny ipv4 any any log
```

In the following example, the contents of an access list named `acl_hw_1` are displayed:

```
RP/0/RSP0/CPU0:router# show access-lists ipv4 acl_hw_1 hardware egress location 0/2/cp0

ipv4 access-list acl_hw_1
 10 permit icmp 192.168.36.0 0.0.0.255 any (251 hw matches)
 20 permit ip 172.16.3.0 0.0.255.255 any (29 hw matches)
 30 deny tcp any any (58 hw matches)
```

This table describes the significant fields shown in the display.

Table 1: show access-lists ipv4 hardware Field Descriptions

Field	Description
hw matches	Number of hardware matches.
ACL name	Name of the ACL programmed in hardware.

Field	Description
Sequence Number	Each ACE sequence number is programmed into hardware with all the fields that are corresponding to the values set in ACE.
Grant	Depending on the ACE rule, the grant is set to deny, permit, or both.
Logging	Logging is set to on if ACE uses a log option to enable logs.
Per ace icmp	If Per ace icmp is set to on in the hardware, ICMP is unreachable, is rate-limited, and is generated. The default is set to on.
Hits	Hardware counter for that ACE.

In the following example, a summary of all IPv4 access lists are displayed:

```
RP/0/RSP0/CPU0:router# show access-lists ipv4 summary
```

```
ACL Summary:
  Total ACLs configured: 3
  Total ACEs configured: 11
```

This table describes the significant fields shown in the display.

Table 2: show access-lists ipv4 summary Field Descriptions

Field	Description
Total ACLs configured	Number of configured IPv4 ACLs.
Total ACEs configured	Number of configured IPV4 ACEs.

In the following example, the OOR details of the IPv4 access lists are displayed:

```
RP/0/RSP0/CPU0:router# show access-lists ipv4 maximum detail
```

```
Default max configurable acls :5000
Default max configurable aces :200000
Current configured acls      :1
Current configured aces     :2
Current max configurable acls :5000
Current max configurable aces :200000
Max configurable acls       :9000
Max configurable aces      :350000
```

This table describes the significant fields shown in the display.

Table 3: show access-lists ipv4 maximum detail Command Field Descriptions

Field	Description
Default max configurable acls	Default maximum number of configurable IPv4 ACLs allowed.
Default max configurable aces	Default maximum number of configurable IPv4 ACEs allowed.
Current configured acls	Number of configured IPv4 ACLs.

Field	Description
Current configured aces	Number of configured IPv4 ACEs.
Current max configurable acls	Configured maximum number of configurable IPv4 ACLs allowed.
Current max configurable aces	Configured maximum number of configurable IPv4 ACEs allowed.
Max configurable acls	Maximum number of configurable IPv4 ACLs allowed.
Max configurable aces	Maximum number of configurable IPv4 ACEs allowed.

This example displays the packet filtering usage for the specified line card:

```
RP/0/RSP0/CPU0:router# show access-lists ipv4 usage pfilter location 0/3/CPU0

Interface : GigabitEthernet0/3/0/1
  Input Common-ACL : ipv4_c_acl  ACL : ipv4_i_acl_1
  Output ACL : ipv4_i_acl_1
```

Note To display the packet filtering usage for bundle interfaces, use the **show access-lists ipv4 usage pfilter location all** command.

This example displays the TCAM resource usage with compression level:

```
RP/0/RSP0/CPU0:router# show access-lists ipv4 acl1 hardware ingress resource-usage location
0/3/CPU0

ACL compression level : 1
Source field Rules: 3652
Prefixes: 20929
Key Width: 189

Level : Fields          TCAM entries   Perf Tradeoff
1      : S              3652          low
```

Related Commands

Command	Description
clear access-list ipv4, on page 4	Resets the IPv4 access list match counters.
copy access-list ipv4 , on page 10	Copies an existing IPv4 access list.
deny (IPv4) , on page 14	Sets the deny conditions for an ACE of an IPv4 access list.
ipv4 access-group, on page 30	Filters incoming or outgoing IPv4 traffic on an interface.
ipv4 access-list, on page 33	Defines an IPv4 access list and enters IPv4 access list configuration mode.
permit (IPv4) , on page 54	Sets the permit conditions for an ACE of an IPv4 access list.

Command	Description
remark (IPv4) , on page 78	Inserts a helpful remark about an IPv4 access list entry.
resequence access-list ipv4 , on page 82	Changes the starting entry number of the first statement in an existing IPv4 access list, and the number by which subsequent statements are incremented.

show access-lists ipv6

To display the contents of current IPv6 access lists, use the **show access-lists ipv6** command in EXEC mode.

```
show access-lists ipv6 [{access-list-name hardware {ingress|egress} [interface type interface-path-id]
{sequence number|location node-id}|summary [access-list-name]|access-list-name [sequence-number]
|maximum [detail] [usage pfilter {resource-usage location node-id |all}]]]
```

Syntax Description

access-list-name	(Optional) Name of a particular IPv6 access list. The name cannot contain a spaces or quotation marks, but can include numbers.
hardware	(Optional) Identifies the access list as an access list for an interface.
ingress	(Optional) Specifies an inbound interface.
egress	Specifies an outbound interface.
interface	(Optional) Displays interface statistics.
type	(Optional) Interface type. For more information, use the question mark (?) online help function.
interface-path-id	(Optional) Either a physical interface instance or a virtual interface instance as follows: <ul style="list-style-type: none"> Physical interface instance. Naming notation is <i>rack/slot/module/port</i> and a slash between values is required as part of the notation. <ul style="list-style-type: none"> <i>rack</i>: Chassis number of the rack. <i>slot</i>: Physical slot number of the modular services card or line card. <i>module</i>: Module number. A physical layer interface module (PLIM) is always 0. <i>port</i>: Physical port number of the interface. <p>Note In references to a Management Ethernet interface located on a route processor card, the physical slot number is alphanumeric (RSP0) and the module is CPU0. Example: interface MgmtEth0/RSP0/CPU0/0.</p> <ul style="list-style-type: none"> Virtual interface instance. Number range varies depending on interface type. <p>For more information about the syntax for the router, use the question mark (?) online help function.</p>
sequence number	(Optional) Sequence number of a particular IPv6 access list. Range is 1 to 2147483644.
resource-usage	Displays the TCAM resource usage with compression level.
location node-id	(Optional) Location of a particular IPv6 access list. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
summary	(Optional) Displays a summary of all current IPv6 access lists.

sequence-number	(Optional) Sequence number of a particular IPv6 access list. Range is 1 to 2147483644.
maximum	(Optional) Displays the current maximum number of configurable IPv6 access control lists (ACLs) and access control entries (ACEs).
detail	(Optional) Displays complete out-of-resource (OOR) details.
usage	(Optional) Displays the usage of the access list on a given line card.
pfilter	(Optional) Displays the packet filtering usage for the specified line card.
all	(Optional) Displays the location of all the line cards.

Command Default Displays all IPv6 access lists.

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.
	Release 4.3.1	The resource-usage keyword was added.
	Release 5.2.2	The show command output was updated to display IPv6 wildcard mask.

Usage Guidelines The **show access-lists ipv6** command is similar to the **show access-lists ipv4** command, except that it is IPv6 specific.

Use the **show access-lists ipv6** command to display the contents of all IPv6 access lists. To display the contents of a specific IPv6 access list, use the *name* argument. Use the *sequence-number* argument to specify the sequence number of the access list.

Use the **hardware**, **ingress** or **egress**, and **location** keywords to display the access list hardware contents and counters for all interfaces that use the specified access list in a given direction (ingress or egress). To display the contents of a specific access list entry, use the **sequence number** keyword and argument. The access group for an interface must be configured using the **ipv6 access-group** command for access list hardware counters to be enabled.

Use the **show access-lists ipv6 summary** command to display a summary of all current IPv6 access lists. To display a summary of a specific IPv6 access list, use the *name* argument.

Use the **show access-lists ipv6 maximum detail** command to display the OOR details for IPv6 access lists. OOR limits the number of ACLs and ACEs that can be configured in the system. When the limit is reached, configuration of new ACLs or ACEs is rejected.

Use the **show access-list ipv6 ipv4 usage** command to display a summary of all interfaces and access lists programmed on the specified line card.

Task ID	Task ID	Operations
	acl	read

Examples

In the following example, the IPv6 ACL is configured with the source IPv6 wildcard mask FF:0:FFFF:AA:20 and the destination wildcard mask 0:FFFF:2233::FFFF, the show command displays these wildcard mask:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# ipv6 access-list acl1
RP/0/RSP0/CPU0:router(config-ipv6-acl)# permit 1:2::3 FF:0:FFFF:AA:20:: 4:5::6
0:FFFF:2233::FFFF
RP/0/RSP0/CPU0:router(config-ipv6-acl)# commit
RP/0/RSP0/CPU0:router# show run ipv6 access-list
ipv6 access-list ACL1
 10 permit ipv6 1:2::3 ff:0:ffff:aa:20:: 4:5::6 0:ffff:2233::ffff
```

In the following example, the contents of all IPv6 access lists are displayed:

```
RP/0/RSP0/CPU0:router# show access-lists ipv6

ipv6 access-list Internetfilter
 3 remark Block BGP traffic from a given host
 4 deny tcp host 6666:1:2:3::10 eq bgp host 7777:1:2:3::20 range 1300 1404 deny tcp host
171.69.2.88 255.255.0.0 any eq telnet
 20 permit ipv6 3333:1:2:3::/64 any
 25 permit ipv6 4444:1:2:3::/64 any
 30 permit ipv6 5555:1:2:3::/64 any
ipv6 access-list marketing
 10 permit ipv6 7777:1:2:3::/64 any (51 matches)
 20 permit ipv6 8888:1:2:3::/64 any (26 matches)
 30 permit ipv6 9999:1:2:3::/64 any (5 matches)
```

In the following example, the contents of an access list named Internetfilter is displayed:

```
RP/0/RSP0/CPU0:router# show access-lists ipv6 Internetfilter

ipv6 access-list Internetfilter
 3 remark Block BGP traffic from a given host
 4 deny tcp host 6666:1:2:3::10 eq bgp host 7777:1:2:3::20 range 1300 1404 deny tcp host
171.69.2.88 255.255.0.0 any eq telnet
 20 permit ipv6 3333:1:2:3::/64 any
 25 permit ipv6 4444:1:2:3::/64 any
 30 permit ipv6 5555:1:2:3::/64 any
```

In the following example, the contents of an access list named acl_hw_1 is displayed:

```
RP/0/RSP0/CPU0:router# show access-lists ipv6 acl_hw_1 hardware egress location 0/2/cp0

ipv6 access-list acl_hw_1
 10 permit icmp any any (251 hw matches)
 20 permit ipv6 3333:1:2:3::/64 any (29 hw matches)
 30 deny tcp any any (58 hw matches)
```

This table describes the significant fields shown in the display.

Table 4: show access-lists ipv6 hardware Command Field Descriptions

Field	Description
hw matches	Number of hardware matches.

In the following example, a summary of all IPv6 access lists is displayed:

```
RP/0/RSP0/CPU0:router# show access-lists ipv6 summary
```

```
ACL Summary:
  Total ACLs configured: 3
  Total ACEs configured: 11
```

This table describes the significant fields shown in the display.

Table 5: show access-lists ipv6 summary Command Field Descriptions

Field	Description
Total ACLs configured	Number of configured IPv6 ACLs.
Total ACEs configured	Number of configured IPv6 ACEs.

In the following example, the OOR details of the IPv6 access lists are displayed:

```
RP/0/RSP0/CPU0:router# show access-lists ipv6 maximum detail
```

```
Default max configurable acls :1000
Default max configurable aces :50000
Current configured acls       :1
Current configured aces       :2
Current max configurable acls :1000
Current max configurable aces :50000
Max configurable acls         :2000
Max configurable aces         :100000
```

This example displays the packet filtering usage for the specified line card:

```
RP/0/RSP0/CPU0:router# show access-lists ipv6 usage pfilter location 0/3/CPU0
```

```
Interface : GigabitEthernet0/3/0/1
  Input Common-ACL : ipv6_c_acl  ACL : ipv6_i_acl_1
  Output ACL : ipv6_i_acl_1
```

This example displays the TCAM resource usage with compression level:

```
RP/0/RSP0/CPU0:router# show access-lists ipv6 acl1 hardware ingress resource-usage location 0/0/CPU0
```

```
NP : 0
Rules (ACE) : 16
```

```

ACL compression level : 1
Fields compressed     : SrcIP
TCAM Entries used    : 383 ( 16k total)
TCAM Key Width       : 640 ( 128 total for compressed fields)
Fields               Prefix count      Bit width/rounded
~~~~~                ~~~~~
SourceIP              43                5/8 (of max 128)

```

Related Commands

Command	Description
copy access-list ipv6, on page 12	Copies an existing IPv6 access list.
deny (IPv6) , on page 23	Sets the deny conditions for an IPv6 access list.
ipv6 access-list, on page 39	Defines an IPv6 access list and enters IPv6 access list configuration mode.
permit (IPv6) , on page 69	Set permit conditions for an IPv6 access list.
remark (IPv6) , on page 80	Inserts a helpful remark about an IPv6 access list entry.
resequence access-list ipv6 , on page 84	Changes the starting entry number of the first statement in an existing IPv4 access list, and the number by which subsequent statements are incremented.

show object-group network

To display the operation state of a network object group, use the **show object-group network** command in EXEC mode.

show object-group network { **ipv4** | **ipv6** } *object-group-name*

Syntax Description	Parameter	Description
	ipv4	Displays the operation state of an IPV4 network object group.
	ipv6	Displays the operation state of an IPV6 network object group.
	<i>object-group-name</i>	Name of the object-group.

Command Default None

Command Modes EXEC mode

Command History	Release	Modification
	Release 4.3.1	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operation
	root-system	read
	system	read

Example

This example shows how to display the operation state of an IPV4 network object group:

```
RP/0/RSP0/CPU0:router# show object-group network ipv4 ipv4_type5_obj1

50.0.0.0/16
50.1.0.0/16
50.2.0.0/16
50.3.0.0/16
50.4.0.0/16
host 40.0.0.1
host 40.0.0.2
host 40.0.0.3
host 40.0.0.4
host 40.0.0.5
object-group ipv4_type1_obj1
range 60.0.0.1 60.0.1.100
!
```

This example shows how to display the operation state of an IPV6 network object group:

```
RP/0/RSP0/CPU0:router# show object-group network ipv6 ipv6_type5_obj1

50::/120
50::100/120
50::200/120
50::300/120
50::400/120
host 40::1
host 40::2
host 40::3
host 40::4
host 40::5
object-group ipv6_type2_obj1
range 60::10 60::20
!
```

Related Commands

Command	Description
show object-group port , on page 100	Displays the operation state of a port object group.

show object-group port

To display the operation state of a port object group, use the **show object-group port** command in EXEC mode.

show object-group port *object-group-name*

Syntax Description	<i>object-group-name</i> Name of the object-group.
---------------------------	----------------------------------------------------

Command Default	None
------------------------	------

Command Modes	EXEC mode
----------------------	-----------

arp

To add a permanent entry in the Address Resolution Protocol (ARP) cache, use the **arp** command in Global Configuration mode. To remove an entry from the ARP cache, enter the **no** form of this command.

```
arp [vrf vrf-name] ip-address hardware-address encapsulation-type [alias]
no arp [vrf vrf-name] ip-address hardware-address encapsulation-type [alias]
```

Syntax Description

vrf	(Optional) Specifies VPN routing and forwarding (VRF) instance.
vrf-name	(Optional) VRF instance that identifies a VPN.
ip-address	IPv4 (network layer) address for which a permanent entry is added to the ARP cache. Enter the IPv4 address in a four-part dotted-decimal format that corresponds to the local data-link address (a 32-bit address).
hardware-address	Hardware (data link layer) address that the IPv4 address is linked to. Enter the local data-link address (a 48-bit address), such as 0800.0900.1834.
encapsulation-type	Encapsulation type. The encapsulation types are: <ul style="list-style-type: none"> • arpa • srp • srpa • srpb <p>For Ethernet interfaces, this is typically the arpa keyword.</p>
alias	(Optional) Causes the software to respond to ARP requests as if it were the owner of both the specified IP address and hardware address, whether proxy ARP is enabled or not.

Command Default

No entries are permanently installed in the ARP cache.

Command Modes

Global Configuration mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

The software uses ARP cache entries to translate 32-bit IP addresses into 48-bit hardware addresses.

Because most hosts support dynamic resolution, you generally need not specify static ARP cache entries.

Static entries are permanent entries that map a network layer address (IPv4 address) to a data-link layer address (MAC address). If the **alias** keyword is specified when creating the entry, the interface to which the entry is attached will act as if it is the owner of the specified addresses, that is, it will respond to ARP request packets for this network layer address with the data link layer address in the entry.

The software does not respond to any ARP requests received for the specified IP address unless proxy ARP is enabled on the interface on which the request is received. When proxy ARP is enabled, the software responds to ARP requests with its own local interface hardware address.

To remove all nonstatic entries from the ARP cache, enter the [clear arp-cache, on page 112](#) in EXEC mode.

Task ID	Task ID	Operations
	cef	read, write

Examples

The following is an example of a static ARP entry for a typical Ethernet host:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# arp 192.168.7.19 0800.0900.1834 arpa
```

Related Commands

Command	Description
clear arp-cache, on page 112	Deletes all dynamic entries from the ARP cache.
show arp, on page 122	Displays the ARP cache.

arp cache-limit

To configure a limit on ARP cache entries on the router, use the **arp cache-limit** command in interface configuration mode.

arp cache-limit *limit*

Syntax Description

limit Specify the value for the cache entries. The supported range in the router is 0–127999.

Note The arp cache resources vary depending on the hardware resources available in a router. Ensure the cache-limit configured such that the available resources in the router are able to accommodate the entries.

Command Default

By default, the ARP cache limit per interface in the router is 127999.

Command Modes

Interface configuration

Command History

Release	Modification
Release 7.9.1	This command was introduced.

Usage Guidelines

No specific guidelines impact the use of this command.

Examples

The following example shows how to set the ARP cache limit for an interface:

```
Router# configure
Router(config)# interface HundredGigE 0/0/0/0
Router(config-if)#arp cache-limit 3900
Router(config-if)#commit
```

arp dagr

To configure Direct Attached Gateway Redundancy (DAGR), use the **arp dagr** command in interface configuration mode.

arp dagr

Syntax Description This command has no keywords or arguments.

Command Default Disabled

Command Modes Interface configuration

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operations
	cef	write

Examples

The following example enables DAGR configuration:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# interface gigabitethernet 0/1/0/0.1
RP/0/RSP0/CPU0:router(config-if)# arp dagr
RP/0/RSP0/CPU0:router(config-if-dagr)#
```

Related Commands

Command	Description
peer (DAGR), on page 115	Creates a DAGR group for a virtual IP address.
priority-timeout, on page 116	Configures the timeout for a high-priority DAGR route.
route distance, on page 119	Configures the route distances for a given DAGR group.
route metric, on page 120	Configures the route metrics for a given DAGR group.
show arp dagr, on page 128	Displays the operational state of all DAGR groups.
timers (DAGR), on page 133	Configures the DAGR timers for sending ARP requests.

arp gratuitous ignore

To ignore receipt of gratuitous Address Resolution Protocol (ARP) packets, use the **arp gratuitous ignore** command in interface configuration mode. To receipt gratuitous ARP packets, use the no form of this command.

arp gratuitous ignore
no arp gratuitous ignore

Syntax Description This command has no keywords or arguments.

Command Default Disabled

Command Modes Interface configuration

Command History	Release	Modification
	Release 4.2.0	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operations
	cef	write

Examples This example shows how to configure **arp gratuitous ignore** command:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# interface gigabitethernet 0/1/0/0
RP/0/RSP0/CPU0:router(config-if)# arp gratuitous ignore
```

Related Commands	Command	Description
	show arp dagr, on page 128	Displays the operational state of all DAGR groups.

arp learning

To enable the dynamic learning of ARP entries for a local subnet or all subnets, use the **arp learning** command.

To disable this command, use the **no** prefix or the **disable** option for this command.

```
arp learning local
no arp learning local
arp learning disable
no arp learning disable
```

Syntax Description	<p>local Enables the dynamic learning of ARP entries for local subnets.</p> <p>When arp learning local is configured on an interface or sub-interface, it learns only the ARP entries from ARP packets on the same subnet.</p> <hr/> <p>disable Disables the dynamic learning of all ARP entries.</p>				
Command Default	This command has no keywords or arguments.				
Command Modes	Interface configuration mode Sub-interface configuration mode				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 4.2.0</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Release 4.2.0	This command was introduced.
Release	Modification				
Release 4.2.0	This command was introduced.				
Usage Guidelines	No specific guidelines impact the use of this command.				
Task ID	<table border="1"> <thead> <tr> <th>Task ID</th> <th>Operations</th> </tr> </thead> <tbody> <tr> <td>cef</td> <td>write</td> </tr> </tbody> </table>	Task ID	Operations	cef	write
Task ID	Operations				
cef	write				

The following example shows how to configure **arp learning local** command that enables the learning of ARP entries for only the local subnet:

```
RP/0/RSP0/CPU0:router(config)#interface GigabitEthernet 0/0/0/1
RP/0/RSP0/CPU0:router(config-if)# ipv4 address 12.1.3.4 255.255.255.0
RP/0/RSP0/CPU0:router(config-if)# arp learning local
RP/0/RSP0/CPU0:router(config-if)# no shut
RP/0/RSP0/CPU0:router(config-if)# commit
```

The following example shows how to configure **arp learning disable** command that disables the learning of all ARP entries.

```
RP/0/RSP0/CPU0:router(config)# interface GigabitEthernet 0/0/0/1
RP/0/RSP0/CPU0:router(config-if)# ipv4 address 12.1.3.4 255.255.255.0
RP/0/RSP0/CPU0:router(config-if)# arp learning disable
```

```
RP/0/RSP0/CPU0:router(config-if)# commit
```

arp purge-delay

To delay purging Address Resolution Protocol (ARP) entries when an interface goes down, use the **arp purge-delay** command in interface configuration mode. To turn off the purge delay feature, use the **no** form of this command.

arp purge-delay *value*
no arp purge-delay *value*

Syntax Description	<i>v value</i> Sets the purge delay time in seconds. Range is 1 to 65535.
---------------------------	---------------------------------------------------------------------------

Command Default	Default value is off.
------------------------	-----------------------

Command Modes	Interface configuration
----------------------	-------------------------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	Use the arp purge-delay command to delay purging ARP entries when an interface goes down. If the interface comes up within the delay time, then the ARP entries are restored to prevent packet loss with Equal Cost Multipath (ECMP) configured.
-------------------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Task ID	Task ID	Operations
	cef	read, write

Examples

The following is an example of setting the purge delay to 50 seconds:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# interface MgmtEth 0/RP1/CPU0/0
RP/0/RSP0/CPU0:router(config-if)# arp purge-delay 50
```

arp timeout

To specify how long dynamic entries learned on an interface remain in the Address Resolution Protocol (ARP) cache, enter the **arp timeout** command in interface configuration mode. To remove the **arp timeout** command from the configuration file and restore the system to its default condition with respect to this command, enter the **no** form of this command.

arp timeout *seconds*
no arp timeout *seconds*

Syntax Description	<i>seconds</i> Indicates the time, in seconds, for which an entry remains in the ARP cache. Range is 30 to 4294967295.
---------------------------	------------------------------------------------------------------------------------------------------------------------

Command Default	Entries remain in the ARP cache for 14,400 seconds (4 hours).
------------------------	---------------------------------------------------------------

Command Modes	Interface configuration
----------------------	-------------------------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	This command is ignored when issued on interfaces that do not use ARP. Also, ARP entries that correspond to the local interface or that are statically configured by the user never time out.
-------------------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

The **arp timeout** command applies only to the interface that is entered. When the timeout is changed for an interface the change applies only to that interface.

The **show interfaces** command displays the ARP timeout value in hours:minutes:seconds, as follows:

```
ARP type: ARPA, ARP Timeout 04:00:00
```

Task ID	Task ID	Operations
	cef	read, write

Examples

The following example shows how to set the ARP timeout to 3600 seconds to allow entries to time out more quickly than the default:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# interface MgmtEth 0/RP1/CPU0/0
RP/0/RSP0/CPU0:router(config-if)# arp timeout 3600
```

Related Commands

Command	Description
clear arp-cache, on page 112	Deletes all dynamic entries from the ARP cache.
show arp, on page 122	Displays the ARP cache.
show interfaces	Displays statistics for all interfaces configured on the networking device. For information on using the show interfaces command, see the <i>Cisco ASR 9000 Series Aggregation Services Router Cisco IOS XR software Interface and Hardware Component Command Reference</i> .

clear arp-cache

To delete all dynamic entries from the Address Resolution Protocol (ARP) cache, clear the fast-switching cache, and clear the IP route cache, use the **clear arp-cache** command in EXEC mode.

To delete all drop adjacencies from the ARP cache, use the **clear arp-cache drop-adjacency** command.

clear arp-cache {**traffic** *type interface-path-id* | **location** *node-id*}

clear arp-cache drop-adjacency {*interface* | *ip-address* | *location*}

Syntax Description

traffic	Deletes statistics on the specified interface.
<i>t type</i>	Interface type. For more information, use the question mark (?) online help function.
<i>interface-path-id</i>	<p>Either a physical interface instance or a virtual interface instance as follows:</p> <ul style="list-style-type: none"> Physical interface instance. Naming notation is <i>rack/slot/module/port</i> and a slash between values is required as part of the notation. <ul style="list-style-type: none"> <i>rack</i>: Chassis number of the rack. <i>slot</i>: Physical slot number of the modular services card or line card. <i>module</i>: Module number. A physical layer interface module (PLIM) is always 0. <i>port</i>: Physical port number of the interface. <p>Note In references to a Management Ethernet interface located on a route processor card, the physical slot number is alphanumeric (RSP0) and the module is CPU0. Example: interface MgmtEth0/RSP0/CPU0/0.</p> <ul style="list-style-type: none"> Virtual interface instance. Number range varies depending on the interface type. <p>For more information about the syntax for the router, use the question mark (?) online help function.</p>
location <i>node-id</i>	Clears the ARP entries for a specified location. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
drop-adjacency	Clears the drop adjacencies for ARP entries.
<i>interface</i> <i>ip-address</i> <i>location</i>	Specifies the interface, ip-address, or location from where the drop adjacencies are to be cleared or deleted.

Command Default No default behavior or values

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.
	Release 6.6.1	The command was modified to enable the deletion of drop adjacencies in the ARP cache.

Usage Guidelines When issued without keywords or arguments, the **clear arp-cache** command clears all entries in the ARP cache.

Configuration of the **clear arp-cache drop-adjacency** command on a particular location is not recommended. If the command is used on a bundle interface, then drop adjacencies may be deleted in one of the line cards and not on other line cards. This scenario can result in entry mismatch. You can use the **clear arp-cache drop-adjacency interface location all** to remove drop adjacency that is learned for the interface on all the line cards.

Task ID	Task ID	Operations
	cef	execute

Examples

The following example shows how to remove traffic statistic entries from the ARP cache that match the specified interface:

```
Router# clear arp-cache traffic gigabitEthernet 0/1/5/1 location 0/1/CPU0
```

The following example shows how to remove entries from the ARP cache that match the specified location:

```
Router# clear arp-cache location 0/1/CPU0
```

This example shows you how to delete drop adjacencies from the ARP cache of an interface:

```
Router# clear arp-cache drop-adjacency tenGigE 0/1/0/0
Router# commit
```

Related Commands	Command	Description
	show arp, on page 122	Displays the ARP cache.

local-proxy-arp

To enable local proxy Address Resolution Protocol (ARP) on an interface, enter the **local-proxy-arp** command in interface configuration mode. To disable local proxy ARP on the interface, enter the **no** form of this command.

local-proxy-arp
no local-proxy-arp

Syntax Description	This command has no keywords or arguments.
---------------------------	--------------------------------------------

Command Default	Local proxy ARP is disabled on all interfaces.
------------------------	------------------------------------------------

Command Modes	Interface configuration
----------------------	-------------------------

Command History	Release	Modification
	Release 4.0.0	This command was introduced.

Usage Guidelines	When local proxy ARP is enabled, the networking device responds to ARP requests that meet all the following conditions:
-------------------------	-------------------------------------------------------------------------------------------------------------------------

- The target IP address in the ARP request, the IP address of the ARP source, and the IP address of the interface on which the ARP request is received are on the same Layer 3 network.
- The next hop for the target IP address is through the same interface as the request is received.

Typically, local proxy ARP is used to resolve MAC addresses to IP addresses in the same Layer 3 network such as, private VLANs that are Layer 2-separated. Local proxy ARP supports all types of interfaces supported by ARP and unnumbered interfaces.

Using the **no** form of the command removes the specified command from the configuration file and restores the system to its default condition with respect to the command.

Task ID	Task ID	Operations
	cef	read, write

Examples

The following example shows how to enable local proxy ARP on TenGigE interface 0/0/0/0:

```
RP/0/RSP0/CPU0:router#(config)# interface TenGigE 0/0/0/0
RP/0/RSP0/CPU0:router#(config-if)# local-proxy-arp
```

peer (DAGR)

To create a Direct Attached Gateway Redundancy (DAGR) group for a virtual IP address, use the **peer** command in DAGR interface configuration mode.

peer ipv4 *IP-address*

Syntax Description	IP-address Virtual IPv4 address for the DAGR group.
---------------------------	-----------------------------------------------------

Command Default	None
------------------------	------

Command Modes	DAGR interface configuration
----------------------	------------------------------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	No specific guidelines impact the use of this command.
-------------------------	--------------------------------------------------------

Task ID	Task ID	Operations
	cef	write

Examples

The following example configures a DAGR group peer:

```
RP/0/RSP0/CPU0:router(config-if-dagr)# peer ipv4 192.168.7.19
RP/0/RSP0/CPU0:router(config-if-dagr-peer)#
```

Related Commands	Command	Description
	arp dagr, on page 105	Configures DAGR.
	priority-timeout, on page 116	Configures the timeout for a high-priority DAGR route.
	route distance, on page 119	Configures the route distances for a given DAGR group.
	route metric, on page 120	Configures the route metrics for a given DAGR group.
	show arp dagr, on page 128	Displays the operational state of all DAGR groups.

priority-timeout

To configure the timer to time out a high-priority Direct Attached Gateway Redundancy (DAGR) route and reverting to normal priority, use the **priority-timeout** command in DAGR peer interface configuration mode.

priority-timeout *time*

Syntax Description	time Time in seconds after which a high-priority route reverts to a normal priority route. The range of values is 1 to 10000.
---------------------------	--------------------------------------------------------------------------------------------------------------------------------------

Command Default	Default for <i>time</i> is 20 seconds.
------------------------	----------------------------------------

Command Modes	DAGR peer interface configuration
----------------------	-----------------------------------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	To use this command, you must be in a user group associated with a task group that includes the proper task IDs. If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.
-------------------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

When this function is applied, the DAGR group configuration is updated in the database.

The new timer values take effect the next time the timer is set. No immediate timer restarts are triggered on the basis of this event.

Task ID	Task ID	Operations
	cef	write

Examples	The following example configures a priority timeout of 25 seconds:
-----------------	--------------------------------------------------------------------

```
RP/0/RSP0/CPU0:router(config-if-dagr-peer)# priority-timeout 25
RP/0/RSP0/CPU0:router(config-if-dagr-peer)#
```

Related Commands	Command	Description
	arp dagr, on page 105	Configures DAGR.
	peer (DAGR), on page 115	Creates a DAGR group for a virtual IP address.
	route distance, on page 119	Configures the route distances for a given DAGR group.
	route metric, on page 120	Configures the route metrics for a given DAGR group.

Command	Description
show arp dagr, on page 128	Displays the operational state of all DAGR groups.
	Configures the DAGR timers for sending ARP requests.

proxy-arp

To enable proxy Address Resolution Protocol (ARP) on an interface, enter the **proxy-arp** command in interface configuration mode. To disable proxy ARP on the interface, enter the **no** form of this command.

proxy-arp
no proxy-arp

Syntax Description This command has no keywords or arguments.

Command Default Proxy ARP is disabled on all interfaces.

Command Modes Interface configuration

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines When proxy ARP is disabled, the networking device responds to ARP requests received on an interface only if one of the following conditions is met:

- The target IP address in the ARP request is the same as the interface IP address on which the request is received.
- The target IP address in the ARP request has a statically configured ARP alias.

When proxy ARP is enabled, the networking device also responds to ARP requests that meet all of the following conditions:

- The target IP address is not on the same physical network (LAN) on which the request is received.
- The networking device has one or more routes to the target IP address.
- All of the routes to the target IP address go through interfaces other than the one on which the request is received.

Using the **no** form of the command removes the specified command from the configuration file and restores the system to its default condition with respect to the command.

Task ID	Task ID	Operations
	cef	read, write

Examples

The following example shows how to enable proxy ARP on MgmtEth interface 0/RP1/CPU0/0:

```
RP/0/RSP0/CPU0:router#(config)# interface MgmtEth 0/RP1/CPU0/0
RP/0/RSP0/CPU0:router#(config-if)# proxy-arp
```

route distance

To configure route distance for a given Direct Attached Gateway Redundancy (DAGR) group, use the **route distance** command in DAGR peer interface configuration mode.

route distance normal *normal-distance* **priority** *priority-distance*

Syntax Description **normal** *normal-distance* Sets normal route (administrative) distance. Range is 0 to 256.

priority *priority-distance* Sets priority route (administrative) distance. Range is 0 to 256.

Command Default Default for *normal-distance* default is 150 and the default for *priority-distance* is 5.

Command Modes DAGR peer interface configuration

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines The default setting for a priority distance takes precedence over that of a typical Internet Gateway Protocol (IGP). The normal distance setting does not.

When this setting is applied, the DAGR group is updated in the database.

Task ID	Task ID	Operations
	cef	write

Examples The following example configures a DAGR group peer with a normal route distance of 48 and priority route distance of 5:

```
RP/0/RSP0/CPU0:router(config-if-dagr-peer) # route distance normal 48 priority 5
RP/0/RSP0/CPU0:router(config-if-dagr-peer) #
```

Related Commands	Command	Description
	arp dagr, on page 105	Configures DAGR.
	peer (DAGR), on page 115	Creates a DAGR group for a virtual IP address.
	priority-timeout, on page 116	Configures the timeout for a high-priority DAGR route.
	route metric, on page 120	Configures the route metrics for a given DAGR group.
	show arp dagr, on page 128	Displays the operational state of all DAGR groups.
	timers (DAGR), on page 133	Configures the DAGR timers for sending ARP requests.

route metric

To configure normal and priority route metrics for a given Direct Attached Gateway Redundancy (DAGR) group, use the **route metric** command in DAGR peer interface configuration mode.

route metric normal *normal-metric* **priority** *priority-metric*

Syntax Description

normal *normal-metric* Sets a normal value for routes installed in the Routing Information Base (RIB). The range of values is 0 to 256.

priority *priority-metric* Sets a priority value for routes installed in the RIB. The range of values is 0 to 256.

Command Default

The default for *normal-metric* is 100, and the default for *priority-metric* is 90.

Command Modes

DAGR peer interface configuration

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

The route metric values are of less significance than the **route distance** command values. Setting a route metric allows the configuration of values for routers installed in the RIB.

When this setting is applied, the DAGR group is updated in the database.

Task ID

Task ID	Operations
cef	write

Examples

The following example configures a DAGR group peer with a normal metric of 48 and a priority metric of 5:

```
RP/0/RSP0/CPU0:router(config-if-dagr-peer)# route metric normal 48 priority 5
RP/0/RSP0/CPU0:router(config-if-dagr-peer)#
```

timers (DAGR), on page 133	Configures the DAGR timers for sending ARP requests.

show arp

To display the Address Resolution Protocol (ARP), enter the **show arp** command in EXEC mode.

show arp *vrf vrf-name* [*{ip-address hardware-address interface-path-id}*] **location** *node-id*

Syntax Description

vrf	(Optional) Specifies VPN routing and forwarding (VRF) instance.
vrf-name	(Optional) VRF instance that identifies a VPN.
ip-address	(Optional) The ARP entries you want to display.
hardware-address	(Optional) The ARP entries that match the 48-bit MAC address are displayed.
interface-path-id	(Optional) Either a physical interface instance or a virtual interface instance as follows: <ul style="list-style-type: none"> Physical interface instance. Naming notation is <i>rack/slot/module/port</i> and a slash between values is required as part of the notation. <ul style="list-style-type: none"> <i>rack</i>: Chassis number of the rack. <i>slot</i>: Physical slot number of the modular services card or line card. <i>module</i>: Module number. A physical layer interface module (PLIM) is always 0. <i>port</i>: Physical port number of the interface. <p>Note In references to a Management Ethernet interface located on a route processor card, the physical slot number is alphanumeric (RSP0) and the module is CPU0. Example: interface MgmtEth0/RSP0/CPU0/0.</p> <ul style="list-style-type: none"> Virtual interface instance. Number range varies depending on the interface type. <p>For more information about the syntax for the router, use the question mark (?) online help function.</p>
location node-id	(Optional) Displays the ARP entry for a specific location. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

Command Default

The active RSP is the default location.

Command Modes

EXEC mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.
Release 6.6.1	The output of the command was modified to include drop adjacencies.

Usage Guidelines

ARP establishes correspondences between network addresses (an IP address, for example) and Ethernet hardware addresses. A record of each correspondence is kept in a cache for a predetermined amount of time. As this time gets over, the records are refreshed after two unicast requests by ARP to the host IP address. If no response is received from the host, then the entry is cleared from the database.

For **show arp** *interface-type interface-instance* form, the **location** and *node-id* keyword and argument is mandatory for Bundle and VLAN-on-Bundle interfaces. These keywords and arguments indicate the location for which the cache entries for the bundle are to be displayed. For physical interfaces, specifying the **location** and *node-id* keyword and argument is optional since the interface can only exist on one node.

```

This table describes the significant fields that are shown in the display.

Table 6: show arp Command Field Descriptions

Field	Description
Address	Displays the network address that corresponds to the hardware address.
Age	Displays the age in hours:minutes:seconds of the cache entry. A hyphen (-) means the address that is local.
Hardware Addr	Displays the LAN hardware address of a MAC address that corresponds to the network address.

Field	Description
State	Displays the current state of the cache entry. Values are: <ul style="list-style-type: none">• Dynamic• Interface• Alias• Static• “-” (indicates global static and alias entries)
Type	Displays the encapsulation type the Cisco IOS XR software is using for the network address in this entry. Value is ARPA.
Interface	Displays the interface that is associated with this network address.

Related Commands

Command	Description
clear arp-cache, on page 112	Deletes all dynamic entries from the ARP cache.

show arp idb

To display the ARP database statistics for an interface, use the **show arp idb** command in EXEC mode.

```
show arp idb interface-name location node-id
```

Syntax Description

interface-name Name of the interface

node-id Location of the interface. LC node for physical interfaces, RP or LC node for virtual interfaces

Command Default

There is no default location, location needs to be provided in the CLI.

Command History

Release	Modification
Release 3.3.0	This command was introduced.

Usage Guidelines

The **show arp idb** command is useful to verify the IP addresses, Mac address, ARP configuration(s) applied on the interface and the entry statistics.

For **show arp idb** *interface-type interface-instance* form, the **location** *node-id* keyword and argument is mandatory for Bundle and VLAN-on-Bundle interfaces to indicate which location the cache entries for the bundle should be displayed.

show arp traffic

To display Address Resolution Protocol (ARP) traffic statistics, enter the **show arp traffic** command in EXEC mode.

show arp traffic [**vrf** *vrf-name*] [*interface-path-id*] [**location** *node-id*]

Syntax Description

vrf	(Optional) Specifies VPN routing and forwarding (VRF) instance.
vrf-name	(Optional) VRF instance that identifies a VPN.
interface- path-id	(Optional) Either a physical interface instance or a virtual interface instance as follows: <ul style="list-style-type: none"> Physical interface instance. Naming notation is <i>rack/slot/module/port</i> and a slash between values is required as part of the notation. <ul style="list-style-type: none"> <i>rack</i>: Chassis number of the rack. <i>slot</i>: Physical slot number of the modular services card or line card. <i>module</i>: Module number. A physical layer interface module (PLIM) is always 0. <i>port</i>: Physical port number of the interface. <p>Note In references to a Management Ethernet interface located on a route processor card, the physical slot number is alphanumeric (RSP0) and the module is CPU0. Example: interface MgmtEth0/RSP0 /CPU0/0.</p> <ul style="list-style-type: none"> Virtual interface instance. Number range varies depending on the interface type. <p>For more information about the syntax for the router, use the question mark (?) online help function.</p>
location <i>node-id</i>	(Optional) Displays the ARP entry for a specific location. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

Command Default

The active RSP is the default location.

Command Modes

EXEC mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.
Release 6.2.1	The command output was modified to include new fields to display subscriber-specific ARP requests, as part of unconditional proxy ARP response feature.
Release 6.6.1	The output of this command was modified to include drop adjacencies.

Usage Guidelines

ARP establishes correspondences between network addresses (an IP address, for example) and Ethernet hardware addresses. A record of each correspondence is kept in a cache for a predetermined amount of time and then discarded.

For **show arp traffic**, *interface-instance*, the **location node-id** keyword and argument is mandatory for Bundle and VLAN-on-Bundle interfaces. These keywords and arguments indicate the location for which the cache entries for the bundle are to be displayed. For physical interfaces, specifying the **location node-id** keyword and argument is optional because the interface can only exist on one node.

Task ID	Operations
cef	read

Examples

The following is sample output from the **show arp traffic** command:

```
Router# show arp traffic

ARP statistics:
  Recv: 2691 requests, 91 replies
  Sent: 67 requests, 2 replies (0 proxy, 1 gratuitous)
  Resolve requests rcvd: 1
  Resolve requests dropped: 0
  Errors: 0 out of memory, 0 no buffers

ARP cache:
  Total ARP entries in cache: 5
  Dynamic: 3, Interface: 1, Standby: 0
  Alias: 0, Static: 0, DHCP:0, DropAdj: 1

  IP Packet drop count for node 0/0/CPU0: 1
```

The following is sample output from the **show arp traffic** command with the **location** keyword and *node-id* argument:

```
Router#show arp traffic location 0/0/CPU0

ARP statistics:
  Recv: 0 requests, 0 replies
  Sent: 0 requests, 0 replies (0 proxy, 0 local proxy, 0 gratuitous)
Subscriber Interface:
    10 requests rcvd, 10 replies sent, 0 gratuitous replies sent
  Resolve requests rcvd: 0
  Resolve requests dropped: 0
  Errors: 0 out of memory, 0 no buffers, 0 out of sunbet
  ARP cache:
  Total ARP entries in cache: 0
  Dynamic: 0, Interface: 0, Standby: 0
  Alias: 0, Static: 0, DHCP: 0
  IP Packet drop count for node 0/0/CPU0: 0
  Total ARP-IDB:0
```

The following is a sample output of **show arp** command with subscriber-specific ARP request counters:

```
Router#show arp traffic location 0/0/CPU0
```

```

ARP statistics:
Recv: 0 requests, 0 replies
Sent: 0 requests, 0 replies (0 proxy, 0 local proxy, 0 gratuitous)
Subscriber Interface:
    10 requests rcv, 10 replies sent, 0 gratuitous replies sent
Resolve requests rcvd: 0
Resolve requests dropped: 0
Errors: 0 out of memory, 0 no buffers, 0 out of sunbet
ARP cache:
Total ARP entries in cache: 0
Dynamic: 0, Interface: 0, Standby: 0
Alias: 0, Static: 0, DHCP: 0

timers (DAGR)

To configure the Direct Attached Gateway Redundancy (DAGR) timers for sending ARP requests, use the **timers** command in DAGR peer interface configuration mode.

timers query query-time standby standby-time

Syntax Description	query query-time	The value is a time (in seconds) between successive ARP requests being sent out to the virtual IP address, when the group is in the query state. The range of values is 1 to 10000.
	standby standby-time	The value is a time (in seconds) between successive ARP requests being sent out to the virtual IP address, when the group is in the standby state. The range of values is 1 to 10000.

Command Default The default for *query-time* is 1 second, and the default for *standby-time* is 20 seconds.

Command Modes DAGR peer interface configuration

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines When this function is applied, the DAGR group configuration is updated in the database. The new timer values take effect the next time the timer is set. No immediate timer restarts are triggered on the basis of this event.

Task ID	Task ID	Operations
	cef	write

Examples The following example configures a DAGR group peer with a query time of 2 and a standby time of 40:

```
RP/0/RSP0/CPU0:router(config-if-dagr-peer)# timers query 2 standby 40
RP/0/RSP0/CPU0:router(config-if-dagr-peer)#
```

Related Commands	Command	Description
	arp dagr, on page 105	Configures DAGR.
	peer (DAGR), on page 115	Creates a DAGR group for a virtual IP address.
	priority-timeout, on page 116	Configures the timeout for a high-priority DAGR route.
	route distance, on page 119	Configures the route distances for a given DAGR group.

Command	Description
route metric, on page 120	Configures the route metrics for a given DAGR group.
show arp dagr, on page 128	Displays the operational state of all DAGR groups.

Cisco Express Forwarding Commands

This chapter describes the commands used to configure and monitor Cisco Express Forwarding (CEF) on a Cisco ASR 9000 Series Aggregation Services Router .

cef adjacency route override rib

To enable the CEF prefer Routing Information Base (RIB) prefixes over Adjacency Information Base (AIB) prefixes in the Global configuration mode. To enable the CEF prefer AIB prefixes over RIB prefixes, use the **no** form of this command.

cef adjacency route override rib

no cef adjacency route override rib

Syntax Description

route	Enables adjacency route configuration
override	Sets override options for the adjacency routes.
rib	Sets options for adjacency routes to override the RIB routes.

Command Default

By default, CEF prefers RIB prefixes over AIB prefixes.

Command Modes

Global configuration

Command History

Release	Modification
Release 6.0	This command was introduced.

Usage Guidelines

CEF may prefer the L2 adjacency for forwarding over the RIB (routing) entry under the following conditions:

- When there is no local ARP entry (yet).
ARP learning may result in the router creating a forwarding entry.
- A forwarding entry of /32 (or /128 for IPv6) RIB routes are overridden when there is a covering connected or attached route.
If an interface has a larger subnet, and you want to redirect a /32 out of that subnet of a different interface via a static route.

This can be seen in scenarios of EVPN and or HSRP, or in bridge domains with a BVI and multiple EFP's.

To deviate from the behavior of preferring a L2 adjacency for forwarding over a route entry, use the **cef adjacency route override rib** command.

Task ID

Task ID	Operation
cef	read, write

Example

The following example shows how to override the CEF adjacency route:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router# cef adjacency route override rib
```

cef load-balancing algorithm adjust

To configure a rotate bit count value to adjust that is rotate the hash result so that it can vary from a next-hop router in a cascaded setup, use the **cef load-balancing algorithm adjust** command in global configuration mode. This command addresses traffic polarization issues in routers in a cascaded setup.

cef load-balancing algorithm adjust *value*

Syntax Description

value This value is subject to a 'modulo' of 4 when applied on ASR 9000 Ethernet Line Card. For example, if the value configured is 10, the actual adjust value applied on ASR 9000 Ethernet Line Cards will be "10 mod 4" which is '2'. ASR 9000 Enhanced Ethernet Line Card will continue using the same adjust value as configured. Range is from 0 to 31.

Note: the hash shift command changes the hash result that is computed by the ingress linecard. This hash change affects both IPv4 and IPv6 for Equal Cost Multipath (ECMP) as well as the Bundle Member selection when used as either a routed (sub)-interface or as attachment circuit (AC) in L2VPN

Command Default

None

Command Modes

Global configuration

Command History

Release	Modification
Release 4.2.3	This command was introduced.

Usage Guidelines

This command has no effect on Layer 3 Multicast IP traffic.

Task ID

Task ID	Operation
config-services	read, write

Example

The following example shows how rotate bit count value to adjust the hash result:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# cef load-balancing algorithm adjust 2
```

cef load-balancing fields

To select the hashing algorithm that is used for load balancing during forwarding, use the **cef load-balancing fields** command in Global Configuration mode. To undo a configuration, use the **no** form of this command.

```
cef load-balancing fields mplsentropy label
no cef load-balancing fields
```

Syntax Description	L3 global	Specifies the Layer 3 load-balancing for the hash algorithm that is based on the following fields: <ul style="list-style-type: none"> • Source IP address—Specifies the source IP address field in the IP packet header. • Destination IP address—Specifies the destination IP address in the IP packet header. • Router ID—Specifies the unique IP address that is assigned to the router. Excludes the following fields from the hash tuple: <ul style="list-style-type: none"> • Source port. • Destination port.
	ipv6 flow-label	Specifies the use of the 20-bit Flow Label field in the IPv6 header as an additional input field for hash algorithms to improve load balancing decisions on Cisco ASR 9000 High Density 100GE Ethernet Line Cards and Cisco ASR 9000 Enhanced Ethernet Line Cards. See RFC 6437 for more details about the IPv6 Flow Label Specification.
Command Default	By default, router ID, source, destination IP address, source, and destination port fields are selected.	
Command Modes	Global Configuration mode	
Command History	Release	Modification
	Release 5.1.1	This command was introduced.

Release	Modification
Release 6.0.1	The ipv6 flow-label keyword was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes the proper task IDs. If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

You can exclude only a Layer 4 configuration.

The existing 5-tuple hash algorithm provides good balancing for packet flows with different Layer 3 and Layer 4 information (for example, source and destination IP addresses and ports). However, in cases where a flow is defined only by source and destination IP addresses, a 3-tuple hashing algorithm is preferred.

The **cef load-balancing fields L3 global** command excludes the source and destination port information from the hash tuple. You can exclude Layer 4 information from the hash tuple only on Cisco ASR 9000 Enhanced Ethernet Line Cards. The **cef load-balancing fields L3 global** command is ignored on the other line cards. The following inputs are processed:

- Source IP address
- Destination IP address
- Router ID

Note This command has no effect on Layer 3 Multicast IP traffic.

Task ID

Task ID	Operations
ipv4	read, write

Examples

The following example shows how to configure Layer 3 and Layer 4 load-balancing for the hash algorithm from the **cef load-balancing fields L3 global** command:

```
RP/0/RSP0/CPU0:router# cef load balacing fields L3 global
```

Related Commands

Command	Description
show cef, on page 173	Displays information about packets forwarded by Cisco Express Forwarding (CEF).
show cef summary, on page 181	Displays summary information for the Cisco Express Forwarding (CEF) table.
show cef ipv4 exact-route, on page 191	Displays an IPv4 Cisco Express Forwarding (CEF) exact route.

Command	Description
show cef ipv4 summary, on page 205	Displays a summary of the IPv4 Cisco Express Forwarding (CEF) table
show cef ipv6 exact-route, on page 220	Displays the path an IPv6 flow comprising a source and destination address would take.
show cef ipv6 summary, on page 232	Displays a summary of the IPv6 Cisco Express Forwarding (CEF) table.

clear adjacency statistics

To clear adjacency packet and byte counter statistics, use the **clear adjacency statistics** command in EXEC mode.

```
clear adjacency statistics [{ipv4 [nexthop ipv4-address] | mpls | ipv6}] [{interface-type
interface-instance | location node-id}]
```

Syntax Description	
ipv4	(Optional) Clears only IPv4 adjacency packet and byte counter statistics.
nexthop <i>ipv4-address</i>	(Optional) Clears adjacency statistics that are destined to the specified IPv4 nexthop.
mpls	(Optional) Clears only MPLS adjacency statistics.
ipv6	(Optional) Clears only IPv6 adjacency statistics.
interface-type	(Optional) Interface type. For more information, use the question mark (?) online help function.
interface-instance	(Optional) Either a physical interface instance or a virtual interface instance: <ul style="list-style-type: none"> Physical interface instance. Naming notation is <i>rack/slot/module/port</i> and a slash mark between values is required as part of the notation. <ul style="list-style-type: none"> <i>rack</i>: Chassis number of the rack. <i>slot</i>: Physical slot number of the line card. <i>module</i>: Module number. A physical layer interface module (PLIM) is always 0. <i>port</i>: Physical port number of the interface. <p>Note In references to a Management Ethernet interface located on a route processor card, the physical slot number is alphanumeric (RSP0) and the module is CPU0. Example: interface MgmtEth0/RSP0</p> <ul style="list-style-type: none"> Virtual interface instance. Number range varies depending on interface type. For more information about the syntax for the router, use the question mark (?) online help function.
location <i>node-id</i>	(Optional) Clears detailed adjacency statistics for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
Command Default	No default behavior or values
Command Modes	EXEC mode

clear adjacency statistics

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines The **clear adjacency statistics** command is useful for troubleshooting network connection and forwarding problems.

If you do not specify any of the optional keywords, all adjacency statistics are cleared for the node on which the command is issued.

Task ID	Task ID	Operations
	basic-services	read, write
	cef	read, write

Related Commands	Command	Description
	show adjacency, on page 169	Displays the IPv4 CEF adjacency table.

clear cef ipv4 drops

To clear Cisco Express Forwarding (CEF) IPv4 packet drop counters, use the **clear cef ipv4 drops** command in EXEC mode.

clear cef ipv4 drops location *node-id*

Syntax Description	location <i>node-id</i> Clears IPv4 packet drop counters for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.						
Command Default	No default behavior or values						
Command Modes	EXEC mode						
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 3.7.2</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Release 3.7.2	This command was introduced.		
Release	Modification						
Release 3.7.2	This command was introduced.						
Usage Guidelines	If you do not specify a node with the location keyword and <i>node-id</i> argument, this command will clear IPv4 CEF drop counters only for the node on which the command is issued.						
Task ID	<table border="1"> <thead> <tr> <th>Task ID</th> <th>Operations</th> </tr> </thead> <tbody> <tr> <td>basic-services</td> <td>read, write</td> </tr> <tr> <td>cef</td> <td>read, write</td> </tr> </tbody> </table>	Task ID	Operations	basic-services	read, write	cef	read, write

Related Commands

Command	Description
show cef ipv4 exceptions, on page 193	Displays IPv4 CEF exception packet counters.

clear cef ipv4 interface bpg-policy-statistics

To clear Cisco Express Forwarding (CEF) IPv4 interface Border Gateway Protocol (BGP) policy statistics, use the **clear cef ipv4 interface bpg-policy-statistics** command in EXEC mode.

clear cef ipv4 interface *type interface-path-id* **bpg-policy-statistics**

Syntax Description	type	Interface type. For more information, use the question mark (?) online help function.
	interface-path-id	Physical interface or virtual interface. Use the show interfaces command to see a list of all interfaces currently configured on the router. For more information about the syntax for the router, use the question mark (?) online help function.

Command Default No default behavior or values

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines This command is not supported on ASR 9000 Ethernet Line Cards. This command clears the Border Gateway Protocol (BGP) policy accounting counters for the specified interface.

Task ID	Task ID	Operations
	basic-services	read, write
	cef	read, write

Examples

The following example shows how to clear IPv4 CEF BGP policy statistics on a tenGigE interface:

```
RP/0/RSP0/CPU0:router# clear cef ipv4 interface tenGigE 0/4/0/0 bpg-policy-statistics
```

Related Commands	Command	Description
	show cef ipv4 interface bpg-policy-statistics, on page 198	Displays IPv4 CEF BGP policy statistics.

clear cef ipv4 interface rpf-statistics

To clear Cisco Express Forwarding (CEF) IPv4 interface unicast reverse path forwarding (RPF) statistics, use the **clear cef ipv4 interface rpf-statistics** command in EXEC mode.

clear cef ipv4 interface *type interface-path-id* **rpf-statistics** [**location** *node-id*]

Syntax Description

type Interface type. For more information, use the question mark (?) online help function.

interface-path-id Either a physical interface instance or a virtual interface instance as follows:

- Physical interface instance. Naming notation is *rack/slot/module/port* and a slash between values is required as part of the notation.
 - *rack*: Chassis number of the rack.
 - *slot*: Physical slot number of the modular services card or line card.
 - *module*: Module number. A physical layer interface module (PLIM) is always 0.
 - *port*: Physical port number of the interface.

Note In references to a Management Ethernet interface located on a route processor card, the physical slot number is alphanumeric (RSP0) and the module is CPU0. Example: interface MgmtEth0/ RSP0

- Virtual interface instance. Number range varies depending on interface type.

For more information about the syntax for the router, use the question mark (?) online help function.

location *node-id* (Optional) Clears IPv4 unicast reverse path forwarding (RPF) counters for the designated node. The *node-id* argument is entered in the *rack/slot/module* notation.

Command Default

No default behavior or values

Command Modes

EXEC mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

The **clear cef ipv4 interface rpf-statistics** command clears the unicast reverse path forwarding (RPF) counters for the specified interface.

Task ID

Task ID	Operations
cef	read

Examples

The following example shows how to clear IPv4 CEF RPF statistics:

```
RP/0/RSP0/CPU0:router# clear cef ipv4 interface tenGigE 0/4/0/0 rpf-statistics
```

clear cef ipv6 drops

To clear Cisco Express Forwarding (CEF) IPv6 packet drop counters, use the **clear cef ipv6 drop** command in EXEC mode.

clear cef ipv6 drops location node-id

Syntax Description	location node-id Clears IPv6 packet drop counters for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
---------------------------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------

Command Default	No default behavior or values
------------------------	-------------------------------

Command Modes	EXEC mode
----------------------	-----------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	If you do not specify a node with the location keyword and <i>node-id</i> argument, this command clears IPv6 CEF drop counters for all nodes.
-------------------------	------------------------------------------------------------------------------------------------------------------------------------------------------

Task ID	Task ID	Operations
	basic-services	read, write
	cef	read, write

Examples

The following example displays sample output for the IPv6 Cisco Express Forwarding (CEF) table packet drop counters, and clears IPv6 CEF drop counters for location 0/1/CPU0:

```
RP/0/RSP0/CPU0:router# clear cef ipv6 drops

Clearing CEF Exception Statistics
```

Related Commands

Command	Description
show cef ipv6 exceptions, on page 222	Displays IPv6 CEF exception packet counters.

clear cef ipv6 interface bgp-policy-statistics

To clear Cisco Express Forwarding (CEF) IPv6 interface Border Gateway Protocol (BGP) policy statistics, use the **clear cef ipv6 interface bgp-policy-statistics** command in EXEC mode.

clear cef ipv6 interface *type interface-path-id* **bgp-policy-statistics**

Syntax Description	type	Interface type. For more information, use the question mark (?) online help function.
	interface-path-id	Physical interface or virtual interface. Use the show interfaces command to see a list of all interfaces currently configured on the router. For more information about the syntax for the router, use the question mark (?) online help function.

Command Default No default behavior or values

Command Modes EXEC mode

Usage Guidelines The **clear cef ipv6 interface bgp-policy-statistics** command clears the Border Gateway Protocol (BGP) policy accounting counters for the specified interface.

Task ID	Task ID	Operations
	basic-services	read, write
	cef	read, write

Examples

The following example shows how to clear IPv6 CEF BGP policy statistics:

```
RP/0/RSP0/CPU0:router# clear cef ipv6 interface MgmtEth 0/CPU0/0 bgp-policy-statistics
```

interface tunnel forwarding adjacency

To enable tunnel as an IPV6 Forwarding-Adjacency (FA), use the **interface tunnel-te forwarding adjacency** command in the global configuration mode. To disable the tunnel as an IPV6 FA, use the **no** form of this command.

```
interface tunnel-te n forwarding-adjacency include-ipv6
no interface tunnel-te n forwarding-adjacency include-ipv6
```

Syntax Description		
	<i>n</i>	Specifies the tunnel interface you want to configure. Range is from 0 to 65535.
	forwarding-adjacency	Enables tunnel as forwarding-adjacency and enter its submenu.
	include-ipv6	Announces tunnel as an IPv6 FA.

Command Default None

Command Modes Global configuration

Command History	Release	Modification
	Release 4.3	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operation
	mpls-te	read, write
	interface	read, write

Example

This example shows how to enable tunnel as an IPv6 FA:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# interface tunnel-te 1 forwarding-adjacency include-ipv6
RP/0/RSP0/CPU0:router(config)#
```

Related Commands

Command	Description
interface tunnel ipv6 enable, on page 159	Enables tunnel as an IPV6 interface.

interface tunnel ipv6 enable

To enable tunnel as an IPV6 interface, use the **interface tunnel ipv6 enable** command in the global configuration mode. To disable the tunnel as an IPV6 interface, use the **no** form of this command.

```
interface tunnel-te n ipv6 enable
no interface tunnel-te n ipv6 enable
```

Syntax Description	<i>n</i>	Specifies the tunnel interface you want to configure. Range is from 0 to 65535.
	ipv6 enable	Enables IPv6 on the interface.

Command Default None

Command Modes Global configuration

Command History	Release	Modification
	Release 4.3	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operation
	network	read, write
	interface	read, write
	ipv6	read, write

Example

This example shows how to enable tunnel as an IPV6 interface:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# interface tunnel-te 1 ipv6 enable
RP/0/RSP0/CPU0:router(config)#
```

Related Commands	Command	Description
	interface tunnel forwarding adjacency, on page 157	Enables tunnel as an IPV6 Forwarding-Adjacency.

ipv4 bgp policy accounting

To enable Border Gateway Protocol (BGP) policy accounting, use the **ipv4 bgp policy accounting** command in interface configuration mode. To disable BGP policy accounting, use the **no** form of this command.

```
ipv4 bgp policy accounting {input | output} {destination-accounting [source-accounting] |
source-accounting [destination-accounting]}
no ipv4 bgp policy accounting {input | output} {destination-accounting [source-accounting] |
source-accounting [destination-accounting]}
```

Syntax Description

input	Enables BGP policy accounting policy on the ingress IPv4 unicast interface.
output	Enables BGP policy accounting policy on the egress IPv4 unicast interface.
{ destination-accounting [source-accounting] source-accounting [destination-accounting]}	<p>When you specify the ingress or egress interface, you must specify one of the following keywords:</p> <ul style="list-style-type: none"> • destination-accounting —Enables accounting policy on the basis of the destination address. • source-accounting —Enables accounting policy on the basis of the source address. <p>After specifying destination-accounting you can optionally specify source-accounting , or after specifying source-accounting , you can optionally specify destination-accounting .</p>

Command Default

There is no BGP policy accounting.

Command Modes

Interface configuration

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes the proper task IDs. If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

When you use the **no** form of the command, accounting is disabled for both the source and destination. To change accounting on either the destination or source address, reconfigure the **ipv4 bgp policy accounting** command specifying the **destination-accounting** or **source-accounting** keyword. In the following example, you want BGP policy accounting disabled on the source address after enabling source and destination address accounting earlier:

```
RP/0/RSP0/CPU0:router(config-if)# ipv4 bgp policy accounting output destination-accounting
```

See the *Routing Configuration Guide for Cisco ASR 9000 Series Routers* for information about configuring a BGP policy. BGP accounting policy is based on community lists, autonomous system numbers, or autonomous system paths.

For BGP policy propagation to function, you must enable BGP.

To specify the accounting policy, the proper route policy configuration must be in place, matching specific BGP attributes using the **set traffic-index** command. In BGP router configuration mode, use the **table-policy** command to modify the accounting buckets when the IP routing table is updated with routes learned from BGP. To display accounting policy information, use the **show cef ipv4 interface bgp-policy-statistics**, **show bgp policy**, and **show route bgp** commands.

This command is not supported on ASR 9000 Ethernet Line Cards.

Task ID

Task ID Operations

network read,
write

Examples

The following example shows how to configure BGP policy accounting:

```
RP/0/RSP0/CPU0:router(config)# interface gigabitethernet pos 0/1/0/0
RP/0/RSP0/CPU0:router(config-if)# ipv4 bgp policy accounting output source-accounting
```

Related Commands

Command	Description
route-policy (BGP)	Defines a route policy. For more information, see <i>Routing Command Reference for Cisco ASR 9000 Series Routers</i>
show bgp policy	Displays information about BGP advertisements under a proposed policy. For more information, see <i>Routing Command Reference for Cisco ASR 9000 Series Routers</i>
show cef ipv4 interface bgp-policy-statistics, on page 198	Displays IPv4 CEF BGP policy statistics.
show route	Displays the current routes for BGP in the RIB. For more information, see <i>Routing Command Reference for Cisco ASR 9000 Series Routers</i>
table-policy	Applies a routing policy to routes being installed into the routing table. For more information, see <i>Routing Command Reference for Cisco ASR 9000 Series Routers</i>

ipv4 bgp policy propagation

To enable QoS Policy Propagation on BGP (QPPB) on an interface, use the **ipv4 bgp policy propagation** command in interface configuration mode. To disable QoS policy propagation on BGP, use the **no** form of this command.

```
ipv4 bgp policy propagation {input} {ip-precedence | qos-group}{destination | source}
```

```
no ipv4 bgp policy propagation {input} {ip-precedence | qos-group}{destination | source}
```

Syntax Description		
input	Enables QPPB on the ingress IPv4 unicast interface.	
ip-precedence	Specifies that the QoS policy is based on the IP precedence.	
qos-group	Specifies that the QoS policy is based on the QoS group ID.	
destination	Specifies that the IP precedence bit or QoS group ID from the destination address entry is used in the route table.	
source	Specifies that the IP precedence bit or QoS group ID from the source address entry is used in the route table.	

Command Default The default is disabled.

Command Modes Interface configuration

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines For the QPPB feature to work, you must enable BGP and CEF. In addition, the proper route-map configuration must be in place to specify the IP precedence or QoS group ID (for example, **set precedence** command).

If you specify both source and destination on the interface, the software looks up the source address in the routing table and classifies the packet based on the source address first; then the software looks up the destination address in the routing table and reclassifies it based on the destination address.

Task ID	Task ID	Operations
	ipv4	read, write
	network	read, write

Examples

The following example shows how to enable QPPB on the GigabitEthernet interface:

The following example shows how to enable QPPB on the Packet-over-SONET/SDH (POS) interface:

```
RP/0/RSP0/CPU0:router(config)# interface gigabitethernet pos 0/1/1/0
RP/0/RSP0/CPU0:router(config-if)# ipv4 address 192.3.1.1 255.255.255.252
RP/0/RSP0/CPU0:router(config-if)# ipv4 bgp policy propagation input ip-precedence destination
```

Related Commands

Command	Description
route-policy (BGP)	Defines a route policy.
show bgp policy	Displays information about BGP advertisements under a proposed policy.
show cef ipv4 interface bgp-policy-statistics , on page 198	Displays IPv4 CEF BGP policy statistics.
show route	Displays the current routes for BGP in the RIB.
table-policy	Applies a routing policy to routes being installed into the routing table. For more information, see <i>Routing Command Reference for Cisco ASR 9000 Series Routers</i>

ipv4 verify unicast source reachable-via

To enable IPv4 unicast Reverse Path Forwarding (RPF) checking, use the **ipv4 verify unicast source reachable-via** command in an appropriate configuration mode. To disable unicast RPF, use the **no** form of this command.

ipv4 verify unicast source reachable-via {**any** | **rx**} [**allow-default**] [**allow-self-ping**]

Syntax Description	any	rx	allow-default	allow-self-ping
	Enables loose unicast RPF checking. If loose unicast RPF is enabled, a packet is not forwarded unless its source prefix exists in the routing table.	Enables strict unicast RPF checking. If strict unicast RPF is enabled, a packet is not forwarded unless its source prefix exists in the routing table and the output interface matches the interface on which the packet was received.	(Optional) Enables the matching of default routes. This option applies to both loose and strict RPF.	(Optional) Enables the router to ping out an interface. This option applies to both loose and strict RPF.

Command Default IPv4 unicast RPF is disabled.

Command Modes Interface configuration

Command History	Release	Modification
	Release 3.7.2	This command was introduced.
	Release 4.2.0	This command was supported in the dynamic template configuration mode for BNG.

Usage Guidelines Use the **ipv4 verify unicast source reachable-via** interface command to mitigate problems caused by malformed or forged (spoofed) IP source addresses that pass through a router. Malformed or forged source addresses can indicate denial-of-service (DoS) attacks based on source IP address spoofing.

When strict unicast RPF is enabled on an interface, the router examines all packets received on that interface. The router checks to make sure that the source address appears in the routing table and matches the interface on which the packet was received.

When loose unicast RPF is enabled on an interface, the router examines all packets received on that interface. The router checks to make sure that the source address can be reached through any of the router interfaces.

Task ID	Task ID	Operations
	ipv4	read, write
	network	read, write
	config-services	read, write

Examples

This example shows how to configure strict RPF on gigabitethernet interface 0/1/0/0:

```
RP/0/RSP0/CPU0:router(config)# interface gigabitethernet 0/1/0/0
RP/0/RSP0/CPU0:router(config-if)# ipv4 verify unicast source reachable-via rx
```

This example shows how to configure loose RPF on gigabitethernet interface 0/0/0/1:

```
RP/0/RSP0/CPU0:routerios(config)# interface gigabitethernet 0/0/0/1
RP/0/RSP0/CPU0:routerios(config-if)# ipv4 verify unicast source reachable-via any
```

ipv6 verify unicast source reachable-via

To enable IPv6 unicast Reverse Path Forwarding (RPF) checking, use the **ipv6 verify unicast source reachable-via** command in interface configuration mode. To disable IPv6 unicast RPF checking, use the **no** form of this command.

ipv6 verify unicast source reachable-via {any | rx} [allow-default] [allow-self-ping]
no ipv6 verify unicast source reachable-via {any | rx} [allow-default] [allow-self-ping]

Syntax Description		
any	Enables loose unicast RPF checking. If loose unicast RPF is enabled, a packet is not forwarded unless its source prefix exists in the routing table.	
rx	Enables strict unicast RPF checking. If strict unicast RPF is enabled, a packet is not forwarded unless its source prefix exists in the routing table and the output interface matches the interface on which the packet was received.	
allow-default	(Optional) Enables the matching of default routes. This option applies to both loose and strict RPF.	
allow-self-ping	(Optional) Enables the router to ping out an interface. This option applies to both loose and strict RPF.	

Command Default Loose IPv6 unicast RPF is disabled.

Command Modes Interface configuration

Command History	Release	Modification
	Release 4.1.1	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operations
	network	read, write
	ipv6	read, write

Examples

The following example shows how to enable loose RPF checking on POS interface 0/1/0/0:

```
RP/0/RSP0/CPU0:router(config)# interface pos 0/1/0/0
RP/0/RSP0/CPU0:router(config-if)# ipv6 verify unicast source reachable-via any
```

The following example shows how to configure strict RPF on gigabitethernet interface 0/1/0/0:

```
RP/0/RSP0/CPU0:router(config)# interface gigabitethernet 0/1/0/0
RP/0/RSP0/CPU0:router(config-if)# ipv6 verify unicast source reachable-via rx
```

The following example shows how to configure loose RPF on gigabitethernet interface 0/0/0/1 :

```
RP/0/RSP0/CPU0:routerios(config)# interface gigabitethernet 0/0/0/1
RP/0/RSP0/CPU0:routerios(config-if)# ipv6 verify unicast source reachable-via any
```

Related Commands

Command	Description
ipv4 verify unicast source reachable-via , on page 164	Enables IPv4 unicast RPF checking.

rp mgmtethernet forwarding

To enable switching from the line card to the route processor Management Ethernet interfaces, use the **rp mgmtethernet forwarding** command in Global Configuration mode. To disable switching from the modular services card to the route processor Management Ethernet interfaces, use the **no** form of this command.

rp mgmtethernet forwarding
no rp mgmtethernet forwarding

Syntax Description This command has no keywords or arguments.

Command Default Switching is disabled.

Command Modes Global Configuration mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced .

Usage Guidelines The rp mgmtethernet forwarding command needs LC reload to take effect.

Note If enabled, the RP CPU is used to forward packets because the RP does not have a packet processing engine like the line cards.

Task ID	Task ID	Operations
	cef	read, write

Examples

The following example shows how to enable switching from the modular services card to the RP Management Ethernet interfaces:

```
RP/0/RSP0/CPU0:router(config)# rp mgmtethernet forwarding
```

show adjacency

To display Cisco Express Forwarding (CEF) adjacency table information, use the **show adjacency** command in EXEC mode.

```
show adjacency [{ ipv4 [ nexthop ipv4-address ] | mpls | ipv6 }] [ interface type
interface-instance ] [summary] [internal] [remote] [detail] [location node-id ]
```

Syntax	Description
ipv4	(Optional) Displays only IPv4 adjacencies.
nexthop <i>ipv4-address</i>	(Optional) Displays adjacencies that are destined to the specified IPv4 nexthop.
mpls	(Optional) Displays only MPLS adjacencies.
ipv6	(Optional) Displays only IPv6 adjacencies.
interface-type	(Optional) Interface type. For more information, use the question mark (?) online help function.
<i>interface-instance</i>	<p>Either a physical interface instance or a virtual interface instance:</p> <ul style="list-style-type: none"> Physical interface instance. Naming notation is <i>rack/slot/module/port</i> and a slash mark between values is required as part of the notation. <ul style="list-style-type: none"> <i>rack</i>: Chassis number of the rack. <i>slot</i>: Physical slot number of the line card. <i>module</i>: Module number. A physical layer interface module (PLIM) is always 0. <i>port</i>: Physical port number of the interface. <p>Note In references to a Management Ethernet interface located on a route processor card, the physical slot number is alphanumeric (RSP0) and the module is CPU0. Example: interface MgmtEth0/RSP0</p> <ul style="list-style-type: none"> Virtual interface instance. Number range varies depending on interface type. <p>For more information about the syntax for the router, use the question mark (?) online help function.</p>
summary	Displays summary of CEF IPv4, IPv6, MPLS adjacency counts for complete and incomplete entries in the adjacency table.
internal	Displays interfaces with internal HEX adjacencies and their hash values.
remote	(Optional) Displays only remote adjacencies. A remote adjacency is an internal adjacency used to forward packets between line cards.
detail	(Optional) Displays detailed adjacency information, including Layer 2 information.

location *node-id* (Optional) Displays detailed CEF information for the designated node. The *node-id* argument is entered in the *rack/slot/module* notation.

Command Default No default behavior or values

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines This command is used to verify that an adjacency exists for a connected device, that the adjacency is valid, and that the MAC header rewrite string is correct.

If you do not specify a node with the **location** keyword and *node-id* argument, this command displays the CEF adjacency table for the node on which the command is issued.

Task ID	Task ID	Operations
	cef	read

Examples

The following is sample output from **show adjacency** command with the **location** keyword specified:

```
RP/0/RSP0/CPU0:router# show adjacency location 0/0/CPU0

Interface Address Version Refcount Protocol

```

This table describes the significant fields shown in the display.

Table 7: show adjacency Command Field Descriptions

Field	Description
Interface	Outgoing interface associated with the adjacency.
Address	Address can represent one of these addresses: <ul style="list-style-type: none"> • Next hop IPv4 or IPv6 address • Point-to-Point address Information in parentheses indicates different types of adjacency.
Version	Version number of the adjacency. Updated whenever the adjacency is updated.
Refcount	Number of references to this adjacency.
Protocol	Protocol for which the adjacency is associated.

show adjacency

Field	Description
0f000800 and 000c86f33d330800453a21c10800	Layer 2 encapsulation string.
mtu	Value of the maximum transmission unit (MTU).
flags	Internal field.
packets	Number of packets going through the adjacency.
bytes	Number of bytes going through the adjacency.

Related Commands

Command	Description
clear adjacency statistics, on page 143	Clears the IPv4 CEF adjacency table.

show cef

To display information about packets forwarded by Cisco Express Forwarding (CEF), use the **show cef** command in EXEC mode.

```
show cef [prefix [mask]] [{hardware {egress | ingress} | detail}] [location {node-id | all}]
```

Syntax Description	
prefix	(Optional) Longest matching CEF entry for the specified IPv4 destination prefix.
mask	(Optional) Exact CEF entry for the specified IPv4 prefix and mask.
hardware	(Optional) Displays detailed information about hardware.
egress	Displays information from the egress packet switch exchange (PSE) file.
ingress	Displays information from the ingress packet switch exchange (PSE) file.
detail	(Optional) Displays full details.
location <i>node-id</i>	(Optional) Displays detailed CEF information for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
all	(Optional) Displays all locations.

Command Default When the prefix is not explicitly specified, this command displays all the IPv4 prefixes that are present in CEF. When not specified, the location defaults to the active Route Processor (RP) node.

Command Modes EXEC mode

	cef	read

Examples

The following example shows how to use the **show cef bgp-attribute** command:

```
RP/0/RSP0/CPU0:router# show cef bgp-attribute

Total number of entries: 75742
BGP Attribute ID: 0x2058a, Local Attribute ID: 0x1
  Origin AS:      195, Next Hop AS:      195
BGP Attribute ID: 0x20583, Local Attribute ID: 0x2
  Origin AS:      22, Next Hop AS:      22
BGP Attribute ID: 0x20582, Local Attribute ID: 0x3
  Origin AS:      21, Next Hop AS:      21
BGP Attribute ID: 0x20585, Local Attribute ID: 0x4
  Origin AS:      28, Next Hop AS:      28
BGP Attribute ID: 0x20584, Local Attribute ID: 0x5
  Origin AS:      27, Next Hop AS:      27
BGP Attribute ID: 0x2057f, Local Attribute ID: 0x6
  Origin AS:      86, Next Hop AS:      86
BGP Attribute ID: 0x2058b, Local Attribute ID: 0x7
  Origin AS:      196, Next Hop AS:      196
BGP Attribute ID: 0x20589, Local Attribute ID: 0x8
  Origin AS:      194, Next Hop AS:      194
```

This table describes the significant fields shown in the display.

Table 8: show cef bgp-attribute Command Field Descriptions

Field	Description
BGP Attribute ID	Displays the id assigned by BGP.
Local Attribute ID	Displays the id assigned by FIB.
Origin AS	Displays the origin AS of the prefix that carries this attribute id.
Next Hop AS	Displays the AS that contains the BGP nexthop for this prefix.

Related Commands

Command	Description
show cef, on page 173	Displays information about packets forwarded by Cisco Express Forwarding (CEF).

show cef external

To display Cisco Express Forwarding (CEF) external client dependency information, use the **show cef external** command in EXEC mode.

```
show cef external [hardware {ingress | egress}] [prefix] {ifhandle | tunnel-id | client-name} {6vpe
| 6vpe-ipvpn | eos0-ldi | ip-reachability} [detail] [location node-id]
```

Syntax Description	
hardware	(Optional) Displays hardware information.
ingress	(Optional) Displays hardware information programmed in ingress packet forwarding hardware.
egress	(Optional) Displays hardware information programmed in egress packet forwarding hardware.
prefix	(Optional) Displays external client information for a specific prefix.
ifhandle	Specifies interface handle.
tunnel-id	Specifies the tunnel identifier.
client-name	Name of a particular client. The dependency information for the given client name is displayed.
6vpe	Displays 6VPE (IPv6 VPN Provide Edge) dependency information.
6vpe-ipvpn	Displays 6VPE over IP-VPN dependency information.
eos0-ldi	Displays Multiprotocol Label Switching (MPLS) end of stack 0 (EOS0) load balancing dependency information.
ip-reachability	Displays Internet Protocol (IP) reachability information.
detail	(Optional) Displays the dependency information in detail.
location <i>node-id</i>	(Optional) Displays external client dependency information for the specified node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

Command Default No default behavior or values

show cef, on page 173	Displays information about packets forwarded by Cisco Express Forwarding (CEF).				

show cef summary

To display summary information for the Cisco Express Forwarding (CEF) table, use the **show cef summary** command in EXEC mode.

```
show cef summary [location {node-id | all}]
```

Syntax Description	
	location <i>node-id</i> (Optional) Displays detailed CEF information for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
	all (Optional) Displays all locations.

Command Default The **show cef summary** command assumes the IPv4 CEF table and the active RP node as the location.

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operations
	cef	read

Examples

The following sample output is from the **show cef summary** command.

```
RP/0/RSP0/CPU0:router# show cef summary location 0/1/CPU0

Router ID is 10.1.1.1

IP CEF with switching (Table Version 0) for node0_1_CPU0

Load balancing: L3
Tableid 0xe0000000, Vrfid 0x60000000, Vrid 0x20000000, Flags 0x301
Vrfname default, Refcount 318
170 routes, 0 reresolve, 0 unresolved (0 old, 0 new), 12240 bytes
183 load sharing elements, 57292 bytes, 184 references
19 shared load sharing elements, 7036 bytes
164 exclusive load sharing elements, 50256 bytes
0 CEF route update drops, 10 revisions of existing leaves
Resolution Timer: 15s
0 prefixes modified in place
0 deleted stale prefixes
21 prefixes with label imposition, 60 prefixes with label information
Adjacency Table has 49 adjacencies
25 incomplete adjacencies
```

This table describes the significant fields shown in the display.

Table 9: show cef summary Command Field Descriptions

Field	Description
Load balancing	Current load-balancing mode. The default value is L3.
Table Version	Version of the CEF table.
tableid	Table identification number.
vrfname	VRF name.
flags	Option value for the table
routes	Total number of routes.
rerresolve	Total number of routes being reresolved.
unresolved (<i>x</i> old, <i>x</i> new)	Number of routes not yet resolved.
load sharing elements	Total number of internal load-sharing data structures.
bytes	Total memory used by internal load sharing data structures.
references	Total reference count of all internal load sharing data structures.
CEF resets	Number of CEF table resets.
revisions of existing leaves	Number of updates to existing prefixes.
Exponential (currently <i>xs</i> , peak <i>xs</i>)	Currently not used.
prefixes modified in place	Prefixes modified in place.
Adjacency Table has <i>x</i> adjacencies	Total number of adjacencies.
<i>x</i> incomplete adjacency	Total number of incomplete adjacencies.

Related Commands

Command	Description
show cef, on page 173	Displays information about packets forwarded by Cisco Express Forwarding (CEF).

show cef ipv4

To display the IPv4 Cisco Express Forwarding (CEF) table, use the **show cef ipv4** command in EXEC mode.

```
show cef [vrf vrf-name] ipv4 [{prefix [mask] | interface-type interface-instance}] [detail] [location node-id]
```

Syntax	Description
vrf	(Optional) Displays VPN routing and forwarding (VRF) instance information.
vrf-name	(Optional) Name of a VRF.
prefix	(Optional) Longest matching CEF entry for the specified IPv4 destination prefix.
mask	(Optional) Exact CEF entry for the specified IPv4 prefix and mask.
interface-type	(Optional) Interface type. For more information, use the question mark (?) online help function.
interface-instance	<p>Either a physical interface instance or a virtual interface instance:</p> <ul style="list-style-type: none"> Physical interface instance. Naming notation is <i>rack/slot/module/port</i> and a slash mark between values is required as part of the notation. <ul style="list-style-type: none"> <i>rack</i>: Chassis number of the rack. <i>slot</i>: Physical slot number of the line card. <i>module</i>: Module number. A physical layer interface module (PLIM) is always 0. <i>port</i>: Physical port number of the interface. <p>Note In references to a Management Ethernet interface located on a route processor card, the physical slot number is alphanumeric (RSP0) and the module is CPU0. Example: interface MgmtEth0/RSP0 /CPU0/0.</p> <ul style="list-style-type: none"> Virtual interface instance. Number range varies depending on interface type. <p>For more information about the syntax for the router, use the question mark (?) online help function.</p>
detail	(Optional) Displays full CEF entry information.
location node-id	(Optional) Displays the IPv4 CEF table for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

Command Default If the location is not specified, the command defaults to the active RP node.

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines If you do not specify a node with the **location** keyword and *node-id* argument, this command displays the CEF table on the node in which the command is issued. Otherwise, the command is effective on the node specified by the **location** *node-id* keyword and argument.

10.25.255.255/32 10.25.255.255    MgmtEth0/RSP0/CPU0/0
10.0.0.0/4      0.0.0.0
10.0.0.1/32     0.0.0.0
10.255.255.255/32 broadcast
```

This table describes the significant fields shown in the display.

Table 10: show cef ipv4 Command Field Descriptions

Field	Description
Prefix	Prefix in the IPv4 CEF table.
Next Hop	Next hop of the prefix.
Interface	Interface associated with the prefix.

show cef ipv4 adjacency

To display Cisco Express Forwarding (CEF) IPv4 adjacency status and configuration information, use the **show cef ipv4 adjacency** command in EXEC mode.

```
show cef [vrf vrf-name] ipv4 adjacency [interface-type interface-path-id] [location node-id] [detail]
[discard] [glean] [null] [punt] [remote] [protected]
```

Syntax Description

vrf	(Optional) Displays VPN routing and forwarding (VRF) instance information.
vrf-name	(Optional) Name of a VRF.
interface-type	(Optional) Interface type. For more information, use the question mark (?) online help function.
<i>interface-path-id</i>	(Optional) Either a physical interface instance or a virtual interface instance: <ul style="list-style-type: none"> Physical interface instance. Naming notation is <i>rack/slot/module/port</i> and a slash mark between values is required as part of the notation. <ul style="list-style-type: none"> <i>rack</i>: Chassis number of the rack. <i>slot</i>: Physical slot number of the line card. <i>module</i>: Module number. A physical layer interface module (PLIM) is always 0. <i>port</i>: Physical port number of the interface. Virtual interface instance. Number range varies depending on interface type. <p>Note In references to a Management Ethernet interface located on a route processor card, the physical slot number is alphanumeric (RSP0) and the module is CPU0. Example: interface MgmtEth0/RSP0 /CPU0/0.</p>
location <i>node-id</i>	(Optional) Displays detailed CEF information for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
detail	(Optional) Displays the detailed adjacency information.
discard	(Optional) Filters out and displays only the discarded adjacency information.
glean	(Optional) Filters out and displays only the glean adjacency information.
null	(Optional) Filters out and displays only the adjacency information.
punt	(Optional) Filters out and displays only the punt adjacency information.
remote	(Optional) Filters out and displays only the remote adjacency information.

For more information about the syntax for the router, use the question mark (?) online help function.

show cef ipv4 adjacency

protected (Optional) Filters out and displays only the IP-Fast Reroute (FRR) protected adjacency information.

Command Default No default behavior or values

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines If you do not specify a node with the **location** keyword and *node-id* argument, the **show cef ipv4 adjacency** command displays the CEF adjacency table for the node on which the command is issued.

Task ID	Task ID	Operations
	cef	read

Examples

The following sample output is from **show cef ipv4 adjacency** command :

```
RP/0/RSP0/CPU0:router:# show cef ipv4 adjacency MgmtEth 0/RSP0/CPU0/0
Display protocol is ipv4
Interface      Address                               Type      Refcount
Mg0/RSP0/CPU0/0Prefix: 10.25.0.3/32      local      2

```

This table describes the significant fields shown in the display.

Table 11: show cef ipv4 adjacency Command Field Descriptions

Field	Description
Interface	Interface associated with the prefix.
Address	Prefix address information.
Type	Type of adjacency, can be either local or remote.
Refcount	Number of times the adjacency is referenced by other routers.

show cef ipv4 adjacency hardware

To display Cisco Express Forwarding (CEF) IPv4 adjacency hardware status and configuration information, use the **show cef ipv4 adjacency hardware** command in EXEC mode.

show cef [**vrf** *vrf-name*] **ipv4 adjacency hardware** {**egress** | **ingress**} [{**detail** | **discard** | **drop** | **glean** | **location** *node-id* | **null** | **punt** | **protected** | **remote**}]

Syntax Description		
vrf	(Optional)	Displays VPN routing and forwarding (VRF) instance information.
vrf-name	(Optional)	Name of a VRF.
egress		Displays information from the egress packet switch exchange (PSE) file.
ingress		Displays information from the ingress packet switch exchange (PSE) file.
detail	(Optional)	Displays full details.
discard	(Optional)	Displays the discard adjacency information.
drop	(Optional)	Displays the drop adjacency information.
glean	(Optional)	Displays the glean adjacency information.
location <i>node-id</i>	(Optional)	Displays detailed CEF information for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
null	(Optional)	Displays the null adjacency information.
punt	(Optional)	Displays the punt adjacency information.
protected	(Optional)	Filters out and displays only the IP-Fast Reroute (FRR) protected adjacency information.
remote	(Optional)	Displays the remote adjacency information.

Command Default No default behavior or values

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Field	Description
Interface	Interface associated with the prefix.
Address	Prefix address information.
Type	Type of adjacency, can be either local or remote.
Refcount	Number of times the adjacency is referenced by other routers.

show cef ipv4 drops

To display IPv4 Cisco Express Forwarding (CEF) table packet drop counters, use the **show cef ipv4 drops** command in EXEC mode.

```
show cef [vrf vrf-name] ipv4 drops [location node-id]
```

Syntax Description	
vrf	(Optional) Displays VPN routing and forwarding (VRF) instance information.
vrf-name	(Optional) Name of a VRF.
location node-id	(Optional) Displays IPv4 CEF table packet drop counters for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

Command Default No default behavior or values

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines A packet might be dropped from the IPv4 CEF table because of unresolved CEF entries, unsupported features, absence of route information, absence of adjacency information, or an IP checksum error.

If you do not specify a node with the **location** keyword and *node-id* argument, this command displays IPv4 CEF packet drop counters for all nodes.

Task ID	Task ID	Operations
	cef	read

Examples

The following is sample output from the **show cef ipv4 drops** for location command:

```
RP/0/RSP0/CPU0:router# show cef ipv4 drops

CEF Drop Statistics
Node: 0/0/CPU0
  Unresolved drops    packets :      0
  Unsupported drops   packets :      0
  Null0 drops         packets :      0
  No route drops      packets :      0
  No Adjacency drops  packets :      0
  Checksum error drops packets :      0
  RPF drops           packets :      0
  RPF suppressed drops packets :      0
  RP destined drops   packets :      0
```

Table 13: show cef ipv4 drop Command Field Descriptions

Field	Description
Unresolved drops	Drops due to unresolved routes.
Unsupported drops	Drops due to an unsupported feature.
Null0 drops	Drops to the Null0 interface.
No route drops	Number of packets dropped because there were no routes to the destination.
No Adjacency drops	Number of packets dropped because there were no adjacencies established.
Checksum error drops	Drops due to IPv4 checksum error.
RPF drops	Drops due to IPv4 unicast RPF ¹ .
RPF suppressed drops	Drops suppressed due to IPv4 unicast RPF.
RP destined drops	Drops destined for the router.

¹ RPF = Reverse Path Forwarding

Related Commands

Command	Description
clear cef ipv4 drops, on page 145	Clears IPv4 CEF packet drop counters.

show cef ipv4 exact-route

To display an IPv4 Cisco Express Forwarding (CEF) exact route, use the **show cef ipv4 exact-route** command in EXEC mode.

```
show cef [vrf vrf-name] ipv4 exact-route {source-address destination-address} [protocol protocol-name]
[source-port source-port] [destination-port destination-port] [ingress-interface type
interface-path-id] [policy-class value] [detail | location node-id]
```

Syntax Description	
vrf	(Optional) Displays VPN routing and forwarding (VRF) instance information.
vrf-name	(Optional) Name of a VRF.
source-address	The IPv4 source address in x.x.x.x format.
destination-address	The IPv4 destination address in x.x.x.x format.
protocol <i>protocol name</i>	(Optional) Displays the specified protocol for the route.
source-port <i>source-port</i>	(Optional) Sets the UDP source port. The range is from 0 to 65535.
destination-port <i>destination-port</i>	(Optional) Sets the UDP destination port. The range is from 0 to 65535.
ingress-interface	(Optional) Sets the ingress interface.
type	(Optional) Interface type. For more information, use the question mark (?) online help function.
interface-path-id	Physical interface or virtual interface. Note Use the show interfaces command to see a list of all interfaces currently configured on the router. For more information about the syntax for the router, use the question mark (?) online help function.
policy-class <i>value</i>	(Optional) Displays the class for the policy-based tunnel selection. The range for the tunnel policy class value is from 1 to 7.
detail	(Optional) Displays full CEF entry information.
location <i>node-id</i>	(Optional) Displays the IPv4 CEF table for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

Command Default No default behavior or values

Command Modes EXEC mode

show cef ipv4 exact-route

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines If the Layer 4 information is enabled, the source-port, destination-port, protocol, and ingress-interface fields are required. Otherwise, the output of the **show cef ipv4 exact-route** command is not correct.

Task ID	Task ID	Operations
	cef	read

Examples

The following sample output is from the **show cef ipv4 exact-route** command:

```
RP/0/RSP0/CPU0:router# show cef ipv4 exact-route 10.1.1.1 10.1.1.2 detail
0.0.0.0/0, version 432, proxy default, internal 0x2000201[1]
  Prefix Len 0, traffic index 0, precedence routine (0)
  via MgmtEth0/RSP0RP1/CPU0/0
```

This table describes the significant fields shown in the display.

Table 14: show cef ipv4 exact-route Command Field Descriptions

Field	Description
Prefix	Prefix in the IPv4 CEF table .
Next Hop	Next hop of the prefix
Interface	Interface associated with the prefix

Related Commands	Command	Description
	show mpls forwarding exact-route	Displays the path an MPLS flow that comprises a source and destination address would take.

show cef ipv4 exceptions

To display IPv4 Cisco Express Forwarding (CEF) exception packet counters, use the **show cef ipv4 exceptions** command in EXEC mode.

```
show cef [vrf vrf-name] ipv4 exceptions [location node-id]
```

Syntax Description	
vrf	(Optional) Displays VPN routing and forwarding (VRF) instance information.
vrf-name	(Optional) Name of a VRF.
location node-id	(Optional) Displays CEF exception packet counters for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

Command Default No default behavior or values

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines CEF exception packets are those packets that have been sent from the hardware to the software because they require additional handling. The types of IPv4 CEF exception packets are displayed in the command's output and are defined.

If you do not specify a node with the **location** keyword and *node-id* argument, this command displays IPv4 CEF exception packet counters on all nodes.

Task ID	Task ID	Operations
	cef	read

Examples

The following is sample output from the **show cef ipv4 exceptions** command:

```
RP/0/RSP0/CPU0:router# show cef ipv4 exceptions

CEF Exception Statistics
Node: 0/0/CPU0
  Slow encap packets :           0
  Redirect packets :           0
  Receive packets :       306404
  Broadcast packets :           0
  IP options packets :           0
  TTL expired packets :           0
  Fragmented packets :           0
Node: 0/1/CPU0
  Slow encap packets :           0
```

show cef ipv4 exceptions

```

Redirect packets : 0
Receive packets : 0
Broadcast packets : 0
IP options packets : 0
TTL expired packets : 0
Fragmented packets : 0
Node: 0/2/CPU0
Slow encap packets : 0
Redirect packets : 0 Receive packets : 0
Broadcast packets : 0
IP options packets : 0
TTL expired packets : 314
Fragmented packets : 0
Node: 0/3/CPU0
Slow encap packets : 0
Redirect packets : 0
Receive packets : 0
Broadcast packets : 0
IP options packets : 0
TTL expired packets : 0
Fragmented packets : 0

```

This table describes the significant fields shown in the display.

Table 15: show cef ipv4 exceptions Command Field Descriptions

Field	Description
Slow encap	Number of packets requiring special processing during encapsulation.
Redirect	Number of ICMP ² redirect messages sent.
Receive	Number of packets destined to the router.
Broadcast	Number of broadcasts received.
IP options	Number of IP option packets.
TTL expired	Number of packets with expired TTLs ³ .
Fragmented	Number of packets that have been fragmented.

² ICMP = internet control message protocol

³ TTL = time to live

Related Commands

Command	Description
clear cef ipv4 exceptions, on page 147	Clears IPv4 CEF exception packet counters.

show cef ipv4 hardware

To display Cisco Express Forwarding (CEF) IPv4 hardware status and configuration information, use the **show cef ipv4 hardware** command in EXEC mode.

```
show cef [vrf vrf-name] ipv4 hardware {egress | ingress [{detail | location node-id}]}
```

Syntax Description	
vrf	(Optional) Displays VPN routing and forwarding (VRF) instance information.
vrf-name	(Optional) Name of a VRF.
egress	Displays information from the egress packet switch exchange (PSE) file.
ingress	Displays information from the ingress packet switch exchange (PSE) file.
detail	(Optional) Displays full details.
location <i>node-id</i>	(Optional) Displays detailed CEF information for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

Command Default No default behavior or values

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operations
	cef	read

show cef ipv4 interface

To display IPv4 Cisco Express Forwarding (CEF)-related information for an interface, use the **show cef ipv4 interface** command in EXEC mode.

```
show cef [vrf vrf-name] ipv4 interface type interface-path-id [detail] [location node-id]
```

Syntax Description

vrf	(Optional) Displays VPN routing and forwarding (VRF) instance information.
vrf-name	(Optional) Name of a VRF.
type	Interface type. For more information, use the question mark (?) online help function.
in interface-path-id	<p>Either a physical interface instance or a virtual interface instance as follows:</p> <ul style="list-style-type: none"> Physical interface instance. Naming notation is <i>rack/slot/module/port</i> and a slash between values is required as part of the notation. <ul style="list-style-type: none"> <i>rack</i>: Chassis number of the rack. <i>slot</i>: Physical slot number of the modular services card or line card. <i>module</i>: Module number. A physical layer interface module (PLIM) is always 0. <i>port</i>: Physical port number of the interface. <p>Note In references to a Management Ethernet interface located on a route processor card, the physical slot number is alphanumeric (RSP0) and the module is CPU0. Example: interface MgmtEth0/RSP0 /CPU0/0.</p> <ul style="list-style-type: none"> Virtual interface instance. Number range varies depending on interface type. <p>For more information about the syntax for the router, use the question mark (?) online help function.</p>
detail	(Optional) Displays detailed CEF information for all the interfaces on the node in which the command is issued.
location <i>node-id</i>	(Optional) Displays IPv4 CEF-related information for an interface. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

Command Default

No default behavior or values

Command Modes

EXEC mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

If you do not specify a node with the **location** keyword and *node-id* argument, the **show cef ipv4 interface rpf-statistics** command displays the CEF-related information for the interface on the route processor.

Task ID

Task ID	Operations
cef	read

Examples

The following is sample output from the **show cef ipv4 interface** command:

```
RP/0/RSP0/CPU0:router# show cef ipv4 interface MgmtEth 0/RSP0/CPU0/0
MgmtEth0/0/CPU0/0 is up (if_handle 0x01000100)
  Forwarding is enabled
  ICMP redirects are never sent
  IP MTU 1500, TableId 0xe0000000
  Reference count 2
```

This table describes the significant fields shown in the display.

Table 16: show cef ipv4 interface Command Field Descriptions

Field	Description
MgmtEth 0/RSP0/CPU0/0 is up	Status of the interface.
if_handle	Internal interface handle.
Forwarding is enabled	Indicates that Cisco Express Forwarding (CEF) is enabled.
ICMP redirects are always sent or never sent	Indicates whether ICMP ⁴ redirect messages should be sent. By default, ICMP redirect messages are always sent.
IP MTU	Value of the IPv4 MTU ⁵ size set on the interface.
Reference count	Internal reference counter.

⁴ ICMP = internet control message protocol

⁵ MTU = maximum transmission unit

show cef ipv4 interface bgp-policy-statistics

To display IPv4 Cisco Express Forwarding (CEF)-related Border Gateway Protocol (BGP) policy statistics information for an interface, use the **show cef ipv4 interface bgp-policy-statistics** command in EXEC mode.

show cef [**vrf** *vrf-name*] **ipv4 interface** *type interface-path-id* **bgp-policy-statistics** [**location** *node-id*]

Syntax Description

vrf	(Optional) Displays VPN routing and forwarding (VRF) instance information.
vrf-name	(Optional) Name of a VRF.
type	Interface type. For more information, use the question mark (?) online help function.
interface-path-id	Physical interface or virtual interface. Note Use the show interfaces command to see a list of all interfaces currently configured on the router. For more information about the syntax for the router, use the question mark (?) online help function.
location node-id	(Optional) Displays IPv4 CEF-related information for an interface. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

Command Default

No default behavior or values

Command Modes

EXEC mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

This command is not supported on ASR 9000 Ethernet Line Cards. This command displays all the configured BGP policy counters for the specified interface.

Task ID

Task ID	Operations
cef	read

Examples

The following is sample output from the **show cef ipv4 interface bgp-policy-statistics** command:

```
RP/0/RSP0/CPU0:router# show cef ipv4 interface TenGigE 0/2/0/4 bgp-policy-statistics

TenGigE0/2/0/4 is up
Input BGP policy accounting on src IP address enabled
buckets packets bytes
```

```

```

This table describes the significant fields shown in the display.

Table 17: show cef ipv4 interface bgp-policy-statistics Command Field Descriptions

Field	Description
GigabitEthernet 0/2/0/4 is up	Status of the interface.
Input BGP policy accounting on src IP address enabled	Enabled BGP policy accounting features.
buckets	Traffic index.
packets	Number of packets counted in the bucket.
bytes	Number of bytes counted in the bucket.

show cef ipv4 non-recursive

To display the IPv4 nonrecursive prefix entries in the IPv4 Cisco Express Forwarding (CEF) table, use the **show cef ipv4 non-recursive** command in EXEC mode.

```
show cef [vrf vrf-name] ipv4 non-recursive [detail] [hardware {egress | ingress}] [interface-type
interface-instance] [location node-id]
```

Syntax Description

vrf	(Optional) Displays VPN routing and forwarding (VRF) instance information.
vrf-name	(Optional) Name of a VRF.
detail	(Optional) Displays detailed information about nonrecursive prefix entries in the IPv4 CEF table.
hardware	(Optional) Displays detailed information about hardware.
egress	(Optional) Displays egress packet switch exchange (PSE).
ingress	(Optional) Displays ingress packet switch exchange (PSE).
interface-type	(Optional) Interface type. For more information, use the question mark (?) online help function.
interface-instance	(Optional) Either a physical interface instance or a virtual interface instance: <ul style="list-style-type: none"> Physical interface instance. Naming notation is <i>rack/slot/module/port</i> and a slash mark between values is required as part of the notation. <ul style="list-style-type: none"> <i>rack</i>: Chassis number of the rack. <i>slot</i>: Physical slot number of the line card. <i>module</i>: Module number. A physical layer interface module (PLIM) is always 0. <i>port</i>: Physical port number of the interface. <p>Note In references to a Management Ethernet interface located on a route processor card, the physical slot number is alphanumeric (RSP0) and the module is CPU0. Example: interface MgmtEth0/RSP0/CPU0/0.</p> <ul style="list-style-type: none"> Virtual interface instance. Number range varies depending on interface type. <p>For more information about the syntax for the router, use the question mark (?) online help function.</p>
location node-id	(Optional) Displays the IPv4 nonrecursive prefix entries in the IPv4 CEF table for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

```

This table describes the significant fields shown in the display.

Table 18: show cef ipv4 non-recursive Command Field Descriptions

Field	Description
Prefix	Nonrecursive prefixes detected on the node.

Field	Description
Next Hop	Routing next hop.
Interface	Interface associated with the nonrecursive prefix.

show cef ipv4 resource

To display the IPv4 nonrecursive prefix entries in the IPv4 Cisco Express Forwarding (CEF) table, use the **show cef ipv4 resource** command in EXEC mode.

```
show cef ipv4 resource [detail] [hardware {egress | ingress}] [location node-id]
```

Syntax Description	detail	(Optional) Displays detailed information resources listed in the IPv4 CEF table.
	hardware	(Optional) Displays detailed information about hardware.
	egress	(Optional) Displays egress packet switch exchange (PSE).
	ingress	(Optional) Displays ingress packet switch exchange (PSE).
	location <i>node-id</i>	(Optional) Displays the IPv4 resource entries in the IPv4 CEF table for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

Command Default No default behavior or values

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines If you do not specify a node with the **location** keyword and *node-id* argument, the output displays the IPv4 CEF nonrecursive routes for the node on which the command is issued.

Task ID	Task ID	Operations
	cef	read

Examples

The following is sample output from the **show cef ipv4 resource** command:

```
RP/0/RSP0/CPU0:router# show cef ipv4 resource detail

```

show cef ipv4 summary

To display a summary of the IPv4 Cisco Express Forwarding (CEF) table, use the **show cef ipv4 summary** command in EXEC mode.

```
show cef [vrf vrf-name] ipv4 summary [location node-id]
```

Syntax Description	
vrf	(Optional) Displays VPN routing and forwarding (VRF) instance information.
vrf-name	(Optional) Name of a VRF.
location node-id	(Optional) Displays a summary of the IPv4 CEF table for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

16 prefixes with label imposition, 51 prefixes with label information
Adjacency Table has 44 adjacencies
1 incomplete adjacency

```

This table describes the significant fields shown in the display.

Table 19: show cef ipv4 summary Command Field Descriptions

Field	Description
Load balancing	Current load-balancing mode. The default value is L3.
Table Version	Version of the CEF table.
tableid	Table identification number.
vrfid	VPN routing and forwarding (VRF) identification (vrfid) number.
vrfname	VRF name.
vrid	Virtual router identification (vrid) number.
flags	Option value for the table
routes	Total number of routes.
rerresolve	Total number of routes being reresolved.
unresolved (<i>x</i> old, <i>x</i> new)	Number of routes not yet resolved.
load sharing elements	Total number of internal load-sharing data structures.
bytes	Total memory used by internal load sharing data structures.
references	Total reference count of all internal load sharing data structures.
CEF resets	Number of CEF table resets.
revisions of existing leaves	Number of updates to existing prefixes.
Exponential (currently <i>xs</i> , peak <i>xs</i>)	Currently not used.
prefixes modified in place	Prefixes modified in place.
Adjacency Table has <i>x</i> adjacencies	Total number of adjacencies.
<i>x</i> incomplete adjacency	Total number of incomplete adjacencies.

Related Commands

Command	Description
bundle-hash	Displays the path a bundle flow that comprises a source and destination address would take.

show cef ipv4 unresolved

To display unresolved routes in the IPv4 Cisco Express Forwarding (CEF) table, use the **show cef ipv4 unresolved** command in EXEC mode.

```
show cef [vrf vrf-name] ipv4 unresolved [detail] [hardware {egress|ingress}] [location node-id]
```

Syntax Description	
vrf	(Optional) Displays VPN routing and forwarding (VRF) instance information.
vrf-name	(Optional) Name of a VRF.
detail	(Optional) Displays detailed information unresolved routes listed in the IPv4 CEF table.
hardware	(Optional) Displays detailed information about hardware.
egress	(Optional) Displays egress packet switch exchange (PSE).
ingress	(Optional) Displays ingress packet switch exchange (PSE).
location <i>node-id</i>	(Optional) Displays the unresolved routes in the IPv4 CEF table for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

Command Default No default behavior or values

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines If you do not specify a node with the **location** keyword and *node-id* argument, the output displays the unresolved routes for the node on which the command is issued.

Task ID	Task ID	Operations
	cef	read

Examples

The following is sample output from the **show cef ipv4 unresolved** command when an unresolved route is detected:

```
RP/0/RSP0/CPU0:router# show cef ipv4 unresolved
Prefix          Next Hop          Interface
10.3.3.3        102.2.2.2        ?
```

This table describes the significant fields shown in the display.

Table 20: show cef ipv4 unresolved Command Field Descriptions

Field	Description
Prefix	Prefix of the unresolved CEF.
Next Hop	Next hop of the unresolved CEF.
Interface	Next hop interface. A question mark (?) indicates that the interface has not been resolved.

show cef ipv6

To display the IPv6 Cisco Express Forwarding (CEF) table, use the **show cef ipv6** command in EXEC mode.

```
show cef [vrfvrf-name] ipv6 [interface-type interface-number / ipv6-prefix/prefix-length] [detail]
[locationnode-id]
```

Syntax Description		
vrf	(Optional)	Displays VPN routing and forwarding (VRF) instance information.
vrf-name	(Optional)	Name of a VRF.
interface-type interface-number	(Optional)	IPv6 prefixes going through the specified next hop interface.
ipv6-prefix/prefix-length	(Optional)	Longest prefix entry in the CEF table matching the specified IPv6 prefix and prefix length.
detail	(Optional)	Displays detailed IPv6 CEF table information.
location <i>node-id</i>	(Optional)	Displays the IPv6 CEF table for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

Command Default No default behavior or values

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines If you do not specify a node with the **location** keyword and *node-id* argument, this command displays the IPv6 CEF table for the node on which the command is issued.

Task ID	Task ID	Operations
	cef	read

Examples

The following sample output is from the **show cef ipv6** command:

```
RP/0/RSP0/CPU0:router# show cef ipv6

::/0

::/128
  drop
::1/128
  loopback
66::4/128
```

```

    receive    Loopback0

    receive
ff02::2/128
    receive
ff02::5/128
    receive
ff02::6/128
    receive
ff02::1:ff00:0/104
    receive

```

This table describes the significant fields shown in the display.

Table 21: show cef ipv6 Command Field Descriptions

Field	Description
drop	Indicates that packets sent to the destination prefix are dropped.
loopback	Indicates that the prefix points to a loopback address. Packets sent to loopback addresses are dropped.
receive	Indicates that the prefix is configured on one of the router interfaces. Packets sent to those prefixes are received by the router.
connected	Indicates that the prefix points to a directly connected next-hop interface.
recursive	Indicates that the prefix is not directly connected but is reachable through the next-hop prefix displayed.

The following sample output is from the **show cef ipv6** with the **detail** keyword:

```

RP/0/RSP0/CPU0:router# show cef ipv6 detail

::/0
  flags: source_rib
  Loadinfo owner: <this route>
  fast adj: glean
  path 1:
    flags      :

```

```

    next hop : ::
    interface :
GigabitEthernet/0/0/0

::/128
  flags: drop, source_fib
  Loadinfo owner: <this route>
  fast adj: drop
  path 1:
    flags      :
    next hop   : ::
    interface  : <not specified>

::1/128
  flags: loopback, source_fib
  Loadinfo owner: <this route>
  fast adj: loopback
  path 1:
    flags      :
    next hop   : ::
    interface  : <not specified>

66::4/128
  flags: receive, source_rib
  Loadinfo owner: <this route>
  fast adj: receive
  path 1:
    flags      : point-to-point
    next hop   : ::
    interface  : Loopback0

```

This table describes the significant output fields shown in the display.

Table 22: show cef ipv6 detail Command Field Descriptions

Field	Description
flags:	Properties of the indicated prefix.
Loadinfo owner:	Owner of the Loadinfo used by the prefix for forwarding. The Loadinfo owner is the prefix that owns the array of pointers to adjacencies.
fast adj:	Cached adjacency used for forwarding.
path 1:	The following three items are displayed below path 1: <ul style="list-style-type: none"> • flags—Properties of the path. • next hop—Next-hop prefix if the packet is being forwarded. • interface—Next-hop interface if the packet is being forwarded.

show cef ipv6 adjacency

To display Cisco Express Forwarding (CEF) IPv6 adjacency status and configuration information, use the **show cef ipv6 adjacency** command in EXEC mode.

show cef [**vrf** *vrf-name*] **ipv6 adjacency** [*interface-type interface-path-id*] [**location** *node-id*] [**detail**] [**discard**] [**glean**] [**null**] [**punt**] [**remote**]

Syntax Description

vrf	(Optional) Displays VPN routing and forwarding (VRF) instance information.
vrf-name	(Optional) Name of a VRF.
interface-type	(Optional) Interface type. For more information, use the question mark (?) online help function.
interface- path-id	(Optional) Either a physical interface instance or a virtual interface instance: <ul style="list-style-type: none"> Physical interface instance. Naming notation is <i>rack/slot/module/port</i> and a slash mark between values is required as part of the notation. <ul style="list-style-type: none"> <i>rack</i>: Chassis number of the rack. <i>slot</i>: Physical slot number of the line card. <i>module</i>: Module number. A physical layer interface module (PLIM) is always 0. <i>port</i>: Physical port number of the interface. <p>Note In references to a Management Ethernet interface located on a route processor card, the physical slot number is alphanumeric (RSP0) and the module is CPU0. Example: interface MgmtEth0/RSP0 /CPU0/0.</p> <ul style="list-style-type: none"> Virtual interface instance. Number range varies depending on interface type. <p>For more information about the syntax for the router, use the question mark (?) online help function.</p>
location <i>node-id</i>	(Optional) Displays detailed CEF information for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
detail	(Optional) Displays the detailed adjacency information.
discard	(Optional) Filters out and displays only the discarded adjacency information.
glean	(Optional) Filters out and displays only the glean adjacency information.
null	(Optional) Filters out and displays only the null adjacency information.
punt	(Optional) Filters out and displays only the punt adjacency information.
remote	(Optional) Filters out and displays only the remote adjacency information.

Command Default No default behavior or values

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines If you do not specify a node with the **location** keyword and *node-id* argument, this command displays the CEF adjacency table for the node on which the command is issued.

show cef ipv6 adjacency hardware

To display Cisco Express Forwarding (CEF) IPv6 adjacency hardware status and configuration information, use the **show cef ipv6 adjacency hardware** command in EXEC mode.

show cef [**vrf** *vrf-name*] **ipv6 adjacency hardware** {**egress** | **ingress**} [{**detail** | **discard** | **drop** | **glean** | **location** *node-id* | **null** | **punt** | **remote**}]

Syntax Description	
vrf	(Optional) Displays VPN routing and forwarding (VRF) instance information.
vrf-name	(Optional) Name of a VRF.
egress	Displays information from the egress packet switch exchange (PSE) file.
ingress	Displays information from the ingress packet switch exchange (PSE) file.
detail	(Optional) Displays full details.
discard	(Optional) Displays the discard adjacency information.
drop	(Optional) Displays the drop adjacency information.
glean	(Optional) Displays the glean adjacency information.
location <i>node-id</i>	(Optional) Displays detailed CEF information for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
null	(Optional) Displays the null adjacency information.
punt	(Optional) Displays the punt adjacency information.
remote	(Optional) Displays the remote adjacency information.

Command Default No default behavior or values

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

	cef	read

Examples

The following sample output is from the **show cef ipv6 adjacency hardware** command:

```
RP/0/RSP0/CPU0:router# show cef ipv6 adjacency hardware
```

show cef ipv6 drops

To display IPv6 Cisco Express Forwarding (CEF) table packet drop counters, use the **show cef ipv6 drops** command in EXEC mode.

```
show cef [vrf vrf-name] ipv6 drops [location node-id]
```

Syntax Description		
vrf	(Optional)	Displays VPN routing and forwarding (VRF) instance information.
vrf-name	(Optional)	Name of a VRF.
location <i>node-id</i>	(Optional)	Displays IPv6 CEF table packet drop counters for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

Command Default No default behavior or values

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines A packet might be dropped by the IPv6 CEF table because of unresolved CEF entries, unsupported features, absence of route information, absence of adjacency information, or an IP checksum error.

If you do not specify a node with the **location** keyword and *node-id* argument, this command displays the packet drops for all nodes.

Note Because no hardware forwarding occurs on the route processor (RP), no packet drop information is displayed for that node.

Task ID	Task ID	Operations
	cef	read

Examples

The following is sample output from the **show cef ipv6 drops** command:

```
RP/0/RSP0/CPU0:router# show cef ipv6 drops location 0/2/CPU0
```

```
IPv6 CEF Drop Statistics
Line status down      ingress :          0 egress : Not Applicable
Packet sanity fail    ingress :          0 egress :          0
PLU set to drop       ingress :          0 egress :          0
Unknown type,plu drop ingress :          0 egress :          0
```

show cef ipv6 drops

```

Packet length err    ingress :                0 egress :                0
TCAM src-comp err   ingress :                0 egress :                0

```

This table describes the significant fields shown in the display.

Table 23: show cef ipv6 drop Command Field Descriptions

Field	Description
Line status down	Packet drops due to the line protocol of the incoming interface being down.
Packet sanity fail	Packet drops due to the prefix failing the IPv6 sanity test. The sanity test verifies that the IPv6 packet is valid.
PLU set to drop	Packet drops due the IPv6 destination prefix being set to drop.
Unknown type, plu drop	Packet drops due to the prefix being of an unknown type.
Packet length errs	Length specified in the header does not match the actual length of the packet received.
TCAM src-comp err	Packet drops due to source compression errors that have occurred in the hardware.

```
RP/0/RSP0/CPU0:router# show cef ipv6 drops location 0/RSP0/CPU0
```

```

CEF Drop Statistics
Node: 0/RSP0/CPU0
Unresolved drops    packets :                0
Unsupported drops   packets :                0
Null0 drops         packets :                0
No route drops      packets :                0
No Adjacency drops  packets :                0
Checksum error drops packets :                0
RPF drops           packets :                0
RPF suppressed drops packets :                0
RP destined drops   packets :                0
Discard drops       packets :                0
GRE lookup drops    packets :                0
GRE processing drops packets :

```

Table 24: show cef ipv6 drops Command Field Descriptions

Field	Description
Unresolved drops	Drops due to unresolved routes.
Unsupported drops	Drops due to an unsupported feature.
Null0 drops	Drops to the Null0 interface.
No route drops	Number of packets dropped because there were no routes to the destination.
No Adjacency drops	Number of packets dropped because there were no adjacencies established.
Checksum error drops	Drops due to IPv6 checksum error.
RPF drops	Drops due to IPv6 unicast RPF ⁶ .

Field	Description
RPF suppressed drops	Drops suppressed due to IPv4 unicast RPF.
RP destined drops	Drops destined for the router.
Discard drops	Drops that were discarded.
GRE lookup drops	
GRE processing drops	

⁶ RPF = Reverse Path Forwarding

Related Commands

Command	Description
clear cef ipv6 drops, on page 152	Clears IPv6 CEF packet drop counters.

show cef ipv6 exact-route

To display the path an IPv6 flow comprising a source and destination address would take, use the **show cef ipv6 exact-route** command in EXEC mode.

show cef [**vrf** *vrf-name*] **ipv6 exact-route** { *source-address destination-address* } [**protocol name**] [**source-port**] [**destination-port**] [**ingress-interface** *type interface-path-id*] [**policy-class value**] [**detail** | **location** *node-id*]

Syntax Description	
vrf	(Optional) Displays VPN routing and forwarding (VRF) instance information.
vrf-name	(Optional) Name of a VRF.
source-address	The IPv6 source address in x:x::x format.
destination-address	The IPv6 destination address in x:x::x format.
protocol <i>protocol name</i>	(Optional) Displays the specified protocol for the route.
source-port <i>source-port</i>	(Optional) Sets the UDP source port. The range is from 0 to 65535.
destination-port <i>destination-port</i>	(Optional) Sets the UDP destination port. The range is from 0 to 65535.
ingress-interface	(Optional) Sets the ingress interface.
type	(Optional) Interface type. For more information, use the question mark (?) online help function.
interface-path-id	Physical interface or virtual interface.
	<p>Note Use the show interfaces command to see a list of all interfaces currently configured on the router.</p> <p>For more information about the syntax for the router, use the question mark (?) online help function.</p>
policy-class <i>value</i>	(Optional) Displays the class for the policy-based tunnel selection. The range for the tunnel policy class value is from 1 to 7.
detail	(Optional) Displays full CEF entry information.
location <i>node-id</i>	(Optional) Displays the IPv6 CEF table for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
Command Default	No default behavior or values
Command Modes	EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines If the Layer 4 information is enabled, the source-port, destination-port, protocol, and ingress-interface fields are required. Otherwise, the output of the **show cef ipv6 exact-route** command is not correct.

Task ID	Task ID	Operations
	cef	read

Examples

The following sample output is from the **show cef ipv6 exact-route** command:

```
RP/0/RSP0/CPU0:router# show cef ipv6 exact-route 222::2 9999::6751 location
0/3/CPU0 source address: 222::2 destination address: 9999::6751
interface : GigabitEthernet0/3/0/3 non local interface
```

show cef ipv6 exceptions

To display IPv6 Cisco Express Forwarding (CEF) exception packet counters, use the **show cef ipv6 exceptions** command in EXEC mode.

show cef [**vrf** *vrf-name*] **ipv6 exceptions** [**location** *node-id*]

Syntax Description	
vrf	(Optional) Displays VPN routing and forwarding (VRF) instance information.
vrf-name	(Optional) Name of a VRF.
location <i>node-id</i>	(Optional) Displays IPv6 CEF exception packet counters for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

Command Default No default behavior or values

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines CEF exception packets are those packets that have been sent from the hardware to the software because they require additional handling. The types of IPv6 CEF exception packets are displayed in the output of **show cef ipv6 exceptions**.

If you do not specify a node with **location** keyword and *node-id* argument, this command displays IPv6 CEF exception packet counters for all nodes.

Task ID	Task ID	Operations
	cef	read

Examples The following is sample output from the **show cef ipv6 exceptions** command:

```
RP/0/RSP0/CPU0:router# show cef ipv6 exceptions location 0/3/CPU0

IPv6 CEF Exception Statistics
Node: 0/3/CPU0
TTL err          ingress :          0 egress : Not Applicable
Link-local dst addr ingress :          0 egress :          0
Hop-by-Hop header ingress :          0 egress :          0
PLU entry set to punt ingress :          0 egress :          0
Packet too big   ingress : Not Applicable egress :          0
Med priority punt ingress :          0 egress : Not Applicable
```

This table describes the significant fields shown in the display.

Table 25: show cef ipv6 exceptions Command Field Descriptions

Field	Description
TTL err	Packets sent to software for processing because the packet header of the IPv6 prefix had a TTL ⁷ error.
Link-local dst addr	Packets sent to the software for processing because the destination address of the IPv6 prefix is link local.
Hop-by-Hop header	Packets sent to the software for processing because the IPv6 packet has a hop-by-hop header.
PLU entry set to punt	Packets sent to software for processing because the IPv6 prefix is set to punt.
Packet too big	Packets sent to the software for processing because the packet size exceeded the MTU ⁸ .
Med priority punt	Field used internally for troubleshooting.

⁷ TTL = time to live

⁸ MTU = maximum transmission unit

Related Commands

Command	Description
clear cef ipv6 exceptions, on page 154	Clears IPv6 CEF exception packet counters.

show cef ipv6 hardware

To display Cisco Express Forwarding (CEF) IPv6 hardware status and configuration information, use the **show cef ipv6 hardware** command in EXEC mode.

```
show cef [vrf vrf-name] ipv6 hardware {egress | ingress [{detail | location node-id]}
```

Syntax Description		
vrf	(Optional)	Displays VPN routing and forwarding (VRF) instance information.
vrf-name	(Optional)	Name of a VRF.
egress		Displays information from the egress packet switch exchange (PSE) file.
ingress		Displays information from the ingress packet switch exchange (PSE) file.
detail	(Optional)	Displays full details.
location <i>node-id</i>	(Optional)	Displays detailed CEF information for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

Command Default No default behavior or values

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

show cef ipv6 interface

To display IPv6 Cisco Express Forwarding (CEF)-related information for an interface, use the **show cef ipv6 interface** command in EXEC mode.

show cef [**vrf** *vrf-name*] **ipv6 interface** *type interface-path-id* [**detail**] [**location** *node-id*] [**rpf-drop**]

Syntax Description	
vrf	(Optional) Displays VPN routing and forwarding (VRF) instance information.
vrf-name	(Optional) Name of a VRF.
type	Interface type. For more information, use the question mark (?) online help function.
interface-path-id	Physical interface or virtual interface. Note Use the show interfaces command to see a list of all interfaces currently configured on the router. For more information about the syntax for the router, use the question mark (?) online help function.
detail	(Optional) Displays detailed CEF information for all the interfaces on the node in which the command is issued.
location <i>node-id</i>	(Optional) Displays IPv4 CEF-related information for an interface. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
rpf-drop	(Optional) Displays information about the drops due to IPv6 unicast RPF.

Command Default No default behavior or values

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.
	Release 4.1.1	The rpf-drop keyword was added.

Usage Guidelines If you do not specify a node with the **location** keyword and *node-id* argument, the **show cef ipv6 interface** command displays the CEF-related information for the interface on the route processor.

Task ID	Task ID	Operations
	cef	read

Examples

The following sample output is from the **show cef ipv6 interface** command:

```
RP/0/RSP0/CPU0:router# show cef ipv6 interface
```

show cef ipv6 non-recursive

To display the IPv6 nonrecursive prefix entries in the IPv6 Cisco Express Forwarding (CEF) table, use the **show cef ipv6 non-recursive** command in EXEC mode.

show cef [**vrf** *vrf-name*] **ipv6 non-recursive** [**hardware** {**egress** | **ingress**}] [**detail**] [**location** *node-id*]

Syntax Description	
vrf	(Optional) Displays VPN routing and forwarding (VRF) instance information.
vrf-name	(Optional) Name of a VRF.
hardware	(Optional) Displays Cisco Express Forwarding (CEF) IPv6 hardware status and configuration information.
egress	(Optional) Displays information from the egress packet switch exchange (PSE) file.
ingress	(Optional) Displays information from the ingress packet switch exchange (PSE) file.
detail	(Optional) Displays full details.
location <i>node-id</i>	(Optional) Displays the nonrecursive prefix entries in the IPv6 CEF table for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

Command Default No default behavior or values

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines If you do not specify a node with the **location** keyword and *node-id* argument, this command displays the nonrecursive routes for the node on which the command is issued.

Task ID	Task ID	Operations
	cef	read

Examples

The following is sample output from the **show cef ipv6 non-recursive** command:

```
RP/0/RSP0/CPU0:router# show cef ipv6 non-recursive
::/0
::/128
  drop
```

```

::1/128
  loopback
66::4/128
  receive      Loopback0
2222::/64
  connected   GigabitEthernet0/4/0/0
2222::1/128
  receive     GigabitEthernet0/4/0/0
3333::/64
  connected   GigabitEthernet0/3/0/0
3333::2/128
  receive     GigabitEthernet0/3/0/0
7777::/64
  connected   GigabitEthernet0/0/0/0
7777::2/128
  receive     GigabitEthernet0/0/0/0
ff00::/8
  drop
ff02::1/128
  receive
ff02::2/128
  receive
ff02::5/128
  receive
ff02::6/128
  receive
ff02::1:ff00:0/104
  receive

```

This table describes the significant fields shown in the display.

Table 26: show cef ipv6 non-recursive Command Field Descriptions

Field	Description
drop	Indicates that packets sent to the destination prefix are dropped.
loopback	Indicates that the prefix points to a loopback address. Packets sent to loopback addresses are dropped.
receive	Indicates that the prefix is configured on one of the router interfaces. Packets sent to those prefixes are received by the router.
connected	Indicates that the prefix points to a directly connected next-hop interface.

show cef ipv6 resource

To display the IPv6 nonrecursive prefix entries in the IPv6 Cisco Express Forwarding (CEF) table, use the **show cef ipv6 resource** command in EXEC mode.

show cef ipv6 resource [**detail**] [**hardware** {**egress** | **ingress**}] [**location** *node-id*]

Syntax Description		
	detail	(Optional) Displays detailed information resources listed in the IPv6 CEF table.
	hardware	(Optional) Displays Cisco Express Forwarding (CEF) IPv6 hardware status and configuration information.
	egress	(Optional) Displays information from the egress packet switch exchange (PSE) file.
	ingress	(Optional) Displays information from the ingress packet switch exchange (PSE) file.
	location <i>node-id</i>	(Optional) Displays the IPv6 resource entries in the IPv6 CEF table for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

Command Default No default behavior or values

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines If you do not specify a node with the **location** keyword and *node-id* argument, the output displays the IPv6 CEF nonrecursive routes for the node on which the command is issued.

Task ID	Task	Operations
	cef	read

Examples

The following is sample output from the **show cef ipv6 resource** command:

```
RP/0/RSP0/CPU0:router# show cef ipv6 resource

CEF resource availability summary state: GREEN
  ipv4 shared memory resource: GREEN
  ipv6 shared memory resource: GREEN
  mpls shared memory resource: GREEN
  common shared memory resource: GREEN
  TABLE hardware resource: GREEN
  LEAF hardware resource: GREEN
  LOADINFO hardware resource: GREEN
  NHINFO hardware resource: GREEN
  LABEL_INFO hardware resource: GREEN
```

```
IDB hardware resource: GREEN
FRR_NHINFO hardware resource: GREEN
LDSH_ARRAY hardware resource: GREEN
RSRC_MON hardware resource: GREEN
```

show cef ipv6 summary

To display a summary of the IPv6 Cisco Express Forwarding (CEF) table, use the **show cef ipv6 summary** command in EXEC mode.

```
show cef [vrf vrf-name] ipv6 summary [location node-id]
```

Syntax Description	
vrf	(Optional) Displays VPN routing and forwarding (VRF) instance information.
vrf-name	(Optional) Name of a VRF.
location node-id	(Optional) Displays a summary of the IPv6 CEF table for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

Command Default No default behavior or values

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines If you do not specify a node with the **location** keyword and *node-id* argument, this command displays a summary of the IPv6 CEF table for the node on which the command is issued.

Task ID	Task ID	Operations
	cef	read

Examples

The following is sample output from the **show cef ipv6 summary** command:

```
RP/0/RSP0/CPU0:router# show cef ipv6 summary

IP CEF with switching (Table Version 0)

Load balancing: L3
Tableid 0xe0800000, Vrfid 0x60000000, Vrid 0x20000000, Flags 0x301
Vrfname default, Refcount 12
4 routes, 0 reresolve, 0 unresolved (0 old, 0 new), 288 bytes
0 load sharing elements, 0 bytes, 0 references
0 shared load sharing elements, 0 bytes
0 exclusive load sharing elements, 0 bytes
0 CEF route update drops, 0 revisions of existing leaves
Resolution Timer: 15s
0 prefixes modified in place
0 deleted stale prefixes
0 prefixes with label imposition, 0 prefixes with label information
Adjacency Table has 44 adjacencies
1 incomplete adjacency
```

This table describes the significant fields shown in the display.

Table 27: show cef ipv6 summary Command Field Descriptions

Field	Description
Load balancing	Current load-balancing mode. The default value is L3.
Table Version	Version of the CEF table.
routes	Total number of routes.
unresolved (<i>x</i> old, <i>x</i> new)	Number of routes not yet resolved.
load sharing elements	Total number of internal load-sharing data structures.
bytes	Total memory used by internal load sharing data structures.
references	Total reference count of all internal load sharing data structures.
CEF resets	Number of CEF table resets.
revisions of existing leaves	Number of updates to existing prefixes.
Exponential (currently <i>xs</i> , peak <i>xs</i>)	Currently not used.
prefixes modified in place	Prefixes modified in place.
Router ID	Router identification.
Adjacency Table has <i>x</i> adjacencies	Total number of adjacencies.
<i>x</i> incomplete adjacency	Total number of incomplete adjacencies.

Related Commands

Command	Description
bundle-hash	Displays the path a bundle flow that comprises a source and destination address would take. For more information, see <i>Interface and Hardware Component Command Reference for Cisco ASR 9000 Series Routers</i>

show cef ipv6 unresolved

To display the unresolved routes in the IPv6 Cisco Express Forwarding (CEF) table, use the **show cef ipv6 unresolved** command in EXEC mode.

show cef [**vrf** *vrf-name*] **ipv6 unresolved** [**detail**] [**hardware** {**egress** | **ingress**}] [**location** *node-id*]

Syntax Description	
vrf	(Optional) Displays VPN routing and forwarding (VRF) instance information.
vrf-name	(Optional) Name of a VRF.
detail hardware	(Optional) Displays full details. (Optional) Displays Cisco Express Forwarding (CEF) IPv6 hardware status and configuration information.
hardware egress	(Optional) Displays Cisco Express Forwarding information from the egress packet switch exchange (CEF PSE) IPv6 hardware status and configuration information file .
egress ingress	(Optional) Displays information from the egress ingress packet switch exchange (PSE) file.
ingress detail	(Optional) Displays information from the ingress packet switch exchange (PSE) file full details .
location <i>node-id</i>	(Optional) Displays the unresolved routes in the IPv6 CEF table for the specified node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

Command Default No default behavior or values

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines If you do not specify a node with the **location** keyword and *node-id* argument, this command displays the unresolved routes for the node on which the command is issued.

Task ID	Task ID	Operations
	cef	read

Examples This following is sample output from **show cef ipv6 unresolved** command when an unresolved route is detected:

```
RP/0/RSP0/CPU0:router# show cef ipv6 unresolved
```

```
9999::/64  
  unresolved
```

This table describes the significant fields shown in the display.

Table 28: show cef ipv6 unresolved Command Field Descriptions

Field	Description
xxx::/xx	Detected unresolved route.

show cef mpls adjacency

To display the Multiprotocol Label Switching (MPLS) adjacency table, use the **show cef mpls adjacency** command in EXEC mode.

```
show cef mpls adjacency [interface-type interface-path-id] [{detail | discard | drop | glean | null | punt | remote}] [location node-id]
```

Syntax Description

interface-type (Optional) Interface type. For more information, use the question mark (?) online help function.

interface- path-id (Optional) Either a physical interface instance or a virtual interface instance:

- Physical interface instance. Naming notation is *rack/slot/module/port* and a slash mark between values is required as part of the notation.
 - *rack*: Chassis number of the rack.
 - *slot*: Physical slot number of the line card.
 - *module*: Module number. A physical layer interface module (PLIM) is always 0.
 - *port*: Physical port number of the interface.

Note In references to a Management Ethernet interface located on a route processor card, the physical slot number is alphanumeric (RSP0) and the module is CPU0. Example: interface MgmtEth0/RSP0 /CPU0/0.

- Virtual interface instance. Number range varies depending on interface type.

For more information about the syntax for the router, use the question mark (?) online help function.

detail (Optional) Displays full details.

discard (Optional) Displays the discard adjacency information.

drop (Optional) Displays the drop adjacency information.

glean (Optional) Displays the glean adjacency information.

null (Optional) Displays the null adjacency information.

punt (Optional) Displays the punt adjacency information.

remote (Optional) Displays the remote adjacency information.

location node-id (Optional) Displays detailed CEF information for the designated node. The *node-id* argument is entered in the *rack/slot/module* notation.

Command Default

No default behavior or values

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines If you do not specify a node with the **location** keyword and *node-id* argument, the **show cef mpls adjacency** command displays the MPLS adjacency table for the node in which the command is issued.

Task ID	Task ID	Operations
	cef	read

Examples This following is sample output from **show cef mpls adjacency** command:

```
RP/0/RSP0/CPU0:router# show cef mpls adjacency
```

Related Commands	Command	Description
	show cef mpls adjacency hardware, on page 238	Displays the Multiprotocol Label Switching (MPLS) adjacency hardware status and configuration information.
	show cef mpls interface, on page 242	Displays the Multiprotocol Label Switching (MPLS) Cisco Express Forwarding (CEF)-related information for an interface.
	show cef mpls unresolved, on page 244	Displays the Multiprotocol Label Switching (MPLS) unresolved routes.

show cef mpls adjacency hardware

To display the Multiprotocol Label Switching (MPLS) adjacency hardware status and configuration information, use the **show cef mpls adjacency hardware** command in EXEC mode.

show cef mpls adjacency hardware {egress | ingress} [{detail | discard | drop | glean | location *node-id* | null | punt | remote}]

Syntax Description

egress	Displays information from the egress packet switch exchange (PSE) file.
ingress	Displays information from the ingress packet switch exchange (PSE) file.
detail	(Optional) Displays full details.
discard	(Optional) Displays the discard adjacency information.
drop	(Optional) Displays the drop adjacency information.
glean	(Optional) Displays the glean adjacency information.
location <i>node-id</i>	(Optional) Displays detailed CEF information for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
null	(Optional) Displays the null adjacency information.
punt	(Optional) Displays the punt adjacency information.
remote	(Optional) Displays the remote adjacency information.

Command Default

No default behavior or values

Command Modes

EXEC mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

No specific guidelines impact the use of this command.

Task ID

Task ID	Operations
cef	read

Examples

The following is sample output from **show cef mpls adjacency hardware** command:

```
RP/0/RSP0/CPU0:router# show cef mpls adjacency hardware
```

Related Commands

Command	Description
show cef mpls adjacency, on page 236	Displays the Multiprotocol Label Switching (MPLS) adjacency table.
show cef mpls interface, on page 242	Displays the Multiprotocol Label Switching (MPLS) Cisco Express Forwarding (CEF)-related information for an interface.
show cef mpls unresolved, on page 244	Displays the Multiprotocol Label Switching (MPLS) unresolved routes.

show cef mpls drops

To display Multiprotocol Label Switching (MPLS) drop counters for packets that belong to a segment routing (SR) network, use the **show cef mpls drops** command in EXEC mode.

show cef mpls drops [**location** {*node-id* | **all**}]

Syntax Description

location *node-id* (Optional) Displays detailed Cisco Express Forwarding (CEF) information for the designated node. The *node-id* argument is entered in the *rack/slot/module* notation.

all (Optional) Displays all locations.

Command Default

No default behavior or values

Command Modes

EXEC mode

Command History

Release	Modification
Release 6.5.1	This command was introduced.

Usage Guidelines

This command is supported on third-generation ASR 9000 line cards. Refer to the [Cisco ASR 9000 Series Aggregation Services Router Ethernet Line Card Installation Guide](#).

Use this command to display the SR MPLS drop counters.

The incoming top MPLS label is inspected. If the label belongs to the Segment Routing Local Block (SRLB) or the Segment Routing Global Block (SRGB), an MPLS SR drop counter is incremented for unknown label value or for MPLS time to live (TTL) expiry.

Note The drop counters will increment for manually allocated adjacency SIDs and prefix SIDs only. They will not increment for dynamically allocated adjacency SIDs.

Task ID

Task ID	Operation
cef	read

Example

This following is sample output from **show cef mpls drops** command:

```
RP/0/RSP0/CPU0:router# show cef mpls drops location 0/0/CPU0
Sat Jun  9 03:49:27.100 IST
CEF Drop Statistics
Node: 0/0/CPU0
  SR MPLS unreachable packets :                100
```

```
SR MPLS TTL expired packets :          400
```

show cef mpls interface

To display the Multiprotocol Label Switching (MPLS) Cisco Express Forwarding (CEF)-related information for an interface, use the **show cef mpls interface** command in EXEC mode.

show cef mpls interface *type interface-path-id* [**detail**] [**location** *node-id*]

Syntax Description

type	Interface type. For more information, use the question mark (?) online help function.
interface-path-id	Either a physical interface instance or a virtual interface instance as follows: <ul style="list-style-type: none"> Physical interface instance. Naming notation is <i>rack/slot/module/port</i> and a slash between values is required as part of the notation. <ul style="list-style-type: none"> <i>rack</i>: Chassis number of the rack. <i>slot</i>: Physical slot number of the modular services card or line card. <i>module</i>: Module number. A physical layer interface module (PLIM) is always 0. <i>port</i>: Physical port number of the interface. <p>Note In references to a Management Ethernet interface located on a route processor card, the physical slot number is alphanumeric (RSP0) and the module is CPU0. Example: interface MgmtEth0/ RSP0</p> <ul style="list-style-type: none"> Virtual interface instance. Number range varies depending on interface type. <p>For more information about the syntax for the router, use the question mark (?) online help function.</p>
detail	(Optional) Displays detailed CEF information for all the interfaces on the node in which the command is issued.
location <i>node-id</i>	(Optional) Displays IPv4 CEF-related information for an interface. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

Command Default

Task ID	Operation						
ip-services	read, write						

Example

This is a sample configuration of the **bootfile** command:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# dhcp ipv4
RP/0/RSP0/CPU0:router(config-dhcpv4)# profile DHCP_SERVER_PROFILE server
RP/0/RSP0/CPU0:router(config-dhcpv4-server-profile)# bootfile USERS
```

clear dhcp ipv4 server binding

To clear all client bindings in server, use the **clear dhcp ipv4 server binding** command in EXEC mode.

clear dhcp ipv4 server binding [**location** *node-ID*] [**interface** *type interface-path-ID*] [**vrf** *vrf-name*] [**ip-address** *address*] [**mac-address** *address*]

Syntax Description		
location <i>node-ID</i>		Clears detailed client binding information for a specified node.
interface <i>type interface-path-ID</i>		Clears client binding by interface. Specifies the interface type. For more information, use the question mark (?) online help function. Physical interface or virtual interface. Use the show interfaces command to see a list of all interfaces currently configured on the router. Note For more information about the syntax for the router, use the question mark (?) online help function.
vrf <i>vrf-name</i>		Clears client binding by vrf name.
ip-address <i>address</i>		Clears detailed client binding information per IP address.
mac-address <i>address</i>		Clears detailed client binding information per mac-address.

Command Default None

Command Modes EXEC mode

Command History	Release	Modification
	Release 5.1	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operation
	ip-services	execute

Example

This is a sample output from the **clear dhcp ipv4 server binding** command:

```
RP/0/RSP0/CPU0:router# clear dhcp ipv4 server binding
```

Related Commands

Command	Description
clear dhcp ipv4 server statistics, on page 252	Clears DHCP server statistics.

clear dhcp ipv4 server statistics

To clear DHCP server statistics, use the **clear dhcp ipv4 server statistics** command in EXEC mode.

clear dhcp ipv4 server statistics [**[raw [all] [include-zeroes] [location *node-ID*]]**]

Syntax Description	raw	Description
	raw	Clears debug statistics.
	all	Clears debug statistics for base mode.
	include-zeroes	Clears debug statistics that are zero.
	location <i>node-ID</i>	Clears DHCP server statistics information for a specified node.

Command Default None

Command History	Release	Modification
	Release 5.1	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operation
	ip-services	execute
	root-system	read, write

Example

This is a sample output from the **clear dhcp ipv4 server statistics** command:

```
RP/0/RSP0/CPU0:router# clear dhcp ipv4 server statistics
```

Related Commands	Command	Description
	clear dhcp ipv4 server binding, on page 250	Clears all client bindings in server.

clear dhcp ipv4 snoop binding

To clear snoop bindings, use the **clear dhcp ipv4 snoop binding** command in EXEC mode.

```
clear dhcp ipv4 snoop binding [bridge-domain name] [mac-address mac-address]
```

Syntax Description

bridge-domain	(Optional) Clears DHCP snoop bindings for a specific bridge domain.
name	(Optional) Bridge domain name
mac-address	(Optional) Clears DHCP snoop bindings for a specified MAC address.
mac-address	(Optional) MAC address.

Command Default

Clears all snoop bindings.

Command Modes

EXEC mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes the proper task IDs. If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Task ID

Task ID	Operations
ip-services	read, write

Examples

The following is an example of the **clear dhcp snoop binding** command removing binding for bridge domain ISP1:

```
RP/0/RSP0/CPU0:router# clear dhcp ipv4 snoop binding bridge-domain ISP1
```

clear dhcp ipv6 proxy binding

To clear Dynamic Host Configuration Protocol (DHCP) relay bindings for prefix delegation, use the **clear dhcp ipv6 proxy binding** command in EXEC mode.

clear dhcp ipv6 proxy binding [*ipv6-prefix*]

Syntax Description

ipv6-prefix The IPv6 network assigned to the interface.

This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal format using 16-bit values between colons.

Command Default

No default behavior or values

Command Modes

EXEC mode

Command History

Release	Modification
Release 4.1.1	This command was introduced.

Usage Guidelines

No specific guidelines impact the use of this command.

Task ID

Task ID	Operation
ip-services	execute

Example

This is a sample output from the **clear dhcp ipv6 proxy binding** command:

```
RP/0/RSP0/CPU0:router# clear dhcp ipv6 proxy binding
```

Related Commands

Command	Description
show dhcp ipv6 proxy binding , on page 333	Displays Dynamic Host Configuration Protocol (DHCP) relay bindings for prefix delegation.

client-mac-mismatch

To enable DHCP MAC address verification.

client-mac-mismatch action drop

Syntax Description	action
	Specifies an action for the router when the DHCP MAC address is a not a match.
	drop
	Drops the packet with the mismatched DHCP MAC address.

Command Default None

Command Modes DHCP Relay Profile Configuration Mode

Command History	Release	Modification
	Release 6.3.2	This command was introduced.

Usage Guidelines Enables MAC address verification. If MAC address in the DHCPv4 protocol header does not match the L2 header source MAC address in the DHCPv4 relay profile, the frame is dropped

Example

Use the following example to configure DHCP MAC address verification.

```
Router# configure

Router(config)# dhcp ipv4
/* Configures DHCP for IPv4 and enters the DHCPv4 configuration submode. */

Router(config-dhcpv4)# profile client relay
/* Enables DHCP relay profile */

Router(config-dhcpv4)# client-mac-mismatch action drop
/* Enables MAC address verification. If MAC address in the DHCPv4 protocol header does not
match the L2 header source MAC address in the DHCPv4 relay profile,
the frame is dropped */

Router(config-dhcpv4-relay-profile)# commit

Router(config-dhcpv4-relay-profile)# exit
```

database (DHCPv6 Binding)

To enable Dynamic Host Configuration Protocol IPv6 (DHCPv6) binding database write to the system persistent memory, use the **database** command in the DHCP IPv6 configuration mode. To disable the DHCPv6 binding table write and to delete the binding table write files from the file system, use the **no** form of this command.

```
database [proxy] [relay] [ full-write-interval full-write-interval ] [ incremental-write-interval
incremental-write-interval ]
no database
```

Syntax Description		
proxy	(Optional) Enables DHCPv6 proxy binding database write to the system file system.	
relay	(Optional) Enables DHCPv6 relay binding database write to the system file system.	
full-write-interval	Sets the interval for a full file write.	
<i>full-write-interval</i>	Full file write interval in minutes. The range is from 0 to 1440. The default value is 10.	
incremental-write-interval	Sets the interval for an incremental file write.	
<i>incremental-write-interval</i>	Incremental file write interval in minutes. The range is from 0 to 1440. The default value is 1.	

Command Default If the command is executed without the keywords **full-write-interval** or **incremental-write-interval**, then the default values of these write intervals are used.

Command Modes DHCP IPv6 configuration
DHCP IPv6 profile relay configuration

Command History	Release	Modification
	Release 6.0.1	This command was introduced.

Usage Guidelines All instances of the previous files are deleted after a full persistent binding file write. The files are written to the file system even if DHCP has no bindings. The incremental file is written even if no new bindings are found in the binding table.

The incremental file does not track deleted bindings. If a binding is deleted and then a system reload occurs before the next full file write, then that binding may reappear when the binding table is recovered from the file system. In this case, the user has to reapply the command to delete the binding. If the binding was deleted because of lease expiry, then it is again deleted when the binding table is recovered from the file system.

The selection of the file system to be used is fixed and not configurable. The file cannot be stored to an external system. Only one file system is used, and if access to this file system fails, then the DHCP binding table backup to file system does not function and an error is logged.

Task ID	Task ID	Operation
	ip-services	read, write

This example shows how to enable DHCPv6 binding database write to the system persistent memory:

```
Router# configure
Router# dhcp ipv6
Router(config-dhcpv6)# database proxy full-write-interval 15 incremental-write-interval 5
```

default-router

To configure the default-router, use the **default-router** command in the DHCPv4 server profile sub-mode. To deconfigure the name of the default-router or the IP address, use the **no** form of this command.

default-router *address1address2 . . . address8*

no default-router *address1address2 . . . address8*

Syntax Description	<i>address1address2...address8</i> Name of the router or IP address. Upto 8 routers can be configured.
---------------------------	--------------------------------------------------------------------------------------------------------

Command Default	None
------------------------	------

Command Modes	DHCPv4 Server Profile DHCPv4 Server Profile Class Sub-mode
----------------------	---------------------------------------------------------------

Command History	Release	Modification
	Release 5.1	This command was introduced.
	Release 5.2.2	This command is supported in DHCPv4 server profile class sub-mode.

Usage Guidelines	No specific guidelines impact the use of this command.
-------------------------	--------------------------------------------------------

Task ID	Task ID	Operation
	ip-services	read, write

Example

This is a sample output from the **default-router** command:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# dhcp ipv4
RP/0/RSP0/CPU0:router(config-dhcpv4)# profile DHCP_SERVER_PROFILE server
RP/0/RSP0/CPU0:router(config-dhcpv4-server-profile)# default-router 10.20.1.2
```

destination (DHCP IPv6)

To specify a destination address to which client messages are forwarded and to enable Dynamic Host Configuration Protocol (DHCP) for IPv6 relay service on the interface, use the **destination** command in DHCP IPv6 interface relay configuration mode. To remove a relay destination on the interface or delete an output interface for a destination, use the **no** form of this command.

```
destination ipv6 address interface-path-id
no destination ipv6 address
```

Syntax Description

ipv6 address address	IPv6 address in the form documented in RFC 2373, where the address is specified in hexadecimal using 16-bit values between colons.
interface-path-id	<p>Either a physical interface instance or a virtual interface instance as follows:</p> <ul style="list-style-type: none"> Physical interface instance. Naming notation is <i>rack/slot/module/port</i> and a slash between values is required as part of the notation. <ul style="list-style-type: none"> <i>rack</i>: Chassis number of the rack. <i>slot</i>: Physical slot number of the modular services card or line card. <i>module</i>: Module number. A physical layer interface module (PLIM) is always 0. <i>port</i>: Physical port number of the interface. <p>Note In references to a Management Ethernet interface located on a route processor card, the physical slot number is alphanumeric (RP0 or RP1) and the module is CPU0. Example: interface MgmtEth0/RP1/CPU0/0.</p> <ul style="list-style-type: none"> Virtual interface instance. Number range varies depending on interface type.

For more information about the syntax for the router, use the question mark (?) online help function.

Command Default

Relay function is disabled and there is no relay destination on the interface.

Command Modes

DHCP IPv6 interface relay configuration

Command History

Release	Modification
Release 4.1.0	Support for DHCP IPv6 relay service.

Usage Guidelines

The **destination** command specifies a destination address to which client messages are forwarded and enables DHCP for IPv6 relay service on the interface. When relay service is enabled on an interface, a DHCP for IPv6 message received on that interface is forwarded to all configured relay destinations. The incoming DHCP for IPv6 message may have come from a client on that interface, or it may have been relayed by another relay agent.

The relay destination can be a unicast address of a server or another relay agent, or it may be a multicast address. There are the following two types of relay destination addresses:

- A link-scoped unicast or multicast IPv6 address, for which a user must specify an output interface
- A global unicast IPv6 address, for which a user can specify an output interface for this kind of address.
- A global or site-scope multicast IPv6 address, for which a user can specify an output interface for this kind of address if 'mhost ipv6 default-interface' is specified.

If no output interface is configured for a destination, the output interface is determined by routing tables. In this case, it is recommended that a unicast or multicast routing protocol be running on the router.

Multiple destinations can be configured on one interface, and multiple output interfaces can be configured for one destination. When the relay agent relays messages to a multicast address, it sets the hop limit field in the IPv6 packet header to 32.

Unspecified, loopback, and node-local multicast addresses are not acceptable as the relay destination. If any one of them is configured, the message "Invalid destination address" is displayed.

Note that it is not necessary to enable the relay function on an interface for it to accept and forward an incoming relay reply message from servers. By default, the relay function is disabled, and there is no relay destination on an interface. The **no** form of the command removes a relay destination on an interface or deletes an output interface for a destination. If all relay destinations are removed, the relay service is disabled on the interface.

The DHCP for IPv6 client, server, and relay functions is mutually exclusive on an interface. When one of these functions is already enabled and a user tries to configure a different function on the same interface, one of the following messages is displayed: "Interface is in DHCP client mode," "Interface is in DHCP server mode," or "Interface is in DHCP relay mode."

Task ID	Task ID	Operations
	ip-services	read, write

Examples

The following is an example of the **destination** command on an interface:

```
RP/0/RSP0/CPU0:router(config)# dhcp ipv6
RP/0/RSP0/CPU0:router(config-dhcpv6)# interface tenGigE 0/5/0/0 relay
RP/0/RSP0/CPU0:router(config-dhcpv6-if)# destination 10:10::10
```

dhcp ipv4

To enable Dynamic Host Configuration Protocol (DHCP) for IPv4 and to enter DHCP IPv4 configuration mode, use the **dhcp ipv4** command in Global Configuration mode. To disable DHCP for IPv4 and exit the DHCP IPv4 configuration mode, use the **no** form of this command.

dhcp ipv4

Syntax Description

This command has no keywords or arguments.

Command Modes

None

Command Modes

Global Configuration mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.
Release 4.2.0	This command was supported for BNG.

Usage Guidelines

Use the **dhcp ipv4** command to enter DHCP IPv4 configuration mode.

Task ID

Task ID	Operations
ip-services	read, write

Examples

This example shows how to enable DHCP for IPv4:

```
RP/0/RSP0/CPU0:router# dhcp ipv4
RP/0/RSP0/CPU0:router(config-dhcpv4)#
```

show dhcp ipv4 client

To display DHCP client binding information, use the **show dhcp ipv4 client** command in EXEC mode.

show dhcp ipv4 client <interfaceName> [detail] [debug]

Syntax Description	interfaceName	Displays the DHCP IPv4 address of the specified interface.
	detail	(Optional) Specifies detailed results.
	debug	(Optional) Displays internal debugging information.

Command Default No default behavior or values

Command Modes EXEC mode

Command History	Release	Modification
	Release 5.2.0	This command was introduced.

Usage Guidelines Use the **show dhcp ipv4 client** command to display the DHCP IPv4 for the specified client.

Task ID	Task ID	Operations
	IP-Services	read

Related Commands

Command	Description
show dhcp ipv4 client statistics, on page 264	Displays the statistics of the DHCP client.

dhcp ipv6

To enable Dynamic Host Configuration Protocol (DHCP) for IPv6 and to enter DHCP IPv6 configuration mode, use the **dhcp ipv6** command in Global Configuration mode. To disable the DHCP for IPv6, use the **no** form of this command.

dhcp ipv6

Syntax Description

This command has no keywords or arguments.

Command Modes

Global Configuration mode

Command History

Release	Modification
Release 4.1.0	This command was introduced.
Release 4.3.0	This command was supported for BNG.

Usage Guidelines

Use the **dhcp ipv6** command to enter DHCP IPv6 configuration mode.

Task ID

Task ID	Operations
ip-services	read, write

Examples

This example shows how to enable DHCP for IPv6:

```
RP/0/RSP0/CPU0:router(config)# dhcp ipv6
RP/0/RSP0/CPU0:router(config-dhcpv6)#
```

dhcp ipv4 none

To disable DHCP snooping on a specific port, use the **dhcp ipv4 none** command in l2vpn bridge group bridge-domain interface configuration mode.

dhcp ipv4 none

Syntax Description	This command has no keywords or arguments.
Command Default	No default behavior or values
Command Modes	l2vpn bridge group bridge-domain interface configuration

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operations
	ip-services	read, write

Examples The following example shows how to disable DHCP snooping on GigabitEthernet interface 0/0/0/0:

```
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd) # interface gigabitethernet 0/0/0/0
RP/0/RSP0/CPU0:router(config-l2vpn-bg-bd-if) # dhcp ipv4 none
```

Related Commands	Command	Description
	show dhcp ipv4 snoop binding, on page 325	Displays DHCP relay agent status specific to a relay profile.

dns-server

To configure the Domain Name System (DNS) servers, use the **dns-server** command in DHCPv4 server profile configuration and DHCPv4 server profile class sub-mode. To remove the DNS servers use the no form of this command.

```
dns-server address1 address2 .....address8
no dns-server address1 address2.....address8
```

Syntax Description	<i>address1</i> , <i>address2...address8</i>	Specifies the server IPv4 address. Upto 8 server addresses can be configured. The servers are listed in order of preference <i>address1</i> is the most preferred server, <i>address2</i> is the next most preferred server, and so on.
Command Default	None.	
Command Modes	DHCPv4 Server Profile DHCPv4 Server Profile Class Sub-mode	
Command History	Release	Modification
	Release 6.0.1	This command was introduced.
Usage Guidelines	No specific guidelines impact the use of this command.	
Task ID	Task ID	Operation
	ip-services	read, write

This example shows how to configure DNS server address:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# dhcp ipv4
RP/0/RSP0/CPU0:router(config-dhcpv4)# profile DHCP_SERVER_PROFILE server
RP/0/RSP0/CPU0:router(config-dhcpv4-server-profile)# dns-server 192.168.155.9
```

domain-name

To configure domain name that DHCP clients will use to resolve DNS names, use the **domain-name** command in DHCP IPv4 server profile configuration mode.

domain-name *domain-name*

Syntax Description	<i>domain-name</i> Specify DHCP server domain name for the client.
---------------------------	--------------------------------------------------------------------

Command Default	None
------------------------	------

Command Modes	DHCP IPv4 Server Profile configuration DHCP IPv4 Server Profile Class sub-mode
----------------------	-----------------------------------------------------------------------------------

Command History	Release	Modification
	Release 6.0.1	This command was introduced.

Usage Guidelines	No specific guidelines impact the use of this command.
-------------------------	--------------------------------------------------------

Task ID	Task ID	Operation
	ip-services	read, write

This example shows how to define cisco.com as domain name for DHCP server:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# dhcp ipv4
RP/0/RSP0/CPU0:router(config-dhcpv4)# profile DHCP_SERVER_PROFILE server
RP/0/RSP0/CPU0:router(config-dhcpv4-server-profile)# domain-name cisco.com
```

duplicate-mac-allowed

To allow duplicate client MAC addresses across different VLANs and interfaces, use the **duplicate-mac-allowed** command in the DHCP IPv4 configuration mode. To disallow duplicate client MAC addresses, use the **no** form of this command.

duplicate-mac-allowed [{**exclude-vlan**}]

Syntax Description	exclude-vlan	Excludes VLANs from the client key; only MAC address and interface form the client key.
Command Default	By default, duplicate MAC address support is disabled.	
Command Modes	DHCP IPv4 configuration	
Command History	Release	Modification
	Release 6.1.2	This command was introduced in BNG, with an addition of exclude-vlan option to exclude VLANs from the client key.
	Release 4.3.2	This command was introduced.
Usage Guidelines	<p>You can enable duplicate MAC addresses on relay, proxy, server, and snooper DHCP modes.</p> <p>Do not enable the duplicate-mac-allowed command for mobile subscribers.</p> <p>With exclude-vlan option enabled, both inner and outer VLANs get excluded. You cannot exclude just one of them.</p>	
Task ID	Task ID	Operation
	ip-services	read, write

Example

This examples shows how to allow duplicate client MAC addresses across different VLANs and interfaces, using the **duplicate-mac-allowed** command:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# dhcp ipv4
RP/0/RSP0/CPU0:router(config-dhcpv4)# duplicate-mac-allowed exclude-vlan
```

Related Commands

Command	Description
dhcp ipv4 , on page 261	Enables Dynamic Host Configuration Protocol (DHCP) for IPv4 and enters DHCP IPv4 configuration mode.

giaddr policy

To configure how Dynamic Host Configuration Protocol (DHCP) IPv4 Relay processes BOOTREQUEST packets that already contain a nonzero giaddr attribute, use the **giaddr policy** command in DHCP IPv4 profile relay configuration submode. To restore the default giaddr policy, use the **no** form of this command.

```
giaddr policy {replace | drop}
no giaddr policy {replace | drop}
```

Syntax Description	<p>replace Replaces the existing giaddr value with a value that it generates.</p> <p>drop Drops the packet that has an existing nonzero giaddr value.</p>				
Command Default	DHCP IPv4 relay retains the existing nonzero giaddr value in the DHCP IPv4 packet received from a client value.				
Command Modes	DHCP IPv4 profile relay configuration				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 3.7.2</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Release 3.7.2	This command was introduced.
Release	Modification				
Release 3.7.2	This command was introduced.				
Usage Guidelines	The giaddr policy command affects only the packets that are received from a DHCP IPv4 client that have a nonzero giaddr attribute.				
Task ID	<table border="1"> <thead> <tr> <th>Task ID</th> <th>Operations</th> </tr> </thead> <tbody> <tr> <td>ip-services</td> <td>read, write</td> </tr> </tbody> </table>	Task ID	Operations	ip-services	read, write
Task ID	Operations				
ip-services	read, write				
Examples	<p>The following example shows how to use the giaddr policy command:</p> <pre>RP/0/RSP0/CPU0:router# config RP/0/RSP0/CPU0:router(config)# dhcp ipv4 RP/0/RSP0/CPU0:router(config-dhcpv4)# profile client relay RP/0/RSP0/CPU0:router(config-dhcpv4-relay-profile)# giaddr policy drop</pre>				

helper-address

To configure the Dynamic Host Configuration Protocol (DHCP) IPv4 or IPv6 relay agent to relay DHCP packets to a specific DHCP server, use the **helper-address** command in an appropriate configuration mode. Use the **no** form of this command to clear the address.

helper-address [**vrf** *vrf-name*] [*address*] [**giaddr** *gateway-address*]

Syntax Description	
<i>vrf-name</i>	(Optional) Specifies the name of a particular VRF.
<i>address</i>	IPv4 and Pv6 address in four part, dotted decimal format.
giaddr <i>gateway-address</i>	(Optional) Specifies the gateway address to use in packets relayed to server. This keyword is applicable for IPv4 helper address.

Command Default Helper address is not configured.

Command Modes DHCP IPv6 proxy profile class configuration
DHCP IPv6 profile relay configuration

Command History	Release	Modification
	Release 3.7.2	This command was introduced.
	Release 4.2.0	This command was supported for BNG.
	Release 4.3.0	The support for IPv6 was added in BNG.
	Release 5.2.2	This command is supported in DHCPv6 profile relay configuration submode.

Usage Guidelines A maximum of upto eight helper addresses can be configured.

Task ID	Task ID	Operations
	ip-services	read, write

Examples

This example shows how to set the helper-address for a VRF using the **helper-address** command in DHCP IPv6 proxy profile class configuration mode:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router (config)# dhcp ipv6
RP/0/RSP0/CPU0:router (config-dhcpv6)# profile myprofile proxy
RP/0/RSP0/CPU0:router (config-dhcpv4-proxy-profile)# class myclass
RP/0/RSP0/CPU0:router (config-dhcpv4-proxy-profile-class)# helper-address vrf my-server-vrf
1:1:1::1
```

Related Commands	Command	Description
	dhcp ipv4 , on page 261	Enables Dynamic Host Configuration Protocol (DHCP) for IPv4 and enters DHCP IPv4 configuration mode.
	relay information check , on page 302	Configures a DHCP server to validate the relay agent information option in forwarded BOOTREPLY messages.
	relay information option , on page 304	Enables the system to insert a DHCP relay agent information option in forwarded BOOTREQUEST messages to a DHCP server.
	relay information option allow-untrusted , on page 306	Configures the DHCP component to not drop BOOTREQUEST messages that have the relay information option set and the giaddr set to zero.
	relay information policy , on page 308	Configures how a relay agent processes BOOTREQUEST messages that already contain a relay information option.

helper-address (ipv6)

To configure the Dynamic Host Configuration Protocol (DHCP) IPv6 relay agent for prefix delegation to relay DHCP packets to a specific DHCP server, use the **helper-address** command in the DHCP IPv6 profile configuration submode. Use the **no** form of this command to clear the address.

```
helper-address ipv6-address [ interface type interface-path-id ]
no helper-address ipv6-address [ interface type interface-path-id ]
```

Syntax Description	
<i>ipv6-address</i>	The IPv6 address assigned to the interface. This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal format using 16-bit values between colons.
interface <i>type</i>	Interface type. For more information, use the question mark (?) online help function.
<i>interface-path-id</i>	(Optional) Either a physical interface instance or a virtual interface instance as follows: <ul style="list-style-type: none"> Physical interface instance. Naming notation is <i>rack/slot/module/port</i> and a slash between value s is required as part of the notation. <ul style="list-style-type: none"> <i>rack</i>: Chassis number of the rack. <i>slot</i>: Physical slot number of the modular services card or line card. <i>module</i>: Module number. A physical layer interface module (PLIM) is always 0. <i>port</i>: Physical port number of the interface. <p>Note In references to a Management Ethernet interface located on a route processor card, the physical slot number is alphanumeric (RSP0) and the module is CPU0. Example: interface MgmtEth0/RSP0/CPU0/0.</p> <ul style="list-style-type: none"> Virtual interface instance. Number range varies depending on interface type. <p>For more information about the syntax for the router, use the question mark (?) online help function.</p>
Command Default	No default behavior or values
Command Modes	DHCP IPv6 profile configuration

Command History	Release	Modification
	Release 4.1.1	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operation
	ip-services	read, write

Example

This is a sample output that shows how to set the helper-address using the **helper-address** command

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# dhcp ipv6
RP/0/RSP0/CPU0:router(config-dhcpv6)# profile p1 proxy
RP/0/RSP0/CPU0:router(config-dhcpv6-profile)# helper-address 2001:db8::3 GigabitEthernet
0/2/0/0
```

Related Commands	Command	Description
	dhcp ipv6 , on page 271	Enables Dynamic Host Configuration Protocol (DHCP) for IPv6.

iana-route-add

To enable route addition for identity association for non temporary address (IANA), use the **iana-route-add** command in DHCPv6 relay profile configuration submode. To disable route addition to IANA, use the **no** form of this command.

iana-route-add
no iana-route-add

Syntax Description	This command has no keywords or arguments.	
Command Default	Disabled.	
Command Modes	DHCP IPv6 relay profile configuration submode	
Command History	Release	Modification
	Release 5.2.2	This command was introduced.

Usage Guidelines The DHCPv6 relay is capable of installing routes for multiple identity association for prefix delegation (IAPD) options within a DHCPv6 message. The route addition for IAPD is enabled by default. The DHCPv6 relay is capable of installing routes for IANA as well, but this feature is disabled by default. Users can enable the route addition to IANA feature by using **iana-route-add** command in DHCPv6 relay profile configuration submode.

Task ID	Task ID	Operation
	ip-services	read, write

Example

This example shows how to enable route addition to IANA:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# dhcp ipv6
RP/0/RSP0/CPU0:router(config-dhcpv6)# profile client relay
RP/0/RSP0/CPU0:router(config-dhcpv6-relay-profile)# iana-route-add
```

interface (DHCP)

To enable Dynamic Host Configuration Protocol (DHCP) for IPv4 or IPv6 on an interface, use the **interface** command in the appropriate configuration mode. To disable DHCPv4 or DHCPv6 on an interface, use the **no** form of the command.

```
interface type interface-path-id { base | cnbng | proxy | relay | server | snoop }
profile profile-name
```

Syntax Description		
<i>type</i>	Interface type. For more information, use the question mark (?) online help function.	
<i>interface-path-id</i>	Physical interface or virtual interface.	
	Note	Use the show interfaces command to see a list of all interfaces currently configured on the router.
	For more information about the syntax for the router, use the question mark (?) online help function.	
cnbng	Attaches a cloud native BNG (cnBNG) profile for the specified interface.	
server	Attaches a server profile for the specified interface.	
relay	Attaches a relay profile for the specified interface.	
snoop	Attaches a snoop profile for the specified interface.	
proxy	Attaches the proxy profile to an interface.	
base	Attaches a base profile for the specified interface.	
profile <i>profile-name</i>	Specifies the profile name.	
Command Default	None	
Command Modes	DHCP IPv6 configuration DHCP IPv4 configuration	
Command History	Release	Modification
	Release 4.1.0	This command was introduced.
	Release 4.3.0	The support for IPv6 was added in BNG.
	Release 5.1	Support for server profile was added.

Release	Modification
Release 5.2.2	Support for DHCP IPv6 relay was added. The keyword base was added as part of DHCPv4 Service Based Mode Selection feature.
Release 6.2.1	Support for DHCP IPv6 base profile was added.
Release 7.3.1	Support for DHCP IPv4 and IPv6 cnBNG profile was added.

Usage Guidelines

The support for **base** profile option for DHCP IPv6 is available in BNG from Release 6.2.1 and later. For more details, refer *PPP Class-based DHCPv6 Mode Selection* feature in *Cisco ASR 9000 Series Aggregation Services Router Broadband Network Gateway Configuration Guide*.

Task ID

Task ID	Operations
ip-services	read, write

Examples

This is an example of attaching a base profile to an interface:

```
RP/0/RSP0/CPU0:router(config)# dhcp ipv4
RP/0/RSP0/CPU0:router(config-dhcpv4)# interface gigabitEthernet 0/0/0/0 base profile
BASE_PROFILE
```

This is an example of enabling the DHCP interface mode on a Packet over Sonet/SDH (POS) interface using the **interface** command:

```
RP/0/RSP0/CPU0:router(config)# dhcp ipv6
RP/0/RSP0/CPU0:router(config-dhcpv6)# interface POS 0/5/0/0 relay
```

This is an example of enabling the DHCP interface mode on a Packet over Sonet/SDH (POS) interface using the **interface** command:

```
RP/0/RSP0/CPU0:router(config)# dhcp ipv4
RP/0/RSP0/CPU0:router(config-dhcpv4)# interface POS 0/5/0/0 server profile TEST
```

This example shows how to attach a base profile to an interface, in DHCPv6 mode:

```
RP/0/RSP0/CPU0:router(config)# dhcp ipv6
RP/0/RSP0/CPU0:router(config-dhcpv6)# interface Bundle-Ether302.2501 base profile base_TEST
```

This example shows how to attach a cnBNG profile to an interface, in DHCPv4 mode:

```
Router(config)#dhcp ipv4  
Router(config-dhcpv4)#interface Bundle-Ether1.1 cnbng profile test-cnbng-profile
```

lease (DHCPv4 Server)

To configure the lease for an IP address assigned from the pool, use the **lease** command in the DHCPv4 server profile submode. To deconfigure, use the **no** form of this command.

```
lease { infinite | days minutes seconds }
no lease { infinite | days minutes seconds }
```

Syntax Description	infinite	Configures an infinite lease.
	<i>days minutes seconds</i>	Configures lease for the specified number of hours, minutes, and seconds.

Command Default None

Command Modes DHCPv4 Server Profile

Command History	Release	Modification
	Release 5.1	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operation
	ip-services	read, write

Example

This is a sample output from the **lease** command:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# dhcp ipv4
RP/0/RSP0/CPU0:router(config-dhcpv4)# profile P1 server
RP/0/RSP0/CPU0:router(config-dhcpv4-server-profile)# lease infinite
```

Related Commands	Command	Description
	#unique_148	Configures the boot file.

limit lease

To configure the limit on a lease per-circuit-id, per-interface, or per-remote-id, use the **limit lease** command in the DHCPv4 server profile submode. To deconfigure, use the **no** form of this command.

```
limit lease {per-circuit-id | per-interface | per-remote-id }value
no limit lease {per-circuit-id | per-interface | per-remote-id }value
```

Syntax Description	per-circuit-id	Inserts the limit lease type circuit-id.
	per-interface	Inserts the limit lease type interface.
	per-remote-id	Inserts the limit lease type remote-id.
	<i>value</i>	Value of limit lease count. Range is from 1 to 240000.
Command Default	None	
Command Modes	DHCPv4 Server Profile	
Command History	Release	Modification
	Release 5.1	This command was introduced.
Usage Guidelines	No specific guidelines impact the use of this command.	
Task ID	Task ID	Operation
	ip-services	read, write

Example

This is a sample output from the **limit lease** command:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# dhcp ipv4
RP/0/RSP0/CPU0:router(config-dhcpv4)# profile P1 server
RP/0/RSP0/CPU0:router(config-dhcpv4-server-profile)# limit lease per-circuit-id 23
```

Related Commands	Command	Description
	#unique_148	Configures the boot file.

netbios-name-server

To configure NetBIOS name servers, use the **netbios-name-server** command in the DHCPv4 server profile submode. To deconfigure, use the **no** form of this command.

netbios-name server *address1address2...address8*
no netbios-name server *address1address2...address8*

Syntax Description	<i>address1address2...address8</i> Name of the server or IP address.
---------------------------	----------------------------------------------------------------------

Command Default	None
------------------------	------

Command Modes	DHCPv4 Server Profile DHCPv4 Server Profile Class Sub-mode
----------------------	---------------------------------------------------------------

Command History	Release	Modification
	Release 5.1	This command was introduced.
	Release 5.2.2	This command is supported in DHCPv4 server profile class sub-mode.

Usage Guidelines	No specific guidelines impact the use of this command.
-------------------------	--------------------------------------------------------

Task ID	Task ID	Operation
	ip-services	read, write

Example

This is a sample configuration for the **netbios-name-server** command:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# dhcp ipv4
RP/0/RSP0/CPU0:router(config-dhcpv4)# profile DHCP_SERVER_PROFILE server
RP/0/RSP0/CPU0:router(config-dhcpv4-server-profile)# netbios-name-server 10.20.3.5
```

netbios-node-type

To configure the type of NetBIOS node, use the **netbios-node-type** command in the DHCPv4 server profile submode. To deconfigure, use the **no** form of this command.

netbios-node-type { *number* | *b-node* | *h-node* | *m-node* | *p-node* }

Syntax Description

number Hexadecimal number.

b-node broadcast node.

h-node hybrid node.

m-node mixed node.

p-node peer-to-peer node.

Command Default

None

Command Modes

DHCPv4 Server Profile

DHCPv4 Server Profile Class Sub-mode

Command History

Release	Modification
Release 5.1	This command was introduced.
Release 5.2.2	This command is supported in DHCPv4 server profile class sub-mode.

Usage Guidelines

No manually configured prefix delegations exist.

Task ID

Task ID	Operation
ip-services	read, write

Example

This is a sample output from the **bootfile** command:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# dhcp ipv4
RP/0/RSP0/CPU0:router(config-dhcpv4)# profile DHCP_SERVER_PROFILE server
RP/0/RSP0/CPU0:router(config-dhcpv4-server-profile)# netbios-node-type p-node
```

option

To configure the DHCP option code, use the **option** command in the DHCPv4 server profile submode. To deconfigure, use the **no** form of this command.

The DHCP options which are not commonly used are configured in a raw format using **option** command.

```
option option-code { ascii string | hex string | ip address }
no option option-code { ascii string | hex string | ip address }
```

Syntax Description

<i>option-code</i>	Specifies the DHCP option code.
ascii string	Specifies the data as an NVT ASCII string.
hex string	Specifies the data as a hex string.
ip address	Specifies the hostname or the IP Address.

Command Default

None

Command Modes

DHCPv4 Server Profile
DHCPv4 Server Profile Class Sub-mode

Command History

Release	Modification
Release 5.1	This command was introduced.
Release 5.2.2	This command is supported in DHCPv4 server profile class sub-mode.

Usage Guidelines

DHCP server profile class sub-mode supports configuring DHCP options except few that are listed in the table below:

Table 31: Not Supported DHCP Options under DHCPv4 Server Profile Class Sub-mode

DHCP Option Name	DHCP Option Code
Pad	0
Host Name	12
Requested Address	50
Over Load	52
Message Type	53
Server Identifier	54
Renewal Time	58

DHCP Option Name	DHCP Option Code
Rebind Time	59
Client Identifier	61
Relay Information	82
End	255

Task ID

Task ID	Operation
ip-services	read, write

Example

This is a sample output from the **option** command:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# dhcp ipv4
RP/0/RSP0/CPU0:router(config-dhcpv4)# profile DHCP_SERVER_PROFILE server
RP/0/RSP0/CPU0:router(config-dhcpv4-server-profile)# option 23 ip 10.20.34.56
RP/0/RSP0/CPU0:router(config-dhcpv4-server-profile)# option 16 hex 20187634
RP/0/RSP0/CPU0:router(config-dhcpv4-server-profile)# option 17 ascii /users/cisco/
```

pool (DHCP)

To configure the Distributed Address Pool Service(DAPS) pool name, use the **pool** command in the DHCPv4 server profile submode. To deconfigure, use the **no pool** form of this command.

pool *pool-name*
no pool *pool-name*

Syntax Description	<i>pool-name</i> Specifies the DAPS pool name.
---------------------------	------------------------------------------------

Command Default	None
------------------------	------

Command Modes	DHCPv4 Server Profile
----------------------	-----------------------

Command History	Release	Modification
	Release 5.1	This command was introduced.

Usage Guidelines	No specific guidelines impact the use of this command.
-------------------------	--------------------------------------------------------

Task ID	Task ID	Operation
	ip-services	read, write

Example

This is a sample output from the **pool** command:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# dhcp ipv4
RP/0/RSP0/CPU0:router(config-dhcpv4)# profile P1 server
RP/0/RSP0/CPU0:router(config-dhcpv4-server-profile)# pool pool1
```

Related Commands

Command	Description
#unique_148	Configures the boot file.

profile (DHCP)

To configure a DHCP relay profile, DHCP snooping profile, DHCP base profile or a DHCP proxy profile for the Dynamic Host Configuration Protocol (DHCP) IPv4 or IPv6 component and to enter the profile mode, use the **profile** command in DHCP IPv4 or DHCP IPv6 configuration mode. To disable this feature and exit the profile mode, use the **no** form of this command.

profile *name* {**base** | **relay** | **snoop** | **proxy** | **server**}
no profile *name* {**base** | **relay** | **snoop** | **proxy** | **server**}

Syntax Description

<i>name</i>	Name that uniquely identifies the relay or snoop profile.
base	Configures a DHCP base profile. If an interface is configured in the DHCP BASE mode, then the DHCP selects either the DHCP proxy or the DHCP server mode to process the client request by matching option 60 (class-identifier) value of the client request with the configured value under the DHCP base profile.

relay

Configures a DHCP relay profile. A DHCP relay agent is a host that forwards DHCP packets between clients and servers. When the clients and servers are not on the same physical subnet, the relay agents are used to forward requests and replies between them.

A DHCP relay agent is any host that forwards DHCP packets between clients and servers. Relay agents are used to forward requests and replies between clients and servers when they are not on the same physical subnet. Relay agent forwarding is distinct from the normal forwarding of an IP router, where IP datagrams are switched between networks rather transparently. By contrast, relay agents receive DHCP messages and then generate a new DHCP message to send out on another interface. The relay agent sets the gateway IP address (giaddr field of the DHCP packet) and, if configured, adds the relay agent information option (option82) in the packet and forwards it to the DHCP server. The reply from the server is forwarded back to the client after removing option 82.

snoop

Configures a DHCP snoop profile. DHCP snooping is a DHCP security feature that provides security by filtering untrusted DHCP messages and by building and maintaining a DHCP snooping binding table.

DHCP snooping is a DHCP security feature that provides security by filtering untrusted DHCP messages and by building and maintaining a DHCP snooping binding table. An untrusted message is a message that is received from outside the network or firewall and that can cause traffic attacks within your network.

The DHCP snooping binding table contains the MAC address, IP address, lease time, binding type, VLAN number, and interface information that corresponds to the local untrusted interfaces of a switch. It does not contain information regarding hosts interconnected with a trusted interface. An untrusted interface is an interface that is configured to receive messages from outside the network or firewall. A trusted interface is an interface that is configured to receive only messages from within the network.

DHCP snooping acts like a firewall between untrusted hosts and DHCP servers. It also gives you a way to differentiate between untrusted interfaces connected to the end-user and trusted interfaces connected to the DHCP server or another switch.

proxy

Configures a DHCP proxy profile.

The DHCP proxy performs all the functions of a relay and also provides some additional functions. The DHCP proxy conceals DHCP server details from DHCP clients. The DHCP proxy modifies the DHCP replies such that the client considers the proxy to be the server. In this state, the client interacts with the proxy as if it is the DHCP server.

The DHCP proxy passes IP configuration information between the client and server. It also keeps track of the client's addresses and lease time. It is used when DHCP client and DHCP server are present on different networks.

The DHCP proxy supports the use of unnumbered interfaces, including use of proxy forwarding. For DHCP clients connected through the unnumbered interfaces, the DHCP proxy automatically adds a static host route once the DHCP client obtains an address, specifying the unnumbered interface as the outbound interface. The route is automatically removed once the lease time expires or when the client releases the address.

server	<p>Configures a DHCP server profile.</p> <p>DHCP server allocates network addresses and passes IP configuration parameters to dynamically configured hosts.</p> <p>When a client initiates a DHCP Discover request on its local Ethernet segment, the DHCP Server sends a notification to the Distributed Address Pool (DAPS) component requesting it allocate addresses to clients from a specified pool. The DAPS selects the client address from the specified pool and returns the address to the DHCP Server. The DHCP Server sends the allocated address through a DHCP OFFER message to the client. The Client chooses one of the OFFER messages for configuration, and responds with a broadcast REQUEST, thereby informing the Server that the OFFER message was acceptable. The Server commits the binding of the Client and its IP Address to persistent storage and responds with an acknowledgement message. The Client commits the IP address and configuration parameters, which includes lease time.</p> <p>The pool is configured under server-profile-mode and server-profile-class-sub-mode. Class based pool selection is always given priority over profile pool selection.</p>

Command History	Release	Modification
	Release 3.7.2	This command was introduced.
	Release 4.0.0	The proxy keyword was added.

Release	Modification
Release 5.1	The server keyword was added.
Release 5.2.2	Support for DHCP IPv6 relay was added. Support for DHCP IPv4 base was added

Usage Guidelines

No specific guidelines impact the use of this command.

Task ID

Task ID	Operations
ip-services	read, write

Examples

This example shows how to use the **profile** command to configure DHCP IPv4 base profile:

```
RP/0/RSP0/CPU0:router(config)# dhcp ipv4
RP/0/RSP0/CPU0:router(config-dhcpv4)# profile DHCP_BASE base
RP/0/RSP0/CPU0:router(config-dhcpv4-base-profile)#
```

This example shows how to use the **profile** command to configure DHCP IPv6 relay profile:

```
RP/0/RSP0/CPU0:router(config)# dhcp ipv6
RP/0/RSP0/CPU0:router(config-dhcpv6)# profile client relay
RP/0/RSP0/CPU0:router(config-dhcpv6-relay-profile)#
```

This example shows how to use the **profile** command to configure DHCP IPv4 relay profile:

```
RP/0/RSP0/CPU0:router(config)# dhcp ipv4
RP/0/RSP0/CPU0:router(config-dhcpv4)# profile client relay
RP/0/RSP0/CPU0:router(config-dhcpv4-relay-profile)#
```

This example shows how to use the **profile** command for a **proxy** profile:

```
RP/0/RSP0/CPU0:router(config)# dhcp ipv4
RP/0/RSP0/CPU0:router(config-dhcpv4)# profile profile1 proxy
RP/0/RSP0/CPU0:router(config-dhcpv4-proxy-profile)#
```

This example shows how to use the **profile** command for a **server** profile:

```
RP/0/RSP0/CPU0:router(config)# dhcp ipv4
RP/0/RSP0/CPU0:router(config-dhcpv4)# profile TEST server
RP/0/RSP0/CPU0:router(config-dhcpv4-server-profile)#
```

quiet-on-unspec-fail

To disable DHCP IPv6 proxy from sending ADV packet when status code is `UNSPEC-FAIL`, use the **quiet-on-unspec-fail** command in DHCP IPv6 configuration mode. To restore the default DHCP IPv6 proxy behaviour, use the **no** form of this command.

quiet-on-unspec-fail

no quiet-on-unspec-fail

Syntax Description

This command has no keywords or arguments.

Command Default

By default, the DHCP IPv6 proxy sends ADV packets when status code is `UNSPEC-FAIL`.

Command Modes

DHCP IPv6 configuration

Command History

Release	Modification
Release 7.3.2	This command was introduced.

Usage Guidelines

You can use the `show running-config dhcp ipv6` command to check if the **quiet-on-unspec-fail** command is configured in the DHCP IPv6 configuration.

Task ID

Task ID	Operations
ip-services	read, write

Examples

The following example shows how to disable DHCP IPv6 Proxy from sending ADV packets when status code is `UNSPEC-FAIL`:

```
Router# configure
Router(config)# dhcp ipv6
Router(config-dhcpv6)# quiet-on-unspec-fail
```

Examples

The following example shows no form of the **quiet-on-unspec-fail** command:

```
Router# configure
Router(config)# dhcp ipv6
Router(config-dhcpv6)# no quiet-on-unspec-fail
```

relay information authenticate

To specify relay agent information option to the policy plane for authentication purposes, use the **relay information authenticate** command in the DHCP IPv4 proxy profile configuration mode. To disable the relay option, use the **no** form of this command.

relay information authenticate {received | inserted}

Syntax Description

received Authenticate using received relay agent information option.

inserted Authenticate using inserted relay agent information option.

Command Default

None

Command Modes

DHCP IPv4 proxy profile configuration

Command History

Release	Modification
Release 4.3.1	This command was introduced.

Usage Guidelines

No specific guidelines impact the use of this command.

Task ID

Task ID	Operations
ip-services	read, write

Examples

This example shows how to specify the received relay agent information option for authentication using the **relay information authenticate** command in DHCP IPv4 proxy profile configuration mode:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# dhcp ipv4
RP/0/RSP0/CPU0:router(config-dhcpv4)# profile myprofile proxy
RP/0/RSP0/CPU0:router(config-dhcpv4-proxy-profile)# relay information authenticate received
```

	basic-services	read, write

This example shows how to use the **relay information check** command:

```
RP/0/RSP0/CPU0:router#config
RP/0/RSP0/CPU0:router(config)# dhcp ipv4
RP/0/RSP0/CPU0:router(config-dhcpv4)# profile client relay
RP/0/RSP0/CPU0:router(config-dhcpv4-relay-profile)# relay information check
```

Related Commands	Command	Description
	dhcp ipv4 , on page 261	Enables DHCP for IPv4 and enters DHCP IPv4 configuration mode.
	helper-address	Configures the DHCP relay agent to relay packets to a specific DHCP Server.
	profile (BNG)	Configures a relay profile for the DHCP IPv4 component.

Command	Description
relay information option , on page 304	Enables the system to insert a DHCP relay agent information option in forwarded BOOTREQUEST messages to a DHCP server.
relay information option allow-untrusted , on page 306	Configures the DHCP component to not drop BOOTREQUEST messages that have the relay information option set and the giaddr set to zero.

relay information option

To configure Dynamic Host Configuration Protocol (DHCP) IPv4 relay or DHCP snooping Relay to insert relay agent information option in forwarded BOOTREQUEST messages to a DHCP server, use the **relay information option** command in DHCP IPv4 relay profile relay configuration or DHCP IPv4 profile snoop submode. To disable inserting relay information into forwarded BOOTREQUEST messages, use the **no** form of this command.

relay information option

Syntax Description This command has no keywords or arguments.

Command Default None

Command Modes

DHCP IPv4
 relay
 profile
 relay
 configuration

DHCP IPv4 profile snoop configuration

Command History	Release	Modification
	Release 3.7.2	This command was introduced.
	Release 4.2.0	This command was supported for BNG.

Usage Guidelines The **relay information option** command automatically adds the circuit identifier suboption and the remote ID suboption to the DHCP relay agent information option.

The **relay information option** command enables a DHCP server to identify the user (for example, cable access router) sending the request and initiate appropriate action based on this information. By default, DHCP does not insert relay information.

If the **information option** command is enabled, DHCP snooping mode does not set the giaddr field in the DHCP packet.

The upstream DHCP server or DHCP relay interface must be configured to accept this type of packet using the **relay information option allow-untrusted** configuration. This configuration prevents the server or relay from dropping the DHCP message.

Task ID	Task ID	Operations
	ip-services	read, write
	basic-services	read, write

This example shows how to use the **relay information option** command:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# dhcp ipv4
RP/0/RSP0/CPU0:router(config-dhcpv4)# profile client relay
RP/0/RSP0/CPU0:router(config-dhcpv4-relay-profile)# relay information option
```

Related Commands

Command	Description
dhcp ipv4 , on page 261	Enables DHCP for IPv4 and enters DHCP IPv4 configuration mode.
helper-address	Configures the DHCP relay agent to relay packets to a specific DHCP Server.
relay information check , on page 302	Configures a DHCP server to validate the relay agent information option in forwarded BOOTREPLY messages.
relay information option allow-untrusted , on page 306	Configures the DHCP component to not drop BOOTREQUEST messages that have the relay information option set and the giaddr set to zero.

relay information option allow-untrusted

To configure the Dynamic Host Configuration Protocol (DHCP) IPv4 relay or DHCP snooping Relay not to drop discard BOOTREQUEST packets that have the relay information option set and the giaddr set to zero, use the **relay information option allow-untrusted** command in DHCP IPv4 relay profile configuration submode or DHCP IPv4 profile snoop configuration submode. To restore the default behavior, which is to discard the BOOTREQUEST packets that have the relay information option and set the giaddr set to zero, use the **no** form of this command.

relay information option allow-untrusted

Syntax Description

This command has no keywords or arguments.

Command Default

The packet is dropped if the relay information is set and the giaddr is set to zero.

Command Modes

DHCP IPv4
 relay
 profile
 relay
 configuration

 DHCP IPv4 profile snoop configuration

Command History

Release	Modification
Release 3.7.2	This command was introduced.
Release 4.2.0	This command was supported for BNG.

Usage Guidelines

According to RFC 3046, relay agents (and servers) receiving a DHCP packet from an untrusted circuit with giaddr set to zero but with a relay agent information option already present in the packet shall discard the packet and increment an error count. This configuration prevents the server or relay from dropping the DHCP message.

Task ID

Task ID	Operations
ip-services	read, write
basic-services	read, write

Examples

This example shows how to use the **relay information option allow-untrusted** command:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# dhcp ipv4
RP/0/RSP0/CPU0:router(config-dhcpv4)# profile client relay
```

```
RP/0/RSP0/CPU0:router(config-dhcpv4-relay-profile)# relay information option allow-untrusted
```

Related Commands

Command	Description
dhcp ipv4 , on page 261	Enables DHCP for IPv4 and enters DHCP IPv4 configuration mode.
<code>helper-address</code>	Configures the DHCP relay agent to relay packets to a specific DHCP Server.
relay information check , on page 302	Configures a DHCP server to validate the relay agent information option in forwarded BOOTREPLY messages.
relay information option , on page 304	Enables the system to insert a DHCP relay agent information option in forwarded BOOTREQUEST messages to a DHCP server.

relay information policy

To configure how the Dynamic Host Configuration Protocol (DHCP) IPv4 relay processes BOOTREQUEST packets that already contain a relay information option, use the **relay information policy** command in DHCP IPv4 relay profile configuration submenu. To restore the default relay information policy, use the **no** form of this command.

relay information policy {drop | keep | encapsulate}

Syntax Description	drop	keep	encapsulate
	Directs the DHCP IPv4 Relay to discard BOOTREQUEST packets with the existing relay information option.	Directs the DHCP IPv4 Relay not to discard a BOOTREQUEST packet that is received with an existing relay information option and to keep the existing relay information option value.	Encapsulates the DHCP relay agent information option received from a prior relay agent in forwarded BOOTREQUEST messages.

Command Default The DHCP IPv4 Relay does not discard a BOOTREQUEST packet that has an existing relay information option. The option and the existing relay information option value is replaced.

Command Modes DHCP IPv4 relay profile configuration

Command History	Release	Modification
	Release 3.7.2	This command was introduced.
	Release 4.2.0	This command was supported for BNG.
	Release 4.3.1	The encapsulate keyword was added.

Usage Guidelines The **encapsulate** keyword allows the second relay agent to encapsulate option 82 information in a message received from the first relay agent, if it is also configured to add its own option 82 information. This configuration allows the DHCP server to use option 82 information from both relay agents.

Task ID	Task ID	Operations
	ip-services	read, write
	basic-services	read, write

Examples

This is sample output from executing the **relay information policy** command:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# dhcp ipv4
RP/0/RSP0/CPU0:router(config-dhcpv4)# profile client relay
```

```
RP/0/RSP0/CPU0:router(config-dhcpv4-relay-profile)# relay information policy keep
```

This example shows how to encapsulate the DHCP relay agent information option:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# dhcp ipv4
RP/0/RSP0/CPU0:router(config-dhcpv4)# profile client relay
RP/0/RSP0/CPU0:router(config-dhcpv4-relay-profile)# relay information policy encapsulate
```

Related Commands	Command	Description
	dhcp ipv4 , on page 261	Enables DHCP for IPv4 and enters DHCP IPv4 configuration mode.

	relay information option allow-untrusted , on page 306	Configures the DHCP component to not drop BOOTREQUEST messages that have the relay information option set and the giaddr set to zero.

requested-ip-address-check

To verify whether a client has inserted Option 50 (Requested-IP-Address), use **requested-ip-address-check** command in the DHCPv4 server profile submode. To disable this feature, use the **no** form of this command.

requested-ip-address-check
no requested-ip-address-check

Syntax Description This command has no keywords or arguments.

Command Default By default, requested-ip-address-check is disabled.

Command Modes DHCPv4 Server Profile

Command History	Release	Modification
	Release 5.1	This command was introduced.

Usage Guidelines If the requested-ip-address-check is enabled, ingress RELEASE/RENEW packets are dropped.

Task ID	Task ID	Operation
	ip-services	read, write

Example

This is a sample output from the **requested-ip-address-check** command:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# dhcp ipv4
RP/0/RSP0/CPU0:router(config-dhcpv4)# profile P1 server
RP/0/RSP0/CPU0:router(config-dhcpv4-server-profile)# requested-ip-address-check disable
```

Related Commands

Command	Description
#unique_148	Configures the boot file.

subnet-mask

To configure subnet mask that DHCP clients should use, use the **subnet-mask** command in DHCP IPv4 server profile configuration mode.

subnet-mask *number*

Syntax Description

number Specify DHCP server's subnet mask number.

Command Default

None

Command Modes

DHCP IPv4 Server Profile configuration

DHCP IPv4 Server Profile Class submode

Command History

Release	Modification
Release 6.0.1	This command was introduced.

Usage Guidelines

If **subnet-mask** is not configured, then the DHCP server will send subnet mask of an access interface to the client.

Task ID

Task ID	Operation
ip-services	read, write

This example shows how to configure subnet mask for DHCP server:

```
Router# config
Router(config)# dhcp ipv4
Router(config-dhcpv4)# profile DHCP_SERVER_PROFILE server
Router(config-dhcpv4-server-profile)# subnet-mask 255.255.255.0
```

secure-arp

To allow DHCP to add an ARP cache entry when DHCP assigns an IP address to a client in IP subscriber sessions, use the **secure-arp** command in DHCP IPv4 profile proxy configuration or DHCP IPv4 server profile mode. To disallow DHCP to add an ARP cache entry when DHCP assigns an IP address to a client, use the **no** form of this command.

secure-arp
no secure-arp

Syntax Description This command has no keywords or arguments.

Command Default By default, secure ARP support is disabled.

Command Modes DHCP IPv4 proxy profile configuration
 DHCP IPv4 Server Profile

Command History	Release	Modification
	Release 5.1.1	This command was introduced.

Usage Guidelines In standalone DHCP sessions, the DHCP server adds an ARP entry when it assigns an IP address to a client. However, for IP subscriber sessions, DHCP server does not add an ARP entry. Although ARP establishes correspondences between network addresses, an untrusted device can spoof IP an address not assigned to it posing a security threat for IP subscriber sessions.

Secure ARP allows DHCP to add an ARP cache entry when DHCP assigns an IP address to a client in IP subscriber sessions. This is to prevent untrusted devices from spoofing IP addresses not assigned to them. Secure ARP is disabled by default.

Task ID	Task ID	Operation
	ip-services	read, write

Example

This examples shows how to allow DHCP to add an ARP cache entry when DHCP assigns an IP address to a client using the **secure-arp** command in DHCP IPv4 server profile configuration:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# dhcp ipv4
RP/0/RSP0/CPU0:router(config-dhcpv4)# profile profile1 server
RP/0/RSP0/CPU0:router(config-dhcpv4-server-profile)# secure-arp
RP/0/RSP0/CPU0:router(config-dhcpv4-server-profile)#
```

sessions mac throttle

To enable DHCP sessions MAC throttling functionality, use the **sessions mac throttle** command in an appropriate DHCP profile configuration mode. To disable DHCP sessions MAC throttling functionality, use the **no sessions mac throttle** form of this command.

sessions mac throttle *limit request-period block-period*
no sessions mac throttle

Syntax Description	limit	request-period	block-period
	Number of DISCOVER packets or SOLICIT packets at which the sessions are to be throttled. The range is from 1 to 65535.	Time interval, in seconds, during which DISCOVER packets or SOLICIT packets are allowed. The range is from 1 to 100.	Time interval during which no more DISCOVER packets or SOLICIT packets from the same MAC address are accepted.

Command Default Disabled.

Command Modes DHCP IPv4 server profile submode
 DHCP IPv4 proxy profile submode
 DHCP IPv6 proxy profile submode

Command History	Release	Modification
	Release 5.1.1	This command was introduced.

Usage Guidelines The packet type for DHCP IPv4 is DISCOVER and the packet type for DHCP IPv6 is SOLICIT.

Task ID	Task ID	Operation
	ip-services	read, write

This example shows how to configure a sessions MAC throttle in DHCP IPv4 server profile submode with a throttle limit of 100 DISCOVER packets, a request period of 50 seconds and a blocking period of 60 seconds:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# dhcp ipv4 profile p1 server
RP/0/RSP0/CPU0:router(config-dhcpv4-server-profile)# sessions mac throttle 100 50 60
```

This example shows how to configure a sessions MAC throttle in DHCP IPv6 proxy profile submode with a throttle limit of 300 SOLICIT packets, a request period of 60 seconds and a blocking period of 40 seconds:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# dhcp ipv6 profile p2 proxy
RP/0/RSP0/CPU0:router(config-dhcpv6-proxy-profile)# sessions mac throttle 300 60 40
```

show dhcp ipv4 proxy interface

To display the proxy interface information for Dynamic Host Configuration Protocol (DHCP) IPv4, use the **show dhcp ipv4 proxy interface** command in EXEC mode.

show dhcp ipv4 proxy interface [*interface-type interface-name*] [**detail**]

Syntax Description	
<i>interface-type</i>	Type of the proxy interface.
<i>interface-name</i>	Name of the proxy interface.
detail	Displays the detailed information of proxy interface.

Command Default None

Command Modes EXEC mode

Command History	Release	Modification
	Release 4.2.0	This command was supported for BNG.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operation
	ip-services	read

This is a sample output from the **show dhcp ipv4 proxy interface** command:

```
RP/0/RSP0/CPU0:router# show dhcp ipv4 proxy interface bundle-Ether 70.16 detail
Sat Jan  5 14:25:53.484 UTC

Interface:          Bundle-Ether70.16
VRF:                default
Mode:               Proxy
Profile Name:       proxy1
Lease Limit:        per circuit id from AAA 2

Lease Count Details:
Circuit id from AAA          Count
c2                            1
```

This table describes the significant fields shown in the display.

Table 32: show dhcp ipv4 proxy interface Command Field Descriptions

Field	Description
Lease Limit	Specifies the lease limit value sent from AAA server.

Field	Description
Count	Specifies the number of sessions on the router having the specific Circuit-ID received from the AAA server.

show dhcp ipv4 relay profile

To display Dynamic Host Configuration Protocol (DHCP) relay agent status, use the **show dhcp ipv4 relay profile** command in EXEC mode.

show dhcp ipv4 relay profile

Syntax Description This command has no keywords or arguments.

Command Default No default behavior or values

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines This command displays the relay profiles created for DHCP IPv4.

Task ID	Task ID	Operations
	ip-services	read

Examples The following is sample output from the **show dhcp ipv4 relay profile** command:

```
RP/0/RSP0/CPU0:router# show dhcp ipv4 relay profile

DHCP IPv4 Relay Profiles
-----
r1
r2
```

Related Commands	Command	Description
	show dhcp ipv4 relay profile name	Displays Dynamic Host Configuration Protocol (DHCP) relay agent status, specific to a relay profile.

show dhcp ipv4 relay profile name

To display Dynamic Host Configuration Protocol (DHCP) relay agent status, specific to a relay profile, use the **show dhcp ipv4 relay profile name** command in EXEC mode.

show dhcp ipv4 relay profile [*name*]

Syntax Description	<i>name</i> (Optional) Name that uniquely identifies the relay profile.				
Command Default	If <i>name</i> is not specified, displays a list of configured DHCP profile names. No default behavior or values

show dhcp ipv4 server binding

To display DHCP client bindings for server, use the **show dhcp ipv4 server binding** command in EXEC mode.

show dhcp ipv4 server binding [**detail**] [**location** *node-ID*] [**interface** *type interface-path-ID*] [**vrf** *vrf-name*] [**ip-address** *address*] [**mac-address** *address*]

Syntax Description	detail	Displays detailed client binding information for all clients.
	location <i>node-ID</i>	Displays detailed client binding information for a specified node.
	interface <i>type interface-path-ID</i>	Displays client binding by interface. Specifies the interface type. For more information, use the question mark (?) online help function. Physical interface or virtual interface. Use the show interfaces command to see a list of all interfaces currently configured on the router. Note For more information about the syntax for the router, use the question mark (?) online help function.
	vrf <i>vrf-name</i>	Displays client binding by vrf name.
	ip-address <i>address</i>	Displays detailed client binding information per IP address or mac-address.
	mac-address <i>address</i>	Displays detailed client binding information per mac-address.

Command Default None.

Command Modes EXEC

Command History	Release	Modification
	Release 5.1	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operation
	ip-services	read

Example

This is a sample output from the **show dhcp ipv4 server binding** command:

```
RP/0/RSP0/CPU0:router# show dhcp ipv4 server binding detail
```

show dhcp ipv4 server binding

```

MAC Address:          ca01.3fcd.0000
VRF:                  default
IP Address:           10.10.10.6
Gateway IP Address:  0.0.0.0
Server IP Address:   11.11.11.3
ReceivedCircuit ID:  -
InsertedCircuit ID:  -
ReceivedRemote ID:   -
InsertedRemote ID:   -
Profile:              foo
State:                BOUND_DPM_CONNECTED
Client Lease:         600 secs (00:10:00)
Client Lease Remaining: 442 secs (00:07:22)

Task ID	Operation				
ip-services	read				

Example

This example show how to display the DHCPv6 database state:

```
RP/0/RSP0/CPU0:router# show dhcp ipv6 database

Database:
Current file version:          1
Full file:
  write interval:              10 seconds
  last file name:              /harddiska:/dhcp/dhcpv6_srp_1_even
  last write time:             Apr-02-2010-08:35:47
  write count:                 10
  failed write count:          0
  record count:                1000
  last write error:            -
  last write error timestamp:  -
Incremental file:
  write interval:              1 second
  last file name:              /harddiska:/dhcp/dhcpv6_srp_1_odd_inc
  last write time:             Apr-02-2010-08:34:47
  write count:                 81
  failed write count:          0
  record count:                373
  last write error:            -
  last write error timestamp:  -
```

show dhcp ipv6 database**Related Commands**

Command	Description
database (DHCPv6 Binding), on page 256	Enables DHCP binding database storage to the file system.

show dhcp ipv6 interface

To display Dynamic Host Configuration Protocol (DHCP) for IPv6 interface information, use the **show dhcp ipv6 interface** command in EXEC mode.

show dhcp ipv6 interface *interface-type interface-instance*

Syntax Description	<p><i>interface-type</i> Interface type. For more information, use the question mark (?) online help function.</p> <hr/> <p><i>interface-instance</i> Either a physical interface instance or a virtual interface instance as follows:</p> <ul style="list-style-type: none"> • Physical interface instance. Naming notation is <i>rack/slot/module/port</i> and a slash between values is required as part of the notation. <ul style="list-style-type: none"> • <i>rack</i>: Chassis number of the rack. • <i>slot</i>: Physical slot number of the modular services card or line card. • <i>module</i>: Module number. A physical layer interface module (PLIM) is always 0. • <i>port</i>: Physical port number of the interface. <p>Note In references to a Management Ethernet interface located on a route processor card, the physical slot number is alphanumeric (RP0 or RP1) and the module is CPU0. Example: interface MgmtEth0/RP1/CPU0/0.</p> <ul style="list-style-type: none"> • Virtual interface instance. Number range varies depending on interface type. <p>For more information about the syntax for the router, use the question mark (?) online help function.</p>
---------------------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Command Default	No default behavior or values
------------------------	-------------------------------

Command Modes	EXEC mode
----------------------	-----------

Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 4.1.0</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Release 4.1.0	This command was introduced.
Release	Modification				
Release 4.1.0	This command was introduced.				

Usage Guidelines	If no interfaces are specified, all interfaces on which DHCP for IPv6 (client or server) is enabled are shown. If an interface is specified, only information about the specified interface is displayed.

Examples	The following is sample output from the show dhcp ipv6 interface command when an interface is not specified:
-----------------	---------------------------------------------------------------------------------------------------------------------

show dhcp ipv6 interface

```
RP/0/RSP0/CPU0:router# show dhcp ipv6 interface
```

```
GigabitEthernet 0/0/0/1 is in relay mode
  Relay destinations:
    2001:eb8:1::1
```

This table describes the significant fields shown in the display.

Table 33: show dhcp ipv6 interface Command Field Descriptions

Field	Description
GigabitEthernet 0/0/0/1 is in relay mode	Displays whether the specified interface is in relay mode.

Related Commands

Command	Description
interface (DHCP), on page 283	Enables DHCP for IPv6 on an interface.

show dhcp ipv4 snoop statistics

To display statistics for a specific bridge domain, use the **show dhcp ipv4 snoop statistics** command in EXEC mode.

```
show dhcp ipv4 snoop statistics [bridge-domain bridge-domain-name]
```

Syntax Description

bridge-domain *bridge-domain-name* (Optional) Specifies a specific bridge-domain.

Command Default

Displays a table of DHCP snooping receive (RX), transmit (TX), and drop (DR) packet statistics for each bridge domain.

Command Modes

EXEC mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes the proper task IDs. If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Task ID

Task ID	Operations
ip-services	read

Examples

The following shows output from the **show dhcp ipv4 snoop statistics** command, showing a table of DHCP snooping RX, TX, and DR packet statistics for each bridge domain:

```
RP/0/RSP0/CPU0:router# show dhcp ipv4 snoop statistics
Sun Apr 6 05:55:57.524 UTC
```

Bridge	RX	TX	DR
mgm:mhd	964	964	0

The following shows output from the **show dhcp ipv4 snoop statistics** command, showing a table of DHCP snooping RX, Tx, and Drop packet statistics for a specific bridge domain:

```
RP/0/RSP0/CPU0:router# show dhcp ipv4 snoop statistics bridge-domain mgm:mhd
Sun Apr 6 05:57:03.600 UTC
```

DNCP IPv4 Snoop Statistics for Bridge mgm:mhd:

show dhcp ipv6 relay binding

To display DHCPv6 client bindings for relay, use the **show dhcp ipv6 relay binding** command in EXEC mode.

```
show dhcp ipv6 relay binding [client-duid client-duid-number ][detail] [interface type
interface-path-id] [location node-id] [summary][ vrf vrf-name]
```

Syntax Description		
client-duid <i>client-duid-number</i>	(Optional) Displays DHCPv6 relay client binding information.	The argument <i>client-duid-number</i> is the client's DHCP Unique Identifier (DUID) number.
	Note	Use the show dhcp ipv6 relay binding command to see the client DUID number.
detail	(Optional) Displays detailed DHCPv6 relay client binding information for all clients.	
interface <i>type</i> <i>interfac-path-id</i>	(Optional) Displays DHCPv6 relay client binding by interface.	Specifies a physical interface or a virtual interface.
	Note	Use the show interfaces command to see a list of all possible interfaces currently configured on the router.
location <i>node-id</i>	(Optional) Displays detailed DHCPv6 relay client binding information for a specified node.	The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
summary	(Optional) Displays the summary of DHCPv6 relay client binding.	
vrf <i>vrf-name</i>	(Optional) Displays DHCPv6 relay client binding information for a VPN routing and forwarding (VRF) instance.	

show dhcp ipv6 relay binding

Command Default	None.	
Command Modes	EXEC mode	
Command History	Release	Modification
	Release 5.2.2	This command was introduced.
Usage Guidelines	No specific guidelines impact the use of this command.	
Task ID	Task ID	Operation
	ip-services	read

This is the sample output for show dhcp ipv6 relay binding command:

```
RP/0/RSP0/CPU0:router# show dhcp ipv6 relay binding
Summary:
Total number of clients: 1

IPv6 Address: fc00:35:0:ef5c:a932:239f:1b0e:e4ed/128 (BVI3500)
  Client DUID: 000100011b626e6f0000cae2da26
  IAID: 0x0
  VRF: default
  Lifetime: 172800 secs (2d00h)
  Expiration: 172766 secs (1d23h)
```

show dhcp ipv6 relay statistics

To display DHCPv6 relay statistics, use the **show dhcp ipv6 relay statistics** command in EXEC mode.

```
show dhcp ipv6 relay statistics [debug [{all | include-zeroes | location node-id}] [vrf vrf-name]
[location nide-id]
```

Syntax Description	Parameter	Description
	debug	(Optional) Displays DHCPv6 relay debug statistics information.
	all	(Optional) Displays DHCPv6 relay debug statistics information for all location.
	include-zeroes	(Optional) Displays DHCPv6 relay debug statistics information that are zero.
	location <i>node-id</i>	(Optional) Displays DHCPv6 relay debug statistics information for for a specified node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
	vrf <i>vrf-name</i>	(Optional) Displays DHCPv6 relay statistics information for a VPN routing and forwarding (VRF) instance.
	location <i>node-id</i>	(Optional) Displays detailed DHCPv6 relay statistics information for a specified node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

Command Default None.

red4             |             0 |             0 |             0 |
red6             |             0 |             0 |             0 |
**eint          |             0 |             0 |             0 |
```

clear dhcp ipv6 relay binding

To clear DHCPv6 relay binding, use the **clear dhcp ipv6 relay binding** command in EXEC mode.

```
clear dhcp ipv6 relay binding [client-duid client-duid-number ] [interface type interface-path-id]
[vrf vrf-name] [location node-id]
```

Syntax Description		
client-duid <i>client-duid-number</i>	(Optional) Clears DHCPv6 relay client binding information.	The argument <i>client-duid-number</i> is the client's DHCP Unique Identifier (DUID) number.
	Note	Use the show dhcp ipv6 relay binding command to see the client DUID number.
interface <i>type interface-path-id</i>	(Optional) Clears DHCPv6 relay client binding information for an interface.	Specifies a physical interface or a virtual interface.
	Note	Use the show interfaces command to see a list of all possible interfaces currently configured on the router.
vrf <i>vrf-name</i>	(Optional) Clears DHCPv6 relay client binding information for a VPN routing and forwarding (VRF) instance.	
location <i>node-id</i>	(Optional) Clears DHCPv6 relay client binding information for a specified node.	The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
Command Default	None.	
Command Modes	EXEC mode	
Usage Guidelines	No specific guidelines impact the use of this command.	

clear dhcp ipv6 relay binding

Task ID	Task ID	Operation
	ip-services	execute
	root-system	read, write

This example shows how to clear DHCPv6 relay binding:

```
Router# clear dhcp ipv6 relay binding
```

clear dhcp ipv6 relay statistics

To clear DHCPv6 relay statistics, use the **clear dhcp ipv6 relay statistics** command in EXEC mode.

```
clear dhcp ipv6 relay statistics [vrf vrf-name [location node-id]]
```

Syntax Description	vrf <i>vrf-name</i>	(Optional) Clears DHCPv6 relay statistics information for a VPN routing and forwarding (VRF) instance.
	location <i>node-id</i>	(Optional) Clears DHCPv6 relay statistics information for a specified node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

Command Default None.

Command Modes EXEC mode

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operation
	ip-services	execute
	root-system	read, write

This example shows how to clear DHCPv6 relay statistics:

```
Router# clear dhcp ipv6 relay statistics
```

show dhcp ipv6 proxy interface

To display the proxy interface information for Dynamic Host Configuration Protocol (DHCP), use the **show dhcp ipv6 proxy interface** command in EXEC mode.

show dhcp ipv6 proxy interface {*type* *interface-path-id*} {**location** *location*}

Syntax Description	
type	Interface type. For more information, use the question mark (?) online help function.
interface-path-id	Physical interface or virtual interface.
Note	Use the show interfaces command to see a list of all interfaces currently configured on the router.
	For more information about the syntax for the router, use the question mark (?) online help function.
location	Displays the node location by Interface.
location	Displays the fully qualified location specification of an interface.

Command Default None

Command Modes EXEC mode

Command History	Release	Modification
	Release 4.3.0	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operation
	ip-services	read

This is a sample output from the **show dhcp ipv6 proxy interface** command:

```
RP/0/RSP0/CPU0:router# show dhcp ipv6 proxy interface
```

```
Tue Sep 4 19:14:54.056 UTC
```

```
Codes: Amb - Ambiguous VLAN, B - Base, R - Relay, P - Proxy,
        SR - Server, S - Snoop, C - Client, INV - Invalid
        CID - Circuit Id, RID - Remote Id, INTF - Interface
```

Interface	Mode	Profile Name	Amb	Lease	Limit
BE1.100	P	pxyl	No	None	
BE1.200	P	pxyl	No	None	
BE1.250	P	pxyl	Yes	None	
BE1.400	P	pxyl	Yes	None	

show dhcp vrf ipv4 server statistics

To display DHCP server statistics for the default vrf or a specific vrf, use the **show dhcp vrf ipv4 server statistics** command in EXEC mode.

```
show dhcp vrf { default | vrf-name } [location node-ID ]
```

Syntax Description		
	default	Display DHCP server statistics for the default vrf.
	<i>vrf-name</i>	Display DHCP server statistics for a specific vrf.
	location <i>node-ID</i>	Displays DHCP server statistics information for a specified node.

Command Default None

Command Modes EXEC mode

Command History	Release	Modification
	Release 5.1	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operation
	ip-services	read

Example

This is a sample output from the **show dhcp vrf default ipv4 server statistics** command:

```
RP/0/RSP0/CPU0:router# show dhcp vrf default ipv4 server statistics
```

time-server

To configure the time server, use the **time-server** command in the DHCPv4 server profile submode. To deconfigure, use the **no** form of this command.

```
time-server address1address2...address8
no time-server address1address2...address8
```

Syntax Description	<i>address1address2...address8</i> Name of the server or IP address.
---------------------------	----------------------------------------------------------------------

Command Default	None
------------------------	------

Command Modes	DHCPv4 Server Profile
----------------------	-----------------------

Command History	Release	Modification
	Release 5.1	This command was introduced.

Usage Guidelines	No specific guidelines impact the use of this command.
-------------------------	--------------------------------------------------------

Task ID	Task ID	Operation
	ip-services	read, write

Example

This is a sample output from the **time-server** command:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# dhcp ipv4
RP/0/RSP0/CPU0:router(config-dhcpv4)# profile P1 server
RP/0/RSP0/CPU0:router(config-dhcpv4-server-profile)# time-server 10.20.3.8
```

Related Commands	Command	Description
	#unique_148	Configures the bootfile.

trust relay-reply

To configure a DHCP IPv6 profile to enable processing relay-replies, use the **trust relay-reply** command in DHCP IPv6 profile configuration mode. To restore the interface to the default behavior, use the **no** form of the command.

trust relay-reply
no trust relay-reply

This command has no keywords or arguments.

Command Default By default, all interfaces are trusted.

Command Modes DHCP IPv6 profile configuration

Command History	Release	Modification
	Release 4.1.1	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operation
	ip-services	read, write

Example

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# dhcp ipv6
RP/0/RSP0/CPU0:router(config-dhcpv6)# profile downstream proxy
RP/0/RSP0/CPU0:router(config-dhcpv6-profile)# helper-address ff05::1:3
RP/0/RSP0/CPU0:router(config-dhcpv6-profile)# exit
RP/0/RSP0/CPU0:router(config-dhcpv6)# profile upstream proxy
RP/0/RSP0/CPU0:router(config-dhcpv6-profile)# trust relay-reply
```

Related Commands

Command	Description
helper-address (ipv6), on page 280	Configures the Dynamic Host Configuration Protocol (DHCP) IPv6 relay agent for prefix delegation.

trusted

To configure a DHCP snooping profile to supported trusted sources, use the **trusted** command in DHCP IPv4 Profile Snoop configuration mode. To restore the interface to the default behavior, use the **no** form of the command.

trusted
no trusted

Command Default By default, the DHCP snooping profile is for untrusted sources.

Command Modes DHCP IPv4 Snoop Profile configuration mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines A bridge port can be configured to be trusted by assigning this DHCP snooping profile to a bridge port or a bridge-domain.

DHCP snooping selectively forwards DHCP DISCOVER and DHCP REQUEST messages to trusted interfaces only, thereby preventing often malicious hosts from seeing the DHCP exchanges.

Task ID	Task ID	Operations
	ip-services	read

Examples The following example shows how to configure the snoop profile named trustedServerProfile to be trusted:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# dhcp ipv4
RP/0/RSP0/CPU0:router(config-dhcpv4)# profile trustedServerProfile snoop
RP/0/RSP0/CPU0:router(config-dhcpv4-snoop-profile)# trusted
```

Related Commands	Command	Description
	relay information option , on page 304	Allows the insertion of a DHCP relay agent information option in forwarded BOOTREQUEST messages on a DHCP server.
	relay information option allow-untrusted , on page 306	Configures the DHCP component to not drop BOOTREQUEST messages that have the relay information option set and giaddr set to zero.

vrf (relay profile)

To configure a relay profile on a VPN routing and forwarding (VRF) instance, use the **vrf (relay profile)** command in Dynamic Host Configuration Protocol (DHCP) IPv4 configuration mode. To disable this feature, use the **no** form of this command.

```
vrf {vrf-name { relay | server } profile-name | default | all}
no vrf {vrf-name { relay | server } profile-name | default | all}
```

Syntax Description	
<i>vrf-name</i>	User-defined name for the VRF.
relay	Specifies a relay profile.
server	Specifies a server profile.
<i>profile-name</i>	Specifies a name for the profile.
default	Specifies a profile for the default VRF.
all	Specifies a profile for all VRFs. This option is not available for server profiles.

Command Default If **default** is selected, then the configuration defaults to VRF.

Command Modes DHCP IPv4 configuration

Command History	Release	Modification
	Release 3.7.2	This command was introduced.
	Release 5.1	The server keyword was added.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operations
	ip-services	read, write

Examples The following example shows how to set the relay profile for all VRFs:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# dhcp ipv4
RP/0/RSP0/CPU0:router(config-dhcpv4)# vrf all
```

The following example shows how to set the server profile for all VRFs:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# dhcp ipv4
```

```
RP/0/RSP0/CPU0:router(config-dhcpv4)# vrf V1 server profile TEST
```

Related Commands

Command	Description
dhcp ipv4 , on page 261	Enables DHCP for IPv4 and enters DHCP IPv4 configuration mode.
giaddr policy, on page 277	Configures how a relay agent processes BOOTREQUEST messages that already contain a nonzero giaddr attribute.
helper-address , on page 278	Configures the DHCP relay agent to relay packets to a specific DHCP Server.
profile (DHCP), on page 293	Configures a relay profile for the DHCP IPv4 component.
relay information check , on page 302	Configures a DHCP server to validate the relay agent information option in forwarded BOOTREPLY messages.
relay information option , on page 304	Enables the system to insert a DHCP relay agent information option in forwarded BOOTREQUEST messages to a DHCP server.
relay information option allow-untrusted , on page 306	Configures the DHCP component to not drop BOOTREQUEST messages that have the relay information option set and the giaddr set to zero.
relay information policy , on page 308	Configures how a relay agent processes BOOTREQUEST messages that already contain a relay information option.

Host Services and Applications Commands

This chapter describes the commands used to configure and monitor host services and applications, such as Domain Name System (DNS), Telnet, File Transfer Protocol (FTP), and Trivial File Transfer Protocol (TFTP), and Remote Copy Protocol (RCP).

For detailed information about host services and applications concepts, configuration tasks, and examples, refer to the *IP Addresses and Services Configuration Guide for Cisco ASR 9000 Series Routers*.

cinetd rate-limit

To configure the rate limit at which service requests are accepted by Cisco inetd (Cinetd), use the **cinetd rate-limit** command in Global Configuration mode. To restore the default, use the **no** form of this command.

cinetd rate-limit *value*
no cinetd rate-limit *value*

Syntax Description

value Number of service requests that are accepted per second. Range is 1 to 100. Default is 1.

Command Default

One service request per second is accepted.

Command Modes

Global Configuration mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

Any service request that exceeds the rate limit is rejected. The rate limit is applied to individual applications.

Task ID

Task ID	Operations
ip-services	read, write

Examples

The following example shows the **cinetd rate-limit** being set to 10:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# cinetd rate-limit 10
```

clear host

To delete temporary entries from the hostname-to-address cache, use the **clear host** command in EXEC mode.

clear host {*host-name* | *}

Syntax Description	
host-name	Name of host to be deleted.
*	Specifies that all entries in the local cache be deleted.

Command Default No default behavior or values

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines The dynamic host entries in the cache are cleared. The temporary entries in the cache are cleared; the permanent entries that were entered with the [domain ipv4 host, on page 356](#) or the [domain ipv6 host, on page 357](#) command are not cleared. By default, no static mapping is configured.

Task ID	Task ID	Operations
	ip-services	execute

Examples The following example shows how to clear all temporary entries from the hostname-and-address cache:

```
RP/0/RSP0/CPU0:router# clear host *
```

Related Commands	Command	Description
	domain ipv4 host, on page 356	Defines a static IPv4 hostname-to-address mapping in the host cache.
	domain ipv6 host, on page 357	Defines a static IPv6 hostname-to-address mapping in the host cache.
	show hosts, on page 384	Displays the default domain name, the style of name lookup service, a list of name server hosts, and the cached list of hostnames and addresses.

destination address(ipsla)

To configure the address of the destination device, use the **destination address** command in the ipsla echo configuration mode. To restore the default, use the **no** form of this command.

destination address *address*
no destination address *address*

Syntax Description	<i>address</i> IPv4/IPv6 address of the destination device.
---------------------------	-------------------------------------------------------------

Command Default	None
------------------------	------

Command Modes	ipsla echo configuration
----------------------	--------------------------

Command History	Release	Modification
	Release 4.3	This command was introduced.

Usage Guidelines	No specific guidelines impact the use of this command.
-------------------------	--------------------------------------------------------

Task ID	Task ID	Operation
	monitor	read, write

Example

This example shows how to configure 10.10.10.20 as the destination address of a device.

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# operation 500
RP/0/RSP0/CPU0:router(config-ipsla-op)# type icmp echo
RP/0/RSP0/CPU0:router(config-ipsla-echo)# timeout 5000
RP/0/RSP0/CPU0:router(config-ipsla-echo)# destination address 10.10.10.20
```

Related Commands	Command	Description
	source address(ipsla) , on page 386	Configures the address of the source device

domain ipv4 host

To define a static hostname-to-address mapping in the host cache using IPv4, use the **domain ipv4 host** command in Global Configuration mode. To remove the **domain ipv4 host** command from the configuration file and restore the system to its default condition, use the **no** form of this command.

```
domain ipv4 host host-name v4address2.....v4address8
no domain ipv4 host host-name v4address1
```

Syntax Description	host-name	Name of the host. The first character can be either a letter or a number.
	v4address1	Associated IP address.
	v4address2...v4address8	(Optional) Additional associated IP address. You can bind up to eight addresses to a hostname.

Command Default No static mapping is configured.

Command Modes Global Configuration mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines The first character can be either a letter or a number. If you use a number, the operations you can perform (such as **ping**) are limited.

Task ID	Task ID	Operations
	ip-services	read, write
	basic-services	read, write

Examples

The following example shows how to define two IPv4 static mappings:

```
RP/0/RSP0/CPU0:router(config)# domain ipv4 host host1 192.168.7.18
RP/0/RSP0/CPU0:router(config)# domain ipv4 host host2 10.2.0.2 192.168.7.33
```

domain ipv6 host

To define a static hostname-to-address mapping in the host cache using IPv6, use the **domain ipv6 host** command in Global Configuration mode. To remove the **domain ipv6 host** command from the configuration file and restore the system to its default condition, use the **no** form of this command.

domain ipv6 host *host-name v6address1 [v6address2v6address4]*
no domain ipv6 host *host-name v6address1*

Syntax Description		
host-name	Name of the host. The first character can be either a letter or a number.	
v6address1	Associated IP address.	
v6address2...v6address4	(Optional) Additional associated IP address. You can bind up to four addresses to a hostname.	

Command Default No static mapping is configured. IPv6 address prefixes are not enabled.

Command Modes Global Configuration mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines The first character can be either a letter or a number. If you use a number, the operations you can perform (such as **ping**) are limited.

Task ID	Task ID	Operations
	ip services	read, write

Examples

The following example shows how to define two IPv6 static mappings:

```
RP/0/RSP0/CPU0:router(config)# domain ipv6 host host1 ff02::2
RP/0/RSP0/CPU0:router(config)# domain ipv6 host host2 ff02::1
```

domain list

To define a list of default domain names to complete unqualified hostnames, use the **domain list** command in Global Configuration mode. To delete a name from a list, use the **no** form of this command.

domain list *domain-name*
no domain list *domain-name*

Syntax Description	domain-name Domain name. Do not include the initial period that separates an unqualified name from the domain name.
---------------------------	---------------------------------------------------------------------------------------------------------------------

Command Default	No domain names are defined.
------------------------	------------------------------

Command Modes	Global Configuration mode
----------------------	---------------------------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	If there is no domain list, the domain name that you specified with the domain name (IPAddr), on page 361 command is used to complete unqualified hostnames. If there is a domain list, the default domain name is not used. The domain list command is similar to the domain name (IPAddr), on page 361 command, except that you can use the domain list command to define a list of domains, each to be tried in turn.
-------------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Task ID	Task ID	Operations
	ip-service	read, write

Examples	The following example shows how to add several domain names to a list:
-----------------	------------------------------------------------------------------------

```
RP/0/RSP0/CPU0:router(config)# domain list domain1.com
RP/0/RSP0/CPU0:router(config)# domain list domain2.edu
```

The following example shows how to add a name to and then delete a name from the list:

```
RP/0/RSP0/CPU0:router(config)# domain list domain3.edu
RP/0/RSP0/CPU0:router(config)# no domain list domain2.edu
```

Related Commands	Command	Description
	domain name (IPAddr), on page 361	Defines a default domain name to complete unqualified hostnames (names without a dotted-decimal domain name).

Command	Description
show hosts, on page 384	Displays the default domain name, the style of name lookup service, a list of name server hosts, and the cached list of hostnames and addresses.

domain lookup disable

To disable the IP Domain Name System (DNS)-based hostname-to-address translation, use the **domain lookup disable** command in Global Configuration mode. To remove the specified command from the configuration file and restore the system to its default condition, use the **no** form of this command.

domain lookup disable
no domain lookup disable

Syntax Description This command has no keywords or arguments.

Command Default The IP DNS-based host-to-address translation is enabled.

Command Modes Global Configuration mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines Using the **no** command removes the specified command from the configuration file and restores the system to its default condition. The **no** form of this command is not stored in the configuration file.

Task ID	Task ID	Operations
	ip-services	read, write

Examples The following example shows how to enable the IP DNS-based hostname-to-address translation:

```
RP/0/RSP0/CPU0:router(config)# domain lookup disable
```

Related Commands	Command	Description
	domain name (IPAddr), on page 361	Defines a default domain name to complete unqualified hostnames (names without a dotted-decimal domain name).
	domain name-server, on page 362	Specifies the address of one or more name servers to use for name and address resolution.
	show hosts, on page 384	Displays the default domain name, the style of name lookup service, a list of name server hosts, and the cached list of hostnames and addresses.

domain name (IPAddr)

To define a default domain name that the software uses to complete unqualified hostnames, use the **domain name** command in the appropriate mode. To remove the name, use the **no** form of this command.

domain name *domain-name*
no domain name *domain-name*

Syntax Description

domain-name Default domain name used to complete unqualified hostnames. Do not include the initial period that separates an unqualified name from the domain name.

Command Default

There is no default domain name.

Command Modes

Global Configuration mode
 DHCP IPv4 server profile

Command History

Release	Modification
Release 3.7.2	This command was introduced.
Release 5.1	This command was supported for the DHCPv4 Server Profile submode.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes the proper task IDs. If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

If a hostname does not contain a domain name, then a dot and the domain name configured by the **domain name** command are appended to the hostname before it is added to the host table.

If no domain name is configured by the **domain name** command and the user provides only the hostname, then the request is not looked up.

Task ID

Task ID	Operations
ip-services	read, write

Related Commands

Command	Description
domain list, on page 358	Defines a list of default domain names to complete unqualified hostnames.
domain name-server, on page 362	Specifies the address of one or more name servers to use for name and address resolution.
show hosts, on page 384	Displays the default domain name, the style of name lookup service, a list of name server hosts, and the cached list of hostnames and addresses.

domain name-server

To specify the address of one or more name servers to use for name and address resolution, use the **domain name-server** command in Global Configuration mode. To remove the address specified, use the **no** form of this command.

domain name-server *server-address*
no domain name-server *server-address*

Syntax Description	<i>server-address</i> IP address of a name server.
---------------------------	----------------------------------------------------

Command Default	If no name server address is specified, the default name server is 255.255.255.255. IPv4 and IPv6 address prefixes are not enabled.
------------------------	-------------------------------------------------------------------------------------------------------------------------------------

Command Modes	Global Configuration mode
----------------------	---------------------------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	<p>You can enter up to six addresses, but only one for each command.</p> <p>If no name server address is specified, the default name server is 255.255.255.255 so that the DNS lookup can be broadcast to the local network segment. If a DNS server is in the local network, it replies. If not, there might be a server that knows how to forward the DNS request to the correct DNS server.</p>
-------------------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Task ID	Task ID	Operations
	ip-services	read, write

Examples	The following example shows how to specify host 192.168.1.111 as the primary name server and host 192.168.1.2 as the secondary server:
-----------------	----------------------------------------------------------------------------------------------------------------------------------------

```
RP/0/RSP0/CPU0:router(config)# domain name-server 192.168.1.111
RP/0/RSP0/CPU0:router(config)# domain name-server 192.168.1.2
```

Related Commands	Command	Description
	domain lookup disable, on page 360	Disables the domain lookup.
	domain name (IPAddr), on page 361	Defines a default domain name to complete unqualified hostnames (names without a dotted-decimal domain name).

ftp client anonymous-password

To assign a password for anonymous users, use the **ftp client anonymous-password** command in Global Configuration mode. To remove the **ftp client anonymous-password** command from the configuration file and restore the system to its default condition, use the **no** form of this command.

```
ftp client anonymous-password password
no ftp client anonymous-password
```

Syntax Description	password Password for the anonymous user.
---------------------------	-------------------------------------------

Command Default	No default behavior or values
------------------------	-------------------------------

Command Modes	Global Configuration mode
----------------------	---------------------------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	The ftp client anonymous-password command is File Transfer Protocol (FTP) server dependent.
-------------------------	----------------------------------------------------------------------------------------------------

Task ID	Task ID	Operations
	ip-services	read, write

Examples	The following example shows how to set the anonymous password to <i>xxxx</i> :
-----------------	--------------------------------------------------------------------------------

```
RP/0/RSP0/CPU0:router(config)# ftp client anonymous-password xxxx
```

Related Commands	Command	Description
	ftp client passive, on page 364	Configures the software to use only passive File Transfer Protocol (FTP) connections.
	ftp client password, on page 366	Specifies the password for the File Transfer Protocol (FTP) connections.
	ftp client source-interface, on page 368	Specifies the source IP address for File Transfer Protocol (FTP) connections.
	ftp client username, on page 370	Specifies the username for File Transfer Protocol (FTP) connections.

ftp client passive

To configure the software to use only passive File Transfer Protocol (FTP) connections, use the **ftp client passive** command in Global Configuration mode. To remove the **ftp client passive** command from the configuration file and restore the system to its default condition, use the **no** form of this command.

ftp client passive
no ftp client passive

Syntax Description This command has no keywords or arguments.

Command Default FTP data connections are active.

Command Modes Global Configuration mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines Using the **ftp client passive** command allows you to make only passive-mode FTP connections. To specify the source IP address for FTP connections, use the **ftp client source-interface** command.

Task ID	Task ID	Operations
	ip-services	read, write

Examples The following example shows how to configure the networking device to use only passive FTP connections:

```
RP/0/RSP0/CPU0:router(config)# ftp client passive

1d:3h:54:47: ftp_fs[16437]: FTP: verifying tuple passive (SET).
1d:3h:54:47: ftp_fs[16437]: FTP: applying tuple passive (SET).
1d:3h:54:47: ftp_fs[16437]: FTP: passive mode has been enabled.
```

Related Commands	Command	Description
	ftp client anonymous-password, on page 363	Assigns a password for anonymous users.
	ftp client password, on page 366	Specifies the password for the File Transfer Protocol (FTP) connections.
	ftp client source-interface, on page 368	Specifies the source IP address for File Transfer Protocol (FTP) connections.

Command	Description
ftp client username, on page 370	Specifies the username for File Transfer Protocol (FTP) connections.

ftp client password

To specify the password for the File Transfer Protocol (FTP) connections, use the **ftp client password** command in Global Configuration mode. To disable this feature, use the **no** form of this command.

ftp client password {*clear-text-password* | **clear** *clear-text password* | **encrypted** *encrypted-text password*}

no ftp client password {*clear-text-password* | **clear** *clear-text password* | **encrypted** *encrypted-text password*}

Syntax Description		
	<code>clear-text-password</code>	Specifies an unencrypted (cleartext) user password
	<code>clear</code> <i>clear-text password</i>	Specifies an unencrypted (cleartext) shared password.
	<code>encrypted</code> <i>encrypted-text password</i>	Specifies an encrypted shared password.

Command Default No default behavior or values

Command Modes Global Configuration mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operations
	ip-services	read, write

Examples The following example shows how to specify the password for the File Transfer Protocol (FTP) connections:

```
RP/0/RSP0/CPU0:router(config)# ftp client password lab
```

Related Commands	Command	Description
	ftp client anonymous-password, on page 363	Assigns a password for anonymous users.
	ftp client passive, on page 364	Configures the software to use only passive File Transfer Protocol (FTP) connections.

Command	Description
ftp client source-interface, on page 368	Specifies the source IP address for File Transfer Protocol (FTP) connections.
ftp client username, on page 370	Specifies the username for File Transfer Protocol (FTP) connections.

ftp client source-interface

To specify the source IP address for File Transfer Protocol (FTP) connections, use the **ftp client source-interface** command in Global Configuration mode. To remove the **ftp client source-interface** command from the configuration file and restore the system to its default condition, use the **no** form of this command.

```
ftp client source-interface type interface-path-id
no ftp client source-interface type interface-path-id
```

Syntax Description	type	Interface type. For more information, use the question mark (?) online help function.
	interface-path-id	Physical interface or virtual interface.
	Note	Use the show interfaces command to see a list of all interfaces currently configured on the router.
		For more information about the syntax for the router, use the question mark (?) online help function.

Command Default The FTP source address is the IP address of the interface used by the FTP packets to leave the networking device.

Command Modes Global Configuration mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines Use this command to set the same source address for all FTP connections. To configure the software to use only passive FTP connections, use the **ftp client passive** command.

Task ID	Task ID	Operations
	ip-services	read, write

Examples The following example shows how to configure the IP address associated with GigabitEthernet interface 0/1/2/1 as the source address on all FTP packets, regardless of which interface is actually used to send the packet:

```
RP/0/RSP0/CPU0:router (config) # ftp client source-interface gigabitethernet 0/1/2/1
```

Related Commands

logging source-interface vrf

To configure the logging source interface in order to identify the syslog traffic that originates in a VRF from a particular router, as coming from a single device, use the **logging source-interface vrf** in Global Configuration mode. To remove the source-interface logging configuration for the given VRF, use the **no** form of this command.

```
logging source-interface interface vrf vrf-name
no logging source-interface interface vrf vrf-name
```

Syntax Description

interface Interface number of the source

vrf-name Name that identifies the VRF

Command Default

If *vrf-name* is not specified, the source interface is configured for the default VRF.

Command Modes

Global Configuration mode

Command History

Release	Modification
Release 4.2.3	This command was introduced.

Usage Guidelines

Normally, a syslog message contains the IPv4 or IPv6 address of the interface used to exit the router. The **logging source-interface** command configures the syslog packets to contain the IPv4 or IPv6 address of a particular interface for a VRF, regardless of which interface the packet uses to exit the router.

Task ID

Task ID	Operation
logging	read, write

Example

This example shows how to configure interface loopback 0 to be the logging source interface for VRF vrf1.

```
RP/0/RSP0/CPU0:router#logging source-interface loopback 0 vrf vrf1
RP/0/RSP0/CPU0:router#logging source-interface loopback 1 vrf default
```

This sample output shows a logging source interface that is correctly configured for the VRF.

```
RP/0/RSP0/CPU0:router#show running configuration logging

logging trap debugging
logging 223.255.254.249 vrf vrf1
logging 223.255.254.248 vrf default
logging source-interface Loopback0 vrf vrf1
logging source-interface Loopback1
```

ping (network)

To check host reachability and network connectivity on IP networks, use the **ping** command in EXEC mode.

```
ping [{ipv4 | ipv6 | vrf vrf-name}] [{host-name | ip-address}] [count number] [size number] [source
ip-address | interface-name | type number] [timeout seconds] [pattern number] [type number]
[priority number] [verbose] [donnotfrag] [validate] [sweep]
```

Syntax	Description
ipv4	(Optional) Specifies IPv4 address prefixes.
ipv6	(Optional) Specifies IPv6 address prefixes.
vrf	(Optional) Specifies VPN routing and forwarding (VRF) instance.
vrf-name	(Optional) VRF name of the system to ping.
host-name	(Optional) Hostname of the system to ping.
ip-address	(Optional) IP address of the system to ping.
count <i>number</i>	(Optional) Sets the repeat count. Range is 0 to 2147483647.
size <i>number</i>	(Optional) Sets the datagram size. Range is 36 to 18024.
source	(Optional) Identifies the source address or source interface.
type <i>number</i>	(Optional) Sets the type of service. Range is 0 to 255. Available when the ipv4 keyword is specified.
timeout <i>seconds</i>	(Optional) Sets the timeout in seconds. Range is 0 to 3600.
priority <i>number</i>	(Optional) Sets the packet priority. Range is 0 to 15. Available when the ipv6 keyword is specified.
pattern <i>number</i>	(Optional) Sets the data pattern. Range is 0 to 65535.
verbose	(Optional) Sets verbose output.
donnotfrag	(Optional) Sets the Don't Fragment (DF) bit in the IP header.
validate	(Optional) Validates the return packet.
sweep	(Optional) Sets the sweep ping.

Command Default No default behavior or values

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines

The default value for the **ping** command refers only to the target IP address. No default value is available for the target IP address.

The ping program sends an echo request packet to an address and then waits for a reply. Ping output can help you evaluate path-to-host reliability, delays over the path, and whether the host can be reached or is functioning.

Note The **ping** (EXEC) command is supported only on IP networks.

If you enter the command without specifying either a hostname or an IP address, the system prompts you to specify the target IP address and several other command parameters. After specifying the target IP address, you can specify alternate values for the remaining parameters or accept the displayed default for each parameter.

If the system cannot map an address for a hostname, it returns an “%Unrecognized host or address, or protocol not running” error message.

To abnormally terminate a ping session, enter the escape sequence, which is, by default, Ctrl-C. Simultaneously press and release the Ctrl and C keys.

This table describes the test characters sent by the ping facility.

Table 34: ping Test Characters

Character	Description
!	Each exclamation point indicates receipt of a reply.
.	Each period indicates that the network server timed out while waiting for a reply.
?	Unknown packet type.
U	A “destination unreachable” error protocol data unit (PDU) was received.
C	A “congestion experienced” packet was received.
M	Fragmentation is needed, but the “don’t fragment” bit in the IP header is set. When this bit is set, the IP layer does not fragment the packet and returns an Internet Control Message Protocol (ICMP) error message to the source if the packet size is larger than the maximum transmission size. When this bit is not set, the IP layer fragments the packet to forward it to the next hop.
Q	A source quench packet was received.

Task ID

Task ID	Operations
basic-services	read, write, execute

Examples

Although the precise dialog varies somewhat between IPv4 and IPv6, all are similar to the ping session, using default values shown in the following output:

```
RP/0/RSP0/CPU0:router# ping
Protocol [ipv4]:
Target IP address: 10.0.0.1
```

```
Repeat count [5]:
Datagram size [100]:
Timeout in seconds [2]:
Extended commands? [no]: yes
Source address or interface: 10.0.0.2
Type of service [0]:
Set DF bit in IP header? [no]:
Validate reply data? [no]: yes
Data pattern [0xABCD]:
Loose, Strict, Record, Timestamp, Verbose[none]:
Sweep range of sizes? [no]:
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 10.25.58.21, timeout is 2 seconds:
!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 2/11/49 ms
```

If you enter a hostname or an address on the same line as the **ping** command, the command performs the default actions appropriate for the protocol type of that hostname or address, as shown in the following output:

```
RP/0/RSP0/CPU0:router# ping server01

Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 192.168.7.27, timeout is 2 seconds:
!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 8/8/9 ms
```

ping bulk (network)

To check reachability and network connectivity to multiple hosts on IP networks, use the **ping bulk** command in EXEC mode.

```
ping bulk ipv4 [input cli [{batch | inline}]]
[vrf vrf-name] [{ip-address | domain-name}]
```

Syntax Description	
ipv4	Specifies IPv4 address prefixes.
input	Specifies input mode.
cli	Specifies input via CLI.
batch	Pings after all destinations are input.
inline	Pings after each destination is input.
vrf <i>vrf-name ip-address domain-name</i>	(Optional) Specifies a particular VRF. IP address of the system to ping. (Optional) Domain name of the system to ping.
	Note You must hit the Enter button and then specify one destination address per line.

Command Default No default behavior or values

Command History	Release	Modification
	Release 4.1.2	This command was introduced.

Usage Guidelines You must hit the Enter button and then specify one destination address per line.
Maximum number of destinations you can specify in the cli or batch mode is 2000.

Task ID	Task ID	Operation
	basic-services	read, write, execute

Example

The following example shows how to ping many hosts by the input via CLI method:

```
RP/0/RSP0/CPU0:router# ping bulk ipv4 input cli batch
```

```
Please enter input via CLI with one destination per line and when done Ctrl-D/(exit)
to initiate pings:
```

```

1: vrf myvrf1 10.2.1.16
2:
Starting pings...
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 10.2.1.16, vrf is myvrf1, timeout is 2
seconds:
!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 5/7/9 ms

```

```
RP/0/RSP0/CPU0:router# ping bulk ipv4 input cli
```

Please enter input via CLI with one destination per line:

```

vrf myvrf1 1.1.1.1
vrf myvrf2 2.2.2.2
vrf myvrf1 myvrf1.cisco.com
vrf myvrf2 myvrf2.cisco.com

```

```

Starting pings...
Type escape sequence to abort.
Sending 1, 100-byte ICMP Echos to 1.1.1.1, vrf is myvrf1:
!
Success rate is 100 percent (1/1), round-trip min/avg/max = 1/1/1 ms
Sending 2, 100-byte ICMP Echos to 2.2.2.2, vrf is myvrf2:
!!
Success rate is 100 percent (2/2), round-trip min/avg/max = 1/1/1 ms
Sending 1, 100-byte ICMP Echos to 1.1.1.1, vrf is myvrf1:
!
Success rate is 100 percent (1/1), round-trip min/avg/max = 1/4/1 ms
Sending 2, 100-byte ICMP Echos to 2.2.2.2, vrf is myvrf2:
!!
Success rate is 100 percent (2/2), round-trip min/avg/max = 1/3/1 ms

```

Command	Description				
rcp client username, on page 378	Configures the remote username to be used when a remote copy using rcp is requested.				

rcp client username

To configure the local user on the client side to be used when requesting a remote copy using remote copy protocol (rcp), use the **rcp client username** command in Global Configuration mode. To restore the system to its default condition, use the **no** form of this command.

rcp client username *username*
no rcp client username *username*

Syntax Description

username Name of the remote user on the rcp server. This name is used for rcp copy requests. If the rcp server has a directory structure, all files and images to be copied are searched for or written relative to the directory in the remote user account.

Command Default

If you do not issue this command, the software sends the remote username associated with the current tty process, if that name is valid, for rcp copy commands. For example, if the user is connected to the networking device through Telnet and the user was authenticated through the **username** command, the software sends that username as the remote username.

If the username for the current tty process is not valid, the software sends the hostname as the remote username. For rcp boot commands, the software sends the network server hostname by default.

Note For Cisco, tty lines are commonly used for access services. The concept of tty originated with UNIX. For UNIX systems, each physical device is represented in the file system. Terminals are called tty devices (tty stands for teletype, the original UNIX terminal).

Command Modes

Global Configuration mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Command History

Release	Modification
Release 3.2	This command was supported.

Usage Guidelines

The rcp protocol requires that a client send the remote username on an rcp request to the network server. Use the **rcp client username** command to specify the remote username to be sent to the network server for an rcp copy request. If the network server has a directory structure, as do UNIX systems, all files and images to be copied are searched for or written relative to the directory in the remote user account. To specify a source address for rcp connections, use the **rcp client source-interface** command.

Note The remote username must be associated with an account on the destination server.

Task ID	Task ID	Operations
	ip-services	read, write

Examples

The following example shows how to configure the remote username to netadmin1:

```
RP/0/RSP0/CPU0:router(config)# rcp client username netadmin1
```

Related Commands

Command	Description
rcp client source-interface, on page 377	Specifies the source IP address for rcp connections.

scp

To securely transfer a file from a local directory to a remote directory or from a remote directory to a local directory, use the **scp** command in EXEC mode.

```
scp {local-directory username@location/directory} /filename {username@location/directory local-directory} /filename
```

Syntax Description		
<i>local-directory</i>		Specifies the local directory on the device.
<i>username@location/directory</i>		Specifies the remote directory where <i>location</i> is the IP address of the remote device.
<i>filename</i>		Specifies the file name to be transferred.

Command Default None

Command Modes EXEC mode

Command History	Release	Modification
	Release 5.1.1	This command was introduced.

Usage Guidelines Secure Copy Protocol (SCP) is a file transfer protocol which provides a secure and authenticated method for transferring files. SCP relies on SSHv2 to transfer files from a remote location to a local location or from local location to a remote location.

Use the **scp** command to copy a file from the local device to a destination device or from a destination device to the local device.

Using SCP, you can only transfer individual files. You cannot transfer a file from a remote device to another remote device.

SSH server process must be running on the remote device.

Task ID	Task ID	Operations
	ip-services	read, write

Examples

The following example shows how to copy a file using the **scp** command from a local directory to a remote directory:

```
RP/0/RSP0/CPU0:router# scp /usr/file1.txt root@209.165.200.1:/root/file3.txt
```

```
Connecting to 209.165.200.1...
```

```
Password:
```

```
Transferred 553065 Bytes
```

```
553065 bytes copied in 0 sec (7576232)bytes/sec
```

The following example shows how to copy a file using the **scp** command from a remote directory to a local directory:

```
RP/0/RSP0/CPU0:router# scp root@209.165.200.1:/root/file4.txt /usr/file.txt  
  
Connecting to 209.165.200.1...  
Password:  
  Transferred 553065 Bytes  
  553065 bytes copied in 0 sec (7576232)bytes/sec
```

show cinetd services

To display the services whose processes are spawned by Cinetd when a request is received, use the **show cinetd services** command in EXEC mode.

show cinetd services

Syntax Description This command has no keywords or arguments.

Command Default No default behavior or values

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operations
	ip-services	read

Examples

The following is sample is output from the **show cinetd services** command:

```
RP/0/RSP0/CPU0:router# show cinetd services
Family Service  Proto  Port  ACL  max_cnt  curr_cnt  wait  Program Option
=====
v4      telnet  tcp    23   unlimited  0        nowait   telnet
v4      tftp    udp    69   unlimited  0        wait     tftpd  disk0
```

This table describes the significant fields shown in the display.

Table 35: show cinetd services Command Field Descriptions

Field	Description
Family	Version of the network layer (IPv4 or IPv6).
Service	Network service (for example, FTP, Telnet, and so on).
Proto	Transport protocol used by the service (tcp or udp).
Port	Port number used by the service.
ACL	Access list used to limit the service from some hosts.
max_cnt	Maximum number of concurrent servers allowed for a service.
curr_cnt	Current number of concurrent servers for a service.

Field	Description
wait	Status of whether Cinetd has to wait for a service to finish before serving the next request.
Program	Name of the program for a service.
Option	Service-specific options.

Related Commands

tftp server, on page 398	Enables or disables the TFTP server or a feature running on the TFTP server.

show hosts

To display the default domain name, the style of name lookup service, a list of name server hosts, and the cached list of hostnames and addresses, use the **show hosts** command in EXEC mode.

show hosts [*host-name*]

Syntax Description	host-name (Optional) Name of the host about which to display information. If omitted, all entries in the local cache are displayed.
---------------------------	-------------------------------------------------------------------------------------------------------------------------------------

Command Default	Unicast address prefixes are the default when IPv4 address prefixes are configured.
------------------------	-------------------------------------------------------------------------------------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	No specific guidelines impact the use of this command.
-------------------------	--------------------------------------------------------

Task ID	Task ID	Operations
	ip-services	read

Examples

The following is sample output from the **show hosts** command:

```
RP/0/RSP0/CPU0:router# show hosts

Default domain is cisco.com
Name/address lookup uses domain service
Name servers are 255.255.255.255
Host          Flags          Age (hr)    Type          Address(es)
host1.cisco.com (temp, OK)    1           IP            192.168.4.10
abc           (perm, OK)    0           IP            10.0.0.0 10.0.0.2 10.0.0.3
```

This table describes the significant fields shown in the display.

Table 36: show hosts Command Field Descriptions

Field	Description
Default domain	Default domain used to complete the unqualified hostnames.
Name/address lookup	Lookup is disabled or uses domain services.
Name servers	List of configured name servers.
Host	Hostname.

Field	Description
Flags	<p>Indicates the status of an entry.</p> <ul style="list-style-type: none"> • temp—Temporary entry entered by a name server; the software removes the entry after 72 hours of inactivity. • perm—Permanent entry entered by a configuration command; does not time out. • OK—Entry is believed to be valid. • ??—Entry is considered suspect and subject to revalidation. • EX—Entry has expired.
Age(hr)	Number of hours since the software most recently referred to the cache entry.
Type	Type of address (IPv4 or IPv6).
Address(es)	Address of the host. One host may have up to eight addresses.

Related Commands

Command	Description
clear host, on page 354	Deletes entries from the host-name-and-address cache.
domain list, on page 358	Defines a list of default domain names to complete unqualified hostnames.
domain lookup disable, on page 360	Disables the IP DNS-based hostname-to-address translation.
domain name (IPAddr), on page 361	Defines a default domain name to complete unqualified hostnames (names without a dotted-decimal domain name).
domain name-server, on page 362	Specifies the address of one or more name servers to use for name and address resolution.

source address(ipsla)

To configure the address of the source device, use the **source address** command in the ipsla echo configuration mode. To restore the default, use the **no** form of this command.

```
source address address
no source address address
```

Syntax Description	<i>address</i> IPv4/IPv6 address of the source device.
---------------------------	--------------------------------------------------------

Command Default	None
------------------------	------

Command Modes	ipsla echo configuration
----------------------	--------------------------

Command History	Release	Modification
	Release 4.3	This command was introduced.

Usage Guidelines	No specific guidelines impact the use of this command.
-------------------------	--------------------------------------------------------

Task ID	Task ID	Operation
	monitor	read, write

Example

This example shows how to configure 10.10.10.5 as the source address of a device.

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipsla
RP/0/RSP0/CPU0:router(config-ipsla)# operation 500
RP/0/RSP0/CPU0:router(config-ipsla-op)# type icmp echo
RP/0/RSP0/CPU0:router(config-ipsla-echo)# timeout 5000
RP/0/RSP0/CPU0:router(config-ipsla-echo)# source address 10.10.10.5
```

Related Commands	Command	Description
	destination address(ipsla), on page 355	Configures the address of the destination device

telnet

To log in to a host that supports Telnet, use the **telnet** command in EXEC mode.

```
telnet [vrf {vrf-name | default}] {ip-addresshost-name} [options]
```

Syntax Description		
vrf		(Optional) Specifies a VPN routing and forwarding (VRF) instance
vrf-name		VRF name of the system to ping.
default		Specifies the default VRF instance.
ip-address		IP address of a specific host on a network. <ul style="list-style-type: none"> • IPv4 address format—Must be entered in the (x.x.x.x) format. • IPv6 address format— Must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.
host-name		Name of a specific host on a network.
options		(Optional) Telnet connection options. See Table 37: Telnet Connection Options, on page 388 for a list of supported options.

Command Default Telnet client is in Telnet connection options nostream mode.

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines If the Telnet server is enabled, you should be able to start a Telnet session as long as you have a valid username and password.

This table lists the supported Telnet connection options.

Table 37: Telnet Connection Options

Option	Description
/stream	Turns on stream processing, which enables a raw TCP stream with no Telnet control sequences. A stream connection does not process Telnet options and can be appropriate for connections to ports running UNIX-to-UNIX copy program (UUCP) and other non-Telnet protocols.
/nostream	Turns off stream processing.
port number	Port number. Range is 0 to 65535.
/source-interface	Specifies source interface.

To display a list of the available hosts, use the **show hosts** command. To display the status of all TCP connections, use the **show tcp** command.

The software assigns a logical name to each connection, and several commands use these names to identify connections. The logical name is the same as the hostname, unless that name is already in use or you change the connection name with the **name-connection EXEC** command. If the name is already in use, the software assigns a null name to the connection.

The Telnet software supports special Telnet commands in the form of Telnet sequences that map generic terminal control functions to operating system-specific functions. To issue a special Telnet command, enter the escape sequence and then a command character. The default escape sequence is Ctrl-^ (press and hold the Control and Shift keys and the 6 key). You can enter the command character as you hold down Ctrl or with Ctrl released; you can use either uppercase or lowercase letters. [Table 38: Special Telnet Escape Sequences, on page 388](#) lists the special Telnet escape sequences.

Table 38: Special Telnet Escape Sequences

Escape Sequence ⁹	Purpose
Ctrl-^ c	Interrupt Process (IP).
Ctrl-^ o	Terminate Output (AO).
Ctrl-^ u	Erase Line (EL).

⁹ The caret (^) symbol refers to Shift-6 on your keyboard.

At any time during an active Telnet session, you can list the Telnet commands by pressing the escape sequence keys followed by a question mark at the system prompt:

ctrl-^?

A sample of this list follows. In this sample output, the first caret (^) symbol represents the Control key, and the second caret represents Shift-6 on your keyboard:

```
RP/0/RSP0/CPU0:router# ^^?
```

```
[Special telnet escape help]
^^B  sends telnet BREAK
^^C  sends telnet IP
^^H  sends telnet EC
^^O  sends telnet AO
^^T  sends telnet AYT
^^U  sends telnet EL
```

You can have several concurrent Telnet sessions open and switch among them. To open a subsequent session, first suspend the current connection by pressing the escape sequence (Ctrl-Shift-6 and then x [Ctrl^x] by default) to return to the system command prompt. Then open a new connection with the **telnet** command.

To terminate an active Telnet session, issue any of the following commands at the prompt of the device to which you are connecting:

- close
- disconnect
- exit
- logout
- quit

Task ID	Task ID	Operations
	basic-services	read, write, execute

Examples

The following example shows how to establish a Telnet session to a remote host named host1:

```
RP/0/RSP0/CPU0:router# telnet host1
```

Related Commands	Command	Description
	aaa authentication login default local	Sets AAA authentication at login. For more information, see <i>System Management Command Reference for Cisco ASR 9000 Series Routers</i> .
	telnet server, on page 394	Enables Telnet services on a networking device.
	terminal length	Sets the number of lines on the current terminal screen for the current session. For more information, see <i>System Management Command Reference for Cisco ASR 9000 Series Routers</i> .
	terminal width	Sets the number of character columns on the terminal screen for the current session. For more information, see <i>System Management Command Reference for Cisco ASR 9000 Series Routers</i> .

telnet client source-interface

To specify the source IP address for a Telnet connection, use the **telnet client source-interface** command in Global Configuration mode. To remove the **telnet client source-interface** command from the configuration file and restore the system to its default condition, use the **no** form of this command.

```
telnet {ipv4 | ipv6} client source-interface type interface-path-id
no telnet client source-interface type interface-path-id
```

Syntax Description		
ipv4	Specifies IPv4 address prefixes.	
ipv6	Specifies IPv6 address prefixes.	
type	Interface type. For more information, use the question mark (?) online help function.	
interface-path-id	Physical interface or virtual interface.	
	Note	Use the show interfaces command to see a list of all interfaces currently configured on the router.
		For more information about the syntax for the router, use the question mark (?) online help function.

Command Default The IP address of the best route to the destination is used as the source IP address.

Command Modes Global Configuration mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines Use the **telnet client source-interface** command to set the IP address of an interface as the source for all Telnet connections.

Task ID	Task ID	Operations
	ipv4	read, write
	ip-services	read, write

Examples

The following example shows how to set the IP address for GigabitEthernet interface 1/0/2/1 as the source address for Telnet connections:

```
RP/0/RSP0/CPU0:router(config)# telnet ipv4 client source-interface gigabitethernet 1/0/2/1
```

Related Commands

Command	Description
telnet server, on page 394	Enables Telnet services on a networking device.

telnet dscp

To define the differentiated services code point (DSCP) value and IPv4 precedence to specifically set the quality-of-service (QoS) marking for Telnet traffic on a networking device, use the **telnet dscp** command in Global Configuration mode. To disable DSCP, use the **no** form of this command.

```
telnet [vrf {vrf-name | default}] ipv4 dscp dscp-value
no telnet [vrf {vrf-name | default}] ipv4 dscp dscp-value
```

Syntax Description	
vrf	(Optional) Specifies a VPN routing and forwarding (VRF) instance.
vrf-name	(Optional) VRF name of the system to ping.
default	(Optional) Specifies the default VRF instance.
ipv4	Specifies IPv4 address prefixes.
dscp-value	Value for DSCP. The range is from 0 to 63. The default value is 0.

Command Default	
	If DSCP is disabled or not configured, the following default values are listed: <ul style="list-style-type: none"> • The default value for the server is 16. • The default value for the client is 0.

Command Modes	
	Global Configuration mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	
	IPv4 is the supported protocol for defining a DSCP value for locally originated Telnet traffic. DSCP can impact both server and client behavior of the specific VRF.

Task ID	Task ID	Operations
	ipv4	read, write
	ip-services	read, write

Examples	
	The following example shows how to define the DSCP value and IPv4 precedence:

```
RP/0/RSP0/CPU0:router(config)# telnet vrf default ipv4 dscp 40
RP/0/RSP0/CPU0:router(config)# telnet vrf default ipv4 dscp 10
```

Related Commands

Command	Description
telnet, on page 387	Logs in to a host that supports Telnet.

telnet server

To enable Telnet services on a networking device, use the **telnet server** command in Global Configuration mode. To disable Telnet services, use the **no** form of this command.

```
telnet [vrf {vrf-name | default}] {ipv4 | ipv6} server max-servers {no-limit|limit} [access-list list-name]
no telnet [vrf {vrf-name | default}] {ipv4 | ipv6} server max-servers {no-limit|limit} [access-list list-name]
```

Syntax Description

vrf	(Optional) Specifies VPN routing and forwarding (VRF) instance.
vrf-name	(Optional) VRF name of the system to ping.
default	(Optional) Specifies the default VRF instance.
ipv4	Specifies IPv4 address prefixes.
ipv6	Specifies IPv6 address prefixes.
max-servers	Sets the number of allowable Telnet servers.
no-limit	Specifies that there is no maximum number of allowable Telnet servers.
limit	Specifies the maximum number of allowable Telnet servers. Range is 1 to 200.
access-list	(Optional) Specifies an access list.
list-name	(Optional) Access list name.

Command Default

Telnet services are disabled.

Command Modes

Global Configuration mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

Disable Telnet services to prevent inbound Telnet connections from being accepted into a networking device using the **telnet** command. After Telnet services are disabled, no new inbound connections are accepted, and the Cisco Internet services daemon (Cinetd) stops listening on the Telnet port.

Enable Telnet services by setting the **max-servers** keyword to a value of one or greater. This allows inbound Telnet connections into a networking device.

This command affects only inbound Telnet connections to a networking device. Outgoing Telnet connections can be made regardless of whether Telnet services are enabled.

Using the **no** form of the command disables the Telnet connection and restores the system to its default condition.

Note Before establishing communications with the router through a Telnet session, configure the telnet server and vty-pool functions (see the *Cisco ASR 9000 Series Aggregation Services Router System Management Command Reference*, the *Cisco ASR 9000 Series Aggregation Services Router System Management Configuration Guide*, and *Cisco ASR 9000 Series Aggregation Services Router IP Addresses and Services Configuration Guide*).

Task ID	Task ID	Operations
	ipv4	read, write
	ip-services	read, write

Examples

The following example shows how to enable Telnet services for one server:

```
RP/0/RSP0/CPU0:router(config)# telnet ipv4 server max-servers 1
```

Related Commands	Command	Description
	telnet, on page 387	Logs in to a host that supports Telnet.

telnet transparent

To send a Carriage Return (CR) as a CR-NULL rather than a Carriage Return-Line Feed (CR-LF) for virtual terminal sessions, use the **telnet transparent** command in line template submode. To remove the **telnet transparent** command from the configuration file and restore the system to its default condition, use the **no** form of this command.

telnet transparent
no telnet transparent

Syntax Description This command has no keywords or arguments.

Command Default No default behavior or values

Command Modes Line console

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines The **telnet transparent** command is useful for coping with different interpretations of end-of-line handling in the Telnet protocol specification.

Task ID	Task ID	Operations
	tty-access	read, write

Examples The following example shows how to configure the vty line to operate in Telnet transparent mode so that when the carriage return key is pressed the system sends the signal as a CR-NULL key combination rather than a CR-LF key combination:

```
RP/0/RSP0/CPU0:router(config)# line console
RP/0/RSP0/CPU0:router(config-line)# telnet transparent
```

Related Commands

Command	Description
telnet, on page 387	Logs in to a host that supports Telnet.

tftp client source-interface

To specify the source IP address for a TFTP connection, use the **tftp client source-interface** command in Global Configuration mode. To remove the **tftp client source-interface** command from the configuration file and restore the system to its default condition, use the **no** form of this command.

```
tftp client source-interface type interface-path-id
no tftp client source-interface type interface-path-id
```

Syntax Description	type	Interface type. For more information, use the question mark (?) online help function.
	interface-path-id	Physical interface or virtual interface.
	Note	Use the show interfaces command to see a list of all interfaces currently configured on the router.
		For more information about the syntax for the router, use the question mark (?) online help function.

Command Default The IP address of the best route to the destination is used as the source IP address.

Command Modes Global Configuration mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines Use the **tftp client source-interface** command to set the IP address of an interface as the source for all TFTP connections.

Task ID	Task ID	Operations
	ip-services	read, write

Examples The following example shows how to set the IP address for GigabitEthernet interface 1/0/2/1 as the source address for TFTP connections:

```
RP/0/RSP0/CPU0:router(config)# tftp client source-interface gigabitethernet 1/0/2/1
```

Related Commands	Command	Description
	tftp server, on page 398	Enables or disables the TFTP server or a feature running on the TFTP server.

tftp server

To enable or disable the TFTP server or a feature running on the TFTP server, use the **tftp server** command in Global Configuration mode. To restore the system to its default condition, use the **no** form of this command.

```
tftp {ipv4 | ipv6} server homedir tftp-home-directory [max-servers [{number | no-limit}]] [access-list name]
```

```
no tftp {ipv4 | ipv6} server homedir tftp-home-directory [max-servers [{number | no-limit}]] [access-list name]
```

Syntax Description

ipv4	Specifies IPv4 address prefixes.
ipv6	Specifies IPv6 address prefixes.
homedir <i>tftp-home-directory</i>	Specifies the home directory.
max-servers <i>number</i>	(Optional) Sets the maximum number of concurrent TFTP servers. The range is from 1 to 2147483647.
max-servers no-limit	(Optional) Sets no limit to process a number of allowable TFTP server.
access-list <i>name</i>	(Optional) Specifies the name of the access list associated with the TFTP server.

Command Default

The TFTP server is disabled by default. When not specified, the default value for the **max-servers** keyword is unlimited.

Command Modes

Global Configuration mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

Using the **no** form of the **tftp server** command removes the specified command from the configuration file and restores the system to its default condition. The **no** form of the command is not stored in the configuration file.

Task ID

Task ID	Operations
ipv4	read, write
ip-services	read, write

Examples

The following example shows that the TFTP server is enabled for the access list named test:

```
RP/0/RSP0/CPU0:router(config)# tftp ipv4 server homedir disk0 access-list test
```

tracert

To discover the routes that packets actually take when traveling to their destination across an IP network, use the **tracert** command in EXEC mode.

tracert [{**ipv4** | **ipv6** | **vrf** *vrf-name*}] [{*host-name*|*ip-address*}] [**source** {*ip-address*|*interface-name*}] [**numeric**] [**timeout** *seconds*] [**probe** *count*] [**minttl** *seconds*] [**maxttl** *seconds*] [**port** *number*] [**priority** *number*] [**verbose**]

Syntax	Description
ipv4	(Optional) Specifies IPv4 address prefixes.
ipv6	(Optional) Specifies IPv6 address prefixes.
vrf	(Optional) Specifies VPN routing and forwarding (VRF) instance.
vrf-name	(Optional) VRF name of the system to ping.
host-name	(Optional) Hostname of system to use as the destination of the trace attempt.
ip-address	(Optional) Address of system to use as the destination of the trace attempt.
source	
<i>ip-address-name</i>	(Optional) IP address A.B.C.D or hostname.
numeric	(Optional) Numeric display only.
timeout <i>seconds</i>	(Optional) Timeout value. Range is 0 to 3600.
probe <i>count</i>	(Optional) Probe count. Range is 0 to 65535.
minttl <i>seconds</i>	(Optional) Minimum time to live. Range is 0 to 255.
maxttl <i>seconds</i>	(Optional) Maximum time to live. Range is 0 to 255.
port <i>number</i>	(Optional) Port number. Range is 0 to 65535.
priority <i>number</i>	(Optional) Packet priority. Range is 0 to 15. Available when the ipv6 keyword is specified.
verbose	(Optional) Verbose output.

Command Default No default behavior or values

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines The default value for the **tracert** command refers only to the destination. No default value is available for the destination address.

The **traceroute** command works by taking advantage of the error messages generated by networking devices when a datagram exceeds its time-to-live (TTL) value.

The **traceroute** command starts by sending probe datagrams with a TTL value of 1, which causes the first networking device to discard the probe datagram and send back an error message. The **traceroute** command sends several probes at each TTL level and displays the round-trip time for each.

The **traceroute** command sends out one probe at a time. Each outgoing packet may result in one or two error messages. A “time-exceeded” error message indicates that an intermediate networking device has seen and discarded the probe. A “destination-unreachable” error message indicates that the destination node has received the probe and discarded it because it could not deliver the packet. If the timer goes off before a response comes in, the **traceroute** command prints an asterisk (*).

The **traceroute** command terminates when the destination responds, when the maximum TTL is exceeded, or when the user interrupts the trace with the escape sequence, which is, by default, Ctrl-C. Simultaneously press and release the Ctrl and C keys.

To use nondefault parameters and invoke an extended **traceroute** test, enter the command without a *host-name* or *ip-address* argument. You are stepped through a dialog to select the desired parameter values for the **traceroute** test.

Because of how IP is implemented on various networking devices, the IP **traceroute** command may behave in unexpected ways.

Not all destinations respond correctly to a probe message by sending back an “ICMP port unreachable” message. A long sequence of TTL levels with only asterisks, terminating only when the maximum TTL has been reached, may indicate this problem.

There is a known problem with the way some hosts handle an “ICMP TTL exceeded” message. Some hosts generate an “ICMP” message, but they reuse the TTL of the incoming packet. Because this value is zero, the ICMP packets do not succeed in returning. When you trace the path to such a host, you may see a set of TTL values with asterisks (*). Eventually the TTL is raised high enough that the “ICMP” message can get back. For example, if the host is six hops away, the **traceroute** command times out on responses 6 through 11.

Task ID	Task ID	Operations
	basic-services	read, write, execute

Examples

The following output shows a sample **traceroute** session when a destination hostname has been specified:

```
RP/0/RSP0/CPU0:router# traceroute host8-sun

Type escape sequence to abort.
Tracing the route to 192.168.0.73
 0 192.168.1.6 (192.168.1.6) 10 msec 0 msec 10 msec
 1 gateway01-gw.gateway.cisco.com (192.168.16.2) 0 msec 10 msec 0 msec
 2 host8-sun.cisco.com (192.168.0.73) 10 msec * 0 msec
```

The following display shows a sample extended **traceroute** session when a destination hostname is not specified:

```
traceroute# traceroute

Protocol [ipv4]:
```

```

Target IP address: ena-view3
Source address or interface: 10.0.58.29
Numeric display? [no]:
Timeout in seconds [3]:
Probe count [3]:
Minimum Time to Live [1]:
Maximum Time to Live [30]:
Port Number [33434]:
Loose, Strict, Record, Timestamp, Verbose[none]:

```

Type escape sequence to abort.

Tracing the route to 171.71.164.199

```

 1  sjc-jpxlnock-vpn.cisco.com (10.25.0.1) 30 msec  4 msec  4 msec
 2  15lab-vlan725-gw1.cisco.com (173.19.72.2) 7 msec  5 msec  5 msec

 8  ena-view3.cisco.com (172.71.164.199) 6 msec  *  8 msec

```

This table describes the characters that can appear in traceroute output.

Table 39: traceroute Text Characters

Character	Description
xx msec	For each node, the round-trip time in milliseconds for the specified number of probes.
*	Probe time out.
?	Unknown packet type.
A	Administratively unreachable. This output usually indicates that an access list is blocking traffic.
H	Host unreachable.
N	Network unreachable.
P	Protocol unreachable.
Q	Source quench.
U	Port unreachable.

HSRP Commands

This chapter describes the Cisco IOS XR software commands used to configure and monitor the Hot Standby Router Protocol (HSRP).

For detailed information about HSRP concepts, configuration tasks, and examples, refer to the *IP Addresses and Services Configuration Guide for Cisco ASR 9000 Series Routers*.

address (hsrp)

To enable hot standby protocol for IP, use the **address (hsrp)** command in the HSRP group submode. To disable hot standby protocol for IP, use the **no** form of this command.

```
address {learnaddress}
no address {learnaddress}
```

Syntax Description	
learn	Learns virtual IP address from peer.
address	Hot standby IP address.

Command Default None

Command Modes HSRP Group Submode

Command History	Release	Modification
	Release 4.2.0	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operation
	hsrp	read, write

Example

This example shows how to enable a group to learn the primary virtual IPv4 address from received HSRP control packets:

(applicable for Cisco IOS XR Releases 4.2.x and below)

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# router hsrp
RP/0/RSP0/CPU0:router(config-hsrp)# interface tenGigE 0/4/0/4
RP/0/RSP0/CPU0:router(config-hsrp-if)# address-family ipv4
RP/0/RSP0/CPU0:router(config-hsrp-ipv4)# hsrp 1
RP/0/RSP0/CPU0:router(config-hsrp-gp)# address learn
RP/0/RSP0/CPU0:router(config-hsrp-gp)#
```

(applicable for Cisco IOS XR Releases 4.3.x and above)

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# router hsrp
RP/0/RSP0/CPU0:router(config-hsrp)# interface tenGigE 0/4/0/4
RP/0/RSP0/CPU0:router(config-hsrp-if)# address-family ipv4
RP/0/RSP0/CPU0:router(config-hsrp-ipv4)# hsrp 1 version 2
```

```
RP/0/RSP0/CPU0:router(config-hsrp-gp)# address learn
RP/0/RSP0/CPU0:router(config-hsrp-gp)#
```

**Note**

- The **version** keyword is available only if IPv4 address-family is selected. By default, version is set to 2 for IPv6 address families.
- HSRP version 2 provides an extended group range of 0-4095.

Related Commands

Command	Description
address secondary (hsrp), on page 411	Configures the secondary virtual IPv4 address for a virtual router.

address global (HSRP)

To configure the global virtual IPv6 address for the HSRP group, use the **address global** command in the virtual router submode. To deconfigure the global virtual IPv6 address for the HSRP group, use the **no** form of this command.

address global *ipv6-address*

no address global *ipv6-address*

Syntax Description	<i>ipv6-address</i> Global HSRP IPv6 address.				
Command Default	None				
Command Modes	HSRP Group Submode, under the IPv6 address-family				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 4.3.0</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Release 4.3.0	This command was introduced.
Release	Modification				
Release 4.3.0	This command was introduced.				
Usage Guidelines	No specific guidelines impact the use of this command.				
Task ID	<table border="1"> <thead> <tr> <th>Task ID</th> <th>Operation</th> </tr> </thead> <tbody> <tr> <td>hsrp</td> <td>read,write</td> </tr> </tbody> </table>	Task ID	Operation	hsrp	read,write
Task ID	Operation				
hsrp	read,write				

Example

This example shows how to add a global virtual IPv6 address for the HSRP group:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# router hsrp
RP/0/RSP0/CPU0:router(config-hsrp)# interface tenGigE 0/4/0/4
RP/0/RSP0/CPU0:router(config-hsrp-if)# address-family ipv6
RP/0/RSP0/CPU0:router(config-hsrp-address-family)# hsrp 3
RP/0/RSP0/CPU0:router(config-hsrp-virtual-router)# address global 4000::1000
RP/0/RSP0/CPU0:router(config-hsrp-virtual-router)#
```

- Note**
- The **version** keyword is available only if IPv4 address-family is selected. By default, version is set to 2 for IPv6 address families.
 - HSRP version 2 provides an extended group range of 0-4095.

address global subordinate (HSRP)

To configure the global virtual IPv6 address for the subordinate group, use the **address global** command in the HSRP slave submode. To deconfigure the global virtual IPv6 address for the subordinate group, use the **no** form of this command.

```
address global ipv6-address
```

```
no address global ipv6-address
```

Syntax Description	<i>ipv6-address</i> Global VRRP IPv6 address.				
Command Default	None				
Command Modes	HSRP Slave Submode, under the IPv6 address-family				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 4.3.0</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Release 4.3.0	This command was introduced.
Release	Modification				
Release 4.3.0	This command was introduced.				
Usage Guidelines	No specific guidelines impact the use of this command.				
Task ID	<table border="1"> <thead> <tr> <th>Task ID</th> <th>Operation</th> </tr> </thead> <tbody> <tr> <td>hsrp</td> <td>read,write</td> </tr> </tbody> </table>	Task ID	Operation	hsrp	read,write
Task ID	Operation				
hsrp	read,write				

Example

This example shows how to add a global virtual IPv6 address for the subordinate group:

```
Router# configure
Router(config)# router hsrp
Router(config-hsrp)# interface tenGigE 0/4/0/4
Router(config-hsrp-if)# address-family ipv6
Router(config-hsrp-address-family)# hsrp 3 slave
Router(config-hsrp-virtual-router)# address global 4000::1000
Router(config-hsrp-virtual-router)#
```

Note

- The **version** keyword is available only if IPv4 address-family is selected. By default, version is set to 2 for IPv6 address families.
- HSRP version 2 provides an extended group range of 0-4095.

address linklocal (HSRP)

To either configure the virtual link-local IPv6 address for the subordinate group or to specify that the virtual link-local IPv6 address should be enabled and calculated automatically from the virtual router virtual Media Access Control (MAC) address, use the **address linklocal** command in the virtual router submode. To deconfigure the virtual link-local IPv6 address for the subordinate group, use the **no** form of this command.

address linklocal

ipv6-address | **autoconfig**

no address linklocal

ipv6-address | **autoconfig**

Syntax Description	
<i>ipv6-address</i>	HSRP IPv6 link-local address.
autoconfig	Autoconfigures the HSRP IPv6 link-local address.

Command Default None

Command Modes HSRP Slave Submode, under the IPv6 address-family

Command History	Release	Modification
	Release 4.3.0	This command was introduced.

Usage Guidelines When you configure HSRP for IPv6, you must also configure the linklocal IPv6 address using either the *ipv6-address* argument or the **autoconfig** keyword. If you configure only the global IPv6 address and commit the changes using the **commit** keyword, the router does not accept the configuration and displays an error message.

Task ID	Task ID	Operation
	hsrp	read, write

Example

This example shows how to autoconfigure the HSRP IPv6 link-local address:

```
Router#configure
Router(config)#router hsrp
Router(config-hsrp)#interface tenGigE 0/4/0/4
Router(config-hsrp-if)#address-family ipv6
Router(config-hsrp-address-family)#hsrp 3 slave
Router(config-hsrp-virtual-router)#address linklocal autoconfig
Router(config-hsrp-virtual-router)#
```

This example shows how to configure the virtual link-local IPv6 address for the subordinate group:

```
Router#configure
Router(config)#router hsrp
Router(config-hsrp)#interface tenGigE 0/4/0/4
Router(config-hsrp-if)#address-family ipv6
Router(config-hsrp-address-family)#hsrp 3 slave
Router(config-hsrp-virtual-router)#address linklocal FE80::260:3EFF:FE11:6770
Router(config-hsrp-virtual-router)#
```

Note

- The **version** keyword is available only if IPv4 address-family is selected. By default, version is set to 2 for IPv6 address families.
 - HSRP version 2 provides an extended group range of 0-4095.
-

address secondary (hsrp)

To configure the secondary virtual IPv4 address for a virtual router, use the **address secondary** command in the Hot Standby Router Protocol (HSRP) virtual router submode. To deconfigure the secondary virtual IPv4 address for a virtual router, use the **no** form of this command.

address *address* **secondary**
no address *address* **secondary**

Syntax Description	secondary	Sets the secondary HSRP IP address.
	<i>address</i>	HSRP IPv4 address.

Command Default None

Command Modes HSRP virtual router

Command History	Release	Modification
	Release 4.2.0	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operation
	hsrp	read, write

Example

This example shows how to set the secondary virtual IPv4 address for the virtual router:

```
(applicable for Cisco IOS XR Releases 4.2.x and below)
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# router hsrp
RP/0/RSP0/CPU0:router(config-hsrp)# interface tenGigE 0/4/0/4
RP/0/RSP0/CPU0:router(config-hsrp-if)# address-family ipv4
RP/0/RSP0/CPU0:router(config-hsrp-ipv4)# hsrp 3
RP/0/RSP0/CPU0:router(config-hsrp-gp)# address 10.20.30.1 secondary
RP/0/RSP0/CPU0:router(config-hsrp-gp)#
```

```
(applicable for Cisco IOS XR Releases 4.3.x and above)
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# router hsrp
RP/0/RSP0/CPU0:router(config-hsrp)# interface tenGigE 0/4/0/4
RP/0/RSP0/CPU0:router(config-hsrp-if)# address-family ipv4
RP/0/RSP0/CPU0:router(config-hsrp-ipv4)# hsrp 3 version 2
RP/0/RSP0/CPU0:router(config-hsrp-gp)# address 10.20.30.1 secondary
```

```
RP/0/RSP0/CPU0:router(config-hsrp-gp)#
```

**Note**

- The **version** keyword is available only if IPv4 address-family is selected. By default, version is set to 2 for IPv6 address families.
- HSRP version 2 provides an extended group range of 0-4095.

Related Commands

Command	Description
address (hsrp), on page 405	Enables hot standby protocol for IP.

authentication (hsrp)

To configure an authentication string for the Hot Standby Router Protocol (HSRP), use the **hsrp authentication** command in HSRP group submode. To delete an authentication string, use the **no** form of this command.

authentication *string*
no authentication [*string*]

Syntax Description	<i>string</i> Authentication string. It can be up to eight characters long. The default is 'cisco'.				
Command Default	The default authentication string is cisco.				
Command Modes	HSRP Group Submode				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 4.2.0</td> <td>This command was introduced. This command replaces the hsrp authentication command.</td> </tr> </tbody> </table>	Release	Modification	Release 4.2.0	This command was introduced. This command replaces the hsrp authentication command.
Release	Modification				
Release 4.2.0	This command was introduced. This command replaces the hsrp authentication command.				
Usage Guidelines	<p>The authentication string is sent unencrypted in all HSRP messages. The same authentication string must be configured on all routers and access servers on a LAN to ensure interoperation. Authentication mismatch prevents a device from learning the designated Hot Standby IP address and the Hot Standby timer values from other routers configured with HSRP.</p> <p>The hsrp authentication command is available for version 1 groups only</p>				
Task ID	<table border="1"> <thead> <tr> <th>Task ID</th> <th>Operations</th> </tr> </thead> <tbody> <tr> <td>hsrp</td> <td>read, write</td> </tr> </tbody> </table>	Task ID	Operations	hsrp	read, write
Task ID	Operations				
hsrp	read, write				

Examples

This example shows how to configure “company1” as the authentication string required to allow Hot Standby routers in group 1 on tenGigE interface 0/4/0/4 to interoperate:

(applicable for Cisco IOS XR Releases 4.2.x and below)

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# router hsrp
RP/0/RSP0/CPU0:router(config-hsrp)# interface tenGigE 0/4/0/4
RP/0/RSP0/CPU0:router(config-hsrp-if)# address-family ipv4
RP/0/RSP0/CPU0:router(config-hsrp-ipv4)# hsrp 1
RP/0/RSP0/CPU0:router(config-hsrp-gp)# authentication company1
RP/0/RSP0/CPU0:router(config-hsrp-gp)#
```

(applicable for Cisco IOS XR Releases 4.3.x and above)

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# router hsrp
RP/0/RSP0/CPU0:router(config-hsrp)# interface tenGigE 0/4/0/4
```

```
RP/0/RSP0/CPU0:router(config-hsrp-if)# address-family ipv4
RP/0/RSP0/CPU0:router(config-hsrp-ipv4)# hsrp 1 version 1
RP/0/RSP0/CPU0:router(config-hsrp-gp)# authentication company1
RP/0/RSP0/CPU0:router(config-hsrp-gp)#
```

Note The **version** keyword is available only if IPv4 address-family is selected. By default, version is set to 2 for IPv6 address families.

Related Commands

Command	Description
show hsrp, on page 446	Displays HSRP information.

bfd fast-detect (hsrp)

To enable bidirectional forwarding (BFD) fast-detection on a HSRP interface, use the **hsrp bfd fast-detect** command in HSRP group submode. This creates a BFD session between the HSRP router and its peer, and if the session goes down while HSRP is in backup state, this will initiate a HSRP failover. To disable BFD fast-detection, use the **no** form of this command.

```
bfd fast-detect [ peer ipv4 ipv4-address interface-type interface-path-id ]
```

Syntax Description	peer ipv4 <i>ipv4-address</i>	(Optional) BFD peer interface IPv4 address.
	<i>interface-type</i> <i>interface-path-id</i>	Physical interface or virtual interface.
	Note	Use the show interfaces command to see a list of all interfaces currently configured on the router.
		For more information about the syntax for the router, use the question mark (?) online help function.

Command Default BFD is disabled.

Command Modes HSRP Group Submode

Command History	Release	Modification
	Release 4.2.0	This command was introduced. This command replaced the hsrp bfd-fast detect command.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operations
	hsrp	read, write

Examples This example shows how to enable bfd fast-detect:

```
(applicable for Cisco IOS XR Releases 4.2.x and below)
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# router hsrp
RP/0/RSP0/CPU0:router(config-hsrp)# interface tenGigE 0/4/0/4
RP/0/RSP0/CPU0:router(config-hsrp-if)# address-family ipv4
RP/0/RSP0/CPU0:router(config-hsrp-ipv4)# hsrp 1
RP/0/RSP0/CPU0:router(config-hsrp-gp)# bfd fast-detect
RP/0/RSP0/CPU0:router(config-hsrp-gp)#
```

(applicable for Cisco IOS XR Releases 4.3.x and above)

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# router hsrp
RP/0/RSP0/CPU0:router(config-hsrp)# interface tenGigE 0/4/0/4
RP/0/RSP0/CPU0:router(config-hsrp-if)# address-family ipv4
RP/0/RSP0/CPU0:router(config-hsrp-ipv4)# hsrp 1 version 2
RP/0/RSP0/CPU0:router(config-hsrp-gp)# bfd fast-detect
RP/0/RSP0/CPU0:router(config-hsrp-gp)#
```

**Note**

- The **version** keyword is available only if IPv4 address-family is selected. By default, version is set to 2 for IPv6 address families.
- HSRP version 2 provides an extended group range of 0-4095.

Related Commands

Command	Description
hsrp bfd multiplier, on page 422	Configures the multiplier value for BFD.

clear hsrp statistics

To reset the Hot Standby Routing Protocol Statistics (HSRP) statistics to zero, use the **clear hsrp statistics** command in EXEC mode.

clear hsrp statistics [**interface** *interface-type interface-path-id* *group*]

Syntax Description

interface *interface-path-id* Physical interface or virtual interface.

Note Use the show interfaces command to see a list of all interfaces currently configured on the router.

For more information about the syntax for the router, use the question mark (?) online help function.

group Group number.

Command Default

None

Command Modes

EXEC mode

Command History

Release	Modification
Release 4.2.0	This command was introduced.

Usage Guidelines

No specific guidelines impact the use of this command.

Task ID

Task ID	Operation
hsrp	read, write

Example

This sample output is from the **clear hsrp statistics** command:

```
RP/0/RSP0/CPU0:router# clear hsrp statistics
```

Related Commands

Command	Description
show hsrp, on page 446	Displays HSRP information.

hsrp authentication

To configure an authentication string for the Hot Standby Router Protocol (HSRP), use the **hsrp authentication** command in HSRP interface configuration mode. To delete an authentication string, use the **no** form of this command.

```
hsrp [group-number] authentication string
no hsrp [group-number] authentication [string]
```

Syntax Description	group-number (Optional) Group number on the interface to which this authentication string applies. Default is 0.
	string Authentication string. It can be up to eight characters long. The default is 'cisco'.

Command Default	The default group number is 0. The default authentication string is cisco.
------------------------	-------------------------------------------------------------------------------

Command Modes	HSRP interface configuration
----------------------	------------------------------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.
	Release 4.2.0	This command has been deprecated. This command was replaced with the authentication hsrp command.

Usage Guidelines	The authentication string is sent unencrypted in all HSRP messages. The same authentication string must be configured on all routers and access servers on a LAN to ensure interoperation. Authentication mismatch prevents a device from learning the designated Hot Standby IP address and the Hot Standby timer values from other routers configured with HSRP.
-------------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Task ID	Task ID	Operations
	hsrp	read, write

Examples	This example shows how to configure “company1” as the authentication string required to allow Hot Standby routers in group 1 on Ten Gigabit Ethernet interface 0/2/0/1 to interoperate:
-----------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

```
RP/0/RSP0/CPU0:router(config)# router hsrp
RP/0/RSP0/CPU0:router(config-hsrp)# interface TenGigE 0/2/0/1
RP/0/RSP0/CPU0:router(config-hsrp-if)# hsrp 1 authentication company1
```

Related Commands

Command	Description
show hsrp, on page 446	Displays HSRP information.

hsrp bfd fast-detect

To enable bidirectional forwarding(BFD) fast-detection on a HSRP interface, use the **hsrp bfd fast-detect** command in interface configuration mode. This creates a BFD session between the HSRP router and its peer, and if the session goes down while HSRP is in backup state, this will initiate a HSRP failover. To disable BFD fast-detection, use the **no** form of this command.

```
hsrp [group number] bfd fast-detect
no hsrp [group number] bfd fast-detect
```

Syntax Description	group number (Optional) HSRP group number. Range is 0 to 255.
---------------------------	---------------------------------------------------------------

Command Default	BFD is disabled.
------------------------	------------------

Command Modes	HSRP interface configuration
----------------------	------------------------------

Command History	Release	Modification
	Release 3.9.0	This command was introduced.
	Release 4.2.0	This command has been deprecated. This command was replaced with the bfd fast-detect (hsrp) command.

Usage Guidelines	No specific guidelines impact the use of this command.
-------------------------	--------------------------------------------------------

Task ID	Task ID	Operations
	hsrp	read, write

Examples	This example shows how to enable bfd fast-detect:
-----------------	---------------------------------------------------

```
RP/0/RSP0/CPU0:router(config)# router hsrp
RP/0/RSP0/CPU0:router(config-hsrp)# interface gig 0/1/1/0
RP/0/RSP0/CPU0:router(config-hsrp-if)# hsrp 1 bfd fast-detect
```

Related Commands	Command	Description
	hsrp bfd multiplier, on page 422	Configures the multiplier value for BFD.

hsrp bfd minimum-interval

To configure the BFD minimum interval to be used for all HSRP BFD sessions on a given interface, use the **hsrp bfd minimum-interval** command in the interface configuration mode. To remove the configured minimum-interval period and set the minimum-interval period to the default period, use the **no** form of this command.

```
hsrp bfd minimum-interval interval
no hsrp bfd minimum-interval interval
```

Syntax Description	interval Specify the minimum-interval in milliseconds. Range is 15 to 30000.
---------------------------	------------------------------------------------------------------------------

Command Default	Default minimum interval is 50 ms.
------------------------	------------------------------------

Command Modes	HSRP interface configuration
----------------------	------------------------------

Command History	Release	Modification
	Release 3.9.0	This command was introduced.

Usage Guidelines	Minimum interval determines the frequency of sending BFD packets to BFD peers. It is the time between successive BFD packets sent for the session. Minimum interval is defined in milliseconds. The configured minimum interval applies to all BFD sessions on the interface.
-------------------------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Task ID	Task ID	Operations
	hsrp	read, write

Examples	The following example shows how to configure a minimum interval of 100 milliseconds:
-----------------	--------------------------------------------------------------------------------------

```
RP/0/RSP0/CPU0:router(config)# router hsrp
RP/0/RSP0/CPU0:router(config-hsrp)# interface gig 0/1/1/0
RP/0/RSP0/CPU0:router(config-hsrp-if)# hsrp bfd minimum-interval 100
```

Related Commands	Command	Description
	hsrp bfd fast-detect	Enables BFD fast-detection on a HSRP interface.
	hsrp bfd multiplier, on page 422	Configures the multiplier value for BFD.

hsrp bfd multiplier

To set the BFD multiplier value, use the **hsrp bfd multiplier** command in the interface configuration mode. To remove the configured multiplier value and set the multiplier to the default value, use the **no** form of this command.

```
hsrp bfd multiplier multiplier
no hsrp bfd multiplier multiplier
```

Syntax Description	multiplier Specifies the BFD multiplier value. Range is 2 to 50.
---------------------------	------------------------------------------------------------------

Command Default	Default value is 3.
------------------------	---------------------

Command Modes	HSRP interface configuration
----------------------	------------------------------

Command History	Release	Modification
	Release 3.9.0	This command was introduced.

Usage Guidelines	The multiplier value specifies the number of consecutive BFD packets that, if not received as expected, cause a BFD session to go down. The BFD multiplier applies to all configured BFD sessions on the interface.
-------------------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Task ID	Task ID	Operations
	hsrp	read, write

Examples	The following example shows how to configure a BFD multiplier with multiplier value of 10:
-----------------	--------------------------------------------------------------------------------------------

```
RP/0/RSP0/CPU0:router(config)# router hsrp
RP/0/RSP0/CPU0:router(config-hsrp)# interface gig 0/1/1/0
RP/0/RSP0/CPU0:router(config-hsrp-if)# hsrp bfd multiplier 10
```

Related Commands	Command	Description
	hsrp bfd fast-detect	Enables BFD fast-detection on a HSRP interface.

hsrp delay

To configure the activation delay for the Hot Standby Router Protocol (HSRP), use the **hsrp delay** command in HSRP interface configuration mode. To delete the activation delay, use the **no** form of this command.

hsrp delay minimum *value* **reload** *value*
no hsrp delay

Syntax Description

minimum *value* Sets the minimum delay in seconds for every interface up event. Range is 0 to 10000.

reload *value* Sets the reload delay in seconds for first interface up event. Range is 0 to 10000.

Command Default

minimum *value* : 1

reload *value* : 5

Command Modes

HSRP interface configuration

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

The **hsrp delay** command delays the start of the HSRP finite state machine (FSM) on an interface up event to ensure that the interface is ready to pass traffic. This ensures that there are no mistaken state changes due to loss of hello packets. The minimum delay is applied on all interface up events and the reload delay is applied on the first interface event.

The values of zero must be explicitly configured to turn this feature off.

Task ID

Task ID	Operations
hsrp	read, write

Examples

The following example shows how to configure a minimum delay of 10 seconds with a reload delay of 100 seconds:

```
RP/0/RSP0/CPU0:router(config)# router hsrp
RP/0/RSP0/CPU0:router(config-hsrp)# interface mgmtEth 0/RP0/CPU0/0
RP/0/RSP0/CPU0:router(config-hsrp-if)# hsrp delay minimum 10 reload 100
```

Related Commands

Command	Description
show hsrp, on page 446	Displays HSRP information.

hsrp ipv4

To activate the Hot Standby Router Protocol (HSRP), use the **hsrp ipv4** command in HSRP interface configuration mode. To disable HSRP, use the **no** form of this command.

```
hsrp [group-number] ipv4 [ip-address [secondary]]
no hsrp [group-number] ipv4 [ip-address [secondary]]
```

Syntax Description

group-number	(Optional) Group number on the interface for which HSRP is being activated. Range is 0 to 255. Default is 0.
ip-address	(Optional) IP address of the Hot Standby router interface.
secondary	(Optional) Indicates that the IP address is a secondary Hot Standby router interface. Useful on interfaces with primary and secondary addresses; you can configure primary and secondary HSRP addresses.

Command Default

group-number : 0
HSRP is disabled by default.

Command Modes

HSRP interface configuration

Command History

Release	Modification
Release 3.9	This command was introduced.

Usage Guidelines

The **hsrp ipv4** command activates HSRP on the configured interface. If an IP address is specified, that address is used as the designated address for the Hot Standby group. If no IP address is specified, the virtual address is learned from the active router. For HSRP to elect a designated router, at least one router in the Hot Standby group must have been configured with, or must have learned, the designated address. Configuring the designated address on the active router always overrides a designated address that is currently in use.

When the **hsrp ipv4** command is enabled on an interface, the handling of proxy Address Resolution Protocol (ARP) requests is changed (unless proxy ARP was disabled). If the Hot Standby state group has been configured with or has learned the designated address, the proxy ARP requests are answered using the MAC address of the Hot Standby group. Otherwise, proxy ARP responses are suppressed.

Configuring secondary Hot Standby router IP addresses is necessary when the interface has secondary IP addresses configured and redundancy must be provided for the networks of these addresses also.

A primary address must be configured before a secondary address. Likewise, a secondary address must be unconfigured before unconfiguring a primary address. All IP addresses can be unconfigured using the **no hsrp ipv4** command.

Task ID

Task ID	Operations
hsrp	read, write

Examples

The following example shows how to activate HSRP for group 1 on tenGigE interface 0/2/0/1. The IP address used by the Hot Standby group is learned using HSRP.

```
RP/0/RSP0/CPU0:router(config)# router hsrp  
RP/0/RSP0/CPU0:router(config-hsrp)# interface tenGigE 0/2/0/1  
RP/0/RSP0/CPU0:router(config-hsrp-if)# hsrp 1 ipv4
```

Related Commands

Command	Description
hsrp redirects, on page 432	Configures ICMP redirect messages to be sent when the HSRP is configured on an interface.
show hsrp, on page 446	Displays HSRP information.

hsrp mac-address

To specify a virtual MAC address for the Hot Standby Router Protocol (HSRP), use the **hsrp mac-address** command in HSRP interface configuration mode. To revert to the standard virtual MAC address (0000.0C07.AC*n*), use the **no** form of this command.

```
hsrp [group-number] mac-address address
no hsrp [group-number] mac-address
```

Syntax Description	<i>group-number</i> (Optional) Group number on the interface for which HSRP is being activated. Default is 0.						
	<i>address</i> MAC address.						
Command Default	<i>group-number</i> : 0						
	If this command is not configured, and the hsrp use-bia command is not configured, the standard virtual MAC address is used: 0000.0C07.AC <i>n</i> , where <i>n</i> is the group number in hexadecimal. This address is specified in RFC 2281, <i>Cisco Hot Standby Router Protocol (HSRP)</i> .						
Command Modes	HSRP interface configuration						
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 3.9</td> <td>This command was introduced.</td> </tr> <tr> <td>Release 4.2.0</td> <td>This command has been deprecated. This command was replaced with the mac-address hsrp command.</td> </tr> </tbody> </table>	Release	Modification	Release 3.9	This command was introduced.	Release 4.2.0	This command has been deprecated. This command was replaced with the mac-address hsrp command.
Release	Modification						
Release 3.9	This command was introduced.						
Release 4.2.0	This command has been deprecated. This command was replaced with the mac-address hsrp command.						

Usage Guidelines

The **hsrp mac-address** command is not recommended except for IBM networking environments in which first-hop redundancy is based on being able to use a virtual MAC address and in which you cannot change the first-hop addresses in the PCs that are connected to an Ethernet switch.

HSRP is used to help end stations locate the first-hop gateway for IP routing. The end stations are configured with a default gateway. However, HSRP can provide first-hop redundancy for other protocols. Some protocols, such as Advanced Peer-to-Peer Networking (APPN), use the MAC address to identify the first-hop for routing purposes. In this case, it is often necessary to specify the virtual MAC address; the virtual IP address is unimportant for these protocols.

Use the **hsrp mac-address** command to specify the virtual MAC address. The MAC address specified is used as the virtual MAC address when the router is active. This command is intended for certain APPN configurations.

This table shows the parallel terms between APPN and IP.

Table 40: APPN and IP Parallel Terms

APPN	IP
end node	host

APPN	IP
network node	router or gateway

Note In an APPN network, an end node is typically configured with the MAC address of the adjacent network node. Use the **hsrp mac-address** command in the routers to set the virtual MAC address to the value used in the end nodes.

Task ID	Task ID	Operations
	hsrp	read, write

Examples

If the end nodes are configured to use 4000.1000.1060 as the MAC address of the network node, the command to configure the virtual MAC address is as follows:

```
RP/0/RSP0/CPU0:router(config)# router hsrp
RP/0/RSP0/CPU0:router(config-hsrp)# interface TenGigE 0/2/0/1
RP/0/RSP0/CPU0:router(config-hsrp-if)# hsrp 5 mac-address 4000.1000.1060
```

Related Commands	Command	Description
	hsrp use-bia, on page 437	Configures HSRP to use the burned-in address of the interface as its virtual MAC address, instead of the preassigned MAC address.

hsrp preempt

To configure Hot Standby Router Protocol (HSRP) preemption and preemption delay, use the **hsrp preempt** command in HSRP interface configuration mode. To restore the default values, use the **no** form of this command.

```
hsrp [group-number] preempt [delay seconds]
no hsrp [group-number] preempt [delay seconds]
```

Syntax Description	<p>group-number (Optional) Group number on the interface to which the other arguments in this command apply. Default is 0.</p> <p>delay seconds (Optional) Time in seconds. The <i>seconds</i> argument causes the local router to postpone taking over the active role for the specified preempt delay <i>seconds</i> value. Range is 0 to 3600 seconds (1 hour). Default is 0 seconds (no delay).</p>						
Command Default	<p><i>group-number</i>: 0</p> <p><i>seconds</i>: 0 seconds (if the router wants to preempt, it does immediately)</p>						
Command Modes	HSRP interface configuration						
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 3.9</td> <td>This command was introduced.</td> </tr> <tr> <td>Release 4.2.0</td> <td>This command has been deprecated. This command was replaced with the preempt hsrp command.</td> </tr> </tbody> </table>	Release	Modification	Release 3.9	This command was introduced.	Release 4.2.0	This command has been deprecated. This command was replaced with the preempt hsrp command.
Release	Modification						
Release 3.9	This command was introduced.						
Release 4.2.0	This command has been deprecated. This command was replaced with the preempt hsrp command.						
Usage Guidelines	<p>When the hsrp preempt command is configured, the local router should attempt to assume control as the active router if it has a hot standby priority higher than the current active router. If the hsrp preempt command is not configured, the local router assumes control as the active router only if no other router is currently in the active state.</p> <p>When a router first comes up, it does not have a complete routing table. If HSRP is configured to preempt, the local HSRP group may become the active router, yet it is unable to provide adequate routing services. This problem can be solved by configuring a delay before the preempting router actually preempts the currently active router.</p> <p>The preempt delay <i>seconds</i> value does not apply if there is no router currently in the active state. In this case, the local router becomes active after the appropriate timeouts (see the hsrp timers command), regardless of the preempt <i>delay seconds</i> value.</p>						
Task ID	<table border="1"> <thead> <tr> <th>Task ID</th> <th>Operations</th> </tr> </thead> <tbody> <tr> <td>hsrp</td> <td>read, write</td> </tr> </tbody> </table>	Task ID	Operations	hsrp	read, write		
Task ID	Operations						
hsrp	read, write						

Examples

In the following example, the router waits for 300 seconds (5 minutes) after having determined that it should preempt before attempting to preempt the active router. The router might become the active router in a shorter span of time despite the configured delay if no active router is present. Only preempting the active router is delayed.

```
RP/0/RSP0/CPU0:router(config)# router hsrp
RP/0/RSP0/CPU0:router(config-hsrp)# interface TenGigE 0/2/0/1
RP/0/RSP0/CPU0:router(config-hsrp-if)# hsrp ipv4 192.168.18.1
RP/0/RSP0/CPU0:router(config-hsrp-if)# hsrp preempt delay 300
```

Related Commands

Command	Description
hsrp priority	Configures HSRP priority.
hsrp track	Configures an interface so that the Hot Standby priority changes based on the availability of other interfaces.
show hsrp, on page 446	Displays HSRP information.

hsrp priority

To configure Hot Standby Router Protocol (HSRP) priority, use the **hsrp priority** command in HSRP interface configuration mode. To restore the default values, use the **no** form of this command.

```
hsrp [group-number] priority priority
no hsrp [group-number] priority priority
```

Syntax Description

group-number (Optional) Group number on the interface to which the priority applies. Default is 0.

priority Priority value that prioritizes a potential Hot Standby router. Range is 1 to 255. Default is 100.

Command Default

group-number: 0
priority: 100

Command Modes

HSRP interface configuration

Command History

Release	Modification
Release 3.9	This command was supported.
Release 4.2.0	This command has been deprecated. This command was replaced with the preempt hsrp command.

Usage Guidelines

The assigned priority is used to help select the active and standby routers. Assuming that preemption is enabled, the router with the highest priority becomes the designated active router. In case of ties, the interface IP addresses are compared, and the interface with the higher IP address has priority.

The priority of the device can change dynamically if an interface is configured with the **hsrp track** command and another interface on the device goes down.

If preemption is not enabled, the router may not become active even though it might have a higher priority than other HSRP routers.

Task ID

Task ID	Operations
hsrp	read, write

Examples

In the following example, the router has a priority of 120:

```
RP/0/RSP0/CPU0:router(config)# router hsrp
RP/0/RSP0/CPU0:router(config-hsrp)# interface TenGigE 0/2/0/1
RP/0/RSP0/CPU0:router(config-hsrp-if)# hsrp ipv4 192.168.18.1
RP/0/RSP0/CPU0:router(config-hsrp-if)# hsrp priority 120
```

Related Commands

Command	Description
hsrp preempt	Configures HSRP preemption and preemption delay.
hsrp track	Configures an interface so that the Hot Standby priority changes based on the availability of other interfaces.
show hsrp, on page 446	Displays HSRP information.

hsrp redirects

To configure Internet Control Message Protocol (ICMP) redirect messages to be sent when the Hot Standby Router Protocol (HSRP) is configured on an interface, use the **hsrp redirects** command in HSRP interface configuration mode. To revert to the default, which is that ICMP messages are enabled, use the **no** form of this command.

hsrp redirects disable
no hsrp redirects disable

Syntax Description	disable Disables the filtering of ICMP redirect messages on interfaces configured with HSRP.
---------------------------	----------------------------------------------------------------------------------------------

Command Default	HSRP ICMP redirects are enabled by default.
------------------------	---------------------------------------------

Command Modes	HSRP interface configuration
----------------------	------------------------------

Command History	Release	Modification
	Release 3.9	This command was introduced.

Usage Guidelines	The hsrp redirects command can be configured on a per-interface basis. When HSRP is first configured on an interface, the setting for that interface inherits the global value. With the hsrp redirects command is enabled, ICMP redirects messages are filtered by replacing the real IP address in the next-hop address of the redirect packet with a virtual IP address if it is known to HSRP.
-------------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Task ID	Task ID	Operations
	hsrp	read, write

Examples	The following example shows how to allow HSRP to filter redirect messages on tenGigE interface 0/2/0/1:
-----------------	---------------------------------------------------------------------------------------------------------

```
RP/0/RSP0/CPU0:router(config)# router hsrp
RP/0/RSP0/CPU0:router(config-hsrp)# interface tenGigE 0/2/0/1
RP/0/RSP0/CPU0:router(config-hsrp-if)# hsrp 1 ipv4 192.168.18.1
RP/0/RSP0/CPU0:router(config-hsrp-if)# hsrp redirects disable
```

Related Commands	Command	Description
	show hsrp, on page 446	Displays HSRP information.

hsrp timers

To configure the time between hello packets and the time before other routers declare the active Hot Standby or standby router to be down, use the **hsrp timers** command in HSRP interface configuration mode. To restore the timers to their default values, use the **no** form of this command.

```
hsrp [group-number] timers {hello-seconds | msec hello-milliseconds} {hold-seconds | msec
hold-milliseconds}
no hsrp [group-number] timers
```

Syntax Description

group-number	(Optional) Group number on the interface to which the timers apply. Default is 0.
hello-seconds	Hello interval in seconds. Range is 1 to 255. Default is 3 seconds.
msec hello-milliseconds	Hello interval in milliseconds. Range is 100 to 3000 milliseconds.
hold-seconds	Time in seconds before the active or standby router is declared to be down. Range is 1 to 255. Default is 10 seconds.
msec hold-milliseconds	Time in milliseconds before the active or standby router is declared to be down. Range is 100 to 3000 milliseconds.

Command Default

group-number: 0
hello-seconds: 3 seconds (If the **msec** keyword is specified, there is no default value.)
hold-seconds: 10 seconds (If the **msec** keyword is specified, there is no default value.)

Command Modes

HSRP interface configuration

Command History

Release	Modification
Release 3.2	This command was introduced.
Release 4.2.0	This command has been deprecated. This command was replaced with the timers (hsrp) command.

Usage Guidelines

Nonactive routers learn timer values from the active router, unless millisecond timer values are being used. If millisecond timer values are being used, all routers must be configured with the millisecond timer values. This rule applies if either the hello time or the hold time is specified in milliseconds.

The timers configured on the active router always override any other timer settings. All routers in a Hot Standby group should use the same timer values. Normally, the hold time is greater than or equal to three times the hello time ($\text{holdtime} > 3 * \text{hellotime}$).

You must specify either the *hello-seconds* argument or the **msec** keyword and *hello-milliseconds* argument, depending on whether you want the hello time in seconds or milliseconds. You must also specify either the *hold-seconds* argument or **msec** keyword and *hold-milliseconds* argument, depending on whether you want the hold time in seconds or milliseconds.

Task ID	Task ID	Operations
	hsrp	read, write

Examples

The following example shows how to set, for group number 1 on Ten Gigabit Ethernet interface 0/2/0/1, the time between hello packets to 5 seconds and the time after which a router is considered to be down to 15 seconds. The configured timer values are used only if the router is active (or before they have been learned).

```
RP/0/RSP0/CPU0:router(config)# router hsrp
RP/0/RSP0/CPU0:router(config-hsrp)# interface TenGigE 0/2/0/1
RP/0/RSP0/CPU0:router(config-hsrp-if)# hsrp 1 ipv4
RP/0/RSP0/CPU0:router(config-hsrp-if)# hsrp 1 timers 5 15
```

The following example shows how to set, for group number 1 on Ten Gigabit Ethernet interface 0/2/0/1, the time between hello packets to 200 milliseconds and the time after which a router is considered to be down to 1000 milliseconds. The configured timer values are always used because milliseconds have been specified.

```
RP/0/RSP0/CPU0:router(config)# router hsrp
RP/0/RSP0/CPU0:router(config-hsrp)# interface TenGigE 0/2/0/1
RP/0/RSP0/CPU0:router(config-hsrp-if)# hsrp 1 ipv4
RP/0/RSP0/CPU0:router(config-hsrp-if)# hsrp 1 timers msec 200 msec 1000
```

Related Commands

Command	Description
show hsrp, on page 446	Displays HSRP information.

hsrp track

To configure an interface so that the Hot Standby priority changes on the basis of the availability of other interfaces, use the **hsrp track** command in HSRP interface configuration mode. To remove the tracking, use the **no** form of this command.

```
hsrp [group-number] track type interface-path-id [priority-decrement]  
no hsrp [group-number] track type interface-path-id [priority-decrement]
```

Syntax Description	
group-number	(Optional) Group number on the interface to which the tracking applies. Default is 0.
type	Interface type. For more information, use the question mark (?) online help function.
interface-path-id	Physical interface or virtual interface.
	<p>Note Use the show interfaces command to see a list of all interfaces currently configured on the router.</p> <p>For more information about the syntax for the router, use the question mark (?) online help function.</p>
priority-decrement	(Optional) Amount by which the Hot Standby priority for the router is decremented (or incremented) when the interface goes down (or comes back up). Range is 1 to 255.

Command Default	
group-number	0
priority-decrement	10

Command Modes	
	HSRP interface configuration

Command History	Release	Modification
	Release 3.9	This command was introduced.
	Release 4.2.0	This command has been deprecated. This command was replaced with the track (hsrp) command.

Usage Guidelines	
	<p>The hsrp track command ties the Hot Standby priority of the router to the availability of its interfaces. It is useful for tracking interfaces that are not configured for the Hot Standby Router Protocol (HSRP). Only IP interfaces are tracked. A tracked interface is up if IP on that interface is up. Otherwise, the tracked interface is down.</p>

When a tracked interface goes down, the Hot Standby priority decreases by 10. If an interface is not tracked, its state changes do not affect the Hot Standby priority. For each group configured for Hot Standby, you can configure a separate list of interfaces to be tracked.

The optional *priority-decrement* argument specifies by how much to decrement the Hot Standby priority when a tracked interface goes down. When the tracked interface comes back up, the priority is incremented by the same amount.

When multiple tracked interfaces are down and *priority-decrement* values have been configured, these configured priority decrements are cumulative. If tracked interfaces are down, but none of them were configured with priority decrements, the default decrement is 10 and it is cumulative.

The **hsrp preempt** command must be used in conjunction with this command on all routers in the group whenever the best available router should be used to forward packets. If the **hsrp preempt** command is not used, then the active router stays active, regardless of the current priorities of the other HSRP routers.

Task ID	Task ID	Operations
	hsrp	read, write

Examples

In the following example, Ten Gigabit Ethernet interface 0/2/0/1 tracks interface 0/1/0/1 and 0/3/0/1. If one or both of these two interfaces go down, the Hot Standby priority of the router decreases by 10. Because the default Hot Standby priority is 100, the priority becomes 90 when one of the tracked interfaces goes down and the priority becomes 80 when both go down.

```
RP/0/RSP0/CPU0:router(config)# router hsrp
RP/0/RSP0/CPU0:router(config-hsrp)# interface TenGigE 0/2/0/1
RP/0/RSP0/CPU0:router(config-hsrp-if)# hsrp track TenGigE 0/1/0/1
RP/0/RSP0/CPU0:router(config-hsrp-if)# hsrp track TenGigE 0/3/0/1
RP/0/RSP0/CPU0:router(config-hsrp-if)# hsrp preempt
RP/0/RSP0/CPU0:router(config-hsrp-if)# hsrp ipv4 192.92.72.46
```

Related Commands

Command	Description
hsrp preempt	Configures HSRP preemption and preemption delay.
hsrp priority	Configures HSRP priority.
show hsrp, on page 446	Displays HSRP information.

hsrp use-bia

To configure the Hot Standby Router Protocol (HSRP) to use the burned-in address of the interface as its virtual MAC address, instead of the preassigned MAC address or the functional address, use the **hsrp use-bia** command in HSRP interface configuration mode. To restore the default virtual MAC address, use the **no** form of this command.

```
hsrp use-bia
no hsrp use-bia
```

Command Default HSRP uses the preassigned MAC address on Ethernet.

Command Modes HSRP interface configuration

Command History	Release	Modification
	Release 3.9	This command was introduced.

Usage Guidelines It is desirable to configure the **hsrp use-bia** command on an interface if there are devices that reject Address Resolution Protocol (ARP) replies with source hardware addresses set to a functional address.

Task ID	Task ID	Operations
	hsrp	read, write

Examples

In the following example, the burned-in address of tenGigE interface 0/2/0/1 will be the virtual MAC address mapped to the virtual IP address for all Hot Standby groups configured on tenGigE interface 0/1/0/1:

```
RP/0/RSP0/CPU0:router(config)# router hsrp
RP/0/RSP0/CPU0:router(config-hsrp)# interface tenGigE 0/2/0/1
RP/0/RSP0/CPU0:router(config-hsrp-if)# hsrp use-bia
```

Related Commands	Command	Description
	hsrp mac-address	Specifies a virtual MAC address for HSRP.
	show hsrp, on page 446	Displays HSRP information.

interface (HSRP)

To enable Hot Standby Router Protocol (HSRP) interface configuration command mode, use the **interface** command in router configuration mode. To terminate interface mode, use the **no** form of this command.

```
interface type interface-path-id
no interface type interface-path-id
```

Syntax Description

type Interface type. For more information, use the question mark (?) online help function.

interface-path-id Physical interface or virtual interface.

Note Use the show interfaces command to see a list of all interfaces currently configured on the router.

For more information about the syntax for the router, use the question mark (?) online help function.

Command Default

HSRP is disabled.

Command Modes

Router HSRP configuration

Usage Guidelines

All the commands used to configure HSRP are used in HSRP interface configuration mode.

Task ID

Task ID	Operations
hsrp	read, write

Examples

The following example show how to enable HSRP interface configuration mode on tenGigE 0/2/0/1:

```
RP/0/RSP0/CPU0:router(config)# router hsrp
RP/0/RSP0/CPU0:router(config-hsrp)# interface tenGigE 0/2/0/1
RP/0/RSP0/CPU0:router(config-hsrp-if)#
```

Related Commands

Command	Description
router hsrp, on page 443	Enables HSRP.

preempt (hsrp)

To configure Hot Standby Router Protocol (HSRP) preemption and preemption delay, use the **hsrp preempt** command in HSRP group submode. To restore the default values, use the **no** form of this command.

preempt [*delay seconds*]
no preempt [*delay seconds*]

Syntax Description	delay seconds (Optional) Time in seconds. The <i>seconds</i> argument causes the local router to postpone the taking over the active role for the specified preempt delay <i>seconds</i> value. Range is from 0 to 3600 (1 hour). Default is 0 (no delay).				
Command Default	The default delay is 0.				
Command Modes	HSRP Group Submode				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 4.2.0</td> <td>This command was introduced. This command replaced the hsrp preempt command.</td> </tr> </tbody> </table>	Release	Modification	Release 4.2.0	This command was introduced. This command replaced the hsrp preempt command.
Release	Modification				
Release 4.2.0	This command was introduced. This command replaced the hsrp preempt command.				

Usage Guidelines

When the **hsrp preempt** command is configured, the local router should attempt to assume control as the active router, if it has a hot standby priority higher than the current active router. If the **hsrp preempt** command is not configured, the local router assumes control as the active router only if no other router is currently in the active state.

When a router first comes up, it does not have a complete routing table. If HSRP is configured to preempt, the local HSRP group may become the active router, yet it is unable to provide adequate routing services. This problem can be solved by configuring a delay before the preempting router actually preempts the currently active router.

The preempt delay *seconds* value does not apply if there is no router currently in the active state. In this case, the local router becomes active after the appropriate timeouts (see the **hsrp timers** command), regardless of the preempt *delay seconds* value.

Task ID	Task ID	Operations
	hsrp	read, write

Examples

This example, the router waits for 300 seconds (5 minutes) after having determined that it should preempt before attempting to preempt the active router. The router might become the active router in a shorter span of time despite the configured delay, if no active router is present. Only preempting the active router is delayed.

(applicable for Cisco IOS XR Releases 4.2.x and below)

```
RP/0/RSP0/CPU0:router# configure
```

```
RP/0/RSP0/CPU0:router(config)# router hsrp
RP/0/RSP0/CPU0:router(config-hsrp)# interface tenGigE 0/4/0/4
RP/0/RSP0/CPU0:router(config-hsrp-if)# address-family ipv4
RP/0/RSP0/CPU0:router(config-hsrp-ipv4)# hsrp 1
RP/0/RSP0/CPU0:router(config-hsrp-gp)# preempt delay 300
RP/0/RSP0/CPU0:router(config-hsrp-gp)#
```

(applicable for Cisco IOS XR Releases 4.3.x and above)

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# router hsrp
RP/0/RSP0/CPU0:router(config-hsrp)# interface tenGigE 0/4/0/4
RP/0/RSP0/CPU0:router(config-hsrp-if)# address-family ipv4
RP/0/RSP0/CPU0:router(config-hsrp-ipv4)# hsrp 1 version 2
RP/0/RSP0/CPU0:router(config-hsrp-gp)# preempt delay 300
RP/0/RSP0/CPU0:router(config-hsrp-gp)#
```

Note

- The **version** keyword is available only if IPv4 address-family is selected. By default, version is set to 2 for IPv6 address families.
 - HSRP version 2 provides an extended group range of 0-4095.
-

priority (hsrp)

To configure Hot Standby Router Protocol (HSRP) priority, use the **priority** command in HSRP group submode. To restore the default values, use the **no** form of this command.

priority *priority*
no priority *priority*

Syntax Description	<i>priority</i> Priority value that prioritizes a potential Hot Standby router. Range is from 1 to 255. Default is 100.				
Command Default	The default priority is 100.				
Command Modes	HSRP interface configuration				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 4.2.0</td> <td>This command was introduced. This command replaced the hsrp priority command</td> </tr> </tbody> </table>	Release	Modification	Release 4.2.0	This command was introduced. This command replaced the hsrp priority command
Release	Modification				
Release 4.2.0	This command was introduced. This command replaced the hsrp priority command				

Usage Guidelines

The assigned priority is used to help select the active and standby routers. Assuming that preemption is enabled, the router with the highest priority becomes the designated active router. In case of ties, the interface IP addresses are compared, and the interface with the higher IP address has priority.

The priority of the device can change dynamically if an interface is configured with the **hsrp track** command and another interface on the device goes down.

If preemption is not enabled, the router may not become active even though it might have a higher priority than other HSRP routers.

Task ID	Task ID	Operations
	hsrp	read, write

Examples

In this example, the router has a priority of 120:

(applicable for Cisco IOS XR Releases 4.2.x and below)

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# router hsrp
RP/0/RSP0/CPU0:router(config-hsrp)# interface tenGigE 0/4/0/4
RP/0/RSP0/CPU0:router(config-hsrp-if)# address-family ipv4
RP/0/RSP0/CPU0:router(config-hsrp-ipv4)# hsrp 1
RP/0/RSP0/CPU0:router(config-hsrp-gp)# priority 120

RP/0/RSP0/CPU0:router(config-hsrp-if)# address-family ipv4
RP/0/RSP0/CPU0:router(config-hsrp-ipv4)# hsrp 1
RP/0/RSP0/CPU0:router(config-hsrp-gp)# name s1
RP/0/RSP0/CPU0:router(config-hsrp-gp)#
```

```
(applicable for Cisco IOS XR Releases 4.3.x and above)
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# router hsrp
RP/0/RSP0/CPU0:router(config-hsrp)# interface tenGigE 0/4/0/4
RP/0/RSP0/CPU0:router(config-hsrp-if)# address-family ipv4
RP/0/RSP0/CPU0:router(config-hsrp-ipv4)# hsrp 1 version 2
RP/0/RSP0/CPU0:router(config-hsrp-gp)# name s1
RP/0/RSP0/CPU0:router(config-hsrp-gp)#
```

**Note**

- The **version** keyword is available only if IPv4 address-family is selected. By default, version is set to 2 for IPv6 address families.
- HSRP version 2 provides an extended group range of 0-4095.

Related Commands

Command	Description
hsrp mac-address	Configures a virtual MAC address for the Hot Standby Router Protocol (HSRP).

show hsrp

To display Hot Standby Router Protocol (HSRP) information, use the **show hsrp** command in EXEC mode.

show hsrp [**interface** *interface-type interface-path-id*] [*group-number*] [{**brief** | **detail**}]

Syntax Description

interface	<i>interface-type</i>	Interface type. For more information, use the question mark (?) online help function.
	<i>interface-path-id</i>	Physical interface or virtual interface.
	Note	Use the show interfaces command to see a list of all interfaces currently configured on the router.
		For more information about the syntax for the router, use the question mark (?) online help function.
	<i>group-number</i>	(Optional) Group number on the interface for which output is displayed.
brief		(Optional) A single line of output summarizes each standby group. The brief keyword is the default if detail is not specified.
detail		(Optional) This keyword has the same effect as not specifying brief ; more output is provided.
		(Optional) After this vertical bar (), specify one of these output modifiers and a keyword from the output: <ul style="list-style-type: none"> • begin —Begins the output from the word that you specify. • exclude —Excludes lines that match the word that you specify. • include —Includes lines that match the word that you specify.

Command Default

By default, a single line of output summarizing each standby group is displayed.

Command Modes

EXEC mode

Command History

Release	Modification
Release 3.9	This command was introduced.

Usage Guidelines

Use the **show hsrp** command to display HSRP information.

If you want to specify a value for the *group-number* argument, you must also specify an interface *type* and *number*.

Task ID	Task ID	Operations
	hsrp	read

Examples

This is sample output from the **show hsrp detail** command:

```
RP/0/RSP0/CPU0:router# show hsrp detail

GigabitEthernet 0/4/0/0 - Group 1
  Local state is Active, priority 100
  Hellotime 3 sec holdtime 10 sec
  Next hello sent in 0.539
  Minimum delay 1 sec, reload delay 5 sec
  BFD enabled: state none, interval 15 ms multiplier 3
  Hot standby IP address is 4.0.0.100 configured
  Active router is local
  Standby router is unknown expired
  Standby virtual mac address is 0000.0c07.ac01
  2 state changes, last state change 00:05:20
```

This table describes the significant fields shown in the display.

Table 41: show hsrp Command Field Descriptions

Field	Description
TenGigE E0/2/0/4	Interface type and number and Hot Standby group number for the interface.
Local state is	State of local networking device; can be one of the following: <ul style="list-style-type: none"> • Active—Current Hot Standby router. • Standby—Router next in line to be the Hot Standby router. • Speak—Router is sending packets to claim the active or standby role. • Listen—Router is neither active nor standby, but if no messages are received from the active or standby router, it will start to “speak.” • Learn—Router is neither active nor standby, nor does it have enough information to attempt to claim the active or standby roles. • Init—Router is not yet ready to participate in HSRP, possibly because the associated interface is not up.
Hellotime	Current time (in seconds) between sending of hello packets, learned dynamically from the hello packets received from the active Hot Standby router.
holdtime	Current time (in seconds) before other routers declare the active or standby router to be down, learned dynamically from the hello packets received from the active Hot Standby router.
Next hello sent in	Time in which the software will send the next hello packet (in hours:minutes:seconds).

Field	Description
BFD enabled	Displays BFD related information (with multiplier and minimum interval details)
Hot standby IP address is configured	IP address of the current Hot Standby router. The word “configured” indicates that this address is known through the hsrp ip command. Otherwise, the address was learned dynamically through HSRP hello packets from other routers that do have the HSRP IP address configured.
Active router is	Value can be “local” or an IP address. Address of the current active Hot Standby router.
Standby router is	Value can be “local” or an IP address of the standby router (the router that is next in line to be the Hot Standby router).
Standby virtual mac address is	MAC address associated with the standby group address.
state changes	Number of times the router changed the standby state.
last state change	Time (in hours:minutes:seconds) expired since the last state change.
Tracking interface states for	List of interfaces that are being tracked and their corresponding states. Based on the hsrp track command.
Priority decrement	Value by which the standby priority is decremented or incremented when the tracked interface goes down or up, respectively. Default is 10.

Related Commands

Command	Description
hsrp authentication	Configures an authentication string for HSRP.
hsrp ipv4	Activates the HSRP.
hsrp mac-address	Specifies a virtual MAC address for HSRP.
hsrp preempt	Configures HSRP preemption and preemption delay.
hsrp priority	Configures HSRP priority.
hsrp timers	Configures the time between hello packets and the time before other routers declare the active Hot Standby or standby router to be down.
hsrp track	Configures an interface so that the Hot Standby priority changes based on the availability of other interfaces.
hsrp use-bia, on page 437	Configures HSRP to use the burned-in address of the interface as its virtual MAC address, instead of the preassigned MAC address.

show hsrp bfd

To display Hot Standby Router Protocol (HSRP) bfd information across all interfaces, use the **show hsrp bfd** command in EXEC mode.

show hsrp bfd [*interface-type interface-path-id ip-address*]

Syntax Description	<i>interface-type</i>	(Optional) Physical interface or virtual interface.
	<i>interface-path-id</i>	Note Use the show interfaces command to see a list of all interfaces currently configured on the router.
		For more information about the syntax for the router, use the question mark (?) online help function.
	<i>ip-address</i>	(Optional) Destination IP address for BFD session.

Command Default None

Command Modes EXEC mode

Router(config-hsrp-ipv4)# hsrp slave
Router(config-hsrp-slave)# mac-address 10.2.4
```

Related Commands	Command	Description
	hsrp slave follow, on page 456	Instructs the subordinate group to inherit its state from a specified group.

timers (hsrp)

To configure the time between hello packets and the time before other routers declare the active Hot Standby or standby router to be down, use the **hsrp timers** command in HSRP group submode. To restore the timers to their default values, use the **no** form of this command.

timers {*hello-seconds* | **msec** *hello-milliseconds*} {*hold-seconds* | **msec** *hold-milliseconds*}
no timers

Syntax Description		
	hello-seconds	Hello interval in seconds. Range is from 1 to 255. Default is 3.
	msec <i>hello-milliseconds</i>	Hello interval in milliseconds. Range is from 100 to 3000.
	hold-seconds	Time in seconds before the active or standby router is declared to be down. Range is from 1 to 255. Default is 10.
	msec <i>hold-milliseconds</i>	Time in milliseconds before the active or standby router is declared to be down. Range is from 100 to 3000.

Command Default The default hello-seconds is 3. (If the **msec** keyword is specified, there is no default value.)
 The default hold-seconds is 10. (If the **msec** keyword is specified, there is no default value.)

Command Modes HSRP Group Submode

Command History	Release	Modification
	Release 4.2.0	This command was introduced.

Usage Guidelines Nonactive routers learn timer values from the active router, unless millisecond timer values are being used. If millisecond timer values are being used, all routers must be configured with the millisecond timer values. This rule applies if either the hello time or the hold time is specified in milliseconds.

The timers configured on the active router always override any other timer settings. All routers in a Hot Standby group should use the same timer values. Normally, the hold time is greater than or equal to three times the hello time ($holdtime > 3 * hellotime$).

You must specify either the *hello-seconds* argument or the **msec** keyword and *hello-milliseconds* argument, depending on whether you want the hello time in seconds or milliseconds. You must also specify either the *hold-seconds* argument or **msec** keyword and *hold-milliseconds* argument, depending on whether you want the hold time in seconds or milliseconds.

Task ID	Task ID	Operations
	hsrp	read, write

Examples

This example shows how to set, for group number 1 on Ten Gigabit Ethernet interface 0/2/0/1, the time between hello packets to 5 seconds and the time after which a router is considered to be down to 15 seconds. The configured timer values are used only if the router is active (or before they have been learned).

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# router hsrp
RP/0/RSP0/CPU0:router(config-hsrp)# interface tenGigE 0/4/0/4
RP/0/RSP0/CPU0:router(config-hsrp-if)# address-family ipv4
RP/0/RSP0/CPU0:router(config-hsrp-ipv4)# hsrp 1
RP/0/RSP0/CPU0:router(config-hsrp-gp)# timers 5 15
RP/0/RSP0/CPU0:router(config-hsrp-gp)#
```

This example shows how to set, for group number 1 on Ten Gigabit Ethernet interface 0/2/0/1, the time between hello packets to 200 milliseconds and the time after which a router is considered to be down to 1000 milliseconds. The configured timer values are always used because milliseconds have been specified.

(applicable for Cisco IOS XR Releases 4.2.x and below)

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# router hsrp
RP/0/RSP0/CPU0:router(config-hsrp)# interface tenGigE 0/4/0/4
RP/0/RSP0/CPU0:router(config-hsrp-if)# address-family ipv4
RP/0/RSP0/CPU0:router(config-hsrp-ipv4)# hsrp 1
RP/0/RSP0/CPU0:router(config-hsrp-gp)# timers msec 200 msec 1000
RP/0/RSP0/CPU0:router(config-hsrp-gp)#
```

(applicable for Cisco IOS XR Releases 4.3.x and above)

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# router hsrp
RP/0/RSP0/CPU0:router(config-hsrp)# interface tenGigE 0/4/0/4
RP/0/RSP0/CPU0:router(config-hsrp-if)# address-family ipv4
RP/0/RSP0/CPU0:router(config-hsrp-ipv4)# hsrp 1 version 2
RP/0/RSP0/CPU0:router(config-hsrp-gp)# timers msec 200 msec 1000
RP/0/RSP0/CPU0:router(config-hsrp-gp)#
```

- Note**
- The **version** keyword is available only if IPv4 address-family is selected. By default, version is set to 2 for IPv6 address families.
 - HSRP version 2 provides an extended group range of 0-4095.

Related Commands

Command	Description
show hsrp, on page 446	Displays HSRP information.

track (hsrp)

To configure an interface so that the Hot Standby priority changes on the basis of the availability of other interfaces, use the **hsrp track** command in HSRP group submode. To remove the tracking, use the **no** form of this command.

```
track type interface-path-id [priority-decrement]
no track type interface-path-id [priority-decrement]
```

Syntax Description

<i>type</i>	Interface type. For more information, use the question mark (?) online help function.
<i>interface-path-id</i>	Physical interface or virtual interface.
Note	Use the show interfaces command to see a list of all interfaces currently configured on the router.
	For more information about the syntax for the router, use the question mark (?) online help function.
<i>priority-decrement</i>	(Optional) Amount by which the Hot Standby priority for the router is decremented (or incremented) when the interface goes down (or comes back up). Range is 1 to 255.

Command Default

The default priority-decrement is 10.

Command Modes

HSRP Group Submode

Command History

Release	Modification
Release 4.2.0	This command was introduced. This command replaced the hsrp track command.

Usage Guidelines

The **hsrp track** command ties the Hot Standby priority of the router to the availability of its interfaces. It is useful for tracking interfaces that are not configured for the Hot Standby Router Protocol (HSRP). Only IP interfaces are tracked. A tracked interface is up if IP on that interface is up. Otherwise, the tracked interface is down.

When a tracked interface goes down, the Hot Standby priority decreases by 10. If an interface is not tracked, its state changes do not affect the Hot Standby priority. For each group configured for Hot Standby, you can configure a separate list of interfaces to be tracked.

The optional *priority-decrement* argument specifies by how much to decrement the Hot Standby priority when a tracked interface goes down. When the tracked interface comes back up, the priority is incremented by the same amount.

When multiple tracked interfaces are down and *priority-decrement* values have been configured, these configured priority decrements are cumulative. If tracked interfaces are down, but none of them were configured with priority decrements, the default decrement is 10 and it is cumulative.

The **hsrp preempt** command must be used in conjunction with this command on all routers in the group whenever the best available router should be used to forward packets. If the **hsrp preempt** command is not used, then the active router stays active, regardless of the current priorities of the other HSRP routers.

Task ID	Task ID	Operations
	hsrp	read, write

Examples

This example shows how to configure an interface so that the Hot Standby priority changes on the basis of the availability of other interfaces.

(applicable for Cisco IOS XR Releases 4.2.x and below)

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# router hsrp
RP/0/RSP0/CPU0:router(config-hsrp)# interface tenGigE 0/4/0/4
RP/0/RSP0/CPU0:router(config-hsrp-if)# address-family ipv4
RP/0/RSP0/CPU0:router(config-hsrp-ipv4)# hsrp 1
RP/0/RSP0/CPU0:router(config-hsrp-gp)# track tenGigE 0/4/0/4 2
RP/0/RSP0/CPU0:router(config-hsrp-gp)#
```

(applicable for Cisco IOS XR Releases 4.3.x and above)

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# router hsrp
RP/0/RSP0/CPU0:router(config-hsrp)# interface tenGigE 0/4/0/4
RP/0/RSP0/CPU0:router(config-hsrp-if)# address-family ipv4
RP/0/RSP0/CPU0:router(config-hsrp-ipv4)# hsrp 1 version 2
RP/0/RSP0/CPU0:router(config-hsrp-gp)# track tenGigE 0/4/0/4 2
RP/0/RSP0/CPU0:router(config-hsrp-gp)#
```

Note

- The **version** keyword is available only if IPv4 address-family is selected. By default, version is set to 2 for IPv6 address families.
- HSRP version 2 provides an extended group range of 0-4095.

hsrp priority, on page 430	Configures HSRP priority.
show hsrp, on page 446	Displays HSRP information.

track(object)

To enable tracking of a named object with the specified decrement, use the **track (object)** command in HSRP group submode. To remove the tracking, use the **no** form of this command.

```
track object name[priority-decrement]
no track object name[priority-decrement]
```

Syntax Description	object name Object tracking. Name of the object to be tracked.
	priority-decrement (Optional) Amount by which the Hot Standby priority for the router is decremented (or incremented) when the interface goes down (or comes back up). Range is 1 to 255.

Command Default The default priority-decrement is 10.

Command Modes HSRP Group Submode

Command History	Release	Modification
	Release 4.2.1	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operations
	hsrp	read, write

Examples

This example shows how to configure object tracking under the HSRP group submode.

(applicable for Cisco IOS XR Releases 4.2.x and below)

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# router hsrp
RP/0/RSP0/CPU0:router(config-hsrp)# interface tenGigE 0/4/0/4
RP/0/RSP0/CPU0:router(config-hsrp-if)# address-family ipv4
RP/0/RSP0/CPU0:router(config-hsrp-ipv4)# hsrp 1
RP/0/RSP0/CPU0:router(config-hsrp-gp)# track object t1 2
RP/0/RSP0/CPU0:router(config-hsrp-gp)#
```

(applicable for Cisco IOS XR Releases 4.3.x and above)

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# router hsrp
RP/0/RSP0/CPU0:router(config-hsrp)# interface tenGigE 0/4/0/4
RP/0/RSP0/CPU0:router(config-hsrp-if)# address-family ipv4
RP/0/RSP0/CPU0:router(config-hsrp-ipv4)# hsrp 1 version 2
RP/0/RSP0/CPU0:router(config-hsrp-gp)# track object t1 2
```

```
RP/0/RSP0/CPU0:router(config-hsrp-gp) #
```

**Note**

- The **version** keyword is available only if IPv4 address-family is selected. By default, version is set to 2 for IPv6 address families.
- HSRP version 2 provides an extended group range of 0-4095.

clear lpts ifib statistics

To clear the Internal Forwarding Information Base (IFIB) statistics, use the **clear lpts ifib statistics** command in EXEC mode.

clear lpts ifib statistics [**location** *node-id*]

Syntax Description	location <i>node-id</i> (Optional) Clears the IFIB statistics for the designated node. The <i>node-id</i> argument is entered in standard <i>rack/slot/module</i> notation.
---------------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Command Default	No default behavior or values
------------------------	-------------------------------

Command Modes	EXEC mode
----------------------	-----------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	If you do not specify a node with the location keyword and <i>node-id</i> argument, the clear lpts ifib statistics command clears the IFIB statistics for the node on which the command is run.
-------------------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Task ID	Task ID	Operations
	lpts	execute

Examples	The following example shows how to clear the IFIB statistics for the RP:
-----------------	--------------------------------------------------------------------------

```
RP/0/RSP0/CPU0:router# clear lpts ifib statistics
```

Related Commands	Command	Description
	show lpts ifib statistics, on page 500	Displays the LPTS IFIB statistics.

clear lpts pifib hardware statistics

To clear the Pre-Internal Forwarding Information Base (Pre-IFIB) hardware statistics, use the **clear lpts pifib hardware statistics** command in EXEC mode.

```
clear lpts pifib hardware statistics location node-id
```

Syntax Description	location node-id Clears the Pre-IFIB hardware statistics for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
---------------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Command Default	No default behavior or values
------------------------	-------------------------------

Command Modes	EXEC mode
----------------------	-----------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	If you do not specify a node with the location keyword and <i>node-id</i> argument, this command clears the Pre-IFIB hardware statistics for the node on which the command is run.
-------------------------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Task ID	Task ID	Operations
	lpts	execute

Examples

The following example shows how to display the sample output from the show lpts hardware police command and then clears the Pre-IFIB hardware statistics for the RP:

```
RP/0/RSP0/CPU0:router# show lpts pifib hardware police location 0/1/CPU0
-----
Node 0/1/CPU0:
-----
Burst = 100ms for all flow types
-----

Related Commands

Command	Description
show lpts pifib hardware police, on page 519	Displays the policer configuration value set.

clear lpts pifib statistics

To clear the Pre-Internal Forwarding Information Base (Pre-IFIB) statistics, use the **clear lpts pifib statistics** command in EXEC mode.

clear lpts pifib statistics [**location** *node-id*]

Syntax Description	location <i>node-id</i> Clears the Pre-IFIB statistics for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
---------------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Command Default	No default behavior or values
------------------------	-------------------------------

Command Modes	EXEC mode
----------------------	-----------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	If you do not specify a node with the location keyword and <i>node-id</i> argument, this command clears the Pre-IFIB statistics for the node on which the command is run.
-------------------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Task ID	Task ID	Operations
	lpts	execute

Examples	The following example shows how to clear the Pre-IFIB statistics for the RP:
-----------------	------------------------------------------------------------------------------

```
RP/0/RSP0/CPU0:router# clear lpts pifib statistics
```

Related Commands	Command	Description
	show lpts pifib statistics, on page 547	Displays the LPTS PIFIB statistics.

flow (LPTS)

To configure the policer for the Local Packet Transport Services (LPTS) flow type, use the **flow** command in pifib policer global configuration mode or pifib policer per-node configuration mode. To disable this feature, use the **no** form of this command.

```
flow flow-type rate rate
no flow flow-type rate rate
```

Syntax Description

flow-type List of supported flow types.

rate rate Specifies the rate in packets per seconds (PPS). The range is from 0 to 4294967295.

Command Default

The default behavior is to load the policer values from the static configuration file that is platform dependent.

Command Modes

Pifib policer global configuration

Pifib policer per-node configuration

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

The table lists the supported flow types and the parameters that are used to define a policer. This table lists the supported flow types and the parameters that are used to define a policer.

Table 42: List of Supported Flow Types

Flow Type	Description	Default Packet Rate (Recommended)
all-routers	Packets sent to all-routers multicast addresses, which include multicast LDP UDP packet.	1000
bgp-cfg-peer	Packets from a configured BGP peer.	2000

Flow Type	Description	Default Packet Rate (Recommended)
bgp-default	Packets from unconfigured, newly configured, or wildcard BGP peers.	2500
bgp-known	Packets from established BGP peering sessions.	1500
css-default	Packets from a new or newly established CSS session.	200
css-known	Packets from an established CSS session.	200
default-flow	Default flow type.	2500
eigrp	EIGRP packets for configured interfaces.	1500
gre	Generic Routing Encapsulation packets	1000
fragment	Fragmented packets.	2500
http-default	Packets from a new or newly established HTTP session.	400
http-known	Packets from an established HTTP session.	200

Flow Type	Description	Default Packet Rate (Recommended)
icmp-app	ICMP or ICMPv6 packets of interest to applications.	1500
icmp-default	Other ICMP or ICMPv6 packets.	1500
icmp-local	ICMP or ICMPv6 packets with local interest.	1500
igmp	IGMP packets.	500
ike	IKE packets.	100
ipsec-default	AH or ESP packets with unknown or newly configured SPIs.	100
ipsec-known	AH or ESP packets with known SPIs.	400
ip-sla	IP SLA packets (this is a hidden flow type)	1000
isis-default	IS-IS packets for unconfigured (or newly, configured) interfaces.	2000
isis-known	IS-IS packets for configured interfaces.	1500

Flow Type	Description	Default Packet Rate (Recommended)
ldp-tcp-cfg-peer	Packets from a configured LDP TCP peer (SYNs or newly, established sessions).	2000
ldp-tcp-default	Packets from an unconfigured, newly configured, or wildcard LDP TCP peer.	2500
ldp-tcp-known	Packets from an established LDP peering session.	1500
ldp-udp	Unicast LDP UDP packets.	2000
lmp-tcp-cfg-peer	Packets from a configured LMP TCP peer (SYNs or newly established sessions).	2000
lmp-tcp-default	Packets from an unconfigured, newly configured, or wild-card LMP TCP peer.	2500
lmp-tcp-known	Packets from an established LMP peering session.	1500
lmp-udp	Unicast LMP UDP packets.	2000

Flow Type	Description	Default Packet Rate (Recommended)
msdp-cfg-peer	Packets from a configured MSDP peer.	200
msdp-default	Packets from an unconfigured, newly configured, or wildcard MSDP peer.	300
msdp-known	Packets from an established MSDP session.	100
multicast-default	Packets for unconfigured or newly configured multicast groups.	2500
multicast-known	Packets for configured multicast groups.	2000
ntp-known	Packets from an established NTP session.	500
ntp-default	Packets from a new or newly established NTP session.	500
ospf-mc_default	OSPF multicast packets for unconfigured (or newly configured) interfaces.	2000

Flow Type	Description	Default Packet Rate (Recommended)
ospf-mc-known	OSPF multicast packets for configured interfaces.	1500
ospf-uc-default	OSPF unicast packets for unconfigured (or newly configured) interfaces.	2000
ospf-uc-known	OSPF unicast packets for configured interfaces.	1000
pim-multicast	PIM multicast packets.	2000
pim-unicast	PIM unicast packets.	1500
rip	RIP packets.	1500
rsh-default	Packets from a new or newly established RSH session.	200
rsh-known	Packets from an established RSH session.	200
rsvp	RSVP packets.	2000
rsvp-udp	RSVP UDP packets.	2000
raw-default	Packets for unconfigured or newly configured IPv4 or IPv6 protocols.	2500

Flow Type	Description	Default Packet Rate (Recommended)
raw-listen	Packets for configured IP protocols.	2500
shttp-default	Packets from a new or newly established SHTTP session.	400
shttp-known	Packets from an established SHTTP session.	200
snmp	SNMP packets.	300
ssh-default	Packets from a new or newly established SSH session.	300
ssh-known	Packets from an established SSH session.	200
tcp-cfg-peer	Packets for configured TCP peers.	2000
tcp-default	Packets for unconfigured or newly configured TCP services.	2500
tcp-known	Packets for established TCP sessions.	2000
tcp-listen	Packets for configured TCP services.	2500

Flow Type	Description	Default Packet Rate (Recommended)
telnet-default	Packets from a new or newly established Telnet session.	200
telnet-known	Packets from an established Telnet session.	200
udp-cfg-peer	Packets for configured UDP-based protocol sessions.	2500
udp-default	Packets for unconfigured or newly configured UDP services.	2500
udp-known	Packets for established UDP sessions.	2000
udp-listen	Packets for configured UDP services.	2500

Task ID**Task ID Operations**

config-services read,
 write

Examples

The following example shows how to configure the LPTS policer for the bgp-known flow type for all line cards:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# lpts pifib hardware police
RP/0/RSP0/CPU0:router(config-pifib-policer-global)# flow bgp-known rate 20000
```

The following example shows how to configure LPTS policer for the Intermediate System-to-Intermediate System (IS-IS)-known flow type for a specific line card:

```
RP/0/RSP0/CPU0:router# configure  
RP/0/RSP0/CPU0:routerconfig# lpts pifib hardware police location 0/2/CPU0  
RP/0/RSP0/CPU0:router(config-pifib-policer-per-node)# flow isis-known rate 22222
```

lpts pifib hardware police

To configure the ingress policers and to enter pifib policer global configuration mode or pifib policer per-node configuration mode, use the **lpts pifib hardware police** command in Global Configuration mode. To set the policer to the default value, use the **no** form of this command.

To map the LPTS policer with an ACL, use the **lpts pifib hardware police acl** command in Global Configuration mode.

```
lpts pifib hardware police [ acl acl-name rate rate [ vrf vrf-name ] ] [ location node-id ] np
np-number [ flow flow-type { default | known } [ rate rate ] [ precedence { number | name } ]
]
no lpts pifib hardware police [ acl acl-name [ vrf vrf-name ] ] [ location node-id ] np np-number
[ flow flow-type { default | known } [ rate rate ] [ precedence { number | name } ] ]
```

Syntax Description		
	location <i>node-id</i>	(Optional) Designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
	flow <i>flow-type</i> rate <i>rate</i>	LPTS flow type and the policer rate in packets per second (PPS).
	default	Indicates generic flows which are policed with default-rate. For example, BGP (*, 179), any packet with port:179 policed with default rate.
	known	Indicates specific flows which are policed with known-rate.
	acl <i>acl-name</i>	(Optional) Maps the LPTS policer with an ACL. The argument <i>acl-name</i> specifies pre Internal Forwarding Information Base access list name.
	vrf <i>vrf-name</i>	(Optional) Specifies VPN routing and forwarding (VRF) instance.

precedence { *number* | *name* }

Sets Type of Service (TOS) precedence value. You can specify either a precedence number or precedence name. The range of argument *number* is between 0 to 7.

The *name* argument has following keywords:

- routine—Match packets with routine precedence (0)
- priority—Match packets with priority precedence (1)
- immediate—Match packets with immediate precedence (2)
- flash—Match packets with flash precedence (3)
- flash-override—Match packets with flash override precedence (4)
- critical—Match packets with critical precedence (5)
- internet—Match packets with internetnetwork control precedence (6)
- network—Match packets with network control precedence (7)

You can configure the IP precedence for a specific node or globally for all nodes.

np *np-number*

Specifies network processor (NP) based policer in LPTS.

Command Modes

Global Configuration mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.
Release 4.2.0	New flow types such as dns, radius, tacacs, ntp known, rsvp known and pim multicast known flow types were added.
Release 4.3.1	The precedence keyword was added.
Release 5.2.2	The acl and vrf keywords were added as part of ACL based policer feature.
Release 5.3.2	The np <i>np-number</i> keyword was added.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operations
	lpts	read, write
	config-services	read, write

Examples

This example shows how to configure the **lpts pifib hardware police** command for all line cards:

```
RP/0/RSP0/CPU0:router(config)# lpts pifib hardware police
RP/0/RSP0/CPU0:router(config-pifib-policer-global)#
```

This example shows how to configure the **lpts pifib hardware police** command for a specific line card:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# lpts pifib hardware police location 0/2/CPU0 flow dns rate
10
```

This example shows how to configure the TOS precedence globally (applies to all line cards at once) using the **lpts pifib hardware police** command:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# lpts pifib hardware police flow telnet default precedence
internet network
```

This example shows how to configure the TOS precedence for the 0/2/CPU0 location using the **lpts pifib hardware police** command:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# lpts pifib hardware police location 0/2/CPU0 flow telnet
default precedence 5 3 6
```

This example shows how to configure ACL based policer:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# lpts pifib hardware police acl acl_name1 rate 100 vrf vrf1
```

Related Commands

Command	Description
flow (LPTS), on page 473	Configures the policer for the LPTS flow type.
show lpts pifib hardware police, on page 519	Displays the policer configuration value set.

show lpts bindings

To display the binding information in the Port Arbitrator, use the **show lpts bindings** command in EXEC mode.

```
show lpts bindings [location node-id] [client-id {clnl | ipsec | ipv4-io | ipv6-io | mpa | tcp | test | udp
| raw}] [brief] [vrf vrf-name]
```

Syntax Description	
location <i>node-id</i>	(Optional) Displays information for the specified node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
client-id	(Optional) Type of client. It can be one of the following values: <ul style="list-style-type: none"> • clnl —ISO connectionless protocol (used by IS-IS) • ipsec —Secure IP • ipv4-io —Traffic processed by the IPv4 stack • ipv6-io —Traffic processed by the IPv6 stack • mpa —Multicast Port Arbitrator (multicast group joins) • tcp —Transmission Control Protocol • test —Test applications • udp —User Datagram Protocol • raw —Raw IP
brief	(Optional) Displays summary output.
vrf <i>vrf-name</i>	(Optional) Name of assigned VRF.

Command Default No default behavior or values

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines The **show lpts bindings** command displays the Local Packet Transport Services (LPTS) bindings (requests to receive traffic of a particular type). Bindings are aggregated into flows by the LPTS Port Arbitrator; flows are then programmed into the Internal Forwarding Information Base (IFIB) and Pre-IFIB to direct packets to applications.

If you specify the optional **client-id** keyword and type of client, only bindings from that client are shown. If you specify the optional **location** keyword and *node-id* argument, only bindings from clients on that node are displayed.

Task ID	Task ID	Operations
	lpts	read

This table describes the significant fields shown in the display.

Table 43: show lpts bindings Command Field Descriptions

Field	Description
Location	Node location, in the format of <i>rack/slot/module</i> .
Client ID	LPTS client type.
Cookie	Client's unique tag for the binding.
Clnt Flags	REUSEPORT -- client has set the SO_REUSEPORT or SO_REUSEADDR socket option.
Layer 3	Layer 3 protocol (IPv4, IPv6, CLNL).
Layer 4	Layer 4 protocol (TCP, UDP).
Local Addr	Local (destination) address.
Remote Addr	Remote (source) address.
Local Port	Local (destination) TCP or UDP port, or ICMP/IGMP packet type, or IPsec SPI.
Remote Port	Remote (source) TCP or UDP port.

The following sample output is from the **show lpts bindings brief** command:

```

RP/0/RSP0/CPU0:router# show lpts bindings brief

@ - Indirect binding; Sc - Scope

Location  Clnt Sc L3   L4   VRF-ID  Local,Remote Address.Port  Interface
-----
0/1/CPU0  IPV4 LO IPV4 ICMP *        any.ECHO any                    any

show lpts ifib

To display the entries in the Internal Forwarding Information Base (IFIB), use the **show lpts ifib** command in EXEC mode.

```
show lpts ifib [entry] [{type {bgp4 | bgp6 | isis | mcast4 | mcast6 | ospf-mc4 | ospf-mc6 | ospf4 | ospf6 | raw4 | raw6 | tcp4 | tcp6 | udp4 | udp6} | all}] [brief [statistics]] [slices] [times] [location node-id]
```

Syntax Description

entry	(Optional) Displays the IFIB entries.
type	(Optional) Displays the following protocol types. <ul style="list-style-type: none"> • bgp4 —IPv4 Border Gateway Protocol (BGP) slice • bgp6 —IPv6 BGP slice • isis —Intermediate System-to-Intermediate System (IS-IS) slice • mcast4 —IPv4 multicast slice • mcast6 —IPv6 multicast slice • ospf-mc4 —IPv4 Open Shortest Path First (OSPF) multicast slice • ospf-mc6 —IPv6 OSPF multicast slice • ospf4 —IPv4 OSPF slice • ospf6 —IPv6 OSPF slice • raw4 —IPv4 raw IP • raw6 —IPv6 raw IP • tcp4 —IPv4 Transmission Control Protocol (TCP) slice • tcp6 —IPv6 TCP slice • udp4 —IPv4 UDP slice • udp6 —IPv6 UDP slice
all	Displays all IFIB types.
brief	(Optional) Displays the IFIB entries in brief format.
statistics	(Optional) Displays the IFIB table with statistics information.
slices	(Optional) Displays IFIB slices.
times	(Optional) Displays the IFIB update transaction times.
location <i>node-id</i>	(Optional) Specifies the location of the Flow Manager. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

Command Default

No default behavior or values

Command Modes

EXEC mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

Use this command to display detailed information about the entries in an IFIB slice. This command is useful for debugging problems with delivering packets to applications.

When the **statistics** keyword is used, detailed statistics are displayed for packet count, number of entries in each slice, and a total entries count.

Task ID

Task ID	Task	Operations

Rejects: 979

```

This table describes the significant fields shown in the display.

Table 49: show lpts ifib slices statistics Command Field Descriptions

Field	Description
Slice	Slice number.
L3-proto	Layer 3 protocol (IPv4, IPv6, CLNL).
L4-proto	Layer 4 protocol (TCP, UDP, and others).
Port	Local (destination) TCP or UDP port.
Location	Node location, in the format <i>rack/slot/module</i> .

Related Commands

Command	Description
show lpts ifib , on page 494	Displays entries in the IFIB.

show lpts ifib statistics

To display Internal Forwarding Information Base (IFIB) statistics, use the **show lpts ifib statistics** command in EXEC mode.

show lpts ifib statistics [**location** *node-id*]

Syntax Description	location <i>node-id</i> (Optional) Displays IFIB statistics for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
---------------------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Command Default	No default behavior or values
------------------------	-------------------------------

Command Modes	EXEC mode
----------------------	-----------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	No specific guidelines impact the use of this command.
-------------------------	--------------------------------------------------------

Task ID	Task ID	Operations
	lpts	read

Examples The following sample output is from the **show lpts ifib statistics** command:

```
RP/0/RSP0/CPU0:router# show lpts ifib statistics

Flow Manager 0/RP1/CPU0:
  Packets in:254
  Packets delivered locally without lookups:0
  Slice lookups:254
    Post-lookup error drops:
      Failed ipv4_netio_input:1
  Rejects:254
  Packets delivered locally:0
  Packets delivered remotely:0
```

This table describes the significant fields shown in the display.

Table 50: show lpts ifib statistics Command Field Descriptions

Field	Description
Packets in	Packets presented to the LPTS decaps node in netio.
Packets delivered locally without lookups	Packets previously resolved on a LC delivered directly to L3.

Field	Description
Slice lookups	Packets requiring slice lookups.
Post-lookup error drops	Packets dropped after a slice lookup.
Rejects	Packets that caused a TCP RST or ICMP Port/Protocol Unreachable.
Packets delivered locally	Packets delivered to local applications after slice lookups.
Packets delivered remotely	Packets delivered to applications on remote RPs.

Note The sample output is an example only and displays only those fields showing a value. No display exists for nonzero values. This command may show other values depending on your router configuration.

Related Commands

Command	Description
show lpts ifib , on page 494	Displays detailed information about entries in an IFIB slice.

show lpts mpa groups

To display aggregate information about multicast bindings for groups, use the **show lpts mpa groups** command in EXEC mode.

show lpts mpa groups *type interface-path-id*

Syntax Description

type Interface type. For more information, use the question mark (?) online help function.

interface-path-id Either a physical interface instance or a virtual interface instance as follows:

- Physical interface instance. Naming notation is *rack/slot/module/port* and a slash between values is required as part of the notation.
 - *rack*: Chassis number of the rack.
 - *slot*: Physical slot number of the modular services card or line card.
 - *module*: Module number. A physical layer interface module (PLIM) is always 0.
 - *port*: Physical port number of the interface.

Note In references to a Management Ethernet interface located on a route processor card, the physical slot number is alphanumeric (RSP0) and the module is CPU0. Example: interface MgmtEth0/RSP0 /CPU0/0.

- Virtual interface instance. Number range varies depending on interface type.

For more information about the syntax for the router, use the question mark (?) online help function.

Command Default

No default behavior or values

Command Modes

EXEC mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

The **show lpts mpa groups** command is used to aggregate information about the multicast groups joined on a specified interface. This command also displays the filter mode and source list associated with the groups joined on a specified interface.

Task ID

Task ID Operations

lpts read

network read

Examples

The following sample output is from the **show lpts mpa groups** command:

```
RP/0/RSP0/CPU0:router# show lpts mpa groups gigabitethernet 0/0/0/0

 224.0.0.2 : includes 0, excludes 1, mode EXCLUDE
 <no source filter>
 224.0.0.13 : includes 0, excludes 1, mode EXCLUDE
 <no source filter>
 224.0.0.22 : includes 0, excludes 1, mode EXCLUDE
 <no source filter>
```

This table describes the significant fields shown in the display.

Table 52: show lpts mpa groups Command Field Descriptions

Field	Description
Includes	Displays the number of sockets that have set up an INCLUDE mode filter for that group and if there are any source-specific filters.
Excludes	Displays the number of sockets that have set up an EXCLUDE mode filter for that group and if there are any source-specific filters.

show lpts pifib

To display Pre-Internal Forwarding Information Base (Pre-IFIB) entries, use the **show lpts pifib** command in EXEC mode.

```
show lpts pifib [entry] [hardware {entry | police}][type {isis | ipv4 | ipv6}]{frag | ixmp | mcast | tcp | udp | ipsec | raw | all}[entry] brief [statistics][location node-id]
```

Syntax Description

entry	(Optional) Pre-IFIB entry.
hardware	(Optional) Displays hardware for Pre-IFIB.
entry	(Optional) Displays the entries for Pre-IFIB.
police	(Optional) Displays the policer values that are being use.
type	(Optional) Protocol type.
isis	(Optional) Intermediate System-to-Intermediate System (IS-IS) sub Pre-IFIB type.
ipv4	(Optional) IPv4 sub Pre-IFIB type. Possible values include frag , ixmp , mcast , tcp , udp , ipsec , and raw .
ipv6	(Optional) IPv6 sub Pre-IFIB type. Possible values include frag , icmp , ixmp , mcast , tcp , udp , ipsec , and raw .
frag	(Optional) IPv4 or IPv6 fragment.
icmp	(Optional) IPv4 or IPv6 IXMP and Internet Group Management Protocol (IGMP).
ixmp	(Optional) IPv4 or IPv6 IXMP (ICMP and Internet Group Management Protocol [IGMP]).
mcast	(Optional) IPv4 or IPv6 Multicast.
tcp	(Optional) IPv4 or IPv6 Transmission Control Protocol (TCP).
udp	(Optional) IPv4 or IPv6 User Datagram Protocol (UDP).
ipsec	(Optional) Secure IP.
raw	(Optional) IPv4 or IPv6 raw IP.
all	(Optional) All sub Pre-IFIBs.
brief	(Optional) Pre-IFIB entries in brief format.
statistics	(Optional) Pre-IFIB table with statistics information.
location <i>node-id</i>	(Optional) The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation (for example, 0/7/CPU0).

Command Default

By default, all entries are displayed.

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines Use the **show lpts pifib** command with the **brief** keyword to perform the following functions:

- Display entries of all or part of a Pre-IFIB.
- Display a short description of each entry in the LPTS Pre-IFIB, optionally displaying packet counts for each entry.

Note These statistics are used only for packets that are processed by a line card, route processor, or distributed route processor.

Pre-IFIB statistics for packets processed by line card hardware are counted separately.

By default, all the defaults are displayed.

Task ID	Task ID	Operations
	lpts	read

Examples

This table describes the significant fields shown in the display for the **show lpts pifib** command with the **brief** and **statistics** keywords .

Table 53: show lpts pifib Command Field Descriptions

Field	Description
Type	Hardware entry type.
VRF ID	VPN routing and forwarding (VRF) identification (vrfid) number.
Local, Remote Address. Port	Indicates local address (in the form of local port and type) and remote address (remote port).
L4	Layer 4 protocol of the entry.
Interface	Interface for this entry.
Accepts/Drops	Number of packets sent to DestAddr/Number of packets dropped due to policing.
Num. Entries	Number of pre-ifib entries of the listed type.
Packets into Pre-IFIB	Packets presented for pre-IFIB lookups.
Lookups	Packets looked up.
Packets delivered locally	Packets delivered to local applications or the local stack (<i>n</i> duplicated) packets duplicated for delivery to applications and the local stack.
Packets delivered remotely	Packets delivered to applications or for lookup on other RPs.

show lpts pifib hardware context

To display the context for the Local Packet Transport Services (LPTS) pre-IFIB hardware-related data structures, use the **show lpts pifib hardware context** command in EXEC mode.

```
show lpts pifib hardware context [location {all | }]
```

Syntax Description	location <i>node-id</i>
	(Optional) Displays pre-Internal Forwarding Information Base (IFIB) information for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
	all Specifies all locations.

show lpts pifib hardware entry

To display entries in the Local Packet Transport Services (LPTS) pre-IFIB hardware table, use the **show lpts pifib hardware entry** command in EXEC mode.

To display entries in the Local Packet Transport Services (LPTS) pre-IFIB hardware table with respect to the ACLs that are configured based on LPTS on all locations or a particular node, use the **show lpts pifib hardware entry aclname acl-name statistics location all | node-id** command in EXEC mode

show lpts pifib hardware entry [**acl** *acl-name*] **np** *np-number* [**type** {**ipv4** | **ipv6** | **isis**}] [**start-index** *number* **num-entries** *number*] [{**brief** | **statistics**}] [**location** {**all** | *node-id*}]

Syntax Description

acl <i>acl-name</i>	(Optional) Specifies the ACL names that are configured based on LPTS on a particular node or all locations.
type	(Optional) Specifies the hardware entry type. Enter one of the following types: <ul style="list-style-type: none"> • ipv4 —Specifies IPv4 entries. • ipv6 —Specifies IPv6 entries. • isis —Specifies ISIS entries.
start-index <i>number</i>	(Optional) Starting index number.
num-entries <i>number</i>	(Optional) Maximum entries permitted.
brief	(Optional) Displays summary hardware entry information.
statistics	(Optional) Displays hardware entry accept or drop statistics for each summary entry.
location all	(Optional) Specifies all locations.
location <i>node-id</i>	(Optional) Displays pre-Internal Forwarding Information Base (IFIB) information for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
np <i>np-number</i>	Displays statistics of network processor (NP) based policer in LPTS.

Command Default

Displays hardware entry information in brief.

Command History

Release	Modification
Release 3.7.2	This command was introduced.
Release 5.2.2	The show command output was updated to display LPTS mapped to an ACL.
Release 5.3.2	The np <i>np-number</i> keyword was added.

Release	Modification
6.5.2	The acl <i>acl-name</i> keyword was added.

Usage Guidelines

SNMP is not supported on ASR 9000 4th Generation Line Cards, Therefore, the ACLs that are configured on ASR 9000 4th Generation Line Cards are not displayed by running this command.

Task ID	Operations
lpts	read

Examples

The following sample output is from the **show lpts pifib hardware entry** command with the **location** keyword:

```
RP/0/RSP0/CPU0:router# show lpts pifib hardware entry location 0/1/CPU0
```

```
Node: 0/0/CPU0:
```

```
-----
M - Fabric Multicast;
L - Listener Tag; T - Min TTL;
F - Flow Type;
DestNode - Destination Node;
DestAddr - Destination Fabric queue;
SID - Stream ID;
Po - Policer; Ct - Stats Counter;
Lp - Lookup priority; Sp - Storage Priority;
Ar - Average rate limit; Bu - Burst;
HAr - Hardware Average rate limit; HBU - Hardware Burst;
Cir - Committed Information rate in HAL
Rsp - Relative sorting position;
Rtp - Relative TCAM position;
na - Not Applicable or Not Available
-----
```

```

This table describes the significant fields shown in the display.

Table 54: show lpts pifib hardware entry Command Field Descriptions

Field	Description
L4 Protocol	Layer 4 protocol of the entry.
VRF ID	VPN routing and forwarding (VRF) identification (vrfid) number.
Source IP	Source IP address for this entry.
Port/Type	Port or Internet Control Message Protocol (ICMP) type for this entry.
Source Port	Source port for this entry.
Is Fragment	Indicates if this entry applies to IP fragments.
Is SYN	Indicates if this entry applies to TCP SYNs.
Interface	Interface for this entry.
V/M/C/L/T/F	<ul style="list-style-type: none"> • V—vital • M—fabric multicast • C—moose congestion flag • L—listener tag • T—minimum time-to-live • F—flow type
DestNode	Destination node to which to send the packet.
DestAddr	Destination address to which to send the packet.
Sq/Dq/Ct	<ul style="list-style-type: none"> • Sq—Ingress Shaping Queue • Dq—Destination Queue • Ct—Stats Counter

Field	Description
Accepted/Dropped	Number of packets sent to DestAddr/Number of packets dropped due to policing.

show lpts pifib hardware police

Displays all the LPTS policer entries from the pre-Internal Forwarding Information Base (PIFIB).

show lpts pifib hardware police [**location** {*allnode-id*}]

Syntax Description	
location <i>node-id</i>	(Optional) Displays pre-Internal Forwarding Information Base (IFIB) information for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
all	Specifies all locations.

Command Default If no policer is configured, the default value is the configured rate.

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.
	Release 6.2.2	XML support was introduced.
	Release 6.2.2	Command output for line cards was added.

Usage Guidelines To retrieve command outputs, the **flow monitor-map** and **sampler-map** statements must be configured and applied to the respective interface, as shown in the following example:

```
!
flow monitor-map fmm
record ipv4
cache entries 10000
cache timeout active 15
cache timeout inactive 5
!
sampler-map fsm
random 1 out-of 1
!
interface MgmtEth0/RSP0/CPU0/0
ipv4 address 10.20.10.10 255.255.0.0
!
interface TenGigE0/3/0/0
ipv4 address 192.168.1.1 255.255.255.0
flow ipv4 monitor fmm sampler fsm ingress
flow ipv4 monitor fmm sampler fsm egress
ipv4 access-group SLMN-DPI ingress
!
```

Task ID	Task ID	Operations
	lpts	read

Examples

This sample output is from the **show lpts pifib hardware police** command with the **location** keyword for 0/2/CPU0:

```
RP/0/RSP0/CPU0:router# show lpts pifib hardware police location 0/2/CPU0
```

```
-----
                        Node 0/2/CPU0:
-----
Burst = 100ms for all flow types
-----
```

Examples

The following sample output displays the policer information for a given network process (NP) on a given node.

```
RP/0/RSP0/CPU0:router# show lpts pifib hardware police np np0 location 0/2/CPU0
...
```

```
-----
                        Node 0/2/CPU0:
-----
Burst = 100ms for all flow types
-----
FlowType          Policer Type   Cur. Rate  Def. Rate  Accepted          Dropped
      TOS Value

```

show lpts pifib hardware police

```

The following table describes the significant fields shown in the display.

Table 55: show lpts pifib hardware police Command Field Descriptions

Field	Description
FlowType	Type of flow that is binding between a tuple and a destination.
Rate (PPS)	Policer rate in packets per second (PPS).
Accept	Number of packets that are accepted by this policer.
Drop	Number of packets that are dropped by this policer.

Related Commands

Command	Description
flow (LPTS), on page 473	Configures the policer for the LPTS flow type.
lpts pifib hardware police, on page 482	Configures the ingress policers and enters pifib policer global configuration mode.

show lpts pifib hardware static-police

Displays the LPTS policer *static* entries from the pre-Internal Forwarding Information Base (PIFIB).

```
show lpts pifib hardware static-police [location {allnode-id}]
```

Syntax Description

location *node-id* (Optional) Displays pre-Internal Forwarding Information Base (IFIB) information for the designated node. The *node-id* argument is entered in the *rack/slot/module* notation.

all Specifies all locations.

Command Modes

EXEC mode

Command History

Release	Modification
Release 6.2.2	This command was introduced

Usage Guidelines

To retrieve command outputs, the **flow monitor-map** and **sampler-map** statements must be configured and applied to the respective interface, as shown in the following example:

```
!
flow monitor-map fmm
record ipv4
cache entries 10000
cache timeout active 15
cache timeout inactive 5
!
sampler-map fsm
random 1 out-of 1
!
interface MgmtEth0/RSP0/CPU0/0
ipv4 address 10.20.10.10 255.255.0.0
!
interface TenGigE0/3/0/0
ipv4 address 192.168.1.1 255.255.255.0
flow ipv4 monitor fmm sampler fsm ingress
flow ipv4 monitor fmm sampler fsm egress
ipv4 access-group SLMN-DPI ingress
!
```

Task ID

Task ID	Operations
lpts	read

A sample output for the command is as shown:

```
RP/0/RSP0/CPU0:router# show lpts pifib hardware static-police location 0/2/CPU0
...
```

```
-----
Node 0/2/CPU0:
-----
```

show lpts pifib hardware static-police

Burst = 100ms for all flow types

This table describes the significant fields shown in the display.

Table 56: show lpts pifib hardware police Command Field Descriptions

Field	Description
FlowType	Type of flow that is binding between a tuple and a destination.
Rate (PPS)	Policer rate in packets per second (PPS).

Field	Description
Accept	Number of packets that are accepted by this policer.
Drop	Number of packets that are dropped by this policer.

Related Commands

Command	Description
flow (LPTS), on page 473	Configures the policer for the LPTS flow type.
lpts pifib hardware police, on page 482	Configures the ingress policers and enters pifib policer global configuration mode.

show lpts pifib hardware usage

To display hardware table usage, use the **show lpts pifib hardware usage** command in EXEC mode.

```
show lpts pifib hardware usage [type {ipv4 | ipv6 | isis}] [location {node-id | all}]
```

Syntax Description	<p>type (Optional) Specifies the hardware entry type. Enter one of the following types:</p> <ul style="list-style-type: none"> • ipv4 —Specifies IPv4 entries. • ipv6 —Specifies IPv6 entries. • isis —Specifies ISIS entries.
	<p>location node-id (Optional) Displays pre-Internal Forwarding Information Base (IFIB) information for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.</p>
	<p>all (Optional) Specifies all locations.</p>

Command Default Without the optional parameters, the **show lpts pifib hardware usage** command displays a brief summary of hardware entry information.

Command Modes EXEC mode

Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 3.7.2</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Release 3.7.2	This command was introduced.
Release	Modification				
Release 3.7.2	This command was introduced.				

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	<table border="1"> <thead> <tr> <th>Task ID</th> <th>Operations</th> </tr> </thead> <tbody> <tr> <td>lpts</td> <td>read</td> </tr> </tbody> </table>	Task ID	Operations	lpts	read
Task ID	Operations				
lpts	read				

Examples The following sample output is from the **show lpts pifib hardware usage** command with the **location** keyword:

```
RP/0/RSP0/CPU0:router# show lpts pifib hardware usage location 0/1/cpu0
```

Type	Size	Used	Used (%)
ipv4	6000	21	0.35
ipv6	4000	15	0.38
isis	4000	1	0.03

This table describes the significant fields shown in the display.

Table 57: show lpts pifib hardware usage Command Field Descriptions

Field	Description
Type	Type of pre-IFIB entry.
Size	Maximum number of entries (72-bits) allowed for the type.
Used	Number of entries in use.
Used(%)	Percentage of total entries in use.

show lpts pifib statistics

To display Pre-Internal Forwarding Information Base (Pre-IFIB) statistics, use the **show lpts pifib statistics** command in EXEC mode.

```
show lpts pifib statistics [location node-id]
```

Syntax Description	location node-id (Optional) Displays Pre-IFIB statistics for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

Task ID	Task ID	Operations
	lpts	read

Examples

The following sample output is from the **show lpts pifib statistics** command:

```
RP/0/RSP0/CPU0:router# show lpts pifib statistics

Packets into Pre-IFIB:80
Lookups:80
Packets delivered locally:80
Packets delivered remotely:0
```

This table describes the significant fields shown in the display.

Table 58: show lpts pifib statistics Command Field Descriptions

Field	Description
Packets into Pre-IFIB	Packets presented for pre-IFIB lookups.
Lookups	Packets looked up.
Packets delivered locally	Packets delivered to local applications or the local stack (<i>n</i> duplicated) packets duplicated for delivery to applications and the local stack.
Packets delivered remotely	Packets delivered to applications or for lookup on other RPs.

Related Commands

Command	Description
show lpts pifib , on page 506	Displays information about pre-IFIB entries.

show lpts port-arbitrator statistics

To display local packet transport services (LPTS) port arbitrator statistics, use the **show lpts port-arbitrator statistics** command in EXEC mode.

show lpts port-arbitrator statistics

Syntax Description This command has no keywords or arguments.

Command Default No default behavior or values

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operations
	lpts	read

Examples

The following sample output is from the **show lpts port-arbitrator statistics** command:

```
RP/0/RSP0/CPU0:router# show lpts port-arbitrator statistics

LPTS Port Arbitrator statistics:
PA FGID-DB library statistics:
 0 FGIDs in use, 512 cached, 0 pending retries
 0 free allocation slots, 0 internal errors, 0 retry attempts
 1 FGID-DB notify callback, 0 FGID-DB errors returned
FGID-DB permit mask: 0x7 (alloc mark rack0)
PA API calls:
      1 init                1 realloc_done
      8 alloc                8 free
     16 join                16 leave
      8 detach
FGID-DB API calls:
      1 register            1 clear_old
      1 alloc                0 free
     16 join                16 leave
      0 mark                 1 mark_done
```

show lpts vrf

To display the Local Packet Transport Services (LPTS) VPN routing and forwarding (VRF) instance identification numbers and names, use the **show lpts vrf** command in EXEC mode.

show lpts vrf

Syntax Description This command has no keywords or arguments.

Command Default No default behavior or values

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operations
	lpts	read

Examples

The following sample output is from the **show lpts vrf** command:

```
RP/0/RSP0/CPU0:router# show lpts vrf

VRF-ID      VRF-NAME
0x00000000  *
0x60000000  default
```

This table describes the significant fields shown in the display.

Table 59: show lpts vrf Command Field Descriptions

Field	Description
VRF-ID	VPN routing and forwarding (VRF) identification (vrfid) number.
VRF-NAME	Name given to the VRF.

show operational LptsIfib

To display all operational data provided as XML schema for the LPTS Internal Forwarding Information Base (IFIB), use the **show operational LptsIfib** command.

```
show operational LptsIfib [ xml ]
```

Syntax Description	show operational LptsIfib	Displays all operational data provided as XML schema for the LPTS Internal Forwarding Information Base (IFIB).
	show operational LptsIfib xml	Displays all operational data provided as XML schema for the LPTS Internal Forwarding Information Base (IFIB) in XML format.
Command Default	No default behavior or values.	
Command Modes	Privileged Executive mode.	
Command History	Release	Modification
	Release 6.2.1	This command was introduced.
Usage Guidelines	Although the show operational command uses the schema database, the command displays the information in a string format like the other show commands. No XML setup or knowledge is required to use the command.	

Sample Output

The following example displays a sample output for the **show operational LptsIfib** command.

```
RP/0/RSP0/CPU0:router# show operational LptsIfib

show operational LptsPifib

To display all operational data provided as XML schema for the LPTS Pre-Internal Forwarding Information Base (PIFIB), use the **show operational LptsPifib** command.

show operational LptsPifib [**xml**]

Syntax Description	show operational LptsPifib	Displays all operational data provided as XML schema for the LPTS Pre-Internal Forwarding Information Base (PIFIB).
	show operational LptsPifib xml	Displays all operational data provided as XML schema for the LPTS Pre-Internal Forwarding Information Base (PIFIB) in XML format.
Command Default	No default behavior or values.	
Command Modes	Privileged Executive mode.	
Command History	Release	Modification
	Release 6.2.1	This command was introduced.
Usage Guidelines	Although the show operational command uses the schema database, the command displays the information in a string format like the other show commands. No XML setup or knowledge is required to use the command.

Network Stack IPv4 and IPv6 Commands

This chapter describes the commands available on the Cisco ASR 9000 Series Aggregation Services Router Cisco IOS XR software to configure and monitor features related to IP Version 4 (IPv4) and IP Version 6 (IPv6).

For detailed information about network stack concepts, configuration tasks, and examples, refer to the *IP Addresses and Services Configuration Guide for Cisco ASR 9000 Series Routers*.

- [clear ipv6 neighbors](#) , on page 563

clear ipv6 neighbors

To delete all entries in the IPv6 neighbor discovery cache, except static entries, use the **clear ipv6 neighbors** command in EXEC mode.

```
clear ipv6 neighbors [location node-id]
```

Syntax Description	location node-id (Optional) The designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.						
Command Default	None						
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 3.7.2</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Release 3.7.2	This command was introduced.		
Release	Modification						
Release 3.7.2	This command was introduced.						
Usage Guidelines	If the location option is specified, only the neighbor entries specified in the location node-id keyword and argument are cleared.						
Task ID	<table border="1"> <thead> <tr> <th>Task ID</th> <th>Operations</th> </tr> </thead> <tbody> <tr> <td>network</td> <td>read, write</td> </tr> <tr> <td>IPv6</td> <td>execute</td> </tr> </tbody> </table>	Task ID	Operations	network	read, write	IPv6	execute
Task ID	Operations						
network	read, write						
IPv6	execute						

Examples

In the following example, only the highlighted entry is deleted:

```
RP/0/RSP0/CPU0:router# clear ipv6 neighbors ?
location specify a node name

RP/0/RSP0/CPU0:router# show ipv6 neighbor

IPv6 Address Age Link-layer Addr State Interface
8888::3 - 1234.2345.9877 REACH GigabitEthernet0/0/0/0
8888::8 - 1234.2345.9877 REACH GigabitEthernet0/0/0/0
fe80::205:1ff:fe9f:6400 1335 0005.019f.6400 STALE GigabitEthernet0/0/0/0
fe80::206:d6ff:fece:3808 1482 0006.d6ce.3808 STALE GigabitEthernet0/0/0/0
fe80::200:11ff:fell:1112 1533 0000.1111.1112 STALE GigabitEthernet0/2/0/2

RP/0/RSP0/CPU0:router# clear ipv6 neighbors location 0/2/0
RP/0/RSP0/CPU0:router# show ipv6 neighbor

IPv6 Address Age Link-layer Addr State Interface
8888::3 - 1234.2345.9877 REACH GigabitEthernet0/0/0/0
8888::8 - 1234.2345.9877 REACH GigabitEthernet0/0/0/0
fe80::205:1ff:fe9f:6400 1387 0005.019f.6400 STALE GigabitEthernet0/0/0/0
fe80::206:d6ff:fece:3808 1534 0006.d6ce.3808 STALE GigabitEthernet0/0/0/0
```

clear ipv6 path-mtu

To clear the learnt path maximum transmission unit (MTU) values of IPv6 packets, use the **clear ipv6 path-mtu** command in the Global Configuration mode.

```
clear ipv6 path-mtu [vrf {vrf-name | all}] [location node-id ] ] [ address { ipv6-address } [ location node-id ] ]
```

Syntax Description

location node-id (Optional) The designated node. The node-id argument is entered in the *rack/slot/module* notation.

ipv6-address (Optional) Specific IPv6 address.

Command Default

None.

Command Modes

Global Configuration mode

Command History

Release	Modification
Release 5.3.2	This command was introduced.

Usage Guidelines

If the location option is specified, only the entries of the node specified in the **location node-id** keyword and argument are cleared. Path MTU discovery for IPv6 packets is supported only for applications using TCP and Ping protocol.

Task ID

Task ID	Operations
ipv6	read, write
network	read, write
config-services	read, write

Examples

This example shows how to clear learnt values of path MTU values of IPv6 packets:

```
RP/0/RSP0/CPU0:router(config)# clear ipv6 path-mtu vrf all
```

Related Commands

Command	Description
show ipv6 path-mtu, on page 672	Displays path MTU details of IPv6 packets.

icmp ipv4 rate-limit unreachable

To limit the rate that IPv4 Internet Control Message Protocol (ICMP) destination unreachable messages are generated, use the **icmp ipv4 rate-limit unreachable** command in Global Configuration mode. To remove the rate limit, use the **no** form of this command.

icmp ipv4 rate-limit unreachable [DF] *milliseconds*
no icmp ipv4 rate-limit unreachable [DF] *milliseconds*

Syntax Description	DF	(Optional) Limits the rate at which ICMP destination unreachable messages are sent when code 4 fragmentation is needed and data fragmentation is (DF) set, as specified in the IP header of the ICMP destination unreachable message.
	<i>milliseconds</i>	Time period (in milliseconds) between the sending of ICMP destination unreachable messages. Range is 1 to 4294967295.

Command Default The default value is one ICMP destination unreachable message every 500 milliseconds.

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines The Cisco IOS XR software maintains two timers: one for general destination unreachable messages and one for DF destination unreachable messages. Both share the same time limits and defaults. If the **DF** option is not configured, the **icmp ipv4 rate-limit unreachable** command sets the time values for DF destination unreachable messages. If the **DF** option is configured, its time values remain independent from those of general destination unreachable messages.

Task ID	Task ID	Operations
	ipv4	read, write
	network	read, write

Examples The following example shows how to set the time interval for the ICMP destination unreachable message to be generated at a minimum interval of 10 ms:

```
RP/0/RSP0/CPU0:router(config)# icmp ipv4 rate-limit unreachable 10
```

ipv4 address (network)

To set a primary or secondary IPv4 address for an interface, use the **ipv4 address** command in interface configuration mode. To remove an IPv4 address, use the **no** form of this command.

```

ipv4 address ipv4-address mask [secondary] [route-tag route-tag value]
no ipv4 address ipv4-address mask [secondary] [route-tag route-tag value]
[ algorithm algo-no ]

```

Syntax Description	Field	Description
	ipv4-address	IPv4 address.
	<i>mask</i>	Mask for the associated IP subnet. The network mask can be specified in either of two ways: <ul style="list-style-type: none"> The network mask can be a four-part dotted decimal address. For example, 255.0.0.0 indicates that each bit equal to 1 means the corresponding address bit belongs to the network address. The network mask can be indicated as a slash (/) and number. For example, /8 indicates that the first 8 bits of the mask are ones, and the corresponding bits of the address are network address.
	secondary	(Optional) Specifies that the configured address is a secondary IPv4 address. If this keyword is omitted, the configured address is the primary IPv4 address.
	route-tag	(Optional) Specifies that the configured address has a route tag to be associated with it.
	<i>route-tag value</i>	(Optional) Value of the route tag. Range is 1 to 4294967295.
	<i>algo-no</i>	Defines the Flexible Algorithm number. Range is from 128-255. 0 is default algorithm value.
	Note	If <i>algo-no</i> is not provided, 0 is taken as default.

Command Default No IPv4 address is defined for the interface.

Command Modes Interface configuration

Command History	Release	Modification
	Release 3.7.2	This command was introduced.
	Release 7.6.1	The keyword algorithm was added.

Usage Guidelines An interface can have one primary IPv4 address and multiple secondary IPv4 addresses. Packets generated by the software always use the primary IPv4 address. Therefore, all networking devices on a segment should share the same primary network number.

Note The same IPv4 address configured on two different interfaces causes an error message to display that indicates the conflict. The interface located in the highest rack, slot, module, instance, and port is disabled.

Hosts can determine subnet masks using the IPv4 Internet Control Message Protocol (ICMP) mask request message. Networking devices respond to this request with an ICMP mask reply message.

You can disable IPv4 processing on a particular interface by removing its IPv4 address with the **no ipv4 address** command. If the software detects another host using one of its IPv4 addresses, it will display an error message on the console.

The optional **secondary** keyword allows you to specify an unlimited number of secondary addresses. Secondary addresses are treated like primary addresses, except that the system never generates datagrams other than routing updates with secondary source addresses. IPv4 broadcasts and Address Resolution Protocol (ARP) requests are handled properly, as are interface routes in the IP routing table.

Secondary IPv4 addresses can be used in a variety of situations. The following are the most common applications:

- There may not be enough host addresses for a particular network segment. For example, your subnetting allows up to 254 hosts per logical subnet, but on one physical subnet you need to have 300 host addresses. Using secondary IPv4 addresses on the networking devices allows you to have two logical subnets using one physical subnet.
- Many older networks were built using Level 2 bridges. The judicious use of secondary addresses can aid in the transition to a subnetted, router-based network. Routers on an older, bridged segment can be easily made aware that there are many subnets on that segment.

The route-tag feature attaches a tag to all IPv4 addresses. The tag is propagated from the Management Agents (MA) to the Address Repository Managers (RPM) to routing protocols, thus enabling the user to control the redistribution of connected routes by looking at the route tags via RPL scripts.

The algorithm command is used to associate the IP address of an interface to an IP flexible algorithm.

Task ID

Task ID Operations

ipv4 read,
write

network read,
write

Examples

The following example shows how to set 192.168.1.27 as the primary address and 192.168.7.17 and 192.168.8.17 as the secondary addresses on GigabitEthernet interface 0/1/1/0:

```
RP/0/RSP0/CPU0:router(config)# interface gigabitethernet 0/1/1/0
RP/0/RSP0/CPU0:router(config-if)# ipv4 address 192.168.1.27 255.255.255.0
RP/0/RSP0/CPU0:router(config-if)# ipv4 address 192.168.7.17 255.255.255.0 secondary
RP/0/RSP0/CPU0:router(config-if)# ipv4 address 192.168.8.17 255.255.255.0 secondary
```

Related Commands

Command	Description
show ipv4 interface , on page 656	Lists a summary of IPv4 information and status for the interface.

ipv4 assembler max-packets

To configure the maximum number of packets that are allowed in assembly queues, use the **ipv4 assembler max-packets** command in Global Configuration mode. To disable this feature, use the **no** from of this command.

ipv4 assembler max-packets *percentage value*
no ipv4 assembler max-packets *percentage value*

Syntax Description	<i>percentage value</i> Percentage of total packets available in the system. The range is from 1 to 50.
---------------------------	---------------------------------------------------------------------------------------------------------

Command Default	None
------------------------	------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	No specific guidelines impact the use of this command.
-------------------------	--------------------------------------------------------

Task ID	Task ID	Operations
	ipv4	read, write
	network	read, write

Examples

The following example shows how to configure the maximum number of packets for the assembly queue:

```
RP/0/RSP0/CPU0:router(config)# ipv4 assembler max-packets 35
```

Related Commands	Command	Description
	ipv4 assembler timeout, on page 570	Configures the number of seconds an assembly queue can hold before a timeout occurs.

ipv4 assembler timeout

To configure the number of seconds an assembly queue can hold before a timeout occurs, use the **ipv4 assembler timeout** command in Global Configuration mode. To disable this feature, use the **no** form of this command.

```
ipv4 assembler timeout seconds
no ipv4 assembler timeout seconds
```

Syntax Description	<i>seconds</i> Number of seconds an assembly queue can hold before a timeout occurs. The range is from 1 to 120.
---------------------------	------------------------------------------------------------------------------------------------------------------

Command Default	None
------------------------	------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	No specific guidelines impact the use of this command.
-------------------------	--------------------------------------------------------

Task ID	Task ID	Operations
	ipv4	read, write
	network	read, write

Examples The following example shows how to configure an assembly queue before a timeout occurs:

```
RP/0/RSP0/CPU0:router (config) # ipv4 assembler timeout 88
```

Related Commands	Command	Description
	ipv4 assembler max-packets, on page 569	Configures the maximum number of packets that are allowed in assembly queues.

ipv4 conflict-policy

To enable IP Address Repository Manager (IPARM) conflict resolution, use the **ipv4 conflict-policy** command in Global Configuration mode. To disable the IPARM conflict resolution, use the **no** form of the command.

```
ipv4 conflict-policy {highest-ip | longest-prefix | static}
no ipv4 conflict-policy {highest-ip | longest-prefix | static}
```

Syntax Description

highest-ip	Keeps the highest ip address in the conflict set.
longest-prefix	Keeps the longest prefix match in the conflict set.
static	Keeps the existing interface running across new address configurations.

Command Default

The precedence rule adopted is loopback > physical > other virtual interfaces. Within virtual interfaces, there is an alphabetical preference, for example, loopback1 > loopback2 > tunnel. Among physical interfaces, the lower rack or slot takes control.

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

Use **ipv4 conflict-policy** command to set an IPARM policy that resolves a conflict in the configured addresses. The policy tells IPARM what address to select from the addresses in conflict. The policy then forces the address in conflict to become inactive.

Task ID

Task ID	Operations
ipv4	read, write
ip-services	read, write

Examples

The following example shows how to enable the static policy for conflict resolution:

```
RP/0/RSP0/CPU0:router(config)# ipv4 conflict-policy static
```

Related Commands

Command	Description
show arm conflicts, on page 644	Displays the IPv4 or IPv6 address conflict information.

ipv4 directed-broadcast

To enable forwarding of IPv4 directed broadcasts on an interface, use the **ipv4 directed-broadcast** command in interface configuration mode. To disable forwarding of IPv4 directed broadcast on an interface, use the **no** form of this command.

ipv4 directed-broadcast
no ipv4 directed-broadcast

Syntax Description This command has no keywords or arguments.

Command Default By default, directed broadcasts are dropped.

Command Modes Interface configuration

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines A directed broadcast is a packet sent to a specific network. IPv4 directed broadcasts are dropped and not forwarded. Dropping IPv4 directed broadcasts makes routers less susceptible to denial-of-service (DoS) attacks.

Task ID	Task ID	Operations
	ipv4	read, write
	network	read, write

Examples The following example shows how to enable the forwarding of IPv4 directed broadcasts on GigabitEthernet interface 0/1/1/0:

```
RP/0/RSP0/CPU0:router(config)# interface gigabitethernet 0/1/1/0
RP/0/RSP0/CPU0:router(config-if)# ipv4 directed-broadcast
```

Related Commands

Command	Description
ipv4 unnumbered point-to-point	Enables IP processing on a point-to-point interface without assigning an explicit IP address to the interface.
show ipv4 interface , on page 656	Lists a summary of IPv4 information and status for the interface.

ipv4 helper-address

To configure the address to which the software forwards User Datagram Protocol (UDP) broadcasts, including BOOTP, received on an interface, use the **ipv4 helper-address** command in interface configuration mode. To remove an IPv4 helper address, use the **no** form of this command.

```
{ipv4 helper-address [vrf vrf-name][destination-address]}
{no ipv4 helper-address [vrf vrf-name][destination-address]}
```

Syntax Description		
vrf	(Optional)	Displays VPN routing and forwarding (VRF) instance information.
<i>vrf-name</i>	(Optional)	Name of a VRF.
<i>destination-address</i>		Destination broadcast or host address to be used when UDP broadcasts are forwarded. There can be more than one helper address per interface.

Command Default IPv4 helper addresses are disabled. Default VRF is assumed if the VRF is not specified.

Command Modes Interface configuration

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines Use this command with the **forward-protocol udp** command in global configuration mode, which specifies by port number the broadcast packets that are forwarded. UDP is enabled by default for well-known ports. The **ipv4 helper-address** command specifies the destination to which the UDP packets are forwarded.

One common application that requires IPv4 helper addresses is Dynamic Host Configuration Protocol (DHCP), which is defined in RFC 1531. DHCP protocol information is carried inside of BOOTP packets. To enable BOOTP broadcast forwarding for a set of clients, configure an IPv4 helper address on the networking device interface physically closest to the client. The IPv4 helper address should specify the address of the DHCP server. If you have multiple servers, you can configure one IPv4 helper address for each server. Because BOOTP packets are forwarded by default, DHCP information can now be forwarded by the networking device. The DHCP server now receives broadcasts from the DHCP clients.

A DHCP relay profile must be configured to perform DHCP Relay. The **ip helper-address** command is used to forward broadcast UDP (non-DHCP) packets.

Legacy DHCP configuration (without a relay profile) is not supported from Release 4.2.0 onwards.

Task ID	Task ID	Operations
	ipv4	read, write
	network	read, write

Examples

The following example shows how to specify that all UDP broadcast packets received on GigabitEthernetinterface 0/1/1/0 are forwarded to 192.168.1.0:

```
RP/0/RSP0/CPU0:router(config)# interface gigabitethernet 0/1/1/0
RP/0/RSP0/CPU0:router(config-if)# ipv4 helper-address 192.168.1.0
```

Related Commands

Command	Description
forward-protocol udp	Specifies which ports the networking device forwards to when forwarding broadcast packets.

ipv4 mask-reply

To enable the Cisco IOS XR software to respond to IPv4 Internet Control Message Protocol (ICMP) mask requests by sending ICMP mask reply messages, use the **ipv4 mask-reply** command in interface configuration mode. To restore the default, use the **no** form of this command.

ipv4 mask-reply
no ipv4 mask-reply

Syntax Description This command has no keywords or arguments.

Command Default IPv4 mask replies are not sent.

Command Modes Interface configuration

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines This command enables the Cisco IOS XR software to respond to IPv4 ICMP mask requests by sending ICMP mask reply messages.

Task ID	Task ID	Operations
	ipv4	read, write
	network	read, write

Examples The following example enables the sending of ICMP mask reply messages on GigabitEthernet interface 0/1/1/0:

```
RP/0/RSP0/CPU0:router(config)# interface gigabitethernet 0/1/1/0
RP/0/RSP0/CPU0:router(config-if)# ipv4 mask-reply
```

ipv4 mtu

To set the maximum transmission unit (MTU) size of IPv4 packets sent on an interface, use the **ipv4 mtu** command in an appropriate configuration mode. To restore the default MTU size, use the **no** form of this command.

ipv4 mtu *bytes*

Syntax Description

bytes MTU in bytes. Range is 68 to 65535 bytes for IPv4 packets. The maximum MTU size that can be set on an interface depends on the interface medium.

Command Default

If no MTU size is configured for IPv4 packets sent on an interface, the interface derives the MTU from the Layer 2 MTU.

Command Modes

Interface configuration (for releases prior to R4.2.0)

Dynamic template configuration (for releases R4.2.0 onward)

Command History

Release	Modification
Release 3.7.2	This command was introduced.
Release 4.2.0	This command was supported in the dynamic template configuration mode for BNG.

Usage Guidelines

The router punts the packets that needs fragmentation; whereas the software path drops the subscriber traffic that needs fragmentation.

The maximum MTU size that can be set on an interface depends on the interface medium. If the Layer 2 MTU is smaller than the Layer 3 MTU, the Cisco IOS XR software uses the Layer 2 MTU value for the Layer 3 MTU. Conversely, if the Layer 3 MTU is smaller than the Layer 2 MTU, the software uses Layer 3 MTU value. In other words the Cisco IOS XR software uses the lower of the two values for the MTU.

All devices on a physical medium must have the same protocol MTU to operate.

For releases R4.2.0 onward, to enter the dynamic template configuration mode, run the **dynamic-template** command in the Global Configuration mode.

Note

Changing the MTU value (with the **mtu** interface configuration command) can affect the IPv4 MTU value. If the current IPv4 MTU value is the same as the MTU value, and you change the MTU value, the IPv4 MTU value will be modified automatically to match the new MTU. However, the reverse is not true; changing the IPv4 MTU value has no effect on the value for the **mtu** command.

Task ID

Task ID	Operations
ipv4	read, write

Task ID	Operations
network	read, write
config-services	read, write

Examples

For releases prior to R4.2.0, this example shows how to set the maximum IPv4 packet size for GigabitEthernet interface 0/1/1/0 to 300 bytes:

```
RP/0/RSP0/CPU0:router(config)# interface gigabitethernet 0/1/1/0
RP/0/RSP0/CPU0:router(config-if)# ipv4 mtu 300
```

For releases R4.2.0 onward, this example shows how to set the maximum IPv4 packet size to 300 bytes in dynamic template configuration mode:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# dynamic-template type ppp p1
RP/0/RSP0/CPU0:router(config-dynamic-template-type)# ipv4 mtu 300
```

Related Commands

Command	Description
show ipv4 interface , on page 656	Displays the MTU status of interfaces configured for IPv4.

ipv4 redirects

To enable the sending of IPv4 Internet Control Message Protocol (ICMP) redirect messages if the software is forced to resend a packet through the same interface on which it was received, use the **ipv4 redirects** command in interface configuration mode. To restore the default, use the **no** form of this command.

ipv4 redirects
no ipv4 redirects

Syntax Description	This command has no keywords or arguments.				
Command Default	ICMP redirect messages are disabled by default on the interface.				
Command Modes	Interface configuration				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 3.7.2</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Release 3.7.2	This command was introduced.
Release	Modification				
Release 3.7.2	This command was introduced.				
Usage Guidelines	ICMP redirect messages are disabled by default on the interface.				

Task ID	Task ID	Operations
	ipv4	read, write
	network	read, write

Examples

The following example shows how to disable the sending of ICMP IPv4 redirect messages on GigabitEthernet interface 0/1/1/0:

```
RP/0/RSP0/CPU0:router(config)# interface gigabitethernet 0/1/1/0
RP/0/RSP0/CPU0:router(config-if)# ipv4 redirects
```

ipv4 source-route

To allow the processing of any IPv4 datagrams containing a source-route header option, use the **ipv4 source-route** command in Global Configuration mode. To have the software discard any IP datagram that contains a source-route option, use the **no** form of this command.

ipv4 source-route
no ipv4 source-route

Syntax Description	This command has no keywords or arguments.	
Command Default	The software discards any IPv4 datagrams containing a source-route header option.	
Command History	Release	Modification
	Release 3.7.2	This command was introduced.
Usage Guidelines	By default, any IPv4 datagram which contains a source-route header option is discarded.	
Task ID	Task ID	Operations
	ipv4	read, write
	network	read, write

Examples

The following example shows how to allow the processing of any IPv4 datagrams containing a source-route header option:

```
RP/0/RSP0/CPU0:router(config)# ipv4 source-route
```

ipv4 tcp-mss-adjust

To enable the transit traffic of TCP flows to be a Maximum Segment Size (MSS) below the GRE tunnel interface or VLAN sub-interface MTU so that traffic fragmentation is prevented when a session is established for IPv4 packets, use the **ipv4 tcp-mss-adjust** command in the interface configuration submode. To disable the transit traffic of TCP flows to be a Maximum Segment Size (MSS) below the GRE tunnel interface or VLAN sub-interface MTU, use the **no** form of this command.

ipv4 tcp-mss-adjust enable
no ipv4 tcp-mss-adjust enable

Syntax Description	enable Enables Maximum Segment Size (MSS) adjustment for tcp flows on the interface.
---------------------------	---------------------------------------------------------------------------------------------

Command Default	None
------------------------	------

Command Modes	Interface Configuration
----------------------	-------------------------

Command History	Release	Modification
	Release 4.3.2	This command was introduced.

Usage Guidelines

Task ID	Task ID	Operation
	mpls-te	read, write
	ipv4	read, write
	network	read, write
	acl	read, write

Example

This example shows how to enable the transit traffic of TCP flows for IPv4 packets using the **ipv4 tcp-mss-adjust** command:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# interface gigabitEthernet 0/0/0/4.20
RP/0/RSP0/CPU0:router(config-if)# ipv4 tcp-mss-adjust enable
```

Related Commands

Command	Description
ipv6 tcp-mss-adjust, on page 635	Enables the transit traffic of TCP flows to be a Maximum Segment Size (MSS) below the GRE tunnel interface or VLAN sub-interface MTU so that traffic fragmentation is prevented when a session is established for IPv6 packets.

ipv4 unnumbered (point-to-point)

To enable IPv4 processing on a point-to-point interface without assigning an explicit IPv4 address to that interface, use the **ipv4 unnumbered** command in an appropriate configuration mode. To disable this feature, use the **no** form of this command.

ipv4 unnumbered *interface-type interface-instance*

Syntax Description

interface-type Interface type. For more information, use the question mark (?) online help function.

interface-instance Either a physical interface instance or a virtual interface instance as follows:

- Physical interface instance. Naming notation is *rack/slot/module/port* and a slash between values is required as part of the notation.
 - *rack*: Chassis number of the rack.
 - *slot*: Physical slot number of the modular services card or line card.
 - *module*: Module number. A physical layer interface module (PLIM) is always 0.
 - *port*: Physical port number of the interface.

Note In references to a Management Ethernet interface located on a route processor card, the physical slot number is alphanumeric (RSP0) and the module is CPU0. Example: interface MgmtEth0/RSP0 /CPU0/0.

- Virtual interface instance. Number range varies depending on interface type.

For more information about the syntax for the router, use the question mark (?) online help function.

Command Default

IPv4 processing on a point-to-point interface is disabled unless an IPv4 address is assigned explicitly to that interface.

Command Modes

Interface configuration (for releases prior to R4.2.0)

Dynamic template configuration (for releases R4.2.0 onward)

Command History

Release	Modification
Release 3.7.2	This command was introduced.
Release 4.2.0	This command was supported in the dynamic template configuration mode for BNG.

Usage Guidelines

For releases R4.2.0 onward, to enter the dynamic template configuration mode, run the **dynamic-template** command in the Global Configuration mode.

Whenever the unnumbered interface generates a packet (for example, for a routing update), it uses the address of the specified interface as the source address of the IPv4 packet. It also uses the IPv4 address of the specified

interface in determining which routing processes are sending updates over the unnumbered interface. Restrictions include the following:

- You cannot use the **ping EXEC** command to determine whether the interface is up because the interface has no address. Simple Network Management Protocol (SNMP) can be used to remotely monitor interface status.

The interface you specify by the *interface-type* and *interface-number* arguments must be enabled (listed as “up” in the **show interfaces** command display).

Task ID	Task ID	Operations
	ipv4	read, write
	network	read, write
	config-services	read, write

Examples

For releases prior to R4.2.0, this example shows how the GigabitEthernet interface 0/1/1/0 is assigned the loopback interface address 5:

```
RP/0/RSP0/CPU0:router(config)# interface loopback 5
RP/0/RSP0/CPU0:router(config-if)# ipv4 address 192.168.6.6 255.255.255.0
RP/0/RSP0/CPU0:router(config)# interface gigabitethernet 0/1/1/0
RP/0/RSP0/CPU0:router(config-if)# ipv4 unnumbered loopback 5
```

For releases R4.2.0 onward, this example shows how the Bundle-Ether interface is assigned address 100.10 in the dynamic template configuration mode:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# dynamic-template type ppp p1
RP/0/RSP0/CPU0:router(config-dynamic-template-type)# ipv4 unnumbered Bundle-Ether100.10
```

ipv4 unreachable disable

To disable the generation of IPv4 Internet Control Message Protocol (ICMP) unreachable messages, use the **ipv4 unreachable disable** command in an appropriate configuration mode. To re-enable the generation of ICMP unreachable messages, use the **no** form of this command.

ipv4 unreachable disable

Syntax Description

This command has no keywords or arguments.

Command Default

IPv4 ICMP unreachable messages are generated.

Command Modes

Interface configuration (for releases prior to R4.2.0)

Dynamic template configuration (for releases R4.2.0 onward)

Command History

Release	Modification
Release 3.7.2	This command was introduced.
Release 4.2.0	This command was supported in the dynamic template configuration mode for BNG.

Usage Guidelines

If the software receives a nonbroadcast packet destined for itself that uses a protocol it does not recognize, it sends an ICMP protocol unreachable message to the source.

If the software receives a datagram that it cannot deliver to its ultimate destination because it knows of no route to the destination address, it replies to the originator of that datagram with an ICMP host unreachable message.

This command affects a number of ICMP unreachable messages.

For releases R4.2.0 onward, to enter the dynamic template configuration mode, run the **dynamic-template** command in the Global Configuration mode.

Task ID

Task ID	Operations
ipv4	read, write
network	read, write
config-services	read, write

Examples

For releases prior to R4.2.0, this example shows how to disable the generation of ICMP unreachable messages on GigabitEthernetinterface 0/1/1/0:

```
RP/0/RSP0/CPU0:router(config)# interface gigabitethernet 0/1/1/0
RP/0/RSP0/CPU0:router(config-if)# ipv4 unreachable disable
```

For releases R4.2.0 onward, this example shows how to disable the generation of ICMP unreachable messages on dynamic template configuration mode:

```
RP/0/RSP0/CPU0:router(config)# dynamic-template type ppp foo  
RP/0/RSP0/CPU0:router(config-dynamic-template-type)# ipv4 unreachable disable
```

ipv4 virtual address

To define an IPv4 virtual address for a network of management Ethernet interfaces, use the **ipv4 virtual interface** command in Global Configuration mode. To remove an IPv4 virtual address from the configuration, use the **no** form of this command.

```
ipv4 virtual address {[vrf vrf-name] ipv4-address/mask | use-as-src-addr}
no ipv4 virtual address {[vrf vrf-name] ipv4-address/mask | use-as-src-addr}
```

Syntax Description

vrf vrf-name	(Optional) Configures the virtual address on a per VPN routing and forwarding (VRF) basis for the management interfaces. The <i>vrf-name</i> argument specifies the name of the VRF.
ipv4 address	Virtual IPv4 address and the mask that is to be unconfigured.
mask	Mask for the associated IP subnet. The network mask can be specified in either of two ways: <ul style="list-style-type: none"> • The network mask can be a four-part dotted-decimal address. For example, 255.0.0.0 indicates that each bit equal to 1 means the corresponding address bit belongs to the network address. • The network mask can be indicated as a slash (/) and number. For example, /8 indicates that the first 8 bits of the mask are ones, and the corresponding bits of the address are network address. A slash between numbers is required as part of the notation.
use-as-src-addr	Enables the virtual address to be used as the default SRC address on sourced packets.

Command Default

No IPv4 virtual address is defined for the configuration.

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

Configuring an IPv4 virtual address enables you to access the router from a single virtual address with a management network. An IPv4 virtual address persists across route processor (RP) failover situations.

Configuring an IPv4 virtual address enables you to access a dual RP router from a single address without prior knowledge of which RP is active. An IPv4 virtual address persists across RP failovers. For this to happen, the virtual IPv4 address must share a common IPv4 subnet with a Management Ethernet interface on both RPs.

If you disable the **ipv4 virtual address** command with the **vrf** keyword, the virtual IP address is unconfigured for the corresponding VRF or for the default if no VRF is specified. This results in the removal of the entry for the virtual IP address in the VRF table and in the ARP cache.

The default VRF is chosen when no VRF is specified. The virtual IP address is activated on a management interface that is attached to a default VRF.

The **use-as-src-addr** keyword eliminates the need for configuring a loopback interface as the source interface (that is, update source) for management applications. When an update source is not configured, management

applications allow the transport processes (TCP, UDP, raw_ip) to pick a suitable source address. The transport processes, in turn, consult the FIB to do so. If a Management Ethernet's IP address is picked as the source address and if the **use-as-src-addr keyword** is configured, then the transport processes replace the Management Ethernet's IP address with a relevant virtual IP address. This functionality works across RP switchovers.

Task ID	Task ID	Operations
	ipv4	read, write
	network	read, write

Examples

The following example shows how to define an IPv4 virtual address:

```
RP/0/RSP0/CPU0:router(config)# ipv4 virtual address 10.3.32.154/8
```

The following example show how to configure the virtual IP addresses for management interfaces on a per VRF basis:

```
RP/0/RSP0/CPU0:router(config)# ipv4 virtual address vrf ppp 10.26.3.4/16
```

ipv6 address

To configure an IPv6 address for an interface and enable IPv6 processing on the interface using an EUI-64 interface ID in the low-order 64 bits of the address, use the **ipv6 address** command in interface configuration mode. To remove the address from the interface, use the **no** form of this command.

```

ipv6 address ipv6-prefix/prefix-length [eui-64] [route-tag route-tag value]
no ipv6 address ipv6-prefix/prefix-length [eui-64] [route-tag route-tag value]
[ algorithm algo-no ]

```

Syntax Description

<i>ipv6-prefix</i>	The IPv6 network assigned to the interface. This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.
<i>/ prefix-length</i>	The length of the IPv6 prefix. A decimal value that indicates how many of the high-order contiguous bits of the address compose the prefix (the network portion of the address). A slash (/) must precede the decimal value.
eui-64	(Optional) Specifies an interface ID in the low-order 64 bits of the IPv6 address.
route-tag	(Optional) Specifies that the configured address has a route tag to be associated with it.
<i>route-tag value</i>	(Optional) Value of the route tag. Range is 1 to 4294967295.
algorithm	(Optional) Associates the Flexible Algorithm with the IP address of the interface.
<i>algo-no</i>	Defines the Flexible Algorithm number. Range is from 128-255. 0 is default algorithm value Note If <i>algo-no</i> is not provided, 0 is taken as default.

Command Default

No IPv6 address is defined for the interface.

Command Modes

Interface configuration

Command History

Release	Modification
Release 3.7.2	This command was introduced.
Release 7.6.1	The keyword algorithm was added.

Usage Guidelines

If the value specified for the */ prefix-length* argument is greater than 64 bits, the prefix bits have precedence over the interface ID.

Using the **no ipv6 address** command without arguments removes all manually configured IPv6 addresses from an interface.

If the Cisco IOS XR software detects another host using one of its IPv6 addresses, it displays an error message on the console.

The route-tag feature attaches a tag to all IPv6 addresses. The tag is propagated from the Management Agents (MA) to the Address Repository Managers (RPM) to routing protocols, thus enabling the user to control the redistribution of connected routes by looking at the route tags via RPL scripts.

The algorithm command is used to associate the IP address of an interface to an IP flexible algorithm.

Task ID	Task ID	Operations
	ipv6	read, write
	network	read, write

Examples

The following example assigns IPv6 address 2001:0DB8:0:1::/64 to GigabitEthernet interface 0/1/1/0 and specifies an EUI-64 interface ID in the low-order 64 bits of the address:

```
RP/0/RSP0/CPU0:router(config)# interface gigabitethernet 0/1/1/0
RP/0/RSP0/CPU0:router(config-if)# ipv6 address 2001:0DB8:0:1::/64 eui-64
```

Related Commands

Command	Description
ipv6 address link-local, on page 590	Configures an IPv6 link-local address for an interface and enables IPv6 processing on the interface.
show ipv6 interface , on page 663	Displays the usability status of interfaces configured for IPv6.

ipv6 address link-local

To configure an IPv6 link-local address for an interface and enable IPv6 processing on the interface, use the **ipv6 address link-local** command in interface configuration mode. The *ipv6-address* value specified with this command overrides the link-local address that is automatically generated for the interface. To remove the address from the interface, use the **no** form of this command.

```
ipv6 address ipv6-address link-local [route-tag route-tag value]  
no ipv6 address ipv6-address link-local [route-tag route-tag value]
```

Syntax Description

<i>ipv6-address</i>	The IPv6 address assigned to the interface. This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.
link-local	Specifies a link-local address. The <i>ipv6-address</i> value specified with this command overrides the link-local address that is automatically generated for the interface.
route-tag	(Optional) Specifies that the configured address has a route-tag to be associated with it.
<i>route-tag value</i>	(Optional) Displays the route-tag value. Range is 1 to 4294967295.

Command Default

No IPv6 address is defined for the interface.

Command Modes

Interface configuration

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

If the Cisco IOS XR software detects another host using one of its IPv6 addresses, the software displays an error message on the console.

The system automatically generates a link-local address for an interface when IPv6 processing is enabled on the interface, typically when an IPv6 address is configured on the interface. To manually specify a link-local address to be used by an interface, use the **ipv6 address link-local** command.

A double colon may be used as part of the *ipv6-address* argument when consecutive 16-bit values are denoted as zero. You can configure multiple IPv6 addresses per interfaces, but only one link-local address.

Task ID

Task ID	Operations
ipv6	read, write
network	read, write

Examples

The following example shows how to assign FE80::260:3EFF:FE11:6770 as the link-local address for GigabitEthernet interface 0/1/1/0:

```
RP/0/RSP0/CPU0:router(config)# interface gigabitethernet 0/1/1/0
RP/0/RSP0/CPU0:router(config-if)# ipv6 address FE80::260:3EFF:FE11:6770 link-local
```

Related Commands

Command	Description
ipv6 address, on page 588	Configures an IPv6 address and enables IPv6 processing on an interface using an EUI-64 interface ID in the low-order 64 bits of the address.
show ipv6 interface , on page 663	Displays the usability status of interfaces configured for IPv6.

ipv6 assembler

To configure the maximum number of packets that are allowed in assembly queues or to configure the number of seconds an assembly queue will hold before timeout, use the **ipv6 assembler** command in the appropriate configuration mode. To disable this feature, use the **no** form of this command.

```
ipv6 assembler {max-packets value | timeout seconds}
no ipv6 assembler {max-packets value | timeout seconds}
```

Syntax Description	
max-packets	Maximum packets allowed in assembly queues.
timeout	Number of seconds an assembly queue will hold before timeout.

Command Default None

Command Modes Global Configuration mode

Command History	Release	Modification
	Release 4.2.0	This command was introduced.
		This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operation
	ipv6	read, write

Example

The following example shows how to configure the maximum number of packets that are allowed in assembly queues:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# ipv6 assembler max-packets 100
```

Related Commands	Command	Description
	ipv4 assembler max-packets, on page 569	Configures the maximum number of packets that are allowed in assembly queues

ipv6 conflict-policy

To enable IP Address Repository Manager (IPARM) conflict resolution, use the **ipv6 conflict-policy** command in Global Configuration mode. To disable the IPARM conflict resolution, use the **no** form of the command.

```
ipv6 conflict-policy {highest-ip | longest-prefix | static}
no ipv6 conflict-policy {highest-ip | longest-prefix | static}
```

Syntax Description	highest-ip	Keeps the highest IP address in the conflict set.
	longest-prefix	Keeps the longest prefix match in the conflict set.
	static	Keeps the existing interface running across new address configurations.

Command Default Default is the lowest rack/slot if no conflict policy is configured.

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operations
	ipv6	read, write
	ip-services	read, write

Examples The following example shows how to enable the longest prefix policy for conflict resolution:

```
RP/0/RSP0/CPU0:router(config)# ipv6 conflict-policy longest-prefix
```

ipv6 enable

To enable IPv6 processing on an interface that has not been configured with an explicit IPv6 address, use the **ipv6 enable** command in an appropriate configuration mode. To disable IPv6 processing on an interface that has not been configured with an explicit IPv6 address, use the **no** form of this command.

ipv6 enable

Syntax Description

This command has no keywords or arguments.

Command Default

IPv6 is disabled.

Command Modes

Interface configuration (not applicable for BNG)
Dynamic template configuration (for BNG)

Command History

Release	Modification
Release 3.7.2	This command was introduced.
Release 4.3.0	This command was supported in the dynamic template configuration mode for BNG.

Usage Guidelines

The **ipv6 enable** command automatically configures an IPv6 link-local unicast address on the interface while also enabling the interface for IPv6 processing. The **no ipv6 enable** command does not disable IPv6 processing on an interface that is configured with an explicit IPv6 address.

For BNG, ensure you run this command in the dynamic template configuration mode. To enter the dynamic template configuration mode, run **dynamic-template** command in the Global Configuration mode.

Task ID

Task ID	Operations
ipv6	read, write
network	read, write
config-services	read, write

Examples

This example (not applicable for BNG) shows how to enable IPv6 processing on GigabitEthernet interface 0/1/1/0:

```
RP/0/RSP0/CPU0:router(config)# interface gigabitethernet 0/1/1/0
RP/0/RSP0/CPU0:router(config-if)# ipv6 enable
```

For BNG, this example show how to enable IPv6 processing on dynamic template configuration mode:

```
RP/0/RSP0/CPU0:router(config)# dynamic-template type ppp foo  
RP/0/RSP0/CPU0:router(config-dynamic-template-type)# ipv6 enable
```

Related Commands

Command	Description
show ipv6 interface , on page 663	Displays the usability status of interfaces configured for IPv6.

ipv6 hop-limit

To configure the maximum number of hops used in router advertisements and all IPv6 packets that are originated by the router, use the **ipv6 hop-limit** command in Global Configuration mode. To return the hop limit to its default value, use the **no** form of this command.

```
ipv6 hop-limit hops
no ipv6 hop-limit hops
```

Syntax Description	<i>hops</i> Maximum number of hops. Range is 1 to 255.				
Command Default	<i>hops</i> : 64 hops				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 3.7.2</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Release 3.7.2	This command was introduced.
Release	Modification				
Release 3.7.2	This command was introduced.				
Usage Guidelines	No specific guidelines impact the use of this command.				

Task ID	Task ID	Operations
	ipv6	read, write
	network	read, write

Examples

The following example shows how to configure a maximum number of 15 hops for router advertisements and all IPv6 packets that are originated from the router:

```
RP/0/RSP0/CPU0:router(config)# ipv6 hop-limit 15
```

ipv6 icmp error-interval

To configure the interval and bucket size for IPv6 Internet Control Message Protocol (ICMP) error messages on all nodes, use the **ipv6 icmp error-interval** command in Global Configuration mode. To return the interval to its default setting, use the **no** form of this command.

```
ipv6 icmp error-interval milliseconds [bucketsize]  
no ipv6 icmp error-interval
```

Syntax Description	
<i>milliseconds</i>	Time interval (in milliseconds) between tokens being placed in the bucket. Range is 0 to 2147483647.
<i>bucketsize</i>	(Optional) The maximum number of tokens stored in the bucket. The acceptable range is 1 to 200 with a default of 10 tokens.

Command Default	
	ICMP rate limiting is enabled by default. To disable ICMP rate limiting, set the interval to zero.
	<i>milliseconds</i> : 100 milliseconds
	<i>bucketsize</i> : 10 tokens

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines Use the **ipv6 icmp error-interval** command in Global Configuration mode to limit the rate at which IPv6 ICMP error messages are sent for each node. A token bucket algorithm is used with one token representing one IPv6 ICMP error message. Tokens are placed in the virtual bucket at a specified interval until the maximum number of tokens allowed in the bucket is reached.

The *milliseconds* argument specifies the time interval between tokens being placed in the bucket. The optional *bucketsize* argument is used to define the maximum number of tokens stored in the bucket. Tokens are removed from the bucket when IPv6 ICMP error messages are sent, which means that if the *bucketsize* argument is set to 20, a rapid succession of 20 IPv6 ICMP error messages can be sent. When the bucket is empty of tokens, IPv6 ICMP error messages are not sent until a new token is placed in the bucket.

Use the **show ipv6 traffic** EXEC command to display IPv6 ICMP rate-limited counters.

Task ID	Task ID	Operations
	ipv6	read, write
	network	read, write

Examples

The following example shows an interval of 50 milliseconds and a bucket size of 20 tokens being configured for IPv6 ICMP error messages:

ipv6 icmp error-interval

```
RP/0/RSP0/CPU0:router(config)# ipv6 icmp error-interval 50 20
```

Related Commands

Command	Description
show ipv6 neighbors , on page 667	Displays IPv6 neighbors discovery cache information.

ipv6 mtu

To set the maximum transmission unit (MTU) size of IPv6 packets sent on an interface, use the **ipv6 mtu** command in an appropriate configuration mode. To restore the default MTU size, use the **no** form of this command.

ipv6 mtu *bytes*

Syntax Description

bytes MTU in bytes. Range is 1280 to 65535 for IPv6 packets. The maximum MTU size that can be set on an interface depends on the interface medium.

Command Default

If no MTU size is configured for IPv6 packets sent on an interface, the interface derives the MTU from the Layer 2 MTU.

Command Modes

Interface configuration (not applicable for BNG)
Dynamic template configuration (for BNG)

Command History

Release	Modification
Release 3.7.2	This command was introduced.
Release 4.3.0	This command was supported in the dynamic template configuration mode for BNG.

Usage Guidelines

If an IPv6 packet exceeds the MTU set for the interface, only the source router of the packet can fragment it.

The maximum MTU size that can be set on an interface depends on the interface medium. If the Layer 2 MTU is smaller than the Layer 3 MTU, the Cisco IOS XR software uses the Layer 2 MTU value for the Layer 3 MTU. Conversely, If the Layer 3 MTU is smaller than the Layer 2 MTU, the software uses Layer 3 MTU value. In other words the Cisco IOS XR software uses the lower of the two values for the MTU.

All devices on a physical medium must have the same protocol MTU to operate.

For BNG, ensure you run this command in the dynamic template configuration mode. To enter the dynamic template configuration mode, run **dynamic-template** command in the Global Configuration mode.

Note

Changing the MTU value (with the **mtu** interface configuration command) can affect the IPv6 MTU value. If the current IPv6 MTU value is the same as the MTU value, and you change the MTU value, the IPv6 MTU value will be modified automatically to match the new MTU. However, the reverse is not true; changing the IPv6 MTU value has no effect on the value for the **mtu** command.

Task ID

Task ID	Operations
ipv6	read, write
network	read, write

Task ID	Operations
config-services	read, write

Examples

This example (not applicable for BNG) shows how to set the maximum IPv6 packet size for GigabitEthernet interface 0/1/1/0 to 1350 bytes:

```
RP/0/RSP0/CPU0:router(config)# interface gigabitethernet 0/1/1/0
RP/0/RSP0/CPU0:router(config-if)# ipv6 mtu 1350
```

For BNG, this example shows how to set the maximum IPv6 packet size to 1350 bytes in the dynamic template configuration mode:

```
RP/0/RSP0/CPU0:router(config)# dynamic-template type ppp foo
RP/0/RSP0/CPU0:router(config-dynamic-template-type)# ipv6 mtu 1350
```

Related Commands

Command	Description
show ipv6 interface , on page 663	Displays the usability status of interfaces configured for IPv6.

ipv6 nd

To configure Neighbor Discovery (ND) subcommands, use the **ipv6 nd** command in Global Configuration mode. To disable this feature, use the **no** form of this command.

```
ipv6 nd { scavenge-timeout seconds | cos cos-value }
no ipv6 nd { scavenge-timeout seconds | cos cos-value }
```

Syntax Description		
	scavenge-timeout <i>seconds</i>	Configures the lifetime of stale ipv6 ne
	cos <i>cos-value</i>	Configures the CoS value for ND packe to 7.

Command History	Release	Modification
	Release 3.7.2	This command was introduced.
	Release 7.3.1	The command was modified to enable the configuration of CoS values for ND packets.

Usage Guidelines

When the scavenge-timer for a neighbor entry expires, the entry is cleared.

For packets with inner and outer ethernet frames, you cannot configure inner and outer CoS values separately.

Task ID	Task ID	Operations
	ipv6	read, write
	network	read, write

Examples

This example shows how to configure the timer to keep the neighbor in stale state in the cache:

```
Router(config)# ipv6 nd scavenge-timeout 3000
```

Examples

This example shows how to configure the CoS values for ND packets:

```
Router(config)# ipv6 nd cos 1
```

ipv6 nd dad attempts

To configure the number of consecutive neighbor solicitation messages that are sent on an interface while duplicate address detection is performed on the unicast IPv6 addresses of the interface, use the **ipv6 nd dad attempts** command in an appropriate configuration mode. To return the number of messages to the default value, use the **no** form of this command.

ipv6 nd dad attempts *value*

Syntax Description	<i>value</i> Number of neighbor solicitation messages. Range is 0 to 600. Configuring a value of 0 disables duplicate address detection processing on the specified interface; a value of 1 configures a single transmission without follow-up transmissions.						
Command Default	Duplicate address detection on unicast IPv6 addresses with the sending of one neighbor solicitation message is enabled. The default is one message.						
Command Modes	Interface configuration (not applicable for BNG) Dynamic template configuration (for BNG)						
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 3.7.2</td> <td>This command was introduced.</td> </tr> <tr> <td>Release 4.3.0</td> <td>This command was supported in the dynamic template configuration mode for BNG.</td> </tr> </tbody> </table>	Release	Modification	Release 3.7.2	This command was introduced.	Release 4.3.0	This command was supported in the dynamic template configuration mode for BNG.
Release	Modification						
Release 3.7.2	This command was introduced.						
Release 4.3.0	This command was supported in the dynamic template configuration mode for BNG.						
Usage Guidelines	<p>Duplicate address detection verifies the uniqueness of new unicast IPv6 addresses before the addresses are assigned to interfaces (the new addresses remain in a tentative state while duplicate address detection is performed). Duplicate address detection uses neighbor solicitation messages to verify the uniqueness of unicast IPv6 addresses.</p> <p>The DupAddrDetectTransmits node configuration variable (as specified in RFC 2462, <i>IPv6 Stateless Address Autoconfiguration</i>) is used to automatically determine the number of consecutive neighbor solicitation messages that are sent on an interface while duplicate address detection is performed on a tentative unicast IPv6 address.</p> <p>The interval between the sending of duplicate address detection neighbor solicitation messages (the duplicate address detection timeout interval) is specified by the neighbor discovery-related variable RetransTimer (as specified in RFC 2461, <i>Neighbor Discovery for IP Version 6 [IPv6]</i>), which is used to determine the time between retransmissions of neighbor solicitation messages to a neighbor when the address is being resolved or when the reachability of a neighbor is being probed. This is the same management variable used to specify the interval for neighbor solicitation messages during address resolution and neighbor unreachability detection. Use the ipv6 nd ns-interval command to configure the interval between neighbor solicitation messages that are sent during duplicate address detection.</p> <p>Duplicate address detection is suspended on interfaces that are administratively down. While an interface is administratively down, the unicast IPv6 addresses assigned to the interface are set to a pending state. Duplicate address detection is automatically restarted on an interface when the interface returns to being administratively up.</p> <p>For BNG, ensure you run this command in the dynamic template configuration mode. To enter the dynamic template configuration mode, run dynamic-template command in the Global Configuration mode.</p>						

Note An interface returning to administratively up restarts duplicate address detection for all of the unicast IPv6 addresses on the interface. While duplicate address detection is performed on the link-local address of an interface, the state for the other IPv6 addresses is still set to tentative. When duplicate address detection is completed on the link-local address, duplicate address detection is performed on the remaining IPv6 addresses.

When duplicate address detection identifies a duplicate address, the state of the address is set to duplicate and the address is not used. If the duplicate address is the link-local address of the interface, the processing of IPv6 packets is disabled on the interface and an error message similar to the following is issued:

```
ipv6_nd[145]: %IPv6_ND-3-ADDRESS_DUPLICATE : Duplicate address 111::1 has been detected
```

If the duplicate address is a global address of the interface, the address is not used and an error message similar to the following is issued:

```
%IPv6-4-DUPLICATE: Duplicate address 3000::4 on GigabitEthernet
```

All configuration commands associated with the duplicate address remain as configured while the state of the address is set to duplicate.

If the link-local address for an interface changes, duplicate address detection is performed on the new link-local address and all of the other IPv6 address associated with the interface are regenerated (duplicate address detection is performed only on the new link-local address).

Task ID	Task ID	Operations
	ipv6	read, write
	config-services	read, write

Examples

This example (not applicable for BNG) shows how to set the number of consecutive neighbor solicitation messages for interface 0/2/0/1 to 1 and then display the state (tentative or duplicate) of the unicast IPv6 address configured for an interface:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# interface gigabitethernet 0/2/0/1
RP/0/RSP0/CPU0:router(config-if)# ipv6 nd dad attempts 1
RP/0/RSP0/CPU0:router(config-if)# Uncommitted changes found, commit them before
exiting(yes/no/cancel)? [cancel]:y
```

```
RP/0/RSP0/CPU0:router# show ipv6 interface
gigabitethernet2/2/0/0 is Up, line protocol is Up
  IPv6 is disabled, link-local address unassigned
  No global unicast address is configured
gigabitethernet2/2/0/1 is Up, line protocol is Up
  IPv6 is enabled, link-local address is fe80::203:fdff:fe1b:4501
  Global unicast address(es):
    1:4::1, subnet is 1:4::/64 [DUPLICATE]
  MTU is 1514 (1500 is available to IPv6)
```

```

ICMP redirects are disabled
ND DAD is enabled, number of DAD attempts 1
ND reachable time is 0 milliseconds
ND advertised retransmit interval is 0 milliseconds
ND router advertisements are sent every 200 seconds
ND router advertisements live for 1800 seconds
Hosts use stateless autoconfig for addresses.
gigabitethernet2/2/0/2 is Shutdown, line protocol is Down
IPv6 is enabled, link-local address is fe80::200:11ff:fe11:1111 [TENTATIVE]
Global unicast address(es):
  111::2, subnet is 111::/64 [TENTATIVE]
MTU is 1514 (1500 is available to IPv6)
ICMP redirects are enabled
ND DAD is enabled, number of DAD attempts 1
ND reachable time is 0 milliseconds
ND advertised retransmit interval is 0 milliseconds
ND router advertisements are sent every 200 seconds
ND router advertisements live for 1800 seconds
Hosts use stateless autoconfig for addresses.

```

For BNG, this example shows how to display the state (tentative or duplicate) of the unicast IPv6 address on the dynamic template configuration mode:

```

RP/0/RSP0/CPU0:router(config)# dynamic-template type ppp p1
RP/0/RSP0/CPU0:router(config-dynamic-template-type)# ipv6 nd dad attempts 1

```

Related Commands

Command	Description
ipv6 nd ns-interval , on page 607	Configures the interval between IPv6 neighbor solicitation transmissions on an interface.

ipv6 nd managed-config-flag

To set the managed address configuration flag in IPv6 router advertisements, use the **ipv6 nd managed-config-flag** command in an appropriate configuration mode. To clear the flag from IPv6 router advertisements, use the **no** form of this command.

ipv6 nd managed-config-flag

Syntax Description

This command has no keywords or arguments.

Command Default

The managed address configuration flag is not set in IPv6 router advertisements.

Command Modes

Interface configuration (not applicable for BNG)
Dynamic template configuration (for BNG)

Command History

Release	Modification
Release 3.7.2	This command was introduced.
Release 4.3.0	This command was supported in the dynamic template configuration mode for BNG.

Usage Guidelines

Setting the managed address configuration flag in IPv6 router advertisements indicates to attached hosts whether they should use stateful autoconfiguration to obtain addresses. If the flag is set, the attached hosts should use stateful autoconfiguration to obtain addresses. If the flag is not set, the attached hosts should not use stateful autoconfiguration to obtain addresses.

Hosts may use stateful and stateless address autoconfiguration simultaneously.

For BNG, ensure you run this command in the dynamic template configuration mode. To enter the dynamic template configuration mode, run **dynamic-template** command in the Global Configuration mode.

Task ID

Task ID	Operations
ipv6	read, write
network	read, write
config-services	read, write

Examples

This example (not applicable for BNG) shows how to configure the managed address configuration flag in IPv6 router advertisements on GigabitEthernet interface 0/1/1/0:

```
Router(config)# interface gigabitethernet 0/1/1/0
Router(config-if)# ipv6 nd managed-config-flag
```

For BNG, this example shows how to configure the managed address configuration flag in IPv6 router advertisements on dynamic template configuration mode:

```
Router(config)# dynamic-template type ppp p1  
Router(config-dynamic-template-type)# ipv6 nd managed-config-flag
```

ipv6 nd ns-interval

To configure the interval between IPv6 neighbor solicitation retransmissions on an interface, use the **ipv6 nd ns-interval** command in an appropriate configuration mode. To restore the default interval, use the **no** form of this command.

ipv6 nd ns-interval *milliseconds*

Syntax Description

milliseconds Interval (in milliseconds) between IPv6 neighbor solicit transmissions. Range is 1000 to 3600000 (BNG) .

Command Default

0 milliseconds (unspecified) is advertised in router advertisements, and the value 1000 is used for the neighbor discovery activity of the router itself.

Command Modes

Interface configuration (not applicable for BNG)
Dynamic template configuration (for BNG)

Command History

Release	Modification
Release 3.7.2	This command was introduced.
Release 4.3.0	This command was supported in the dynamic template configuration mode for BNG.

Usage Guidelines

This value is included in all IPv6 router advertisements sent out from this interface. Very short intervals are not recommended in normal IPv6 operation. When a nondefault value is configured, the configured time is both advertised and used by the router itself.

For BNG, ensure you run this command in the dynamic template configuration mode. To enter the dynamic template configuration mode, run **dynamic-template** command in the Global Configuration mode.

Task ID

Task ID	Operations
ipv6	read, write
network	read, write
config-services	read, write

Examples

This example (not applicable for BNG) configures an IPv6 neighbor solicit transmission interval of 9000 milliseconds for GigabitEthernet interface 0/1/1/0:

```
Router(config)# interface gigabitethernet 0/1/1/0
Router(config-if)# ipv6 nd ns-interval 9000
```

For BNG, this example configures an IPv6 neighbor solicit transmission interval of 9000 milliseconds in the dynamic template configuration mode:

```
Router(config)# dynamic-template type ppp p1  
Router(config-dynamic-template-type)# ipv6 nd ns-interval 9000
```

ipv6 nd other-config-flag

To set the other stateful configuration flag in IPv6 router advertisements, use the **ipv6 nd other-config-flag** command in an appropriate configuration mode. To clear the flag from IPv6 router advertisements, use the **no** form of this command.

ipv6 nd other-config-flag

Syntax Description

This command has no keywords or arguments.

Command Default

The other stateful configuration flag is not set in IPv6 router advertisements.

Command Modes

Interface configuration (not applicable for BNG)
Dynamic template configuration (for BNG)

Command History

Release	Modification
Release 3.7.2	This command was introduced.
Release 4.3.0	This command was supported in the dynamic template configuration mode for BNG.

Usage Guidelines

The setting of the other stateful configuration flag in IPv6 router advertisements indicates to attached hosts how they can obtain autoconfiguration information other than addresses. If the flag is set, the attached hosts should use stateful autoconfiguration to obtain the other (nonaddress) information.

Note If the managed address configuration flag is set using the **ipv6 nd managed-config-flag** command, then an attached host can use stateful autoconfiguration to obtain the other (nonaddress) information regardless of the setting of the other stateful configuration flag.

For BNG, ensure you run this command in the dynamic template configuration mode. To enter the dynamic template configuration mode, run **dynamic-template** command in the Global Configuration mode.

Task ID

Task ID	Operations
ipv6	read, write
network	read, write
config-services	read, write

Examples

This example (not applicable for BNG) configures the “other stateful configuration” flag in IPv6 router advertisements on GigabitEthernet interface 0/1/1/0:

ipv6 nd other-config-flag

```
Router(config)# interface gigabitethernet 0/1/1/0
Router(config-if)# ipv6 nd other-config-flag
```

For BNG, this example configures the other stateful configuration flag for IPv6 router advertisements in the dynamic template configuration mode:

```
Router(config)# dynamic-template type ppp p1
Router(config-dynamic-template-type)# ipv6 nd other-config-flag
```

Related Commands

Command	Description
ipv6 nd managed-config-flag , on page 605	Sets the managed address configuration flag in IPv6 router advertisements.

ipv6 nd prefix

To configure how IPv6 prefixes are advertised in IPv6 router advertisements, use the **ipv6 nd prefix** command in interface configuration mode. To advertise a prefix with default parameter values, use the **no** form of this command. To prevent a prefix (or prefixes) from being advertised, use the **no-adv** keyword.

```
ipv6 nd prefix {ipv6prefix/prefix-length | default [{valid-lifetime | at | infinite | no-adv | no-autoconfig | off-link}]}
```

```
no ipv6 nd prefix {ipv6prefix/prefix-length | default [{valid-lifetime | at | infinite | no-adv | no-autoconfig | off-link}]}
```

Syntax Description	
ipv6-prefix	The IPv6 network number to include in router advertisements. This keyword must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.
/prefix-length	The length of the IPv6 prefix. A decimal value that indicates how many of the high-order contiguous bits of the address compose the prefix (the network portion of the address). A slash (/) must precede the decimal value.
default	(Optional) Specifies all prefixes.
valid-lifetime	(Optional) The amount of time (in seconds) that the specified IPv6 prefix is advertised as being valid. The range of values is 0 to 4294967295 seconds.
at	(Optional) The date and time at which the lifetime and preference expire. The prefix is valid until this specified date and time are reached. Dates are expressed in the form <i>date-valid-expire month-valid-expire hh:mm-valid-expire date-prefer-expire month-prefer-expire hh:mm-prefer-expire</i> .
infinite	(Optional) The valid lifetime does not expire.
no-adv	(Optional) The prefix is not advertised.
no-autoconfig	(Optional) Indicates to hosts on the local link that the specified prefix cannot be used for IPv6 autoconfiguration.
off-link	(Optional) Indicates that the specified prefix is assigned to the link. Nodes sending traffic to such addresses that contain the specified prefix consider the destination to be locally reachable on the link. This prefix should not be used for <i>onlink</i> determination.

Command Default All prefixes configured on interfaces that originate IPv6 router advertisements are advertised with a valid lifetime of 2592000 seconds (30 days) and a preferred lifetime of 604800 seconds (7 days), and with both the “onlink” and “autoconfig” flags set.

Command Modes Interface configuration

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines

This command allows control over the individual parameters per prefix, including whether or not the prefix should be advertised.

To control how prefixes are advertised, use the **ipv6 nd prefix** command. By default, prefixes configured as addresses on an interface using the **ipv6 address** command are advertised with default values. If you configure prefixes for advertisement using the **ipv6 nd prefix** command, only the specified prefixes are advertised with the configured values, all other prefixes are advertised with default values.

The default keyword can be used to set default parameters for all prefixes.

A date can be set to specify the expiration of a prefix. The valid and preferred lifetimes are counted down in real time. When the expiration date is reached, the prefix is no longer advertised.

When onlink is “on” (by default), the specified prefix is assigned to the link. Nodes sending traffic to such addresses that contain the specified prefix consider the destination to be locally reachable on the link.

When autoconfig is “on” (by default), it indicates to hosts on the local link that the specified prefix can be used for IPv6 autoconfiguration.

Task ID**Task ID Operations**

ipv6	read, write
------	----------------

network	read, write
---------	----------------

Examples

The following example includes the IPv6 prefix 2001:0DB8::/35 in router advertisements sent out GigabitEthernet interface 0/1/0/0 with a valid lifetime of 1000 seconds and a preferred lifetime of 900 seconds:

```
RP/0/RSP0/CPU0:router(config)# interface gigabitethernet 0/1/0/0
RP/0/RSP0/CPU0:router(config-if)# ipv6 nd prefix 2001:0DB8::/35 1000 900
```

Related Commands

Command	Description
ipv6 address, on page 588	Configures an IPv6 address and enables IPv6 processing on an interface using an EUI-64 interface ID in the low-order 64 bits of the address.
ipv6 address link-local, on page 590	Configures an IPv6 link-local address for an interface and enables IPv6 processing on the interface.

ipv6 nd ra-interval

To configure the interval between IPv6 router advertisement transmissions on an interface, use the **ipv6 nd ra-interval** command in an appropriate configuration mode. To restore the default interval, use the **no** form of this command.

ipv6 nd ra-interval *seconds*

Syntax Description

seconds The interval (in seconds) between IPv6 router advertisement transmissions.

Command Default

seconds : 200 seconds

Command Modes

Interface configuration (not applicable for BNG)
Dynamic template configuration (for BNG)

Command History

Release	Modification
Release 3.7.2	This command was introduced.
Release 4.3.0	This command was supported in the dynamic template configuration mode for BNG.

Usage Guidelines

The interval between transmissions should be less than or equal to the IPv6 router advertisement lifetime if the router is configured as a default router by using the **ipv6 nd ra-lifetime** command. To prevent synchronization with other IPv6 nodes, randomly adjust the actual value used to within 20 percent of the specified value.

For BNG, ensure you run this command in the dynamic template configuration mode. To enter the dynamic template configuration mode, run **dynamic-template** command in the Global Configuration mode.

Task ID

Task ID	Operations
ipv6	read, write
network	read, write
config-services	read, write

Examples

This example (not applicable for BNG) configures an IPv6 router advertisement interval of 201 seconds on GigabitEthernet interface 0/1/1/0:

```
Router(config)# interface gigabitethernet 0/1/1/0
Router(config-if)# ipv6 nd ra-interval 201
```

For BNG, this example configures an IPv6 router advertisement interval of 201 seconds in the dynamic template configuration mode:

ipv6 nd ra-interval

```
Router(config)# dynamic-template type ppp p1Router  
Router(config-dynamic-template-type)# ipv6 nd ra-interval 201
```

Related Commands

Command	Description
ipv6 nd ra-lifetime , on page 615	Configures the lifetime of an IPv6 router advertisement.

ipv6 nd ra-lifetime

To configure the router lifetime value in IPv6 router advertisements on an interface, use the **ipv6 nd ra-lifetime** command in an appropriate configuration mode. To restore the default lifetime, use the **no** form of this command.

ipv6 nd ra-lifetime *seconds*

Syntax Description

seconds The validity (in seconds) of this router as a default router on this interface.

Command Default

seconds : 1800 seconds

Command Modes

Interface configuration (not applicable for BNG)
Dynamic template configuration (for BNG)

Command History

Release	Modification
Release 3.7.2	This command was introduced.
Release 4.3.0	This command was supported in the dynamic template configuration mode for BNG.

Usage Guidelines

The router lifetime value is included in all IPv6 router advertisements sent out the interface. The value indicates the usefulness of the router as a default router on this interface. Setting the value to 0 indicates that the router should not be considered a default router on this interface. The router lifetime value can be set to a nonzero value to indicate that it should be considered a default router on this interface. The nonzero value for the router lifetime value should not be less than the router advertisement interval.

For BNG, ensure you run this command in the dynamic template configuration mode. To enter the dynamic template configuration mode, run **dynamic-template** command in the Global Configuration mode.

Task ID

Task ID	Operations
ipv6	read, write
network	read, write
config-services	read, write

Examples

This example (not applicable for BNG) configures an IPv6 router advertisement lifetime of 1801 seconds on GigabitEthernet interface 0/1/1/0:

```
Router(config)# interface gigabitethernet 0/1/1/0
Router(config-if)# ipv6 nd ra-lifetime 1801
```

For BNG, this example configures an IPv6 router advertisement lifetime of 1801 seconds in the dynamic template configuration mode:

```
Router(config)# dynamic-template type ppp p1  
Router(config-dynamic-template-type)# ipv6 nd ra-lifetime 1801
```

Related Commands

Command	Description

ipv6 nd ra dns server

To configure the IPv6 router advertisement of DNS server addresses on an interface, use the **ipv6 nd ra dns server** command in interface configuration mode. To remove the IPv6 router advertisement of DNS server addresses, use the **no** form of this command.

```

ipv6 nd ra dns server ipv6-address {seconds | infinite-lifetime | zero-lifetime }
no ipv6 nd ra dns server ipv6-address
no ipv6 nd ra dns server

```

Syntax Description

server <i>ipv6-address</i>	Specify the DNS server address to be advertised in an IPv6 router advertisement (RA).
<i>seconds</i> infinite-lifetime zero-lifetime	The amount of time that the DNS server is advertised in an IPv6 RA. The range for seconds is from 200 to 4294967295. The lifetime can also be specified as infinite or zero.

Command Default

The DNS server is not advertised in an IPv6 RA.

Command Modes

Interface configuration

Command History

Release	Modification
Release 6.1.1	This command was introduced.

Usage Guidelines

This configuration is not allowed for management interfaces.

You can use the **ipv6 nd ra dns server** command to configure up to five DNS server addresses in an RA.

If you configure a seconds value of zero, the DNS server will no longer be used.

Use the **no ipv6 nd ra dns server** *ipv6-address* command to delete a single DNS server under an interface.

Use the **no ipv6 nd ra dns server** command to delete all DNS servers under an interface.

Task ID

Task ID	Operations
ipv6	read, write
network	read, write
config-services	read, write

Examples

The following example configures a DNS server with an IPv6 address of 2001:DB8:1::1 to be advertised in an RA with a lifetime of 600 seconds:

```
RP/0/RSP0/CPU0:router(config)# interface GigabitEthernet 0/2/0/0
RP/0/RSP0/CPU0:router(config-if)# ipv6 nd ra dns server 2001:DB8:1::1 600
```

The following example configures a DNS server with an IPv6 address of 4::4 to be advertised in an RA with an infinite lifetime:

```
RP/0/RSP0/CPU0:router(config)# interface GigabitEthernet 0/2/0/0
RP/0/RSP0/CPU0:router(config-if)# ipv6 nd ra dns server 4::4 infinite-lifetime
```

Related Commands

show ipv6 interface , on page 663	Displays the usability status of interfaces configured for IPv6.

ipv6 nd ra dns search list

To configure the IPv6 router advertisement of DNS search list on an interface, use the **ipv6 nd ra dns search list** command in interface configuration mode. To remove the IPv6 router advertisement of DNS search list, use the **no** form of this command.

```

ipv6 nd ra dns search list name {seconds | infinite-lifetime | zero-lifetime }
no ipv6 nd ra dns search list name
no ipv6 nd ra dns search list
  
```

Syntax Description		
	<i>name</i>	Specify the DNS search list to be advertised in an IPv6 router advertisement (RA).
	<i>seconds</i> infinite-lifetime zero-lifetime	The amount of time that the DNS search list is advertised in an IPv6 RA. The range for seconds is from 200 to 4294967295. The lifetime can also be specified as infinite or zero.

Command Default The DNS search list is not advertised in an IPv6 RA.

Command Modes Interface configuration

Command History	Release	Modification
	Release 6.1.1	This command was introduced.

Usage Guidelines This configuration is not allowed for management interfaces.

You can use the **ipv6 nd ra dns search list** command to configure up to 50 DNS search lists in an RA.

If you configure a seconds value of zero, the DNS server will no longer be used.

Use the **no ipv6 nd ra dns search list** *name* command to delete a single DNS search list under an interface. Use the **no ipv6 nd ra dns search list** command to delete all DNS search lists under an interface.

Task ID	Task ID	Operations
	ipv6	read, write
	network	read, write
	config-services	read, write

Examples

The following example configures a DNS search list with a name of aaa.cc.com to be advertised in an RA with an infinite lifetime:

```
RP/0/RSP0/CPU0:router(config)# interface GigabitEthernet 0/2/0/0
RP/0/RSP0/CPU0:router(config-if)# ipv6 nd ra dns search list aaa.cc.com infinite-lifetime
```

Related Commands

Command	Description

show ipv6 interface , on page 663	Displays the usability status of interfaces configured for IPv6.

ipv6 nd ra specific route

To configure specific route for a router on a specific interface, use the **ipv6 nd ra specific route** command in interface configuration mode. To delete a single or all specific routes, use the **no** form of this command.

```

ipv6 nd ra specific route prefix Lifetime {seconds | infinite-lifetime | zero-lifetime } [preference { high | medium | low }]
no ipv6 nd ra specific route prefix
no ipv6 nd ra specific route

```

Syntax Description	route <i>prefix</i>	Variable-length field containing an IP address or a prefix of an IP address to identify a route.
	Lifetime { <i>seconds</i> infinite-lifetime zero-lifetime }	The length of time the route prefix is valid for route determination specified as seconds, infinite, or zero.
	[preference { high medium low }]	(Optional) Preference for the router specified on an interface specified as high, medium, or low.

Command Default Router advertisements (RAs) are sent with the medium preference.

Command Modes Interface configuration

Command History	Release	Modification
	Release 6.1.2	This command was introduced.

Usage Guidelines This configuration is not allowed for management interfaces.

If the Lifetime is set to zero, then the host will no longer use the router for route aspect of the route information option.

If no preference is specified, then the default value for preference (medium) is used.

Use the **no ipv6 nd ra specific route** *prefix* command to delete a single specific route under an interface. Use the **no ipv6 nd ra specific route** command to delete all specific routes under an interface.

Task ID	Task ID	Operations
	ipv6	read, write
	network	read, write
	config-services	read, write

Examples The following example configures a specific route for the router on gigabit Ethernet interface 0/2/0/0:

■ **ipv6 nd ra specific route**

```
RP/0/RSP0/CPU0:router(config)# interface GigabitEthernet 0/2/0/0  
RP/0/RSP0/CPU0:router(config-if)# ipv6 nd ra specific route 3::3/116 Lifetime 1112 preference  
low
```

Task ID	Operations								
ipv6	read, write								
network	read, write								
config-services	read, write								
Examples	This example (not applicable for BNG) shows how to configure an IPv6 reachable time of 1,700,000 milliseconds for GigabitEthernet interface 0/1/1/0:								

```
Router(config)# interface gigabitethernet 0/1/1/0
Router(config-if)# ipv6 nd reachable-time 1700000
```

For BNG, this example shows how to configure an IPv6 reachable time of 1,700,000 milliseconds in the dynamic template configuration mode:

```
Router(config)# dynamic-template type ppp p1
Router(config-dynamic-template-type)# ipv6 nd reachable-time 1700000
```

ipv6 nd redirects

To send Internet Control Message Protocol (ICMP) redirect messages, use the **ipv6 nd redirects** command in interface configuration mode. To restore the system default, use the **no** form of this command.

ipv6 nd redirects
no ipv6 nd redirects

Syntax Description This command has no keywords or arguments.

Command Default The default value is disabled.

Command Modes Interface configuration

Command History	Release	Modification
	Release 3.7.2	This command was introduced.
	Release 3.9.0	No modification.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operations
	ipv6	read, write
	network	read, write

Examples

The following example shows how to redirect IPv6 nd-directed broadcasts on GigabitEthernet interface 0/2/0/2:

```
RP/0/RSP0/CPU0:router(config)# interface gigabitethernet 0/0/0/0
0/2/0/2
RP/0/RSP0/CPU0:router(config-if)# ipv6 nd redirects
```

Related Commands	Command	Description
	show ipv6 interface , on page 663	Displays the usability status of interfaces configured for IPv6.

ipv6 nd router-preference

To configure a default router preference (DRP) for the router on a specific interface, use the **ipv6 nd router-preference** command in interface configuration mode. To return to the default DRP, use the **no** form of this command.

```
ipv6 nd router-preference {high | medium | low }
no ipv6 nd router-preference
```

Syntax Description

high	Preference for the router specified on an interface is high.
medium	Preference for the router specified on an interface is medium.
low	Preference for the router specified on an interface is low.

Command Default

Router advertisements (RAs) are sent with the medium preference.

Command Modes

Interface configuration

Command History

Release	Modification
Release 6.1.1	This command was introduced.

Usage Guidelines

This configuration is not allowed for management interfaces.

RA messages are sent with the DRP configured by the `ipv6 nd router-preference` command. If no DRP is configured, RAs are sent with a medium preference.

A DRP is useful when, for example, two routers on a link may provide equivalent, but not equal-cost, routing, and policy may dictate that hosts should prefer one of the routers.

Task ID

Task ID	Operations
ipv6	read, write
network	read, write
config-services	read, write

Examples

The following example configures a DRP of high for the router on gigabit Ethernet interface 0/2/0/0:

```
RP/0/RSP0/CPU0:router(config)# interface GigabitEthernet 0/2/0/0
RP/0/RSP0/CPU0:router(config-if)# ipv6 nd router-preference high
```

Related Commands

Command	Description
ipv6 nd ra-lifetime , on page 615	Configures the lifetime of an IPv6 router advertisement.
show ipv6 interface , on page 663	Displays the usability status of interfaces configured for IPv6.

ipv6 nd suppress-ra

To suppress IPv6 router advertisement transmissions on a LAN interface, use the **ipv6 nd suppress-ra** command in an appropriate configuration mode. To reenale the sending of IPv6 router advertisement transmissions on a LAN interface, use the **no** form of this command.

ipv6 nd suppress-ra

Syntax Description	This command has no keywords or arguments.								
Command Default	IPv6 router advertisements are automatically sent on other types of interlaces if IPv6 unicast routing is enabled on the interfaces. IPv6 router advertisements are not sent on other types of interfaces.								
Command Modes	Interface configuration (not applicable for BNG) Dynamic template configuration (for BNG)								
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 3.7.2</td> <td>This command was introduced.</td> </tr> <tr> <td>Release 4.3.0</td> <td>This command was supported in the dynamic template configuration mode for BNG.</td> </tr> <tr> <td>Release 7.10.1</td> <td>This command was supported in the cnbng-nal configuration mode for Cloud Native BNG.</td> </tr> </tbody> </table>	Release	Modification	Release 3.7.2	This command was introduced. Release 4.3.0	This command was supported in the dynamic template configuration mode for BNG.								
Release 7.10.1	This command was supported in the cnbng-nal configuration mode for Cloud Native BNG.								
Usage Guidelines	<p>Use the no ipv6 nd suppress-ra command to enable the sending of IPv6 router advertisement transmissions on non-LAN interface types (for example, serial or tunnel interfaces).</p> <p>For BNG, ensure you run this command in the dynamic template configuration mode. To enter the dynamic template configuration mode, run dynamic-template command in the Global Configuration mode.</p>								

Task ID	Task ID	Operations
	ipv6	read, write
	network	read, write
	config-services	read, write

Examples

This example (not applicable for BNG) shows how to suppress IPv6 router advertisements on GigabitEthernet interface 0/1/1/0:

```
Router(config)# interface gigabitethernet 0/1/1/0
Router(config-if)# ipv6 nd suppress-ra
```

For BNG, this example shows how to suppress IPv6 router advertisements in the dynamic template configuration mode:

```
Router(config)# dynamic-template type ppp p1  
Router(config-dynamic-template-type)# ipv6 nd suppress-ra
```

For Cloud Native BNG, this example shows how to suppress IPv6 router advertisements in the cnbng-nal configuration mode:

ipv6 neighbor

To configure a static entry in the IPv6 neighbor discovery cache, use the **ipv6 neighbor** command in Global Configuration mode. To remove a static IPv6 entry from the IPv6 neighbors discovery cache, use the **no** form of this command.

ipv6 neighbor *ipv6-address interface-type interface-instance hardware-address*
no ipv6 neighbor *ipv6-address interface-type interface-instance hardware-address*

Syntax Description	
<i>ipv6-address</i>	The IPv6 address that corresponds to the local data-link address. This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.
<i>interface-type</i>	Interface type. For more information, use the question mark (?) online help function.
<i>interface-instance</i>	Either a physical interface instance or a virtual interface instance as follows: <ul style="list-style-type: none"> Physical interface instance. Naming notation is <i>rack/slot/module/port</i> and a slash between values is required as part of the notation. <ul style="list-style-type: none"> <i>rack</i>: Chassis number of the rack. <i>slot</i>: Physical slot number of the modular services card or line card. <i>module</i>: Module number. A physical layer interface module (PLIM) is always 0. <i>port</i>: Physical port number of the interface. <p>Note In references to a Management Ethernet interface located on a route processor card, the physical slot number is alphanumeric (RSP0) and the module is CPU0. Example: interface MgmtEth0/RSP0 /CPU0/0.</p> <ul style="list-style-type: none"> Virtual interface instance. Number range varies depending on interface type. <p>For more information about the syntax for the router, use the question mark (?) online help function.</p>
<i>hardware-address</i>	The local data-link address (a 48-bit address).

Command Default Static entries are not configured in the IPv6 neighbor discovery cache.

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines The **ipv6 neighbor** command is similar to the **arp** (global) command.
If an entry for the specified IPv6 address already exists in the neighbor discovery cache—learned through the IPv6 neighbor discovery process—the entry is automatically converted to a static entry.

Use the **show ipv6 neighbors** command to display static entries in the IPv6 neighbors discovery cache. A static entry in the IPv6 neighbor discovery cache has one state: reach (reachable)—The interface for this entry is up. If the interface for the entry is down, the **show ipv6 neighbors** command does not show the entry.

Note Reachability detection is not applied to static entries in the IPv6 neighbor discovery cache; therefore, the descriptions for the reach (reachable) state are different for dynamic and static cache entries. See the **show ipv6 neighbors** command for a description of the reach (reachable) state for dynamic cache entries.

The **clear ipv6 neighbors** command deletes all entries in the IPv6 neighbors discovery cache, except static entries. The **no ipv6 neighbor** command deletes a specified static entry from the neighbor discovery cache; the command does not remove dynamic entries—learned from the IPv6 neighbor discovery process—from the cache. Disabling IPv6 on an interface by using the **no ipv6 enable** or the **no ipv6 unnumbered** command deletes all IPv6 neighbor discovery cache entries configured for that interface, except static entries (the state of the entry changes to reach [reachable]).

Static entries in the IPv6 neighbor discovery cache are not modified by the neighbor discovery process.

Note Static entries for IPv6 neighbors can be configured only on IPv6-enabled LAN and ATM LAN Emulation interfaces.

Task ID

Task ID Operations

ipv6 read,
write

network read,
write

Examples

The following example shows how to configure a static entry in the IPv6 neighbor discovery cache for a neighbor with the IPv6 address 2001:0DB8::45A and link-layer address 0002.7D1A.9472 on ethernet interface 0/RSP0 /CPU0:

```
RP/0/RSP0/CPU0:router(config)# ipv6 neighbor 2001:0DB8::45A 0002.7D1A.9472
```

Related Commands

Command	Description
clear ipv6 neighbors , on page 563	Deletes all entries in the IPv6 neighbors discovery cache, except static entries.
ipv6 enable , on page 594	Disables IPv6 processing on an interface that has not been configured with an explicit IPv6 address.
show ipv6 neighbors , on page 667	Displays IPv6 neighbors discovery cache information.

ipv6 path-mtu enable

To enable the command to configure path maximum transmission unit (MTU) discovery of IPv6 packets, use the **ipv6 path-mtu enable** command in the Global Configuration mode.

ipv6 path-mtu enable

Command Default

None.

Command Modes

Global Configuration mode

Command History

Release	Modification
Release 5.3.2	This command was introduced.

Usage Guidelines

Path MTU discovery for IPv6 packets is supported only for applications using TCP and Ping protocol.

Task ID

Task ID	Operations
ipv6	read, write
network	read, write
config-services	read, write

Examples

This example shows how to enable path MTU discovery command of IPv6 packets:

```
RP/0/RSP0/CPU0:router(config)# ipv6 path-mtu enable
```

Related Commands

Command	Description
show ipv6 path-mtu, on page 672	Displays path MTU details of IPv6 packets.
clear ipv6 path-mtu, on page 564	Clears learnt path MTU values of IPv6 packets.

ipv6 path-mtu timeout

To set the maximum transmission unit (MTU) timeout value of IPv6 packets, use the **ipv6 path-mtu timeout** command in the Global Configuration mode.

ipv6 path-mtu timeout *minutes*

Syntax Description	<i>minutes</i> MTU timeout in minutes. Range is 1 to 15 minutes. Default timeout value is 10 minutes.
---------------------------	-------------------------------------------------------------------------------------------------------

Command Default	None.
------------------------	-------

Command Modes	Global Configuration mode
----------------------	---------------------------

Command History	Release	Modification
	Release 5.3.2	This command was introduced.

Usage Guidelines	Path MTU discovery for IPv6 packets is supported only for applications using TCP and Ping protocol.
-------------------------	-----------------------------------------------------------------------------------------------------

Task ID	Task ID	Operations
	ipv6	read, write
	network	read, write
	config-services	read, write

Examples

This example shows how to set path MTU timeout of IPv6 packets:

```
RP/0/RSP0/CPU0:router(config)# ipv6 path-mtu timeout 15
```

Related Commands	Command	Description
	show ipv6 path-mtu, on page 672	Displays path MTU details of IPv6 packets.
	clear ipv6 path-mtu, on page 564	Clears learnt path MTU values of IPv6 packets.

ipv6 source-route

To enable processing of the IPv6 type source (type 0) routing header, use the **ipv6 source-route** command in Global Configuration mode. To disable the processing of this IPv6 extension header, use the **no** form of this command.

ipv6 source-route
no ipv6 source-route

Syntax Description This command has no keywords or arguments.

Command Default The **no** version of the **ipv6 source-route** command is the default.

Command History	Release	Modification
	Release 4.2.0	This command was introduced.

Usage Guidelines The **no ipv6 source-route** command (which is the default) prevents hosts from performing source routing using your routers. When the **no ipv6 source-route** command is configured and the router receives a packet with a type 0 source routing header, the router drops the packet and sends an IPv6 ICMP error message back to the source and logs an appropriate debug message.

Task ID	Task ID	Operation
	network	read, write
	ipv6	read, write

Example

The following example shows how to allow the processing of any IPv6 datagrams containing a source-route header option:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# ipv6 source-route
RP/0/RSP0/CPU0:router(config)#
```

Related Commands

Command	Description
ipv4 source-route, on page 579	Allow the processing of any IPv4 datagrams containing a source-route header option.

ipv6 tcp-mss-adjust

To enable the transit traffic of TCP flows to be a Maximum Segment Size (MSS) below the GRE tunnel interface or VLAN sub-interface MTU so that traffic fragmentation is prevented when a session is established for IPv6 packets, use the **ipv6 tcp-mss-adjust** command in the interface configuration submode. To disable the transit traffic of TCP flows to be a Maximum Segment Size (MSS) below the GRE tunnel interface or VLAN sub-interface MTU, use the **no** form of this command.

ipv6 tcp-mss-adjust enable
no ipv6 tcp-mss-adjust enable

Syntax Description	enable Enables Maximum Segment Size (MSS) adjustment for tcp flows on the interface..
---------------------------	----------------------------------------------------------------------------------------------

Command Default	None
------------------------	------

Command Modes	Interface Configuration
----------------------	-------------------------

Command History	Release	Modification
	Release 4.3.2	This command was introduced.

Usage Guidelines	No specific guidelines impact the use of this command.
-------------------------	--------------------------------------------------------

Task ID	Task ID	Operation
	mpls-te	read, write
	ipv6	read, write

Example

This example shows how to enable the transit traffic of TCP flows for IPv6 packets using the **ipv6 tcp-mss-adjust** command:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# interface gigabitEthernet 0/0/0/4.20
RP/0/RSP0/CPU0:router(config-if)# ipv6 tcp-mss-adjust enable
```

Related Commands

Command	Description
ipv4 tcp-mss-adjust, on page 580	Enables the transit traffic of TCP flows to be a Maximum Segment Size (MSS) below the GRE tunnel interface or VLAN sub-interface MTU so that traffic fragmentation is prevented when a session is established for IPv4 packets.

ipv6 unreachable disable

To disable the generation of IPv6 Internet Control Message Protocol (ICMP) unreachable messages, use the **ipv6 unreachable disable** command in an appropriate configuration mode. To re-enable the generation of ICMP unreachable messages, use the **no** form of this command.

ipv6 unreachable disable

Syntax Description

This command has no keywords or arguments.

Command Default

IPv6 ICMP unreachable messages are generated.

Command Modes

Interface configuration (not applicable for BNG)
Dynamic template configuration (for BNG)

Command History

Release	Modification
Release 3.7.2	This command was introduced.
Release 4.3.0	This command was supported in the dynamic template configuration mode for BNG.

Usage Guidelines

If the software receives a nonbroadcast packet destined for itself that uses a protocol it does not recognize, it sends an ICMP protocol unreachable message to the source.

If the software receives a datagram that it cannot deliver to its ultimate destination because it knows of no route to the destination address, it replies to the originator of that datagram with an ICMP host unreachable message.

This command affects a number of ICMP unreachable messages.

For BNG, ensure you run this command in the dynamic template configuration mode. To enter the dynamic template configuration mode, run **dynamic-template** command in the Global Configuration mode.

Task ID

Task ID	Operations
ipv6	read, write
network	read, write
config-services	read, write

Examples

This example (not applicable for BNG) shows how to disable the generation of ICMP unreachable messages on GigabitEthernet interface 0/6/0/0:

```
RP/0/RSP0/CPU0:router(config)# interface gigabitethernet 0/6/0/0
RP/0/RSP0/CPU0:router(config-if)# ipv6 unreachable disable
```

For BNG, this example shows how to disable the generation of ICMP unreachable messages on dynamic template configuration mode:

```
RP/0/RSP0/CPU0:router(config)# dynamic-template type ppp foo  
RP/0/RSP0/CPU0:router(config-dynamic-template-type)# ipv6 unreachable disable
```

ipv6 virtual address

To define an IPv6 virtual address for a network of management Ethernet interfaces, use the **ipv6 virtual address** command in Global Configuration mode. To remove an IPv6 virtual address from the configuration, use the **no** form of this command.

```
ipv6 virtual address {[vrf vrf-name] ipv6-address/prefix-length | use-as-src-addr}
no ipv6 virtual address {[vrf vrf-name] ipv6-address/prefix-length | use-as-src-addr}
```

Syntax Description		
vrf vrf-name	(Optional) Configures the virtual address on a per VPN routing and forwarding (VRF) basis for the management interfaces. The <i>vrf-name</i> argument specifies the name of the VRF.	
<i>ipv6 address</i>	The virtual IPv6 address to be used.	
<i>prefix-length</i>	The length of the IPv6 prefix. A decimal value that indicates how many of the high-order contiguous bits of the address comprise the prefix (the network portion of the address). A slash mark must precede the decimal value.	
use-as-src-addr	Enables the virtual address to be used as the default SRC address on sourced packets.	

Command Default No IPv6 virtual address is defined for the configuration.

Command History	Release	Modification
	Release 5.3.1	This command was introduced.

Usage Guidelines

Configuring an IPv6 virtual address enables you to access the router from a single virtual address with a management network. An IPv6 virtual address persists across route processor (RP) failover situations.

Configuring an IPv6 virtual address enables you to access a dual RP router from a single address without prior knowledge of which RP is active. An IPv6 virtual address persists across RP failovers. For this to happen, the virtual IPv6 address must share a common IPv6 subnet with a Management Ethernet interface on both RPs.

If you disable the **ipv6 virtual address** command with the **vrf** keyword, the virtual IP address is unconfigured for the corresponding VRF or for the default if no VRF is specified. This results in the removal of the entry for the virtual IP address in the VRF table and in the ARP cache.

The default VRF is chosen when no VRF is specified. The virtual IP address is activated on a management interface that is attached to a default VRF.

The **use-as-src-addr** keyword eliminates the need for configuring a loopback interface as the source interface (that is, update source) for management applications. When an update source is not configured, management applications allow the transport processes (TCP, UDP, raw_ip) to pick a suitable source address. The transport processes, in turn, consult the FIB to do so. If a Management Ethernet's IP address is picked as the source address and if the **use-as-src-addr** keyword is configured, then the transport processes replace the Management Ethernet's IP address with a relevant virtual IP address. This functionality works across RP switchovers.

Task ID	Task ID	Operations
	ipv6	read, write
	network	read, write

Examples

The following example shows how to define an IPv6 virtual address:

```
RP/0/RSP0/CPU0:router(config)# ipv6 virtual address 0:0:0:7272::72/64
```

The following example shows how to configure the virtual IP addresses for management interfaces on a per VRF basis:

```
RP/0/RSP0/CPU0:router(config)# ipv6 virtual address vrf ppp 0:0:0:7272::72/64
```

local pool

To create one or more local address pools from which IP addresses are assigned when a peer connects, use the **local pool** command in Global Configuration mode. To restore the default behavior, use the **no** form of this command.

```
local pool [ipv4] [vrf vrf_name] {poolname | default} first-ip-address [last-ip-address]
no local pool [ipv4] [vrf vrf_name] {poolname | default} first-ip-address [last-ip-address]
```

Syntax Description		
vrf		Specifies that a VRF name will be given. If its parameter is missing, the default VRF is assumed.
<i>vrf_name</i>		Specifies the name of the VRF to which the addresses of the pool belongs. If no name is given, the default VRF is assumed.
default		Creates a default local IPv4 address pool that is used if no other pool is named.
<i>poolname</i>		Specifies the name of the local IPv4 address pool.
<i>first-ip-address</i>		Specifies the first address in an IPv4 address range. If high-IP-address is not specified, the address range is considered to have only one address.
<i>last-ip-address</i>	(Optional)	Specifies the last address in an IPv4 address range. If high-IP-address is not specified, the address range is considered to have only one address.

Command Default Special default pool if VRF is not specified. By default, this functionality is disabled.

Command Modes Global Configuration mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines Use this command to create local address pools to use in assigning IP addresses when a peer connects. You can also add range of IP addresses to an existing pool. If no pool name is specified, the pool with the name "default" is used.

The optional **vrf** keyword and associated *vrf_name* allows the association of an IPv4 address pool with a named VRF. Any IPv4 address pool created without the **vrf** keyword automatically becomes a member of a default VRF. An IPv4 address pool name can be associated with only one VRF. Subsequent use of the same pool name, within a pool group, is treated as an extension of that pool, and any attempt to associate an existing local IPv4 address pool name with a different VRF is rejected. Therefore, each use of a pool name is an implicit selection of the associated VRF.

Note To reduce the chances of inadvertent generation of duplicate addresses, the system allows creation of the default pool only in the default VRF.

All IPv4 address pools within a VRF are checked to prevent overlapping addresses; however, addresses may overlap across different VRFs.

Task ID	Task ID	Operations
	ipv4	read, write
	ipv6	read, write
	network	read, write

Examples

The following example creates a local IPv4 address pool named “pool2,” which contains all IPv4 addresses in the range 172.16.23.0 to 172.16.23.255:

```
RP/0/RSP0/CPU0:router(config)# local pool ipv4 pool2 172.16.23.0 172.16.23.255
```

The following example configures a pool of 1024 IP addresses:

```
RP/0/RSP0/CPU0:router(config)#no local pool ipv4 default
RP/0/RSP0/CPU0:router(config)#local pool ipv4 default 10.1.1.0 10.1.4.255
```

Note It is good practice to precede local pool definitions with a **no** form of the command to remove any existing pool, because the specification of an existing pool name is taken as a request to extend that pool with the new IPv4 addresses. To extend the pool, the **no** form of the command is not applicable.

The following example configures multiple ranges of IPv4 addresses into one pool:

```
RP/0/RSP0/CPU0:router(config)#local pool ipv4 default 10.1.1.0 10.1.9.255
RP/0/RSP0/CPU0:router(config)#local pool ipv4 default 10.2.1.0 10.2.9.255
```

The following examples show how to configure two pool groups and IPv4 address pools in the base system group:

```
RP/0/RSP0/CPU0:router(config)#local pool vrf grp1 ipv4 p1_g1 10.1.1.1 10.1.1.50
RP/0/RSP0/CPU0:router(config)#local pool vrf grp1 ipv4 p2_g1 10.1.1.100 10.1.1.110
RP/0/RSP0/CPU0:router(config)#local pool vrf grp2 ipv4 p1_g2 10.1.1.1 10.1.1.40
RP/0/RSP0/CPU0:router(config)#local pool ipv4 lp1 10.1.1.1 10.1.1.10
RP/0/RSP0/CPU0:router(config)#local pool vrf grp1 ipv4 p3_g1 10.1.2.1 10.1.2.30
RP/0/RSP0/CPU0:router(config)#local pool vrf grp2 ipv4 p2_g2 10.1.1.50 10.1.1.70
RP/0/RSP0/CPU0:router(config)#local pool ipv4 lp2 10.1.2.1 10.1.2.10
```

In this example:

- VRF grp1 consists of pools p1_g1, p2_g1, and p3_g1.
- VRF grp2 consists of pools p1_g2 and p2_g2.

- Pools lp1 and lp2 are not explicitly associated with a vrf and are therefore members of the default vrf.

Note IPv4 address 10.1.1.1 overlaps in vrfs grp1, grp2 and the default vrf . There is no overlap within any vrf that includes the default vrf.

The following examples shows the configurations of IP address pools and groups for use by a VPN and VRF:

```
RP/0/RSP0/CPU0:router(config)# local pool vrf vpn1 ipv4 p1_vpn1 10.1.1.1 10.1.1.50
RP/0/RSP0/CPU0:router(config)# local pool vrf vpn1 ipv4 p2_vpn1 10.1.1.100 10.1.1.110
RP/0/RSP0/CPU0:router(config)# local pool vrf vpn2 ipv4 p1_vpn2 10.1.1.1 10.1.1.40
RP/0/RSP0/CPU0:router(config)# local pool ipv4 lp1 10.1.1.1 10.1.1.10
RP/0/RSP0/CPU0:router(config)# local pool vrf vpn1 ipv4 p3_vpn1 10.1.2.1 10.1.2.30
RP/0/RSP0/CPU0:router(config)# local pool vrf vpn2 ipv4 p2_vpn2 10.1.1.50 10.1.1.70 group
vpn2
RP/0/RSP0/CPU0:router(config)# local pool ipv4 lp2 10.1.2.1 10.1.2.10
```

These examples show configuration of pools in two VRFs and the default VRF:

- VRF vpn1 consists of pools p1_vpn1, p2_vpn1, and p3_vpn1.
- VRF vpn2 consists of pools p1_vpn2 and p2_vpn2.
- Pools lp1 and lp2 are not associated with a VRF and therefore belong to the default VRF.

Note IPv4 address 10.1.1.1 overlaps across VRFs vpn1, vpn2 and the default VRF . There is no overlap within any VRF.

The VPN requires a configuration that selects the proper vrf by selecting the proper pool based on remote user data. Each user in a given VPN can select an address space using the pool and associated vrf appropriate for that VPN. Duplicate addresses in other VPNs (other vrfs) are not a concern, because the address space of a VPN is specific to that VPN. In the example, a user in VRF vpn1 is associated with a combination of the pools p1_vpn1, p2_vpn1, and p3_vpn1, and is allocated addresses from that address space. Addresses are returned to the same pool from which they were allocated.

show arm conflicts

To display IPv4 or IPv6 address conflict information identified by the Address Repository Manager (ARM), use the **show arm conflicts** command in EXEC mode.

```
show arm {ipv4 | ipv6} [vrf vrf-name] conflicts [{address | override | unnumbered}]
```

Syntax Description		
ipv4		Displays IPv4 address conflicts.
ipv6		Displays IPv6 address conflicts.
vrf	(Optional)	Displays VPN routing and forwarding (VRF) instance information. Available for IPv4 only.
<i>vrf-name</i>	(Optional)	Name of a VRF.
address	(Optional)	Displays address conflict information.
override	(Optional)	Displays address conflict override information.
unnumbered	(Optional)	Displays unnumbered interface conflict information.

Command Default None

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines Use the **show arm conflicts** command to display information about IPv4 or IPv6 address conflicts. You can use address conflict information to identify misconfigured IPv4 or IPv6 addresses.

Conflict information is displayed for interfaces that are forced down and for interfaces that are up.

Issuing the **show arm conflicts** command without specifying any optional keywords displays the output generated from both the **address** and **unnumbered** keywords.

Task ID	Task ID	Operations
	network	read

Examples

The following sample output is from the **show arm ipv4 conflicts** command:

```
RP/0/RSP0/CPU0:router# show arm ipv4 conflicts

F Forced down
| Down interface & addr                               Up interface & addr

F Lo2 10.1.1.2/24                                     Lo1 10.1.1.1/24

Forced down interface                               Up interface
```

```
tu2->tu1                tu1->Lo1
```

The following is sample output from the **show arm ipv4 conflicts** command with the **address** keyword:

```
RP/0/RSP0/CPU0:router# show arm ipv4 conflicts address

F Forced down
| Down interface & addr                Up interface & addr
F Lo2 10.1.1.2/24                      Lo1 10.1.1.1/24
```

The following is sample output from the **show arm ipv4 conflicts** command with the **unnumbered** keyword:

```
RP/0/RSP0/CPU0:router# show arm ipv4 conflicts unnumbered

Forced down interface                Up interface                VRF
tu2->tu1                            tu1->Lo1
```

This table describes the significant fields shown in the display.

Table 60: show arm conflicts Command Field Descriptions

Field	Description
Forced down	Legend defining a symbol that may appear in the output for this command.
Down interface & addr	Forced down interface name, type, and address.
Up interface & addr	List of interfaces that are up.
Forced down interface	Unnumbered interfaces that are in conflict and forced down.
Up interface	Unnumbered interfaces that are in conflict and are up.

show arm database

To display IPv4 or IPv6 address information stored in the Address Repository Manager (ARM) database, use the **show arm database** command in EXEC mode.

```
show arm {ipv4 | ipv6} [vrf {vrf-name}] database [{interface type interface-path-id | network
prefix / length}]
```

Syntax Description

ipv4	Displays IPv4 address information.
ipv6	Displays IPv6 address information.
vrf	(Optional) Displays VPN routing and forwarding (VRF) instance information.
<i>vrf-name</i>	(Optional) Name of a VRF.
interface	(Optional) Displays the IPv4 or IPv6 address configured on the specified interface.
<i>type</i>	(Optional) Interface type. For more information, use the question mark (?) online help function.
<i>interface-path-id</i>	Physical interface or virtual interface.
Note	Use the show interfaces command to see a list of all interfaces currently configured on the router.
	For more information about the syntax for the router, use the question mark (?) online help function.
network	(Optional) Displays addresses that match a prefix.
<i>prefix / length</i>	(Optional) Network prefix and mask. A slash (/) must precede the specified mask. The range is from 0 to 128.

Command Default

None

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

The **show arm database** command should be used to display information in the IP ARM database. Database information is displayed with the IPv4 or IPv6 address, interface type and name, and producer information.

Task ID

Task ID	Operations
network	read

Examples

The following is sample output from the **show arm database** command:

```

RP/0/RSP0/CPU0:router# show arm
ipv4 database interface loopback database

This table describes the significant fields shown in the display.

Table 61: show arm database Command Field Descriptions

Field	Description
Primary	Primary IP address.
Secondary	Secondary IP address.
Unnumbered Address	Interface is unnumbered and the address displayed is that of the referenced interface.
Interface	Interface that has this IP address.
Producer	Process that provides the IP address to the ARM.

show arm router-ids

To display the router identification information with virtual routing and forwarding table information for the Address Repository Manager (ARM), use the **show arm router-ids** command in EXEC mode.

show arm [ipv4] router-ids

Syntax Description	ipv4 (Optional) Displays IPv4 router information.
---------------------------	----------------------------------------------------------

Command Default	None
------------------------	------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	Use the show arm router-ids command with the ipv4 keyword to display the selected router ID information for the router.
-------------------------	---------------------------------------------------------------------------------------------------------------------------------------

Task ID	Task ID	Operations
	network	read

Examples

The following is sample output from the **show arm router-ids** command:

```
RP/0/RSP0/CPU0:router# show arm router-ids
Router-ID           Interface
10.10.10.10         Loopback0
```

This table describes the significant fields shown in the display.

Table 62: show arm router-ids Command Field Descriptions

Field	Description
Router-ID	Router identification.
Interface	Interface identification.

show arm registrations producers

To display producer registration information for the Address Repository Manager (ARM), use the **show arm registrations producers** command in EXEC mode.

show arm {ipv4 | ipv6} registrations producers

Syntax Description

ipv4 Displays IPv4 producer registration information.

ipv6 Displays IPv6 producer registration information.

Command Default

None

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

Use the **show arm registrations producers** command to display information on producers of IP ARM registrations. Registration information is displayed with the ID.

Task ID

Task ID	Operations
network	read

Examples

The following is sample output from the **show arm registrations producers** command:

```
RP/0/RSP0/CPU0:router# show arm ipv4 registrations producers
```

Id	Node	Producer Id	IPC Version	Connected?
0	0/0/0	ipv4_io	1.1	Y
4	0/1/0	ipv4_io	1.1	Y
3	0/2/0	ipv4_io	1.1	Y
2	0/4/0	ipv4_io	1.1	Y
1	0/6/0	ipv4_io	1.1	Y

This table describes the significant fields shown in the display.

Table 63: show arm registrations producers Command Field Descriptions

Field	Description
Id	An identifier used by the IP Address ARM (IP ARM) to keep track of the producer of the IP address.
Node	The physical node (RP/LC CPU) where the producer is running.
Producer Id	The string used by the producer when registering with IP ARM.

Field	Description
IPC Version	Version of the apis used by the producer to communicate with IP ARM.
Connected?	Status of whether the producer is connected or not.

show arm summary

To display summary information for the IP Address Repository Manager (ARM), use the **show arm summary** command in EXEC mode.

show arm {ipv4 | ipv6} summary

Syntax Description	
ipv4	Displays IPv4 summary information.
ipv6	Displays IPv6 summary information.

Command Default None

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines Use the **show arm summary** command to display a summary of the number of producers, address conflicts, and unnumbered interface conflicts in the router.

Task ID	Task ID	Operations
	network	read

Examples

The following is sample output from the **show arm summary** command:

```
Router# show arm ipv4 summary
IPv4 Producers                :          3
IPv4 address conflicts        :          0
IPv4 unnumbered interface conflicts :          0
IPv4 DB Master version        : 0x00000000
```

This table describes the significant fields shown in the display.

Table 64: show arm summary Command Field Descriptions

Field	Description
IPv4 Producers	Number of IPv4 producers on the router.
IPv4 address conflicts	Number of IPv4 address conflicts on the router.
IPv4 unnumbered interface conflicts	Number of IPv4 conflicts on unnumbered interfaces.
IPv4 DB Master version	IPv4 DB Master version

show arm vrf-summary

To display a summary of VPN routing and forwarding (VRF) instance information identified by the Address Repository Manager (ARM), use the **show arm vrf-summary** command in EXEC mode.

show arm {ipv4 | ipv6} vrf-summary

Syntax Description	
ipv4	Displays IPv4 address information.
ipv6	Displays IPv6 address information.

Command Default	None
-----------------	------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines Use the **show arm vrf-summary** command to display information about an IPv4 VPN routing and forwarding instance.

Task ID	Task ID	Operations
	network	read

Examples

The following example is output from the **show arm vrf-summary** command:

```
RP/0/RSP0/CPU0:router# show arm vrf-summary

VRF IDs:          VRF-Names:
0x60000000        default
0x60000001        vrf1
0x60000002        vrf2
```

This table describes the significant fields shown in the display.

Table 65: show arm vrf-summary Command Field Descriptions

Field	Description
VRF IDs	VPN routing and forwarding (VRF) identification (vrfid) number.
VRF-Names	Name given to the VRF.

show clns statistics

To display Connectionless Network Service (CLNS) protocol statistics, use the **show clns statistics** command in EXEC mode.

show clns statistics

Syntax Description This command has no keywords or arguments.

Command Default None

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines Use this command to display CLNS statistics.

Task ID	Task ID	Operations
	isis	read

Examples

The following is sample output from the **show clns statistics** command:

```
RP/0/RSP0/CPU0:router# show clns statistics

CLNS Statistics:
Last counter clear:                2868 seconds ago
Total number of packets sent:      0
Total number of packets received:  0
Send packets dropped, buffer overflow: 0
Send packets dropped, out of memory: 0
Send packets dropped, other:      0
Receive socket max queue size:    0
Class   Overflow/Max   Rate Limit/Max
IIH     0/0              0/0
LSP     0/0              0/0
SNP     0/0              0/0
OTHER  0/0              0/0
Total   0                0
```

This table describes the significant fields shown in the display.

Table 66: show cns traffic Command Field Descriptions

Field	Description
Class	Indicates the packet type. Packets types are as follows: <ul style="list-style-type: none">• IIH—Intermediate System-to-Intermediate-System hello packets• lsp—Link state packets• snp—Sequence number packets• other
Overflow/Max	Indicates the number of packet drops due to the socket queue being overflowed. The count displays in an x/y format where x indicates the total number of packet drops and y indicates the maximum number of drops in a row.
Rate Limit/Max	Indicates the number of packet drops due to rate limitation. The count displays in an x/y format where x indicates the total number of packet drops and y indicates the maximum number of drops in a row.

show ipv4 interface

To display the usability status of interfaces configured for IPv4, use the **show ipv4 interface** command in the EXEC mode.

show ipv4 [**vrf** *vrf-name*] **interface** [{*type interface-path-id* | **brief** | **summary**}]

Syntax Description

vrf	(Optional) Displays VPN routing and forwarding (VRF) instance information.
<i>vrf-name</i>	(Optional) Name of a VRF.
<i>type</i>	Interface type. For more information, use the question mark (?) online help function.
<i>interface-path-id</i>	Either a physical interface instance or a virtual interface instance as follows: <ul style="list-style-type: none"> Physical interface instance. Naming notation is <i>rack/slot/module/port</i> and a slash between values is required as part of the notation. <ul style="list-style-type: none"> <i>rack</i>: Chassis number of the rack. <i>slot</i>: Physical slot number of the modular services card or line card. <i>module</i>: Module number. A physical layer interface module (PLIM) is always 0. <i>port</i>: Physical port number of the interface. <p>Note In references to a Management Ethernet interface located on a route processor card, the physical slot number is alphanumeric (RSP0) and the module is CPU0. Example: interface MgmtEth0/RSP0 /CPU0/0.</p> <ul style="list-style-type: none"> Virtual interface instance. Number range varies depending on interface type. <p>For more information about the syntax for the router, use the question mark (?) online help function.</p>
brief	(Optional) Displays the primary IPv4 addresses configured on the router's interfaces and their protocol and line states.
summary	(Optional) Displays the number of interfaces on the router that are assigned, unassigned, or unnumbered.

Command Default

If VRF is not specified, the software displays the default VRF.

Command Modes

EXEC mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.
Release 4.2.0	This command was supported for BNG.

Usage Guidelines

The **show ipv4 interface** command provides output similar to the **show ipv6 interface** command, except that it is IPv4-specific.

The interface name will be displayed only if the name belongs to the VRF instance. If the *vrf-name* is not specified then the interface instance will be displayed only if the interface belongs to the default VRF.

Task ID**Task ID Operations**

ipv4	read
------	------

network	read
---------	------

Examples

This is the sample output of the **show ipv4 interface** command:

```
RP/0/RSP0/CPU0:router# show ipv4 interface

Loopback0 is Up, line protocol is Up
  Internet address is 10
  .0.0.1/8

  Secondary address 10.0.0.2/8
  MTU is 1514 (1514 is available to IP)
  Multicast reserved groups joined: 10.0.0.1
  Directed broadcast forwarding is disabled
  Outgoing access list is not set
  Inbound access list is not set
  Proxy ARP is enabled
  ICMP redirects are always sent
  ICMP unreachable are always sent
gigabitethernet0/0/0/0 is Up, line protocol is Up
  Internet address is 10.25.58.1/16
  MTU is 1514 (1500 is available to IP)
  Multicast reserved groups joined: 10.0.224.1
  Directed broadcast forwarding is disabled
  Outgoing access list is not set
  Inbound access list is not set
  Proxy ARP is enabled
  ICMP redirects are always sent
  ICMP unreachable are always sent
gigabitethernet0/0/0/0 is Shutdown, line protocol is Down
  Vrf is default (vrfid 0x60000000)
  Internet protocol processing disabled
```

This table describes the significant fields shown in the display.

Table 67: show ipv4 interface Command Field Descriptions

Field	Description
Loopback0 is Up	If the interface hardware is usable, the interface is marked “Up.” For an interface to be usable, both the interface hardware and line protocol must be up.
line protocol is Up	If the interface can provide two-way communication, the line protocol is marked “Up.” For an interface to be usable, both the interface hardware and line protocol must be up.

Field	Description
Internet address	IPv4 Internet address and subnet mask of the interface.
Secondary address	Displays a secondary address, if one has been set.
MTU	Displays the IPv4 MTU ¹⁰ value set on the interface.
Multicast reserved groups joined	Indicates the multicast groups this interface belongs to.
Directed broadcast forwarding	Indicates whether directed broadcast forwarding is enabled or disabled.
Outgoing access list	Indicates whether the interface has an outgoing access list set.
Inbound access list	Indicates whether the interface has an incoming access list set.
Proxy ARP	Indicates whether proxy ARP ¹¹ is enabled or disabled on an interface.
ICMP redirects	Specifies whether ICMPv4 ¹² redirects are sent on this interface.
ICMP unreachable	Specifies whether unreachable messages are sent on this interface.
Internet protocol processing disabled	Indicates an IPv4 address has not been configured on the interface.

¹⁰ MTU = maximum transmission unit

¹¹ ARP = Address Resolution Protocol address resolution protocol

¹² ICMPv4 = Internet Control Message Protocol internet control message protocol version 4

show local pool

To display IPv4 local pool details, use the **show local pool** command in EXEC mode.

```
show {local|other_pool_types} pool [vrf vrf_name] {ipv4 | ipv6} {default|poolname}
```

Syntax	Description
local	Specifies that the address pool is local.
vrf	Specifies that a VRF name will be given. If is parameter is missing, the default VRF is assumed.
<i>vrf_name</i>	Specifies the name of the VRF to which the addresses of the pool belongs. If no name is given, the default VRF is assumed.
default	Creates a default local IPv4 address pool that is used if no other pool is named.
<i>poolname</i>	Specifies the name of the local IPv4 address pool.

Command Default None

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operations
	ipv4	read
	network	read

Examples

The following is sample output from the **show ipv4 local pool** with a poolname of P1:

```
RP/0/RSP0/CPU0:router# show ipv4 local pool P1

Pool Begin End FreeInUse
P1 172.30.228.11172.30.228.1660
Available addresses:
172.30.228.11
172.30.228.12
172.30.228.13
172.30.228.14
172.30.228.15
172.30.228.16
Inuse addresses:
None
```

This table describes the significant fields shown in the display.

Table 68: show ipv4 local pool Command Descriptions

Field	Description
Pool	Name of the pool.
Begin	First IP address in the defined range of addresses in this pool.
End	Last IP address in the defined range of addresses in this pool.
Free	Number of addresses available.
InUse	Number of addresses in use.

Related Commands

Command	Description
local pool, on page 641	Creates one or more local address pools from which IP addresses are assigned when a peer connects.

show ipv4 traffic

To display the IPv4 traffic statistics, use the **show ipv4 traffic** command in the EXEC mode.

show ipv4 traffic [brief]

Syntax Description	brief (Optional) Displays only IPv4 and Internet Control Message Protocol version 4 (ICMPv4) traffic.						
Command Default	None						
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 3.7.2</td> <td>This command was introduced .</td> </tr> <tr> <td>Release 4.2.0</td> <td>This command was supported for BNG.</td> </tr> </tbody> </table>	Release	Modification	Release 3.7.2	This command was introduced . Task ID	Operations						
ipv4	read						
network	read						

Examples

This is the sample output of the **show ipv4 traffic** command:

```
RP/0/RSP0/CPU0:router# show ipv4 traffic

IP statistics:
  Rcvd: 16372 total, 16372 local destination
        0 format errors, 0 bad hop count
        0 unknown protocol, 0 not a gateway
        0 security failures, 0 bad source, 0 bad header
        0 with options, 0 bad, 0 unknown
  Opts: 0 end, 0 nop, 0 basic security, 0 extended security
        0 strict source rt, 0 loose source rt, 0 record rt
        0 stream ID, 0 timestamp, 0 alert, 0 cipso
  Frags: 0 reassembled, 0 timeouts, 0 couldn't reassemble
        0 fragmented, 0 fragment count
  Bcast: 0 sent, 0 received
  Mcast: 0 sent, 0 received
        Drop: 0 encapsulation failed, 0 no route, 0 too big, 0 sanity address check
  Sent: 16372 total

ICMP statistics:
  Sent: 0 admin unreachable, 0 network unreachable
        0 host unreachable, 0 protocol unreachable
        0 port unreachable, 0 fragment unreachable
        0 time to live exceeded, 0 reassembly ttl exceeded
        5 echo request, 0 echo reply
        0 mask request, 0 mask reply
```

```

    0 parameter error, 0 redirects
    5 total
Rcvd: 0 admin unreachable, 0 network unreachable
      2 host unreachable, 0 protocol unreachable
      0 port unreachable, 0 fragment unreachable
      0 time to live exceeded, 0 reassembly ttl exceeded
      0 echo request, 5 echo reply
      0 mask request, 0 mask reply
      0 redirect, 0 parameter error
      0 source quench, 0 timestamp, 0 timestamp reply
      0 router advertisement, 0 router solicitation
      7 total, 0 checksum errors, 0 unknown

UDP statistics:
    16365 packets input, 16367 packets output
    0 checksum errors, 0 no port
    0 forwarded broadcasts

TCP statistics:
    0 packets input, 0 packets output
    0 checksum errors, 0 no port

```

This table describes the significant fields shown in the display.

Table 69: show ipv4 traffic Command Field Descriptions

Field	Description
bad hop count	Occurs when a packet is discarded because its TTL ¹³ field was decremented to zero.
encapsulation failed	Usually indicates that the router had no ARP request entry and therefore did not send a datagram.
format errors	Indicates a gross error in the packet format, such as an impossible Internet header length.
IP statistics Rcvd total	Indicates the total number of local destination and other packets received in the software plane. It does not account for the IP packets forwarded or discarded in hardware.
no route	Counted when the Cisco IOS XR software discards a datagram it did not know how to route.

¹³ TTL = time-to-live

show ipv6 interface

To display the usability status of interfaces configured for IPv6, use the **show ipv6 interface** command in the EXEC mode.

```
show ipv6 [vrf vrf-name] interface [{summary | [type interface-path-id][brief [{link-local | global}]]}]
```

Syntax Description	
vrf	(Optional) Displays VPN routing and forwarding (VRF) instance information.
<i>vrf-name</i>	(Optional) Name of a VRF.
<i>type</i>	(Optional) Interface type. For more information, use the question mark (?) online help function.
<i>interface-path-id</i>	<p>(Optional) Either a physical interface instance or a virtual interface instance as follows:</p> <ul style="list-style-type: none"> Physical interface instance. Naming notation is <i>rack/slot/module/port</i> and a slash between values is required as part of the notation. <ul style="list-style-type: none"> <i>rack</i>: Chassis number of the rack. <i>slot</i>: Physical slot number of the modular services card or line card. <i>module</i>: Module number. A physical layer interface module (PLIM) is always 0. <i>port</i>: Physical port number of the interface. <p>Note In references to a Management Ethernet interface located on a route processor card, the physical slot number is alphanumeric (RSP0) and the module is CPU0. Example: interface MgmtEth0/RSP0 /CPU0/0.</p> <ul style="list-style-type: none"> Virtual interface instance. Number range varies depending on interface type. <p>For more information about the syntax for the router, use the question mark (?) online help function.</p>
brief	(Optional) Displays the primary IPv6 addresses configured on the router interfaces and their protocol and line states.
link-local	(Optional) Displays the link local IPv6 address.
global	(Optional) Displays the global IPv6 address.
summary	(Optional) Displays the number of interfaces on the router that are assigned, unassigned, or unnumbered.
Command Default	None
Command Modes	EXEC mode

show ipv6 interface

Command History	Release	Modification
	Release 3.7.2	This command was introduced.
	Release 4.3.0	This command was supported for BNG.
	Release 5.1.2	The link-local and global keywords were added to the command.

Usage Guidelines The **show ipv6 interface** command provides output similar to the **show ipv4 interface** command, except that it is IPv6-specific.

Use the **link-local** or **global** keywords along with the **brief** keyword to view the link local or global IPv6 addresses.

Task ID	Task ID	Operations
	ipv6	read

Examples

This is the sample output of the **show ipv6 interface** command:

```
RP/0/RSP0/CPU0:router# show ipv6 interface

GigabitEthernet0/2/0/0 is Up, line protocol is Up, Vrfid is default (0x60000000)
IPv6 is enabled, link-local address is fe80::212:daff:fe62:c150
Global unicast address(es):
  202::1, subnet is 202::/64
Joined group address(es): ff02::1:ff00:1 ff02::1:ff62:c150 ff02::2
  ff02::1
MTU is 1514 (1500 is available to IPv6)
ICMP redirects are disabled
ICMP unreachable are enabled
ND DAD is enabled, number of DAD attempts 1
ND reachable time is 0 milliseconds
ND advertised retransmit interval is 0 milliseconds
ND router advertisements are sent every 200 seconds
ND router advertisements live for 1800 seconds
Hosts use stateless autoconfig for addresses.
Outgoing access list is not set
Inbound access list is not set
```

This table describes the significant fields shown in the display.

Table 70: show ipv6 interface Command Field Descriptions

Field	Description
GigabitEthernet0 /3/0/0 is Shutdown, line protocol is Down	Indicates whether the interface hardware is currently active (whether line signal is present) and whether it has been taken down by an administrator. If the interface hardware is usable, the interface is marked "Up." For an interface to be usable, both the interface hardware and line protocol must be up.

Field	Description
line protocol is Up (or down)	Indicates whether the software processes that handle the line protocol consider the line usable (that is, whether keepalives are successful). If the interface can provide two-way communication, the line protocol is marked “Up.” For an interface to be usable, both the interface hardware and line protocol must be up.
IPv6 is enabled, stalled, disabled (stalled and disabled are not shown in sample output)	Indicates that IPv6 is enabled, stalled, or disabled on the interface. If IPv6 is enabled, the interface is marked “enabled.” If duplicate address detection processing identified the link-local address of the interface as being a duplicate address, the processing of IPv6 packets is disabled on the interface and the interface is marked “stalled.” If IPv6 is not enabled, the interface is marked “disabled.”
link-local address	Displays the link-local address assigned to the interface.
TENTATIVE	<p>The state of the address in relation to duplicate address detection. States can be any of the following:</p> <ul style="list-style-type: none"> • duplicate—The address is not unique and is not being used. If the duplicate address is the link-local address of an interface, the processing of IPv6 packets is disabled on that interface. • tentative—Duplicate address detection is either pending or under way on this interface. <p>Note If an address does not have one of these states (the state for the address is blank), the address is unique and is being used.</p>
Global unicast addresses	Displays the global unicast addresses assigned to the interface.
ICMP redirects	State of Internet Control Message Protocol (ICMP) IPv6 redirect messages on the interface (the sending of the messages is enabled or disabled).
ND DAD	State of duplicate address detection on the interface (enabled or disabled).
number of DAD attempts	Number of consecutive neighbor solicitation messages that are sent on the interface while duplicate address detection is performed.
ND reachable time	Displays the neighbor discovery reachable time (in milliseconds) assigned to this interface.

This is the sample output of the **show ipv6 interface brief link-local** command:

```
RP/0/RSP0/CPU0:router#show ipv6 interface brief link-local
```

```
Interface                IPv6-Address           Status    Protocol
GigabitEthernet0/0/0/0  fe80::fe:8ff:feeb:26c5 Up        Up
GigabitEthernet0/0/0/1  fe80::4f:88ff:fea0:8c9d Up        Up
GigabitEthernet0/0/0/3  unassigned            Shutdown Down
GigabitEthernet0/0/0/4  unassigned            Shutdown Down
```

This is the sample output of the **show ipv6 interface brief global** command:

show ipv6 interface

```
RP/0/RSP0/CPU0:router#show ipv6 interface brief global
```

```
Interface                IPv6-Address            Status    Protocol
GigabitEthernet0/0/0/0  2001:db8::1            Up        Up
GigabitEthernet0/0/0/1  2001:db8::2            Up        Up
GigabitEthernet0/0/0/3  unassigned              Shutdown  Down
GigabitEthernet0/0/0/4  unassigned              Shutdown  Down
```

This is the sample output of the **show ipv6 interface type interface-path-id brief link-local** command:

```
RP/0/RSP0/CPU0:router#show ipv6 interface gigabitEthernet 0/0/0/0 brief link-local
```

```
Interface                IPv6-Address            Status    Protocol
GigabitEthernet0/0/0/0  fe80::fe:8ff:feeb:26c5 Up        Up
```

This is the sample output of the **show ipv6 interface type interface-path-id brief global** command:

```
RP/0/RSP0/CPU0:router#show ipv6 interface gigabitEthernet 0/0/0/0 brief global
```

```
Interface                IPv6-Address            Status    Protocol
GigabitEthernet0/0/0/0  2001:db8::1            Up        Up
```

This is the sample output of the **show ipv6 vrf vrf-name interface brief link-local** command:

```
RP/0/RSP0/CPU0:router#show ipv6 vrf vrf1 interface brief link-local
```

```
Interface                IPv6-Address            Status    Protocol
GigabitEthernet0/0/0/2  fe80::46:c8ff:fe22:daae Up        Up
```

This is the sample output of the **show ipv6 vrf vrf-name interface brief global** command:

```
RP/0/RSP0/CPU0:router#show ipv6 vrf vrf1 interface brief global
```

```
Interface                IPv6-Address            Status    Protocol
GigabitEthernet0/0/0/2  2001:db8::2            Up        Up
```

This is the sample output of the **show ipv6 vrf vrf-name interface type interface-path-id brief link-local** command:

```
RP/0/RSP0/CPU0:router#show ipv6 vrf vrf1 interface gigabitEthernet 0/0/0/2 brief link-local
```

```
Interface                IPv6-Address            Status    Protocol
GigabitEthernet0/0/0/2  fe80::46:c8ff:fe22:daae Up        Up
```

This is the sample output of the **show ipv6 vrf vrf-name interface type interface-path-id brief global** command:

```
RP/0/RSP0/CPU0:router#show ipv6 vrf vrf1 interface gigabitEthernet 0/0/0/2 brief global
```

```
Interface                IPv6-Address            Status    Protocol
GigabitEthernet0/0/0/2  2001:db8::2            Up        Up
```

Related Commands

Command	Description
show ipv4 interface , on page 656	Displays the usability status of interfaces configured for IPv4.

show ipv6 neighbors

To display the IPv6 neighbor discovery cache information, use the **show ipv6 neighbors** command in the EXEC mode.

```
show ipv6 neighbors [{type interface-path-id | location node-id}]
```

Syntax Description	
<i>type</i>	(Optional) Interface type. For more information, use the question mark (?) online help function.
<i>interface-path-id</i>	(Optional) Physical interface instance or a virtual interface.
	Note Use the show interfaces command to see a list of all interfaces currently configured on the router.
	For more information about the syntax for the router, use the question mark (?) online help function.
location <i>node-id</i>	(Optional) Designates a node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

Command Default All IPv6 neighbor discovery cache information is displayed.

Command History	Release	Modification
	Release 3.7.2	This command was introduced.
	Release 4.3.0	This command was supported for BNG.

Usage Guidelines When the *interface-type* and *interface-number* arguments are not specified, cache information for all IPv6 neighbors is displayed. Specifying the *interface-type* and *interface-number* arguments displays only cache information about the specified interface.

Task ID	Task ID	Operations
	ipv6	read

Examples

This is the sample output of the **show ipv6 neighbors** command when entered with an interface type and number:

```
RP/0/RSP0/CPU0:router# show ipv6 neighbors gigabitethernet 0/0/0/0

IPv6 Address                               Age Link-layer Addr State Interface
2000:0:0:4::2                               0 0003.a0d6.141e REACH gigabitethernet2
FE80::203:A0FF:FED6:141E                     0 0003.a0d6.141e REACH gigabitethernet2
3001:1::45a                                  - 0002.7d1a.9472 REACH gigabitethernet2
```

This is the sample output of the **show ipv6 neighbors** command when entered with an IPv6 address:

show ipv6 neighbors

```
RP/0/RSP0/CPU0:router# show ipv6 neighbors 2000:0:0:4::2
```

```
IPv6 Address          Age Link-layer Addr State Interface
2000:0:0:4::2        0 0003.a0d6.141e REACH gigabitethernet2
```

This is the sample output of the **show ipv6 neighbors** command:

```
RP/0/RSP0/CPU0:router# show ipv6 neighbors
```

This table describes significant fields shown in the display.

Table 71: show ipv6 neighbors Command Field Descriptions

Field	Description
IPv6 Address	IPv6 address of neighbor or interface.
Age	Time (in minutes) since the address was confirmed to be reachable. A hyphen (-) indicates a static entry.
Link-layer Addr	MAC address. If the address is unknown, a hyphen (-) is displayed.
State	<p>The state of the neighbor cache entry. These are the states for dynamic entries in the IPv6 neighbor discovery cache:</p> <ul style="list-style-type: none"> • INCOMP (incomplete)—Address resolution is being performed on the entry. A neighbor solicitation message has been sent to the solicited-node multicast address of the target, but the corresponding neighbor advertisement message has not yet been received. • reach (reachable)—Positive confirmation was received within the last ReachableTime milliseconds that the forward path to the neighbor was functioning properly. While in reach state, the device takes no special action as packets are sent. • stale—More than ReachableTime milliseconds have elapsed since the last positive confirmation was received that the forward path was functioning properly. While in stale state, the device takes no action until a packet is sent. • delay—More than ReachableTime milliseconds have elapsed since the last positive confirmation was received that the forward path was functioning properly. A packet was sent within the last DELAY_FIRST_PROBE_TIME seconds. If no reachability confirmation is received within DELAY_FIRST_PROBE_TIME seconds of entering the delay state, send a neighbor solicitation message and change the state to probe. • probe—A reachability confirmation is actively sought by resending neighbor solicitation messages every RetransTimer milliseconds until a reachability confirmation is received. <p>These are the possible states for static entries in the IPv6 neighbor discovery cache:</p> <ul style="list-style-type: none"> • reach (reachable)—The interface for this entry is up. • INCOMP (incomplete)—The interface for this entry is down. <p>Note Reachability detection is not applied to static entries in the IPv6 neighbor discovery cache; therefore, the descriptions for the INCOMP (incomplete) and reach (reachable) states are different for dynamic and static cache entries.</p>

show ipv6 neighbors

Field	Description
Interface	Interface from which the address is reachable.

Related Commands

Command	Description
show ipv6 neighbors summary , on page 671	Displays summary information for the neighbor entries.

show ipv6 neighbors summary

To display summary information for the neighbor entries, use the **show ipv6 neighbors summary** command in the EXEC mode.

show ipv6 neighbors summary

Syntax Description

None

Command Default

The default value is disabled.

Command Modes

EXEC mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.
Release 4.3.0	This command was supported for BNG.

Usage Guidelines

No specific guidelines impact the use of this command.

Task ID

Task ID	Operations
ipv6	read

Examples

This is the sample output of the **show ipv6 neighbors summary** command that shows the summary information for the neighbor entries:

```
RP/0/RSP0/CPU0:router# show ipv6 neighbors summary

Mcast nbr entries:
  Subtotal: 0
Static nbr entries:
  Subtotal: 0
Dynamic nbr entries:
  Subtotal: 0

Total nbr entries: 0
```

Related Commands

Command	Description
show ipv6 neighbors , on page 667	Displays IPv6 neighbor discovery cache information.

show ipv6 path-mtu

To display path maximum transmission unit (MTU) details of IPv6 packets, use the **show ipv6 path-mtu** command in the Global Configuration mode.

```
show ipv6 path-mtu [ vrf { vrf-name | all } [ location node-id ] ] [ location node-id ]
```

Syntax Description	location node-id (Optional) The designated node. The node-id argument is entered in the <i>rack/slot/module</i> notation.
---------------------------	----------------------------------------------------------------------------------------------------------------------------------

Command Default	None.
------------------------	-------

Command Modes	Global Configuration mode
----------------------	---------------------------

Command History	Release	Modification
	Release 5.3.2	This command was introduced.

Usage Guidelines	If the location option is specified, only the details of the node specified in the location node-id keyword and argument are displayed. Path MTU discovery for IPv6 packets is supported only for applications using TCP and Ping protocol.
-------------------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Task ID	Task ID	Operations
	ipv6	read, write
	network	read, write
	config-services	read, write

Examples

This example shows how to display path MTU details of IPv6 packets:

```
RP/0/RSP0/CPU0:router(config)# show ipv6 path-mtu

Destination:      4::1
Interface:        GigabitEthernet0/0/0/7
VRF:              default
Path MTU:         1400
Time Left:        00:14:52
```

Related Commands

Command	Description
clear ipv6 path-mtu, on page 564	Clears learnt path MTU values of IPv6 packets.

show ipv6 traffic

To display the IPv6 traffic statistics, use the **show traffic** command in the EXEC mode.

show ipv6 traffic [brief]

Syntax Description	brief (Optional) Displays only IPv6 and Internet Control Message Protocol version 6 (ICMPv6) traffic statistics.						
Command Default	None						
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 3.7.2</td> <td>This command was introduced.</td> </tr> <tr> <td>Release 4.3.0</td> <td>This command was supported for BNG.</td> </tr> </tbody> </table>	Release	Modification	Release 3.7.2	This command was introduced. Release	Modification						
Release 3.7.2	This command was introduced.						
Release 4.3.0	This command was supported for BNG.						
Usage Guidelines	The show ipv6 traffic command provides output similar to the show ipv4 traffic command, except that it is IPv6-specific.						
Task ID	<table border="1"> <thead> <tr> <th>Task ID</th> <th>Operations</th> </tr> </thead> <tbody> <tr> <td>ipv6</td> <td>read</td> </tr> <tr> <td>network</td> <td>read</td> </tr> </tbody> </table>	Task ID	Operations	ipv6	read	network	read
Task ID	Operations						
ipv6	read						
network	read						

Examples

This is the sample output of the **show ipv6 traffic** command:

```
RP/0/RSP0/CPU0:router# show ipv6 traffic

IPv6 statistics:
Rcvd: 0 total, 0 local destination
      0 source-routed, 0 truncated
      0 format errors, 0 hop count exceeded
      0 bad header, 0 unknown option, 0 bad source
      0 unknown protocol
      0 fragments, 0 total reassembled
      0 reassembly timeouts, 0 reassembly failures
      0 reassembly max drop
      0 sanity address check drops
Sent: 0 generated, 0 forwarded
      0 fragmented into 0 fragments, 0 failed
      0 no route, 0 too big
Mcast: 0 received, 0 sent

ICMP statistics:
Rcvd: 0 input, 0 checksum errors, 0 too short
      0 unknown error type
      unreach: 0 routing, 0 admin, 0 neighbor,
              0 address, 0 port, 0 unknown
      parameter: 0 error, 0 header, 0 option,
                 0 unknown
```

```

    0 hopcount expired, 0 reassembly timeout,
    0 unknown timeout, 0 too big,
    0 echo request, 0 echo reply
Sent: 0 output, 0 rate-limited
unreach: 0 routing, 0 admin, 0 neighbor,
         0 address, 0 port, 0 unknown
parameter: 0 error, 0 header, 0 option
           0 unknown
0 hopcount expired, 0 reassembly timeout,
0 unknown timeout, 0 too big,
0 echo request, 0 echo reply

Neighbor Discovery ICMP statistics:
Rcvd: 0 router solicit, 0 router advert, 0 redirect
      0 neighbor solicit, 0 neighbor advert
Sent: 0 router solicit, 0 router advert, 0 redirect
      0 neighbor solicit, 0 neighbor advert

UDP statistics:
    0 packets input, 0 checksum errors

    0 packets output

TCP statistics:s
    0 packets input, 0 checksum errors, 0 dropped
    0 packets output, 0 retransmitted

```

This table describes the significant fields shown in the display.

Table 72: show ipv6 traffic Command Field Descriptions

Field	Description
Rcvd:	Statistics in this section refer to packets received by the router.
total	Total number of packets received by the software.
local destination	Locally destined packets received by the software.
source-routed	Packets seen by the software with RH.
truncated	Truncated packets seen by the software.
bad header	An error was found in generic HBH, RH, DH, or HA. Software only.
unknown option	Unknown option type in IPv6 header.
unknown protocol	Protocol specified in the IP header of the received packet is unreachable.
Sent:	Statistics in this section refer to packets sent by the router.
forwarded	Packets forwarded by the software. If the packet cannot be forwarded in the first lookup (for example, the packet needs option processing), then the packet is not included in this count, even if it ends up being forwarded by the software.
Mcast:	Multicast packets.
ICMP statistics:	Internet Control Message Protocol statistics.

show ipv6 traffic**Related Commands**

Command	Description
show ipv4 traffic , on page 661	Displays statistics about IPv4 traffic.

show mpa client

To display information about the Multicast Port Arbitrator (MPA) clients, use the **show mpa client** command in EXEC mode.

```
show mpa client {consumers | producers}
```

Syntax Description	
consumers	Displays the clients for the consumers.
producers	Displays the clients for the producers.

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operations
	network	read

Examples

The following sample output is from the **show mpa client** command:

```
RP/0/RSP0/CPU0:router# show mpa client consumers
```

```
List of producer clients for ipv4 MPA
```

Location	Protocol	Process
0/1/CPU0	255	raw
0/1/CPU0	17	udp
0/4/CPU0	17	udp
0/4/CPU0	255	raw
0/4/CPU1	17	udp
0/4/CPU1	255	raw
0/6/CPU0	17	udp
0/6/CPU0	255	raw
0/RP1/CPU0	17	udp
0/RP1/CPU0	255	raw

show mpa groups

To display Multicast Port Arbitrator (MPA) multicast group information, use the **show mpa groups** command in EXEC mode.

show mpa groups *type interface-path-id*

Syntax Description

type Interface type. For more information, use the question mark (?) online help function.

interface-path-id Either a physical interface instance or a virtual interface instance as follows:

- Physical interface instance. Naming notation is *rack/slot/module/port* and a slash between values is required as part of the notation.
 - *rack*: Chassis number of the rack.
 - *slot*: Physical slot number of the modular services card or line card.
 - *module*: Module number. A physical layer interface module (PLIM) is always 0.
 - *port*: Physical port number of the interface.

Note In references to a Management Ethernet interface located on a route processor card, the physical slot number is alphanumeric (RSP0) and the module is CPU0. Example: interface MgmtEth0/RSP0 /CPU0/0.

- Virtual interface instance. Number range varies depending on interface type.

For more information about the syntax for the router, use the question mark (?) online help function.

Examples

The following sample output is from the **show mpa groups** command:

```
RP/0/RSP0/CPU0:router# show mpa groups gig 0/1/0/2
Mon Jul 27 04:07:19.802 DST
GigabitEthernet0/1/0/2 :-
  224.0.0.1 : includes 0, excludes 1, mode EXCLUDE
    <no source filter>
  224.0.0.2 : includes 0, excludes 1, mode EXCLUDE
```

```
<no source filter>
224.0.0.5 : includes 0, excludes 1, mode EXCLUDE
<no source filter>
224.0.0.6 : includes 0, excludes 1, mode EXCLUDE
<no source filter>
224.0.0.13 : includes 0, excludes 1, mode EXCLUDE
<no source filter>
224.0.0.22 : includes 0, excludes 1, mode EXCLUDE
<no source filter>
```

show mpa ipv4

To display information for Multicast Port Arbitrator (MPA) for IPv4, use the **show mpa ipv4** command in EXEC mode.

```
show mpa ipv4 {client {consumers | producers} | groups type interface-path-id }
```

Syntax Description	
client	Displays information about the MPA clients.
consumers	Displays the clients for the consumers.
producers	Displays the clients for the producers.
groups	Displays information about the MPA multicast group.
<i>type</i>	Interface type. For more information, use the question mark (?) online help function.
<i>interface-path-id</i>	<p>Either a physical interface instance or a virtual interface instance as follows:</p> <ul style="list-style-type: none"> Physical interface instance. show vrf

To display the contents of the VPN routing and forwarding (VRF) instance, use the **show vrf** command in EXEC mode.

show vrf {*allvrf-name*} [**detail**]

Syntax Description	all	Displays contents of all the VRFs.
	vrf-name	Name that uniquely identifies the VRF.
	detail	(Optional) Displays detailed information about the corresponding VRF.

Command Default No default behavior or values

Command History	Release	Modification
	Release 3.7.2	This command was introduced.
	Release 4.1.1	The detail keyword was added.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operations
	network	read, write

Examples The following example shows how to use the **show vrf** command:

```
RP/0/RSP0/CPU0:router# show vrf all
```

VRF	RD	RT	AFI	SAFI
vpn_1	not set	import 2:2	IPV4	Unicast
		export 2:2	IPV4	Unicast
vpn_2	not set	import 3:3	IPV4	Unicast
		export 3:3	IPV4	Unicast

This table describes the significant fields shown in the display.

Table 73: show vrf Command Field Descriptions

Field	Description
VRF	User-assigned VRF names.
RD	Displays the associated route-distinguishers for each VRF.

Field	Description
RT	Displays import and export route target extended communities.
AFI	Displays the IP address family.
SAFI	Displays the VRF topology.

The following example shows how to use the **show vrf detail** command:

```
RP/0/RSP0/CPU0:router# show v1 detail

V1; RD not set; VPN ID not set
VRF mode: Big
Description not set
Address family IPV4 Unicast
  No import VPN route-target communities
  No export VPN route-target communities
  No import route policy
  No export route policy
Address family IPV6 Unicast
  No import VPN route-target communities
  No export VPN route-target communities
  No import route policy
  No export route policy
```

Related Commands

Command	Description
vrf, on page 686	Configures a VRF instance for a routing protocol.

vrf

To configure a VPN routing and forwarding (VRF) instance for a routing protocol, use the **vrf** command in router configuration mode. To disable the VRF instance, use the **no** form of this command.

vrf *vrf-name*
no vrf *vrf-name*

Syntax Description

vrf-name Name of the VRF instance. The following names cannot be used: all, default, and global.

Command Default

All routing protocols insert their routes into a VRF's routing table.

Note The number of supported VRFs is platform specific.

Command Modes

Router configuration

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

No specific guidelines impact the use of this command.

Task ID

Task ID	Operations
ip	read,
services	write

Examples

The following example shows how to configure VRF using the **vrf** command:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router (config)# vrf client
```

vrf(address-family)

To configure the address family for a VRF instance, use the **vrf(address-family)** command in VRF configuration mode. To disable the address family, use the **no** form of this command.

```
vrf vrf-name [address-family {ipv4 | ipv6} unicast]
no vrf vrf-name [address-family {ipv4 | ipv6} unicast]
```

Syntax Description	
<i>vrf-name</i>	Name of the VRF instance.
address-family	(Optional) Enables AFI or SAFI configuration.
ipv4	Enables address-family configuration for IPv4 addresses.
ipv6	Enables address-family configuration for IPv6 addresses.
unicast	Indicates unicast topology.

Command Default None

Command Modes VRF configuration

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operations
	ip	read,
	services	write

Examples

The following example shows how to configure the address family for a VRF instance, using the **vrf (address-family)** command:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# vrf client
RP/0/RSP0/CPU0:router(config-vrf)# address-family ipv4 unicast
RP/0/RSP0/CPU0:router(config-vrf-af)#
```

Related Commands	Command	Description
	vrf, on page 686	Configures a VRF instance for a routing protocol.

vrf (description)

To add a brief description for the VRF instance being configured, use the **vrf (description)** command in VRF configuration mode. To remove a description, use the **no** form of this command.

```
vrf vrf-name [description]
no vrf vrf-name [description]
```

Syntax Description

vrf-name Name of the VRF instance.

description (Optional) Specifies a description for the VRF instance.

Command Default

No default behavior of values

Command Modes

VRF configuration

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

The description line can have a maximum of 244 characters.

Task ID

Task ID	Operations
ip services	read, write

Examples

The following example shows how to insert a description to a VRF instance using the **vrf (description)** command:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# vrf v1
RP/0/RSP0/CPU0:router(config-vrf)# description client
```

Related Commands

Command	Description
vrf, on page 686	Configures a VRF instance for a routing protocol.

vrf(fallback-vrf)

To configure a fallback VRF for a destination that does not match any routes in VRF, use the **fallback-vrf** *fallback-vrf-name* command in VRF configuration mode. To undo a configuration, use the no form of this command.

```
fallback-vrf {fallback-vrf-name | default}
no fallback-vrf [{fallback-vrf-name | default}]
```

Syntax Description	<i>fallback-vrf-name</i> Specifies a fallback VRF routing table.
	default If you use the default keyword, the global routing table is used for route lookup.

Command Default No default behavior or values.

Command Modes VRF configuration.

Command History	Release	Modification
	Release 5.1.1	This command was introduced.

Usage Guidelines To use this command, you must be in a user group associated with a task group that includes the proper task IDs. If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

If the destination prefix of a data packet does not match any routes in VRF, a default route is used to lookup the global routing table. However, using a default route needs an explicit next hop which may not be efficient. A better option is to configure a fallback VRF route so that if the destination does not have a match in the VRF table, the fallback VRF table is used.

If you configure a static default route to VRF, static default route takes precedence over the fallback VRF. The fallback VRF can either be the global routing table or a non-global VRF table. If you use the **default** keyword, the global routing table is used for route lookup.

You can configure a fallback VRF only on Cisco ASR 9000 Enhanced Ethernet Line Cards. The **fallback-vrf** command is not available on the other line cards.

Task ID	Task ID	Operations
	ip	read,
	services	write

Examples The following example shows how to configure a fallback VRF table using the **fallback-vrf** *fallback-vrf-name* command:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# vrf vrf1
```

```
RP/0/RSP0/CPU0:router(config-vrf)# fallback-vrf vrf2
```

This is the sample output of the **show cef vrf** command:

```
RP/0/RSP0/CPU0:router#show cef vrf vrf1 209.165.200.225/27

209.165.200.225/27, version 0, proxy default, internal 0x4800021 (ptr 0x716b0924) [1], 0x0
(0x7164c550), 0x0 (0x0)
Updated Sep 24 12:46:32.351

    next hop point2point
```

vrf (mhost)

To configure a multicast default interface for a particular VRF to send and receive packets from the host stack, use the **vrf (mhost)** command in VRF configuration mode. To remove the configuration, use the **no** form of this command.

```
vrf vrf-name [mhost {ipv4 | ipv6} interface]
no vrf vrf-name [mhost {ipv4 | ipv6} interface]
```

Syntax Description	
<i>vrf-name</i>	Name of the VRF instance.
mhost	(Optional) Enables the multicast host stack options.
ipv4	Specifies IPv4 address.
ipv6	Specifies IPv6 address.
interface	Specifies the default <i>multicast interface</i> .

Command Default None

Command Modes VRF configuration

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines The default interface should belong to the vrf for which its being configured.

Task ID	Task ID	Operations
	ip	read,
	services	write

Examples The following example shows how to configure VRF a multicast default interface using the **vrf(mhost)** command:

```
RP/0/RSP0/CPU0:router(config)# configvrf 101
RP/0/RSP0/CPU0:router(config-vrf)# vrf clientmhost ipv4 default-interface loop101
```

Related Commands	Command	Description
	vrf, on page 686	Configures a VRF instance for a routing protocol.

vrf mode

To enable big VRF mode, use the **vrf mode** command in the Global Configuration mode. To disable big VRF mode, use the **no** form of this command.

mode big
no mode big

Syntax Description	mode big	VRF mode big sets the maximum prefix scale to more than 64 K.
---------------------------	-----------------	---------------------------------------------------------------

Command Default By default, big VRF mode is disabled.

Command Modes Global Configuration mode

Command History	Release	Modification
	Release 4.1.1	This command was introduced.

Usage Guidelines A router maintains about 16 VRF IDs (including the default) for big VRF mode. On an existing committed vrf, the mode change is not advisable.

Task ID	Task ID	Operation
	ip-services	read, write

Example

The following example shows how to enable big mode:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# vrf v1
RP/0/RSP0/CPU0:router(config-vrf)# mode big
RP/0/RSP0/CPU0:router(config-vrf)#
```

Related Commands	Command	Description
	show vrf, on page 684	Displays the contents of the VPN routing and forwarding (VRF) instance.

NSH Based Service Chaining Commands

This chapter describes the commands available on the Cisco ASR 9000 Series Aggregation Services Router Cisco IOS XR software to configure and monitor features related to Network Service Header (NSH) based service chaining.

For detailed information about network stack concepts, configuration tasks, and examples, refer to the *IP Addresses and Services Configuration Guide for Cisco ASR 9000 Series Routers*.

- [service-function-path](#), on page 694
- [service-function-chaining path id](#), on page 695
- [service-function-chaining sf](#), on page 696
- [service-function-chaining sff](#), on page 697

service-function-path

A service function path can be associated with a class under policy configuration. To configure the service-function-path identifier prior to this association, use the command **service-function-path** command in the policy map class configuration mode.

service-function-path *path-id* **index** *index-id*

Syntax Description	<i>path-id</i> Specifies the service function path identifier.
	<i>index-id</i> Specifies index value for service function (SF) or service function forwarder (SFF).

Command Default No default action.

Command Modes Policy map class configuration

Command History	Release	Modification
	Release 6.1.1	This command was introduced.

Usage Guidelines The path identifier can have a value between 1 and 16777215 (24 bits).

Task ID	Task ID	Operations
	qos	read, write

Examples

This example shows how to configure the service function path identifier:

```
RP/0/RSP0/CPU0:router(config)# policy-map type pbr gre-policy
RP/0/RSP0/CPU0:router(config-pmap)# class type traffic gre-class
RP/0/RSP0/CPU0:router(config-pmap-c)# service-function-path 10 index 40
```

service-function-chaining path id

To define the sequence of the service function (SF) or the service function forwarder (SFF) through indices in a SF path, use the command **service-function-chaining path id** command in the service function chaining submode of the configuration mode.

```
service-function-chaining path id path-id metadata metadata-name index sf sf-name [ sf | sff sf-name / sff-name . . . ] index sff sff-name [ sf | sff sf-name / sff-name . . . ] index terminate default-action | metadata-disposition-name
```

Syntax Description	<i>path-id</i>	Specifies the service function chaining path identifier.
	<i>index</i>	Specifies index value for SF or SFF.
	sf <i>sf-name</i>	Specifies SF name.
	sff <i>sff-name</i>	Specifies SFF name.
Command Default	No default action.	
Command Modes	Service function chaining submode of the configuration mode.	
Command History	Release	Modification
	Release 6.1.1	This command was introduced.
Usage Guidelines	<p>An index defines the sequence of the SF or SFF in the SF path. The highest index value indicates that SF/SFF are placed first in the service chain. The SF path can contain more than one SFF. One SF path can have different configurations on different nodes. The index of a SFF should be greater than the index of a SF.</p> <p>The SF indices must be contiguous. Non-contiguous indices are not allowed and will be dropped by the platform. The SF index can have a value between 1 and 255 (8 bits).</p>	
Task ID	Task ID	Operations
	qos	read, write
Examples	<p>The following is a configuration example of SF path:</p> <pre>RP/0/RSP0/CPU0:router(config)# service-function-chaining path id 10 RP/0/RSP0/CPU0:router(config-service-function-chaining)# 40 sf SF-NAME RP/0/RSP0/CPU0:router(config-service-function-chaining)# 39 sff SFF-NAME RP/0/RSP0/CPU0:router(config-service-function-chaining)# 38 terminate default-action</pre>	

service-function-chaining sf

To define a service function (SF) with a name and configure reachability parameters, use the command **service-function-chaining sf** command in the service function chaining submode of the configuration mode.

service-function-chaining sf *sf-name* **locator** *locator-id* **transport** *type* **source-address ipv4** *src-addr* **destination-address ipv4** *dst-addr* **vni** *value*

Syntax Description		
sf <i>sf-name</i>		Specifies SF name.
locator <i>locator-id</i>		Defines reachability information.
transport <i>type</i>		Specifies transport type.
source-address ipv4 <i>src-addr</i>		Specifies source IPv4 address.
destination-address ipv4 <i>dst-addr</i>		Specifies destination IPv4 address.
vni <i>value</i>		Specifies Visual Networking Index (VNI) value, in the range between 4000 and 4099. See this white paper for related information.

Command Default No default action.

Command Modes Service function chaining submode of the configuration mode.

Command History	Release	Modification
	Release 6.1.1	This command was introduced.

Usage Guidelines SF can use up to one **locator** keyword to define reachability information. Reachability information includes transport type and other parameters.

Task ID	Task ID	Operations
	qos	read, write

Examples The following is a configuration example of SF with locator and reachability information:

```
Router(config)# service-function-chaining sf SFNAME
Router(config-service-function-chaining)# locator SFLOCID
Router(config-service-function-chaining)# transport vxlan-gpe
Router(config-service-function-chaining)# source-address ipv4 192.0.2.10
Router(config-service-function-chaining)# destination-address ipv4 192.0.2.20
Router(config-service-function-chaining)# vni 4010
```

service-function-chaining sff

To define a service function forwarder (SFF) with a name and configure reachability parameters, use the command **service-function-chaining sff** command in the service function chaining submode of the configuration mode.

service-function-chaining sff *sff-name* **locator** *locator-id* **transport** *type* **source-address ipv4** *src-addr* **destination-address ipv4** *dst-addr* **vni** *value*

Syntax Description	Parameter	Description
	sff <i>sff-name</i>	Specifies SFF name.
	locator <i>locator-id</i>	Defines reachability information.
	transport <i>type</i>	Specifies transport type.
	source-address ipv4 <i>src-addr</i>	Specifies source IPv4 address.
	destination-address ipv4 <i>dst-addr</i>	Specifies destination IPv4 address.
	vni <i>value</i>	Specifies Visual Networking Index (VNI) value, in the range between 4000 and 4099. See this white paper for related information.

Command Default No default action.

Command Modes Service function chaining submode of the configuration mode.

Command History	Release	Modification
	Release 6.1.1	This command was introduced.

Usage Guidelines SFF can use up to one **locator** keyword to define reachability information. Reachability information includes transport type and other parameters.

Task ID	Task ID	Operations
	qos	read, write

Examples

The following is a configuration example of SFF with locator and reachability information:

```
RP/0/RSP0/CPU0:router(config)# service-function-chaining sff SFFNAME
RP/0/RSP0/CPU0:router(config-service-function-chaining)# locator SFFLOCID
RP/0/RSP0/CPU0:router(config-service-function-chaining)# transport vxlan-gpe
RP/0/RSP0/CPU0:router(config-service-function-chaining)# source-address ipv4 192.0.2.10
RP/0/RSP0/CPU0:router(config-service-function-chaining)# destination-address ipv4 192.0.2.20
RP/0/RSP0/CPU0:router(config-service-function-chaining)# vni 4010
```

service-function-chaining sff

Proxy Mobile IPv6 Local Mobility Anchor Commands

This chapter describes the Cisco IOS XR software commands used to configure and monitor features related to the Proxy Mobile IPv6 Local Mobility Anchor (LMA).

For detailed information about Proxy Mobile IPv6 LMA concepts, configuration tasks, and examples, refer to the *IP Addresses and Services Configuration Guide for Cisco ASR 9000 Series Routers*.

aaa accounting (pmipv6-lma)

To enable Local Mobility Anchor (LMA) accounting, use the **aaa accounting** command in PMIPv6 LMA configuration mode. To disable LMA accounting, use the **no** form of this command.

```
aaa accounting [ interim interim-interval ]
no aaa accounting [ interim interim-interval ]
```

Syntax Description	<i>interim-interval</i> Interim accounting interval in minutes. It can have a value between 1 and 86400.				
Command Default	None.				
Command Modes	PMIPv6 LMA configuration				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 5.3.0</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Release 5.3.0	This command was introduced.
Release	Modification				
Release 5.3.0	This command was introduced.				
Usage Guidelines	<p>If the interim <i>interim-interval</i> option is specified, Interim-Update records are sent to the RADIUS security server at the configured <i>interim-interval</i> specified in minutes. Otherwise, only Start and Stop records are sent to the RADIUS security server.</p> <p>There are two types of accounting sessions, one for Mobile Nodes and one for tunnels. Interim-Update records are enabled only for tunnel accounting and not for Mobile Node accounting. For information about AAA/RADIUS configuration for accounting, see the <i>Authentication, Authorization, and Accounting Commands</i> chapter in Cisco ASR 9000 Series Aggregation Services Router System Security Command Reference.</p>				
Task ID	<table border="1"> <thead> <tr> <th>Task ID</th> <th>Operation</th> </tr> </thead> <tbody> <tr> <td>ipv6</td> <td>read, write</td> </tr> </tbody> </table>	Task ID	Operation	ipv6	read, write
Task ID	Operation				
ipv6	read, write				

This example shows how to enable LMA accounting:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# ipv6 mobile pmipv6-lma LMA domain cisco.com
RP/0/RSP0/CPU0:router(config-pmipv6-lma)# aaa accounting interim 2
```

address (pmipv6)

To configure the IPv4 or IPv6 address for the LMA, use the **address** command in the PMIPv6 LMA configuration mode. To remove the IPv4 or IPv6 address for the LMA, use the no form of this command.

```
address {ipv4 ipv4-address | ipv6 ipv6-address}
no address {ipv4 ipv4-address | ipv6 ipv6-address}
```

Syntax Description	
	<i>ipv4-address</i> The IPv4 address for the LMA.
	<i>ipv6-address</i> The IPv6 address for the LMA.

Command Default	None
-----------------	------

Command Modes	IPv6 LMA configuration
---------------	------------------------

Command History	Release	Modification
	Release 5.2.2	This command was introduced.

Usage Guidelines	No specific guidelines impact the use of this command.
------------------	--------------------------------------------------------

Task ID	Task ID	Operation
	ipv6	read, write

This example shows how to configure the IPv4 address for the LMA within the PMIPv6 LMA configuration mode:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# ipv6 mobile pmipv6-lma lma1 domain cisco.com
RP/0/RSP0/CPU0:router(config-pmipv6-lma)# address ipv4 192.168.0.1
```

address (pmipv6-lma-ml-cust-tpt)

To configure customer-specific IPv4 or IPv6 address for the Local Mobility Anchor (LMA) within a Mobile Local Loop (MLL), use the **address** command in the PMIPv6 LMA MLL Customer Transport configuration mode. To remove existing customer-specific IPv4 or IPv6 address, use the **no** form of this command.

```
address {ipv4 ipv4-address | ipv6 ipv6-address}
no address {ipv4 ipv4-address | ipv6 ipv6-address}
```

Syntax Description	<i>ipv4-address</i> The IPv4 address for the LMA.				
	<i>ipv6-address</i> The IPv6 address for the LMA.				
Command Default	None				
Command Modes	PMIPv6 LMA MLL Customer Transport configuration				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 5.3.0</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Release 5.3.0	This command was introduced.
Release	Modification				
Release 5.3.0	This command was introduced.				
Usage Guidelines	There can only be two instances of addresses, one for IPv4 and one for IPv6.				
Task ID	<table border="1"> <thead> <tr> <th>Task ID</th> <th>Operation</th> </tr> </thead> <tbody> <tr> <td>ipv6</td> <td>read, write</td> </tr> </tbody> </table>	Task ID	Operation	ipv6	read, write
Task ID	Operation				
ipv6	read, write				

This example shows how to configure a customer-specific IPv4 address:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# ipv6 mobile pmipv6-lma LMA domain cisco.com
RP/0/RSP0/CPU0:router(config-pmipv6-lma)# mobility-service mobile-local-loop
RP/0/RSP0/CPU0:router(config-pmipv6-lma-ml)# customer CUST1 vrf VRF1
RP/0/RSP0/CPU0:router(config-pmipv6-lma-ml-cust)# transport vrf TVRF1
RP/0/RSP0/CPU0:router(config-pmipv6-lma-ml-cust-tpt)# address ipv4 192.168.0.1
```

auth-option

To enable authentication for the Proxy Mobile IPv6 (PMIPv6) domain and for a peer MAG with the LMA, use the **auth-option** command in the appropriate configuration mode. To disable the authentication, use the no form of this command.

auth-option spi *spi-hex-value* **key ascii** *string*
no auth-option spi *spi-hex-value* **key ascii** *string*

Syntax Description		
spi <i>spi-hex-value</i>	Specifies the Security Parameter Index (SPI) in hexadecimal format. The range is from 0 to FFFFFFFF.	
key ascii	Specifies the security key in ASCII format.	
<i>string</i>	String key value.	

Command Default No authentication is set

Command Modes PMIPv6 domain configuration
 PMIPv6 LMA configuration

Command History	Release	Modification
	Release 5.2.2	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operation
	ipv6	read, write

This example shows how to configure authentication for the PMIPv6 domain:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# ipv6 mobile pmipv6-domain cisco.com
RP/0/RSP0/CPU0:router(config-pmipv6-domain)# auth-option spi FF key ascii FFD
```

auth-option (pmipv6-lma-ml-cust)

To enable customer-specific authentication in a Local Mobility Anchor (LMA) within a Mobile Local Loop (MLL), use the **auth-option** command in the PMIPv6 LMA MLL Customer configuration mode. To disable the customer-specific authentication, use the **no** form of this command.

auth-option spi *spi-hex-value* **key ascii** *string*
no auth-option spi *spi-hex-value* **key ascii** *string*

Syntax Description	
spi <i>spi-hex-value</i>	Specifies the Security Parameter Index (SPI) in hexadecimal format. The range is from 0 to FFFFFFFF.
key ascii	Specifies the security key in ASCII format.
<i>string</i>	String key value.

Command Default None.

Command Modes PMIPv6 LMA MLL Customer configuration

Command History	Release	Modification
	Release 5.3.0	This command was introduced.

Usage Guidelines This configuration overrides the global **auth-option** configuration in the PMIPv6 LMA Domain.

Task ID	Task ID	Operation
	ipv6	read, write

This example shows how to configure authentication for a customer:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# ipv6 mobile pmipv6-lma LMA domain cisco.com
RP/0/RSP0/CPU0:router(config-pmipv6-lma)# mobility-service mobile-local-loop
RP/0/RSP0/CPU0:router(config-pmipv6-lma-ml)# customer CUST1 vrf VRF1
RP/0/RSP0/CPU0:router(config-pmipv6-lma-ml-cust)# auth-option spi FF key ascii FFD
```

bce

To configure binding cache entries (BCEs) or bindings information, use the **bce** command in the PMIPv6 LMA configuration mode. To remove the BCEs information use the no form of this command.

bce {**delete-wait-time** *milliseconds* | **lifetime** *seconds* | **maximum** *number*}
no bce {**delete-wait-time** *milliseconds* | **lifetime** *seconds* | **maximum** *number*}

Syntax Description		
delete-wait-time <i>milliseconds</i>		Specifies the time that LMA must wait before it deletes a BCE of a MN, upon receiving a PBU message from a MAG with a lifetime value of 0. The time is entered in milliseconds and the range is 100-65535.
lifetime <i>seconds</i>		Specifies the permitted lifetime of a BCE in seconds. The granted lifetime is minimum of this configured value and the value received from the MAG in the PBU packet. The time is entered in seconds and the range is 10-65535.
maximum <i>number</i>		Specifies the maximum number of BCEs that the LMA can support. The range is 1-128000.

Command Default None.

Command Modes PMIPv6 LMA configuration

Command History	Release	Modification
	Release 5.2.2	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operation
	ipv6	read, write

This example shows how to configure maximum number of BCEs that LMA can support:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# ipv6 mobile pmipv6-lma lma1 domain cisco.com
RP/0/RSP0/CPU0:router(config-pmipv6-lma)# bce maximum 3400
RP/0/RSP0/CPU0:router(config-pmipv6-lma)# commit
```

This example shows how to configure permitted lifetime of a BCE:

```
RP/0/RSP0/CPU0:router(config-pmipv6-lma)# bce lifetime 2500
RP/0/RSP0/CPU0:router(config-pmipv6-lma)# commit
```

bce (pmipv6-lma-ml-cust)

To configure customer-specific permitted lifetime of binding cache entries (BCEs) in a Local Mobility Anchor (LMA) within a Mobile Local Loop (MLL), use the **bce** command in the PMIPv6 LMA MLL Customer configuration mode. To remove customer-specific BCE lifetime, use the **no** form of this command.

bce lifetime *seconds*
no bce lifetime *seconds*

Syntax Description	lifetime <i>seconds</i> Permitted lifetime of a BCE in seconds. The granted lifetime is minimum of this configured value and the value received from the MAG in the PBU packet. The time is entered in seconds and the range is 10-65535.				
Command Default	None.				
Command Modes	PMIPv6 LMA MLL Customer configuration				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 5.3.0</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Release 5.3.0	This command was introduced.
Release	Modification				
Release 5.3.0	This command was introduced.				
Usage Guidelines	This configuration overrides the global LMA BCE configuration.				
Task ID	<table border="1"> <thead> <tr> <th>Task ID</th> <th>Operation</th> </tr> </thead> <tbody> <tr> <td>ipv6</td> <td>read, write</td> </tr> </tbody> </table>	Task ID	Operation	ipv6	read, write
Task ID	Operation				
ipv6	read, write				

This example shows how to configure customer-specific lifetime of a BCE:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# ipv6 mobile pmipv6-lma LMA domain cisco.com
RP/0/RSP0/CPU0:router(config-pmipv6-lma)# mobility-service mobile-local-loop
RP/0/RSP0/CPU0:router(config-pmipv6-lma-ml)# customer CUST1 vrf VRF1
RP/0/RSP0/CPU0:router(config-pmipv6-lma-ml-cust)# bce lifetime 2500
```

bri

To configure binding revocation indication (BRI) message parameters, use the **bri** command in the appropriate configuration mode. To remove BRI message parameters, use the no form of this command.

```
bri {delay {max | min} milliseconds | retries number}
no bri {delay {max | min} milliseconds | retries number}
```

Syntax Description

delay min *milliseconds* **delay max** Specifies the minimum and maximum time in milliseconds to wait before sending a BRI message to the LMA or MAG. The range is 500-65535.

retries *number* Specifies the number of times the LMA should retransmit a BRI message. The range is 1-10.

Command Default

None.

Command Modes

PMIPv6 LMA configuration

Command History

Release	Modification
Release 5.2.2	This command was introduced.

Usage Guidelines

No specific guidelines impact the use of this command.

Task ID

Task ID	Operation
ipv6	read, write

This example shows how to configure BRI parameters for LMA:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# ipv6 mobile pmipv6-lma lma1 domain cisco.com
RP/0/RSP0/CPU0:router(config-pmipv6-lma)#bri delay max 5000
RP/0/RSP0/CPU0:router(config-pmipv6-lma)#bri delay min 500
RP/0/RSP0/CPU0:router(config-pmipv6-lma)#bri retries 5
```

customer (pmipv6-domain-nai)

To configure the name of the customer for a Mobile Node (MN) present in the PMIPv6 domain, use the **customer** command in PMIPv6 Domain NAI configuration mode. To disable the customer configuration, use the **no** form of this command.

customer *customer-name*
no customer *customer-name*

Syntax Description	<i>customer-name</i> Name of the customer.				
Command Default	None.				
Command Modes	PMIPv6 Domain NAI configuration				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 5.3.0</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Release 5.3.0	This command was introduced.
Release	Modification				
Release 5.3.0	This command was introduced.				
Usage Guidelines	The customer is configured during Local Mobility Anchor (LMA) Mobile Local Loop (MLL) service configuration.				
Task ID	<table border="1"> <thead> <tr> <th>Task ID</th> <th>Operation</th> </tr> </thead> <tbody> <tr> <td>ipv6</td> <td>read, write</td> </tr> </tbody> </table>	Task ID	Operation	ipv6	read, write
Task ID	Operation				
ipv6	read, write				

This example shows how to configure a customer to which NAI belongs:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# ipv6 mobile pmipv6-domain cisco.com
RP/0/RSP0/CPU0:router(config-pmipv6-domain)# nai example@example.com
RP/0/RSP0/CPU0:router(config-pmipv6-domain-nai)# customer CUST1
```

customer (pmipv6-lma-ml)

To configure the name and the VRF of a customer, use the **customer** command in PMIPv6 Local Mobility Anchor (LMA) Mobile Local Loop (MLL) configuration mode. To remove an existing customer, use the **no** form of this command.

customer *customer-name* **vrf** *vrf-name*
no customer *customer-name* **vrf** *vrf-name*

Syntax Description	<i>customer-name</i>	Name of the customer.
	<i>vrf-name</i>	Name of the VRF.
Command Default	None.	
Command Modes	PMIPv6 LMA MLL configuration	
Command History	Release	Modification
	Release 5.3.0	This command was introduced.
Usage Guidelines	There can be many customers, however no two customers can be configured with the same VRF.	
Task ID	Task ID	Operation
	ipv6	read, write

This example shows how to configure the name and the VRF of a customer:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# ipv6 mobile pmipv6-lma LMA domain cisco.com
RP/0/RSP0/CPU0:router(config-pmipv6-lma)# mobility-service mobile-local-loop
RP/0/RSP0/CPU0:router(config-pmipv6-lma-ml1)# customer CUST1 vrf VRF1
RP/0/RSP0/CPU0:router(config-pmipv6-lma-ml1-cust)#
```

clear ipv6 mobile pmipv6 lma binding

To clear all bindings held by the LMA, or bindings corresponding to a mobile access gateway peer (MAG), and a mobile node (MN) use the **clear ipv6 mobile pmipv6 lma binding** command in EXEC mode.

```
clear ipv6 mobile pmipv6 lma binding [{all | mag mag-identifier | nai string}]
```

Syntax Description	all	Clears all binding sessions held by the LMA.
	mag <i>mag-identifier</i>	Clears the binding sessions for the MAG.
	nai <i>string</i>	Clears the binding sessions for the MN.

Command Default None.

Command Modes EXEC mode

Command History	Release	Modification
	Release 5.2.2	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operation
	ipv6	read, write

This example shows how to clear the binding sessions for the MN:

```
RP/0/RSP0/CPU0:router# clear ipv6 mobile pmipv6 lma binding nai example@example.com
```

clear ipv6 mobile pmipv6 lma statistics

To clear PMIPv6 LMA statistics corresponding to a specified domain and a peer or a customer, use the **clear ipv6 mobile pmipv6 lma statistics** in EXEC mode.

clear ipv6 mobile pmipv6 lma statistics [**domain** *domain-name* **peer** *peer-id* | **customer** *customer-name*]

Syntax Description	domain <i>domain-name</i>	Clears LMA statistics for the domain specified.
	peer <i>peer-id</i>	Clears peer MAG statistics.
	customer <i>customer-name</i>	Clears statistics of a specific customer.
Command Default	None.	
Command Modes	EXEC mode	
Command History	Release	Modification
	Release 5.2.2	This command was introduced.
	Release 5.3.1	The customer <i>customer-name</i> keyword was added to this command.
Usage Guidelines	No specific guidelines impact the use of this command.	
Task ID	Task ID	Operation
	ipv6	read, write

This example shows how to clear all LMA statistics:

```
RP/0/RSP0/CPU0:router# clear ipv6 mobile pmipv6 lma statistics
```

default profile

To enable the default profile for the mobile node (MN), use the **default profile** command in Local Mobility Anchor (LMA) configuration mode. To disable the default profile, use the no form of this command.

default profile *name*
no default profile *name*

Syntax Description	<i>name</i> Profile name of the MN.				
Command Default	The default profile is disabled.				
Command Modes	PMIPv6 LMA configuration				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 5.2.2</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Release 5.2.2	This command was introduced.
Release	Modification				
Release 5.2.2	This command was introduced.				
Usage Guidelines	No specific guidelines impact the use of this command.				
Task ID	<table border="1"> <thead> <tr> <th>Task ID</th> <th>Operation</th> </tr> </thead> <tbody> <tr> <td>ipv6</td> <td>read, write</td> </tr> </tbody> </table>	Task ID	Operation	ipv6	read, write
Task ID	Operation				
ipv6	read, write				

This example shows how to configure the default profile for the MN:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# ipv6 mobile pmipv6-lma lma1 domain cisco.com
RP/0/RSP0/CPU0:router(config-pmipv6-lma)#address ipv6 2031:D8:0:0:FF00::F0
RP/0/RSP0/CPU0:router(config-pmipv6-lma)#default profile profile1
```

dscp control-plane (pmipv6-lma)

To configure the value of Differentiated Services Code Point (DSCP) in the outgoing PMIPv6 control plane messages, use the **dscp control-plane** command in PMIPv6 LMA configuration mode. To disable DSCP value configuration, use the **no** form of this command.

```
dscp control-plane dscp-value [ force ]
no dscp control-plane dscp-value [ force ]
```

Syntax Description	<i>dscp-value</i> DSCP value. It can have a value between 1 and 63.
---------------------------	---------------------------------------------------------------------

Command Default	None.
------------------------	-------

Command Modes	PMIPv6 LMA configuration
----------------------	--------------------------

Command History	Release	Modification
	Release 5.3.0	This command was introduced.

Usage Guidelines	The outgoing PMIPv6 control plane messages include locally generated packets such as Proxy Binding Revocation Indications (PBRIs), Proxy Binding Revocation Acknowledgments (PBRAs), Heartbeat Requests, and packets sent in response to packets received from MAG such as Proxy Binding Acknowledgments (PBAs), PBRIs, PBRAs, and Heartbeat Responses.
-------------------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

If *dscp-value* is not specified, then the DSCP received in a request is used in the outgoing response packet. DSCP is not set in the other outgoing packets.

If *dscp-value* is specified without the **force** option:

- The configured DSCP value is set in locally generated packets.
- If the received packet does not have DSCP marking, the configured value is set in the outgoing packet.
- If the received packet has DSCP marking that matches the configured value, then the DSCP received is set in the outgoing response packet.
- If the received packet has DSCP marking that does not match the configured value, then the DSCP received is used in the outgoing response packet.

If *dscp-value* is specified with the **force** option, then the configured DSCP value is set in all outgoing packets.

Task ID	Task ID	Operation
	ipv6	read, write

This example shows how to configure a DSCP value:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# ipv6 mobile pmipv6-lma LMA domain cisco.com
RP/0/RSP0/CPU0:router(config-pmipv6-lma)# dscp control-plane 45
```

dscp control-plane (pmipv6-lma-mag)

To configure the value of Differentiated Services Code Point (DSCP) in the outgoing PMIPv6 control plane messages to the peering Mobile Access Gateway (MAG), use the **dscp control-plane** command in PMIPv6 LMA MAG configuration mode. To disable DSCP value configuration, use the **no** form of this command.

dscp control-plane *dscp-value* [**force**]
no dscp control-plane *dscp-value* [**force**]

Syntax Description	<i>dscp-value</i> DSCP value. It can have a value between 1 and 63.
---------------------------	---------------------------------------------------------------------

Command Default	None.
------------------------	-------

Command Modes	PMIPv6 LMA MAG configuration
----------------------	------------------------------

Command History	Release	Modification
	Release 5.3.0	This command was introduced.

Usage Guidelines This command overrides the **dscp control-plane** command configured at LMA global level. The outgoing PMIPv6 control plane messages include locally generated packets such as Proxy Binding Revocation Indications (PBRIs), Proxy Binding Revocation Acknowledgments (PBRAs), Heartbeat Requests, and packets sent in response to packets received from MAG such as Proxy Binding Acknowledgments (PBAs), PBRIs, PBRAs, and Heartbeat Responses.

If *dscp-value* is not specified, then the DSCP received in a request is used in the outgoing response packet. DSCP is not set in the other outgoing packets.

If *dscp-value* is specified without the **force** option:

- The configured DSCP value is set in locally generated packets.
- If the received packet does not have DSCP marking, the configured value is set in the outgoing packet.
- If the received packet has DSCP marking that matches the configured value, then the DSCP received is set in the outgoing response packet.
- If the received packet has DSCP marking that does not match the configured value, then the DSCP received is used in the outgoing response packet.

If *dscp-value* is specified with the **force** option, then the configured DSCP value is set in all outgoing packets.

Task ID	Task ID	Operation
	ipv6	read, write

This example shows how to configure a DSCP value:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# ipv6 mobile pmipv6-lma lma domain cisco.com
RP/0/RSP0/CPU0:router(config-pmipv6-lma)# mag mag1 dn1
RP/0/RSP0/CPU0:router(config-pmipv6-lma-mag)# dscp control-plane 30
```

dynamic mag learning

To enable local mobility anchor (LMA) to accept proxy mobile IPv6 (PMIPv6) signaling messages from any MAG that is not locally configured, use the **dynamic mag learning** command in PMIPv6 LMA configuration mode. To enable the LMA to reject the PMIPv6 signaling messages from any MAG that is not locally configured, use the no form of the command.

dynamic mag learning
no dynamic mag learning

Syntax Description This command has no keywords or arguments.

Command Default LMA does not accept PMIPv6 signaling messages from any MAG that is not locally configured.

Command Modes PMIPv6 LMA configuration

Command History	Release	Modification
	Release 5.2.2	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operation
	ipv6	read, write

This example shows how to enable LMA to accept proxy mobile IPv6 (PMIPv6) signaling messages from any MAG that is not locally configured:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# ipv6 mobile pmipv6-lma lma1 domain cisco.com
RP/0/RSP0/CPU0:router(config-pmipv6-lma)#dynamic mag learning
```

enforce heartbeat-to-mag (pmipv6-lma)

To enforce the values of Local Mobility Anchor (LMA) heartbeat parameters on the Mobile Access Gateway (MAG), use the **enforce heartbeat-to-mag** command in PMIPv6 LMA configuration mode. To disable this enforcement, use the **no** form of this command.

enforce heartbeat-to-mag
no enforce heartbeat-to-mag

Syntax Description This command has no keywords or arguments.

Command Default None.

Command Modes PMIPv6 LMA configuration

Command History	Release	Modification
	Release 5.3.1	This command was introduced.

Usage Guidelines Use this command to enforce on the MAG the values of heartbeat parameters (interval, retries and timeout) that are configured on the LMA either at the global level or at the peer/customer level. If heartbeat is configured both at the global and peer/customer levels, the values to be enforced on the MAG are used from the peer/customer level.

Task ID	Task ID	Operation
	ipv6	read, write

This example shows how to enforce heartbeat values on the MAG:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# ipv6 mobile pmipv6-lma LMA domain cisco.com
RP/0/RSP0/CPU0:router(config-pmipv6-lma)# enforce heartbeat-to-mag
```

heartbeat (pmipv6-lma)

To configure Local Mobility Anchor (LMA) heartbeat options, use the **heartbeat interval** command in PMIPv6 LMA configuration mode. To disable LMA heartbeat options, use the **no** form of this command.

heartbeat interval *interval-value* **retries** *retries-value* **timeout** *timeout-value*
no heartbeat interval *interval-value* **retries** *retries-value* **timeout** *timeout-value*

Syntax Description	
<i>interval-value</i>	Interval between two heartbeat messages in seconds. It can have a value between 10 and 3600.
<i>retries-value</i>	Number of retries (in the absence of reply from the peer) before the path to the peer is declared as down. It can have a value between 1 and 10.
<i>timeout-value</i>	Timeout value to wait for a response from the peer after which the request is declared as timed out.

Command Default None.

Command Modes PMIPv6 LMA configuration

Command History	Release	Modification
	Release 5.3.0	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operation
	ipv6	read, write

This example shows how to configure heartbeat options for LMA:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# ipv6 mobile pmipv6-lma LMA domain cisco.com
RP/0/RSP0/CPU0:router(config-pmipv6-lma)# heartbeat interval 20 retries 5 timeout 10
```

heartbeat (pmipv6-lma-ml-cust)

To configure customer-specific heartbeat options in a Local Mobility Anchor (LMA) within a Mobile Local Loop (MLL), use the **heartbeat interval** command in PMIPv6 LMA MLL Customer configuration mode. To disable customer-specific heartbeat options, use the **no** form of this command.

heartbeat interval *interval-value* **retries** *retries-value* **timeout** *timeout-value*
no heartbeat interval *interval-value* **retries** *retries-value* **timeout** *timeout-value*

Syntax Description	<i>interval-value</i>	Interval between two heartbeat messages in seconds. It can have a value between 10 and 3600.
	<i>retries-value</i>	Number of retries (in the absence of reply from the peer) before the path to the peer is declared as down. It can have a value between 1 and 10.
	<i>timeout-value</i>	Timeout value to wait for a response from the peer after which the request is declared as timed out.
Command Default	None.	
Command Modes	PMIPv6 LMA MLL Customer configuration	
Command History	Release	Modification
	Release 5.3.0	This command was introduced.
Usage Guidelines	This command overrides the global LMA heartbeat configuration.	
Task ID	Task ID	Operation
	ipv6	read, write

This example shows how to configure heartbeat options for a customer:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# ipv6 mobile pmipv6-lma LMA domain cisco.com
RP/0/RSP0/CPU0:router(config-pmipv6-lma)# mobility-service mobile-local-loop
RP/0/RSP0/CPU0:router(config-pmipv6-lma-ml) # customer CUST1 vrf VRF1
RP/0/RSP0/CPU0:router(config-pmipv6-lma-ml-cust) # heartbeat interval 30 retries 10 timeout 10
```

hnp

To configure maximum home network prefix (HNP) that a mobile node can possess, use the **hnp** command in PMIPv6 LMA configuration mode. To remove the configured HNP number, use the no form of this command.

hnp maximum *number*
no hnp maximum *number*

Syntax Description	maximum <i>number</i> Specifies the maximum allowed number of HNPs associated with a mobile node.
---------------------------	----------------------------------------------------------------------------------------------------------

Command Default	None.
------------------------	-------

Command Modes	PMIPv6 LMA configuration
----------------------	--------------------------

Command History	Release	Modification
	Release 5.2.2	This command was introduced.

Usage Guidelines	No specific guidelines impact the use of this command.
-------------------------	--------------------------------------------------------

Task ID	Task ID	Operation
	ipv6	read, write

This example shows how to configure two HNPs for a mobile node:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# ipv6 mobile pmipv6-lma lma1 domain cisco.com
RP/0/RSP0/CPU0:router(config-pmipv6-lma)#hnp maximum 2
```

ipv6 mobile pmipv6-domain

To configure the Proxy Mobile IPv6 (PMIPv6) domain, use the **ipv6 mobile pmipv6-domain** command in Global Configuration mode. To remove the PMIPv6 domain configuration, use the no form of this command.

ipv6 mobile pmipv6-domain *domain-name*

no ipv6 mobile pmipv6-domain *domain-name*

Syntax Description	<i>domain-name</i> Specifies PMIPv6 domain name.
---------------------------	--------------------------------------------------

Command Default	No PMIPv6 domain is configured.
------------------------	---------------------------------

Command Modes	Global Configuration mode
----------------------	---------------------------

Command History	Release	Modification
	Release 5.2.2	This command was introduced.

Usage Guidelines	No specific guidelines impact the use of this command.
-------------------------	--------------------------------------------------------

Task ID	Task ID	Operation
	ipv6	read, write

This example shows how to enter PMIPv6 domain configuration mode and configure the PMIPv6 domain:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# ipv6 mobile pmipv6-domain cisco.com
RP/0/RSP0/CPU0:router(config-pmipv6-domain)#
```

ipv6 mobile pmipv6-lma

To enable Local Mobility Anchor (LMA) service on the router, use the **ipv6 mobile pmipv6-lma** command in Global Configuration mode. To disable the LMA service, use the no form of this command.

```
ipv6 mobile pmipv6-lma lma-name domain domain-name
no ipv6 mobile pmipv6-lma lma-name domain domain-name
```

Syntax Description	<i>lma-name</i>	Specifies LMA name. This can be an instance name or any string that uniquely identifies the LMA.
	domain <i>domain-name</i>	Specifies the PMIP domain to which the LMA belongs.
Command Default	LMA service on the router is not configured.	
Command Modes	Global Configuration mode	
Command History	Release	Modification
	Release 5.2.2	This command was introduced.
Usage Guidelines	No specific guidelines impact the use of this command.	
Task ID	Task ID	Operation
	ipv6	read, write

This example shows how to configure the LMA:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# ipv6 mobile pmipv6-lma lma1 domain cisco.com
RP/0/RSP0/CPU0:router(config-pmipv6-lma)#
```

ipv4-address

To configure the IPv4 address for a MAG within an LMA, use the **ipv4-address** command in the PMIPv6 LMA-MAG configuration mode. To remove the IPv4 address for the MAG, use the no form of this command.

```
ipv4-address ipv4-address
no ipv4-address ipv4-address
```

Syntax Description	<i>ipv4-address</i> The IPv4 address for the MAG.				
Command Default	No IPv4 address is configured for the MAG.				
Command Modes	PMIPv6 LMA-MAG configuration				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 5.2.2</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Release 5.2.2	This command was introduced.
Release	Modification				
Release 5.2.2	This command was introduced.				
Usage Guidelines	No specific guidelines impact the use of this command.				
Task ID	<table border="1"> <thead> <tr> <th>Task ID</th> <th>Operation</th> </tr> </thead> <tbody> <tr> <td>ipv6</td> <td>read, write</td> </tr> </tbody> </table>	Task ID	Operation	ipv6	read, write
Task ID	Operation				
ipv6	read, write				

This example shows how to configure the IPv4 address for the MAG within the PMIPv6 LMA:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# ipv6 mobile pmipv6-lma lma1 domain DOMAIN1
RP/0/RSP0/CPU0:router(config-pmipv6-lma)#mag mag1 DOMAIN2
RP/0/RSP0/CPU0:router(config-pmipv6-lma-mag)#ipv4-address 192.168.12.3
```

ipv6-address

To configure the IPv6 address for a MAG within an LMA, use the **ipv6-address** command in the PMIPv6 LMA-MAG configuration mode. To remove the IPv6 address for the MAG, use the no form of this command.

ipv6-address *ipv6-address*
no ipv6-address *ipv6-address*

Syntax Description	<i>ipv6-address</i> The IPv6 address for the MAG.
---------------------------	---------------------------------------------------

Command Default	No IPv6 address is configured for the MAG.
------------------------	--------------------------------------------

Command Modes	PMIPv6 LMA-MAG configuration
----------------------	------------------------------

Command History	Release	Modification
	Release 5.2.2	This command was introduced.

Usage Guidelines	No specific guidelines impact the use of this command.
-------------------------	--------------------------------------------------------

Task ID	Task ID	Operation
	ipv6	read, write

This example shows how to configure the IPv6 address for the MAG within the PMIPv6 LMA:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# ipv6 mobile pmipv6-lma lma1 domain DOMAIN1
RP/0/RSP0/CPU0:router(config-pmipv6-lma)#mag mag1 DOMAIN2
RP/0/RSP0/CPU0:router(config-pmipv6-lma-mag)#ipv6-address 2010:DB::1
```

lma

To specify the Local Mobility Anchors (LMAs), or to configure the LMA for the Mobile Access Gateway (MAG), use the **lma** command in the appropriate configuration mode. To disable the LMA configuration, use the no form of this command

lma *lma-identifier*
no lma *lma-identifier*

Syntax Description	<i>lma-identifier</i> Specifies LMA identifier.				
Command Default	None.				
Command Modes	PMIPv6 domain configuration				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 5.2.2</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Release 5.2.2	This command was introduced.
Release	Modification				
Release 5.2.2	This command was introduced.				
Usage Guidelines	No specific guidelines impact the use of this command.				
Task ID	<table border="1"> <thead> <tr> <th>Task ID</th> <th>Operation</th> </tr> </thead> <tbody> <tr> <td>ipv6</td> <td>read, write</td> </tr> </tbody> </table>	Task ID	Operation	ipv6	read, write
Task ID	Operation				
ipv6	read, write				

This example shows how to configure the LMA in PMIPv6 domain configuration mode:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# ipv6 mobile pmipv6-domain cisco.com
RP/0/RSP0/CPU0:router(config-pmipv6-domain)#lma lma1
RP/0/RSP0/CPU0:router(config-pmipv6-domain-lma)#
```

mag

To configure the Mobile Access Gateway (MAG) within the Proxy Mobile IPv6 (PMIPv6) domain or to configure the MAG within a Local Mobility Anchor (LMA), use the **mag** command in the PMIPv6 domain configuration mode or LMA configuration mode. To disable the MAG configuration, use the no form of this command

mag *identifier domain-name*

Syntax Description	<i>identifier</i>	MAG identifier.
	<i>domain-name</i>	PMIPv6 domain identifier.

Command Default The LMA within the PMIPV6 domain is not configured.

Command Modes PMIPv6 LMA configuration
PMIPv6 domain configuration

Command History	Release	Modification
	Release 5.2.2	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operation
	ipv6	read, write

This example shows how to configure the MAG in the PMIPv6 LMA:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# ipv6 mobile pmipv6-lma lma1 domain cisco.com
RP/0/RSP0/CPU0:router(config-pmipv6-lma) #mag mag1 dn1
RP/0/RSP0/CPU0:router(config-pmipv6-lma-mag) #
```

mnp (pmipv6-lma-ml)

To configure the maximum number of mobile network prefixes on a per address family, per logical mobile network (MN), and per customer basis, use the **mnp** command in PMIPv6 LMA Mobile Local Loop (MLL) configuration mode. As the maximum number is configured at the MLL service level, the configured values apply to all the customers configured under this service except for the customers for whom these values are configured explicitly under customer configuration. To disable the configuration, use the **no** form of this command.

```
mnp {ipv4 | ipv6 | afi-all } {logical-mn | customer } maximum number
no mnp {ipv4 | ipv6 | afi-all } {logical-mn | customer } maximum number
```

Syntax Description		
	ipv4	Specifies the limit for IPv4 prefixes.
	ipv6	Specifies the limit for IPv6 prefixes.
	afi-all	Specifies the limit for the aggregate of IPv4 and IPv6 prefixes.
	logical-mn	Specifies the limit for every logical MN belonging to all customers.
	customer	Specifies the limit for every customer across all of its logical MNs.
	maximum number	Specifies the maximum number of prefixes.

Command Default None.

Command Modes PMIPv6 LMA MLL configuration

Command History	Release	Modification
	Release 5.3.2	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operation
	ipv6	read, write

This example shows how to configure the limit for IPv4 prefixes:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# ipv6 mobile pmipv6-lma LMA domain cisco.com
RP/0/RSP0/CPU0:router(config-pmipv6-lma)# mobility-service mobile-local-loop
RP/0/RSP0/CPU0:router(config-pmipv6-lma-ml)# mnp ipv4 logical-mn maximum 10
```

mnp (pmipv6-lma-ml-cust)

To configure the maximum number of mobile network prefixes on a per address family, per logical mobile network (MN), and per customer basis, use the **mnp** command in PMIPv6 LMA Mobile Local Loop (MLL) Customer configuration mode. This configuration overrides the prefix limits configured at the MLL service level. To disable the configuration, use the **no** form of this command.

```
mnp {ipv4 | ipv6 | afi-all } {logical-mn | customer } maximum number
no mnp {ipv4 | ipv6 | afi-all } {logical-mn | customer } maximum number
```

Syntax Description	Parameter	Description
	ipv4	Specifies the limit for IPv4 prefixes.
	ipv6	Specifies the limit for IPv6 prefixes.
	afi-all	Specifies the limit for the aggregate of IPv4 and IPv6 prefixes.
	logical-mn	Sets the limit for every logical MN belonging to the specified customer.
	customer	Sets the limit for the specified customer across all of its logical MNs.
	maximum number	Specifies the maximum number of prefixes.

Command Default None.

Command Modes PMIPv6 LMA MLL Customer configuration

Command History

Release	Modification
Release 5.3.2	This command was introduced.

Usage Guidelines This command overrides the prefix limits configured at the MLL service level.

Task ID	Task ID	Operation
	ipv6	read, write

This example shows how to configure the limit for IPv4 prefixes:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# ipv6 mobile pmipv6-lma LMA domain cisco.com
RP/0/RSP0/CPU0:router(config-pmipv6-lma)# mobility-service mobile-local-loop
RP/0/RSP0/CPU0:router(config-pmipv6-lma-ml)# customer CUST1 vrf VRF1
RP/0/RSP0/CPU0:router(config-pmipv6-lma-ml-cust)# mnp ipv4 logical-mn maximum 10
```

mobility-service mobile-local-loop

To configure Mobile Loop Local (MLL) service on the Local Mobility Anchor (LMA), use the **mobility-service mobile-local-loop** command in PMIPv6 LMA configuration mode. To disable the MLL service, use the **no** form of this command.

mobility-service mobile-local-loop
no mobility-service mobile-local-loop

Command Default

None.

Command Modes

PMIPv6 LMA configuration

Command History

Release	Modification
Release 5.3.0	This command was introduced.

Usage Guidelines

No specific guidelines impact the use of this command.

Task ID

Task ID	Operation
ipv6	read, write

This example shows how to configure the MLL service:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# ipv6 mobile pmipv6-lma LMA domain cisco.com
RP/0/RSP0/CPU0:router(config-pmipv6-lma)# mobility-service mobile-local-loop
RP/0/RSP0/CPU0:router(config-pmipv6-lma-ml1)#
```

network

To associate a network, to which an IPv4 or IPv6 pool can be configured, with a Local Mobility Anchor (LMA), use the **network** command in LMA configuration mode. To disassociate the network from the LMA, use the no form of this command.

network *name*
no network *name*

Syntax Description	<i>name</i> Name of the network to be associated with the LMA.
---------------------------	----------------------------------------------------------------

Command Default	No network is associated.
------------------------	---------------------------

Command Modes	PMIPv6 LMA configuration
----------------------	--------------------------

Command History	Release	Modification
	Release 5.2.2	This command was introduced.

Usage Guidelines	No specific guidelines impact the use of this command.
-------------------------	--------------------------------------------------------

Task ID	Task ID	Operation
	ipv6	read, write

This example shows how to associate a network with an LMA:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# ipv6 mobile pmipv6-lma lma1 domain cisco.com
RP/0/RSP0/CPU0:router(config-pmipv6-lma) #network cisco
RP/0/RSP0/CPU0:router(config-pmipv6-lma-network) #
```

network (pmipv6-lma-ml-cust)

To associate a customer-specific network (to which an IPv4 or IPv6 pool can be configured) in a Local Mobility Anchor (LMA) within a Mobile Local Loop (MLL), use the **network** command in PMIPv6 LMA MLL Customer configuration mode. To remove an existing customer-specific network, use the **no** form of this command.

```
network { unauthorized | authorized network-name }
no network { unauthorized | authorized network-name }
```

Syntax Description	<i>network-name</i> Name of the network to be associated with a customer.
---------------------------	---------------------------------------------------------------------------

Command Default	None.
------------------------	-------

Command Modes	PMIPv6 LMA MLL Customer configuration
----------------------	---------------------------------------

Command History	Release	Modification
	Release 5.3.0	This command was introduced.

Usage Guidelines	Use the unauthorized keyword to configure an unauthorized network. In this case, no network pools are configured for address assignment. The address/prefix of the Logical Mobile Node (LMN) on the Mobile Access Gateway (MAG) and the network prefixes on the Mobile Network interfaces are accepted as received in the Proxy Binding Update (PBU).
-------------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Use the **authorized** keyword to configure a named network. In this case, the address/prefix of the LMN and Mobile Network prefixes are validated against the configured network pool. The uniqueness of the named network is ensured.

Task ID	Task ID	Operation
	ipv6	read, write

This example shows how to associate a network with a customer:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# ipv6 mobile pmipv6-lma LMA domain cisco.com
RP/0/RSP0/CPU0:router(config-pmipv6-lma)# mobility-service mobile-local-loop
RP/0/RSP0/CPU0:router(config-pmipv6-lma-ml1)# customer CUST1 vrf VRF1
RP/0/RSP0/CPU0:router(config-pmipv6-lma-ml1-cust)# network authorized cisco
RP/0/RSP0/CPU0:router(config-pmipv6-lma-ml1-cust-network)#
```

nai (pmipv6-domain)

To configure the network access identifier (NAI) for the mobile node (MN) within the PMIPv6 domain, use the **nai** command in PMIPv6 domain configuration mode. To disable the NAI configuration, use the no form of this command.

```
nai [user]@realm
no nai [user]@realm
```

Syntax Description	<i>[user]@realm</i> Fully qualified specific user address and realm. The @ symbol is required. You can specify <i>@realm</i> for any user address at a specific realm.
---------------------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Command Default	NAI for the MN is not specified.
------------------------	----------------------------------

Command Modes	PMIPv6 domain configuration
----------------------	-----------------------------

Command History	Release	Modification
	Release 5.2.2	This command was introduced.

Usage Guidelines	No specific guidelines impact the use of this command.
-------------------------	--------------------------------------------------------

Task ID	Task ID	Operation
	ipv6	read, write

This example shows how to configure the NAI within the PMIPv6 domain:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# ipv6 mobile pmipv6-domain cisco.com
RP/0/RSP0/CPU0:router(config-pmipv6-domain)# nai example@example.com
RP/0/RSP0/CPU0:router(config-pmipv6-domain-nai)#
```

pool (pmipv6)

To specify the IPv4 or IPv6 address pool, from which a home address is allocated to a mobile node (MN), in a Local Mobility Anchor (LMA), use the **pool** command in LMA-network configuration mode. To disassociate an IPv4 or IPv6 address pool from an LMA, use the no form of this command.

```
pool {mobile-node | mobile-network} {ipv4 | ipv6} start-address address pool-prefix length
network-prefix length
no pool {mobile-node | mobile-network} {ipv4 | ipv6} start-address address pool-prefix length
network-prefix length
```

Syntax Description		
mobile-node		Specifies pool configuration for mobile nodes.
mobile-network		Specifies pool configuration for mobile networks.
ipv4		Specifies IPv4 address pool.
ipv6		Specifies IPv6 address pool.
start-address address		Specifies address pool start address.
pool-prefix length		Specifies the prefix length of the pool address. The range is from 8 to 30.
network-prefix length		Specifies the network prefix length of the pool address. This argument is applicable for mobile network. The range is from 8 to 32.

Command Default None.

Command Modes PMIPv6 LMA network configuration

Command History	Release	Modification
	Release 5.2.2	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operation
	ipv6	read, write

This example shows how to specify the IPv4 address pool in an LMA:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# ipv6 mobile pmipv6-lma lmal domain cisco.com
```

```
RP/0/RSP0/CPU0:router(config-pmipv6-lma)# network n1
RP/0/RSP0/CPU0:router(config-pmipv6-lma-network)# pool mobile-network ipv4 start-address
192.168.20.2 pool-prefix 22 network-prefix 8
```

pool (pmipv6-ml-cust-network)

To specify the IPv4 or IPv6 address pool for a customer-specific network in a Local Mobility Anchor (LMA) within a Mobile Local Loop (MLL), use the **pool** command in PMIPv6 LMA MLL Customer Network configuration mode. To disassociate an IPv4 or IPv6 address pool from a customer, use the **no** form of this command.

```
pool {mobile-node | mobile-network} {ipv4 | ipv6} start-address address pool-prefix length
network-prefix length
no pool {mobile-node | mobile-network} {ipv4 | ipv6} start-address address pool-prefix length
network-prefix length
```

Syntax Description	mobile-node	Specifies pool configuration for mobile nodes.
	mobile-network	Specifies pool configuration for mobile networks.
	ipv4	Specifies IPv4 address pool.
	ipv6	Specifies IPv6 address pool.
	start-address address	Specifies address pool start address.
	pool-prefix length	Specifies the prefix length of the pool address. The range is from 8 to 30. For ipv6 option, the range is from 8 to 62.
	network-prefix length	Specifies the network prefix length of the pool address. This argument is applicable for mobile network. The range is from 8 to 32. For ipv6 option, the range is from 8 to 64.
Command Default	None.	
Command Modes	PMIPv6 LMA MLL Customer Network configuration	
Command History	Release	Modification
	Release 5.3.0	This command was introduced.
Usage Guidelines	Use this command only if you have configured a named network using the network authorized command.	
Task ID	Task ID	Operation
	ipv6	read, write

This example shows how to specify customer-specific IPv4 address pool in an LMA:

pool (pmipv6-ml1-cust-network)

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# ipv6 mobile pmipv6-lma LMA domain cisco.com
RP/0/RSP0/CPU0:router(config-pmipv6-lma)# mobility-service mobile-local-loop
RP/0/RSP0/CPU0:router(config-pmipv6-lma-ml1)# customer CUST1 vrf VRF1
RP/0/RSP0/CPU0:router(config-pmipv6-lma-ml1-cust)# network authorized cisco
RP/0/RSP0/CPU0:router(config-pmipv6-lma-ml1-cust-network)# pool mobile-network ipv4
start-address 192.168.20.2 pool-prefix 22 network-prefix 8
```

redistribute home-address (pmipv6-lma)

To enable redistribution of Home Address (HoA) and Home Network prefix (HNP) routes into routing protocols, use the **redistribute home-address** command in PMIPv6 LMA configuration mode. To disable redistribution of HoA and HNP routes, use the **no** form of this command.

```
redistribute home-address { host-prefix | disable }
no redistribute home-address { host-prefix | disable }
```

Syntax Description	host-prefix	Enables redistribution of HoA host prefix and HNP. If HoA and HNP are assigned from pools configured on the LMA, the pool prefixes are not redistributed.
	disable	Disables redistribution of HoA host prefix and HNP as well as HoA/HNP pool prefixes.
Command Default	None.	
Command Modes	PMIPv6 LMA configuration	
Command History	Release	Modification
	Release 5.3.1	This command was introduced.
Usage Guidelines	No specific guidelines impact the use of this command.	
Task ID	Task ID	Operation
	ipv6	read, write

This example shows how to enable redistribution of HoA host prefix and HNP:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# ipv6 mobile pmipv6-lma LMA domain cisco.com
RP/0/RSP0/CPU0:router(config-pmipv6-lma)# redistribute home-address host-prefix
```

replay-protection

To configure the replay protection mechanism within the Proxy Mobile IPv6 (PMIPv6) Local Mobility Anchor (LMA), use the **replay-protection** command in the PMIPv6 LMA configuration mode. To reset the replay protection mechanism to default window time, use the no form of this command.

replay-protection timestamp window *seconds*
no replay-protection timestamp

Syntax Description	timestamp	Enables the timestamp.
	window <i>seconds</i>	Specifies the maximum time difference, in seconds, between the time stamp in the received Proxy Binding Update (PBU) message and the current time of the day on the Local Mobility Anchor (LMA). The range is 1-255 seconds.

Command Default The replay protection mechanism is configured with the default time stamp window period of 7 seconds.

Command Modes PMIPv6 LMA configuration

Command History	Release	Modification
	Release 5.2.2	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operation
	ipv6	read, write

This example shows how to configure the replay protection mechanism with a window period of 150 seconds within PMIPv6 LMA:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# ipv6 mobile pmipv6-lma lma1 domain cisco.com
RP/0/RSP0/CPU0:router(config-pmipv6-lma)#replay-protection timestamp window 150
```

This example shows how to reset the replay protection mechanism to default window period within PMIPv6 LMA:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# ipv6 mobile pmipv6-lma lma1 domain cisco.com
RP/0/RSP0/CPU0:router(config-pmipv6-lma)#no replay-protection timestamp
```

show ipv6 mobile pmipv6 lma binding

To display the list of the Local Mobility Anchor (LMA) bindings established over the Proxy Mobile IPv6 (PMIPv6) signaling plane, use the **show ipv6 mobile pmipv6 lma binding** command in EXEC mode.

```
show ipv6 mobile pmipv6 lma bindings{ nai nai-string| mag mag-identifier}
```

Syntax Description	nai <i>nai-string</i>	Displays the bindings for the mobile node (MN).
	mag <i>mag-identifier</i>	Displays the bindings for the Mobile Access Gateway (MAG).
Command Default	None.	
Command Modes	EXEC mode	
Command History	Release	Modification
	Release 5.2.2	This command was introduced.
Usage Guidelines	No specific guidelines impact the use of this command.	
Task ID	Task ID	Operation
	ipv6	read

This is the sample output for the **show ipv6 mobile pmipv6 lma binding** command:

```
RP/0/RSP0/CPU0:router# show ipv6 mobile pmipv6 lma binding
-----
[Binding][MN]: State: BCE_ACTIVE
[Binding][MN]: NAI: MAG@HDFC
[Binding][MN]: HOA: 10.10.10.150, Prefix: 24
[Binding][MN]: HNP: 2002:10::1
[Binding][MN][PEER]: Default Router: 10.10.10.1
    [Binding][MN]: ATT: (4)
        [Binding][MN][PEER1]: LLID: MAG@HDFC
        [Binding][MN][PEER1]: Id: MAG1
        [Binding][MN][PEER1]: Lifetime: 3600(sec)
        [Binding][MN][PEER1]: Lifetime Remaining: 3219(sec)
        [Binding][MN][PEER1]: Tunnel: tunnel-ip65536
        [Binding][MN][GREKEY]: Upstream: 0, Downstream: 0
-----
```

show ipv6 mobile pmipv6 lma globals

To display the global configuration details of the Local Mobility Anchor (LMA) or a specific customer, use the **show ipv6 mobile pmipv6 lma globals** command in EXEC mode.

```
show ipv6 mobile pmipv6 lma globals [ customer customer-name ]
```

Syntax Description	customer customer-name (Optional) Displays global configuration details of a specific customer.
---------------------------	--------------------------------------------------------------------------------------------------------

Command Default	None.
------------------------	-------

Command Modes	EXEC mode
----------------------	-----------

Command History	Release	Modification
	Release 5.2.2	This command was introduced.
	Release 5.3.2	The customer customer-name keyword was added to this command.

Usage Guidelines	No specific guidelines impact the use of this command.
-------------------------	--------------------------------------------------------

Task ID	Task ID	Operation
	ipv6	read

show ipv6 mobile pmipv6 lma stats

To display the global Local Mobility Anchor (LMA) statistics, use the **show ipv6 mobile pmipv6 lma stats** command in EXEC mode.

```
show ipv6 mobile pmipv6 lma stats [domain domain-name peer peer-name | customer
customer-name ]
```

Syntax Description	Parameter	Description
	domain <i>domain-name</i>	(Optional) Displays the Proxy Mobile IPv6 (PMIPv6) domain information.
	peer <i>peer-name</i>	(Optional) Displays the Mobile Access Gateway (MAG) information.
	customer <i>customer-name</i>	(Optional) Displays statistics corresponding to a specific customer.

Command Default None.

Command Modes EXEC mode

Command History	Release	Modification
	Release 5.2.2	This command was introduced.
	Release 5.3.1	The keyword customer <i>customer-name</i> was added to this command.
	Release 5.3.2	The output of this command has been updated.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task	Operation
	ipv6	read

transport (pmipv6-lma-ml-cust)

To configure customer-specific transport options in a Local Mobility Anchor (LMA) within a Mobile Local Loop (MLL), use the **transport** command in PMIPv6 LMA MLL Customer configuration mode. To disable customer-specific transport options, use the **no** form of this command.

```
transport [ vrf vrf-name ]
no transport [ vrf vrf-name ]
```

Syntax Description	<i>vrf-name</i> Name of the VRF.				
Command Default	None.				
Command Modes	PMIPv6 LMA MLL Customer configuration				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 5.3.0</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Release 5.3.0	This command was introduced.
Release	Modification				
Release 5.3.0	This command was introduced.				

Usage Guidelines Transport options include peering or transport VRF and the LMA IPv4 and/or IPv6 addresses. The addresses are configured in the transport configuration mode using the **address** command.

A customer can have multiple transports and can have the same addresses in all transports. However, each customer must have a unique IPv4 and/or a unique IPv6 address.

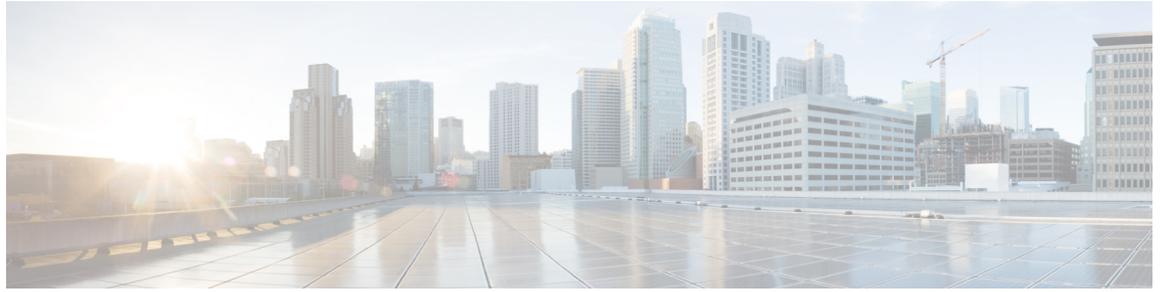

Note If the transport is in global VRF, then the **vrf** keyword and *vrf-name* can be omitted in this command.

Task ID	Task ID	Operation
	ipv6	read, write

This example shows how to configure transport options for a customer:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# ipv6 mobile pmipv6-lma LMA domain cisco.com
RP/0/RSP0/CPU0:router(config-pmipv6-lma)# mobility-service mobile-local-loop
RP/0/RSP0/CPU0:router(config-pmipv6-lma-ml)# customer CUST1 vrf VRF1
RP/0/RSP0/CPU0:router(config-pmipv6-lma-ml-cust)# transport vrf TVRF1
RP/0/RSP0/CPU0:router(config-pmipv6-lma-ml-cust-tpt)#
```

transport (pmipv6-lma-ml-cust)

Prefix List Commands

This chapter describes the Cisco IOS XR software commands used to configure IP Version 4 (IPv4) and IP Version 6 (IPv6) prefix lists on Cisco ASR 9000 Series Aggregation Services Routers .

For detailed information about prefix list concepts, configuration tasks, and examples, refer to the *IP Addresses and Services Configuration Guide for Cisco ASR 9000 Series Routers*.

- [clear prefix-list ipv4](#), on page 750
- [clear prefix-list ipv6](#) , on page 752

- [show prefix-list afi-all](#), on page 775
- [show prefix-list ipv4](#), on page 776
- [show prefix-list ipv4 standby](#), on page 778
- [show prefix-list ipv6](#), on page 779

clear prefix-list ipv4

To reset the hit count on an IP Version 4 (IPv4) prefix list, use the **clear prefix-list ipv4** command in EXEC mode.

```
clear prefix-list ipv4 name [sequence-number]
```

Syntax Description	
<i>name</i>	Name of the prefix list from which the hit count is to be cleared.
<i>sequence-number</i>	(Optional) Sequence number of a prefix list. Range is 1 to 2147483646.

Command Default	No default behavior or values
-----------------	-------------------------------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	The hit count is a value indicating the number of matches to a specific prefix list entry. Use the clear prefix-list ipv4 command to clear counters for a specified configured prefix list.
------------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Use the *sequence-number* argument to clear counters for a prefix list with a specific sequence number.

Task ID	Task ID	Operations
	acl	read, write

Examples

The following example displays IPv4 prefix lists, shows how to clear the counters for list3, then shows how to display the IPv4 prefix lists again, showing that counters are cleared for list3:

```
RP/0/RSP0/CPU0:router# show prefix-list ipv4

ipv4 prefix-list list1
 10 permit 172.18.30.154/16 (8 matches)
ipv4 prefix-list list2
 20 deny 172.24.30.164/16 (12 matches)
ipv4 prefix-list list3
 30 permit 172.19.31.154/16 (32 matches)

RP/0/RSP0/CPU0:router# clear prefix-list ipv4 list3

RP/0/RSP0/CPU0:router# show prefix-list ipv4

ipv4 prefix-list list1
 10 permit 172.18.30.154/16 (8 matches)
ipv4 prefix-list list2
 20 deny 172.24.30.164/16 (12 matches)
ipv4 prefix-list list3
 30 permit 172.19.31.154/16
```

Related Commands

Command	Description
deny (prefix-list), on page 758	Sets deny conditions for an IPv4 or IP IPv6 prefix list.
ipv4 prefix-list, on page 761	Defines an IPv4 prefix list.
permit (prefix-list), on page 765	Sets permit conditions for an IPv4 or IPv6 prefix list.
show prefix-list ipv4, on page 776	Displays the configuration of the current IPv4 prefix list.

clear prefix-list ipv6

To reset the hit count on an IP Version 6 (IPv6) prefix list, use the **clear prefix-list ipv6** command in EXEC mode.

```
clear prefix-list ipv6 name [sequence-number]
```

Syntax Description	name	Name of the prefix list from which the hit count is to be cleared.
	<i>sequence-number</i>	(Optional) Clears counters for a prefix list with a specific sequence number. Range is 1 to 2147483646.

Command Default No default behavior or values

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines The hit count is a value indicating the number of matches to a specific prefix list entry. Use the **clear prefix-list ipv6** command to clear counters for a specified configured prefix list.

Use the *sequence-number* argument to clear counters for a prefix list with a specific sequence number.

Task ID	Task ID	Operations
	acl	read, write

Examples

The following example shows IPv6 prefix lists, clears the counters for sequence number 60 on prefix list list3, then displays the IPv6 prefix lists again, showing that counters are cleared for sequence number 60:

```
RP/0/RSP0/CPU0:router# show prefix-list ipv6

ipv6 prefix-list list1
 40 permit 2000:1::/64 (5 matches)
 60 deny 3000:1::/64 (7 matches)

RP/0/RSP0/CPU0:router# clear prefix-list ipv6 list1 60
RP/0/RSP0/CPU0:router# show prefix-list ipv6

ipv6 prefix-list list1
 40 permit 2000:1::/64 (5 matches)
 60 deny 3000:1::/64
```

Related Commands

Command	Description
deny (prefix-list), on page 758	Sets deny conditions for an IPv4 or IPv6 prefix list.
ipv6 prefix-list, on page 763	Defines an IPv6 prefix list.
permit (prefix-list), on page 765	Sets permit conditions for an IPv4 or IPv6 prefix list.
show prefix-list ipv6, on page 779	Displays the contents of the current IPv6 prefix list.

copy prefix-list ipv4

To create a copy of an existing IP Version 4 (IPv4) prefix list, use the **copy prefix-list ipv4** command in EXEC mode.

copy prefix-list ipv4 *source-name* *destination-name*

Syntax Description	
<i>source-name</i>	Name of the prefix list to be copied.
<i>destination-name</i>	Destination prefix list where the contents of the <i>source-name</i> will be copied.

Command Default No default behavior or values

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines Use the **copy prefix-list ipv4** command to copy a configured prefix list. Use the *source-name* argument to specify the prefix list to be copied and the *destination-name* argument to specify where to copy the contents of the source prefix list. The *destination-name* argument must be a unique name; if the *destination-name* argument name exists for a prefix list or access list, the prefix list is not copied. The **copy prefix-list ipv4** command checks that the source prefix list exists, then checks the existing list names to prevent overwriting existing prefix lists.

Task ID	Task ID	Operations
	acl	read, write
	filesystem	execute

Examples

The following example displays IPv4 prefix lists, shows how to copy prefix-list1 to list4, then displays the IPv4 prefix lists again, showing prefix list4:

```
RP/0/RSP0/CPU0:router# show prefix-list ipv4

ipv4 prefix-list list1
 10 permit 172.24.20.164/16
ipv4 prefix-list list2
 20 deny 172.18.30.154/16
ipv4 prefix-list list3
 30 permit 172.29.30.154/16

RP/0/RSP0/CPU0:router# copy prefix-list ipv4 list1 list4

RP/0/RSP0/CPU0:router# show prefix-list ipv4
ipv4 prefix-list list1
 10 permit 172.24.20.164/16
ipv4 prefix-list list2
 20 deny 172.18.30.154/16
```

```
ipv4 prefix-list list3
 30 permit 172.29.30.154/16
ipv4 prefix-list list4
 10 permit 172.24.20.164/16
```

Related Commands

Command	Description

show prefix-list ipv4, on page 776	Displays the contents of the current IPv4 prefix lists.

copy prefix-list ipv6

To create a copy of an existing IP Version 6 (IPv6) prefix list, use the **copy prefix-list ipv6** command in EXEC mode.

copy prefix-list ipv6 *source-name* *destination-name*

Syntax Description	
<i>source-name</i>	Name of the prefix list to be copied.
<i>destination-name</i>	Destination prefix list where the contents of the <i>source-name</i> will be copied.

Command Default No default behavior or values

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines Use the **copy prefix-list ipv6** command to copy a configured prefix list. Use the *source-name* argument to specify the prefix list to be copied and the *destination-name* argument to specify where to copy the contents of the source prefix list. The *destination-name* argument must be a unique name; if the *destination-name* argument name exists for a prefix list or access list, the prefix list is not copied. The **copy prefix-list ipv6** command checks that the source prefix list exists then checks the existing list names to prevent overwriting existing prefix lists.

Task ID	Task ID	Operations
	acl	read, write
	filesystem	execute

Examples

The following example shows IPv6 prefix lists, shows how to copy prefix-list1 to list4, then displays the IPv6 prefix lists again, showing prefix list4:

```
RP/0/RSP0/CPU0:router# show prefix-list ipv6

ipv6 prefix-list list1
 40 permit 2000:1::/64
 60 deny 3000:1::/64
ipv6 prefix-list list2
 10 permit 5555::/24

RP/0/RSP0/CPU0:router# copy prefix-list ipv6 list1 list3

RP/0/RSP0/CPU0:router# show prefix-list ipv6

ipv6 prefix-list list1
```

```
40 permit 2000:1::/64
60 deny 3000:1::/64
ipv6 prefix-list list2
10 permit 5555::/24
ipv6 prefix-list list3
40 permit 2000:1::/64
60 deny 3000:1::/6
```

Related Commands

Command	Description
ipv6 prefix-list, on page 763	Defines an IPv6 prefix list.
show prefix-list ipv6, on page 779	Displays the contents of current IPv6 prefix list.

deny (prefix-list)

To set deny conditions for an IP Version 4 (IPv4) or IP Version 6 (IPv6) prefix list, use the **deny** command in IPv4 prefix list configuration or IPv6 prefix list configuration modes. To remove a condition from a prefix list, use the **no** form of this command.

```
[sequence-number] deny network/length [ge value] [le value] [eq value]
no sequence-number deny
```

Syntax Description

<i>sequence-number</i>	(Optional) Sets deny conditions for a prefix list with a specific sequence number. If you do not use a sequence number, the condition defaults to the next available sequence number in the prefix list. Range is 1 to 2147483646. By default, the first statement is number 10, and the subsequent statements are incremented by 10. The sequence-number argument must be used with the no form of the command.
<i>network / length</i>	Network number and length (in bits) of the network mask.
ge value	(Optional) Specifies a prefix length greater than or equal to the value. It is the lowest value of a range of the <i>length</i> (the “from” portion of the length range).
le value	(Optional) Specifies a prefix length less than or equal to the value. It is the highest value of a range of the <i>length</i> (the “to” portion of the length range).
eq value	(Optional) Exact value of the <i>length</i> .

Command Default

There is no specific condition under which a packet is denied passing the IPv4 or IPv6 prefix list.

Command Modes

IPv4 prefix list configuration
IPv6 prefix list configuration

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

Use the **deny** command to specify conditions under which a packet cannot pass the prefix list.

The **ge**, **le** and **eq** keywords can be used to specify the range of the prefix length to be matched, for prefixes that are more specific than the *network/length* argument. Exact match is assumed when neither **ge** nor **le** is specified. The range is assumed to be from the **ge value** to 32 if only the **ge** keyword is specified. The range is assumed to be from the *length* to the **le value argument** if only the **le** attribute is specified.

A specified **ge value** or **le value** must satisfy the following condition:

$length < ge\ value < le\ value \leq 32$ (for IPv4)

$length < ge\ value < le\ value \leq 128$ (for IPv6)

Task ID	Task ID	Operations
	acl	read, write

Examples

The following example shows how to deny the route 10.0.0.0/0:

```
RP/0/RSP0/CPU0:router(config)# ipv4 prefix-list list1
RP/0/RSP0/CPU0:router(config-ipv4_pfx)# 50 deny 10.0.0.0/0
```

The following example shows how to deny all routes with a prefix of 10.3.32.154:

```
RP/0/RSP0/CPU0:router(config)# ipv4 prefix-list list1
RP/0/RSP0/CPU0:router(config-ipv4_pfx)#80 deny 10.3.32.154 le 32
```

The following example shows how to deny all masks with a length greater than 25 bits routes with a prefix of 172.18.30.154/16:

```
RP/0/RSP0/CPU0:router(config)# ipv4 prefix-list list1
RP/0/RSP0/CPU0:router(config-ipv4_pfx)#100 deny 172.18.30.154/16 ge 25
```

The following example shows how to deny mask lengths greater than 25 bits in all address space:

```
RP/0/RSP0/CPU0:router(config)# ipv6 prefix-list list2
RP/0/RSP0/CPU0:router(config-ipv6_pfx)# 70 deny 2000:1::/64 ge 25
```

The following example shows how to add deny conditions to list3, then use the **no** form of the command to remove the condition with the sequence number 30:

```
RP/0/RSP0/CPU0:router(config)# ipv6 prefix-list list3

RP/0/RSP0/CPU0:router(config-ipv6_pfx)# deny 2000:1::/64 ge 25
RP/0/RSP0/CPU0:router(config-ipv6_pfx)# deny 3000:1::/64 le 32
RP/0/RSP0/CPU0:router(config-ipv6_pfx)# deny 4000:1::/64 ge 25
Uncommitted changes found, commit them? [yes]: y

RP/0/RSP0/CPU0:router# show prefix-list ipv6

ipv6 prefix-list list3
 10 deny 2000:1::/64 ge 25
 20 deny 3000:1::/64 le 32
 30 deny 4000:1::/64 ge 25

RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipv6 prefix-list list3
RP/0/RSP0/CPU0:router(config-ipv6_pfx)# no 30
Uncommitted changes found, commit them? [yes]: y
RP/0/RSP0/CPU0:router# show prefix-list ipv6

ipv6 prefix-list list3
 10 deny 2000:1::/64 ge 25
```

```
20 deny 3000:1::/64 le 32
```

Related Commands

Command	Description

show prefix-list ipv4, on page 776	Displays the contents of the current IPv4 prefix list.
show prefix-list ipv6, on page 779	Displays the contents of the current IPv6 prefix list.

ipv4 prefix-list

To define an IP Version (IPv4) prefix list by name, use the **ipv4 prefix-list** command in Global Configuration mode. To remove the prefix list, use the **no** form of this command.

```
ipv4 prefix-list name
no ipv4 prefix-list name
```

Syntax Description	
	<i>name</i> Name of the prefix list. Names cannot contain a space or quotation marks.

Command Default	
	No IPv4 prefix list is defined.

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines Use the **ipv4 prefix-list** command to configure an IPv4 prefix list. This command places the router in prefix-list configuration mode, in which the denied or permitted access conditions must be defined with the **deny** or **permit** command. You must add a condition to create the prefix list.

Use the **resequence prefix-list ipv4** command to renumber existing statements and increment subsequent statements to allow a new IPv4 prefix list statement (**permit**, **deny**, or **remark**) to be added. Specify the first entry number (the *base*) and the increment by which to separate the entry numbers of the statements. The software will renumber the existing statements, thereby making room to add new statements with the unused entry numbers.

Task ID	Task ID	Operations
	acl	read, write
	ipv4	read, write

Examples

The following example shows the prefix lists, then configures list2, then shows the conditions in both prefix lists:

```
RP/0/RSP0/CPU0:router# show prefix-list ipv4

ipv4 prefix-list list1
 10 permit 172.20.10.171/16 le 24
 20 permit 172.18.0.0/16
 30 deny 172.24.20.164/16 ge 25

RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipv4 prefix-list list2

RP/0/RSP0/CPU0:router(config-ipv4_pfx)#deny 172.18.30.154/16 ge 25
RP/0/RSP0/CPU0:router(config-ipv4_pfx)#
```

```
Uncommitted changes found, commit them? [yes]: Y
```

```
RP/0/RSP0/CPU0:router# show prefix-list ipv4
```

```
ipv4 prefix-list list1
 10 permit 172.20.10.171/16 le 24
 20 permit 172.18.0.0/16
 30 deny 172.24.20.164/16 ge 25
ipv4 prefix-list list2
 10 deny 172.18.30.154/16 ge 25
```

Related Commands

remark (prefix-list), on page 768	Inserts a helpful remark about a prefix list entry.
show prefix-list ipv6, on page 779	Displays the contents of the current IPv6 prefix list.

permit (prefix-list)

To set permit conditions for an IP Version 4 (IPv4) or IP Version 6 (IPv6) prefix list, use the **permit** command in IPv4 prefix list configuration or IPv6 prefix list configuration modes. To remove a condition from a prefix list, use the **no** form of this command.

```
[sequence-number] permit network/length [ge value] [le value] [eq value]
no sequence-number permit
```

Syntax Description

<i>sequence-number</i>	(Optional) Number of the permit statement in the prefix list. This number determines the order of the statements in the prefix list. Range is 1 to 2147483646. By default, the first statement is number 10, and the subsequent statements are incremented by 10.
<i>network / length</i>	Network number and length (in bits) of the network mask.
ge value	(Optional) Specifies a prefix length greater than or equal to the value. It is the lowest value of a range of the <i>length</i> (the “from” portion of the length range). Range is 1 to 128.
le value	(Optional) Specifies a prefix length less than or equal to the value. It is the highest value of a range of the <i>length</i> (the “to” portion of the length range). Range is 1 to 128.
eq value	(Optional) Exact value of the <i>length</i> . Range is 1 to 128.

Command Default

No default behavior or value

Command Modes

IPv4 prefix list configuration
IPv6 prefix list configuration

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

Use the **permit** command to specify conditions under which a packet can pass the prefix list.

The **ge**, **le** and **eq** keywords can be used to specify the range of the prefix length to be matched, for prefixes that are more specific than the *network/length* argument. Exact match is assumed when neither **ge** nor **le** is specified. The range is assumed to be from the **ge value** to 32 if only the **ge** keyword is specified. The range is assumed to be from the *length* to the **le value** argument if only the **le** attribute is specified.

A specified **ge value** or **le value** must satisfy the following condition:

$length < ge\ value < le\ value \leq 32$ (for IPv4)

$length < ge\ value < le\ value \leq 128$ (for IPv6)

Task ID	Task ID	Operations
	acl	read, write

Examples

The following example shows how to permit the prefix 172.18.0.0/16:

```
RP/0/RSP0/CPU0:router(config)# ipv4 prefix-list list1
RP/0/RSP0/CPU0:router(config-ipv4_pfx)# permit 172.18.0.0/16
```

The following example shows how to accept a mask length of up to 24 bits in routes with the prefix 172.20.10.171/16:

```
RP/0/RSP0/CPU0:router(config)# ipv4 prefix-list list1
RP/0/RSP0/CPU0:router(config-ipv4_pfx)# permit 172.20.10.171/16 le 24
```

The following example shows how to permit mask lengths from 8 to 24 bits in all address space:

```
RP/0/RSP0/CPU0:router(config)# ipv6 prefix-list list1
RP/0/RSP0/CPU0:router(config-ipv6_pfx)# permit 2000:1::/64 ge 8 le 24
```

The following example shows how to add permit conditions to list3, then remove the condition with the sequence number 30:

```
RP/0/RSP0/CPU0:router(config)# ipv6 prefix-list list3
RP/0/RSP0/CPU0:router(config-ipv6_pfx)# permit 2000:1::/64 ge 25
RP/0/RSP0/CPU0:router(config-ipv6_pfx)# permit 3000:1::/64 le 32
RP/0/RSP0/CPU0:router(config-ipv6_pfx)# permit 3000:1::/64 ge 25
Uncommitted changes found, commit them? [yes]: y
RP/0/RSP0/CPU0:router#show ipv6 prefix-list

ipv6 prefix-list list3
 10 permit 2000:1::/64 ge 25
 20 permit 3000:1::/64 le 32
 30 permit 4000:1::/64 ge 25

RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipv6 prefix-list list3
RP/0/RSP0/CPU0:router(config-ipv6_pfx)# no 30
Uncommitted changes found, commit them? [yes]: y
RP/0/RSP0/CPU0:router# show prefix-list ipv6

ipv6 prefix-list list3
 10 permit 2000:1::/64 ge 25
 20 permit 3000:1::/64 le 32

10 deny 2000:1::/64 ge 25
20 deny 3000:1::/64 le 32
30 deny 4000:1::/64 ge 25
```

Related Commands

Command	Description
deny (prefix-list), on page 758	Sets deny conditions for an IPv4 or IPv6 prefix list.
ipv4 prefix-list, on page 761	Creates an IPv4 prefix list.
ipv6 prefix-list, on page 763	Creates an IPv6 prefix list.
remark (prefix-list), on page 768	Inserts a helpful remark about a prefix list entry.
show prefix-list ipv4, on page 776	Displays the contents of current IPv4 prefix lists.
show prefix-list ipv6, on page 779	Displays the contents of current IPv6 prefix lists.

remark (prefix-list)

To write a helpful comment (remark) for an entry in either an IP Version 4 (IPv4) or IP Version 6 (IPv6) prefix list, use the **remark** command in IPv4 prefix-list configuration or IPv6 prefix-list configuration modes. To remove the remark, use the **no** form of this command.

```
[sequence-number] remark remark
no sequence-number
```

Syntax Description	
<i>sequence-number</i>	(Optional) Number of the remark statement in the prefix list. This number determines the order of the statements in the prefix list. The number can be from 1 to 2147483646. (By default, the first statement is number 10, and the subsequent statements are incremented by 10).
<i>remark</i>	Comment that describes the entry in the prefix list, up to 255 characters long.

Command Default The prefix list entries have no remarks.

Command Modes IPv4 prefix-list configuration
IPv6 prefix-list configuration

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines Use the **remark** command to write a helpful comment for an entry in a prefix list. The remark can be up to 255 characters in length; anything longer is truncated.

If you know the sequence number of the remark you want to delete, you can remove it by entering the **no sequence-number** command.

Use the **resequence prefix-list ipv4** command if you want to add statements to an existing IPv4 prefix list.

Task ID	Task ID	Operations
	acl	read, write

Examples

In the following example, a remark is made to explain a prefix list entry:

```
RP/0/RSP0/CPU0:router(config)# ipv4 prefix-list deny-ten
RP/0/RSP0/CPU0:router(config-ipv4_pfx)# 10 remark Deny all routes with a prefix of 10/8
RP/0/RSP0/CPU0:router(config-ipv4_pfx)# 20 deny 10.0.0.0/8 le 32
RP/0/RSP0/CPU0:router(config-ipv4_pfx)# end
```

In the following example, a remark is made to explain usage:

```

RP/0/RSP0/CPU0:router# show prefix-list ipv6

ipv6 prefix-list list1
 40 permit 2000:1::/64
 60 deny 3000:1::/64

RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ipv6 prefix-list list1
RP/0/RSP0/CPU0:router(config-ipv6-pfx)# 10 remark use from july23 forward
RP/0/RSP0/CPU0:router(config-ipv6-pfx)#

 10 remark use from july23 forward
 40 permit 2000:1::/64
 60 deny 3000:1::/64

```

Related Commands

Command	Description
ipv4 prefix-list, on page 761	Creates an entry in a prefix list.
resequence prefix-list ipv4, on page 770	Renumbers existing statements and increments subsequent statements.
show prefix-list ipv4, on page 776	Displays information about a prefix list or prefix list entries.

resequence prefix-list ipv4

To renumber existing statements and increment subsequent statements to allow a new prefix list statement (**permit**, **deny**, or **remark**) to be added, use the **resequence prefix-list ipv4** command in Admin Configuration mode.

```
resequence prefix-list ipv4 name [base [increment]]
```

Syntax Description

<i>name</i>	Name of a prefix list.
<i>base</i>	(Optional) Number of the first statement in the specified prefix list, which determines its order in the prefix list. Maximum value is 2147483646.
<i>increment</i>	(Optional) Number by which the base sequence number is incremented for subsequent statements. Maximum value is 2147483646.

Command Default

base: 10
increment: 10

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

The sequence number of a prefix list entry determines the order of the entries in the list. The router compares network addresses to the prefix list entries. The router begins the comparison at the top of the prefix list, with the entry having the lowest sequence number.

If multiple entries of a prefix list match a prefix, the entry with the lowest sequence number is considered the real match. When a match or deny occurs, the router does not go through the rest of the prefix list.

By default, the first statement in a prefix list is sequence number 10, and the subsequent statements are incremented by 10.

Use the **resequence prefix-list ipv4** command to add a **permit**, **deny**, or **remark** statement between consecutive entries in an existing IPv4 prefix list. Specify the first entry number (the *base*) and the increment by which to separate the entry numbers of the statements. The software renumbers the existing statements, thereby making room to add new statements with the unused entry numbers.

Examples

The following example shows how to display the sequence number intervals for prefix list list1, resequence list1 from 10 to 30, and displays the resulting sequence numbers:

```
RP/0/RSP0/CPU0:router# show prefix-list ipv4
```

```

ipv4 prefix-list list1
 10 permit 172.20.10.171/16 le 24
 20 permit 172.18.0.0/16
 30 deny 172.24.20.164/16 ge 25
ipv4 prefix-list list2
 10 deny 172.18.30.154/16 ge 25

RP/0/RSP0/CPU0:router# resequence prefix-list ipv4 list1 10 30

RP/0/0/CPU0:Apr  4 02:29:39.513 : ipv4_acl_action_edm[183]: %LIBTARCFG-6-COMMIT
: Configuration committed by user 'UNKNOWN'.  Use 'show commit changes 10000000
24' to view the changes.

RP/0/RSP0/CPU0:router# show prefix-list ipv4

ipv4 prefix-list list1
 10 permit 172.20.10.171/16 le 24
 40 permit 172.18.0.0/16
 70 deny 172.24.20.164/16 ge 25
ipv4 prefix-list list2
 10 deny 172.18.30.154/16 ge 25

```

Related Commands

Command	Description
deny (prefix-list), on page 758	Sets deny conditions for an IPv4 or IPv6 prefix list.
permit (prefix-list), on page 765	Sets permit conditions for an IPv4 or IPv6 prefix list.
remark (prefix-list), on page 768	Inserts a helpful remark about a prefix list entry.
show prefix-list ipv4, on page 776	Displays the contents of the current IPv4 prefix list.

resequence prefix-list ipv6

To renumber existing statements and increment subsequent statements to allow a new prefix list statement (**permit**, **deny**, or **remark**) to be added, use the **resequence prefix-list ipv6** command in EXEC mode.

```
resequence prefix-list ipv6 name [base [increment]]
```

Syntax Description

<i>name</i>	Name of a prefix list.
<i>base</i>	(Optional) Number of the first statement in the specified prefix list, which determines its order in the prefix list. Maximum value is 2147483644.
<i>increment</i>	(Optional) Number by which the base sequence number is incremented for subsequent statements. Maximum value is 2147483644.

Command Default

base: 10
increment: 10

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

The sequence number of a prefix list entry determines the order of the entries in the list. The router compares network addresses to the prefix list entries. The router begins the comparison at the top of the prefix list, with the entry having the lowest sequence number.

If multiple entries of a prefix list match a prefix, the entry with the lowest sequence number is considered the real match. Once a match or deny occurs, the router does not go through the rest of the prefix list.

By default, the first statement in a prefix list is sequence number 10, and the subsequent statements are incremented by 10.

Use the **resequence prefix-list ipv6** command to add a **permit**, **deny**, or **remark** statement between consecutive entries in an existing IPv6 prefix list. Specify the first entry number (the *base*) and the increment by which to separate the entry numbers of the statements. The software renumbers the existing statements, thereby making room to add new statements with the unused entry numbers.

24' to view the changes.
```

show prefix-list

To display information about a prefix list or prefix list entries, use the **show prefix-list** command in EXEC mode.

```
show prefix-list [list-name] [sequence-number]
```

Syntax Description	
<i>list-name</i>	(Optional) Name of a prefix list.
<i>sequence-number</i>	(Optional) Sequence number of the prefix list entry. Range is 1 to 2147483646.

Command Default No default behavior or values

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operations
	acl	read

Examples The following sample output is from the **show prefix-list** command:

```
RP/0/RSP0/CPU0:router# show prefix-list
```

show prefix-list afi-all

To display the contents of the prefix list for all the address families, use the **show prefix-list afi-all** command in EXEC mode.

show prefix-list afi-all

Syntax Description	This command has no keywords or arguments.
---------------------------	--------------------------------------------

Command Default	No default behavior or values
------------------------	-------------------------------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	No specific guidelines impact the use of this command.
-------------------------	--------------------------------------------------------

Task ID	Task ID	Operations
	acl	read

Examples The following sample output is from the **show prefix-list afi-all** command:

```
RP/0/RSP0/CPU0:router# show prefix-list afi-all
```

show prefix-list ipv4

To display the contents of current IP Version 4 (IPv4) prefix list, use the **show prefix-list ipv4** command in EXEC mode.

```
show prefix-list ipv4 [list-name] [sequence-number] [summary]
```

Syntax Description	
<i>list-name</i>	(Optional) Name of a prefix list.
<i>sequence-number</i>	(Optional) Sequence number of the prefix list entry. Range is 1 to 2147483646.
summary	(Optional) Displays summary output of prefix list contents.

Command Default All IPv4 prefix lists are displayed.

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines Use the **show prefix-list ipv4** command to display the contents of all IPv4 prefix lists. To display the contents of a specific IPv4 prefix list, use the *name* argument. Use the *sequence-number* argument to specify a given prefix list entry. Use the **summary** keyword to display a summary of prefix list contents.

Task ID	Task ID	Operations
	acl	read

Examples

The following example displays all configured prefix lists:

```
RP/0/RSP0/CPU0:router# show prefix-list ipv4

ipv4 prefix-list list1
 10 permit 172.20.10.171/16 le 24
 20 permit 172.18.0.0/16
 30 deny 172.24.20.164/16 ge 25
ipv4 prefix-list list2
 10 deny 172.18.30.154/16 ge 25
```

The following example uses the *list-name* argument to display the prefix list named list1:

```
RP/0/RSP0/CPU0:router# show prefix-list ipv4 list1

ipv4 prefix-list list1
 10 permit 172.20.10.171/16 le 24
 20 permit 172.18.0.0/16
 30 deny 172.24.20.164/16 ge 25
```

The following example uses the *list-name* and *sequence-number* argument to display a prefix list named list1 with a sequence number of 10:

```
RP/0/RSP0/CPU0:router# show prefix-list ipv4 list1 30

ipv4 prefix-list list1
 30 deny 172.24.20.164/16 ge 25
```

Related Commands

Command	Description
clear prefix-list ipv4, on page 750	Resest the hit count on an IPv4 prefix list.
ipv4 prefix-list, on page 761	Defines an IPv4 prefix list.
show prefix-list ipv6, on page 779	Displays the contents of the current IPv6 prefix list.

show prefix-list ipv4 standby

To display the contents of current IPv4 standby access lists, use the **show access-lists ipv4 standby** command in EXEC mode.

```
show prefix-list ipv4 standby [prefix-list name] [summary]
```

Syntax Description	
<i>prefix-list name</i>	(Optional) Name of a particular IPv4 prefix list. The value of the prefix-list-name argument is a string of alphanumeric characters that cannot include spaces or quotation marks.
summary	(Optional) Displays a summary of all current IPv4 standby prefix lists.

Command Default	No default behavior or values
-----------------	-------------------------------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	Use the show prefix-list ipv4 standby command to display the contents of current IPv4 standby prefix lists. To display the contents of a specific IPv4 prefix list, use the <i>name</i> argument.
------------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Use the **show prefix-list ipv4 standby summary** command to display a summary of all standby IPv4 prefix lists.

Task ID	Task ID	Operations
	acl	read

Examples

In the following example, the contents of all IPv4 access lists are displayed:

```
RP/0/RSP0/CPU0:router# show prefix-list ipv4 standby summary
Prefix List Summary:
  Total Prefix Lists configured:          2
  Total Prefix List entries configured :  6
```

show prefix-list ipv6

To display the contents of the current IP Version 6 (IPv6) prefix list, use the **show prefix-list ipv6** command in EXEC mode.

```
show prefix-list ipv6 [list-name] [sequence-number] [summary]
```

Syntax Description		
	<i>list-name</i>	(Optional) Name of a prefix list.
	<i>sequence-number</i>	(Optional) Sequence number of the prefix list entry. Range is 1 to 2147483646.
	summary	(Optional) Displays summary output of prefix list contents.

Command Default All IPv6 prefix lists are displayed.

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines Use the **show prefix-list ipv6** command to display the contents of all IPv4 prefix lists.

To display the contents of a specific IPv6 prefix list, use the *name* argument. Use the *sequence-number* argument to specify a given prefix list entry. Use the **summary** keyword to display a summary of prefix list contents.

Task ID	Task ID	Operations
	acl	read

Examples

The following example shows how to display all configured prefix lists:

```
RP/0/RSP0/CPU0:router# show prefix-list ipv6

ipv6 prefix-list list1
 10 permit 5555::/24
 20 deny 3000::/24
 30 permit 2000::/24
ipv6 prefix-list list2
 10 permit 2000::/24
```

The following example uses the *list-name* argument to display the prefix list named list1:

```
RP/0/RSP0/CPU0:router# show prefix-list ipv6 list1

ipv6 prefix-list list1
 10 permit 5555::/24
 20 deny 3000::/24
 30 permit 2000::/24
```

The following example uses the *list-name* and *sequence-number* argument to display a prefix list named list1 with a sequence number of 10:

```
RP/0/RSP0/CPU0:router# show prefix-list ipv6 list1 10

ipv6 prefix-list abc
 10 permit 5555::/24
```

The following example displays a summary of prefix list contents:

```
RP/0/RSP0/CPU0:router# show prefix-list ipv6 summary

Prefix List Summary:
  Total Prefix Lists configured:      2
  Total Prefix List entries configured: 2
```

Related Commands

Command	Description
clear prefix-list ipv6 , on page 752	Resest the hit count on an IPv4 prefix list.
copy prefix-list ipv6 , on page 756	Creates a copy of an existing IPv6 prefix list.
ipv6 prefix-list, on page 763	Creates an IPv6 prefix list.

Transport Stack Commands

This chapter describes the Cisco IOS XR software commands used to configure and monitor features related to the transport stack (Nonstop Routing [NSR], TCP, User Datagram Protocol [UDP], and RAW) on the Cisco ASR 9000 Series Aggregation Services Router . Any IP protocol other than TCP or UDP is known as a RAW protocol.

For detailed information about transport stack concepts, configuration tasks, and examples, refer to the *IP Addresses and Services Configuration Guide for Cisco ASR 9000 Series Routers*.

clear nsr ncd client

To clear the counters of a specified client or all the clients of nonstop routing (NSR) Consumer Demuxer (NCD), use the **clear nsr ncd client** command in EXEC mode.

```
clear nsr ncd client {PID value | all} [location node-id]
```

Syntax Description		
	<i>PID value</i>	Process ID value of the client in which counters need to be cleared. The range is from 0 to 4294967295.
	all	Clears the counters for all NCD clients.
	location <i>node-id</i>	(Optional) Displays information for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

Command Default The default value for the *node-id* argument is the current node in which the command is being executed. The *PID value* argument does not have a default value.

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines The **location** keyword is used so that active and standby TCP instances are independently queried. The active and standby instances of some NSR-capable applications communicate through two queues, and these applications are multiplexed onto these queues. NSR consumer demuxer (NCD) is a process that provides the demuxing services on the receiver side.

You can use the **clear nsr ncd client** command to troubleshoot traffic issues. If you clear the existing counters, it can help you to monitor the delta changes.

Task ID	Task ID	Operations
	transport	execute

Examples The following example shows how to clear all the counters for all NCD clients:

```
RP/0/RSP0/CPU0:router# clear nsr ncd client all
RP/0/RSP0/CPU0:router# show nsr ncd client all
```

```
Client PID                : 3874979
Client Protocol           : TCP
Client Instance           : 1
Total packets received    : 0
Total acks received       : 0
Total packets/acks accepted : 0
Errors in changing packet ownership : 0
Errors in setting application offset : 0
```

clear nsr ncd client

```
Errors in enqueueing to client      : 0
Time of last clear                  : Sun Jun 10 14:43:44 20
```

```
RP/0/RSP0/CPU0:router# show nsr ncd client brief
```

```

Total   Total   Accepted
Pid    Protocol Instance Packets Acks   Packets/Acks
3874979 TCP      1         0     0         0

```

Related Commands

Command	Description
clear nsr ncd queue, on page 785	Clears the counters for the NSR Consumer Demuxer (NCD) queue.
show nsr ncd client, on page 813	Displays information about the clients for NSR Consumer Demuxer (NCD).
show nsr ncd queue, on page 815	Displays information about the nonstop routing (NSR) Consumer Queue and Dispatch (QAD) queues.

clear nsr ncd queue

To clear the counters for the nonstop routing (NSR) Consumer Demuxer (NCD) queue, use the **clear nsr ncd queue** command in EXEC mode.

```
clear nsr ncd queue {all | high | low} [location node-id]
```

Syntax Description	all	Clears the counters for all the NCD queues.
	high	Clears the counters for the high-priority NCD queue.
	low	Clears the counters the low-priority NCD queue.
	location node-id	(Optional) Displays information for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

Command Default If a value is not specified, the current RP in which the command is being executed is taken as the location.

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines The **location** keyword is used so that active and standby TCP instances are independently queried.

Task ID	Task ID	Operations
	transport	execute

Examples

The following example shows how to clear the counters for all the NCD queues:

```
RP/0/RSP0/CPU0:router# clear nsr ncd queue all
RP/0/RSP0/CPU0:router# show nsr ncd queue all

Queue Name                               : NSR_LOW
Total packets received                    : 0
Total packets accepted                    : 0
Errors in getting datagram offset         : 0
Errors in getting packet length           : 0
Errors in calculating checksum             : 0

Errors in reading packet data             : 0
Errors due to bad NCD header              : 0
Drops due to a non-existent client        : 0
Errors in changing packet ownership       : 0
Errors in setting application offset       : 0
Errors in enqueueing to client            : 0
Time of last clear                        : Sun Jun 10 14:44:38 2007
```

clear nsr ncd queue

```

Queue Name                : NSR_HIGH
Total packets received    : 0
Total packets accepted    : 0
Errors in getting datagram offset : 0
Errors in getting packet length : 0
Errors in calculating checksum : 0
Errors due to bad checksum : 0
Errors in reading packet data : 0
Errors due to bad NCD header : 0
Drops due to a non-existent client : 0
Errors in changing packet ownership : 0
Errors in setting application offset : 0
Errors in enqueueing to client : 0
Time of last clear        : Sun Jun 10 14:44:38 2007

```

```
RP/0/RSP0/CPU0:router# show nsr ncd queue brief
```

Queue	Total Packets	Accepted Packets
NSR_LOW	0	0
NSR_HIGH	0	0

Related Commands

Command	Description
clear nsr ncd client, on page 783	Clears the counters for the NSR Consumer Demuxer (NCD) client.
nsr process-failures switchover, on page 808	Configures failover as a recovery action for active instances to switch over to a standby route processor (RP) or a distributed route processor (DRP) to maintain nonstop routing (NSR).
show nsr ncd client, on page 813	Displays information about the clients for NSR Consumer Demuxer (NCD).
show nsr ncd queue, on page 815	Displays information about the nonstop routing (NSR) Consumer Queue and Dispatch (QAD) queues.

clear raw statistics pcb

To clear statistics for a single RAW connection or for all RAW connections, use the **clear raw statistics pcb** command in EXEC mode.

```
clear raw statistics pcb {all | pcb-address} [location node-id]
```

Syntax Description		
	all	Clears statistics for all RAW connections.
	pcb-address	Clears statistics for a specific RAW connection.
	location <i>node-id</i>	(Optional) Clears statistics for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

Command Default No default behavior or values

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines Use the **all** keyword to clear all RAW connections. To clear a specific RAW connection, enter the protocol control block (PCB) address of the RAW connection. Use the **show raw brief** command to obtain the PCB address.

Use the **location** keyword and *node-id* argument to clear RAW statistics for a designated node.

Task ID	Task ID	Operations
	transport	execute

Examples

The following example shows how to clear statistics for a RAW connection with PCB address 0x80553b0:

```
RP/0/RSP0/CPU0:router# clear raw statistics pcb 0x80553b0
RP/0/RSP0/CPU0:router# show raw statistics pcb 0x80553b0
```

```
Statistics for PCB 0x80553b0
Send: 0 packets received from application
0 xipc pulse received from application
0 packets sent to network
0 packets failed getting queued to network
Rcvd: 0 packets received from network
0 packets queued to application
0 packets failed queued to application
```

The following example shows how to clear statistics for all RAW connections:

clear raw statistics pcb

```
RP/0/RSP0/CPU0:router# clear raw statistics pcb all
RP/0/RSP0/CPU0:router# show raw statistics pcb all
```

```
Statistics for PCB 0x805484c
Send: 0 packets received from application
0 xipc pulse received from application
0 packets sent to network
0 packets failed getting queued to network
Rcvd: 0 packets received from network
0 packets queued to application
0 packets failed queued to application
```

```
Statistics for PCB 0x8054f80
Send: 0 packets received from application
0 xipc pulse received from application
0 packets sent to network
0 packets failed getting queued to network
Rcvd: 0 packets received from network
0 packets queued to application
0 packets failed queued to application
```

```
Statistics for PCB 0x80553b0
Send: 0 packets received from application
0 xipc pulse received from application
0 packets sent to network
0 packets failed getting queued to network
Rcvd: 0 packets received from network
0 packets queued to application
0 packets failed queued to application
```

Related Commands

Command	Description
show raw brief, on page 817	Displays information about active RAW IP sockets.
show raw statistics pcb, on page 823	Displays statistics for either a single RAW connection or all RAW connections.

clear tcp nsr client

To bring the nonstop routing (NSR) down on all the sessions that are owned by the specified client, use the **clear tcp nsr client** command in EXEC mode.

```
clear tcp nsr client {ccb-address | all} [location node-id]
```

Syntax Description		
	<i>ccb-address</i>	Client Control Block (CCB) of the NSR client.
	all	Specifies all the clients.
	location <i>node-id</i>	(Optional) Displays client information for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

Command Default The location defaults to the current node in which the command is executing.

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines The **location** keyword is used so that active and standby TCP instances are independently queried. The output of the **show tcp nsr client** command is used to locate the CCB of the desired client. Use the **clear tcp nsr client** command to gracefully bring down NSR session that are owned by one client or all clients. In addition, the **clear tcp nsr client** command is used as a work around if the activity on the sessions freezes.

Task ID	Task ID	Operations
	transport	execute

Examples

The following example shows that the nonstop routing (NSR) client is cleared for 0x482afacc. The two sessions had NSR already up before executing the **clear tcp nsr client** command. NSR is no longer up after executing the **clear tcp nsr client** command.

```
RP/0/RSP0/CPU0:router# show tcp nsr client brief

CCB          Proc Name   Instance   Sets      Sessions/NSR Up Sessions
0x482c10e0   mpls_ldp    1          2         3/1
0x482afacc   mpls_ldp    2          1         2/2

RP/0/RSP0/CPU0:router# clear tcp nsr client 0x482afacc
RP/0/RSP0/CPU0:router# show tcp nsr client brief

0x482c10e0   mpls_ldp    1          2         3/1
0x482afacc   mpls_ldp    2          1         2/0
```

Related Commands

Command	Description
nsr process-failures switchover, on page 808	Configures failover as a recovery action for active instances to switch over to a standby route processor (RP) or a distributed route processor (DRP) to maintain nonstop routing (NSR).
show tcp nsr client brief, on page 834	Displays brief information about the state of nonstop routing (NSR) of TCP clients on different nodes.

clear tcp nsr pcb

To bring the nonstop routing (NSR) down on a specified connection or all connections, use the **clear tcp nsr pcb** command in EXEC mode.

```
clear tcp nsr pcb {pcb-address | all} [location node-id]
```

Syntax Description		
pcb-address	PCB address range for the specific connection information. 0 to ffffffff. For example, the address range can be 0x482a4e20.	
all	Specifies all the connections.	
location node-id	(Optional) Displays connection information for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.	

Command Default If a value is not specified, the current RSP in which the command is being executed is taken as the location.

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines To use this command, you must be in a user group associated with a task group that includes the proper task IDs. If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The **location** keyword is used so that active and standby TCP instances are independently queried.

The output of the **show tcp nsr brief** command is used to locate the Protocol Control Block (PCB) of a desired connection.

Task ID	Task ID	Operations
	transport	execute

Examples

The following example shows that the information for TCP connections is cleared:

```
RP/0/RSP0/CPU0:router# show tcp nsr brief

Related Commands

Command	Description
show tcp nsr brief, on page 832	Displays the key nonstop routing (NSR) state of TCP connections on different nodes.

Command	Description
show tcp nsr detail pcb, on page 838	Displays detailed information about the state of nonstop routing (NSR) for TCP connections.

clear tcp nsr session-set

To clear the nonstop routing (NSR) on all the sessions in the specified session-set or all session sets, use the **clear tcp nsr session-set** command in EXEC mode.

```
clear tcp nsr session-set { sscb-address | all} [location node-id]
```

Syntax Description	
<i>sscb-address</i>	Session-Set Control Block (SSCB) address range for the specific session set information. 0 to ffffffff. For example, the address range can be 0x482a4e20.
all	Specifies all the session sets.
location <i>node-id</i>	(Optional) Displays session set information for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

Command Default If a value is not specified, the current RP in which the command is being executed is taken as the location.

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines The **location** keyword is used so that active and standby TCP instances are independently queried. The output of the **show tcp nsr session-set brief** command is used to locate the SSCB of the desired session-set.

Task ID	Task ID	Operations
	transport	execute

Examples The following example shows that the information for the session sets is cleared:

```
RP/0/RSP0/CPU0:router# show tcp nsr client brief

CCB          Proc Name      Instance  Sets      Sessions/NSR Up Sessions

clear tcp nsr statistics client

To clear the nonstop routing (NSR) statistics of the client, use the **clear tcp nsr statistics client** command in EXEC mode.

clear tcp nsr statistics client {*ccb-address* | **all**} [**location** *node-id*]

Syntax Description	
<i>ccb-address</i>	Client Control Block (CCB) of the desired client. For example, the address range can be 0x482a4e20.
all	Specifies all the clients.
location <i>node-id</i>	(Optional) Displays client information for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

Command Default If a value is not specified, the current RP in which the command is being executed is taken as the location.

Command Modes EXEC

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines To use this command, you must be in a user group associated with a task group that includes the proper task IDs. If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The **location** keyword is used so that active and standby TCP instances are independently queried.

		show tcp nsr statistics summary, on page 851

clear tcp pcb

To clear TCP protocol control block (PCB) connections, use the **clear tcp pcb** command in EXEC mode.

```
clear tcp pcb {pcb-address | all} [location node-id]
```

Syntax Description

<i>pcb-address</i>	Clears the TCP connection at the specified PCB address.
all	Clears all open TCP connections.
location <i>node-id</i>	(Optional) Clears the TCP connection for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

Command Default

No default behavior or values

Command Modes

EXEC mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

The **clear tcp pcb** command is useful for clearing hung TCP connections. Use the [show tcp brief, on page 825](#) command to find the PCB address of the connection you want to clear.

If the **clear tcp pcb all** command is used, the software does not clear a TCP connection that is in the listen state. If a specific PCB address is specified, then a connection in listen state is cleared.

Task ID

Task ID	Operations
	transport execute

Examples

The following example shows that the TCP connection at PCB address 60B75E48 is cleared:

```
RP/0/RSP0/CPU0:router# clear tcp pcb 60B75E48
```

Related Commands

Command	Description
show tcp brief, on page 825	Displays the TCP summary table.

clear tcp statistics

To clear TCP statistics, use the **clear tcp statistics** command in EXEC mode.

```
clear tcp statistics {pcb {all pcb-address} | summary} [location node-id]
```

Syntax Description

pcb all	(Optional) Clears statistics for all TCP connections.
pcb <i>pcb-address</i>	(Optional) Clears statistics for a specific TCP connection.
summary	(Optional) Clears summary statistic for a specific node or connection.
location <i>node-id</i>	(Optional) Clears TCP statistics for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

Command Default

No default behavior or values

Command Modes

EXEC mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

Use the **clear tcp statistics** command to clear TCP statistics. Use the [show tcp statistics, on page 830](#) command to display TCP statistics. You might display TCP statistics and then clear them before you start debugging TCP.

The optional **location** keyword and *node-id* argument can be used to clear TCP statistics for a designated node.

Task ID

Task ID	Operations
transport	execute

Examples

The following example shows how to clear TCP statistics:

```
RP/0/RSP0/CPU0:router# clear tcp statistics
```

Related Commands

Command	Description
show tcp statistics, on page 830	Displays TCP statistics.

clear udp statistics

To clear User Datagram Protocol (UDP) statistics, use the **clear udp statistics** command in EXEC mode.

```
clear udp statistics {pcb {all pcb-address} | summary} [location node-id]
```

Syntax Description

pcb all	Clears statistics for all UDP connections.
pcb pcb-address	Clears statistics for a specific UDP connection.
summary	Clears UDP summary statistics.
location node-id	(Optional) Clears UDP statistics for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

Command Default

No default behavior or values

Command Modes

EXEC mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

Use the **clear udp statistics** command to clear UDP statistics. Use the [show udp statistics, on page 858](#) command to display UDP statistics. You might display UDP statistics and then clear them before you start debugging UDP.

The optional **location** keyword and *node-id* argument can be used to clear UDP statistics for a designated node.

Task ID

Task ID	Operations
transport	execute

Examples

The following example shows how to clear UDP summary statistics:

```
RP/0/RSP0/CPU0:router# clear udp statistics summary
```

Related Commands

Command	Description
show udp statistics, on page 858	Displays UDP statistics.

forward-protocol udp

To configure the system to forward any User Datagram Protocol (UDP) datagrams that are received as broadcast packets to a specified helper address, use the **forward-protocol udp** command in Global Configuration mode. To restore the system to its default condition with respect to this command, use the **no** form of this command.

forward-protocol udp {*port-number* | **disable** | **domain** | **nameserver** | **netbios-dgm** | **netbios-ns** | **tacacs** | **tftp**}

no forward-protocol udp {*port-number* | **disable** | **domain** | **nameserver** | **netbios-dgm** | **netbios-ns** | **tacacs** | **tftp**}

Syntax Description	
<i>port-number</i>	Forwards UDP broadcast packets to a specified port number. Range is 1 to 65535.
disable	Disables IP Forward Protocol UDP.
domain	Forwards UDP broadcast packets to Domain Name Service (DNS, 53).
nameserver	Forwards UDP broadcast packets to IEN116 name service (obsolete, 42).
netbios-dgm	Forwards UDP broadcast packets to NetBIOS datagram service (138).
netbios-ns	Forwards UDP broadcast packets to NetBIOS name service (137).
tacacs	Forwards UDP broadcast packets to TACACS (49).
tftp	Forwards UDP broadcast packets to TFTP (69).

Command Default Disabled

Command Modes Global Configuration mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines Use the **forward-protocol udp** command to specify that UDP broadcast packets received on the incoming interface are forwarded to a specified helper address.

When you configure the **forward-protocol udp** command, you must also configure the **helper-address** command to specify a helper address on an interface. The helper address is the IP address to which the UDP datagram is forwarded. Configure the **helper-address** command with IP addresses of hosts or networking devices that can handle the service. Because the helper address is configured per interface, you must configure a helper address for each incoming interface that will be receiving broadcasts that you want to forward.

You must configure one **forward-protocol udp** command per UDP port you want to forward. The port on the packet is either port 53 (**domain**), port 69 (**tftp**), or a port number you specify.

Task ID	Task ID	Operations
	transport	read, write

Examples

The following example shows how to specify that all UDP broadcast packets with port 53 or port 69 received on incoming MgmtEth interface 0/0/CPU0/0 are forwarded to 172.16.0.1. MgmtEth interface 0/0/CPU0/0 receiving the UDP broadcasts is configured with a helper address of 172.16.0.1, the destination address to which the UDP datagrams are forwarded.

```
RP/0/RSP0/CPU0:router(config)# forward-protocol udp domain disable
RP/0/RSP0/CPU0:router(config)# forward-protocol udp tftp disable
RP/0/RSP0/CPU0:router(config)# interface MgmtEth 0/0/CPU0/0
RP/0/RSP0/CPU0:router(config-if)# ipv4 helper-address 172.16.0.1
```

nsr process-failures switchover

To configure failover as a recovery action for active instances to switch over to a standby route processor (RP) to maintain nonstop routing (NSR), use the **nsr process-failures switchover** command in Global Configuration mode. To disable this feature, use the **no** form of this command.

nsr process-failures switchover
no nsr process-failures switchover

Syntax Description	This command has no keywords or arguments.	
Command Default	If not configured, a process failure of the active TCP or its applications (for example LDP, BGP, and so forth) can cause sessions to go down, and NSR is not provided.	
Command Modes	Global Configuration mode	
Command History	Release	Modification
	Release 3.7.2	This command was introduced.
Usage Guidelines	No specific guidelines impact the use of this command.	
Task ID	Task ID	Operations
	transport	read, write
Examples	The following example shows how to use the nsr process-failures switchover command:	
	<pre>RP/0/RSP0/CPU0:router(config)# nsr process-failures switchover</pre>	

service tcp-small-servers

To enable small TCP servers such as the ECHO, use the **service tcp-small-servers** command in Global Configuration mode. To disable the TCP server, use the **no** form of this command.

```
service {ipv4 | ipv6} tcp-small-servers [{max-servers number | no-limit}] [access-list-name]
no service {ipv4 | ipv6} tcp-small-servers [{max-servers number | no-limit}] [access-list-name]
```

Syntax Description	ip4	Specifies IPv4 small servers.
	ipv6	Specifies IPv6 small servers.
	max-servers	(Optional) Sets the number of allowable TCP small servers.
	number	(Optional) Number value. Range is 1 to 2147483647.
	no-limit	(Optional) Sets no limit to the number of allowable TCP small servers.
	access-list-name	(Optional) The name of an access list.
Command Default	TCP small servers are disabled.	
Command Modes	Global Configuration mode	
Command History	Release	Modification
	Release 3.7.2	This command was introduced.
Usage Guidelines	The TCP small servers currently consist of three services: Discard (port 9), Echo (port 7), and Chargen (port 19). These services are used to test the TCP transport functionality. The Discard server receives data and discards it. The Echo server receives data and echoes the same data to the sending host. The Chargen server generates a sequence of data and sends it to the remote host.	

Task ID	Task ID	Operations
	ipv4	read, write
	ip-services	read, write

Examples

In the following example, small IPv4 TCP servers are enabled:

```
RP/0/RSP0/CPU0:router(config)# service ipv4 tcp-small-servers max-servers 5 acl100
```

Related Commands

Command	Description
service udp-small-servers, on page 811	Enables small UDP servers such as the ECHO.
show cinetd services	Displays the services whose processes are spawned by cinetd.

service udp-small-servers

To enable small User Datagram Protocol (UDP) servers such as the ECHO, use the **service udp-small-servers** command in Global Configuration mode. To disable the UDP server, use the **no** form of this command.

```
service {ipv4 | ipv6} udp-small-servers [{max-servers number | no-limit}] [access-list-name]
no service {ipv4 | ipv6} udp-small-servers [{max-servers number | no-limit}] [access-list-name]
```

Syntax Description	Parameter	Description
	ip4	Specifies IPv4 small servers.
	ip6	Specifies IPv6 small servers.
	max-servers	(Optional) Sets the number of allowable UDP small servers.
	<i>number</i>	(Optional) Number value. Range is 1 to 2147483647.
	no-limit	(Optional) Sets no limit to the number of allowable UDP small servers.
	<i>access-list-name</i>	(Optional) Name of an access list.

Command Default UDP small servers are disabled.

Command Modes Global Configuration mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines The UDP small servers currently consist of three services: Discard (port 9), Echo (port 7), and Chargen (port 19). These services are used to test the UDP transport functionality. The discard server receives data and discards it. The echo server receives data and echoes the same data to the sending host. The chargen server generates a sequence of data and sends it to the remote host.

Task ID	Task ID	Operations
	ipv6	read, write
	ip-services	read, write

Examples

The following example shows how to enable small IPv6 UDP servers and set the maximum number of allowable small servers to 10:

```
RP/0/RSP0/CPU0:router(config)# service ipv6 udp-small-servers max-servers 10
```

Related Commands

Command	Description
service tcp-small-servers, on page 809	Enables small TCP servers such as the ECHO.

show nsr ncd client

To display information about the clients for nonstop routing (NSR) Consumer Demuxer (NCD), use the **show nsr ncd client** command in EXEC mode.

```
show nsr ncd client {PID value | all | brief} [location node-id]
```

Syntax Description		
	<i>PID value</i>	Process ID (PID) information for a specific client. The range is from 0 to 4294967295.
	all	Displays detailed information about all the clients.
	brief	Displays brief information about all the clients.
	location node-id	(Optional) Displays information for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

Command Default If a value is not specified, the current RP in which the command is being executed is taken as the location.

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines The **location** keyword is used so that active and standby TCP instances are independently queried.

Task ID	Task ID	Operations
	transport	read

Examples

The following sample output shows detailed information about all the clients:

```
RP/0/RSP0/CPU0:router# show nsr ncd client all

Client PID                : 3874979
Client Protocol            : TCP
Client Instance            : 1
Total packets received    : 28
Total acks received       : 0
Total packets/acks accepted : 28
Errors in changing packet ownership : 0
Errors in setting application offset : 0
Errors in enqueueing to client : 0
Time of last clear        : Never cleared
```

The following sample output shows brief information about all the clients:

```
RP/0/RSP0/CPU0:router# show nsr ncd client brief
```

```

Pid      Protocol  Instance  Total  Total  Accepted
                            Packets Acks   Packets/Acks
3874979  TCP        1         28    0      28

```

This table describes the significant fields shown in the display.

Table 74: show nsr ncd client Command Field Descriptions

Field	Description
Client PID	Process ID of the client process.
Client Protocol	Protocol of the client process. The protocol can be either TCP, OSPF, or BGP.
Client Instance	Instance number of the client process. There can be more than one instance of a routing protocol, such as OSPF.
Total packets received	Total packets received from the partner stack on the partner route processor (RP).
Total acks received	Total acknowledgements received from the partner stack on the partner RP for the packets sent to the partner stack.
Total packets/acks accepted	Total packets and acknowledgements received from the partner stack on the partner RP.
Errors in changing packet ownership	NCD changes the ownership of the packet to that of the client before queueing the packet to the client. This counter tracks the errors, if any, in changing the ownership.
Errors in setting application offset	NCD sets the offset of the application data in the packet before queueing the packet to the client. This counter tracks the errors, if any, in setting this offset.
Errors in enqueueing to client	Counter tracks any queueing errors.
Time of last clear	Statistics last cleared by the user.

Related Commands

Command	Description
clear nsr ncd client, on page 783	Clears the counters for the NSR Consumer Demuxer (NCD) client.
clear nsr ncd queue, on page 785	Clears the counters for the NSR Consumer Demuxer (NCD) queue.
show nsr ncd queue, on page 815	Displays information about the nonstop routing (NSR) Consumer Queue and Dispatch (QAD) queues.

show nsr ncd queue

To display information about the queues that are used by the nonstop routing (NSR) applications to communicate with their partner stacks on the partner route processors (RPs), use the **show nsr ncd queue** command in EXEC mode.

```
show nsr ncd queue {all | brief | high | low} [location node-id]
```

Syntax Description	
all	Displays detailed information about all the consumer queues.
brief	Displays brief information about all the consumer queues.
high	Displays information about high-priority Queue and Dispatch (QAD) queues.
low	Displays information about low-priority QAD queues.
location node-id	(Optional) Displays information for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

Command Default If a value is not specified, the current RP in which the command is being executed is taken as the location.

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines The **location** keyword is used so that active and standby TCP instances are independently queried.

Task ID	Task ID	Operations
	transport	read

Examples The following sample output shows brief information about all the consumer queues:

```
RP/0/RSP0/CPU0:router# show nsr ncd queue brief

      Queue          Total      Accepted
      NSR_LOW        992         992
      NSR_HIGH         0           0
```

This table describes the significant fields shown in the display.

Table 75: show nsr ncd queue Command Field Descriptions

Field	Description
Total Packets	Total number of packets that are received from the partner stack.

show nsr ncd queue

Field	Description
Accepted Packets	Number of received packets that were accepted after performing some validation tasks.
Queue	Name of queue. NSR_HIGH and NSR_LOW are the two queues. High priority packets flow on the NSR_HIGH queue. Low priority packets flow on the NSR_LOW queue.

Related Commands

Command	Description
clear nsr ncd client, on page 783	Clears the counters for the NSR consumer demuxer (NCD) client.
clear nsr ncd queue, on page 785	Clears the counters for the NSR consumer demuxer (NCD) queue.
show nsr ncd client, on page 813	Displays information about the clients for NSR consumer demuxer(NCD).

show raw brief

To display information about active RAW IP sockets, use the **show raw brief** command in EXEC mode.

show raw brief [**location** *node-id*]

Syntax Description	location <i>node-id</i> (Optional) Displays information for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
---------------------------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Command Default	No default behavior or values
------------------------	-------------------------------

Command Modes	EXEC mode
----------------------	-----------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	Protocols such as Open Shortest Path First (OSPF) and Protocol Independent Multicast (PIM) use long-lived RAW IP sockets. The ping and traceroute commands use short-lived RAW IP sockets. Use the show raw brief command if you suspect a problem with one of these protocols.
-------------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Task ID	Task ID	Operations
	transport	read

Examples	The following is sample output from the show raw brief command:
-----------------	------------------------------------------------------------------------

```
RP/0/RSP0/CPU0:router# show raw brief
PCB          Recv-Q  Send-Q  Local Address          Foreign Address  Protocol
0x805188c    0        0  0.0.0.0                0.0.0.0         2
0x8051dc8    0        0  0.0.0.0                0.0.0.0        103
0x8052250    0        0  0.0.0.0                0.0.0.0        255
```

This table describes the significant fields shown in the display.

Table 76: show raw brief Command Field Descriptions

Field	Description
PCB	Protocol control block address. This is the address to a structure that contains connection information such as local address, foreign address, local port, foreign port, and so on.
Recv-Q	Number of bytes in the receive queue.
Send-Q	Number of bytes in the send queue.
Local Address	Local address and local port.

Field	Description
Foreign Address	Foreign address and foreign port.
Protocol	Protocol that is using the RAW IP socket. For example, the number 2 is IGMP, 103 is PIM, and 89 is OSPF.

show raw detail pcb

To display detailed information about active RAW IP sockets, use the **show raw detail pcb** command in EXEC mode.

```
show raw detail pcb {pcb-address | all} location node-id
```

Syntax Description		
	<i>pcb-address</i>	Displays statistics for a specified RAW connection.
	all	Displays statistics for all RAW connections.
	location <i>node-id</i>	Displays information for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

Command Default No default behavior or values

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines The **show raw detail pcb** command displays detailed information for all connections that use the RAW transport. Information that is displayed includes family type (for example, 2 for AF_INET also known as IPv4), PCB address, Layer 4 (also known as transport) protocol, local address, foreign address, and any filter that is being used.

Task ID	Task ID	Operations
	transport	read

Examples The following is sample output from the **show raw detail pcb** command:

```
RP/0/RSP0/CPU0:router# show raw detail pcb 0x807e89c
```

```
=====
PCB is 0x807e89c, Family: 2, PROTO: 89, VRF: 0x0
  Local host: 0.0.0.0
  Foreign host: 0.0.0.0

Current send queue size: 0
Current receive queue size: 0
Paw socket: Yes
```

This table describes the significant fields shown in the display.

Table 77: show raw detail pcb Command Field Descriptions

Field	Description
JID	Job ID of the process that created the socket.
Family	Network protocol. IPv4 is 2; IPv6 is 26.
PCB	Protocol control block address.
L4-proto	Layer 4 (also known as transport) protocol.
Laddr	Local address.
Faddr	Foreign address.
ICMP error filter mask	If an ICMP filter is being set, output in this field has a nonzero value.
LPTS socket options	If an LPTS option is being set, output in this field has a nonzero value.
Packet Type Filters	Packet filters that are being set for a particular RAW socket, including the number of packets for that filter type. Multiple filters can be set.

show raw extended-filters

To display information about active RAW IP sockets, use the **show raw extended-filters** command in EXEC mode.

```
show raw extended-filters {interface-filter location node-id | location node-id | paktype-filter
location node-id}
```

Syntax Description	interface-filter	Displays the protocol control blocks (PCBs) with configured interface filters.
	location <i>node-id</i>	Displays information for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
	paktype-filter	Displays the PCBs with configured packet type filters.

Command Default No default behavior or values

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines The **show raw extended-filters** command displays detailed information for all connections that use the RAW transport. Information that is displayed includes family type (for example, 2 for AF_INET also known as IPv4), PCB address, Layer 4 (also known as transport) protocol, local address, foreign address, and any filter that is being used.

Task ID	Task ID	Operations
	transport	read

Examples The following is sample output from the **show raw extended-filters** command:

```
RP/0/RSP0/CPU0:router# show raw extended-filters 0/0/CPU0

Total Number of matching PCB's in database: 1
JID: 0/0
Family: 2
PCB: 0x0803dd38
L4-proto: 1
Laddr: 0.0.0.0
Faddr: 0.0.0.0
ICMP error filter mask: 0x3ff
LPTS socket options: 0x0020
Packet Type Filters:
0
[220 pkts in]
3
[0 pkts in]
```

```
4
[0 pkts in]
```

This table describes the significant fields shown in the display.

Table 78: show raw extended-filters Output Command Field Descriptions

Field	Description
JID	Job ID of the process that created the socket.
Family	Network protocol. IPv4 is 2; IPv6 is 26.
PCB	Protocol control block address.
L4-proto	Layer 4 (also known as transport) protocol.
Laddr	Local address.
Faddr	Foreign address.
ICMP error filter mask	If an ICMP filter is being set, output in this field has a nonzero value.
LPTS socket options	If an LPTS option is being set, output in this field has a nonzero value.
Packet Type Filters	Packet filters that are being set for a particular RAW socket, including the number of packets for that filter type. Multiple filters can be set.

show raw statistics pcb

To display statistics for a single RAW connection or for all RAW connections, use the **show raw statistics pcb** command in EXEC mode.

```
show raw statistics pcb {all | pcb-address} location node-id
```

Syntax Description	all	Displays statistics for all RAW connections.
	pcb-address	Displays statistics for a specified RAW connection.
	location node-id	(Optional) Displays RAW statistics for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

Command Default No default behavior or values

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines Use the **all** keyword to display all RAW connections. If a specific RAW connection is desired, then enter the protocol control block (PCB) address of that RAW connection. Use the **show raw brief** command to obtain the PCB address.

Use the **location** keyword and *node-id* argument to display RAW statistics for a designated node.

Task ID	Task ID	Operations
	transport	read

Examples In the following example, statistics for a RAW connection with PCB address 0x80553b0 are displayed:

```
RP/0/RSP0/CPU0:router# show raw statistics pcb 0x80553b0

Statistics for PCB 0x80553b0
Send: 0 packets received from application
0 xipc pulse received from application
0 packets sent to network
0 packets failed getting queued to network
Rcvd: 0 packets received from network
0 packets queued to application
0 packets failed queued to application
```

In this example, statistics for all RAW connections are displayed:

```
RP/0/RSP0/CPU0:router# show raw statistics pcb all
```

```

Statistics for PCB 0x805484c, Vrfid: 0x60000000
Send: 0 packets received from application
0 xipc pulse received from application
0 packets sent to network
0 packets failed getting queued to network
Rcvd: 0 packets received from network
0 packets queued to application
0 packets failed queued to application

```

This table describes the significant fields shown in the display.

Table 79: show raw statistics pcb Command Field Descriptions

Field	Description
Send:	Statistics in this section refer to packets sent from an application to RAW.
Vrfid	VPN routing and forwarding (VRF) identification (vrfid) number.
xipc pulse received from application	Number of notifications sent from applications to RAW.
packets sent to network	Number of packets sent to the network.
packets failed getting queued to network	Number of packets that failed to get queued to the network.
Rcvd:	Statistics in this section refer to packets received from the network.
packets queued to application	Number of packets queued to an application.
packets failed queued to application	Number of packets that failed to get queued to an application.

Related Commands

Command	Description
clear raw statistics pcb, on page 787	Clears statistics for either a single RAW connection or for all RAW connections.
show raw brief, on page 817	Displays information about active RAW IP sockets.

Field	Description
State	State of the TCP connection.

Related Commands

Command	Description
clear tcp pcb, on page 803	Clears the TCP connection.

show tcp detail

To display the details of the TCP connection table, use the **show tcp detail** command in EXEC mode.

```
show tcp detail pcb [{value | all}]
```

Syntax Description

pcb	Displays TCP connection information.
value	Displays a specific connection information. Range is from 0 to ffffffff.
all	Displays all connections information.

Command Default

No default behavior or values

show tcp statistics

To display TCP statistics, use the **show tcp statistics** command in EXEC mode.

show tcp statistics {**pcb** {**all** *pcb-address*} | **summary** } [**location** *node-id*]

Syntax Description	
pcb <i>pcb-address</i>	(Optional) Displays detailed statistics for a specified connection.
pcb all	(Optional) Displays detailed statistics for all connections.
summary	(Optional) Clears summary statistic for a specific node or connection.
location <i>node-id</i>	(Optional) Displays statistics for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

Command Default No default behavior or values

Command Modes EXEC mode

        0 xipc pulse received from application
        0 bytes sent to network
        0 packets failed getting queued to network
Rcvd:  0 packets received from network
        0 packets queued to application
        0 packets failed queued to application
```

This table describes the significant fields shown in the display.

Table 81: show tcp statistics Command Field Descriptions

Field	Description
vrfid	VPN routing and forwarding (VRF) identification (vrfid) number.

Field	Description
Send	Statistics in this section refer to packets sent by the router.
Rcvd:	Statistics in this section refer to packets received by the router.

Related Commands

Command	Description
clear tcp statistics, on page 804	Clears TCP statistics.

show tcp nsr brief

To display the key nonstop routing (NSR) state of TCP connections on different nodes, use the **show tcp nsr brief** command in EXEC mode.

show tcp nsr brief [**location** *node-id*]

Syntax Description	location <i>node-id</i> (Optional) Displays information for all TCP sessions for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
---------------------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Command Default	If a value is not specified, the current RP in which the command is being executed is taken as the location.
------------------------	--------------------------------------------------------------------------------------------------------------

Command Modes	EXEC mode
----------------------	-----------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	The location keyword is used so that active and standby TCP instances are independently queried.
-------------------------	---------------------------------------------------------------------------------------------------------

Task ID	Task ID	Operations
	transport	read

Examples

The following sample output shows the administrative and operational NSR state of each TCP session in the NSR column:

```
RP/0/RSP0/CPU0:router# show tcp nsr brief
```

PCB	Local Address	Foreign Address	NSR	RcvOnly
0x482c6b8c	10

This table describes the significant fields shown in the display.

Table 82: show tcp nsr brief Command Field Descriptions

Field	Description
PCB	Protocol Control Block (PCB).
Local Address	Local address and port of the TCP connection.
Foreign Address	Foreign address and port of the TCP connection.
NSR	Current operational NSR state of this TCP connection.
RevOnly	If yes, the TCP connection is replicated only in the receive direction. Some applications may need to replicate a TCP connection that is only in the receive direction.

Related Commands

Command	Description
clear tcp nsr pcb, on page 791	Brings the NSR down on a specified connection or all connections.
show tcp nsr client brief, on page 834	Displays brief information about the state of nonstop routing (NSR) for the TCP clients on different nodes.

show tcp nsr client brief

To display brief information about the state of nonstop routing (NSR) for TCP clients on different nodes, use the **show tcp nsr client brief** command in EXEC mode.

show tcp nsr client brief [**location** *node-id*]

Syntax Description	location <i>node-id</i> (Optional) Displays brief client information for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
---------------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Command Default	If a value is not specified, the current RP in which the command is being executed is taken as the location.
------------------------	--------------------------------------------------------------------------------------------------------------

Command Modes	EXEC mode
----------------------	-----------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	The location keyword is used so that active and standby TCP instances are independently queried.
-------------------------	---------------------------------------------------------------------------------------------------------

Task ID	Task ID	Operations
	transport	read

Examples The following sample output is from the **show tcp nsr client brief** command:

```
RP/0/RSP0/CPU0:router# show tcp nsr client brief location 0/1/CPU0
```

CCB	Proc Name	Instance	Sets	Sessions/NSR Up	Sessions
0x482bf378	mpls_ldp	1	1	1/1	
0x482bd32c	mpls_ldp	2	1	0/0	

This table describes the significant fields shown in the display.

Table 83: show tcp nsr client brief Command Field Descriptions

Field	Description
CCB	Client Control Block (CCB). Unique ID to identify the client.
Proc Name	Name of the client process.
Instance	Instance is identified as the instance number of the client process because there can be more than one instance for a routing application.
Sets	Set number is identified as the ID of the session-set.
Sessions/NSR Up Sessions	Total sessions in the set versus the number of the sessions in which NSR is up.

Related Commands

Command	Description
clear tcp nsr client, on page 789	Clears detailed information about the nonstop routing (NSR) clients.
show tcp nsr brief, on page 832	Displays the key nonstop routing (NSR) state of TCP connections on different nodes.

show tcp nsr detail client

To display detailed information about the nonstop routing (NSR) clients, use the **show tcp nsr detail client** command in EXEC mode.

show tcp nsr detail client {*ccb-address* | **all**} [**location** *node-id*]

Syntax Description	
<i>ccb-address</i>	Client Control Block (CCB) address range for the specific client information. 0 to ffffffff. For example, the address range can be 0x482a4e20.
all	Specifies all the clients.
location <i>node-id</i>	(Optional) Displays client information for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

Command Default If a value is not specified, the current RP in which the command is being executed is taken as the location.

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines The **location** keyword is used so that active and standby TCP instances are independently queried.

Task ID	Task ID	Operations
	transport	read

show tcp nsr detail session-set

To display the detailed information about the nonstop routing (NSR) state of the session sets on different nodes, use the **show tcp nsr detail session-set** command in EXEC mode.

show tcp nsr detail session-set {*sscb-address* | **all**} [**location** *node-id*]

Syntax Description	
<i>sscb-address</i>	Session-Set Control Block (SSCB) address range for the specific session set information. 0 to ffffffff. For example, the address range can be 0x482c6b8c.
all	Specifies all the session sets.
location <i>node-id</i>	(Optional) Displays information for session sets for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

Command Default If a value is not specified, the current RP in which the command is being executed is taken as the location.

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines The **location** keyword is used so that active and standby TCP instances are independently queried.

show tcp nsr session-set brief

To display brief information about the session sets for the nonstop routing (NSR) state on different nodes, use the **show tcp nsr session-set brief** command in EXEC mode.

```
show tcp nsr session-set brief [location node-id]
```

Syntax Description	location node-id (Optional) Displays information for session sets for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
---------------------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Command Default	If a value is not specified, the current RP in which the command is being executed is taken as the location.
------------------------	--------------------------------------------------------------------------------------------------------------

Command Modes	EXEC mode
----------------------	-----------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	<p>The location keyword is used so that active and standby TCP instances are independently queried.</p> <p>A session set consists of a subset of the application's session in which the subset is protected by only one standby node. The TCP NSR state machine operates with respect to these session sets.</p>
-------------------------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Task ID	Task ID	Operations
	transport	read

Examples	The following sample output shows all the session sets that are known to the TCP instance:
-----------------	--------------------------------------------------------------------------------------------

```
RP/0/RSP0/CPU0:router# show tcp nsr session-set brief
```

SSCB	Client	LocalAPP	Set-Id	Family	Role	Protect-Node	Total/Synced
0x482bc80c	2810078	mpls_ldp#1	1	IPv4	Active	0/1/CPU0	1/1
0x482bb3bc	2810078	mpls_ldp#1	2	IPv4	Active	0/1/CPU0	2/0
0x4827fea8	2859233	mpls_ldp#2	1	IPv6	Active	0/1/CPU0	2/2

The following sample output shows brief information about the session sets for location 0/1/CPU0:

```
RP/0/RSP0/CPU0:router# show tcp nsr session-set brief location 0/1/CPU0
```

SSCB	Client	LocalAPP	Set-Id	Family	Role	Protect-Node	Total/Synced
0x4827ff74	602319	mpls_ldp#1	1	IPv4	Stdby	0/0/CPU0	1/1
0x482b8f54	602320	mpls_ldp#2	1	IPv6	Stdby	0/0/CPU0	2/2

This table describes the significant fields shown in the display.

Table 84: show tcp nsr session-set brief Command Field Descriptions

Field	Description
SSCB	Unique ID for Session-Set Control Block (SSCB) to identify a session-set of a client.
Client	PID of the client process.
LocalAPP	Name and instance number of the client process.
Set-Id	ID of the session-set.
Family	Address family of the sessions added to the session set for IPv4 or IPv6.
Role	Role of the TCP stack for active or standby.
Protect-Node	Node that is offering the protection, for example, partner node.
Total/Synced	Total number of sessions in the set versus the sessions that have been synchronized.

Related Commands

Command	Description
clear tcp nsr session-set, on page 794	Clears information about session sets.
show tcp nsr detail session-set, on page 841	Displays the detailed information about the nonstop routing (NSR) state of the session sets on different nodes.

show tcp nsr statistics client

To display the nonstop routing (NSR) statistics for the clients, use the **show tcp nsr statistics client** command in EXEC mode.

show tcp nsr statistics client {*ccb-address* | **all**} [**location** *node-id*]

Syntax Description	
<i>ccb-address</i>	Client Control Block (CCB) address range for the specific statistics information for the client. 0 to ffffffff. For example, the address range can be 0x482c6b8c.
all	Specifies all the statistics for the clients.
location <i>node-id</i>	(Optional) Displays statistics for the client for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

Command Default If a value is not specified, the current RP in which the command is being executed is taken as the location.

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines The **location** keyword is used so that active and standby TCP instances are independently queried.

Task ID	Task ID	Operations
	transport	read

Examples The following sample output shows all the statistics for the client:

```
RP/0/RSP0/CPU0:router# show tcp nsr statistics client all

To display the nonstop routing (NSR) statistics for a session set, use the **show tcp nsr statistics session-set** command in EXEC mode.

show tcp nsr statistics session-set {*sscb-address* | **all**} [**location** *node-id*]

Syntax Description	<i>sscb-address</i>	Session-Set Control Block (SSCB) address range for the specific session set information for the statistics. 0 to ffffffff. For example, the address range can be 0x482b3444.
	all	Specifies all the session sets for the statistics.
	location <i>node-id</i>	(Optional) Displays session set information for the statistics for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

Command Default If a value is not specified, the current RP in which the command is being executed is taken as the location.

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines The **location** keyword is used so that active and standby TCP instances are independently queried.

Task ID	Task ID	Operations
	transport	read

Examples The following sample output shows all session set information for the statistics:

```
RP/0/RSP0/CPU0:router# show tcp nsr statistics session-set all

=====Session Set Stats =====
SSCB 0x482bc80c, Set ID: 1
Number of times init-sync was attempted :1
Number of times init-sync was successful :1
Number of times init-sync failed       :0
Number of times switch-over occurred   :0
Last clear at: Never Cleared

=====Session Set Stats =====

show udp brief

To display a summary of the User Datagram Protocol (UDP) connection table, use the **show udp brief** command in EXEC mode.

```
show udp brief [location node-id]
```

Syntax Description	location node-id (Optional) Displays information for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
---------------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------

Command Default	No default behavior or values

```

This table describes the significant fields shown in the display.

Table 85: show udp brief Command Field Descriptions

Field	Description
PCB	Protocol control block address. This is the address to a structure that contains connection information such as local address, foreign address, local port, foreign port, and so on.
Recv-Q	Number of bytes in the receive queue.
Send-Q	Number of bytes in the send queue.
Local Address	Local address and local port.

Field	Description
Foreign Address	Foreign address and foreign port.

Related Commands

Command	Description
show tcp brief, on page 825	Displays details of TCP connections.

show udp detail pcb

To display detailed information of the User Datagram Protocol (UDP) connection table, use the **show udp detail pcb** command in EXEC mode.

show udp detail pcb {*pcb-address* | **all**} [**location** *node-id*]

Syntax Description		
	<i>pcb-address</i>	Address of a specified UDP connection.
	all	Provides statistics for all UDP connections.
	location <i>node-id</i>	(Optional) Displays information for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

Command Default No default behavior or values

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operations
	transport	read

Examples The following is sample output from the **show udp detail pcb all** command:

```
RP/0/RSP0/CPU0:router# show udp detail pcb all location 0/3/CPU0
=====
PCB is 0x4822fea0, Family: 2, VRF: 0x60000000
  Local host: 0.0.0.0:3784
  Foreign host: 0.0.0.0:0

Current send queue size: 0
Current receive queue size: 0
=====
PCB is 0x4822d0e0, Family: 2, VRF: 0x60000000
  Local host: 0.0.0.0:3785
  Foreign host: 0.0.0.0:0

Current send queue size: 0
Current receive queue size: 0
```

This table describes the significant fields shown in the display.

Table 86: show raw pcb Command Field Descriptions

Field	Description
PCB	Protocol control block address.
Family	Network protocol. IPv4 is 2; IPv6 is 26.
VRF	VPN routing and forwarding (VRF) instance name.
Local host	Local host address.
Foreign host	Foreign host address.
Current send queue size	Size of the send queue (in bytes).
Current receive queue size	Size of the receive queue (in bytes).

show udp extended-filters

To display the details of the UDP extended-filters, use the **show udp extended-filters** command in EXEC mode.

```
show udp extended-filters {location node-id | peer-filter {location node-id}}
```

Syntax Description	location <i>node-id</i> Displays information for the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
	peer-filter Displays connections with peer filter configured.

Command Default No default behavior or values

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operations
	transport	read

Examples

The following is sample output from the **show udp extended-filters** command for a specific location (0/0/CPU0):

```
RP/0/RSP0/CPU0:router# show udp extended-filters location 0/0/CPU0

Total Number of matching PCB's in database: 1
-----
JID: 248
Family: 2
PCB: 0x48247e94
L4-proto: 17
Lport: 646
Fport: 0
Laddr: 0.0.0.0
Faddr: 0.0.0.0
ICMP error filter mask: 0x0
LPTS options: 0x00000000
-----
```

show udp statistics

To display User Datagram Protocol (UDP) statistics, use the **show udp statistics** command in EXEC mode.

show udp statistics {summary | pcb {pcb-addressall}} [location node-id]

Syntax Description

summary Displays summary statistics.

pcb *pcb-address* Displays detailed statistics for each connection.

pcb *all* Displays detailed statistics for all connections.

location *node-id* (Optional) Displays information for the designated node. The *node-id* argument is entered in the *rack/slot/module* notation.

Command Default

No default behavior or values

Command Modes

EXEC mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

UDP clones the received packets if there are multiple multicast applications that are interested in receiving those packets.

Task ID

Task ID	Operations
transport	read

Examples

The following is sample output from the **show udp statistics summary** command:

```
RP/0/RSP0/CPU0:router# show udp statistics summary
```

```
UDP statistics:
Rcvd: 0 Total, 0 drop, 0 no port
      0 checksum error, 0 too short
Sent: 0 Total, 0 error
0 Total forwarding broadcast packets
0 Cloned packets, 0 failed clonimgication
```

This table describes the significant fields shown in the display.

Table 87: show udp Command Field Descriptions

Field	Description
Rcvd: Total	Total number of packets received.

Field	Description
Rcvd: drop	Total number of packets received that were dropped.
Rcvd: no port	Total number of packets received that have no port.
Rcvd: checksum error	Total number of packets received that have a checksum error.
Rcvd: too short	Total number of packets received that are too short for UDP packets.
Sent: Total	Total number of packets sent successfully.
Sent: error	Total number of packets that cannot be sent due to errors.
Total forwarding broadcast packets	Total number of packets forwarded to the helper address.
Cloned packets	Total number of packets cloned successfully.
failed cloning	Total number of packets that failed cloning.

Related Commands

Command	Description
clear udp statistics, on page 805	Clears UDP statistics.

tcp mss

To configure the TCP maximum segment size that determines the size of the packet that TCP uses for sending data, use the **tcp mss** command in Global Configuration mode.

tcp mss *segment-size*

Syntax Description	<i>segment-size</i> Size, in bytes, of the packet that TCP uses to send data. Range is 68 to 10000 bytes.				
Command Default	If this configuration does not exist, TCP determines the maximum segment size based on the settings specified by the application process, interface maximum transfer unit (MTU), or MTU received from Path MTU Discovery.				
Command Modes	Global Configuration mode				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 3.7.2</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Release 3.7.2	This command was introduced.
Release	Modification				
Release 3.7.2	This command was introduced.				
Usage Guidelines	No specific guidelines impact the use of this command.				
Task ID	<table border="1"> <thead> <tr> <th>Task ID</th> <th>Operations</th> </tr> </thead> <tbody> <tr> <td>transport</td> <td>read, write</td> </tr> </tbody> </table>	Task ID	Operations	transport	read, write
Task ID	Operations				
transport	read, write				

Examples

This example shows how to configure the TCP maximum segment size:

```
RP/0/RSP0/CPU0:router(config)# tcp mss 1460
RP/0/RSP0/CPU0:router(config)# exit

Uncommitted changes found, commit them? [yes]:
RP/0/RSP0/CPU0:router:Sep  8 18:29:51.084 : config[65700]: %LIBTARCFG-6-COMMIT :

Configuration committed by user 'lab'.  Use 'show commit changes 1000000596' to view the
changes.
RP/0/RSP0/CPU0:routerSep  8 18:29:51.209 : config[65700]: %SYS-5-CONFIG_I : Configured from
console by lab
```

tcp path-mtu-discovery

To allow TCP to automatically detect the highest common maximum transfer unit (MTU) for a connection, use the **tcp path-mtu-discovery** in Global Configuration mode. To reset the default, use the **no** form of this command.

```
tcp path-mtu-discovery [{age-timer minutes | infinite}]
no tcp path-mtu-discovery
```

Syntax Description	
age-timer <i>minutes</i>	(Optional) Specifies a value in minutes. Range is 10 to 30.
infinite	(Optional) Turns off the age timer.

Command Default	
	Disabled
age-timer	default is 10 minutes

Command Modes	
	Global Configuration mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines Use the **tcp path-mtu-discovery** command to allow TCP to automatically detect the highest common MTU for a connection, such that when a packet traverses between the originating host and the destination host the packet is not fragmented and then reassembled.

The age timer value is in minutes, with a default value of 10 minutes. The age timer is used by TCP to automatically detect if there is an increase in MTU for a particular connection. If the **infinite** keyword is specified, the age timer is turned off.

Task ID	Task ID	Operations
	transport	read, write

Examples

The following example shows how to set the age timer to 20 minutes:

```
RP/0/RSP0/CPU0:router(config)# tcp path-mtu-discovery age-timer 20
```

tcp selective-ack

To enable TCP selective acknowledgment (ACK) and identify which segments in a TCP packet have been received by the remote TCP, use the **tcp selective-ack** command in Global Configuration mode. To reset the default, use the **no** form of this command.

tcp selective-ack
no tcp selective-ack

Syntax Description This command has no keywords or arguments.

Command Default TCP selective ACK is disabled.

Command Modes Global Configuration mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines If TCP Selective ACK is enabled, each packet contains information about which segments have been received by the remote TCP. The sender can then resend only those segments that are lost. If selective ACK is disabled, the sender receives no information about missing segments and automatically sends the first packet that is not acknowledged and then waits for the other TCP to respond with what is missing from the data stream. This method is inefficient in Long Fat Networks (LFN), such as high-speed satellite links in which the bandwidth * delay product is large and valuable bandwidth is wasted waiting for retransmission.

Task ID	Task ID	Operations
	transport	read, write

Examples In the following example, the selective ACK is enabled:

```
RP/0/RSP0/CPU0:router(config)# tcp selective-ack
```

Related Commands	Command	Description
	tcp timestamp, on page 864	Measures the round-trip time of a packet.

tcp synwait-time

To set a period of time the software waits while attempting to establish a TCP connection before it times out, use the **tcp synwait-time** command in Global Configuration mode. To restore the default time, use the **no** form of this command.

tcp synwait-time *seconds*
no tcp synwait-time *seconds*

Syntax Description	<i>seconds</i> Time (in seconds) the software waits while attempting to establish a TCP connection. Range is 5 to 30 seconds.				
Command Default	The default value for the synwait-time is 30 seconds.				
Command Modes	Global Configuration mode				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 3.7.2</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Release 3.7.2	This command was introduced.
Release	Modification				
Release 3.7.2	This command was introduced.				
Usage Guidelines	No specific guidelines impact the use of this command.				
Task ID	<table border="1"> <thead> <tr> <th>Task ID</th> <th>Operations</th> </tr> </thead> <tbody> <tr> <td>transport</td> <td>read, write</td> </tr> </tbody> </table>	Task ID	Operations	transport	read, write
Task ID	Operations				
transport	read, write				

Examples

The following example shows how to configure the software to continue attempting to establish a TCP connection for 18 seconds:

```
RP/0/RSP0/CPU0:router(config)# tcp synwait-time 18
```

tcp timestamp

To more accurately measure the round-trip time of a packet, use the **tcp timestamp** command in Global Configuration mode. To reset the default, use the **no** form of this command.

tcp timestamp
no tcp timestamp

Syntax Description This command has no keywords or arguments.

Command Default A TCP time stamp is not used.

Command Modes Global Configuration mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines Use the **tcp timestamp** command to more accurately measure the round-trip time of a packet. If a time stamp is not used, a TCP sender deduces the round-trip time when an acknowledgment of its packet is received, which is not a very accurate method because the acknowledgment can be delayed, duplicated, or lost. If a time stamp is used, each packet contains a time stamp to identify packets when acknowledgments are received and the round-trip time of that packet.

This feature is most useful in Long Fat Network (LFN) where the bandwidth * delay product is long.

Task ID	Task ID	Operations
	transport read,	write

Examples The following example shows how to enable the timestamp option:

```
RP/0/RSP0/CPU0:router(config)# tcp timestamp
```

Related Commands	Command	Description
	tcp selective-ack, on page 862	Enables the TCP selective acknowledgment feature.

tcp window-size

To alter the TCP window size, use the **tcp window-size** command in Global Configuration mode. To restore the default value, use the **no** form of this command.

tcp window-size *bytes*
no tcp window-size

Syntax Description *bytes* Window size in bytes. Range is 2048 to 65535 bytes.

Command Default The default value for the window size is 16k.

Command Modes Global Configuration mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines

Note Do not use this command unless you clearly understand why you want to change the default value.

Task ID	Task ID	Operations
	transport	read, write

Examples

The following example shows how to set the TCP window size to 3000 bytes:

```
RP/0/RSP0/CPU0:router(config)# tcp window-size 3000
```

VRRP Commands

This document describes the Cisco IOS XR software commands used to configure and monitor the Virtual Router Redundancy Protocol (VRRP) on Cisco ASR 9000 Series Aggregation Services Routers .

For detailed information about VRRP concepts, configuration tasks, and examples, refer to the *IP Addresses and Services Configuration Guide for Cisco ASR 9000 Series Routers*.

accept-mode

To disable the installation of routes for the Virtual Router Redundancy Protocol (VRRP) virtual addresses, use the **accept-mode** command in the VRRP virtual router submenu. To enable the installation of routes for the VRRP virtual addresses, use the **no** form of this command.

accept-mode disable

no accept-mode disable

Syntax Description	disable Disables the accept mode.				
Command Default	By default, the accept mode is enabled.				
Command Modes	VRRP virtual router configuration				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 4.1.0</td> <td>This command was introduced. This command replaced the vrrp assume-ownership disable command.</td> </tr> </tbody> </table>	Release	Modification	Release 4.1.0	This command was introduced. This command replaced the vrrp assume-ownership disable command.
Release	Modification				
Release 4.1.0	This command was introduced. This command replaced the vrrp assume-ownership disable command.				
Usage Guidelines	No specific guidelines impact the use of this command.				
Task ID	<table border="1"> <thead> <tr> <th>Task ID</th> <th>Operation</th> </tr> </thead> <tbody> <tr> <td>vrrp</td> <td>read, write</td> </tr> </tbody> </table>	Task ID	Operation	vrrp	read, write
Task ID	Operation				
vrrp	read, write				

Example

This example shows how to disable the installation of routes for the VRRP virtual addresses:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# router vrrp
RP/0/RSP0/CPU0:router(config-vrrp)# interface TenGigE 0/4/0/4
RP/0/RSP0/CPU0:router(config-vrrp-if)# address-family ipv4
RP/0/RSP0/CPU0:router(config-vrrp-address-family)# vrrp 3 version 2
RP/0/RSP0/CPU0:router(config-vrrp-virtual-router)# accept-mode disable
RP/0/RSP0/CPU0:router(config-vrrp-virtual-router)#
```

Related Commands	Command	Description
	address (VRRP), on page 873	Sets the primary virtual IPv4 address for a virtual router.
	address global, on page 875	Configures the global virtual IPv6 address for a virtual router.
	address linklocal, on page 877	Sets the virtual link-local IPv6 address for a virtual router.

Command	Description
address secondary, on page 879	Sets the secondary virtual IPv4 address for a virtual router.
message state disable, on page 888	Disables the task of logging the VRRP state change events.

accept-mode (subordinate)

To disable the installation of routes for the Virtual Router Redundancy Protocol (VRRP) virtual addresses, use the **accept-mode** command in the VRRP slave submenu. To enable the installation of routes for the VRRP virtual addresses, use the **no** form of this command.

accept-mode disable

no accept-mode disable

Syntax Description	disable Disables the accept mode.				
Command Default	By default, the accept mode is enabled.				
Command Modes	VRRP slave submenu configuration				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 4.3</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Release 4.3	This command was introduced.
Release	Modification				
Release 4.3	This command was introduced.				
Usage Guidelines	No specific guidelines impact the use of this command.				
Task ID	<table border="1"> <thead> <tr> <th>Task ID</th> <th>Operation</th> </tr> </thead> <tbody> <tr> <td>vrrp</td> <td>read, write</td> </tr> </tbody> </table>	Task ID	Operation	vrrp	read, write
Task ID	Operation				
vrrp	read, write				

Example

This example shows how to disable the installation of routes for the VRRP virtual addresses:

```
Router# configure
Router(config)# router vrrp
Router(config-vrrp)# interface tenGigE 0/4/0/4
Router(config-vrrp-if)# address-family ipv4
Router(config-vrrp-address-family)# vrrp 3 slave
Router(config-vrrp-virtual-router)# accept-mode disable
Router(config-vrrp-virtual-router)#
```

Related Commands	Command	Description
	accept-mode, on page 869	Disable the installation of routes for the Virtual Router Redundancy Protocol (VRRP) virtual addresses.

address-family

To enable address-family mode, use the **address-family** command in interface configuration mode. To terminate address-family mode, use the **no** form of this command.

address-family {**ipv4** | **ipv6**}
no address-family {**ipv4** | **ipv6**}

Syntax Description

ipv4 IPv4 address-family.

ipv6 IPv6 address-family.

Command Default

None.

Command Modes

Interface configuration

Command History

Release	Modification
Release 4.1.0	This command was introduced.

Usage Guidelines

No specific guidelines impact the use of this command.

Task ID

Task ID	Operation
vrrp	read, write

Example

The following example shows how to enable address-family mode:

```
RP/0/RSP0/CPU0:router # config
RP/0/RSP0/CPU0:router(config)# router vrrp
RP/0/RSP0/CPU0:router(config-vrrp)# interface tenGigE 0/4/0/4
RP/0/RSP0/CPU0:router(config-vrrp-if)# address-family ipv4
```

Related Commands

Command	Description
interface (VRRP), on page 886	Enables VRRP interface configuration mode.

address (VRRP)

To configure the primary virtual IPv4 address for a virtual router, use the **address** command in the Virtual Router Redundancy Protocol (VRRP) virtual router submode. To deconfigure the primary virtual IPv4 address for the virtual router, use the **no** form of this command.

address *address*

no address *address*

Syntax Description	<i>address</i> VRRP IPv4 address.				
Command Default	None				
Command Modes	VRRP virtual router				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 4.1.0</td> <td>This command was introduced. This command replaced the vrrp ipv4 command.</td> </tr> </tbody> </table>	Release	Modification	Release 4.1.0	This command was introduced. This command replaced the vrrp ipv4 command.
Release	Modification				
Release 4.1.0	This command was introduced. This command replaced the vrrp ipv4 command.				
Usage Guidelines	No specific guidelines impact the use of this command.				
Task ID	<table border="1"> <thead> <tr> <th>Task ID</th> <th>Operation</th> </tr> </thead> <tbody> <tr> <td>vrrp</td> <td>read, write</td> </tr> </tbody> </table>	Task ID	Operation	vrrp	read, write
Task ID	Operation				
vrrp	read, write				

Example

This example shows how to set the primary virtual IPv4 address for the virtual router:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# router vrrp
RP/0/RSP0/CPU0:router(config-vrrp)# interface TenGigE 0/4/0/4
RP/0/RSP0/CPU0:router(config-vrrp-if)# address-family ipv4
RP/0/RSP0/CPU0:router(config-vrrp-address-family)# vrrp 3 version 3
RP/0/RSP0/CPU0:router(config-vrrp-virtual-router)# address 192.168.18.1
RP/0/RSP0/CPU0:router(config-vrrp-virtual-router)#
```

Related Commands	Command	Description
	accept-mode, on page 869	Disables the installation of routes for the VRRP virtual addresses.
	address global, on page 875	Configures the global virtual IPv6 address for a virtual router.
	address linklocal, on page 877	Sets the virtual link-local IPv6 address for a virtual router.

Command	Description
address secondary, on page 879	Sets the secondary virtual IPv4 address for a virtual router.
message state disable, on page 888	Disables the task of logging the VRRP state change events.

address global

To configure the global virtual IPv6 address for a virtual router, use the **address global** command in the Virtual Router Redundancy Protocol (VRRP) virtual router submode. To deconfigure the global virtual IPv6 address for a virtual router, use the **no** form of this command.

address global *ipv6-address*

no address global *ipv6-address*

Syntax Description	<i>ipv6-address</i> Global VRRP IPv6 address.
---------------------------	-----------------------------------------------

Command Default	None
------------------------	------

Command Modes	VRRP virtual router
----------------------	---------------------

Command History	Release	Modification
	Release 4.1.0	This command was introduced.

Usage Guidelines	No specific guidelines impact the use of this command.
-------------------------	--------------------------------------------------------

Task ID	Task ID	Operation
	vrrp	read, write

Example

This example shows how to add a global virtual IPv6 address for the virtual router:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# router vrrp
RP/0/RSP0/CPU0:router(config-vrrp)# interface TenGigE 0/4/0/4
RP/0/RSP0/CPU0:router(config-vrrp-if)# address-family ipv6
RP/0/RSP0/CPU0:router(config-vrrp-address-family)# vrrp 3 version 3
RP/0/RSP0/CPU0:router(config-vrrp-virtual-router)# address global 4000::1000
RP/0/RSP0/CPU0:router(config-vrrp-virtual-router)#
```

Related Commands

Command	Description
address (VRRP), on page 873	Sets the primary virtual IPv4 address for a virtual router.
accept-mode, on page 869	Disables the installation of routes for the VRRP virtual addresses.
address linklocal, on page 877	Sets the virtual link-local IPv6 address for a virtual router.

Command	Description
address secondary, on page 879	Sets the secondary virtual IPv4 address for a virtual router.
message state disable, on page 888	Disables the task of logging the VRRP state change events.

address linklocal

To either configure the virtual link-local IPv6 address for a virtual router or to specify that the virtual link-local IPv6 address should be enabled and calculated automatically from the virtual router virtual Media Access Control (MAC) address, use the **address linklocal** command in the Virtual Router Redundancy Protocol (VRRP) virtual router submode. To deconfigure the virtual link-local IPv6 address for a virtual router, use the **no** form of this command.

address linklocal [*ipv6-address* | **autoconfig**]

no address linklocal [*ipv6-address* | **autoconfig**]

Syntax Description	<i>ipv6-address</i> VRRP IPv6 link-local address.				
	autoconfig Autoconfigures the VRRP IPv6 link-local address.				
Command Default	None				
Command Modes	VRRP virtual router				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 4.1.0</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Release 4.1.0	This command was introduced.
Release	Modification				
Release 4.1.0	This command was introduced.				
Usage Guidelines	No specific guidelines impact the use of this command.				
Task ID	<table border="1"> <thead> <tr> <th>Task ID</th> <th>Operation</th> </tr> </thead> <tbody> <tr> <td>vrrp</td> <td>read, write</td> </tr> </tbody> </table>	Task ID	Operation	vrrp	read, write
Task ID	Operation				
vrrp	read, write				

Example

This example shows how to autoconfigure the VRRP IPv6 link-local address:

```
RP/0/RSP0/CPU0:router#configure
RP/0/RSP0/CPU0:router(config)#router vrrp
RP/0/RSP0/CPU0:router(config-vrrp)#interface TenGigE 0/4/0/4
RP/0/RSP0/CPU0:router(config-vrrp-if)#address-family ipv6
RP/0/RSP0/CPU0:router(config-vrrp-address-family)#vrrp 3
RP/0/RSP0/CPU0:router(config-vrrp-virtual-router)#address linklocal autoconfig
RP/0/RSP0/CPU0:router(config-vrrp-virtual-router)#
```

This example shows how to configure the virtual link-local IPv6 address for the virtual router:

```
RP/0/RSP0/CPU0:router#configure
RP/0/RSP0/CPU0:router(config)#router vrrp
```

```

RP/0/RSP0/CPU0:router(config-vrrp)#interface TenGigE 0/4/0/4
RP/0/RSP0/CPU0:router(config-vrrp-if)#address-family ipv6
RP/0/RSP0/CPU0:router(config-vrrp-address-family)#vrrp 3
RP/0/RSP0/CPU0:router(config-vrrp-virtual-router)#address linklocal FE80::260:3EFF:FE11:6770

RP/0/RSP0/CPU0:router(config-vrrp-virtual-router)#

```

Note The **version** keyword is available only if IPv4 address-family is selected. By default, version is set to 3 for IPv6 address families.

Related Commands

Command	Description
address (VRRP), on page 873	Sets the primary virtual IPv4 address for a virtual router.
address global, on page 875	Configures the global virtual IPv6 address for a virtual router.
accept-mode, on page 869	Disables the installation of routes for the VRRP virtual addresses.
address secondary, on page 879	Sets the secondary virtual IPv4 address for a virtual router.
message state disable, on page 888	Disables the task of logging the VRRP state change events.

address secondary

To configure the secondary virtual IPv4 address for a virtual router, use the **address secondary** command in the Virtual Router Redundancy Protocol (VRRP) virtual router submenu. To deconfigure the secondary virtual IPv4 address for a virtual router, use the **no** form of this command.

address *address* **secondary**

no address *address* **secondary**

Syntax Description	
secondary	Sets the secondary VRRP IP address.
<i>address</i>	VRRP IPv4 address.

Command Default None

Command Modes VRRP virtual router

Command History	Release	Modification
	Release 4.1.0	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operation
	vrrp	read, write

Example

This example shows how to set the secondary virtual IPv4 address for the virtual router:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# router vrrp
RP/0/RSP0/CPU0:router(config-vrrp)# interface TenGigE 0/4/0/4
RP/0/RSP0/CPU0:router(config-vrrp-if)# address-family ipv4
RP/0/RSP0/CPU0:router(config-vrrp-address-family)# vrrp 3 version 2
RP/0/RSP0/CPU0:router(config-vrrp-virtual-router)# address 192.168.18.1 secondary
RP/0/RSP0/CPU0:router(config-vrrp-virtual-router)#
```

Related Commands	Command	Description
	address (VRRP), on page 873	Sets the primary virtual IPv4 address for a virtual router.
	address global, on page 875	Configures the global virtual IPv6 address for a virtual router.

Command	Description
address linklocal, on page 877	Sets the virtual link-local IPv6 address for a virtual router.
accept-mode, on page 869	Disables the installation of routes for the VRRP virtual addresses.
message state disable, on page 888	Disables the task of logging the VRRP state change events.

bfd minimum-interval (VRRP)

To configure the BFD minimum interval to be used for all VRRP BFD sessions on a given interface, use the **bfd minimum-interval** command in the interface configuration mode. To remove the configured minimum-interval period and set the minimum-interval period to the default period, use the **no** form of this command.

```
bfd minimum-interval interval
no bfd minimum-interval interval
```

Syntax Description	<i>interval</i> Specify the minimum-interval in milliseconds. Range is 15 to 30000.
---------------------------	-------------------------------------------------------------------------------------

Command Default	Default minimum interval is 15 ms.
------------------------	------------------------------------

Command Modes	VRRP interface configuration
----------------------	------------------------------

Command History	Release	Modification
	Release 4.1.0	This command was introduced.

Usage Guidelines	Minimum interval determines the frequency of sending BFD packets to BFD peers. It is the time between successive BFD packets sent for the session. Minimum interval is defined in milliseconds. The configured minimum interval applies to all BFD sessions on the interface.
-------------------------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Task ID	Task ID	Operations
	vrrp	read, write

Examples

The following example shows how to configure a minimum interval of 100 milliseconds:

```
RP/0/RSP0/CPU0:router(config)# router vrrp
RP/0/RSP0/CPU0:router(config-vrrp)# interface gig 0/1/1/0
RP/0/RSP0/CPU0:router(config-vrrp-if)# bfd minimum-interval 100
```

bfd multiplier (VRRP)

To set the BFD multiplier value, use the **bfd multiplier** command in the interface configuration mode. To remove the configured multiplier value and set the multiplier to the default value, use the **no** form of this command.

bfd multiplier *multiplier*
no bfd multiplier *multiplier*

Syntax Description	<i>multiplier</i> Specifies the BFD multiplier value. Range is 2 to 50.
---------------------------	-------------------------------------------------------------------------

Command Default	Default value is 3.
------------------------	---------------------

Command Modes	VRRP interface configuration
----------------------	------------------------------

Command History	Release	Modification
	Release 4.1.0	This command was introduced.

Usage Guidelines	The multiplier value specifies the number of consecutive BFD packets that, if not received as expected, cause a BFD session to go down. The BFD multiplier applies to all configured BFD sessions on the interface.
-------------------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Task ID	Task ID	Operations
	vrrp	read, write

Examples	The following example shows how to configure a BFD multiplier with multiplier value of 10:
-----------------	--------------------------------------------------------------------------------------------

```
RP/0/RSP0/CPU0:router(config)# router vrrp
RP/0/RSP0/CPU0:router(config-vrrp)# interface gig 0/1/1/0
RP/0/RSP0/CPU0:router(config-vrrp-if)# bfd multiplier 10
```

clear vrrp statistics

To reset the Virtual Router Redundancy Protocol (VRRP) statistics (to zero or default value), use the **clear vrrp statistics** command in EXEC mode.

```
clear vrrp statistics {ipv4 | ipv6}[interface type interface-path-id [vrid]]
```

Syntax Description	
ipv4	(Optional) Resets the IPv4 information.
ipv6	(Optional) Resets the IPv6 information.
interface type	(Optional) Interface type. For more information, use the question mark (?) online help function.
<i>interface-path-id</i>	<p>(Optional) Either a physical interface instance or a virtual interface instance as follows:</p> <ul style="list-style-type: none"> • Physical interface instance. Naming notation is <i>rack/slot/module/port</i> and a slash between values is required as part of the notation. <ul style="list-style-type: none"> • <i>rack</i>: Chassis number of the rack. • <i>slot</i>: Physical slot number of the modular services card or line card. • <i>module</i>: Module number. A physical layer interface module (PLIM) is always 0. • <i>port</i>: Physical port number of the interface. <p>Note In references to a Management Ethernet interface located on a route processor card, the physical slot number is alphanumeric (RSP0) and the module is CPU0. Example: interface mgmtEth 0/RSP0 /CPU0/0.</p> <ul style="list-style-type: none"> • Virtual interface instance. Number range varies depending on interface type. <p>For more information about the syntax for the router, use the question mark (?) online help function.</p>
vrid	(Optional) Virtual router identifier, which is the number identifying the virtual router for which status is displayed.
Command Default	No default behavior or values

clear vrrp statistics

Command Modes EXEC mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines If no **interface** is specified, the statistics for all virtual routers on all interfaces are cleared.
If no value for *vrid* is specified, the statistics for all virtual routers on the specified interface are cleared.

Task ID	Task ID	Operations
	vrrp	read, write

Examples The following example shows how to clear vrrp statistics:

```
RP/0/RSP0/CPU0:router# clear vrrp statistics
```

Related Commands	Command	Description
	show vrrp	Displays a brief or detailed status of one or all Virtual Router Redundancy Protocol (VRRP) virtual routers.

delay (VRRP)

To configure the activation delay for a VRRP router, use the **delay** command in VRRP interface configuration mode. To delete the activation delay, use the **no** form of this command.

delay minimum *value* **reload** *value*
no delay

Syntax Description	minimum <i>value</i>	Sets the minimum delay in seconds for every interface up event. Range is 0 to 10000.
	reload <i>value</i>	Sets the reload delay in seconds for first interface up event. Range is 0 to 10000.

Command Default	minimum <i>value</i> : 1 reload <i>value</i> : 5
------------------------	-------------------------------------------------------------------

Command Modes	VRRP interface configuration
----------------------	------------------------------

Command History	Release	Modification
	Release 4.1.0	This command was introduced. This command replaced the vrrp delay command.

Usage Guidelines The **vrrp delay** command delays the start of the VRRP finite state machine (FSM) on an interface up event to ensure that the interface is ready to pass traffic. This ensures that there are no mistaken state changes due to loss of hello packets. The minimum delay is applied on all interface up events and the reload delay is applied on the first interface up event.

The values of zero must be explicitly configured to turn this feature off.

Task ID	Task ID	Operations
	vrrp	read, write

Examples The following example shows how to configure a minimum delay of 10 seconds with a reload delay of 100 seconds:

```
RP/0/RSP0/CPU0:router(config)# router vrrp
RP/0/RSP0/CPU0:router(config-vrrp)# interface mgmtEth 0/RSP0/CPU0/0
RP/0/RSP0/CPU0:router(config-vrrp-if)# delay minimum 10 reload 100
```

Related Commands	Command	Description
	show vrrp	Displays a brief or detailed status of one or all Virtual Router Redundancy Protocol (VRRP) virtual routers.

interface (VRRP)

To enable VRRP interface configuration mode, use the **interface (VRRP)** command in VRRP configuration mode. To terminate VRRP interface configuration mode, use the **no** form of this command.

```
interface type interface-path-id
no interface type interface-path-id
```

Syntax Description	<i>type</i>	Interface type. For more information, use the question mark (?) online help function.
	<i>interface-path-id</i>	Physical interface or virtual interface.
	Note	Use the show interfaces command to see a list of all interfaces currently configured on the router.
		For more information about the syntax for the router, use the question mark (?) online help function.

Command Default VRRP is disabled.

Command Modes VRRP configuration

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines Use the **interface (VRRP)** command to enter VRRP interface configuration mode. You must configure all VRRP configuration commands in VRRP interface configuration mode.

Task ID	Task ID	Operations
	vrrp	read, write

Examples The following example shows how to configure VRRP and a virtual router 1 on 10-Gigabit Ethernet interface 0/3/0/0:

```
RP/0/RSP0/CPU0:router(config)# router vrrp
RP/0/RSP0/CPU0:router(config-vrrp)# interface TenGigE 0/3/0/0
RP/0/RSP0/CPU0:router(config-vrrp-if)# vrrp 1 ipv4 192.168.18.1
```

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# router vrrp
RP/0/RSP0/CPU0:router(config-vrrp)# interface tenGigE 0/4/0/4
RP/0/RSP0/CPU0:router(config-vrrp-if)# address-family ipv4
```

```
RP/0/RSP0/CPU0:router(config-vrrp-address-family)# vrrp 3 version 2
RP/0/RSP0/CPU0:router(config-vrrp-virtual-router)#
```

Related Commands

Command	Description
router vrrp, on page 889	Configures a VRRP redundancy process.

message state disable

To disable the task of logging the Virtual Router Redundancy Protocol (VRRP) state change events via syslog, use the **message state disable** command in the VRRP virtual router submode. To re-enable the task of logging the VRRP state change events, use the **no** form of this command.

message state disable

no message state disable

Syntax Description This command has no keywords or arguments.

Command Default By default, the task of logging the VRRP state change events is enabled.

Command Modes VRRP global

Command History	Release	Modification
	Release 4.1.0	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task	Operation ID
	vrrp	read, write

Example

This example shows how to disable the logging of VRRP state change events:

```
RP/0/RSP0/CPU0:router#configure
RP/0/RSP0/CPU0:router(config)#router vrrp
RP/0/RSP0/CPU0:router(config-vrrp)#message state disable
RP/0/RSP0/CPU0:router(config-vrrp)#
```

Related Commands

Command	Description
address (VRRP), on page 873	Sets the primary virtual IPv4 address for a virtual router.
address global, on page 875	Configures the global virtual IPv6 address for a virtual router.

address secondary, on page 879	Sets the secondary virtual IPv4 address for a virtual router.
address linklocal, on page 877	Sets the virtual link-local IPv6 address for a virtual router.

router vrrp

To configure Virtual Router Redundancy Protocol (VRRP), use the **router vrrp** command in Global Configuration mode. To remove the VRRP configuration, use the **no** form of this command.

router vrrp
no router vrrp

Command Default This command has no keywords or arguments.
 VRRP is disabled.

Command Modes Global Configuration mode

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines Use the **router vrrp** command to enter VRRP configuration mode.
 You must configure all VRRP configuration commands in VRRP interface configuration mode.

Task ID	Task ID	Operations
	vrrp	read, write

Examples The following example shows how to configure a VRRP with virtual router 1 on an interface:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# router vrrp
RP/0/RSP0/CPU0:router(config-vrrp)# interface tenGigE 0/4/0/4
RP/0/RSP0/CPU0:router(config-vrrp-if)# address-family ipv4
RP/0/RSP0/CPU0:router(config-vrrp-address-family)# vrrp 3 version 2
RP/0/RSP0/CPU0:router(config-vrrp-virtual-router)#
```

Related Commands	Command	Description
	interface (VRRP), on page 886	Enables VRRP interface configuration mode.

session name(vrrp)

To configure a VRRP session name, use the **session name** command in the VRRP virtual router submode. To deconfigure a VRRP session name, use the **no** form of this command.

name *name*
no name *name*

Syntax Description	<i>name</i> MGO session name
---------------------------	------------------------------

Command Default	None
------------------------	------

Command Modes	VRRP virtual router configuration
----------------------	-----------------------------------

Command History	Release	Modification
	Release 4.3	This command was introduced.

Usage Guidelines	No specific guidelines impact the use of this command.
-------------------------	--------------------------------------------------------

Task ID	Task ID	Operation
	vrrp	read

Example

This example shows how to configure a VRRP session name.

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# router vrrp
RP/0/RSP0/CPU0:router(config-vrrp)# interface tenGigE 0/4/0/4
RP/0/RSP0/CPU0:router(config-vrrp-if)# address-family ipv4
RP/0/RSP0/CPU0:router(config-vrrp-ipv4)# vrrp 1
RP/0/RSP0/CPU0:router(config-vrrp-virtual-router)# name s1
RP/0/RSP0/CPU0:router(config-vrrp-virtual-router)#
```

Related Commands

Command	Description
accept-mode, on page 869	Disable the installation of routes for the Virtual Router Redundancy Protocol (VRRP) virtual addresses.

show vrrp

To display a brief or detailed status of one or all Virtual Router Redundancy Protocol (VRRP) virtual routers, use the **show vrrp** command in EXEC mode.

```
show vrrp [{ipv4 | ipv6}] [interface type interface-path-id [vrid]] [{brief | detail | statistics [all]}]
```

Syntax	Description
ipv4	(Optional) Displays the IPv4 information.
ipv6	(Optional) Displays the IPv6 information.
interface	(Optional) Displays the status of the virtual router interface.
<i>type</i>	(Optional) Interface type. For more information, use the question mark (?) online help function.
<i>interface-path-id</i>	Physical interface or virtual interface. Note Use the show interfaces command to see a list of all interfaces currently configured on the router. For more information about the syntax for the router, use the question mark (?) online help function.
<i>vrid</i>	(Optional) Virtual router identifier, which is the number identifying the virtual router for which status is displayed. The virtual router identifier is configured with the vrrp ipv4 command. Range is 1 to 255.
brief	(Optional) Provides a summary view of the virtual router information.
detail	(Optional) Displays detailed running state information.
statistics	(Optional) Displays total statistics.

all (Optional) Displays statistics for each virtual router.

Command Modes EXEC mode

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines If no interface is specified, all virtual routers on all interfaces are displayed. If no vrid is specified, all vrids on the given interface are displayed.

Task ID

Task ID	Operations
vrrp	read

Examples The following sample output is from the **show vrrp** command:

```
Router# show vrrp
                A indicates IP address owner
                | P indicates configured to preempt
                | |
Interface   vrID Prio A P State   Master addr   VRouter addr
Te0/3/0/0   1 100 P Init   unknown      192.168.18.10
Te0/3/0/2   7 100 P Init   unknown      192.168.19.1
```

This table describes the significant fields shown in the display.

Table 88: show vrrp Command Field Descriptions

Field	Description
Interface	Interface of the virtual router.
vrID	ID of the virtual router.
Prio	Priority of the virtual router.
A	Indicates whether the VRRP router is the IP address owner.
P	Indicates whether the VRRP router is configured to preempt (default).
State	State of the virtual router.
Master addr	IP address of the IP address owner router.
VRouter addr	Virtual router IP address of the virtual router.

The following sample output is from the **show vrrp** command with the **detail** keyword:

```
Router# show vrrp detail
GigabitEthernet0/4/0/0 - IPv4 vrID 1
  State is Master, IP address owner
    2 state changes, last state change 00:00:59
  Virtual IP address is 192.168.10.1
    Secondary Virtual IP address is 192.168.10.2
    Secondary Virtual IP address is 192.168.11.1
  Virtual MAC address is 0000.5E00.0101
  Master router is local
  Advertise time 1 secs

```
Configured priority 100, may preempt
Minimum delay 0 secs
```

This table describes the significant fields shown in the displays.

Table 89: show vrrp detail Command Field Descriptions

Field	Description
TenGigE 0/3/0/0 - vrID 1	Interface type and number, and VRRP group number.
State is	Role this interface plays within VRRP (IP address owner router or backup router).
Virtual IP address is	Virtual IP address for this virtual router.
Virtual MAC address is	Virtual MAC address for this virtual router.
Master router is	Location of the IP address owner router.
Advertise time	Interval (in seconds) at which the router sends VRRP advertisements when it is the IP address owner virtual router. This value is configured with the vrrp timer command.
Master Down Timer	Time the backup router waits for the IP address owner router advertisements before assuming the role of IP address owner router.
Minimum delay	Time that the state machine start-up is delayed when an interface comes up, giving the network time to settle. The minimum delay is the delay that is applied after any subsequent interface up event (if the interface flaps) and the reload delay is the delay applied after the first interface up event.
Current priority	Priority of the virtual router.
Configured priority	Priority configured on the virtual router.
may preempt	Indication of whether preemption is enabled or disabled.
minimum delay	Delay time before preemption (default) occurs.
Tracked items	Section indicating the items being tracked by the VRRP router.
Interface	Interface being tracked.
State	State of the tracked interface.
Priority Decrement	Priority to decrement from the VRRP priority when the interface is down.

The following sample output is from the **show vrrp** command with the **interface** keyword for 10-Gigabit Ethernet interface 0/3/0/0:

```
Router# show vrrp interface HundredGigE 0/3/0/0

          A indicates IP address owner
          | P indicates configured to preempt
```

```
Interface      vrID Prio A P State      Master addr      VRouter addr
Te0/3/0/0      1   100 P Init      unknown          192.168.10.20
Te0/3/0/2      7   100 P Init      unknown          192.168.20.0
```

vrrp slave follow

To instruct the subordinate group to inherit its state from a specified group, use the **vrrp slave follow** command in VRRP slave submode.

follow *mgo-session-name*

Syntax Description	<i>mgo-session-name</i> Name of the MGO session from which the subordinate group will inherit the state.
---------------------------	----------------------------------------------------------------------------------------------------------

Command Default	None
------------------------	------

Command Modes	VRRP slave submode configuration
----------------------	----------------------------------

Usage Guidelines	No specific guidelines impact the use of this command.
-------------------------	--------------------------------------------------------

Task ID	Task ID	Operation
	vrrp	read, write

Example

This example shows how to instruct the subordinate group to inherit its state from a specified group.

```
Router# configure
Router(config)# router vrrp
Router(config-vrrp)# interface tenGigE 0/4/0/4
Router(config-vrrp-if)# address-family ipv4
Router(config-vrrp-address-family)# vrrp 2 slave
Router(config-vrrp-slave)# follow m1
```

Note	Before configuring a subordinate group to inherit its state from a specified group, the group must be configured with the session name command on another vrrp group.

subordinate primary virtual IPv4 address(vrrp)

To configure the primary virtual IPv4 address for the subordinate group, use the **subordinate primary virtual IPv4 address** command in the VRRP slave submode.

address *ip-address*

Syntax Description	<i>ip-address</i> IP address of the Hot Standby router interface.
---------------------------	-------------------------------------------------------------------

Command Default	None
------------------------	------

Command Modes	VRRP slave submode configuration
----------------------	----------------------------------

Command History	Release	Modification
	Release 4.3	This command was introduced.

Usage Guidelines	No specific guidelines impact the use of this command.
-------------------------	--------------------------------------------------------

Task ID	Task ID	Operation
	vrrp	read, write

Example

This example shows how to configure the primary virtual IPv4 address for the subordinate group.

```
Router# configure
Router(config)# router vrrp
Router(config-vrrp)# interface tenGigE 0/4/0/4
Router(config-vrrp-if)# address-family ipv4
Router(config-vrrp-address-family)# vrrp 2 slave
Router(config-vrrp-slave)# address 192.168.10.4
```

Related Commands	Command	Description
		accept-mode, on page 869

subordinate secondary virtual IPv4 address(vrrp)

To configure the secondary virtual IPv4 address for the subordinate group, use the **subordinate secondary virtual IPv4 address** command in the VRRP slave submode.

address *ip-address* **secondary**

Syntax Description	<i>ip-address</i> IP address of the Hot Standby router interface.				
	secondary Sets the secondary hot standby IP address.				
Command Default	None				
Command Modes	VRRP slave submode configuration				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 4.3</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Release 4.3	This command was introduced.
Release	Modification				
Release 4.3	This command was introduced.				
Usage Guidelines	Before configuring secondary virtual IPv4 address, the primary virtual IPv4 address for the subordinate group must be configured.				
Task ID	<table border="1"> <thead> <tr> <th>Task ID</th> <th>Operation</th> </tr> </thead> <tbody> <tr> <td>vrrp</td> <td>read, write</td> </tr> </tbody> </table>	Task ID	Operation	vrrp	read, write
Task ID	Operation				
vrrp	read, write				

Example

This example shows how to configure the secondary virtual IPv4 address for the subordinate group.

```
Router# configure
Router(config)# router vrrp
Router(config-vrrp)# interface tenGigE 0/4/0/4
Router(config-vrrp-if)# address-family ipv4
Router(config-vrrp-address-family)# vrrp 2 slave
Router(config-vrrp-slave)# address 192.168.10.4 secondary
```

Related Commands	Command	Description
	accept-mode, on page 869	Disable the installation of routes for the Virtual Router Redundancy Protocol (VRRP) virtual addresses.

snmp-server traps vrrp events

To enable the Simple Network Management Protocol (SNMP) server notifications (traps) available for VRRP, use the **snmp-server traps vrrp events command** in Global Configuration mode. To disable all available VRRP SNMP notifications, use the **no** form of this command.

```
snmp-server traps vrrp events
no snmp-server traps vrrp events
```

Syntax Description	events Specifies all VRRP SNMP server traps.
---------------------------	-----------------------------------------------------

Command Default	None
------------------------	------

Command Modes	Global Configuration mode
----------------------	---------------------------

Command History	Release	Modification
	Release 3.9.0	This command was introduced.

Usage Guidelines	No specific guidelines impact the use of this command.
-------------------------	--------------------------------------------------------

Task ID	Task ID	Operations
	snmp	read, write

Examples The following example shows how to enable snmpserver notifications for VRRP:

```
RP/0/RSP0/CPU0:routerrouter(config)# snmp-server traps vrrp events
```

track object(vrrp)

To enable tracking of a named object with the specified decrement, use the **track object** command in VRRP virtual router submode. To remove the tracking, use the **no** form of this command.

```
track object name[priority-decrement]
no track object name[priority-decrement]
```

Syntax Description	object name Object tracking. Name of the object to be tracked.
	priority-decrement (Optional) Amount by which the VRRP priority for the router is decremented when the interface goes down (or comes back up). Range is 1 to 255.

Command Default The default priority-decrement is 10.

Command Modes VRRP virtual router configuration

Command History	Release	Modification
	Release 4.3	This command was introduced.

Usage Guidelines No specific guidelines impact the use of this command.

Task ID	Task ID	Operation
	vrrp	read, write

Example

This example shows how to configure object tracking under the VRRP virtual router submode.

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# router vrrp
RP/0/RSP0/CPU0:router(config-vrrp)# interface tenGigE 0/4/0/4
RP/0/RSP0/CPU0:router(config-vrrp-if)# address-family ipv4
RP/0/RSP0/CPU0:router(config-vrrp-ipv4)# vrrp 1
RP/0/RSP0/CPU0:router(config-vrrp-virtual-router)# track object t1 2
RP/0/RSP0/CPU0:router(config-vrrp-virtual-router)#
```

Related Commands	Command	Description
	accept-mode, on page 869	Disable the installation of routes for the Virtual Router Redundancy Protocol (VRRP) virtual addresses.

vrrp

To enable Virtual Router Redundancy Protocol (VRRP) virtual router mode, use the **vrrp** command in address-family mode. To terminate VRRP virtual router mode, use the **no** form of this command.

vrrp *vrid version version-no*
novrrp *vrid version version-no*

Syntax Description	<p><i>vrid</i> (Optional) Virtual router identifier, which is the number identifying the virtual router for which status is displayed. The virtual router identifier is configured with the vrrp ipv4 command. Range is 1 to 255.</p> <hr/> <p>version <i>version-no</i> The VRRP version number. Range is 2-3.</p> <p>Note The version keyword is available only for the ipv4 address family. By default, version is set to 3 for IPv6 address families.</p>				
Command Default	None.				
Command Modes	address-family				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 4.1.0</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Release 4.1.0	This command was introduced.
Release	Modification				
Release 4.1.0	This command was introduced.				
Usage Guidelines	No specific guidelines impact the use of this command.				
Task ID	<table border="1"> <thead> <tr> <th>Task ID</th> <th>Operation</th> </tr> </thead> <tbody> <tr> <td>vrrp</td> <td>read, write</td> </tr> </tbody> </table>	Task ID	Operation	vrrp	read, write
Task ID	Operation				
vrrp	read, write				

Example

The following example shows how to enable VRRP virtual router mode:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# router vrrp
RP/0/RSP0/CPU0:router(config-vrrp)# interface tenGigE 0/4/0/4
RP/0/RSP0/CPU0:router(config-vrrp-if)# address-family ipv4
RP/0/RSP0/CPU0:router(config-vrrp-address-family)# vrrp 3 version 2
RP/0/RSP0/CPU0:router(config-vrrp-virtual-router)#
```

Related Commands

Command	Description
interface (VRRP), on page 886	Enables VRRP interface configuration mode.

vrrp assume-ownership disable

To disable the default configuration that causes a VRRP router to assume ownership of the virtual IP address when in the IP address owner router's state, use the **vrrp assume-ownership** command in VRRP interface configuration mode. To restore the default setting (assumed ownership), use the **no** form of this command.

vrrp vrid assume-ownership disable

no vrrp vrid assume-ownership disable

Syntax Description	<p><i>vrid</i> Virtual router identifier, which is the number identifying the virtual router for which virtual IP address ownership is being configured.</p> <p>disable Does not accept VRRP packets.</p>						
Command Default	VRRP packets .						
Command Modes	VRRP interface configuration						
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 3.7.2</td> <td>This command was introduced.</td> </tr> <tr> <td>Release 4.1.0</td> <td>This command has been deprecated. This command was replaced with the accept-mode, on page 869 command.</td> </tr> </tbody> </table>	Release	Modification	Release 3.7.2	This command was introduced.	Release 4.1.0	This command has been deprecated. This command was replaced with the accept-mode, on page 869 command.
Release	Modification						
Release 3.7.2	This command was introduced.						
Release 4.1.0	This command has been deprecated. This command was replaced with the accept-mode, on page 869 command.						
Usage Guidelines	<p>By default, the router assumes ownership of the virtual IP address if it is the IP address owner router regardless of whether it is the IP address owner, which means that it accepts packets sent to that IP address during verification of network configuration. If the vrrp assume-ownership default is in effect, a router that is not the IP address owner, but is the IP address owner router for another IP address, accepts and responds to pings and accepts a Telnet to that router. Accepting packets sent to the other IP address is a useful tool during verification of network configuration.</p> <p>This command is ignored (irrelevant) when the router is the IP address owner (section 6.4.3 of RFC 2338, <i>Virtual Router Redundancy Protocol</i>).</p>						
Task ID	<table border="1"> <thead> <tr> <th>Task ID</th> <th>Operations</th> </tr> </thead> <tbody> <tr> <td>vrrp</td> <td>read, write</td> </tr> </tbody> </table>	Task ID	Operations	vrrp	read, write		
Task ID	Operations						
vrrp	read, write						
Examples	<p>The following example shows how the configuration disables the vrrp assume-ownership command on 10-Gigabit Ethernet interface 0/3/0/0:</p> <pre>Router(config)# router vrrp Router(config-vrrp)# interface TenGigE 0/3/0/0 Router(config-vrrp-if)# vrrp 1 ipv4 10.0.0.101 Router(config-vrrp-if)# vrrp 1 assume-ownership disable</pre>						

Related Commands

Command	Description
vrrp ipv4, on page 911	Enables VRRP on an interface and specifies the IP address of the virtual router.

vrrp bfd fast-detect

To enable bidirectional forwarding detection (BFD) fast detection on a VRRP interface, use the **vrrp bfd fast-detect** command in the interface configuration mode. This creates a BFD session between the Virtual Router Redundancy Protocol (VRRP) router and its peer, and if the session goes down while the VRRP is in the backup state, a VRRP failover is initiated. To disable BFD fast-detection, use the **no** form of this command.

```
vrrp vrid bfd fast-detect peer {ipv4 | ipv6} address
no vrrp vrid bfd fast-detect peer {ipv4 | ipv6} address
```

Syntax Description	<i>vrid</i>	Virtual Router Identifier.
	peer	VRRP peer for BFD monitoring.
	ipv4 <i>address</i>	IPv4 address of the BFD peer interface.
	ipv6 <i>address</i>	IPv6 address of the BFD peer interface.
Command Default	BFD is disabled.	
Command Modes	VRRP interface configuration VRRP virtual router	
Command History	Release	Modification
	Release 3.9.0	This command was introduced.
	Release 4.1.0	The IPv6 keyword was introduced.
Usage Guidelines	BFD is supported only on systems with exactly two redundant VRRP routers.	
Task ID	Task ID	Operations
	vrrp	read, write

Examples

The following example shows how to enable **bfd fast-detect** for an IPv4 address:

```
RP/0/RSP0/CPU0:router# config
RP/0/RSP0/CPU0:router(config)# router vrrp
RP/0/RSP0/CPU0:router(config-vrrp)# interface gig 0/1/1/0
RP/0/RSP0/CPU0:router(config-vrrp-if)# vrrp 1 bfd fast-detect peer ipv4 10.1.1.1
```

Examples

The following example shows how to enable **bfd fast-detect** for an IPv6 address:

```

RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# router vrrp
RP/0/RSP0/CPU0:router(config-vrrp)# interface tenGigE 0/4/0/4
RP/0/RSP0/CPU0:router(config-vrrp-if)# address-family ipv6
RP/0/RSP0/CPU0:router(config-vrrp-address-family)#vrrp 3 version 3
RP/0/RSP0/CPU0:router(config-vrrp-virtual-router)#bfd fast-detect peer ipv6
fe80::211:bcff:fea5:28bb

```

Related Commands

Command	Description
vrrp bfd minimum-interval, on page 907	Configures the BFD minimum interval value for a given interface.
vrrp bfd multiplier, on page 908	Configures the BFD multiplier value for a given interface.

vrrp bfd minimum-interval

To configure the BFD minimum interval to be used for all VRRP BFD sessions on a given interface, use the **vrrp bfd minimum-interval** command in the interface configuration mode. To remove the configured minimum-interval period and set the minimum-interval period to the default period, use the **no** form of this command.

```
vrrp bfd minimum-interval interval
no vrrp bfd minimum-interval interval
```

Syntax Description	<i>interval</i> Specify the minimum-interval in milliseconds. Range is 15 to 30000.
---------------------------	-------------------------------------------------------------------------------------

Command Default	Default minimum interval is 15 ms.
------------------------	------------------------------------

Command Modes	VRRP interface configuration
----------------------	------------------------------

Command History	Release	Modification
	Release 3.9.0	This command was introduced.
	Release 4.1.0	This command has been deprecated. This command was replaced with the bfd minimum-interval (VRRP), on page 881 command.

Usage Guidelines	Minimum interval determines the frequency of sending BFD packets to BFD peers. It is the time between successive BFD packets sent for the session. Minimum interval is defined in milliseconds. The configured minimum interval applies to all BFD sessions on the interface.
-------------------------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Task ID	Task ID	Operations
	vrrp	read, write

Examples

The following example shows how to configure a minimum interval of 100 milliseconds:

```
RP/0/RSP0/CPU0:router(config)# router vrrp
RP/0/RSP0/CPU0:router(config-vrrp)# interface gig 0/1/1/0
RP/0/RSP0/CPU0:router(config-vrrp-if)# vrrp bfd minimum-interval 100
```

vrrp bfd multiplier

To set the BFD multiplier value, use the **vrrp bfd multiplier** command in the interface configuration mode. To remove the configured multiplier value and set the multiplier to the default value, use the **no** form of this command.

```
vrrp bfd multiplier multiplier
no vrrp bfd multiplier multiplier
```

Syntax Description	<i>multiplier</i> Specifies the BFD multiplier value. Range is 2 to 50.						
Command Default	Default value is 3.						
Command Modes	VRRP interface configuration						
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 3.9.0</td> <td>This command was introduced.</td> </tr> <tr> <td>Release 4.1.0</td> <td>This command has been deprecated. This command was replaced with the bfd multiplier (VRRP), on page 882 command.</td> </tr> </tbody> </table>	Release	Modification	Release 3.9.0	This command was introduced.	Release 4.1.0	This command has been deprecated. This command was replaced with the bfd multiplier (VRRP), on page 882 command.
Release	Modification						
Release 3.9.0	This command was introduced.						
Release 4.1.0	This command has been deprecated. This command was replaced with the bfd multiplier (VRRP), on page 882 command.						
Usage Guidelines	The multiplier value specifies the number of consecutive BFD packets that, if not received as expected, cause a BFD session to go down. The BFD multiplier applies to all configured BFD sessions on the interface.						
Task ID	<table border="1"> <thead> <tr> <th>Task ID</th> <th>Operations</th> </tr> </thead> <tbody> <tr> <td>vrrp</td> <td>read, write</td> </tr> </tbody> </table>	Task ID	Operations	vrrp	read, write		
Task ID	Operations						
vrrp	read, write						

Examples

The following example shows how to configure a BFD multiplier with multiplier value of 10:

```
RP/0/RSP0/CPU0:router(config)# router vrrp
RP/0/RSP0/CPU0:router(config-vrrp)# interface gig 0/1/1/0
RP/0/RSP0/CPU0:router(config-vrrp-if)# vrrp bfd multiplier 10
```

vrrp delay

To configure the activation delay for a VRRP router, use the **vrrp delay** command in VRRP interface configuration mode. To delete the activation delay, use the **no** form of this command.

```
vrrp delay minimum value reload value
no vrrp delay
```

Syntax Description	minimum <i>value</i> Sets the minimum delay in seconds for every interface up event. Range is 0 to 10000.						
	reload <i>value</i> Sets the reload delay in seconds for first interface up event. Range is 0 to 10000.						
Command Default	minimum <i>value:</i> 1 reload <i>value:</i> 5						
Command Modes	VRRP interface configuration						
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 3.7.2</td> <td>This command was introduced.</td> </tr> <tr> <td>Release 4.1.0</td> <td>This command has been deprecated. This command was replaced with the delay (VRRP), on page 885 command.</td> </tr> </tbody> </table>	Release	Modification	Release 3.7.2	This command was introduced.	Release 4.1.0	This command has been deprecated. This command was replaced with the delay (VRRP), on page 885 command.
Release	Modification						
Release 3.7.2	This command was introduced.						
Release 4.1.0	This command has been deprecated. This command was replaced with the delay (VRRP), on page 885 command.						
Usage Guidelines	<p>The vrrp delay command delays the start of the VRRP finite state machine (FSM) on an interface up event to ensure that the interface is ready to pass traffic. This ensures that there are no mistaken state changes due to loss of hello packets. The minimum delay is applied on all interface up events and the reload delay is applied on the first interface up event.</p> <p>The values of zero must be explicitly configured to turn this feature off.</p>						
Task ID	<table border="1"> <thead> <tr> <th>Task ID</th> <th>Operations</th> </tr> </thead> <tbody> <tr> <td>vrrp</td> <td>read, write</td> </tr> </tbody> </table>	Task ID	Operations	vrrp	read, write		
Task ID	Operations						
vrrp	read, write						

Examples

The following example shows how to configure a minimum delay of 10 seconds with a reload delay of 100 seconds:

```
RP/0/RSP0/CPU0:router(config)# router vrrp
RP/0/RSP0/CPU0:router(config-vrrp)# interface mgmtEth 0/RSP0/CPU0/0
RP/0/RSP0/CPU0:router(config-vrrp-if)# vrrp delay minimum 10 reload 100
```

Related Commands

Command	Description
show vrrp, on page 891	Displays a brief or detailed status of one or all Virtual Router Redundancy Protocol (VRRP) virtual routers.

vrrp ipv4

To enable the Virtual Router Redundancy Protocol (VRRP) on an interface and specify the IP address of the virtual router, use the **vrrp ipv4** command in VRRP interface configuration mode. To disable VRRP on the interface and remove the IP address of the virtual router, use the **no** form of this command.

```
vrrp vrid ipv4 ip-address [secondary]  
no vrrp vrid ipv4 ip-address [secondary]
```

Syntax Description	<i>vrid</i> Virtual router identifier, which is the number identifying the virtual router. Range is 1 to 255.						
	<i>ip-address</i> IP address of the virtual router.						
	secondary (Optional) Indicates additional IP addresses supported by this group.						
Command Default	VRRP is not configured on the interface.						
Command Modes	VRRP interface configuration						
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 3.7.2</td> <td>This command was introduced.</td> </tr> <tr> <td>Release 4.1.0</td> <td>This command has been deprecated. This command was replaced with the address (VRRP), on page 873 command.</td> </tr> </tbody> </table>	Release	Modification	Release 3.7.2	This command was introduced.	Release 4.1.0	This command has been deprecated. This command was replaced with the address (VRRP), on page 873 command.
Release	Modification						
Release 3.7.2	This command was introduced.						
Release 4.1.0	This command has been deprecated. This command was replaced with the address (VRRP), on page 873 command.						
Usage Guidelines	<p>Configure the vrrp ipv4 command once without the secondary keyword to indicate the virtual router IP address. If you want to indicate additional IP addresses supported by the virtual router, include the secondary keyword.</p> <p>Removing the VRRP configuration from the IP address owner and leaving the IP address of the interface active is considered a misconfiguration because this results in duplicate IP addresses on the LAN.</p>						
Task ID	<table border="1"> <thead> <tr> <th>Task ID</th> <th>Operations</th> </tr> </thead> <tbody> <tr> <td>vrrp</td> <td>read, write</td> </tr> </tbody> </table>	Task ID	Operations	vrrp	read, write		
Task ID	Operations						
vrrp	read, write						

Examples

The following example shows how to enable VRRP on 10-Gigabit Ethernet interface 0/3/0/0. The VRRP virtual router identifier is 1, and 10.0.1.10 is the IP address of the virtual router. The secondary IP address is 10.0.1.20.

```
RP/0/RSP0/CPU0:router(config)# router vrrp  
RP/0/RSP0/CPU0:router(config-vrrp)# interface TenGigE 0/3/0/0  
  
RP/0/RSP0/CPU0:router(config-vrrp-if)# vrrp 1 ipv4 10.0.1.20 secondary  
RP/0/RSP0/CPU0:router(config-vrrp-if)# vrrp ipv4 10.0.1.0
```

Related Commands

Command	Description
show vrrp, on page 891	Displays a brief or detailed status of one or all Virtual Router Redundancy Protocol (VRRP) virtual routers.

vrrp preempt

VRRP preempt is enabled by default. This means, a VRRP router with higher priority than the current IP address owner router will take over as new IP address owner router. To disable this feature, use the **preempt disable** command. To delay preemption, so that the higher priority router waits for a period of time before taking over, use the **preempt delay** command. To restore the default behavior (preempt enabled with no delay), use the **no** form of the command.

```
preempt {delay seconds | disable}
no preempt {delay seconds | disable}
```

Syntax Description	delay seconds	Specifies the number of seconds the router delays before issuing an advertisement claiming virtual IP address ownership to be the IP address owner router. Range is 1 to 3600 seconds (1 hour).
	disable	Disables preemption.

Command Default VRRP preempt is enabled.
seconds : 0 (no delay)

Command Modes VRRP virtual router

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines By default, the router being configured with this command takes over as new IP address owner router for the virtual router if it has a higher priority than the current IP address owner router. You can configure a delay, which causes the VRRP router to wait the specified number of seconds before issuing an advertisement claiming virtual IP address ownership to be the IP address owner router.

Note The router that is the virtual IP address owner preempts, regardless of the setting of this command.

Task ID	Task ID	Operations
	vrrp	read, write

Examples

The following example shows how to configure the router to preempt the current IP address owner router when its priority of 200 is higher than that of the current IP address owner router. If the router preempts the current IP address owner router, it waits 15 seconds before issuing an advertisement claiming that it is the new IP address owner router.

```
Router(config)# router vrrp
Router(config-vrrp)# interface TenGigE 0/3/0/0
Router(config-vrrp-if)# address-family ipv4
Router(config-vrrp-address-family)# vrrp 1 version 3
Router(config-vrrp-virtual-router)# preempt delay 15
Router(config-vrrp-virtual-router)# priority 200
```

Related Commands

Command	Description
vrrp priority, on page 915	Sets the priority of the virtual router.

vrrp priority

To set the priority of the virtual router, use the **priority** command in VRRP virtual router submode. To remove the priority of the virtual router, use the **no** form of this command.

priority *priority*
nopriority *priority*

Syntax Description	<i>priority</i> Priority of the virtual router. Range is 1 to 254.
---------------------------	--------------------------------------------------------------------

Command Default	<i>priority</i> : 100
------------------------	-----------------------

Command Modes	VRRP virtual router
----------------------	---------------------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	Use this command to control which router becomes the IP address owner router. This command is ignored while the router is the virtual IP address owner.
-------------------------	---------------------------------------------------------------------------------------------------------------------------------------------------------

Task ID	Task ID	Operations
	vrrp	read, write

Examples	The following example shows how to configure the router with a priority of 254:
-----------------	---------------------------------------------------------------------------------

```
Router(config)# router vrrp
Router(config-vrrp)# interface TenGigE 0/3/0/0
Router(config-vrrp-if)# address-family ipv4
Router(config-vrrp-address-family)# vrrp 1 version 3
Router(config-vrrp-virtual router)# priority 254
```

Related Commands	Command	Description
	vrrp preempt, on page 913	Controls which router becomes the IP address owner router.

vrrp text-authentication

To configure the simple text authentication used for Virtual Router Redundancy Protocol (VRRP) packets received from other routers running VRRP, use the **text-authentication** command in VRRP virtual router submode. To disable VRRP authentication, use the **no** form of this command.

text-authentication *string*
no text-authentication [*string*]

Syntax Description	<i>string</i> Authentication string (up to eight alphanumeric characters) used to validate incoming VRRP packets.
---------------------------	-------------------------------------------------------------------------------------------------------------------

Command Default	No authentication of VRRP messages occurs.
------------------------	--------------------------------------------

Command Modes	VRRP virtual router
----------------------	---------------------

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	When a VRRP packet arrives from another router in the VRRP group, its authentication string is compared to the string configured on the local system. If the strings match, the message is accepted. If they do not match, the packet is discarded.
-------------------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

All routers within the group must be configured with the same authentication string.

Note	Plain text authentication is not meant to be used for security. It simply provides a way to prevent a misconfigured router from participating in VRRP.
-------------	--------------------------------------------------------------------------------------------------------------------------------------------------------

Task ID	Task ID	Operations
	vrrp	read, write

Examples

The following example shows how to configure an authentication string of x30dn78k:

```
RP/0/RSP0/CPU0:router(config)# router vrrp
RP/0/RSP0/CPU0:router(config-vrrp)# interface TenGigE 0/3/0/0
RP/0/RSP0/CPU0:router(config-vrrp-if)# address-family ipv4
RP/0/RSP0/CPU0:router(config-vrrp-address-family)# vrrp 1 version 2
RP/0/RSP0/CPU0:router(config-vrrp-virtual-router)# text-authentication x30dn78k
```

Note	Text authentication is only valid for VRRP version 2 routers.
-------------	---------------------------------------------------------------

vrrp timer

To configure the interval between successive advertisements by the IP address owner router in a Virtual Router Redundancy Protocol (VRRP) virtual router, use the **timer** command in VRRP virtual router submode. To restore the default value, use the **no** form of this command.

```
timer [msec] interval [force]
no timer [msec] interval [force]
```

Syntax Description	Parameter	Description
	msec	(Optional) Changes the unit of the advertisement time from seconds to milliseconds. Without this keyword, the advertisement interval is in seconds. Range is 20 to 3000 milliseconds.
	<i>interval</i>	Time interval between successive advertisements by the IP address owner router. The unit of the interval is in seconds, unless the msec keyword is specified. Range is 1 to 255 seconds.
	force	(Optional) Forces the configured value to be used. This keyword is required if milliseconds is specified.

Command Default	Default Value
	<i>interval</i> : 1 second

Command Modes	Mode
	VRRP virtual router

Command History	Release	Modification
	Release 3.7.2	This command was introduced.

Usage Guidelines	Guidelines
	No specific guidelines impact the use of this command.

Task ID	Task ID	Operations
	vrrp	read, write

Examples

The following example shows how to configure the IP address owner router to send advertisements every 4 seconds:

```
Router(config)# router vrrp
Router(config-vrrp)# interface TenGigE 0/3/0/0
Router(config-vrrp-if)# address-family ipv4
Router(config-vrrp-address-family)# vrrp 1 version 3
Router(config-vrrp-virtual-router)# timer 4
```

vrrp track interface

To configure the Virtual Router Redundancy Protocol (VRRP) to track an interface, use the **track interface** command in VRRP virtual router submode. To disable the tracking, use the **no** form of this command.

track interface *type interface-path-id* [*priority-decrement*]

no track interface *type interface-path-id* [*priority-decrement*]

Syntax Description

<i>vrid</i>	Virtual router identifier, which is the number identifying the virtual router to which tracking applies.
<i>type</i>	Interface type. For more information, use the question mark (?) online help function.
<i>interface-path-id</i>	Physical interface or virtual interface. Note Use the show interfaces command to see a list of all interfaces currently configured on the router. For more information about the syntax for the router, use the question mark (?) online help function.
<i>priority-decrement</i>	(Optional) Amount by which the priority for the router is decremented (or incremented) when the tracked interface goes down (or comes back up). Decrements can be set to any value between 1 and 254. Default value is 10.

Command Default

The default decrement value is 10. Range is 1 to 254.

Command Modes

VRRP virtual router

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Usage Guidelines

The **vrrp track interface** command ties the priority of the router to the availability of its interfaces. It is useful for tracking interfaces that are not configured for VRRP. Only IP interfaces are tracked. A tracked interface is up if IP on that interface is up. Otherwise, the tracked interface is down.

You can configure VRRP to track an interface that can alter the priority level of a virtual router for a VRRP virtual router. When the IP protocol state of an interface goes down or the interface has been removed from the router, the priority of the backup virtual router is decremented by the value specified in the *priority-decrement* argument. When the IP protocol state on the interface returns to the up state, the priority is restored.

Task ID

Task ID	Operations
vrrp	read, write

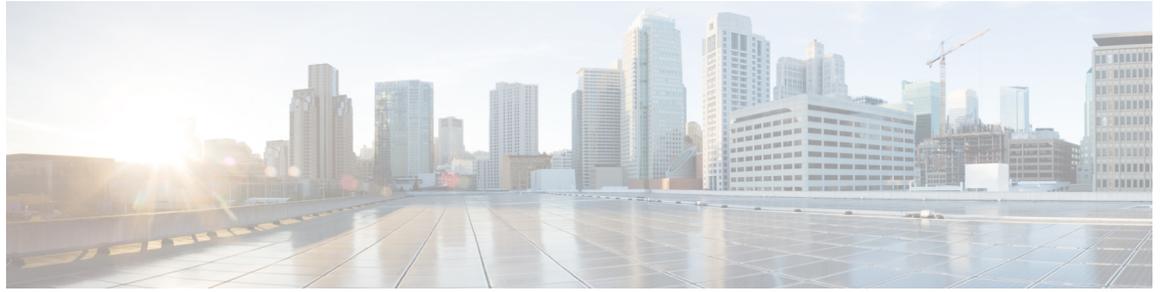

Examples

In the following example, 10-Gigabit Ethernet interface 0/3/0/0 tracks interface 0/3/0/3 and 0/3/0/2. If one or both of these two interfaces go down, the priority of the router decreases by 10 (default priority decrement) for each interface. The default priority decrement is changed using the *priority-decrement* argument. In this example, because the default priority of the virtual router is 100, the priority becomes 90 when one of the tracked interfaces goes down and the priority becomes 80 when both go down. See the **priority** command for details on setting the priority of the virtual router.

```
RP/0/RSP0/CPU0:router(config)# router vrrp
RP/0/RSP0/CPU0:router(config-vrrp)# interface TenGigE 0/3/0/0
RP/0/RSP0/CPU0:router(config-vrrp-if)# address-family ipv4
RP/0/RSP0/CPU0:router(config-vrrp-address-family)# vrrp 1 version 3
RP/0/RSP0/CPU0:router(config-vrrp-virtual-router)# track interface TenGigE 0/3/0/3
RP/0/RSP0/CPU0:router(config-vrrp-virtual-router)# track interface TenGigE 0/3/0/2
```

Related Commands

Command	Description
vrrp priority, on page 915	Sets the priority of the virtual router.

Video Monitoring Commands

This chapter describes the commands used to configure and monitor video monitoring service on Cisco ASR 9000 Series Routers.

For detailed information about video monitoring concepts, configuration tasks, and examples, refer to the *Implementing Video Monitoring Service on Cisco ASR 9000 Series Routers* chapter in *IP Addresses and Services Configuration Guide for Cisco ASR 9000 Series Routers*.

- [clear performance traffic clone profile, on page 922](#)
- [clear performance traffic statistics, on page 923](#)
- [show performance traffic alerts, on page 924](#)
- [show performance traffic clone profile, on page 926](#)
- [show policy-map type performance-traffic, on page 928](#)

clear performance traffic clone profile

To clear all packets cloned to a destination, use the **clear performance traffic clone profile** command in EXEC mode.

clear performance traffic clone profile *profile name*

Syntax Description	<i>profile name</i> Profile name of clone whose packets need to be cleared.
---------------------------	-----------------------------------------------------------------------------

Command Default	None
------------------------	------

Command Modes	EXEC mode
----------------------	-----------

Command History	Release	Modification
	Release 4.0.1	This command was introduced.

Usage Guidelines	No specific guidelines impact the use of this command.
-------------------------	--------------------------------------------------------

Task ID	Task ID	Operation
	netflow	read, write

Example

This example shows how to execute the **clear performance traffic clone profile** command from the command line interface

```
RP/0/RSP0/CPU0:router#clear performance traffic clone
profile
```

clear performance traffic statistics

To clear all policy-map statistics, use the **clear performance traffic statistics** command in EXEC mode. This command clears all interval statistics, except the aggregate statistics.

clear performance traffic statistics interface *type instance* **input**

Syntax Description	interface Specifies the particular interface or all interfaces whose statistics must be cleared.
---------------------------	---------------------------------------------------------------------------------------------------------

input	Specifies the direction of traffic.
--------------	-------------------------------------

Command Default	None
------------------------	------

Command Modes	EXEC mode
----------------------	-----------

Command History	Release	Modification
	Release 3.9.0	This command was introduced.

Usage Guidelines	No specific guidelines impact the use of this command.
-------------------------	--------------------------------------------------------

Task ID	Task ID	Operations
	netflow	read, write

Examples

This example shows how to execute the **clear performance traffic statistics** command from the command line interface:

```
RP/0/RSP0/CPU0:router clear performance traffic statistics interface gigabitEthernet
0/0/0/8 input
```

show performance traffic alerts

To display the active TCA (Threshold Crossing Alerts), use the **show performance traffic alerts** command in EXEC mode. TCAs are set when the configured parameters are met. TCAs are cleared when the configured parameters are not true. An event is generated for both set and clear.

show performance traffic alerts interface *type instance* input

Syntax Description	interface Specifies a particular interface or all interfaces for which the performance traffic alerts are set.
---------------------------	-----------------------------------------------------------------------------------------------------------------------

Command Default	None.
------------------------	-------

Command Modes	EXEC mode
----------------------	-----------

Command History	Release	Modification
	Release 3.9.0	This command was introduced.

Usage Guidelines	No specific guidelines impact the use of this command.
-------------------------	--------------------------------------------------------

Task ID	Task	Operations
	netflow	read

Examples This is a sample output from the **show performance traffic alerts** command:

```
RP/0/RSP0/CPU0:router# show performance traffic alerts interface ten0/6/0/0 input

This table describes the significant fields shown in the display.

Table 90: show performance traffic alerts Field Descriptions

Field	Description
Group/Flow Alerts	This alert is grouped or applies to a single flow.
Class	Name of the class-map used in the policy.
Flow ID	Unique identifier for the flow. Note The flow id number will be different for unbind and rebind.
Num Flows	Number of flows that have been set in this group alert.
Num Grouped Alerts	Total number of grouped alerts.
Num Alerts	Total number of alerts set by flow.
Severity	Indicates the configured severity.
Highest Alert Severity	Indicates the highest severity of an alert set.
React ID	Specifies the configured react ID.
Metric	Indicates the type of alert set.

show performance traffic clone profile

To display the configured trap and clone profiles and the associated clone flows, use the **show performance traffic clone profile** command in EXEC mode.

show performance traffic clone profile *profile name*

Syntax Description	<i>profile name</i> Profile name of clone.				
Command Default	None				
Command Modes	EXEC mode				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Release 4.0.1</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	Release 4.0.1	This command was introduced.
Release	Modification				
Release 4.0.1	This command was introduced.				
Usage Guidelines	No specific guidelines impact the use of this command.				

Task ID	Task	Operation
	netflow	read

Example

This example shows how to execute the **show performance traffic clone profile** command from the command line interface

```
RP/0/RSP0/CPU0:router#show performance traffic clone profile
```

```
-----

show policy-map type performance-traffic

To display the policy-map statistics of video monitoring features, use the **show policy-map type performance-traffic** command in EXEC mode. This command helps you to monitor the Quality of Experience (QoE) of the service provider's video flows.

show policy-map type performance-traffic interface *type instance* [{**aggregate** | **brief** | **cumulative** | **detail** | **input** | **last** | **match**}]

Syntax Description	
interface <i>type instance</i>	Specifies particular interface to display.
aggregate	(Optional) Displays total number of flows and last time changed.
brief	(Optional) Displays only key metrics.
cumulative	(Optional) Displays cumulative statistics over the life time of the flow.
detail	(Optional) Displays detailed metrics.
input	(Optional) Displays input traffic policy.
last	(Optional) Displays last <i>n</i> intervals.
match	(Optional) Specifies match criteria to filter.

Command Default The command default is 1.

Command Modes EXEC mode

This table describes the significant fields shown in the display.

Table 91: show policy-map type performance traffic command Descriptions

Field	Description
DF	Delay Factor.
Mrv	Media Rate Variation.
Total intvls	Number of user-defined intervals.
Service-policy	Name of the service-policy for this flow.
Duration	Length of an interval.
Num-flows	Total number of flows matching this policy.
Flow	Unique flow-ID
