Preface

From Release 6.1.2 onwards, Cisco introduces support for the 64-bit Linux-based IOS XR operating system. Extensive feature parity is maintained between the 32-bit and 64-bit environments. Unless explicitly marked otherwise, the contents of this document are applicable for both the environments. For more details on Cisco IOS XR 64 bit, refer to the Release Notes for Cisco ASR 9000 Series Routers, Release 6.1.2 document.

This reference describes the Cisco IOS XR Quality of Service commands. The preface for Modular Quality of Service Command Reference for Cisco ASR 9000 Series Routers contains these sections:

- Changes to This Document, on page ix
- Communications, Services, and Additional Information, on page x

Communications, Services, and Additional Information

- To receive timely, relevant information from Cisco, sign up at Cisco Profile Manager.
- To get the business impact you’re looking for with the technologies that matter, visit Cisco Services.
- To submit a service request, visit Cisco Support.
- To discover and browse secure, validated enterprise-class apps, products, solutions and services, visit Cisco Marketplace.
- To obtain general networking, training, and certification titles, visit Cisco Press.
- To find warranty information for a specific product or product family, access Cisco Warranty Finder.

Cisco Bug Search Tool

Cisco Bug Search Tool (BST) is a web-based tool that acts as a gateway to the Cisco bug tracking system that maintains a comprehensive list of defects and vulnerabilities in Cisco products and software. BST provides you with detailed defect information about your products and software.
**ANCP Commands**

This module describes the commands used to configure Access Node Control Protocol (ANCP).

To use commands of this module, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using any command, contact your AAA administrator for assistance.

For detailed information regarding ANCP concepts, configuration tasks and examples, see the Configuring ANCP chapter in the *Modular QoS Configuration Guide for Cisco ASR 9000 Series Routers*

- show ancp redundancy iccp group, on page 33
- show ancp summary, on page 39
To enable Access Node Control Protocol (ANCP), use the `ancp` command in Global Configuration mode. To disable ANCP and delete the ANCP configuration, use the `no` form of the command.

```
ancp
no ancp
```

**Syntax Description**

This command has no keywords or arguments.

**Command Default**

Disabled

**Command Modes**

Global Configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ancp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to enable ANCP and enter ANCP configuration mode:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ancp
RP/0/RSP0/CPU0:router(config-ancp)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show ancp summary</code>, on page 39</td>
<td>Displays information about ANCP configuration, including server sender name and neighbor and port counts by state.</td>
</tr>
</tbody>
</table>
an cp an-port circuit-id

To define a unique access node ID for each access port, use the `an cp an-port circuit-id` command in the appropriate configuration mode. This information is included in the ANCP Port Up and Port Down messages.

```
an cp an-port circuit-id Access-Loop-Circuit-Id [{interface type interface-path-id | interface Bundle-Ether bundle-id}]
n o an cp an-port circuit-id Access-Loop-Circuit-Id [{interface type interface-path-id | interface Bundle-Ether bundle-id}]
```

**Syntax Description**

- **Access-Loop-Circuit-Id**: Unique access loop circuit ID name identifying the access port. Maximum 63 characters.
- **interface**: Describes the access node (AN) port.
- **type**: Interface type:
  - `GigabitEthernet` (GigabitEthernet/IEEE 802.3 interface)
  - `TenGigE` (TenGigabitEthernet/IEEE 802.3 interface)
- **interface-path-id**: Physical interface instance. Naming notation is `slot / module / port / interface . subinterface`.
- **interface Bundle-Ether**: Identifies a Bundle-Ether (Aggregated Ethernet) interface.
- **bundle-id**: Bundle-Ether interface instance. Range is a number from 1 through 65535. Naming notation is `interface . subinterface`.

**Command Default**

No default behavior or values

**Command Modes**

Global Configuration mode

**ANCP configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>3.9.0</td>
<td>This command was updated to support the mapping of ANCP ports to VLAN interfaces over Ethernet bundles.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Only subinterfaces of Ethernet and Ethernet bundle interfaces can be mapped to AN ports. The circuit ID must be supplied before an access node port configuration can be committed. When using a shared policy instance in subinterfaces with ANCP, the same AN port circuit ID must be mapped to all subinterfaces that have the same shared policy instance. Circuit ID information can be displayed using the `show an cp an-port` command.
Task ID | Task ID | Operations
--- | --- | ---
ancp | read, write

Examples

The following example shows a unique access node ID being defined:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ancp an-port circuit-id circuit1 interface gigabitethernet 2/0/1/1.1
```

Related Commands

<table>
<thead>
<tr>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear ancp an-port, on page 9</td>
<td>Clears access node (AN) ports of dynamic data or statistics.</td>
</tr>
<tr>
<td>show ancp an-port, on page 14</td>
<td>Displays data or message statistics referring to individual or multiple Access Node (AN) ports.</td>
</tr>
</tbody>
</table>
anpcp neighbor

To map a neighbor configuration to the respective TCP connection, use the anpcp neighbor command in the appropriate configuration mode. To remove the map, use the no form of the command.

```
anpcp neighbor sender-name {H.H.H.A.B.C.D} {description string | adjacency-timer interval}
no anpcp neighbor sender-name {H.H.H.A.B.C.D} {description string | adjacency-timer interval}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sender-name</td>
<td>ANCP neighbor identification.</td>
</tr>
<tr>
<td>H.H.H</td>
<td>MAC address of the sending interface.</td>
</tr>
<tr>
<td>A.B.C.D</td>
<td>IP address of the sending interface.</td>
</tr>
<tr>
<td>description string</td>
<td>Identifier of ANCP neighbor. General string up to 63 characters.</td>
</tr>
<tr>
<td>adjacency-timer interval</td>
<td>The adjacency timer controls the frequency of adjacency protocol messages sourced by the ANCP server. Use the adjacency-timer keyword to define the maximum delay between different stages of ANCP session establishment and the period of ANCP keepalive. The adjacency-timer interval is measured in milliseconds. Replace the interval argument with a number between 100 and 255 (10 to 25.5 seconds). Defaults to 100 ms (10 seconds).</td>
</tr>
</tbody>
</table>

#### Command Default

Adjacency timer interval default is 10 seconds.

#### Command Modes

- Global Configuration mode
- ANCP configuration

#### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

#### Usage Guidelines

The TCP connection from any neighbor is accepted on any interface that is IP enabled. To match the neighbor configuration to a respective TCP connection, ANCP neighbors are identified by a sender name that must match the corresponding field in adjacency protocol messages.

To configure both description and adjacency-timer parameters, use two separate command lines as shown in the Examples section. If a neighbor session is already established, it resets so that the adjacency timer can take affect.

#### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ancp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

#### Examples

The following example shows how to map a neighbor configuration to its respective connection:
RP/0/RSP0/CPU0:router#  configure
RP/0/RSP0/CPU0:router(config)#  ancp neighbor sender-name 0001.2222.3333 description VendorA-1
RP/0/RSP0/CPU0:router(config)#  ancp neighbor sender-name 0001.2222.3333 adjacency-timer 20

### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear ancp neighbor, on page 11</td>
<td>Clears the adjacency connection with the neighbor.</td>
</tr>
<tr>
<td>clear ancp summary statistics, on page 13</td>
<td>Clears aggregate message statistics only, without modifying individual neighbor or port statistics.</td>
</tr>
<tr>
<td>show ancp neighbor, on page 25</td>
<td>Displays data or message statistics associated with individual ANCP adjacencies or sets of adjacencies.</td>
</tr>
<tr>
<td>show ancp neighbor summary, on page 28</td>
<td>Displays adjacency counts by state.</td>
</tr>
</tbody>
</table>
ancp rate-adjustment

To apply a mathematical correction to the ANCP rate update prior to applying it as a shaper rate, use the `ancp rate-adjustment` command in the appropriate configuration mode. To disable the rate adjustment, use the `no` form of the command.

```
ancp rate-adjustment dsl-type access-loop-type percent-factor factor
no ancp rate-adjustment dsl-type access-loop-type percent-factor factor
```

**Syntax Description**

- `dsl-type` Sets DSL type. Possible values are:
  - adsl1
  - adsl2
  - adsl2+
  - vdsl1
  - vdsl2
  - sdsl

- `access-loop-type` Sets the access loop type, either Ethernet or ATM.

- `percent-factor` `factor` Sets the percentage of the ANCP rate. This value should be applied to the ANCP reported rate update prior to configuring it as a shaping rate.

**Command Default**

No default behavior or values

**Command Modes**

- Global Configuration mode
- ANCP configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Both `dsl-type` and `access-loop-type` must be specified in order to configure rate adjustment. `access-loop-type` and `dsl-type` are compared to appropriate values in optional TLVs in the ANCP Port Up message. The ANCP rate is adjusted by a configured factor in case of a match.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ancp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to configure a percent factor of 90 with DSL type ADSL2, and an access loop type of Ethernet:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# ancp rate-adjustment adsl2 ethernet percent-factor 90
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show ancp summary</code>, on page 39</td>
<td>Displays information about ANCP configuration, including server sender name and neighbor and port counts by state.</td>
</tr>
</tbody>
</table>
**anpc server sender-name**

To configure a local sender name to be used by the ANCP server in adjacency protocol messages toward DSLAMs, use the `anpc server sender-name` command in the appropriate configuration mode. To return the local sender name to its default value, use the `no` form of the command.

```
anpc server sender-name {H.H.HA.B.C.D}
no anpc server sender-name {H.H.HA.B.C.D}
```

**Syntax Description**

- **H.H.H**: MAC address of the sending interface.
- **A.B.C.D**: IP address of the sending interface.

**Command Default**

By default, the local sender name is set to the MAC address of a Management Ethernet port.

**Command Modes**

- Global Configuration mode
- ANCP configuration

**Command History**

```
Release   Modification

Release 3.7.2  This command was introduced.
```

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Examples**

The following example shows how to configure a local sender name:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# anpc server sender-name 0013.1aff.c2bd
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show anpc summary, on page 39</td>
<td>Displays information about ANCP configuration, including server sender name and neighbor and port counts by state.</td>
</tr>
</tbody>
</table>
## clear ancp an-port

To clear access node (AN) ports of dynamic data or statistics, either individually or in groups, use the `clear ancp an-port` command in EXEC mode mode.

```
clear ancp an-port {all | circuit-id Access-Loop-Circuit | interface type interface-path-id | interface Bundle-Ether bundle-id | neighbor {description string | sender-name \{H.H.H.A.B.C.D\}}} \{statistics\}
```

<table>
<thead>
<tr>

</table>

---

Modular Quality of Service Command Reference for Cisco ASR 9000 Series Routers
This command was updated to support the mapping of ANCP ports to VLAN interfaces over Ethernet bundles.

### Usage Guidelines

Individual ports can be identified by circuit ID or mapped interfaces, as with `show` commands.

Dynamic data or statistics can be cleared for all ports or for all ports for just a given neighbor.

When used without the `statistics` keyword, the `clear ancp an-port` command clears dynamic data, including all rate information, for the selected AN ports. Ports that are not mapped to any local interface are removed from the ANCP port database. When used with the `statistics` keyword, statistics for the selected ports will be reset.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ancp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear ancp neighbor, on page 11</td>
<td>Clears the adjacency connection with the neighbor.</td>
</tr>
<tr>
<td>clear ancp summary statistics, on page 13</td>
<td>Clears aggregate message statistics only, without modifying individual neighbor or port statistics.</td>
</tr>
</tbody>
</table>
clear ancp neighbor

To clear the adjacency connection with the neighbor, use the `clear ancp neighbor` command in EXEC mode.

```
clear ancp neighbor {all | description string | sender-name \{H.H.H.A.B.C.D\}} [[state | statistics]]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Clears all ANCP neighbors.</td>
</tr>
<tr>
<td><strong>description string</strong></td>
<td>Identifies an ANCP neighbor. General string of up to 63 characters.</td>
</tr>
<tr>
<td><strong>sender-name</strong></td>
<td>ANCP neighbor identification.</td>
</tr>
<tr>
<td><strong>H.H.H</strong></td>
<td>MAC address of the sending interface.</td>
</tr>
<tr>
<td><strong>A.B.C.D</strong></td>
<td>IP address of the sending interface.</td>
</tr>
<tr>
<td><strong>state</strong></td>
<td>(Optional) Resets adjacencies.</td>
</tr>
<tr>
<td><strong>statistics</strong></td>
<td>(Optional) Resets only adjacency message statistics.</td>
</tr>
</tbody>
</table>

**Command Default**

No default behavior or values

**Command Modes**

EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Neighbor data or statistics can be cleared individually or as a list.

If the `state` keyword is specified, adjacencies are not cleared, they are reset. ANCP adjacency protocol restarts, but TCP connections remain open. Unmapped ports belonging to the adjacency are removed.

If the `statistics` keyword is specified, the adjacency state remains intact and only adjacency message statistics are reset.

If neither option is specified, selected adjacencies are cleared, and if no description for these adjacencies is present, they are removed from the ANCP neighbor database. Whether the neighbor is reset or fully cleared, all unmapped ports belonging to this neighbor are removed. Mapped ports are placed in a down state and rates remain intact.

**Note**

Mapped access node port data is not affected by this operation.
clear ancp neighbor

### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ancp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

### Examples

The following example shows how to clear all neighbor data and statistics:

```
RP/0/RSP0/CPU0:router# clear ancp neighbor all
```

The following example shows how to clear a specific neighbor:

```
RP/0/RSP0/CPU0:router# clear ancp neighbor description vendor1a
```

### Related Commands

<table>
<thead>
<tr>

<td>Clears aggregate message statistics only, without modifying individual neighbor or port statistics.</td>
</tr>
</tbody>
</table>
clear ancp summary statistics

To clear aggregate message statistics only, without modifying individual neighbor or port statistics, use the `clear ancp summary statistics` command in EXEC mode mode.

```
clear ancp summary statistics
```

**Syntax Description**

This command has no keywords or arguments.

**Command Default**

No default behavior or values

**Command Modes**

EXEC mode

**Command History**

<table>
<thead>
<tr>

<td>ancp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to clear aggregate message statistics:

```
RP/0/RSP0/CPU0:router# clear ancp summary statistics
```
show ancp an-port

Use the show ancp an-port command to display data or message statistics referring to individual or multiple Access Node (AN) ports.

Syntax Description

- **all** (Optional) Displays data for all AN ports.
- **configured** (Optional) Displays data for AN ports mapped to local subinterfaces.
- **dynamic-only** (Optional) Displays data for AN ports not mapped to any local subinterfaces.
- **summary** (Optional) Displays summary data for all active AN ports.
- **statistics** (Optional) Displays message statistics for AN ports.

Command Default

If no arguments are specified, the show ancp an-port command displays all ANCP ports sorted by circuit ID.

Command Modes

EXEC mode

Command History

- **Release 3.7.2** This command was introduced.
- **Release 3.9.0** This command was updated to support the mapping of ANCP ports to VLAN interfaces over Ethernet bundles.
- **Release 4.0.0** This command was modified to provide information on the ICCP groups of VLAN sub-interfaces.

Usage Guidelines

No specific guidelines impact the use of this command.

Task ID

<table>

show ancp an-port circuit-id

Use the `show ancp an-port circuit-id` command to display data or message statistics for an AN port identified by its circuit-id.

```
show ancp an-port circuit-id Access-Loop-Circuit-Id [[detail | statistics [detail]]]
```

**Syntax Description**

- **Access-Loop-Circuit-Id**: Unique access loop circuit ID name identifying the access port. Maximum 63 characters.
- **detail**: (Optional) Displays additional data on a list of interfaces mapped to the port.
- **statistics**: (Optional) Displays message statistics for an AN port.

**Command Default**

No default behavior or values.

**Command Modes**

EXEC mode

**Command History**

- **Release 3.7.2**: This command was introduced.
- **Release 3.9.0**: This command was updated to support the mapping of ANCP ports to VLAN interfaces over Ethernet bundles.
- **Release 4.0.0**: This command was modified to provide information on the ICCP groups of VLAN sub-interfaces.

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>

show ancp an-port interface

Use the **show ancp an-port interface** command to display data or message statistics for a sub-interface mapped to an AN port.

```
show ancp an-port interface {physical interface-id [{detail | statistics [detail]}] | mapping}
```

**Syntax Description**

- **physical interface-id** (Optional) Physical layer identifier as defined in Table 2: Physical Interface-id parameters for the show ancp an-port command, on page 18.
- **detail** (Optional) Displays additional data on a list of interfaces mapped to the port.
- **statistics** (Optional) Displays message statistics for an AN port.
- **mapping** (Optional) Displays a summary of sub-interface mapping to AN ports.

**Command Default**

No default behavior or values.

**Command Modes**

EXEC mode

show ancp neighbor

To display data or message statistics associated with individual ANCP adjacencies or sets of adjacencies, use the `show ancp neighbor` command in EXEC mode.

```
show ancp neighbor {description string | sender-name {H.H.H | A.B.C.D}} [all] state {none | synsent | synrcvd | estab} [statistics] [summary]
```

### Syntax Description
- **description string**: Identifier of ANCP neighbor. General string up to 63 characters.
- **sender-name**: ANCP neighbor identification.
  - **H.H.H**: MAC address of the sending interface.
  - **A.B.C.D**: IP address of the sending interface.
- **all**: Displays all ANCP neighbors.
- **state**: Displays ANCP neighbors in specified state.
  - **none**: Displays ANCP neighbors in a down state.
  - **synsent**: Displays ANCP neighbors in the SYNSENT state.
  - **synrcvd**: Displays ANCP neighbors in the SYNRCVD state.
  - **estab**: Displays ANCP neighbors in the ESTAB state.
- **statistics**: (Optional) Displays packet statistics.
- **summary**: (Optional) Displays a summary of all active ANCP neighbors.

### Command Default
No default behavior or values

### Command Modes
EXEC mode

### Command History
- **Release 3.7.2**: This command was introduced.

### Examples
The following example shows the output from a specific neighbor using the `sender-name` MAC address:
The following example shows the same command with the addition of the `detail` keyword, showing a summary of AN ports that were reported by that neighbor:

```
RP/0/RSP0/CPU0:router# show ancp neighbor sender-name 0006.2aaa.281b detail
```

The following example shows the same command, this time with the addition of the `statistics` keyword, showing a summary of message statistics for the selected neighbor:

```
RP/0/RSP0/CPU0:router# show ancp neighbor sender-name 0006.2aaa.281b statistics
```
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear ancp neighbor, on page 11</td>
<td>Clears the adjacency connection with the neighbor.</td>
</tr>
<tr>
<td>show ancp an-port, on page 14</td>
<td>Displays data or message statistics referring to individual or multiple Access Node (AN) ports.</td>
</tr>
<tr>
<td>show ancp neighbor summary, on page 28</td>
<td>Displays adjacency counts by state.</td>
</tr>
<tr>
<td>show qos summary BNG, on page 229</td>
<td>Lists the interfaces at a specific location.</td>
</tr>
</tbody>
</table>
**show ancp neighbor summary**

To display adjacency counts by state, use the `show ancp neighbor summary` command in EXEC mode.

```
show ancp neighbor summary [statistics] [detail]
```

**Syntax Description**

- `statistics` (Optional) Provides summary message statistics.
- `detail` (Optional) Displays the current rate adjustment table.

**Command Default**

No default behavior or values

**Command Modes**

EXEC mode

**Command History**

Release 3.7.2  This command was introduced.

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ancp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows the output from the `show ancp neighbor summary` command:

```
RP/0/RSP0/CPU0:router# show ancp neighbor summary

ANCP Neighbor Summary Information
---------------------------------
Neighbor count by state:
 - SYNSENT 0
 - SYNRCVD 0
 - ESTAB 1
```

The following example shows the same command with the addition of the `detail` keyword, showing a summary of individual neighbor data:

```
RP/0/RSP0/CPU0:router# show ancp neighbor summary detail

ANCP Neighbor Summary Information
---------------------------------
Neighbor count by state:
 - SYNSENT 0
 - SYNRCVD 0
 - ESTAB 1
```
Summary Data By Neighbor
----------------------------------------------------------
Neighbor Neighbor Description Sender-Name State Up Down
----------------- -------------- -------- ------- -------
first 0006.2aaa.281b ESTAB 5 2
- 0101.0101.0000 - 0 0

This example shows how to display summary message statistics by adding the `statistics` keyword to the `show ancp neighbor summary` command:

RP/0/RSP0/CPU0:router# show ancp neighbor summary statistics

```
ANCP summary Neighbor Statistics
------------------------------------
Sent  Received
SYN  4  8
SYNACK  5  0
ACK  886  3525
RSTACK  2  0
Port Up - 16
Port Down - 0
Drops 0 0
Total 8897 3549
```

**Examples**

The following example shows how to display the state of ICCP in the ANCP application:

```
RP/0/RSP0/CPU0:router# show ancp redundancy iccp
Tue Nov 17 17:17:04.043 EST
ANCP ICCP Information
-----------------------------------------------
ICCP State                       UP
ICCP Congestion               Cleared
ICCP Group Count              1
ICCP Group Interface Count 1
Creation Timestamp       Tue Nov 17 14:20:15 2009
```

The following table describes the significant fields shown in the display.

**Table 3: show ancp redundancy iccp Field Descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ICCP State</td>
<td>ANCP ICCP State.</td>
</tr>
<tr>
<td>ICCP Congestion</td>
<td>State of ICCP congestion.</td>
</tr>
<tr>
<td>ICCP Group Count</td>
<td>Number of ICCP Groups that ANCP VLAN sub-interfaces are members of.</td>
</tr>
</tbody>
</table>
### ANCP Commands

#### Field | Description
---|---
ICCP Group Interface Count | Number of MC-LAG VLAN sub-interfaces to which ANCP circuits are mapped.
Creation Timestamp | Timestamp of ANCP registration with the ICCP server.

The following example shows how to display the ANCP ICCP statistics:

```
RP/0/RSP0/CPU0:router# show ancp redundancy iccp statistics
Tue Nov 17 17:17:08.150 EST

ANCP ICCP Statistics
-----------------------------------------------

ICCP Statistics
-----------------------------------------------
Up Rx 1
Down Rx 0
Congestion Clear Rx 0
Congestion Clear Rx Drop 0
Congestion Detected Rx 0
Congestion Detected Rx Drop 0
Tx Failure 0

ICCP Group Statistics
-----------------------------------------------
Peer Up Rx 0
Peer Down Rx 0
Sync Request Rx 0
Connect Tx 1
Connect Tx Failure 0
Disconnect Tx 0
Disconnect Tx Failure 0
Start Retry Timer 0

ICCP Interface Statistics
-----------------------------------------------
Active Rx 0
Standby Rx 0
Down Rx 0
Sync Request Rx 0
Sync Request Rx Drop 0
Sync Request Tx 0
Sync Request Tx Drop 0
Sync Rx 0
Sync Rx Drop 0
Sync Start Rx 0
Sync Start Rx Drop 0
Sync End Rx 0
Sync End Rx Drop 0
Sync Unsolicited Rx 0
Sync Unsolicited Rx Drop 0
Sync Invalid Rx 0
Sync Tx 0
Sync Tx Drop 0
App State Rx 0
App_State_Rx Drop 0
App State Tx 0
App_State_Tx Drop 0
Start Retry Timer 0
```
The output indicates the number and type of messages (for example, Up Rx) received (denoted by Rx) and transmitted (denoted by Tx) by the ANCP application. Failure denotes a failed message. Drop indicates a dropped message. Start Retry Timer indicates the number of times the Retry Timer has been initiated as a result of a message transmission failure.

show ancp redundancy iccp group

To display the state and/or statistics of an ICCP Group that an ANCP VLAN sub-interface is a member of, use the show ancp redundancy iccp group command in EXEC mode.

```
```

**Syntax Description**

- **ICCP group id** (Optional) Number identifying the ICCP Group. Range is 1 to 24.
- **interface** (Optional) Displays information for a particular physical layer interface.
- **Bundle-Ether instance.subinterface** (Optional) Specifies an aggregated Ethernet interface.
  - Replace the `instance` argument with an Ethernet bundle instance. Range is 1 to 65535.
  - Replace the `subinterface` argument with a subinterface value. Range is 0 to 2147483647.
- **statistics** (Optional) Displays message statistics.
- **detail** (Optional) Displays detailed information.

**Command Default**

No default behavior or values.

**Command Modes**

EXEC mode

**Command History**

</table>

**Examples**

The following example shows how to display the state of ICCP groups configured on the ANCP application:

```
RP/0/RSP0/CPU0:router# show ancp redundancy iccp group
Tue Nov 17 17:19:30.484 EST

ICCP                  Active     Standby
Group Id       Peers     Interfaces Interfaces ICCP Group State
```

---

**Modular Quality of Service Command Reference for Cisco ASR 9000 Series Routers**

Page 33
The output indicates the Group IDs, their states, and the number of peers. It also indicates the number of interfaces within each group for which the ANCP is the active or standby PoA.

The following example shows how to display details of ICCP Group 1:

RP/0/RSP0/CPU0:router# show ancp redundancy iccp group 1
Tue Nov 17 17:19:33.470 EST

ICCP Group 1 Information
-----------------------------------------------
State Connected Peer Present
Previous State Connected No Peers
Number of Active Interfaces 1
Number of Standby Interfaces 0
Number of Peers 1
Creation Timestamp Tue Nov 17 17:16:57 2009

ICCP Group 1 Peers
Ip Address Timestamp
--------------------------
10.10.10.1 Tue Nov 17 17:18:49 2009

The output indicates the current and previous states of ICCP Group 1, its creation timestamp, and the number of peers and their IP addresses. It also indicates the number of interfaces within each group for which the ANCP is the active or standby PoA.

The following example shows how to display the statistics of ICCP Group 1:

RP/0/RSP0/CPU0:router# show ancp redundancy iccp group 1 statistics
Tue Nov 17 17:19:38.262 EST

ICCP Group 1 Statistics
-----------------------------------------------
Peer Up Rx 1
Peer Down Rx 0
Sync Request Rx 0
Connect Tx 1
Connect Tx Failure 0
Disconnect Tx 0
Disconnect Tx Failure 0
Start Retry Timer 0

ICCP Group 1 Interface Statistics
-----------------------------------------------
Active Rx 1
Standby Rx 0
Down Rx 0
Sync Request Rx 0
Sync Request Rx Drop 0
Sync Request Tx 4
Sync Request Tx Drop 0
Sync Rx 0
Sync Rx Drop 0
Sync Start Rx 0
Sync Start Rx Drop 0
Sync End Rx 0
Sync End Rx Drop 0
Sync Unsolicited Rx 0
Sync Unsolicited Rx Drop 0
Sync Invalid Rx 0
Sync Tx 0
Sync Tx Drop 0
App State Rx 0
App_State_Rx Drop 0
App State Tx 0
App_State_Tx Drop 0
Start Retry Timer 4

The output indicates the number and type of messages (for example, Up Rx) received (denoted by Rx) and transmitted (denoted by Tx) in ICCP Group 1. Failure denotes a failed message. Drop indicates a dropped message. Start Retry Timer indicates the number of times the Retry Timer has been initiated as a result of a message transmission failure.

The following example shows how to display information on the ICCP interfaces.

RP/0/RSP0/CPU0:router# show ancp redundancy iccp group interface
Tue Nov 17 17:24:31.356 EST
ICCP Interfaces

<table>
<thead>
<tr>
<th>Interface</th>
<th>ICCP Group Id</th>
<th>Redundancy State</th>
<th>ICCP Group Port State</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bundle-Ether1.1</td>
<td>1</td>
<td>ACTIVE</td>
<td>Active Peers</td>
</tr>
</tbody>
</table>

The output indicates the MC-LAG Bundle-Ether sub-interfaces that are mapped to ANCP circuits, their ICCP Group ID's, redundancy states and ICCP Group Port States.

The following example shows how to display information on the Bundle-Ether interface at location 1.1.

RP/0/RSP0/CPU0:router# show ancp redundancy iccp group interface bundle-Ether 1.1
Tue Nov 17 17:24:37.111 EST
ICCP Group Interface Bundle-Ether1.1

<table>
<thead>
<tr>
<th>ICCP Group Id</th>
<th>Redundancy State</th>
<th>ICCP Group Port</th>
<th>Previous State</th>
<th>Last Redundancy State Change Timestamp</th>
<th>Last Sync Timestamp</th>
<th>Creation Timestamp</th>
<th>Request Id</th>
<th>Retry Timer</th>
<th>Retry Timer Period</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>ACTIVE</td>
<td>Active ICCP Down</td>
<td>Active No Peers</td>
<td>Thu Aug 5 12:20:40 2010</td>
<td>None</td>
<td>Thu Aug 5 12:20:40 2010</td>
<td>0</td>
<td>Not Running</td>
<td></td>
</tr>
</tbody>
</table>

The output displays information about the MC-LAG Bundle-Ether 1.1 interface, which is mapped to an ANCP circuit. ICCP Group Port indicates the current state of the ICCP Group Port. Previous State indicates the previous state of the ICCP Group Port. The Request ID is the tag attached to the last request message sent to the active PoA, for this interface. It is used to correlate PoA requests and responses. When a response to a request is not received, the request message is resent after the Retry Timer Period has elapsed. The Retry Timer field indicates the current state of the retry timer.

The following example shows how to display statistics for the Bundle_Ether interface at location 1.1.
The output indicates the number and type of messages (for example, Up Rx) received (denoted by Rx) and transmitted (denoted by Tx), which relate to the MC-LAG Bundle Ether 1.1 interface. Failure denotes a failed message. Drop indicates a dropped message. Start Retry Timer indicates the number of times the Retry Timer has been initiated as a result of a message transmission failure.

The following example shows how to display information on the ICCP Group 1 interfaces.

The output indicates the redundancy states and ICCP Group Port States of the MC-LAG Bundle-Ether sub-interfaces that are mapped to ANCP circuits in ICCP Group 1.

The following example shows how to display information on the Bundle_Ether interface, in ICCP Group 1, at location 1.1.
The output displays information about the MC-LAG Bundle-Ether 1.1 interface, in ICCP Group 1, which is mapped to an ANCP circuit. ICCP Group Port indicates the current state of the ICCP Group Port. Previous State indicates the previous state of the ICCP Group Port. The Request ID is the tag attached to the last request message sent to the active PoA, for this interface. It is used to correlate PoA requests and responses. When a response to a request is not received, the request message is resent after the Retry Timer Period has elapsed. The Retry Timer field indicates the current state of the retry timer.

The following example shows how to display statistics for the Bundle_Ether interface, in ICCP Group 1, at location 1.1.

```
RP/0/RSP0/CPU0:router# show ancp redundancy iccp group 1 interface bundle-Ether 1.1 statistics
Tue Nov 17 17:25:27.719 EST
ICCP Group Interface Bundle-Ether1.1 Statistics
-------------------------------------------------------------------------------------------
Active Rx 1

Packet Classification Commands

This chapter describes the commands used for QoS packet classification.

To use commands of this module, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using any command, contact your AAA administrator for assistance.

For detailed information about Packet Classification concepts, configuration tasks and examples, see the Configuring Modular QoS Service Packet Classification and Marking chapter in the Modular QoS Configuration Guide for Cisco ASR 9000 Series Routers.

class (policy-map)

To specify the name of the class whose policy you want to create or change, use the class command in policy map configuration mode. To remove a class from the policy map, use the no form of this command.

```
class [type qos] {class-name | class-default} 
no class [type qos] {class-name | class-default}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>qos</td>
<td>(Optional) Specifies a quality-of-service (QoS) class.</td>
</tr>
<tr>
<td>class-name</td>
<td>Name of the class for which you want to configure or modify policy.</td>
</tr>
<tr>
<td>class-default</td>
<td>Configures the default class.</td>
</tr>
</tbody>
</table>

**Command Default**

No class is specified.

Type is QoS when not specified.

**Command Modes**

Policy map configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Within a policy map, the class (policy-map) command can be used to specify the name of the class whose policy you want to create or change. The policy map must be identified first.

To identify the policy map (and enter the required policy map configuration mode), use the policy-map command before you use the class (policy-map) command. After you specify a policy map, you can configure the policy for new classes or modify the policy for any existing classes in that policy map.

The class name that you specify in the policy map ties the characteristics for that class—that is, its policy—to the class map and its match criteria, as configured using the class-map command.

The class-default keyword is used for configuring default classes. It is a reserved name and cannot be used with user-defined classes. It is always added to the policy map (type qos) even if the class is not configured. For example, the following configuration shows that the class has not been configured, but the running configuration shows ‘class class-default’.

```
RP/0/RSP0/CPU0:router(config)# policy-map pml
RP/0/RSP0/CPU0:router(config-pmap)# end-policy-map
RP/0/RSP0/CPU0:router(config)# end
RP/0/RSP0/CPU0:router# show running-config
!
policy-map pml
  class class-default
  !
  end-policy-map
!```
This example shows how to create a policy map called policy1, which is defined to shape class1 traffic at 30 percent and default class traffic at 20 percent.

```
RP/0/RSP0/CPU0# class-map class1
RP/0/RSP0/CPU0(config-cmap)# match precedence 3
RP/0/RSP0/CPU0(config-cmap)# policy-map policy1
RP/0/RSP0/CPU0(config-pmap)# class class1
RP/0/RSP0/CPU0(config-pmap-c)# shape average 100 mbps
RP/0/RSP0/CPU0(config-pmap-c)# exit
RP/0/RSP0/CPU0(config-pmap-c)# class class-default
RP/0/RSP0/CPU0(config-pmap-c)# shape average 50 mbps
```

The default class is used for packets that do not satisfy configured match criteria for class1. Class1 must be defined before it can be used in policy1, but the default class can be directly used in a policy map, as the system defines it implicitly.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>class-map, on page 47</td>
<td>Defines a traffic class and the associated rules that match packets to the class.</td>
</tr>
<tr>

<td>Creates or modifies a policy map that can be attached to one or more interfaces to specify a service policy.</td>
</tr>
</tbody>
</table>
class-map

To define a traffic class and the associated rules that match packets to the class, use the class-map command in Global Configuration mode. To remove an existing class map from the router, use the no form of this command.

```
class-map [type [traffic | qos]] [match-all] [match-any] class-map-name
no class-map [type [traffic | qos]] [match-all] [match-any] class-map-name
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>type qos</strong></td>
</tr>
<tr>
<td><strong>traffic</strong></td>
</tr>
<tr>
<td><strong>match-all</strong></td>
</tr>
<tr>
<td><strong>match-any</strong></td>
</tr>
<tr>
<td><strong>class-map-name</strong></td>
</tr>
</tbody>
</table>

**Command Default**

Type is QoS when not specified.

**Command Modes**

Global Configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The class-map command specifies the name of the class for which you want to create or modify class map match criteria. Use of this command enables class map configuration mode in which you can enter any match command to configure the match criteria for this class. Packets arriving on the interface are checked against the match criteria configured for a class map to determine if the packet belongs to that class.

These commands can be used in a class map:

- match access-group
- match atm
- match [not] cos
- match destination-address
- match [not] discard-class
- match [not] dscp
- match frame-relay dlci
- match [not] mpls experimental topmost
- match [not] precedence
- match precedence
- match [not] protocol
- match [not] qos-group
Task ID | Task ID Operations
--- | ---
qos | read, write

Examples

This example shows how to specify class101 as the name of a class and defines a class map for this class. The packets that match the access list 101 are matched to class class101.

```
RP/0/RSP0/CPU0:router(config)# class-map class101
RP/0/RSP0/CPU0:router(config-cmap)# match access-group ipv4 101
```

</table>
end-policy-map

To end the configuration of a policy map and to exit policy map configuration mode, use the `end-policy-map` command in policy map configuration mode.

**Syntax Description**

This command has no keywords or arguments.

**Command Default**

No default behavior or values

**Command Modes**

Policy map configuration

**Command History**

Release 3.7.2 This command was introduced.

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Examples**

This example shows how to end the policy map configuration and exit policy map configuration mode.

```
RP/0/RSP0/CPU0:router(config)# policy-map policy1
RP/0/RSP0/CPU0:router(config-pmap)# class class1
RP/0/RSP0/CPU0:router(config-pmap-c)# police rate 250
RP/0/RSP0/CPU0:router(config-pmap-c)# set precedence 3
RP/0/RSP0/CPU0:router(config-pmap)# end-policy-map
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>policy-map</code>, on page 138</td>
<td>Creates or modifies a policy map that can be attached to one or more interfaces to specify a service policy.</td>
</tr>
</tbody>
</table>
**exceed-action**

To configure the action to take on packets that exceed the rate limit, use the `exceed-action` command in policy map police configuration mode. To remove an exceed action from the policy-map, use the `no` form of this command.

```
exceed-action [{drop | set options | transmit}]
no exceed-action [{drop | set options | transmit}]
```

**Syntax Description**

- **drop**  (Optional) Drops the packet.
- **set options**  Configures the specified packet properties. Replace `options` with one of the following keywords or keyword arguments:
  - `atm-clp value` — Sets the cell loss priority (CLP) bit.
  - `cos [inner] value` — Sets the class of service value. Range is 0 to 7.
  - `cos value` — Sets the class of service value. Range is 0 to 7.
  - `dei` — Sets the drop eligible indicator (DEI). Can be 0 or 1.
  - `discard-class value` — Sets the discard class value. Range is 0 to 7.
  - `dscp value` — Sets the differentiated services code point (DSCP) value and sends the packet. See `Table 4: IP DSCP Reserved Keywords, on page 75` for a list of valid values.
  - `dscp [tunnel] value` — Sets the differentiated services code point (DSCP) value and sends the packet. See `Table 4: IP DSCP Reserved Keywords, on page 75` for a list of valid values. With the `tunnel` keyword, the DSCP is set in the outer header.
  - `fr-de value` — Sets the Frame Relay discard eligible (DE) bit on the Frame Relay frame then transmits that packet. In congested environments, frames with the DE bit set to 1 are discarded before frames with the DE bit set to 0. The frame relay DE bit has only one bit and has only two settings, 0 or 1. The default DE bit setting is 0.
  - `mpls experimental {topmost | imposition} value` — Sets the experimental (EXP) value of the Multiprotocol Label Switching (MPLS) packet topmost label or imposed label. Range is 0 to 7.
  - `precedence precedence` — Sets the IP precedence and sends the packet. See `Table 5: IP Precedence Values and Names, on page 80` for a list of valid values.
  - `precedence [tunnel] precedence` — Sets the IP precedence and sends the packet. See `Table 5: IP Precedence Values and Names, on page 80` for a list of valid values. With the `tunnel` keyword, the precedence is set in the outer header.
  - `qos-group value` — Sets the QoS group value.
  - `qos-group value` — Sets the QoS group value. Range is 0 to 63.
  - `srp-priority value` — Sets the Spatial Reuse Protocol (SRP) priority. Range is 0 to 7.
- **transmit**  (Optional) Transmits the packets.

**Command Default**

By default, if no action is configured on a packet that exceeds the rate limit, the packet is dropped.

**Command Modes**

Policy map police configuration
**Command History**

</table>

**Usage Guidelines**

For more information regarding the traffic policing feature, see the `police rate`, on page 129 command.

The `set dei` action in policy maps is supported on 802.1ad packets for:

- Ingress and egress
- Layer 2 subinterfaces
- Layer 2 main interfaces
- Layer 3 main interfaces

**Note**

The set DEI action is ignored for traffic on interfaces that are not configured for 802.1ad encapsulation.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>qos</td>
<td>read,</td>
</tr>
<tr>
<td></td>
<td>write</td>
</tr>
</tbody>
</table>

**Examples**

In this example for MPLS, traffic policing is configured to drop traffic that exceeds the rate limit:

```
RP/0/RSP0/CPU0:router (config)# class-map class1
RP/0/RSP0/CPU0:router (config-cmap)# match mpls experimental topmost 0
RP/0/RSP0/CPU0:router (config-cmap)# exit

RP/0/RSP0/CPU0:router (config)# policy-map policy1
RP/0/RSP0/CPU0:router (config-pmap)# class class1
RP/0/RSP0/CPU0:router (config-pmap-c)# police rate 250 kbps burst 50
RP/0/RSP0/CPU0:router (config-pmap-c-police)# exceed-action drop
RP/0/RSP0/CPU0:router (config-pmap-c-police)# exit
RP/0/RSP0/CPU0:router (config-pmap-c)# exit
RP/0/RSP0/CPU0:router (config-pmap)# exit

RP/0/RSP0/CPU0:router (config)# interface pos 0/5/0/0
RP/0/RSP0/CPU0:router (config-if)# service-policy input policy1
```

In this example, the police rate is set to 5 Mbps. Conforming traffic is marked with a DEI value of 0; traffic that exceeds the police rate is marked with a DEI value of 1.

```
RP/0/RSP0/CPU0:router (config)# policy-map lad-mark-dei
RP/0/RSP0/CPU0:router (config-pmap)# class cl
RP/0/RSP0/CPU0:router (config-pmap-c)# police rate 5 mbps
RP/0/RSP0/CPU0:router (config-pmap-c-police)# conform-action set dei 0
```
exceed-action

RP/0/RSP0/CPU0:router(config-pmap-c-police)# exceed-action set dei 1
RP/0/RSP0/CPU0:router(config-pmap-c-police)# end-policy-map

<table>

** hw-module qos-mode pwhe-aggregate-shaper **

To enable co-existence mode, use the `hw-module qos-mode pwhe-aggregate-shaper` command in Global Configuration mode. To disable co-existence mode, use the `no` form of this command.

**Note**

If you are running either on Cisco IOS XR or Cisco IOS XR 64 bit, use the `hw-module qos-mode pwhe-aggregate-shaper` command in Global configuration mode.

```
hw-module {all | location node-id} qos-mode pwhe-aggregate-shaper sub-interface {egress | ingress} {non-queuing | queuing}
no hw-module {all | location node-id} qos-mode pwhe-aggregate-shaper sub-interface {egress | ingress}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Specifies all location.</td>
</tr>
<tr>
<td>location node-id</td>
<td>Specifies location of a particular node. The <code>node-id</code> argument is entered in the rack/slot/module notation.</td>

</tr>
</thead>
<tbody>
<tr>
<td>Release 6.1.2</td>
<td>Support for Cisco IOS XR 64 bit bit was added.</td>
</tr>
<tr>
<td>Release 5.1.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command indicates that the PWHE main interface policies can co-exist with subinterface policies. The mode change takes effect immediately on a line card (LC) if there is no PWHE main or subinterface policy on the LC, otherwise LC reload is required.
To avoid LC reload we recommend that the mode change is performed when there is no policy applied on any PWHE main or subinterfaces.

The co-existence mode with subinterface queuing policies is known as co-existence queuing mode.

The co-existence mode with subinterface non-queuing policies is known as co-existence non-queuing mode.

Adding, deleting and in-place modification of the PWHE aggregate shaper are allowed regardless of presence of subinterface policies.

```
hw-module { all | location node-id } qos-mode pwhe-aggregate-shaper sub-interface ingress queuing
```

will not be rejected if there are LCs in the chassis which do not support ingress queuing.

Use the `show qos pwhe-aggregate-shaper` command to view current configured mode and operating mode.

---

### Example

This example shows how to configure co-existence queuing mode in egress direction for all the line cards.

```
RP/0/RSP0/CPU0:router(config)# hw-module all qos-mode pwhe-aggregate-shaper sub-interface egress queuing
```
**match cac**

To identify specified call admission control (CAC) fields as a match criteria in a class map, use the `match cac` command in class map configuration mode. To remove a specified CAC field from the matching criteria for a class map, use the `no` form of this command.

```
match cac {admitted | unadmitted} [ local ]
no match cac {admitted | unadmitted}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>admnitted</th>
<th>Specifies the packets admitted by CAC action as the match criteria in a class map.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>unadmitted</td>
<td>Specifies the packets unadmitted by CAC action as the match criteria in a class map.</td>
</tr>
<tr>
<td></td>
<td>local</td>
<td>Specified the CAC local.</td>
</tr>
</tbody>
</table>

**Command Default**

No match criteria are specified.

**Command Modes**

Class map configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 5.1.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `match cac` command specifies a call admission control field or action that is used as the match criteria against which packets are checked to determine if they belong to the class specified by the class map.

To use the `match cac` command, you must first enter the `class-map` command to specify the name of the class whose match criteria you want to establish.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>qos</td>
<td>read, write</td>
</tr>
</tbody>
</table>

This example shows how to configure admit class for CAC.

```
RP/0/RSP0/CPU0:router(config)# class-map match-all video
RP/0/RSP0/CPU0:router(config-cmap)# match cac admitted local
RP/0/RSP0/CPU0:router(config-cmap)# exit
```
match cos

To identify specified class of service (CoS) values as a match criteria in a class map, use the **match cos** command in class map configuration mode. To remove a specified CoS class value from the matching criteria for a class map, use the **no** form of this command.

**match [not] cos {cos-value [cos-value1 . . . cos-value7] | inner inner-cos-value [inner cos-value1 . . . inner cos-value7]}

**no match [not] cos {cos-value [cos-value1 . . . cos-value7] | inner inner-cos-value [inner cos-value1 . . . inner cos-value7]}

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>not</strong></td>
<td>(Optional) Negates the specified match result.</td>
</tr>
<tr>
<td><strong>cos-value</strong></td>
<td>Identifier that specifies the exact value from 0 to 7. Up to eight CoS identifiers can be specified to match packets.</td>
</tr>
<tr>
<td><strong>inner</strong></td>
<td>(Optional) Specifies the inner CoS value in, for example, a QinQ configuration.</td>
</tr>
<tr>
<td><strong>inner-cos-value</strong></td>
<td>Identifier that specifies the exact value from 0 to 7. Up to eight inner CoS identifiers can be specified to match packets.</td>
</tr>
</tbody>
</table>

### Command Default

No match criteria are specified.

### Command Modes

Class map configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The **match cos** command specifies a class of service that is used as the match criteria against which packets are checked to determine if they belong to the class specified by the class map.

To use the **match cos** command, you must first enter the **class-map** command to specify the name of the class whose match criteria you want to establish. If you specify more than one **match cos** command in a class map, the values of subsequent match statements are added to the first **match cos** command.

The **match cos** command is supported on egress Layer 2 interfaces, Layer 2 subinterfaces, and Layer 3 physical interfaces. Layer 3 physical interfaces are supported, because it is possible for a Layer 3 interface to have underlying Layer 2 subinterfaces.

### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>qos</td>
<td>read, write</td>
</tr>
</tbody>
</table>

### Examples

This example shows how to configure the service policy called policy1 and attach service policy policy1 to an interface. In this example, class map cos146 evaluates all packets entering HundredGigE interface 0/7/0/0.100 for class of service values of 1, 4, or 6. If the incoming packet has been marked
with any of these CoS values, the packet is queued to the class queue with the bandwidth setting of
300 kbps.

RP/0/RSP0/CPU0:router(config)# class-map cos146
RP/0/RSP0/CPU0:router(config-cmap)# match cos 1 4 6
RP/0/RSP0/CPU0:router(config-cmap)# exit

RP/0/RSP0/CPU0:router(config)# policy-map policy1
RP/0/RSP0/CPU0:router(config-pmap)# class cos146
RP/0/RSP0/CPU0:router(config-pmap-c)# bandwidth 300
RP/0/RSP0/CPU0:router(config-pmap-c)# exit
RP/0/RSP0/CPU0:router(config-pmap)# exit

RP/0/RSP0/CPU0:router(config)# interface HundredGigE 0/7/0/0
RP/0/RSP0/CPU0:router(config-if)# service-policy input policy1

<td>set cos, on page 258</td>
<td>Sets the Layer 2 class of service (CoS) value of an outgoing packet.</td>
</tr>
</tbody>
</table>
**match vlan**

To identify selected VLAN IDs as the match criteria for a class map, use the `match vlan` command in class map configuration mode. To remove VLAN ID match criteria from a class map, use the `no` form of this command.

```
match vlan [inner] vlanid [vlanid1 ... vlanid7]
no match vlan [inner] vlanid [vlanid1 ... vlanid7]
```

**Syntax Description**

- `inner` (Optional) Specifies the inner VLAN for the match in, for example, a QinQ configuration.
- `vlanid` VLAN identifier that specifies the exact value from 1 to 4094 or a range of values from 1 to 4094. Up to eight values can be specified in a match statement.

**Command Default**

No match criteria are specified.

**Command Modes**

Class map configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `match vlan` command specifies a VLAN ID that is used as the match criteria against which packets are checked to determine if they belong to the class specified by the class map.

To use the `match vlan` command, you must first enter the `class-map` command to specify the name of the class whose match criteria you want to establish. If you specify more than one `match vlan` command in a class map, up to eight values of the subsequent match statements are added to the first `match vlan` command, exceeding which, the statement is rejected.

This command is supported only on Layer 3 ingress.

**Examples**

This example shows how to configure the service policy called policy1 and attach service policy policy1 to an interface. In this example, class map vlan1 evaluates all packets entering GigabitEthernet interface 0/1/0/0 for VLAN IDs of 1234, 1698, and all the VLAN IDs in the range 3000 to 4000. If the incoming packet has been marked with any of these VLAN IDs, the packet is queued to the class queue with the bandwidth setting of 300 kbps.

```
RP/0/RSP0/CPU0:router(config)# class-map vlan1
RP/0/RSP0/CPU0:router(config-cmap)# match vlan 1234 1698 3000-4000
RP/0/RSP0/CPU0:router(config-cmap)# exit
RP/0/RSP0/CPU0:router(config)# policy-map policy1
RP/0/RSP0/CPU0:router(config-pmap)# class vlan1
```
RP/0/RSP0/CPU0:router(config-pmap-c)# **bandwidth 300**
RP/0/RSP0/CPU0:router(config-pmap-c)# **exit**
RP/0/RSP0/CPU0:router(config-pmap)# **exit**
RP/0/RSP0/CPU0:router(config)# **interface gigabitethernet 0/1/0/0**
RP/0/RSP0/CPU0:router(config-if)# **service-policy input policy1**

</tr>
</tbody>
</table>
**match ethertype**

To identify selected Ethernet type fields as the match criteria for a class map, use the `match ethertype` command in class map configuration mode. To remove the Ethernet type fields match criteria from a class map, use the `no` form of this command.

```
match ethertype  ethertype_field
no match ethertype  ethertype_field
```

**Syntax Description**

*ethertype_field*  Ethernet type field that specifies the Ethernet service. Values can be:

- `<1536-65535>`—Ethertype value; only 2054 (the value representing ARP) is supported.
- `arp` — Match on address resolution protocol.
- `ipv4` (not supported).
- `ipv6` (not supported).

**Caution**  If you specify any value other than the supported values, the system allows you to commit the configuration. However, if you try to commit a configuration that applies the policy-map (containing the invalid ethertype match) to an interface, the system rejects the commit action.

**Command Default**

No match criteria are specified.

**Command Modes**

Class map configuration

**Command History**

match flow-key

To identify specified flow keys as a match criteria in a class map, use the `match flow-key` command in class map configuration mode. To remove a specified flow key from the matching criteria for a class map, use the `no` form of this command.

```
match flow-key [5-tuple | dst-ip | src-ip] [flow-cache {idle-timeout period | none}]
no match flow-key
```

**Syntax Description**

- **5-tuple**: Specifies the 5 tuples to identify a flow. The 5 tuples required to define a flow are: source IP address, destination IP address, source port number, destination port number, and protocol.
- **dst-ip**: Specifies the destination IP address of the flow mask.
- **src-ip**: Specifies the source IP address of the flow mask.
- **flow-cache**: Configures the flow-cache parameters.
- **idle-timeout**: Specifies the maximum time of inactivity for a flow.
- **period**: Specifies the idle timeout period in seconds.
- **none**: Specifies that the flow does not expire.

**Command Default**

- Default flow mask is 5-tuple.
- Default idle timeout is 30s.

**Command Modes**

Class map configuration

**Command History**

```
Release | Modification
---------|-------------
5.1.1    | This command was introduced.
```

**Usage Guidelines**

The `match flow-key` command specifies a flow mask that is used as the match criteria against which packets are checked to determine if they belong to the class specified by the class map.

**Task ID**

```
<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>qos</td>
<td>read, write</td>
</tr>
</tbody>
</table>
```

This example shows how to configure the source IP address of the flow mask as the only flow tuple and a flow idle timeout of 200 seconds.

```
RP/0/RSP0/CPU0:router(config)# class-map match-all video1
RP/0/RSP0/CPU0:router(config-cmap)# match precedence 5
```
match flow-key

RP/0/RSP0/CPU0:router(config-cmap)# match flow-key src-ip flow-cache idle-timeout 200
RP/0/RSP0/CPU0:router(config-cmap)# exit
match fr-de

To match packets on the basis of the Frame Relay discard eligibility (DE) bit setting, use the **match fr-de** command in class-map configuration mode. To remove the match criterion, use the **no** form of this command.

```
match fr-de  fr-de-bit-value
no match fr-de  fr-de-bit-value
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>match fr-de</td>
<td>(Optional) Negates the specified match result.</td>
</tr>
<tr>
<td>no match fr-de</td>
<td>Specifies the Frame Relay DE bit. Value can be 1.</td>
</tr>
</tbody>
</table>

**Command Default**

Packets are not matched on the basis of the Frame Relay DE bit setting.

**Command Modes**

Class map configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0.0</td>
<td>This command was introduced</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This match criterion can be used under a subinterface (L2 PVC) using the **service-policy** command, and it is supported in the ingress direction only. This match criterion can also be used in hierarchical policy maps.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>qos</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to create a class called match-fr-de and match packets on the basis of the Frame Relay DE bit setting. Packets match Frame Relay DE bit 1.

```
RP/0/RSP0/CPU0:router(config)# class-map match-fr-de
RP/0/RSP0/CPU0:router(config-cmap)# match fr-de 1
RP/0/RSP0/CPU0:router(config-cmap)# end
```

To match Frame Relay DE bit 0, use this configuration:

```
RP/0/RSP0/CPU0:router(config)# class-map match-not-fr-de
RP/0/RSP0/CPU0:router(config-cmap)# match not fr-de 1
RP/0/RSP0/CPU0:router(config-cmap)# end
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>

</tbody>
</table>
match frame-relay dlci

To specify a Frame Relay packet data-link connection identifier (DLCI) number or number range as a match criterion in a class map, use the `match frame-relay dlci` command in class map configuration mode. To remove a previously specified DLCI number as a match criterion, use the `no` form of this command.

```
match frame-relay dlci [{DlciStart-Dlci-EndDlci}]
no match frame-relay dlci [{DlciStart-Dlci-EndDlci}]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dlci</td>
<td>A DLCI number associated with the packet. Range is from 16 to 1007.</td>
</tr>
<tr>
<td>StartDlci-EndDlci</td>
<td>A DLCI number range from 16 to 1007. Numbers are separated by a hyphen.</td>
</tr>
</tbody>
</table>

**Command Default**

No DLCI number is specified.

**Command Modes**

Class map configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The match criterion for the `match frame-relay dlci` command can be used only on hierarchical policy maps.

**Examples**

The following example shows how to create the fr-dlci class map, and specify the Frame Relay DLCI number range 100-200 as a match criterion. Packets with DLCIs matching this criterion are placed in fr-dlci. In this example, class map fr-dlci evaluates all packets entering Packet-over-SONET/SDH (POS) interface 0/1/0/0.1 for DLCIs in the range from 100 through 200. If the incoming packet has been marked with the DLCI in the range from 100 through 200, the packet is queued to the class queue with the bandwidth setting of 300 kbps.

```
RP/0/RSP0/CPU0:router (config)# class-map fr-dlci
RP/0/RSP0/CPU0:router (config-cmap)# match frame-relay dlci 100-200
RP/0/RSP0/CPU0:router (config-cmap)# end
RP/0/RSP0/CPU0:router (config)# policy-map policy1
RP/0/RSP0/CPU0:router (config-pmap)# class fr-dlci
RP/0/RSP0/CPU0:router (config-pmap-c)# bandwidth 300
RP/0/RSP0/CPU0:router (config-pmap-c)# exit
RP/0/RSP0/CPU0:router (config-pmap)# exit
RP/0/RSP0/CPU0:router (config)# interface pos 0/1/0/0.1
RP/0/RSP0/CPU0:router (config)# service-policy output policy1
RP/0/RSP0/CPU0:router (config)# interface pos 0/1/0.1 point-to-point pvc 16
```

RP/0/RSP0/CPU0:router(config-fr-vc)# service-policy output policy1
```
**match access-group**

To identify a specified access control list (ACL) number as the match criteria for a class map, use the **match access-group** command in class map configuration mode. To remove ACL match criteria from a class map, use the **no** form of this command.

```
match [not] access-group {ipv4 | ipv6 | ethernet-service} access-group-name
no match [not] access-group {ipv4 | ipv6 | ethernet-service} access-group-name
```

**Syntax Description**

- **not** (Optional) Negates the specified match result.
- **ipv4** Specifies the name of the IPv4 access group to be matched.
- **ipv6** Specifies the name of the IPv6 access group to be matched.
- **ethernet-service** Specifies the name of the ethernet-service access group to be matched.
- **access-group-name** ACL whose contents are used as the match criteria against which packets are checked to determine if they belong to this class.

**Command Default**

By default, if neither IPv6 nor IPv4 is specified as the match criteria for a class map, IPv4 addressing is used.

**Command Modes**

Class map configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>

<td>Support for IPv6 ACLs with source port matching was added in MQC policy maps.</td>
</tr>
<tr>
<td>Release 6.0.1</td>
<td>The <strong>ethernet-service</strong> keyword was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

For class-based features (such as marking, Modified Deficit Round Robin [MDRR], and policing), you define traffic classes based on match criteria, including ACLs and input interfaces. Packets satisfying the match criteria for a class constitute the traffic for that class.

The **match access-group** command specifies an ACL whose contents are used as the match criteria against which packets are checked to determine if they belong to the class specified by the class map.
Access Control Entries with TCP fields such as, SYN, ACK and FIN in the corresponding ACL are not supported.

To use the `match access-group` command, you must first enter the `class-map` command to specify the name of the class whose match criteria you want to establish. You can specify up to eight IPv4 and IPv6 ACLs in a match statement.

QoS classification based on the packet length or TTL (time to live) field in the IPv4 and IPv6 headers is not supported.

When an ACL list is used within a class-map, the deny action of the ACL is ignored and the traffic is classified based on the specified ACL match parameters.

**Note**

- You can provide multiple values in a configuration; only the first value is considered for the match criteria. Subsequent values indicated in the match statement are ignored for classification.
- The capture statements in an ethernet-service ACL are ignored.
- An ethernet-service ACL should have only permit statements. If there are any deny statements, the policy is rejected.
- If you specify a value for the `Ether-Type` keyword using the `match access-group ethernet-service` command, the value is ignored.

### Task ID

</tr>
</tbody>
</table>

Usage Guidelines

The `match destination-address` command specifies a destination address that is used as the match criteria against which packets are checked to determine if they belong to the class specified by the class map.

To use the `match destination-address` command, you must first enter the `class-map` command to specify the name of the class whose match criteria you want to establish. If you specify more than one `match destination-address` command in a class map, only the last command entered applies.

The `match destination-address` command is supported only on an output service policy.

Layer 2 match criteria on a Layer 3 target, or Layer 3 match criteria on a Layer 2 target, is not allowed. The `match destination-address` command is supported on egress Layer 2 interfaces, Layer 2 subinterfaces, and Layer 3 physical interfaces. Layer 3 physical interfaces are supported, because it is possible for a Layer 3 interface to have underlying Layer 2 subinterfaces.

The command is allowed on a policy map that is attached to an Ethernet interface. The command is invalid on a policy that is attached to a Packet-over-SONET/SDH (POS) interface or a routed VLAN subinterface.

The match 48-bit MAC address is specified in xxxx.xxxx.xxxx format on L2VPN PE interfaces.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `match discard-class` command specifies a discard class that is used as the match criteria against which packets are checked to determine if they belong to the class specified by the class map.

To use the `match discard-class` command, you must first enter the `class-map` command to specify the name of the class whose match criteria you want to establish. If you specify more than one `match discard-class` command in a class map, the new values are added to the existing match statement.

The `match discard-class` command sets the match criteria for examining discard classes marked on the packet. Up to eight discard class values can be matched in one match statement. For example, `match discard-class 0 1 2 3 4 5 6 7` returns matches for discard class values 0, 1, 2, 3, 4, 5, 6, and 7. Only one of the seven values is needed to yield a match (OR operation).

The discard class value is used as a matching criterion only. The value has no mathematical significance. For instance, the discard class value 2 is not greater than 1. The value simply indicates that a packet marked with the discard class of 2 should be treated differently than a packet marked with a discard class value of 1.

The `match discard-class` command is not supported on the Asynchronous Transfer Mode (ATM) interfaces.

**Note**

The `match discard-class` command is applied only for egress policies.

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>

</thead>
<tbody>
<tr>
<td>qos</td>
<td>read, write</td>
</tr>
</tbody>
</table>
This example shows a service policy called policy1 attached to an interface. In this example, class map discard class5 is created to evaluate all packets leaving GigabitEthernet 0/1/0/9 interface for a discard-class value of 5. Packets marked with the discard class value of 5 are queued to a class queue with the bandwidth setting 300 kbps.

```
RP/0/RSP0/CPU0:router(config)# class-map discard-class5
RP/0/RSP0/CPU0:router(config-cmap)# match discard-class 5
RP/0/RSP0/CPU0:router(config-cmap)# exit
RP/0/RSP0/CPU0:router(config)# policy-map policy1
RP/0/RSP0/CPU0:router(config-pmap)# class discard-class5
RP/0/RSP0/CPU0:router(config-pmap-c)# bandwidth 300
RP/0/RSP0/CPU0:router(config-pmap-c)# exit
RP/0/RSP0/CPU0:router(config-pmap)# exit
RP/0/RSP0/CPU0:router(config)# interface gigabitethernet 0/1/0/9
RP/0/RSP0/CPU0:router(config-if)# service-policy output policy1
```
**match dscp**

To identify specific IP differentiated services code point (DSCP) values as match criteria for a class map, use the `match dscp` command in class map configuration mode. To remove a DSCP value from a class map, use the `no` form of this command.

```
match dscp {[[ipv4 | ipv6]] dscp-value [dscp-value1 ... dscp-value7] | [min-value - max-value]}
no match dscp {[[ipv4 | ipv6]] dscp-value [dscp-value1 ... dscp-value7] | [min-value - max-value]}
```

**Syntax Description**

- `not` (Optional) Negates the specified match result.
- `ipv4` (Optional) Specifies the IPv4 DSCP value.
- `ipv6` (Optional) Specifies the IPv6 DSCP value.
- `dscp-value` IP DSCP value identifier that specifies the exact value or a range of values. Range is 0 - 63. Up to eight IP DSCP values can be specified to match packets. Reserved keywords can be specified instead of numeric values. Table 4: IP DSCP Reserved Keywords, on page 75 describes the reserved keywords.
- `min-value` Lower limit of DSCP range to match. Value range is 0 - 63.
- `max-value` Upper limit of DSCP range to match. Value range is 0 - 63.

**Command Default**

Matching on IP Version 4 (IPv4) and IPv6 packets is the default.

**Command Modes**

Class map configuration

</tbody>
</table>

**Usage Guidelines**

The `match dscp` command specifies a DSCP value that is used as the match criteria against which packets are checked to determine if they belong to the class specified by the class map.

To use the `match dscp` command, you must first enter the `class-map` command to specify the name of the class whose match criteria you want to establish. If you specify more than one `match dscp` command in a class map, only the last command entered applies.

The `match dscp` command examines the higher-order six bits in the type of service (ToS) byte of the IP header. Only one of the eight values is needed to yield a match (OR operation).

The command supports only eight IP DSCP values. If you try to configure more match statements after all the eight values are matched, the statements get rejected.

The IP DSCP value is used as a matching criterion only. The value has no mathematical significance. For instance, the IP DSCP value 2 is not greater than 1. The value simply indicates that a packet marked with the
IP DSCP value of 2 should be treated differently than a packet marked with an IP DSCP value of 1. The treatment of these marked packets is defined by the user through the setting of policies in policy map class configuration mode.

RP/0/RSP0/CPU0:router (config-if)# service-policy input policy1
```
match mpls experimental topmost

To identify specific three-bit experimental (EXP) field values in the topmost Multiprotocol Label Switching (MPLS) label as match criteria for a class map, use the `match mpls experimental topmost` command in class map configuration mode. To remove experimental field values from the class map match criteria, use the `no` form of the command.

```
match [not] mpls experimental topmost exp-value [exp-value1 ... exp-value7]
no match [not] mpls experimental topmost exp-value [exp-value1 ... exp-value7]
```

**Syntax Description**
- `not` not
- `exp-value` Experimental value that specifies the exact value from 0 to 7. Up to eight experimental values can be specified to match MPLS headers.

**Command Default**
No default behavior or values

**Command Modes**
Class map configuration

**Command History**
```
Release   Modification
3.7.2      This command was introduced.
```

**Usage Guidelines**
The `match mpls experimental topmost` command is used by the class map to identify MPLS experimental values matching on a packet.

To use the `match mpls experimental topmost` command, you must first enter the `class-map` command to specify the name of the class whose match criteria you want to establish. If you specify more than one `match mpls experimental topmost` command in a class map, the new values are added to the existing match statement.

This command examines the three experimental bits contained in the topmost label of an MPLS packet. Up to eight experimental values can be matched in one match statement. For example, `match mpls experimental topmost 2 4 5 7` returns matches for experimental values of 2, 4, 5, and 7. Only one of the four values is needed to yield a match (OR operation).

The experimental values are used as a matching criterion only. The value has no mathematical significance. For instance, the experimental value 2 is not greater than 1. The value indicates that a packet marked with the experimental value of 2 should be treated differently than a packet marked with the EXP value of 1. The treatment of these different packets is defined by the user through the setting of QoS policies in policy map class configuration mode.

**match precedence**

To identify IP precedence values as match criteria, use the `match precedence` command in class map configuration mode. To remove precedence values from a class map, use the `no` form of this command.

```
match [not] precedence [ipv4 | ipv6] precedence-value [precedence-value1 ... precedence-value7]
no match [not] precedence [ipv4 | ipv6] precedence-value [precedence-value1 ... precedence-value7]
```

**Syntax Description**

- **not** (Optional) Negates the specified match result.
- **ipv4** (Optional) Specifies the IPv4 precedence value.
- **ipv6** (Optional) Specifies the IPv6 precedence value.
- **precedence-value** An IP precedence value identifier that specifies the exact value. Range is from 0 to 7. Reserved keywords can be specified instead of numeric values. Table 5: IP Precedence Values and Names, on page 80 describes the reserved keywords.

Up to eight precedence values can be matched in one match statement.

**Command Default**

Matching on both IP Version 4 (IPv4) and IPv6 packets is the default.

**Command Modes**

Class map configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>

match protocol

To identify a specific protocol as the match criterion for a class map, use the `match protocol` command in class map configuration mode. To remove protocol-based match criteria from a class map, use the `no` form of this command.

```
match [not] protocol {protocol-value [protocol-value1 ... protocol-value7] | [min-value - max-value]}
no match [not] protocol {protocol-value [protocol-value1 ... protocol-value7] | [min-value - max-value]}
```

**Syntax Description**

- **not** (Optional) Negates the specified match result.
- **protocol-value** A protocol identifier. A single value for `protocol-value` (any combination of numbers and names) can be matched in one match statement.
- **min-value** Lower limit of protocol range to match. Value range is 0 - 255.
- **max-value** Upper limit of protocol range to match. Value range is 0 - 255.

**Command Default**

No default behavior or values

**Command Modes**

Class map configuration

**Command History**

Release 3.7.2 This command was introduced.

Release 5.2.0 The `min-value` and `max-value` variables were added.

**Usage Guidelines**

Definitions of traffic classes are based on match criteria, including protocols, access control lists (ACLs), input interfaces, QoS labels, and experimental (EXP) field values. Packets satisfying the match criteria for a class constitute the traffic for that class.

The `match protocol` command specifies the name of a protocol to be used as the match criteria against which packets are checked to determine if they belong to the class specified by the class map. Available protocol names are listed in the table that follows.

The `protocol-value` argument supports a range of protocol numbers. After you identify the class, you may use the `match protocol` command to configure its match criteria.

#### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>qos</td>
<td>read, write</td>
</tr>
</tbody>
</table>

#### Examples

In this example, all TCP packets belong to class class1:

```
RP/0/RSP0/CPU0:router(config)# class-map class1
RP/0/RSP0/CPU0:router(config-cmap)# match protocol tcp
```
**match qos-group**

To identify specific quality-of-service (QoS) group values as match criteria in a class map, use the `match qos-group` command in class map configuration mode. To remove a specific QoS group value from the matching criteria for a class map, use the `no` form of this command.

```
match [not] qos-group [qos-group-value 1 ... qos-group-value 8]
no match [not] qos-group
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>not</code></td>
<td>(Optional) Negates the specified match result.</td>
</tr>
<tr>
<td><code>qos-group-value</code></td>
<td>QoS group value identifier that specifies the exact value from 0 to 63 or a range of values from 0 to 63. Up to eight values can be entered in one match statement.</td>
</tr>
</tbody>
</table>

**Command Default**

No match criteria are specified.

**Command Modes**

Class map configuration

---

**Usage Guidelines**

The `match qos-group` command sets the match criteria for examining QoS groups marked on the packet. Up to eight QoS group values can be matched in one match statement. For example, `match qos-group 4 9 11 15 16 21 30 31` returns matches for QoS group values of 4, 9, 11, 15, 16, 21, 30, and 31. Only one of the eight values is needed to yield a match (OR operation).

The QoS group value is used as a matching criterion only. The value has no mathematical significance. For instance, the QoS group value 2 is not greater than 1. The value simply indicates that a packet marked with the QoS group value of 2 should be treated differently than a packet marked with a QoS group value of 1. The treatment of these different packets is defined using the `service-policy` command in policy map class configuration mode.

The QoS group setting is limited in scope to the local router. Typically, the QoS group is set on the local router and is used in conjunction with WRED or MDRR to give differing levels of service based on the group identifier.

The `match qos-group` command is supported only on egress policies.

---

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>qos</td>
<td>read, write</td>
</tr>

</table>

**Examples**

This example shows a service policy called policy1 attached to an interface. In this example, class map qosgroup5 will evaluate all packets leaving GigabitEthernet interface 0/1/0/9 for a QoS group value of 5. If the packet has been marked with the QoS group value of 5, the packet is queued to the class queue with the bandwidth setting 300 kbps.
RP/0/RSP0/CPU0:router(config)# class-map qosgroup5
RP/0/RSP0/CPU0:router(config-cmap)# match qos-group 5
RP/0/RSP0/CPU0:router(config-cmap)# exit
RP/0/RSP0/CPU0:router(config)# policy-map policy1
RP/0/RSP0/CPU0:router(config-pmap)# class qosgroup5
RP/0/RSP0/CPU0:router(config-pmap-c)# bandwidth 300
RP/0/RSP0/CPU0:router(config-pmap-c)# exit
RP/0/RSP0/CPU0:router(config-pmap)# exit
RP/0/RSP0/CPU0:router(config)# interface gigabitethernet 0/1/0/9
RP/0/RSP0/CPU0:router(config-if)# service-policy input policy1

**match source-address**

To identify a specific source MAC address as match criterion in a class map, use the `match source-address` command in class map configuration mode. To remove a specific source MAC address from the matching criteria for a class map, use the `no` form of this command.

```plaintext
match source-address mac address
no match source-address mac address
```

**Syntax Description**

- **mac** Specifies a MAC address
- **address** Specifies a source MAC address.

**Command Default**

No default behavior or values

**Command Modes**

Class map configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `match source-address` command specifies a source address that is used as the match criterion against which packets are checked to determine if they belong to the class specified by the class map.

To use the `match source-address` command, you must first enter the `class-map` command to specify the name of the class whose match criteria you want to establish. If you specify more than one `match source-address` command in a class map, only the last command entered applies.

This command is supported on an input service policy only.

Layer 2 match criteria on a Layer 3 target, or Layer 3 match criteria on a Layer 2 target is not allowed.

The `match source-address` command is supported on egress Layer 2 interfaces, Layer 2 subinterfaces, and Layer 3 physical interfaces. Layer 3 physical interfaces are supported, because it is possible for a Layer 3 interface to have underlying Layer 2 subinterfaces.

The `match source-address` command is allowed on a policy map that is attached to an Ethernet interface. The command is invalid on a policy that is attached to a Packet-over-SONET/SDH (POS) interface or a routed VLAN subinterface.

The match 48-bit MAC address is specified in xxxx.xxxx.xxxx format on L2VPN PE interfaces.

set fr-de

To change the discard eligible (DE) bit setting in the address field of a Frame Relay frame to 1 for all traffic leaving an interface, use the set fr-de command in policy map configuration mode. To remove the DE bit setting, use the no form of this command.

```
set fr-de [fr-de-bit-value]
no set fr-de [fr-de-bit-value]
```

**Syntax Description**

- **not** (Optional) Negates the specified match result.
- **fr-de-bit-value** (Optional) Specifies the Frame Relay DE bit. Value can be 0 or 1. Value can be 1.

**Command Default**
The default value is 0.

**Command Modes**
Policy map configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
To disable this command in a traffic policy, use the no set fr-de command in policy map configuration mode of the traffic policy.

If the DE bit is already set to 1, no changes are made to the frame.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>qos</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**
The following example shows how to set the DE bit using the set fr-de command in the traffic policy. The router sets the DE bit of outbound packets belonging to the ip-precedence class.

```
RP/0/RSP0/CPU0:router(config)# class-map ip-precedence
RP/0/RSP0/CPU0:router(config-cmap)# match precedence 0 1
RP/0/RSP0/CPU0:router(config-cmap)# exit
RP/0/RSP0/CPU0:router(config)# policy-map set-de
RP/0/RSP0/CPU0:router(config-pmap)# class ip-precedence
RP/0/RSP0/CPU0:router(config-pmap-c)# set fr-de 1
RP/0/RSP0/CPU0:router(config-pmap-c)# exit
RP/0/RSP0/CPU0:router(config-pmap)# exit
RP/0/RSP0/CPU0:router(config)# interface serial 0/1/0/0/1
RP/0/RSP0/CPU0:router(config-if)# no ip address
RP/0/RSP0/CPU0:router(config-if)# encapsulation frame-relay
RP/0/RSP0/CPU0:router(config-if)# interface serial 0/1/0/0.1 point-to-point
RP/0/RSP0/CPU0:router(config-subif)# ip address 10.1.1.1 255.255.255.255
```
RP/0/RSP0/CPU0:router(config-autif)# **pvc 16**
RP/0/RSP0/CPU0:router(config-fr-vc)# **service-policy output set-de**

### Related Commands

<table>

</tr>
</tbody>
</table>
set discard-class

To set the discard class and Quality of Service (QoS) group identifiers on IP Version 4 (IPv4) or Multiprotocol Label Switching (MPLS) packets, use the set discard-class command in policy map class configuration mode. To leave the discard-class values unchanged, use the no form of this command.

```
set discard-class discard-class-value
no set discard-class discard-class-value
```

**Syntax Description**
- `discard-class-value`: Discard class ID. An integer from 0 to 7, to be marked on the packet.

**Command Default**
No default behavior or values

**Command Modes**
Policy map class configuration

**Command History**
- **Release 3.7.2**: This command was introduced.

**Usage Guidelines**
The set discard-class command associates a discard class ID with a packet. After the discard class is set, other QoS services such as Modified Deficit Round Robin (MDRR) and Weighted Random Early Detection (WRED) can operate on the bit settings.

Discard-class indicates the discard portion of the per hop behavior (PHB). The set discard-class command is typically used in Pipe mode. Discard-class is required when the input PHB marking is used to classify packets on the output interface.

The discard-class values can be used to specify the type of traffic that is dropped when there is congestion.

**Note**
Marking of the discard class has only local significance on a node.

**Task ID**
```
<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>qos</td>
<td>read, write</td>
</tr>
</tbody>
</table>
```

**Examples**
This example shows how to set the discard class value to 5 for packets that match the MPLS experimental bits 1:

```
RP/0/RSP0/CPU0:router(config)# class-map cust1
RP/0/RSP0/CPU0:router(config-cmap)# match mpls experimental topmost 1
RP/0/RSP0/CPU0:router(config-cmap)# exit
RP/0/RSP0/CPU0:router(config)# policy-map policy2
RP/0/RSP0/CPU0:router(config-pmap)# class cust1
RP/0/RSP0/CPU0:router(config-pmap-c)# set discard-class 5
RP/0/RSP0/CPU0:router(config-pmap-c)# exit
```
RP/0/RSP0/CPU0:router(config-pmap)# exit
RP/0/RSP0/CPU0:router(config)# interface gigabitethernet 0/1/0/9
RP/0/RSP0/CPU0:router(config-if)# service-policy input policy2

Related Commands

</tr>
</tbody>
</table>
set dscp

To mark a packet by setting the IP differentiated services code point (DSCP) in the type of service (ToS) byte, use the `set dscp` command in policy-map class configuration mode. To remove a previously set DSCP value, use the `no` form of this command.

```
set dscp [tunnel] dscp-value
no set dscp [tunnel] dscp-value
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>tunnel</code></td>
<td>(Optional) Sets the DSCP on the outer IP header. This command is available on Layer 3 interfaces in the ingress direction.</td>
</tr>
<tr>
<td><code>dscp-value</code></td>
<td>Number from 0 to 63 that sets the DSCP value. Reserved keywords can be specified instead of numeric values. Table 4: IP DSCP Reserved Keywords, on page 75 describes the reserved keywords.</td>
</tr>
</tbody>
</table>

**Command Default**

No default behavior or values

**Command Modes**

Policy map class configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>3.9.1</td>
<td>The <code>tunnel</code> keyword on Layer 3 interfaces in the ingress direction was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

After the DSCP bit is set, other quality-of-service (QoS) services can then operate on the bit settings.

The network gives priority (or some type of expedited handling) to marked traffic. Typically, you set the DSCP value at the edge of the network (or administrative domain); data then is queued based on the DSCP value. Modified Deficit Round Robin (MDRR) can speed up handling for high DSCP traffic at congestion points. Weighted Random Early Detection (WRED) ensures that high DSCP traffic has lower loss rates than other traffic during times of congestion.

Reserved keywords can be specified instead of numeric values. Table 4: IP DSCP Reserved Keywords, on page 75 describes the reserved keywords.

**Task ID**

Task ID | Operations
-------|------------
qos    | read, write

**Examples**

In this example, the DSCP ToS byte is set to 8 in the policy map called policy1. All packets that satisfy the match criteria of class1 are marked with the DSCP value of 8. The network configuration determines how packets are marked.
RP/0/RSP0/CPU0:router  (config)# policy-map policy1
RP/0/RSP0/CPU0:router(config-pmap)# class class1
RP/0/RSP0/CPU0:router(config-pmap-c)# set dscp 8

set mpls experimental

To set the experimental (EXP) value of the Multiprotocol Label Switching (MPLS) packet topmost or imposition labels, use the `set mpls experimental` command in policy map configuration mode. To leave the EXP value unchanged, use the `no` form of this command.

```
set mpls experimental {imposition | topmost} exp-value
no set mpls experimental {imposition | topmost} exp-value
```

**Syntax Description**
- `imposition` Specifies to set the EXP value of the imposition label.
- `topmost` Specifies to set the EXP value of the topmost label.
- `exp-value` Value of the MPLS packet label. Range is 0 to 7.

**Command Default**
No MPLS experimental value is set

**Command Modes**
Policy map class configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
After the MPLS experimental bits are set, other QoS services such as Modified Deficit Round Robin (MDRR) and Weighted Random Early Detection (WRED) then operate on the bit settings.

The network gives priority (or some type of expedited handling) to the marked traffic through the application of MDDR or WRED at points downstream in the network. Typically, the MPLS experimental value is set at the edge of the network (or administrative domain) and queuing is acted on it thereafter. MDDR can speed up handling for high-priority traffic at congestion points. WRED ensures that high-priority traffic has lower loss rates than other traffic during times of congestion.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>qos</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**
This example shows how to set the MPLS experimental to 5 for packets that match access list 101:

```
RP/0/RSP0/CP00:router(config)# class-map class1
RP/0/RSP0/CP00:router(config-cmap)# match access-group ipv4 acl101
RP/0/RSP0/CP00:router(config-cmap)# exit

RP/0/RSP0/CP00:router(config)# policy-map policy1
RP/0/RSP0/CP00:router(config-pmap)# class class1
RP/0/RSP0/CP00:router(config-pmap-c)# set mpls experimental topmost 5
RP/0/RSP0/CP00:router(config-pmap-c)# exit
RP/0/RSP0/CP00:router(config-pmap)# exit
```
RP/0/RSP0/CPU0:router(config)# interface HundredGigE 0/1/0/0
RP/0/RSP0/CPU0:router(config-if)# service-policy output policy1

</table>
**set precedence**

To set the precedence value in the IP header, use the `set precedence` command in policy map class configuration mode. To leave the precedence value unchanged, use the `no` form of this command.

```bash
set precedence [tunnel] value
no set precedence [tunnel] value
```

**Syntax Description**
- **tunnel** (Optional) Sets the IP precedence on the outer IP header. This command is available on Layer 3 interfaces in the ingress direction.
- **value** Number or name that sets the precedence bits in the IP header. Range is from 0 to 7. Reserved keywords can be specified instead of numeric values. Table 5: IP Precedence Values and Names, on page 80 describes the reserved keywords.

**Command Default**
No default behavior or values

**Command Modes**
Policy map class configuration

**Command History**
- Release 3.7.2 This command was introduced.
- Release 3.9.1 The `tunnel` keyword on Layer 3 interfaces in the ingress direction was added.

**Usage Guidelines**
Precedence can be set using a number or corresponding name. After IP Precedence bits are set, other QoS services such as Modified Deficit Round Robin (MDRR) and Weighted Random Early Detection (WRED) then operate on the bit settings.

The network gives priority (or some type of expedited handling) to the marked traffic through the application of MDRR or WRED at points downstream in the network. IP precedence can be set at the edge of the network (or administrative domain) and have queueing act on it thereafter. MDRR can speed handling for high-precedence traffic at congestion points. WRED ensures that high-precedence traffic has lower loss rates than other traffic during times of congestion.

The mapping from keywords such as 0 (routine) and 1 (priority) to a precedence value is useful only in some instances. That is, the use of the precedence bit is evolving. You can define the meaning of a precedence value by enabling other features that use the value. In the case of high-end Internet QoS, IP precedences can be used to establish classes of service that do not necessarily correspond numerically to better or worse handling in the network.

**Task ID**

**dscp precedence(ntp)**

To configure DSCP Precedence for the IPv4/IPv6 NTP packets, enter Network Time Protocol (NTP) configuration mode and run NTP configuration commands, use the DSCP Precedence(NTP) command.

```
{ntp ipv4 | ipv6} dscp
```

**Syntax Description**

- `<0-7>`: Precedence value
- `critical`: Match packets with critical precedence (5)
- `flash`: Match packets with flash precedence (3)
- `flash-override`: Match packets with flash override precedence (4)
- `immediate`: Match packets with immediate precedence (2)
- `internet`: Match packets with internetwork control precedence (6)
- `network`: Match packets with network control precedence (7)
- `priority`: Match packets with priority precedence (1)
- `routine`: Match packets with routine precedence (0)

**Command Modes**

NTP Configuration mode.

**Command History**

- **Release 5.3.2**
  - This command was introduced.

**Usage Guidelines**

Use **Precedence** values to set the configuration levels for the NTP packets at IP layer.

**Task ID**

- **Task ID**
  - IP: read, write

**Example**

```
RP/0/RSP0/CPU0:router(config-ntp)#ntp ipv4 precedence ?
<0-7> Precedence value
critical Match packets with critical precedence (5)
flash Match packets with flash precedence (3)
flash-override Match packets with flash override precedence (4)
immediate Match packets with immediate precedence (2)
internet Match packets with internetwork control precedence (6)
network Match packets with network control precedence (7)
priority Match packets with priority precedence (1)
```
routine Match packets with routine precedence (0)

RP/0/RSP0/CPU0:router(config-ntp)#ntp ipv6 precedence ?
<0-7> Precedence value
critical Match packets with critical precedence (5)
flash Match packets with flash precedence (3)
flash-override Match packets with flash override precedence (4)
immediate Match packets with immediate precedence (2)
internet Match packets with internetwork control precedence (6)
network Match packets with network control precedence (7)
priority Match packets with priority precedence (1)
routine Match packets with routine precedence (0)
shape average (BNG)

To shape traffic to the indicated bit rate according to the algorithm specified, use the `shape average` command in policy map class configuration mode. To remove traffic shaping, use the `no` form of this command.

```
shape average {percent {percentage | $shape-rate = percentage} | rate [units] | per-thousand value | per-million value | $shape-rate = rate [units]}
```

**Syntax Description**

- `percent percentage` Specifies the interface bandwidth in percentage. Values can be from 1 to 100.
- `rate` Average shaping rate in the specified units. Values can be from 1 to 4294967295.
- `units` (Optional) Units for the bandwidth. Values can be:
  - `Excess burst size`—values can be from 1 to 4294967295
  - `bps`—bits per second (default)
  - `gbps`—gigabits per second
  - `kbps`—kilobits per second
  - `mbps`—megabits per second
- `per-thousand value` Specifies shape rate as parts per thousand of the available bandwidth.
- `per-million value` Specifies shape rate as parts per million of the available bandwidth.
- `$` Specifies that a QoS shaper variable is configured.
- `shape-rate` QoS shaper variable name that can be parameterized.

**Command Default**

`units: bps`

**Command Modes**

Policy map class configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Release 5.2.0</td>
<td>$shape-rate = rate option was added to support QoS shaper parameterization in BNG.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

For `shape average` commands in the child policy, the reference used for percentage parameters is relative to the maximum rate of the parent. If shaping or policing is not configured on the parent, then the parent inherits the interface rate.

If you have both shape and bandwidth configured for a class, ensure that the shape percent value is always greater than the percent value for bandwidth.

The shaper parameters, used to override the locally-configured values in BNG, can either be sent to BNG by the RADIUS server during connection establishment, as CISCO VSAs in an Access Accept message, or can be sent to BNG as part of the CoA messages.
<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>qos</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

This example sets traffic shaping to 50 percent of the parent shaper rate:

```
RP/0/RSP0/CPU0:router(config)# policy-map policy1
RP/0/RSP0/CPU0:router(config-pmap)# class class1
RP/0/RSP0/CPU0:router(config-pmap-c)# shape average percent 50
```

This example shows how to set traffic shaping to 100000 kbps:

```
RP/0/RSP0/CPU0:router(config)# policy-map policy1
RP/0/RSP0/CPU0:router(config-pmap)# class class1
RP/0/RSP0/CPU0:router(config-pmap-c)# shape average 100000 kbps
```

This example shows how to set the default value of QoS shape-rate variable (shaper4) as 100000 kbps, in BNG:

```
RP/0/RSP0/CPU0:router(config)# policy-map policy1
RP/0/RSP0/CPU0:router(config-pmap)# class class1
RP/0/RSP0/CPU0:router(config-pmap-c)# shape average $shaper4 = 100000 kbps
```
show qos pwhe-aggregate-shaper

To display current configured coexistence mode and coexistence operating modes, use the show qos pwhe-aggregate-shaper command in EXEC mode.

show qos pwhe-aggregate-shaper { all | location node-id }

Syntax Description

- **all**: Specifies all locations.
- **location node-id**: Specifies location of a particular node. The **node-id** argument is entered in the rack/slot/module notation.

Command Default

None.

Command Modes

EXEC mode

Command History

- **Release 5.1.1**: This command was introduced.

Usage Guidelines

No specific guidelines impact the use of this command.

Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>qos</td>
<td>read</td>
</tr>
</tbody>
</table>

Example

This example shows PW-HE coexistence mode and coexistence operating modes for location 0/1/CPU0.

```
RP/0/RSP0/CPU0:router# show qos pwhe-aggregate-shaper location 0/1/CPU0

Configured Operational
Node ingress egress ingress egress
--------------------------
0/1/CPU0    disabled    disabled    disabled    disabled
```

This example shows PW-HE coexistence mode and coexistence operating modes for all locations.

```
RP/0/RSP0/CPU0:router# show qos pwhe-aggregate-shaper all

Configured Operational
Node ingress egress ingress egress
--------------------------
0/1/CPU0 non-queuing queuing non-queuing queuing
```

'**all**' line cards configured for ingress coexistence non-queuing
This example shows PW-HE coexistence mode and coexistence operating modes for all locations. In this example, line card (LC) at location 0/2/CPU0 is not in the chassis.

```
RP/0/RSP0/CPU0:router# show qos pwhe-aggregate-shaper all
```

<table>
<thead>
<tr>
<th>Node</th>
<th>Configured ingress</th>
<th>egress</th>
<th>Operational ingress</th>
<th>egress</th>
</tr>
</thead>
<tbody>
<tr>
<td>0/2/CPU0</td>
<td>queuing</td>
<td>non-queuing</td>
<td>?</td>
<td>?</td>
</tr>
<tr>
<td>0/1/CPU0</td>
<td>non-queuing</td>
<td>queuing</td>
<td>non-queuing</td>
<td>queuing</td>
</tr>
</tbody>
</table>

'? ' means line card is offline - has not booted up or not inserted into the chassis.

This example shows PW-HE coexistence mode and coexistence operating modes for all locations. In this example, LC at location 0/2/CPU0 does not support PW-HE QoS and LC at location 0/1/CPU0 supports PW-HE QoS, and both the LCs are active.

```
RP/0/RSP0/CPU0:router# show qos pwhe-aggregate-shaper all
```

<table>
<thead>
<tr>
<th>Node</th>
<th>Configured ingress</th>
<th>egress</th>
<th>Operational ingress</th>
<th>egress</th>
</tr>
</thead>
<tbody>
<tr>
<td>0/2/CPU0</td>
<td>queuing</td>
<td>non-queuing</td>
<td>N/A</td>
<td>N/A</td>
</tr>
<tr>
<td>0/1/CPU0</td>
<td>non-queuing</td>
<td>queuing</td>
<td>non-queuing</td>
<td>queuing</td>
</tr>
</tbody>
</table>

'N/A' means line card does not support PWHE QoS.
show qos-ea interface

To display internal programming information for an interface, use the `show qos-ea interface` command in EXEC mode.

```
show qos-ea interface type interface-path-id { input | output } { detail | member } interface-type interface-path-id [ location/interface-path-id ]
```

**Syntax Description**

- `type`: Interface type.
  - For interface type **PW-Ether** or **PW-IW** provide interface handle number. The range is from 1 to 32768.

- `interface-path-id`: Physical interface or virtual interface. Use the `show interfaces` command to see a list of configured interfaces.

- `input`: Refers to policy applied in ingress direction.

- `output`: Refers to policy applied egress direction.

- `detail`: Displays detailed output.

- `member`: Specifies member of bundle interface or pin-down (generic list) interface of PWHE interface.

- `location`: (Optional) Specifies the location of the node.

**Command Default**

None.

**Command Modes**

EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 5.1</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Release 5.1.1</td>
<td>The show outputs were updated for CAC and UBRL details.</td>
</tr>
<tr>
<td>PWHE Ethernet interface type <strong>PW-Ether</strong> and <strong>PW-IW</strong> were added.</td>
<td></td>
</tr>
</tbody>
</table>

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Examples**

This is the sample output which shows the QoS information on a Ten Gigabit Ethernet interface, applicable for the releases 5.3.2 onwards:

```

show qos status interface

To display the status of the service-policy applied on the interface, use the `show qos status interface` command in EXEC mode.

```
show qos status interface [interface {type all} interface-path-id] [input | output] nv [satellite satellite-id]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>type</code></td>
<td>Interface type. For more information, use the question mark (?) online help function.</td>
</tr>
<tr>
<td><code>interface-path-id</code></td>
<td>Physical interface instance. Naming notation is rack/slot/module/port and a slash between values is required as part of the notation.</td>
</tr>
<tr>
<td></td>
<td>• <code>rack</code>—Chassis number of the rack.</td>
</tr>
<tr>
<td></td>
<td>• <code>slot</code>—Physical slot number of the line card.</td>
</tr>
<tr>
<td></td>
<td>• <code>module</code>—Module number. A physical layer interface module (PLIM) is always 0.</td>
</tr>
<tr>
<td></td>
<td>• <code>port</code>—Physical port number of the interface.</td>
</tr>
<tr>
<td>Note</td>
<td>In references to a Management Ethernet interface located on a route processor card, the physical slot number is alphanumeric (RSP0 or RSP1) and the module is CPU0.</td>
</tr>
<tr>
<td>Example</td>
<td>interface MgmtEth0/RSP0/CPU0/0.</td>
</tr>

This sample output shows how to the status of the service-policy applied on the TenGigE interface 0/6/1/0 that are in the output and input direction:

```
RP/0/RSP0/CPU0:router# show qos status interface gigabitEthernet 200/0/0/0 nv
GigabitEthernet200/0/0/0 Satellite: 200 input: marking
  Last Operation Attempted : ADD
  Status : ACTIVE
GigabitEthernet200/0/0/0 direction output: Service Policy not installed
RP/0/RSP0/CPU0:router# show qos status interface gigabitEthernet 200/0/0/0 input nv
GigabitEthernet200/0/0/0 Satellite: 200 input: marking
  Last Operation Attempted : ADD
  Status : ACTIVE
```
Congestion Management Commands

This chapter describes the commands used to manage congestion.

To use commands of this module, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using any command, contact your AAA administrator for assistance.

For detailed information about congestion management concepts, configuration tasks and examples, see the Configuring Congestion Management chapter in the Modular QoS Configuration Guide for Cisco ASR 9000 Series Routers.

admit cac local

To configure the call admission control (CAC) local flow type and to enter the policy map class cac configuration sub-mode, use the **admit cac local** command in policy map class configuration mode. To delete CAC configuration, use the **no** form of this command.

```
   admit cac local
   no admit cac local
```

**Syntax Description**

This command has no keywords or arguments.

**Command Default**

None.

**Command Modes**

Policy map class configuration

**Command History**

- **Release 5.1.1**
  - This command was introduced.

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

- **Task ID**
  - qos read, write

This example shows how to configure the call admission control (CAC) local flow type and to enter the policy map class cac configuration mode.

```
RP/0/RSP0/CPU0:router(config)# policy-map policy1
RP/0/RSP0/CPU0:router(config-cmap)# class class1
RP/0/RSP0/CPU0:router(config-cmap-c)# admit cac local
RP/0/RSP0/CPU0:router(config-cmap-c-cac)# exit
```
flow idle-timeout

To configure the maximum time of inactivity for a flow, use the `flow idle-timeout` command in policy map class cac configuration mode. To remove the configured idle timeout for a flow, use the `no` form of this command.

```
flow idle-timeout  period
no  flow idle-timeout
```

**Syntax Description**

- **period** Specifies the maximum time the flow can be inactive. The value is in seconds.

  The valid `period` range is between 10s to 2560 seconds. The timeout has a granularity of 10s.

**Command Default**

Default period of 30s

**Command Modes**

Policy map class cac configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.1.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>qos</td>
<td>read, write</td>
</tr>
</tbody>
</table>

This example shows how to configure the maximum time of inactivity for the flow as 34 seconds.

```
RP/0/RSP0/CPU0:router(config)# policy-map policy1
RP/0/RSP0/CPU0:router(config-cmap)# class class1
RP/0/RSP0/CPU0:router(config-cmap-c)# admit cac local
RP/0/RSP0/CPU0:router(config-cmap-c-cac)# flow idle-timeout 34
RP/0/RSP0/CPU0:router(config-cmap-c-cac)# exit
```
flow rate

To configure the per flow rate for a flow, use the `flow rate` command in policy map class cac configuration mode. To remove the configured flow rate, use the `no` form of this command.

```
flow rate  rate
no  flow rate
```

**Syntax Description**
rate   Specifies the committed per flow rate. The value ranges from 1-4294967294.

The committed per flow rate allows these options:
- bps: Bits per second
- cellsps: Cells per second
- gbps: Gigabits per second
- kbps: Kilobits per second
- mbps: Megabits per second

**Command Default**
The default unit is Kbps.

**Command Modes**
Policy map class cac configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

</thead>
<tbody>
<tr>
<td>5.1.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>qos</td>
<td>read, write</td>
</tr>
</tbody>
</table>

This example shows how to configure flow rate of 100 Kbps.

```
RP/0/RSP0/CPU0:router(config)# policy-map policy1
RP/0/RSP0/CPU0:router(config-cmap)# class class1
RP/0/RSP0/CPU0:router(config-cmap-c)# admit cac local
RP/0/RSP0/CPU0:router(config-cmap-c-cac)# flow rate 100
RP/0/RSP0/CPU0:router(config-cmap-c-cac)# exit
```
rate

To configure the combined rate of all flows, use the **rate** command in policy map class cac configuration mode. To remove the configured rate, use the **no** form of this command.

```
rate rate
no rate
```

**Syntax Description**

- **rate**  Specifies the committed aggregate rate for all flows. The value ranges from 1-4294967294.

  The committed aggregate rate for all flows allows these options:
  - **bps**: Bits per second
  - **cellsps**: Cells per second
  - **gbps**: Gigabits per second
  - **kbps**: Kilobits per second
  - **mbps**: Megabits per second

**Command Default**

- The default unit is Kbps.

**Command Modes**

- Policy map class cac configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.1.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>qos</td>
<td>read, write</td>
</tr>
</tbody>
</table>

This example shows how to configure the per flow rate 896 kbps.

```
RP/0/RSP0/CPU0:router(config)# policy-map policy1
RP/0/RSP0/CPU0:router(config-cmap)# class class1
RP/0/RSP0/CPU0:router(config-cmap-c)# admit cac local
RP/0/RSP0/CPU0:router(config-cmap-c-cac)# rate 896
RP/0/RSP0/CPU0:router(config-cmap-c-cac)# exit
```
**hw-module buffer-carve-mode**

To enable the static buffer allocation mode, use the `hw-module buffer-carve-mode` command in the XR config mode.

To return to the default buffer value (dynamic), use the `no` form of this command.

```
hw-module buffer-carve mode location 0/0/CPU0 mode
```

**Syntax Description**

- `mode` Specifies the buffer mode option.
  - `dynamic`—Sets buffer management to dynamic allocation (default).
  - `static`—Sets buffer management to static allocation.

**Command Default**

Dynamic mode is enabled by default.

**Command Modes**

XR config mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.1.1</td>
<td>This command was introduced</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>qos</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

```
RP/0/RSP0/CPU0:router (admin-config) # R2#conf
RP/0/RSP0/CPU0:router (admin-config) # R2(config)# hw-module buffer-carve-mode location 0/0/CPU0 static
RP/0/RSP0/CPU0:router (admin-config) # R2(config)# commit
RP/0/RSP0/CPU0:router (admin-config) # R2(config)# end
```
hw-module fia-vqi-shaper location

To configure the Virtual Queuing Index (VQI) shaper value and enhance the shaper value, use the `hw-module fia-vqi-shaper location` command in Global Configuration mode. To return to the default shaper value, use the `no` form of this command.

```
hw-module fia-vqi-shaper location <lc-location> enhance
```

**Syntax Description**

<table>
<thead>
<tr>
<th><code>&lt;lc-location&gt;</code></th>
<th>Specifies the location of a particular egress line card.</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>enhance</code></td>
<td>Provides the option to enhance the fabric shaper limit to 18 Gigabit Ethernet from the earlier 13 Gigabit Ethernet mode.</td>
</tr>
</tbody>
</table>

**Command Default**

The default VQI shape value is 13 Gigabit Ethernet.

**Command Modes**

Global Configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 5.1.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The VQI shaper value can only be implemented on the egress card.

If the shape granularity is not enhanced, a default value of 13 Gigabit Ethernet is applied to all output interfaces belonging to a particular line card.

Using this command does not affect the ingress shaper value of the line card.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>root-lr</td>
<td>read, write</td>
</tr>
</tbody>
</table>

RP/0/RSP0/CPU0:router(config)# hw-module fia-vqi-shaper location enhance
**hw-module flow-qos location max-flow-count**

To configure the required number of policers for the flow-aware QoS feature, use the `hw-module flow-qos location max-flow-count` command in admin configuration mode. If you are running on Cisco IOS XR 64 bit, then use the same command in XR config mode. To remove the configured policers, use the `no` form of this command.

```plaintext
hw-module flow-qos location node-id max-flow-count value
go hw-module flow-qos location node-id max-flow-count value
```

**Syntax Description**

- **node-id**  
  Physical location of the Shared Interface Processor (SIP). Naming notation is `rack/slot/module`; a slash between values is required as part of the notation.
  - **rack** — Chassis number of the rack.
  - **slot** — Physical slot number of the modular services card or line card.
  - **module** — Module number. A physical layer interface module (PLIM) is always 0.

- **value**  
  Specify the value in multiples of 1K (1024).
  - For Cisco IOS XR from 1 to 256
  - For Cisco IOS XR 64 bit from 1 to 368

**Command Default**

None

**Command Modes**

- Admin configuration mode - Cisco IOS XR
- XR config mode - Cisco IOS XR 64 bit

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.1.2</td>
<td>Support for Cisco IOS XR 64 bit was added.</td>
</tr>
<tr>
<td>5.1.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>root-lr</td>
<td>read, write</td>
</tr>
</tbody>
</table>

This example shows how to set the required number of policers for the flow-aware qos feature to 128 at location 0/1/CPU0:

```plaintext
RP/0/RSP0/CPU0:router (admin-config)# hw-module flow-qos location 0/1/CPU0 max-flow-count 128
```
This example shows how to set the required number of policers for the flow-aware qos feature to 125 on a line card running on Cisco IOS XR 64 bit:

```
RP/0/RSP0/CPU0:router(config)# hw-module flow-qos location 0/0/0 max-flow-count 125
```
**hw-module location qos-mode port-limit-oversubscribe**

To enable the port limit oversubscribe mode on a specific line card, use the `hw-module location qos-mode port-limit-oversubscribe` command in the admin configuration mode. If you are running Cisco IOS XR 64 bit, then use the same command in XR config mode. To disable the port limit mode on a specific line card, use the `no` form of this command.

```
hw-module location node-id qos-mode port-limit-oversubscribe
no hw-module location node-id qos-mode port-limit-oversubscribe
```

**Syntax Description**

- `location node-id` Specifies location of a particular node. The `node-id` argument is entered in the rack/slot/module notation.

**Command Default**

No default behavior or values.

**Command Modes**

- Admin configuration mode - Cisco IOS XR
- XR config mode - Cisco IOS XR 64 bit

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.2.2</td>
<td>Support for Cisco IOS XR 64 bit was added.</td>
</tr>
<tr>
<td>Release 5.1.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is available only on the ASR 9000 Enhanced Ethernet Line Card. You must reload LCs for configuration changes to take effect.

**Note**

Due to hardware limitations and different port buffer sizes, the traffic is processed differently on the following LCs:

- Cisco ASR 9000 Enhanced Ethernet Line Card - The command is ignored and has no effect.

- Cisco ASR 9000 High Density 100GE Ethernet line cards - The command doubles the per port buffer limit on SE linecards and is ignored on TR linecards.

- Cisco ASR 9000 Series 24-port and 48-port dual-rate 10GE/1GE line cards - The command doubles the per port buffer limit on SE linecards and is ignored on TR linecards.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>qos</td>
<td>read, write</td>
</tr>
<tr>
<td>root-lr</td>
<td>read, write</td>
</tr>
</tbody>
</table>
Example

This example shows how to enable port limit on a line card:

```
RP/0/RSP0/CPU0:router(admin-config)# hw-module location 0/1/CPU0 qos-mode port-limit-oversubscribe
RP/0/RSP0/CPU0:router(admin-config)# commit
```

This example shows how to enable port limit on a line card running on Cisco IOS XR 64 bit:

```
RP/0/RSP0/CPU0:router(config)# hw-module location 0/0/0 qos-mode port-limit-oversubscribe
RP/0/RSP0/CPU0:router(config)# commit
```
interface-taps

Configures the policer rate on the interface.

```
interface-taps 2gig
no interface-taps 2gig
```

This command has no arguments.

**Command Default**
None.

**Command Modes**
Global configuration mode.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Configuring the `interface-taps 2gig` command changes the default policer rate on the interface to 2Gbps (bidirectional 1Gbps).

**Note**
The default policer rate is 512 Mbps on Typhoon line cards and 1Gbps on Tomahawk line cards.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>qos</td>
<td>read, write</td>
</tr>
</tbody>
</table>

The following example shows how you can configure the policer rate to 2Gbps (bidirectional 1Gbps).

```
RP/0/RSP0/CPU0:router(config)# interface-taps 2gig
RP/0/RSP0/CPU0:router(config)# commit
```
**police rate**

To configure traffic policing and enter policy map police configuration mode, use the `police rate` command in policy map class configuration mode. To remove traffic policing from the configuration, use the `no` form of this command.

```
police rate {value [units] | percent percentage | per-thousand value | per-million value} [burst burst-size [burst-units]] [peak-rate {value [units] | percent percentage} [peak-burst peak-burst [burst-units]]]
```

```
no police rate {value [units] | percent percentage | per-thousand value | per-million value} [burst burst-size [burst-units]] [peak-rate {value [units] | percent percentage} [peak-burst peak-burst [burst-units]]]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>value</code></td>
<td>Committed information rate (CIR). Range is from 1 to 4294967295.</td>

<tr>
<td><code>peak-burst</code></td>
<td>(Optional) Specifies the peak burst size in the specified <strong>burst-units</strong>. The range is from 1 to 4294967295.</td>
</tr>
</tbody>
</table>
The `police rate` command can set the DSCP, the precedence, or the discard class for IP packets, and experimental and discard-class values for MPLS packets.

Policing can be applied in both ingress and egress directions.

The parameters set by the action keywords are rounded by the hardware. To check the actual values programmed in the hardware use the `show qos interface` command.

For `police rate` commands, interpret the `percent` keyword in this way:

- For a one-level policy, the `percent` keyword specifies the CIR as a percentage of the link rate. For example, the command `police rate percent 35` configures the CIR as 35% of the link rate.
- For a two-level policy, in the parent policy, the `percent` keyword specifies the parent CIR as a percentage of the link rate. In the child policy, the percent keyword specifies the child CIR as a percentage of the maximum policing or shaping rate of the parent. If traffic policing or shaping is not configured on the parent, the parent inherits the interface policing or shaping rate.

Hierarchical policing is also supported. In such a configuration, both parent and child policies have class-maps containing policing statements, as in this example:

```conf
! policy-map child
 class gold
  police rate percent 50
  conform-action set precedence immediate
  exceed-action drop
  !
! policy-map parent
 class match_all
  police rate 10000 kbps burst 15000
  exceed-action drop
  service-policy child

The router supports hierarchical ingress policing, which consists of a two-level hierarchical policy-map. The two levels are:

- Parent level: Consists of a class-default or match-vlan class (in nCmD model) only and has policing with only transmit/drop actions.
- Child level: Consists of a flat policy that can be configured with any action other than the queuing action. This level does not contain configurations that require a continuous bit support.

You can police the ingress interface while applying different classification submodels on the ingress interfaces. The order of the actions within the hierarchical policy-map is from child to parent as specified by the Modular Quality of Service command-line interface (MQC). This is with the exception of the queuing action (shape),
which is executed after any police/set actions. If a police action is configured in a child policy, the child police action is executed before the parent police action.

The police action is invoked with only transmit/drop actions under the conform-action and exceed-action options specified for class-default traffic.

This example explains a hierarchical policer configuration:

```
! policy-map parent
class class-default

service-policy child
  police rate percent 50
  conform-action transmit
  exceed-action drop
!
```

Note If you use conform-action drop in the class default of the input qos policy, then it can lead to dropping of DHCP packets. Therefore, there should be a separate class for DHCP packets. You can use the following ACL configuration in the class-map:

```
ipv4 access-list test-ipv4
10 permit udp any host 255.255.255.255 eq bootps
!
```

Note Configured values take into account the Layer 2 encapsulation applied to traffic. This applies to both ingress and egress policing. For Ethernet transmission, the encapsulation is considered to be 14 bytes, whereas for IEEE 802.1Q, the encapsulation is 18 bytes.

The policer uses an incremental step size of 64 kbps. The configured value is rounded down to the nearest 64 kbps. The value shown in the output of the running-configuration shows the configured value as entered by the user.

If the burst value is not configured, it is automatically set to 100 msec-worth of the CIR value. For example, if a CIR value of 1,000,000 kbps is entered, the burst value is calculated to be 12,500,000 bytes. The maximum burst value supported depends on the line card (LC) on which the QoS policy is applied:

- For ASR 9000 Enhanced Ethernet Line Card, the maximum allowed burst value is 4294967295.
- For A9K-SIP-700 Line Card, the maximum allowed burst value is 4294967295.
- For ASR 9000 Ethernet Line Card, the maximum supported burst value is dependent on the Policer rate and is calculated by the formula:

  \[ \text{Maximum supported burst value} = \left( \frac{16 \times \text{Policer rate in Bytes Per Second}}{67108864 \times 250 \times 1000000} \right) \]

  However, if no Policer rate is specified, the maximum supported burst value is taken as 2147483647.

When you define policers, for optimum performance use these formulas to calculate the burst values:

Committed Burst \((B_c) = \text{CIR bps} \times (1 \text{ byte} / 8 \text{ bits}) \times 1.5 \text{ seconds}\)
Excess Burst (Be) = 2 \times Bc

For example, if CIR = 2,000,000 bps, the calculated burst value is 2,000,000 \times (1/8) \times 1.5 = 375,000 bytes.

For more information, see the "Committed Bursts and Excess Bursts" section in the Modular QoS Configuration Guide for Cisco ASR 9000 Series Routers.

- Set the peak-burst value according to the formula peak-burst = 2 \times burst.
- A police rate minimum of 8 pps and a granularity of 8 pps is supported.

In this example for MPLS, traffic policing is configured with the average rate at 250 kbps, and the normal burst size at 50 bytes for all packets leaving GigabitEthernet interface 0/1/0/9:

```
RP/0/RSP0/CPU0:router(config)# class-map class1
RP/0/RSP0/CPU0:router(config-cmap)# match mpls experimental topmost 0
RP/0/RSP0/CPU0:router(config-cmap)# exit
RP/0/RSP0/CPU0:router(config)# policy-map policy1
RP/0/RSP0/CPU0:router(config-pmap)# class class1
RP/0/RSP0/CPU0:router(config-pmap-c)# police rate 250 kbps burst 50
RP/0/RSP0/CPU0:router(config-pmap-c-police)# conform-action set mpls experimental topmost 4
RP/0/RSP0/CPU0:router(config-pmap-c)# exit
RP/0/RSP0/CPU0:router(config-pmap)# exit
RP/0/RSP0/CPU0:router(config)# interface gigabitethernet 0/1/0/9
RP/0/RSP0/CPU0:router(config-if)# service-policy input policy1
```

In this example, traffic policing is configured with an average rate of 200 pps, and a normal burst size of 50 packets, for all packets in class-map class1, leaving GigabitEthernet interface 0/1/0/9:

```
RP/0/RSP0/CPU0:router(config)# policy-map pps-1r2c
RP/0/RSP0/CPU0:router(config-pmap)# class class1
RP/0/RSP0/CPU0:router(config-pmap-c)# police rate 200 pps burst 50 packets
RP/0/RSP0/CPU0:router(config-pmap-c)# exit
RP/0/RSP0/CPU0:router(config-pmap)# exit
RP/0/RSP0/CPU0:router(config)# interface gigabitethernet 0/1/0/9
RP/0/RSP0/CPU0:router(config-if)# service-policy output policy1
```

</tbody>
</table>

**Usage Guidelines**

- The policer actions (conform, exceed and violet) under shared and referred policers may be different for different classes that share and refer a policer.

- The parameters set by the action keywords are rounded by the hardware. To check the actual values programmed in the hardware use the `show qos interface` command.

- For **police bucket** commands, interpret the **percent** keyword in this way:
  - For a one-level policy, the **percent** keyword specifies the CIR as a percentage of the link rate. For example, the command `police rate percent 35` configures the CIR as 35% of the link rate.
  - For a two-level policy, in the parent policy, the **percent** keyword specifies the parent CIR as a percentage of the link rate. In the child policy, the percent keyword specifies the child CIR as a percentage of the maximum policing or shaping rate of the parent. If traffic policing or shaping is not configured on the parent, the parent inherits the interface policing or shaping rate.
Configured values take into account the Layer 2 encapsulation applied to traffic. This applies to both ingress and egress policing. For Ethernet transmission, the encapsulation is considered to be 14 bytes, whereas for IEEE 802.1Q, the encapsulation is 18 bytes.

The policer uses an incremental step size of 64 kbps. The configured value is rounded down to the nearest 64 kbps. The value shown in the output of the running-configuration shows the configured value as entered by the user.

If the burst value is not configured, it is automatically set to 100 msec-worth of the CIR value. For example, if a CIR value of 1,000,000 kbps is entered, the burst value is calculated to be 12,500,000 bytes. The maximum burst value supported depends on the line card (LC) on which the QoS policy is applied:

- For ASR 9000 Enhanced Ethernet Line Card, the maximum allowed burst value is 4294967295.
- For A9K-SIP-700 Line Card, the maximum allowed burst value is 4294967295.
- For ASR 9000 Ethernet Line Card, the maximum supported burst value is dependent on the Policer rate and is calculated by the formula:
  \[ \text{Maximum supported burst value} = \left( \frac{16 \times \text{Policer rate in Bytes Per Second}}{67108864} \right) / (250 \times 1000000) \]
  However, if no Policer rate is specified, the maximum supported burst value is taken as 2147483647.

When you define policers, for optimum performance use these formulas to calculate the burst values:

- Committed Burst (Bc) = CIR bps \times 1 \text{ byte} / 8 \text{ bits} \times 1.5 \text{ seconds}
- Excess Burst (Be) = 2 \times Bc

For example, if CIR = 2,000,000 bps, the calculated burst value is 2,000,000 \times (1/8) \times 1.5 = 375,000 bytes.

In this example for dual ingress traffic, traffic policing is configured with the average rate at 2 Mbps, and the policer bucket to police traffic at rate 1Mbps is shared:

```
RP/0/RSP0/CPU0:router#(config-pmap-c) policy-map parent
RP/0/RSP0/CPU0:router#(config-pmap-c) class voip
RP/0/RSP0/CPU0:router#(config-pmap-c) class long-distance
RP/0/RSP0/CPU0:router#(config-pmap-c) policy rate 2 mbps
RP/0/RSP0/CPU0:router#(config-pmap-c) priority level 1
RP/0/RSP0/CPU0:router#(config-pmap-c) service-policy voip-child
RP/0/RSP0/CPU0:router#(config-pmap-c) policy bucket shared sp1 rate 1 mbps
RP/0/RSP0/CPU0:router#(config-pmap-c) end policy-map
```
In this example for dual ingress traffic, policer bucket is referred to police traffic at rate 1Mbps:

```bash
RP/0/RSP0/CPU0:router#(config-pmap-c) policy-map voip-child
RP/0/RSP0/CPU0:router#(config-pmap-c) class long-distance-voip
  RP/0/RSP0/CPU0:router#(config-pmap-c) police bucket referred sp1
RP/0/RSP0/CPU0:router#(config-pmap-c) class class-default
RP/0/RSP0/CPU0:router#(config-pmap-c) end policy-map
```
policy-map

To create or modify a policy map that can be attached to one or more interfaces to specify a service policy, use the `policy-map` command in Global Configuration mode. To delete a policy map, use the `no` form of this command.

```
policy-map [type qos] policy-name
no policy-map [type qos] policy-name
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type qos</td>
<td>(Optional) Specifies type of the service policy.</td>
</tr>
<tr>
<td>qos</td>
<td>(Optional) Specifies a quality-of-service (QoS) policy map.</td>
</tr>
<tr>
<td>pbr</td>
<td>(Optional) Specifies a policy-based routing (PBR) policy map.</td>
</tr>
<tr>
<td>policy-name</td>
<td>Name of the policy map.</td>
</tr>
</tbody>
</table>

**Command Default**

A policy map does not exist until one is configured. Because a policy map is applied to an interface, no restrictions on the flow of data are applied to any interface until a policy map is created. Type is QoS when not specified.

**Command Modes**

Global Configuration mode

**Command History**

</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>5.2.0</td>
<td>The <code>pbr</code> keyword was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `policy-map` command to specify the name of the policy map to be created, added to, or modified before you can configure policies for classes whose match criteria are defined in a class map. Entering the `policy-map` command enables policy map configuration mode in which you can configure or modify the class policies for that policy map.

You can configure class policies in a policy map only if the classes have match criteria defined for them. Use the `class-map` and `match` commands to configure the match criteria for a class. Because you can configure a maximum of 1024 classes in one policy map, no policy map can contain more than 1024 class policies. The maximum number of 1024 classes per policy includes the implicit default class and its child policies.

A single policy map can be attached to multiple interfaces concurrently.

The maximum number of policy maps supported is 2000.

**Note**

When a policy map is applied on a physical port, all subinterfaces under the same physical port inherit the same policy.
These examples show how to create a policy map called policy1 and configures two class policies included in that policy map. The policy map is defined to contain policy specification for class1 and the default class (called class-default) to which packets that do not satisfy configured match criteria are directed. Class1 specifies policy for traffic that matches access control list 136.

RP/0/RSP0/CPU0:router(config)# class-map class1
RP/0/RSP0/CPU0:router(config-cmap)# match access-group ipv4 136
RP/0/RSP0/CPU0:router(config)# policy-map policy1
RP/0/RSP0/CPU0:router(config-pmap)# class class1
RP/0/RSP0/CPU0:router(config-pmap-c)# police cir 250
RP/0/RSP0/CPU0:router(config-pmap-c)# set precedence 3
RP/0/RSP0/CPU0:router(config-pmap-c)# exit
RP/0/RSP0/CPU0:router(config-pmap-c)# class class-default
RP/0/RSP0/CPU0:router(config-pmap-c)# queue-limit bytes 1000000
priority (QoS)

To assign priority to a traffic class based on the amount of available bandwidth within a traffic policy, use the `priority` command in policy map class configuration mode. To remove a previously specified priority for a class, use the `no` form of this command.

```
priority [level priority-level]
no priority
```

**Syntax Description**

- `level priority-level` (Optional) Sets multiple levels of priority to a traffic class. Values are 1, 2, 3, 4, 5, 6 and 7. Default level is 1. Level 1 traffic has higher priority.

**Command Default**

No default action.

**Command Modes**

Policy map class configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Release 5.0.0</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Release 5.3.2</td>
<td>Priority levels 4, 5, 6 and 7 are added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `priority` command configures low-latency queueing (LLQ), providing strict priority queueing (PQ). Strict PQ allows delay-sensitive data such as voice to be dequeued and sent before packets in other queues are dequeued. When a class is marked as high priority using the `priority` command, we recommend that you configure a policer to limit the priority traffic. This policer ensures that the priority traffic does not starve all other traffic on the line card, which protects low-priority traffic from starvation. Use the `police rate` to explicitly configure the policer.

The `priority` command sets up classes based on a variety of criteria (not just User Datagram Protocol [UDP] ports) and assigns a priority to them.

The `bandwidth` and `priority` commands cannot be used in the same class, within the same policy map. These commands can be used together in the same policy map.

Within a policy map, you can give one or more classes priority status. When multiple classes within a single policy map are configured as priority classes, all traffic from these classes is queued to the same, single, priority queue.

Fabric QoS is configured using the `priority` command in the ingress service policy.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>

#### Usage Guidelines

The `show qos interface` command displays configuration for all classes in the service policy that is attached to an interface.

Use this command to check the actual values programmed in the hardware from the action keywords in the `police rate` command.

(Only BNG) To enter the dynamic template configuration mode, run `dynamic-template` command in the Global Configuration mode.

Policer not configured for this class
WRED not configured for this class

Use the host-link option to display the output for the desired Bundle ICL. In cases when the Satellite is hosted on a redundant (Bundle ICL), the qos command to check for the qos programming also needs to include the host-link option.

The host-link is the underlying ICL Bundle member, this output can be executed for all the members belonging to the ICL Bundle via the host-link option.

For eg, Bundle ICL, Bundle-ether 2, hosting the sat-ether interface gig 100/0/0/34 has a member tengige 0/3/0/7. The qos command to check for the qos programming would be:

```
RP/0/RSP0/CPU0:router # sh qos inter gigabitEthernet 100/0/0/34 output host-link tengige 0/3/0/7 location 0/3/CPU0
```

show qos-ea interface

To display internal programming information for an interface, use the `show qos-ea interface` command in EXEC mode.

```
show qos-ea interface  type  interface-path-id { input | output } { detail | member }  interface-type  interface-path-id [ location/interface-path-id ]
```

**Syntax Description**

- **type** Interface type.
  - For interface type `PW-Ether` or `PW-IW` provide interface handle number. The range is from 1 to 32768.

- **interface-path-id** Physical interface or virtual interface. Use the `show interfaces` command to see a list of configured interfaces.

- **input** Refers to policy applied in ingress direction.

- **output** Refers to policy applied egress direction.

- **detail** Displays detailed output.

- **member** Specifies member of bundle interface or pin-down (generic list) interface of PWHE interface.

- **location** (Optional) Specifies the location of the node.

**Command Default**

None.

**Command Modes**

EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 5.1</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Release 5.1</td>
<td>The show outputs were updated for CAC and UBRL details. PWHE Ethernet interface type <code>PW-Ether</code> and <code>PW-IW</code> were added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Examples**

This is the sample output which shows the QoS information on a Ten Gigabit Ethernet interface, applicable for the releases 5.3.2 onwards:

show fmgr interface

To display ternary content addressable memory (TCAM) feature entries for QoS, use the show fmgr interface command in EXEC mode.

```
show fmgr interface type interface-path-id feature {policer | qos | qos-all} {input | output} [{all | dup-bank | hw | ipv4-mpls | ipv6 | l2 | location node-id | sw}]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>type</strong></td>
<td>Interface type. For more information, use the question mark (?) online help function.</td>
</tr>
<tr>
<td><strong>interface-path-id</strong></td>
<td>Physical interface or virtual interface.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>Use the show interfaces command to see a list of all interfaces currently configured on the router.</td>
</tr>
<tr>
<td><strong>feature</strong></td>
<td>Displays feature specific information.</td>
</tr>
<tr>
<td><strong>policer</strong></td>
<td>Displays policer entries.</td>
</tr>
<tr>
<td><strong>qos</strong></td>
<td>Displays QoS entries.</td>
</tr>
<tr>
<td><strong>qos-all</strong></td>
<td>Displays entries for both QoS and policer.</td>
</tr>
<tr>
<td><strong>input</strong></td>
<td>Specifies the ingress direction.</td>
</tr>
<tr>
<td><strong>output</strong></td>
<td>Specifies the egress direction.</td>
</tr>
<tr>
<td><strong>all</strong></td>
<td>(Optional) Displays all TCAM entries.</td>
</tr>
<tr>
<td><strong>dup-bank</strong></td>
<td>(Optional) Displays entries from the duplicate bank in turbo mode.</td>
</tr>
<tr>
<td><strong>hw</strong></td>
<td>(Optional) Reads from the hardware.</td>
</tr>
<tr>
<td><strong>ipv4-mpls</strong></td>
<td>(Optional) Displays ipv4-mpls entries.</td>
</tr>
<tr>
<td><strong>ipv6</strong></td>
<td>(Optional) Displays ipv6 entries.</td>
</tr>
<tr>
<td><strong>l2</strong></td>
<td>(Optional) Displays Layer 2 entries.</td>
</tr>
<tr>
<td><strong>location node-id</strong></td>
<td>(Optional) Identifies the location of the interface whose TCAM information you want to display. The node-id is expressed in the rack/slot/module notation.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>Use the show platform command to see the location of all nodes installed in the router.</td>
</tr>
<tr>
<td><strong>sw</strong></td>
<td>(Optional) Reads from the software.</td>
</tr>

Examples

The following sample output shows how to display all ingress QoS and policer TCAM entries for a Gigabit Ethernet interface:

```
RP/0/RSP0/CPU0:router# show fmgr interface GigabitEthernet 0/1/5/0 feature qos-all in

QOS ENTRIES
===============================================================================
Interface = GigabitEthernet0_1_5_0 Feature = qos Direction = in
TCAM Fields: ip/mpls bndl vlg_id cid dscp exp dc qos-id
CSRAM Fields: prio sh_q red_ctr qos_grp dc l2_mark l3_mark l3_mark_val max_th seg_size min_th 1st_seg pol_has_hpq
===============================================================================
No QoS configured on this interface

POLICER ENTRIES
===============================================================================
Interface = GigabitEthernet0_1_5_0 Feature = policer Direction = in
TCAM Fields: IPv4: ip/mpls vlg_id l2_cos drid ip_src l4_proto frag dscp ip_dest qos_grp dc dst_port qos-id
MPLS: ip/mpls vlg_id l2_cos label exp qos_grp dc qos-id
CSRAM Fields: cid token1 stats_ptr conform1 exceed1 violate1 token2 conform2 exceed2 violate2
===============================================================================
No QoS configured on this interface

POLICER ENTRIES
===============================================================================
Interface = GigabitEthernet0_1_5_0 Feature = policer Direction = in
TCAM Fields: IPv6: ipv6 vlg_id l2_cos dest_port src_port ip_dest ip_src ext_dst ext_rtg ext_h ext_frag dest_rng_id dc qos_grp l4_proto dscp/prec qos-id
```
CSRAM Fields:
cid token1 stats_ptr conform1 exceed1 violate1 token2 conform2 exceed2 violate2

No QoS configured on this interface

RP/0/RP0/CPU0:router#

The following table describes the significant fields shown in the display.

**Table 8: show fmgr interface Field Descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QOS ENTRIES</td>
<td>Displays the following QoS information:</td>
</tr>
<tr>
<td></td>
<td>• Interface—Interface type and identifier.</td>
</tr>
<tr>
<td></td>
<td>• Feature—Feature currently running on the specified interface.</td>
</tr>
<tr>
<td></td>
<td>• Direction—Direction of interface (ingress or egress).</td>
</tr>
<tr>
<td>CSRAM Fields</td>
<td>General CSRAM information.</td>
</tr>
<tr>
<td>POLICER ENTRIES</td>
<td>General policer and TCAM information for the specified interface.</td>
</tr>
</tbody>
</table>
show hw-module qos output shape granularity location

To display shape granular information, use the show hw-module qos output shape granularity location command in EXEC mode.

**show hw-module qos output shape granularity location** {all interface-path-id}

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
<th>Command Default</th>
<th>Command Modes</th>
<th>Command History</th>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Displays shape granularity information for all interfaces.</td>
<td>None</td>
<td>EXEC mode</td>
<td>Release 3.9.2 This command was introduced.</td>
<td>No specific guidelines impact the use of this command.</td>
</tr>
<tr>
<td>interface-path-id</td>
<td>Physical location of the Shared Interface Processor (SIP). Naming notation is rack/slot/module; a slash between values is required as part of the notation.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>• rack — Chassis number of the rack.</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>• slot — Physical slot number of the modular services card or line card.</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>• module — Module number. A physical layer interface module (PLIM) is always 0.</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Example**

This sample output shows how to display shape granularity for the output interface at location 0/1/CPU0:

```
RP/0/RSP0/CPU0:router# show hw-module qos output shape granularity location 0/1/CPU0

QOS SHAPING GRANULARITY
----------------------------------------
Location  Shape  Programmed  reload
Granularity  Granularity  (Y / N)
----------------------------------------
0/1/CPU0  ---  256Kbps  N

Table 9: show hw-module qos output shape granularity location Field Descriptions, on page 164 describes the significant fields shown in the display.

Table 9: show hw-module qos output shape granularity location Field Descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configured Shape Granularity</td>
<td>User-configured shape granularity for the specified location.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>HW Programmed Granularity</td>
<td>Hardware programmed shape granularity for the specified location.</td>
</tr>
<tr>
<td>LC reload (Y/N)</td>
<td>Specifies whether a line card reload will be required to enable the user configured shape granularity.</td>
</tr>
</tbody>
</table>
show policy-map interface

To display policy configuration information for all classes configured for all service policies on the specified interface, use the `show policy-map interface` command in EXEC mode.

```
show policy-map[ accounting | control | pbr | performance-traffic | qos ] [interface type | all] interface-path-id] [input | output [member interface type interface-path-id]] nv [satellite satellite-id]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>type accounting</strong></td>
<td>Displays accounting details for a policy-map.</td>
</tr>
<tr>
<td><strong>type control</strong></td>
<td>Displays control details for a policy-map.</td>
</tr>
<tr>
<td><strong>type pbr</strong></td>
<td>Displays Policy-based routing (PBR) details for a policy-map.</td>
</tr>
<tr>
<td><strong>type performance-traffic</strong></td>
<td>Displays real time application flow monitoring details for a policy-map.</td>
</tr>
<tr>
<td><strong>type qos</strong></td>
<td>Displays qos statistics for qos policies.</td>
</tr>
<tr>
<td><strong>interface type</strong></td>
<td>Interface type. For more information, use the question mark (?) online help function.</td>
</tr>
<tr>
<td><strong>all</strong></td>
<td>Specifies all interfaces.</td>
</tr>
<tr>
<td><strong>interface-path-id</strong></td>
<td>Physical interface instance. Naming notation is rack/slot/module/port and a slash between values is required as part of the notation.</td>
</tr>
<tr>
<td><strong>input</strong></td>
<td>(Optional) Displays per class statistics on inbound traffic for the specified policy map and interface.</td>
</tr>
<tr>
<td><strong>output</strong></td>
<td>(Optional) Displays per class statistics on outbound traffic for the specified policy map and interface.</td>
</tr>
</tbody>
</table>

**Notes**

- In references to a Management Ethernet interface located on a route processor card, the physical slot number is alphanumeric (RSP0 or RSP1) and the module is CPU0.

Example: `interface MgmtEth0/RSP0/CPU0/0`.

For more information about the syntax for the router, use the question mark (?) online help function.
member (Optional) Specifies the bundle member’s interface or PWHE member interface name.

nv Displays the statistics of the satellite access or fabric interfaces.

satellite Displays the per class statistics on the inbound or outbound traffic for the specified satellite.

satellite-id Displays the satellite statistics based on the specified satellite ID.

Command Default
None

Command Modes
EXEC mode

Command History
Release 3.7.2 This command was introduced.
Release 4.0.0 The show policy-map interface command output was updated to show IPHC statistics.
Release 4.3.1 The pbr keyword was added.
Release 5.1.1 The nv satellite keywords and the satellite-id variable were added. The show outputs were updated for nv satellite details.
The show outputs were updated for CAC and UBRL details.
PWHE interface type PW-Ether and PW-IW were added.

Usage Guidelines
The show policy-map interface command displays the statistics for classes in the service policy attached to an interface.

The show policy-map interface command displays the statistics for shared and referred classes separately. To determine the policer action, an aggregate of the shared policer statistics should be collected.

For PWHE aggregate shaper the show policy-map interface command displays aggregate of all the queuing stats for subinterface policies if they co-exist.

The output of the show policy-map interface command is inconsistent for priority level 1, priority level 2, priority level 3 that is configured on the bundle interface, when the interface has either of these combinations:

- 3rd generation of ASR 9000 LC with SE and TR versions
- 4th generation of ASR 9000 LC with SE and 3rd generation of ASR 9000 LC with TR versions

Additionally, for priority level 3 configuration the show policy-map interface command output is inconsistent when the bundle interface has a combination of 3rd generation ASR 9000 LC with TR and 4th generation of ASR 9000 LC with TR versions.

In order to display consistent show policy-map interface, use show policy-map interface bundle-eth <number> [input | output] member {interface type interface-path-id} command.
Examples

This sample output shows how to display policy statistics information for all classes on the TenGigE interface 0/6/1/0 that are in the output direction:

```
RP/0/RSP0/CPU0:router# show policy-map interface TenGigE0/1/0/0 nv

TenGigE0/1/0/0 direction input: Service Policy not installed
TenGigE0/1/0/0 Satellite: 0 output: policy_queue

Policed(exceed) : 0/0 0
Policed(violate) : 0/0 0
Policed and dropped : 0/0

GigabitEthernet0/1/0/0 direction output: Service Policy not installed
The `show policy-map interface` command displays matched rate that is more than the line rate, when a:

- kernel crash is executed on an active route switch processor (RSP) of host.
- state of policy-map changes from standby to new active.
- state of new active offloaded policy-map changes to an active state for ICL interface.

The `show policy-map interface` command does not show updated conform stats for 2R3C configuration when policy rate is changed.

In the `show policy-map interface` command output, displayed police rate and actual police rate for an interface varies.

This table describes the significant fields shown in the display.

### Table 10: `show policy-map interface` Field Descriptions

<table>

show policy-map shared-policy-instance

To display the statistics for all details of the shared policy instance, use the `show policy-map shared-policy-instance` command in EXEC mode.

```plaintext
show policy-map shared-policy-instance instance-name member member-interface [input|output] location node-id
```

**Syntax Description**
- `instance-name` String of up to 32 characters to identify the shared policy instance.
- `member` Identifies a specific bundle member link or PWHE member.
- `member-interface` Identifies interface type and interface-path-id.
- `input` (Optional) Display the policy map attached to the input interface.
- `output` (Optional) Display the policy map attached to the output interface.
- `location node-id` Location of node. The node-id argument is entered in the `rack/slot/module` notation.

**Command Default**
If neither `input` nor `output` is selected, statistics for both are displayed.

**Command Modes**
EXEC mode

**Command History**
- **Release 3.7.2** This command was introduced.
- **Release 3.9.0** This command was updated to support shared policy instance over bundle interfaces.
- **Release 5.1.1** This command was updated to support SPI over PW-Ether subinterface.

**Usage Guidelines**
QoS statistics are only available for the shared policy instance. There are no per-member interface QoS statistics.

**Task ID**
- `qos` read, write

**Examples**
The following example shows how to display statistics for all details of the shared policy instance named `inst-shape`:

```
RP/0/RSP0/CP00:router# show policy-map shared-policy-instance inst-shape input location 0/RSP0/CP00
input: shape
Class class-default
```
Congestion Management Commands

Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>policy-map, on page 138</td>
<td>Creates or modifies a policy map that can be attached to one or more interfaces to specify a service policy.</td>
</tr>
<tr>
<td>service-policy (interface BNG), on page 226</td>
<td>Attaches a policy map to an input interface or output interface to be used as the service policy for that interface.</td>
</tr>
<tr>
<td>show policy-map interface, on page 166</td>
<td>Displays policy configuration information for all classes configured for all service policies on the specified interface.</td>
</tr>
</tbody>
</table>
show policy-map targets

To display information about the interfaces on which policy maps are applied, use the `show policy-map targets` command in EXEC mode.

```
show policy-map targets [{location node-id | pmap-name name} | type [ pbr | performance-traffic | redirect | traffic ] [{location node-id | pmap-name name}] | type qos [{location node-id | pmap-name name}] | type qos]
```

**Syntax Description**
- `location node-id` (Optional) Displays information about the interfaces on which policy maps are applied for the specified location. The `node-id` argument is entered in the `rack/slot/module` notation.
- `pmap-name name` (Optional) Displays information about the interfaces on which the specified policy map is applied.
- `type pbr` (Optional) Displays information about Policy-based routing (PBR).
- `type performance-traffic` (Optional) Displays information about the interfaces on which Realtime Application Flow Monitoring policy maps are applied.
- `type qos` (Optional) Displays information about the interfaces on which QoS policy maps are applied. This is the default type.

**Command Default**

The default QoS policy type is QoS.

**Command Modes**

EXEC mode

**Command History**

```
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.9.0</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Release 4.3.1</td>
<td>The <code>pbr</code> keyword was added.</td>
</tr>
<tr>
<td>Release 5.1.1</td>
<td>The show outputs were updated for <code>nv</code> satellite details.</td>
</tr>
</tbody>
</table>
```

**Usage Guidelines**

For a short period of time while a QoS policy is being modified, there might not be any policy in effect on the interfaces in which the modified policy is used. For this reason, modify QoS policies that affect the fewest number of interfaces at a time. Use the `show policy-map targets` command to identify the number of interfaces that will be affected during policy map modification.

When an unsupported policy-map is offloaded, a warning message stating 'policy is not offloaded' is shown. But the `show policy-map targets` command shows the unsupported policy-map entry for an interface.

**Task ID**

```
<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>qos</td>
<td>read</td>
</tr>
</tbody>
</table>
```
Examples

In this example, the Gigabit Ethernet interface 0/1/0/0 has one policy map attached as a main policy. Outgoing traffic on this interface will be affected if the policy is modified:

RP/0/RSP0/CPU0:router# show policy-map targets

Fri Jul 16 16:38:24.789 DST
1) Policymap: policy1  Type: qos
   Targets (applied as main policy):
       GigabitEthernet0/1/0/0 output
   Total targets: 1
   
   Targets (applied as child policy):
   Total targets: 0

This example shows target of the offloaded policies that are applied for ingress and egress traffic to the LC at location 0/1/cpu0:

RP/0/RSP0/CPU0:router# show policy-map targets location 0/1/cpu0

1) Policymap: policy  Type: qos
   Targets (applied as main policy):
       GigabitEthernet1000/0/0/0 input
       GigabitEthernet1000/0/0/1 input
   Total targets: 2
   
   Targets (applied as child policy):
   Total targets: 0

2) Policymap: policy_queue  Type: qos
   Targets (applied as main policy):
       TenGigE0/1/0/0 output
   Total targets: 1
   
   Targets (applied as child policy):
   Total targets: 0

Related Commands

</tbody>
</table>
show qos flow-aware summary location

To display the flow aware qos summary information on the specified interface, use the `show qos flow-aware summary location` command in the EXEC mode.

```
show qos flow-aware summary location [interface-path-id | all]
```

**Syntax Description**

- `interface-path-id` Physical location of the Shared Interface Processor (SIP). Naming notation is `rack/slot/module`; a slash between values is required as part of the notation.
  - `rack` — Chassis number of the rack.
  - `slot` — Physical slot number of the modular services card or line card.
  - `module` — Module number. A physical layer interface module (PLIM) is always 0.

- `all` Specifies all location.

**Command Default**

No default behavior or values

**Command Modes**

EXEC mode

**Command History**

<table>
<thead>
<tr>

  Number of CAC Flow Counters In Use: 1
NP id: 1
  Max number of Flow Table Entries: 51200
  Used Flow Table Entries: 0
```
show qos flow-aware summary location

Number of CAC Flow Counters In Use: 1
show qos inconsistency (BNG)

To display inconsistency information for the QoS policy on an interface, use the show qos inconsistency command in EXEC mode.

```
show qos inconsistency [detail warning-type | file filename | location node-id] | summary [file filename | location node-id]
```

**Syntax Description**

- **detail** Displays interface and policy name details of the inconsistency.
- **warning-type** Selects the warning types to display:
  - 0—All warning types
  - 1—ANCP - No shaper at top policy map
  - 2—ANCP - Multiple classes at top policy map
  - 3—ANCP - Downstream rate less than shaper rate
  - 4—ANCP - Downstream rate more than port speed
  - 5—ANCP - Policy resolution failure
  - 6—ANCP - Traffic manager program failure
  - 7—Port speed - Policy resolution failure
  - 8—Port speed - Traffic manager program failure
  - 9—Bundle member addition failure
  - 10—Interface state not matching system configuration
- **file filename** Specify a file name, such as disk0:tmp.log or bootflash:.
- **location node-id** Displays detailed QoS information for the designated node. The **node-id** argument is entered in the rack/slot/module notation.
- **summary** Displays summary counts of QoS inconsistency warnings.

**Command Default**

None

**Command Modes**

EXEC mode

**Command History**

- **Release 3.7.2** This command was introduced.
- **Release 4.3.0** The command was supported in dynamic template configuration mode in BNG.

**Usage Guidelines**

To enter the dynamic template configuration mode, run `dynamic-template` command in the Global Configuration mode.

**Task ID**

- **qos** read
This example provides detail about QoS policy inconsistency, for all warning types:

```
RP/0/RSP0/CPU0:router# show qos inconsistency detail 0 location 0/7/CPU0
```

Interface Lists with QoS Inconsistency Warning:

show qos shared-policy-instance (BNG)

To list interface details for a specific location of a specific shared policy instance, attached to either an input or output interface, use the `show qos shared-policy-instance` command in EXEC mode.

```
show qos shared-policy-instance instance-name {input | output} location node-id
```

### Syntax Description

- **instance-name**
  - String of up to 32 characters to identify the shared policy instance.
- **input**
  - Displays details for the shared policy instance attached to the input interface.
- **output**
  - Displays details for the shared policy instance attached to the output interface.
- **location node-id**
  - Location of node. The node-id argument is entered in `rack/slot/module` notation.

**violate-action**

To configure the action to take on packets that violate the rate limit, use the `violate-action` command in policy map police configuration mode. To remove a conform action from the policy-map, use the `no` form of this command.

```
violate-action {drop | set options | transmit}
noviolate-action {drop | set options | transmit}
```

**Syntax Description**

- **drop**  
  Drops the packet.
  
  - `qos-group value`—Sets QoS group value. Range is 0 to 63.

- **transmit**  
  Transmits the packets.

**Command Default**

No default behavior or values

**Command Modes**

Policy map police configuration

**Command History**

- **Release**  
  - 3.7.2  
  - This command was introduced.

**Usage Guidelines**

For more information regarding the traffic policing feature refer to the `police rate`, on page 129 command.

The `violate-action` command can set the DSCP, the precedence, or the discard class for IP packets, and experimental and discard-class values for MPLS packets.

**Task ID**

</thead>
<tbody>
<tr>
<td>qos</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

In this example for MPLS, traffic policing is configured to drop packets that violate the rate limit:

```
RP/0/RSP0/CPU0:router(config)# class-map class1
RP/0/RSP0/CPU0:router(config-cmap)# match mpls experimental topmost 0
RP/0/RSP0/CPU0:router(config-cmap)# exit
RP/0/RSP0/CPU0:router(config)# policy-map policy1
RP/0/RSP0/CPU0:router(config-pmap)# class class1
RP/0/RSP0/CPU0:router(config-pmap-c)# police rate 250 kbps burst 50
RP/0/RSP0/CPU0:router(config-pmap-c-police)# violate-action drop
RP/0/RSP0/CPU0:router(config-pmap-c-police)# exit
RP/0/RSP0/CPU0:router(config-pmap-c)# exit
RP/0/RSP0/CPU0:router(config)# interface gigabitethernet 0/0/0/9
RP/0/RSP0/CPU0:router(config-if)# service-policy input policy1
```

Congestion Avoidance Commands

This chapter describes commands used to avoid congestion.

Congestion avoidance is achieved through packet dropping. Cisco IOS XR software supports the following quality of service (QoS) congestion avoidance techniques that drop packets:

- Random early detection (RED)
- Weighted random early detection (WRED)
- Tail drop

To use commands of this module, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using any command, contact your AAA administrator for assistance.

For detailed information about congestion avoidance concepts, configuration tasks and examples, see the Configuring Congestion Avoidance module in the Modular QoS Configuration Guide for Cisco ASR 9000 Series Routers.

bandwidth (QoS)

To specify the minimum bandwidth allocated to a class belonging to a policy map, use the `bandwidth` command in policy map class configuration mode. To remove the bandwidth specified for a class, use the `no` form of this command.

```
bandwidth {rate [units] | percent percentage-value}
no bandwidth {rate [units] | percent percentage-value}
```

**Syntax Description**

<table>
<thead>
<tr>
<th></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>rate</strong></td>
<td>Minimum bandwidth, in the units specified, to be assigned to the class. Range is from 1 to 4294967295.</td>
</tr>
<tr>
<td><strong>units</strong></td>
<td>Specifies the units for the bandwidth. Values can be:</td>
</tr>
<tr>
<td></td>
<td>• bps—bits per second</td>
</tr>
<tr>
<td></td>
<td>• gbps—gigabits per second</td>
</tr>
<tr>
<td></td>
<td>• kbps—kilobits per second (default)</td>
</tr>
<tr>
<td></td>
<td>• mbps—megabits per second</td>
</tr>
<tr>
<td><strong>percent percentage-value</strong></td>
<td>Specifies the amount of guaranteed bandwidth, based on an absolute percentage of available bandwidth. Range is from 1 to 100.</td>
</tr>
</tbody>
</table>

**Command Default**

The default units is kbps.

**Command Modes**

Policy map class configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `bandwidth` command is used to specify the minimum guaranteed bandwidth allocated for traffic matching a particular class. Bandwidth may be defined as a specific value or may be set as a percentage of the interface bandwidth.

If a percentage value is set, the accuracy that can be expected is 1 percent.

**Note**

The bandwidth value takes into account the Layer 2 encapsulation that is applied to traffic leaving the interface. For Ethernet, the encapsulation is considered to be 14 bytes; whereas for IEEE 802.1Q, the encapsulation is 18 bytes. The actual bandwidth assigned to a class can be seen in the output of the `show qos interface` command.

Be careful when specifying bandwidth guarantees close to 100 percent, because the Layer 2 encapsulation considered does not include the entire Layer 2 header. This can lead to oversubscription, particularly in the case of small packet sizes.

A policy map can have a single bandwidth statement per class. Both percentage and actual value bandwidth configurations can be used within a policy map.
The `bandwidth` command does not specify how the bandwidth is to be shared. Instead it specifies how much bandwidth is guaranteed per class, by setting the number of tokens that are assigned to the token bucket of a particular class. For configured behavior to work correctly, you must ensure that the sum of the bandwidths plus any priority traffic is not greater than the bandwidth of the interface itself. If the interface is oversubscribed, unpredictable behavior results.

The bandwidth of the interface is set to be that of the physical interface, unless a hierarchical policy is defined that reduces the bandwidth available to the traffic. The following example shows a hierarchical policy being used to shape traffic to the specified value. The child policy then determines how the shaped bandwidth should be apportioned between the specified classes:

```
policy-map parent
 class match_all
  shape average 1000000
  bandwidth 1000000
  service-policy child

policy-map child
 class gold
  bandwidth percent 20
 class silver
  bandwidth percent 40
 class default
  bandwidth percent 40
```

Note

The `bandwidth` command is part of the parent policy. In this instance, the `bandwidth` command not only sets the minimum bandwidth for the class but also resets the reference point for the `bandwidth percent` statements in the child policy.

- If bandwidth is configured in the parent class, parent minimum bandwidth is used as a reference for the child bandwidth percentages.
- If bandwidth is not configured in the parent class, the implicit minimum bandwidth, which is a portion of the total unallocated bandwidth allocated to the class based on the explicit or implicit bandwidth remaining, is used as a reference.

For subinterface policies:

- If bandwidth is configured in the parent class, parent minimum bandwidth is used as a reference for child bandwidth percentages.
- If bandwidth remaining is configured in the parent class, `bandwidth-remaining-percent * interface-rate` is used as a reference.
- If bandwidth is not configured in the parent class, `shape rate` is used as a reference.

In this example, the hierarchical policy is attached to the main interface, and the parent classes are a mix of bandwidth and shape only classes:

```
policy-map hqos
 class c1
  bandwidth percent 40
  service-policy child
 class c2
  shape average 500000000
  service-policy child
```
The reference for the child policy in class c2 is the implicit bandwidth of class c2 bounded by the shape rate of class c2. Therefore, the reference = (60 percent * interface bandwidth) / 3 bounded by 500000000 kbps.

In this example, the hierarchical policy is a class-default only parent shape configured on subinterfaces:

```
policy-map sub_int_hqos
  class class-default
    shape average 40
    service-policy child
```

The class-default parent shape rate is used as reference.

When the `percent` keyword is used with the `bandwidth` command, the bandwidth of the interface is defined as being the Layer 2 capacity excluding the Gigabit Ethernet or POS encapsulation but including the High-Level Data Link Control (HDLC) flags, frame check sequence (FCS), and so on. These have to be included because they are applied per packet, and the system cannot predict how many packets of a particular packet size are being sent out.

For example, the following policy is applied to an OC-192 interface:

```
policy-map oc-192
  class c1
    bandwidth percent 50
```

The resulting bandwidth reservation for class c1 is 4,792,320 kbps. This equates to 50 percent of the OC-192 bandwidth excluding the GE or POS overhead.

<table>
<thead>
<tr>

bandwidth remaining

To specify how to allocate leftover bandwidth to various classes, use the `bandwidth remaining` command in policy map class configuration mode. To return to the system defaults, use the `no` form of this command.

```
bandwidth remaining [{percent percentage-value | ratio ratio-value}]
no bandwidth remaining [{percent percentage-value | ratio ratio-value}]
```

**Syntax Description**

- `percent percentage-value`  Specifies the amount of guaranteed bandwidth, based on an absolute percentage of the available bandwidth. Range is from 1 to 100.
- `ratio ratio-value`  Specifies the amount of guaranteed bandwidth, based on a bandwidth ratio value. Range is 1 to 1020.

**Command Default**

No bandwidth is specified.

**Command Modes**

Policy map class configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `bandwidth remaining` command is used to set the Modified Deficit Round Robin (MDRR) weight for the particular class.

When applied within an egress service policy, the command is used to define how any unallocated bandwidth should be apportioned. It is typically used in conjunction with the bandwidth configuration at the parent level in hierarchical policy maps. In such a combination, if the minimum bandwidth guarantees are met, the remaining bandwidth is shared in the ratio defined by the `bandwidth remaining` command in the class configuration in the policy map.

The available bandwidth is equally distributed among those queueing classes that do not have the remaining bandwidth explicitly configured.

**Note**

On egress, the actual bandwidth of the interface is determined to be the Layer 2 capacity excluding CRC. These have to be included because they are applied per packet, and the system cannot predict how many packets of a particular packet size are being sent out.

The `bandwidth remaining` command is used to proportionally allocate bandwidth to the particular classes, but there is no reserved bandwidth capacity.

On both ingress and egress, if the `bandwidth remaining` command is not present, then the bandwidth is shared equally among the configured queueing classes present in the policy-map. When attempting precise calculations of expected MDRR behavior, you must bear in mind that because you are dealing with the bandwidth remaining on the link, you must convert the values to the bandwidth remaining percentages on the link, based upon the packet sizes of the traffic within the class. If the packet sizes are the same in all the classes, then the defined ratio is enforced precisely and predictably on the link.
### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>qos</td>
<td>read, write</td>
</tr>
</tbody>
</table>

### Examples

This example shows how the remaining bandwidth is shared by classes class1 and class2 in a 20:80 ratio.

```
RP/0/RSP0/CPU0:router(config)# policy-map policy1
RP/0/RSP0/CPU0:router(config-pmap)# class class1
RP/0/RSP0/CPU0:router(config-pmap-c)# bandwidth remaining percent 20
RP/0/RSP0/CPU0:router(config-pmap-c)# exit
RP/0/RSP0/CPU0:router(config-pmap)# class class2
RP/0/RSP0/CPU0:router(config-pmap-c)# bandwidth remaining percent 80
```
child-conform-aware

To prevent the parent policer from dropping any ingress traffic that conforms to the maximum rate specified in the child policer, use the child-conform-aware command in policy map police configuration mode. To remove this action from the policy map, use the no form of this command.

child-conform-aware
no child-conform-aware

Syntax Description
This command has no keywords or arguments.

Command Default
The child-conform-aware command is not configured.

Command Modes
Policy map police configuration

Command History
Release 4.0.0 This command was introduced.

Usage Guidelines
In hierarchical policing, traffic is policed first at the child policer level and then at the parent policer level. It is possible for traffic that conforms to the maximum rate specified by the child policer to be dropped by the parent policer.

In enhanced hierarchical ingress policing, the child-conform-aware command prevents the parent policer from dropping any ingress traffic that conforms to the maximum rate specified in the child policer.

Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>qos</td>
<td>read, write</td>
</tr>
</tbody>
</table>

Examples
This example shows parent and child policy maps in which two classes are defined in the child policy. In class AF1, the exceed action is set to an action other than to drop traffic.

If the child-conform-aware command were not configured in the parent policy, the parent policer would drop traffic that matches the conform rate of the child policer but exceeds the conform rate of the parent policer.

The child-conform-aware command prevents the parent policer from dropping any ingress traffic that conforms to the maximum rate specified in the child policer.

This example shows parent and child policies in which two classes are defined in the child policy. In class AF1, the exceed action is set to an action other than to drop traffic.

If the child-conform-aware command were not configured in the parent policy, the parent policer would drop traffic that matches the conform rate of the child policer but exceeds the conform rate of the parent policer.

When used in the parent policer, the child-conform-aware command prevents the parent policer from dropping any ingress traffic that conforms to the committed rate specified in the child policer.
In this example, class EF in the child policy is configured with a committed rate of 1 Mbps, a conform action and an exceed action. The traffic that is below 1 Mbps is presented to the parent policer with the MPLS EXP bit set to 4, and traffic that exceeds 1 Mbps is dropped.

Class AF1 in the child policy is configured with a committed rate of 1 Mbps, a conform action and an exceed action. The traffic that is below 1 Mbps is presented to the parent policer with the MPLS EXP bit set to 3, and traffic that exceeds 1 Mbps is presented to the parent policer with the MPLS EXP bit set to 2.

With this child policy configuration, the parent policer sees traffic from the child classes as exceeding its committed rate of 2 Mbps. Without the child-conform-aware command in the parent policer, the parent policers to 2 Mbps, which can result into dropping some conformed traffic from class EF in the child policy. When the child-conform-aware command is configured in the parent policer, the parent policer does not drop any traffic that conforms under the child policy.

```
RP/0/RSP0/CPU0:router(config)# policy-map parent
RP/0/RSP0/CPU0:router(config-pmap)# class class-default
RP/0/RSP0/CPU0:router(config-pmap-c)# service-policy child
RP/0/RSP0/CPU0:router(config-pmap-c)# police rate 2 mbps
RP/0/RSP0/CPU0:router(config-pmap-c)# child-conform-aware
RP/0/RSP0/CPU0:router(config-pmap-c)# conform-action transmit
RP/0/RSP0/CPU0:router(config-pmap-c)# exceed-action drop

</tbody>
</table>
The **set dei** action in policy maps is supported on 802.1ad packets for:

- Ingress and egress
- Layer 2 subinterfaces
- Layer 2 main interfaces
- Layer 3 main interfaces

The set DEI action is ignored for traffic on interfaces that are not configured for 802.1ad encapsulation.

### Examples

In this example for MPLS, traffic policing is configured to set the MPLS experimental bit for packets that conform to the rate limit:

```
RP/0/RSP0/CPU0:router(config)# class-map class
RP/0/RSP0/CPU0:router(config-cmap)# match mpls experimental topmost 0
RP/0/RSP0/CPU0:router(config-cmap)# exit

RP/0/RSP0/CPU0:router(config)# policy-map child
RP/0/RSP0/CPU0:router(config-pmap)# class prec1
RP/0/RSP0/CPU0:router(config-pmap-c)# police rate 100000000 peak-rate 3125000 peak-burst 3125000
RP/0/RSP0/CPU0:router(config-pmap-c-police)# conform-action set mpls experimental imp 1
RP/0/RSP0/CPU0:router(config-pmap-c-police)# conform-action set qos-group 1
RP/0/RSP0/CPU0:router(config-pmap-c-police)# exit
RP/0/RSP0/CPU0:router(config-pmap-c)# exit
RP/0/RSP0/CPU0:router(config-pmap)# exit

RP/0/RSP0/CPU0:router(config)# interface gigabitethernet 0/1/0/9
RP/0/RSP0/CPU0:router(config-if)# service-policy input policy1
```

In this example, the police rate is set to 5 Mbps. Conforming traffic is marked with a DEI value of 0; traffic that exceeds the police rate is marked with a DEI value of 1.

```
RP/0/RSP0/CPU0:router(config)# policy-map 1ad-mark-dei
RP/0/RSP0/CPU0:router(config-pmap)# class c1
RP/0/RSP0/CPU0:router(config-pmap-c)# police rate 5 mbps
RP/0/RSP0/CPU0:router(config-pmap-c-police)# conform-action set dei 0
RP/0/RSP0/CPU0:router(config-pmap-c-police)# exceed-action set dei 1
RP/0/RSP0/CPU0:router(config-pmap-c-police)# end-policy-map
```

**conform-color**

To configure preclassification of Frame Relay packets that are not discard-eligible, use the **conform-color** command in policy map police configuration mode. To remove a conform color from the policy-map, use the **no** form of this command.

```
conform-color class-map-name
no conform-color class-map-name
```

**Syntax Description**

- **class-map-name** Specifies the class-map to associate with the conform-color.

**Command Default**

By default, if no preclassification is configured for a packet, the packet is not analyzed by the color-aware policer on the ingress interface, and the packet is given regular policing treatment.

**Command Modes**

Policy map police configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.1.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Typically, frame relay packets from a previous node are marked by default as fr-de = 0 (meaning not discard eligible) or fr-de = 1 (meaning discard eligible). For non-discard-eligible treatment, you must create a class map for the fr-de=0 case and assign the conform-color to that class-map.

For more information regarding the traffic policing feature, see the **police rate**, on page 129 command.

**Note**

The multi-action policer sets cannot be used for IP packets.

**Examples**

In this example, conform-color is configured for preclassification of packets that are not discard-eligible.

```
RP/0/RSP0/CPU0:router(config)# configure
RP/0/RSP0/CPU0:router(config)# class-map match-all match_not_frde
RP/0/RSP0/CPU0:router(config-cmap)# match fr-de 1
RP/0/RSP0/CPU0:router(config-cmap)# policy-map 2R3C_conform_example
RP/0/RSP0/CPU0:router(config-pmap)# class class-default
RP/0/RSP0/CPU0:router(config-pmap-c)# police rate 768000 burst 288000 peak-rate 1536000 peak-burst 576000

hw-module all qos-mode ingress-queue-enable

To enable ingress queueing mode on MOD80-SE and MOD80-TR 4X10 MPA line cards (LCs), use the `hw-module all qos-mode ingress-queue-enable` command in the admin configuration mode. If you are running on Cisco IOS XR 64 bit, then use the same command in XR config mode. To disable ingress queueing mode on MOD80-SE and MOD80-TR 4X10 MPA LCs, use the `no` form of this command.

```
hw-module all qos-mode ingress-queue-enable
no hw-module all qos-mode ingress-queue-enable
```

**Syntax Description**
This command has no keywords or arguments.

**Command Default**
No default behavior or values.

**Command Modes**
Admin configuration mode - Cisco IOS XR
XR Config mode - Cisco IOS XR 64 bit

**Command History**

<table>

This example shows how to enable ingress queueing mode on MOD80-SE and MOD80-TR 4X10 MPA LCs:
```
RP/0/RSP0/CPU0:router(admin-config)# hw-module all qos-mode ingress-queue-enable
RP/0/RSP0/CPU0:router(admin-config)# commit
```

This example shows how to enable ingress queueing mode on all line cards running on Cisco IOS XR 64 bit:
```
RP/0/RSP0/CPU0:router(config)# hw-module all qos-mode ingress-queue-enable
RP/0/RSP0/CPU0:router(config)# commit
```
**hw-module all qos-mode per-priority-buffer-limit**

To enable per priority buffer limit mode on all line cards (LCs), use the `hw-module all qos-mode per-priority-buffer-limit` command in the admin configuration mode. If you are running on Cisco IOS XR 64 bit, then use the same command in XR config mode. To disable per priority buffer limit mode on all LCs, use the `no` form of this command.

```
no hw-module all qos-mode per-priority-buffer-limit
```

**Syntax Description**
This command has no keywords or arguments.

**Command Default**
No default behavior or values.

**Command Modes**
- Admin configuration mode - Cisco IOS XR

```
RP/0/RSP0/CPU0:router(admin-config)# hw-module all qos-mode wred-buffer-mode
RP/0/RSP0/CPU0:router(admin-config)# commit
```

This example shows how to enable buffer accounting mode on all line cards running on Cisco IOS XR 64 bit:

```
RP/0/RSP0/CPU0:router(config)# hw-module all qos-mode wred-buffer-mode
RP/0/RSP0/CPU0:router(config)# commit
```
**hw-module location qos-mode lowburst-enabled**

To enable lowburst mode on specific line card, use the `hw-module location qos-mode lowburst-enabled` command in the admin configuration mode. If you are running on Cisco IOS XR 64 bit, then use the same command in XR config mode. To disable lowburst mode on specific line card, use the `no` form of this command.

---

**Note**

Lowburst mode is not required on Cisco ASR 9000 4th generation QSFP 28-based Dense 100GE line cards.

```bash
hw-module location node-id qos-mode lowburst-enabled
no hw-module location node-id qos-mode lowburst-enabled
```

**Syntax Description**

- `location node-id` Specifies location of a particular node. The `node-id` argument is entered in the rack/slot/module notation.

**Command Default**

No default behavior or values.

**Command Modes**

- Admin configuration mode - Cisco IOS XR
- XR config mode - Cisco IOS XR 64 bit

**Command History**

**Example**

This example shows how to enable lowburst on a line card:

```bash
RP/0/RSP0/CPU0:router(admin-config)# hw-module location 0/1/CPU0 qos-mode lowburst-enabled
RP/0/RSP0/CPU0:router(admin-config)# commit
```

This example shows how to enable lowburst on a line card running on Cisco IOS XR 64 bit:
RP/0/RSP0/CPU0:router(config)# hw-module location 0/0/0 qos-mode lowburst-enabled
RP/0/RSP0/CPU0:router(config)# commit
**hw-module location qos-child-shaping-disabled**

To disable QoS mode child level or flat policy shaping on the line card interfaces, use the `hw-module location qos-child-shaping-disabled` command in the admin configuration mode. If you are running on Cisco IOS XR 64 bit, then use the same command in XR config mode.

```
hw-module location node-id qos-child-shaping-disabled
```

**Syntax Description**

| location node-id | Specifies location of a particular node. The node-id argument is entered in the rack/slot/module notation. |

**Command Default**

No default behavior or values.

**Command Modes**

- Admin configuration mode - Cisco IOS XR
- XR config mode - Cisco IOS XR 64 bit

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

<tr>
<td>Release 6.1.2</td>
<td>Support for Cisco IOS XR 64 bit was added.</td>
</tr>
<tr>
<td>Release 5.1.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is available only on the ASR 9000 Enhanced Ethernet Line Card.

You must reload LCs for configuration changes to take effect.

**Example**

This example shows how to disable qos child shaping on a line card:

```
RP/0/RSP0/CPU0:router(admin-config)# hw-module location 0/1/CPU0 qos-child-shaping-disabled
RP/0/RSP0/CPU0:router(admin-config)# commit
```

This example shows how to disable qos child shaping on a line card running on Cisco IOS XR 64 bit:

```
RP/0/RSP0/CPU0:router(config)# hw-module location 0/0/0 qos-child-shaping-disabled
```
RP/0/RSP0/CPU0:router(config)# commit
queue-limit

To specify or modify the maximum number of packets the queue can hold for a class policy configured in a policy map, use the `queue-limit` command in policy map class configuration mode. To remove the queue packet limit from a class, use the `no` form of this command.

```
queue-limit  value  [unit]
no  queue-limit
```

**Syntax Description**

- `value` Maximum threshold for tail drop in bytes. Range is from 1 to 4294967295.
- `unit` (Optional) Units for the queue limit value. Values can be:
  - `bytes` — bytes
  - `kbytes` — kilobytes
  - `mbytes` — megabytes
  - `ms` — milliseconds
  - `packets` — packets (default)
  - `us` — microseconds

  **Note** When the specified `units` is packets, packets are assumed to be 256 bytes in size.

**Command Default**

100 milliseconds: maximum threshold for tail drop
10 milliseconds: maximum threshold for high-priority queues

Maximum threshold units are in packets.

**Usage Guidelines**

Packets satisfying the match criteria for a class accumulate in the queue reserved for the class until they are serviced by the scheduling mechanism. The `queue-limit` command defines the maximum threshold for a class. When that threshold is reached, enqueued packets to the class queue result in tail drop (packet drop). Tail drop is a congestion avoidance technique that drops packets when an output queue is full, until congestion is eliminated.

Use the `show qos interface` command to display the queue limit and other policer values.

**Queue Limit Default Values**

These default values are used when `queue-limit` is not configured in the class:
• If QoS is not configured:
  • The queue limit is 100 ms at the interface rate.

• If QoS is configured and Weighted Random Early Detection (WRED) is not configured:
  • Queue limit is 100 ms at the guaranteed service rate of the queue for non-priority queues.
  • Queue limit is 100 ms at the interface rate for Level 1 priority classes.
  • Queue limit is 100 ms at parent guaranteed service rate for Level 2 priority classes.

• If QoS is configured and WRED is configured:
  • Queue limit is two times the WRED maximum threshold. The maximum threshold can be an explicitly configured value or an implicit 100 ms.
  • If more than one WRED profile is configured in the class, the maximum threshold is the maximum for all profiles.
  • When the `queue-limit` is configured in time units, the guaranteed service rate is used to compute the queue limit.

These restrictions apply to queue limits:

• Queue limit should be at least the maximum MTU size, which is 9 * 1024 bytes = 9kb.
• Queue limit cannot exceed 1 GB, which is the maximum packet buffer size in ingress and egress queuing ASICs.
• Only time-based units are allowed on bundle targets.

**Guaranteed Service Rate**

The guaranteed service rate is defined as the service rate of the queue when all queues are backlogged and derived as:

\[
\text{minimum}_{\text{bandwidth}} + (\text{bandwidth}_{\text{remaining}} \times \text{unallocated}_{\text{bandwidth}})
\]

This example shows the guaranteed service rate calculation:

```
policy-map sample_policy
  class c1
    bandwidth percent 30
    bandwidth remaining percent 40
  class c2
    bandwidth percent 20
  class class-default
```

guaranteed service rate of c1 = 30 percent LR + (40 percent * 50 percent * LR)
guaranteed service rate of c2 = 20 percent LR + (30 percent * 50 percent * LR)
guaranteed service rate of class-default = 30 percent * 50 percent * LR

• Where LR is line rate of the target on which service policy "sample_policy" is attached.
• 50 percent is unallocated bandwidth.
### Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>qos</td>
<td>read, write</td>
</tr>
</tbody>
</table>

### Examples

This example shows how to set the queue limit for a class to 1000000 packets for policy map policy1:

```plaintext
RP/0/RSP0/CPU0:router(config)# policy-map policy1
RP/0/RSP0/CPU0:router(config-pmap)# class class1
RP/0/RSP0/CPU0:router(config-pmap-c)# queue-limit 1000000
```

random-detect

To enable random early detection (RED), use the `random-detect` command in policy map class configuration mode. To remove RED, use the `no` form of this command.

```
random-detect {cos value | default | dei value | discard-class value | dscp value | exp value | precedence value | min-threshold [units] max-threshold [units] [probability]}
no random-detect [{cos value | default | dei value | discard-class value | dscp value | exp value | precedence value | min-threshold [units] max-threshold [units]}]
```

**Syntax Description**

- **cos value**
  - COS-based WRED.

- **default**
  - Enables RED with default minimum and maximum thresholds.

- **dei value**
  - Discard-eligibility indicator based WRED. Can be 0 or 1.

- **discard-class value**
  - Discard-class based WRED.

- **dscp value**
  - DSCP-based WRED.

- **exp value**
  - MPLS Experimental-based WRED.

- **precedence value**
  - Precedence-based WRED. Values can be:
    - 0 or routine
    - 1 or priority
    - 2 or immediate
    - 3 or flash
    - 4 or flash-override
    - 5 or critical
    - 6 or internet
    - 7 or network

- **min-threshold**
  - Minimum threshold in number of packets. The value range of this argument is from 0 to 1073741823 in bytes.

- **max-threshold**
  - Maximum threshold the units specified. The value range of this argument is from the value of the `min-threshold` argument or 23, whichever is larger, to 1073741823. When the queue length exceeds the maximum threshold, RED drops all packets with the specified discard class value.

- **units**
  - (Optional) Units for the threshold values. Values can be:
    - bytes—bytes
    - gbytes—gigabytes
    - kbytes—kilobytes
    - mbytes—megabytes
    - ms—milliseconds
    - packets—packets (default)
    - us—microseconds
The RED congestion avoidance technique takes advantage of the congestion control mechanism of TCP. By randomly dropping packets before periods of high congestion, RED tells the packet source to decrease its transmission rate. Assuming the packet source is using TCP, it decreases its transmission rate until all the packets reach their destination, indicating that the congestion is cleared. You can use RED as a way to cause TCP to slow transmission of packets. TCP not only pauses, but it also restarts quickly and adapts its transmission rate to the rate that the network can support.

RED distributes losses in time and maintains normally low queue depth while absorbing traffic bursts. When enabled on an interface, RED begins dropping packets when congestion occurs at a rate you select during configuration.

When time units are used, the guaranteed service rate is used to compute thresholds.

The default value for RED is calculated as follows:

\[ B = \frac{1}{2} \text{default max-threshold, based on 100 ms} \]

where B is the bandwidth for the queue. When all the queues are congested, the bandwidth for the queue is equal to the guaranteed service rate of the queue.

The mark probability is always set to 1.

When the value of the `units` argument is packets, packets are assumed to be 256 bytes in size.

### Weighted Random Early Detection

The following restrictions apply to Weighted Random Early Detection (WRED):

- For thresholds in time units, the guaranteed service rate is used to calculate the thresholds in bytes.
- Default RED minimum threshold—50 ms at the guaranteed service rate.
- Default RED maximum threshold—100 ms as the guaranteed service rate.

For bundles, queue limit and WRED thresholds are supported in time units only.

**Note**

RED is enabled when you configure any of the supported `random-detect` commands.

Random early detection based on the DEI value is supported on 802.1ad packets for:

- Ingress and egress
- Layer 2 subinterfaces
- Layer 2 main interfaces
Layer 3 main interfaces

If there are any marking actions in the policy, the marked values are used for doing WRED.

The exponential weight factor is set to 0 for Cisco ASR 9000 series routers.

<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>qos</td>
<td>read, write</td>
</tr>
</tbody>
</table>

Examples

This example shows how to enable RED using a minimum threshold value of 1000000 and a maximum threshold value of 2000000:

```
RP/0/RSP0/CPU0:router(config)# policy-map policy1
RP/0/RSP0/CPU0:router(config-pmap)# class class1
RP/0/RSP0/CPU0:router(config-pmap-c)# random-detect 1000000 2000000
```

In this example, congestion is managed by dropping packets with a DEI value of 1 before dropping packets with a DEI value of 0.

```
RP/0/RSP0/CPU0:router(config)# policy-map dei-sample
RP/0/RSP0/CPU0:router(config-pmap)# class class-default
RP/0/RSP0/CPU0:router(config-pmap-c)# random-detect dei 1 1000 6000
RP/0/RSP0/CPU0:router(config-pmap-c)# random-detect dei 0 5000 10000
RP/0/RSP0/CPU0:router(config-pmap-c)# end-policy-map
```

random-detect cos

To configure Weighted Random Early Detection (WRED) thresholds for packets with a specific class of service (CoS) value, use the `random-detect cos` command in policy map class configuration mode. To return the thresholds to the default for the CoS, use the `no` form of this command.

```
random-detect cos cos-value min-threshold [units] max-threshold [units]
no random-detect cos cos-value min-threshold [units] max-threshold [units]
```

### Syntax Description

- **cos-value**: CoS value. Valid values are from 0 to 7. Up to eight values can be entered separated by commas.
- **min-threshold**: Minimum threshold in number of packets. The value range of this argument is from 0 to 1073741823 in bytes.
- **max-threshold**: Maximum threshold in number of packets. The value range of this argument is from the value of the `min-threshold` argument to 1073741823.
- **units**: (Optional) Units for the threshold values. Values can be:
  - `bytes` — bytes
  - `gbytes` — gigabytes
  - `kbytes` — kilobytes
  - `mbytes` — megabytes
  - `ms` — milliseconds
  - `packets` — packets (default)
  - `us` — microseconds

### Command Default

Default unit for `max-threshold` and `min-threshold` is `packets`.

- `min-threshold`: 30 ms
- `max-threshold`: 100 ms

### Command Modes

Policy map class configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The `random-detect cos` command is allowed in a service policy attached to a Layer 2 VPN attachment circuit or physical Ethernet interface only. (The command in invalid in a policy attached to a Layer 3 interface.)

#### Note

Only time-based units are allowed on bundle targets.

When the value of the `units` argument is packets, packets are assumed to be 256 bytes in size.
### Examples

This example shows how to configure CoS:

```
RP/0/RSP0/CPU0:router(config)# policy-map map
RP/0/RSP0/CPU0:router(config-pmap)# class c
RP/0/RSP0/CPU0:router(config-pmap-c)# random-detect cos 3 1000 bytes 2000 bytes
```

random-detect dscp

To configure the Weighted Random Early Detection (WRED) thresholds for packets with a specific differentiated services code point (DSCP) value, use the random-detect dscp command in policy map class configuration mode. To return the thresholds to the default for the DSCP value, use the no form of this command.

random-detect dscp dscp-value min-threshold [units] max-threshold [units]
no random-detect dscp dscp-value min-threshold [units] max-threshold [units]

Syntax Description

**dscp-value**
- DSCP value. Up to eight dscp-values (any combination of numbers, ranges, and reserved keywords) can be used separated by commas. The following arguments are supported:
  - Number from 0 to 63 that sets the DSCP value.
  - Range of DSCP values. Range is from 0 to 63.
  - Reserved keywords can be specified instead of numeric values. Table 4: IP DSCP Reserved Keywords, on page 75 describes the reserved keywords.

**min-threshold**
- Minimum threshold in number of packets. The value range of this argument is from 0 to 1073741823. When the average queue length reaches the minimum threshold, WRED randomly drops some packets with the specified DSCP value.

**max-threshold**
- Maximum threshold in number of packets. The value range of this argument is from the value of the min-threshold argument to 1073741823. When the average queue length exceeds the maximum threshold, WRED drops all packets with the specified DSCP value.

**units**
- (Optional) Units for the threshold values. Values can be:
  - **bytes**—bytes
  - **gbytes**—gigabytes
  - **kbytes**—kilobytes
  - **mbytes**—megabytes
  - **ms**—milliseconds
  - **packets**—packets (default)
  - **us**—microseconds

Command Default
- Match packets with default DSCP (000000).
- Default unit for max-threshold and min-threshold is packets.

Command Modes
- Policy map class configuration

Command History
- **Release**
  - **Modification**
    - Release 3.7.2  This command was introduced.

Usage Guidelines
- WRED is a congestion avoidance mechanism that slows traffic by randomly dropping packets when congestion exists. WRED is most useful with protocols like TCP that respond to dropped packets by decreasing the transmission rate.
Reserved keywords can be specified instead of numeric values. See Table 4: IP DSCP Reserved Keywords, on page 75 for the list of keywords.

When the value of the units argument is packets, packets are assumed to be 256 bytes in size.

<table>
<thead>
<tr>
<th>Task ID</th>
<th>ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>qos</td>
<td></td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

This example shows that for packets with DSCP AF11, the WRED minimum threshold is 1,000,000 bytes and the maximum threshold is 2,000,000 bytes:

```shell
RP/0/RSP0/CPU0:router(config)# policy-map policy1
RP/0/RSP0/CPU0:router(config-pmap)# class class1
RP/0/RSP0/CPU0:router(config-pmap-c)# random-detect dscp AF11 1000000 2000000
```

</tbody>
</table>
**random-detect precedence**

To configure the Weighted Random Early Detection (WRED) thresholds for packets with a particular IP precedence, use the `random-detect precedence` command in policy map class configuration mode. To return the thresholds to the default for the precedence, use the `no` form of this command.

```
random-detect precedence precedence-value min-threshold [units] max-threshold [units]
no random-detect precedence precedence-value min-threshold [units] max-threshold [units]
```

**Syntax Description**

- `precedence-value`: An IP precedence value identifier that specifies the exact value. Range is from 0 to 7. Reserved keywords can be specified instead of numeric values. Table 5: IP Precedence Values and Names, on page 80 describes the reserved keywords. Up to eight values or reserved keywords can be entered separated by commas.

- `min-threshold`: Minimum threshold in number of packets. Range is from 0 to 1073741823 in bytes.

- `max-threshold`: Maximum threshold in the units specified. Range is from the value of the `min-threshold` argument to 1073741823. When the average queue length exceeds the maximum threshold, WRED drops all packets with the specified precedence value.

- `units`: (Optional) Units for the threshold values. Values can be:
  - `bytes`—bytes
  - `gbytes`—gigabytes
  - `kbytes`—kilobytes
  - `mbytes`—megabytes
  - `ms`—milliseconds
  - `packets`—packets (default)
  - `us`—microseconds

**Command Default**

Default unit for `max-threshold` and `min-threshold` is `packets`.

**Command Modes**

Policy map class configuration

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

WRED is a congestion avoidance mechanism that slows traffic by randomly dropping packets when congestion exists. WRED is most useful with protocols like TCP that respond to dropped packets by decreasing the transmission rate.

When you configure the `random-detect` command on an interface, packets are given preferential treatment based on the IP precedence of the packet. Use the `random-detect precedence` command to adjust the treatment for different precedences.

When the value of the `units` argument is packets, packets are assumed to be 256 bytes in size.

service-policy (policy map class)

To use a service policy as a QoS policy within a policy map (called a hierarchical service policy), use the service-policy command in policy map class configuration mode. To disable a particular service policy as a QoS policy within a policy map, use the no form of this command.

```
service-policy [type qos] policy-map-name
no service-policy [type qos] policy-map-name
```

**Syntax Description**
- **type qos** (Optional) Specifies a QoS service policy.
- **policy-map-name** Name of the predefined policy map to be used as a QoS policy. The name can be a maximum of 40 alphanumeric characters.

**Command Default**
No service policy is specified.
Type is QoS when not specified.

**Command Modes**
Policy map class configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The `service-policy (policy-map class)` command creates hierarchical service policies in policy-map class configuration mode.

This command is different from the `service-policy (interface)` command used in interface configuration mode.

The child policy is the previously defined service policy that is being associated with the class default of the parent policy-map. The new service policy using the preexisting service policy is the parent policy.

The `service-policy (policy-map class)` command has these restrictions:

- The `priority` command can be used only in the child policy.
- If the `bandwidth` command is used in the child policy, the `bandwidth` command must also be used in the parent policy. The one exception is for policies using the default class.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>qos</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to create a hierarchical service policy in the service policy called parent:

```
RP/0/RSP0/CPU0:router(config)# policy-map child
RP/0/RSP0/CPU0:router(config-pmap)# class class1
RP/0/RSP0/CPU0:router(config-pmap-c)# priority
```
RP/0/RSP0/CPU0:router(config-pmap-c)# exit
RP/0/RSP0/CPU0:router(config-pmap)# exit
RP/0/RSP0/CPU0:router(config)# policy-map parent
RP/0/RSP0/CPU0:router(config-pmap)# class class-default
RP/0/RSP0/CPU0:router(config-pmap-c)# shape average 10000000
RP/0/RSP0/CPU0:router(config-pmap-c)# service-policy child

</tbody>
</table>
# service-policy (interface BNG)

To attach a policy map to an input interface or output interface to be used as the service policy for that interface, and optionally multiple subinterfaces, use the `service-policy` command in the appropriate configuration mode. To remove a service policy from an input or output interface, use the `no` form of the command.

```
service-policy {input | output} policy-map [shared-policy-instance instance-name]
```

**Syntax Description**
- `input` Attaches the specified policy map to the input interface.
- `output` Attaches the specified policy map to the output interface.
- `policy-map` Name of a service policy map (created using the `policy-map` command) to be attached.
- `shared-policy-instance` (Optional) Allows sharing of QoS resources across multiple subinterfaces. **Note** Sharing across multiple physical interfaces is not supported.
- `instance-name` (Optional) String of up to 32 characters to identify the shared policy instance.

**Command Default**
No service policy is specified.

**Command Modes**
- Interface configuration. This does not apply to BNG.
- Layer 2 transport configuration. This does not apply to BNG.
- Subinterface configuration. This does not apply to BNG.
- Dynamic template configuration

**Command History**
- **Release** 3.7.2 This command was introduced.
- **Release** 3.9.0 This command was updated to support shared policy instance over bundle interfaces.
- **Release** 4.3.0 The command was supported in dynamic template configuration mode in BNG.

**Usage Guidelines**
You can attach a single policy map to one or more interfaces to specify the service policy for those interfaces. The class policies composing the policy map are then applied to packets that satisfy the class map match criteria for the class. To apply a new policy to an interface, you must remove the previous policy. A new policy cannot replace an existing policy.

To enter the dynamic template configuration mode, run `dynamic-template` command in the Global Configuration mode.

### Examples

This example shows policy map policy1 applied to Packet-over-SONET/SDH (POS) interface 0/2/0/0:

```conf
RP/0/RSP0/CPU0:router(config)# class-map class1
RP/0/RSP0/CPU0:router(config-cmap)# match precedence ipv4 1
RP/0/RSP0/CPU0:router(config-cmap)# exit
RP/0/RSP0/CPU0:router(config)# policy-map policy1
RP/0/RSP0/CPU0:router(config-pmap)# class class1
RP/0/RSP0/CPU0:router(config-pmap-c)# set precedence 2
RP/0/RSP0/CPU0:router(config-pmap)# exit
RP/0/RSP0/CPU0:router(config)# interface POS 0/2/0
RP/0/RSP0/CPU0:router(config-if)# service-policy output policy1
```

This example shows policy map policy2 applied to GigabitEthernet subinterface 0/1/0/0.1.

```conf
RP/0/RSP0/CPU0:router(config)# class-map class2
RP/0/RSP0/CPU0:router(config-cmap)# exit
RP/0/RSP0/CPU0:router(config)# policy-map policy2
RP/0/RSP0/CPU0:router(config-pmap)# class-map class2
RP/0/RSP0/CPU0:router(config-pmap-c)# set precedence 3
RP/0/RSP0/CPU0:router(config-pmap)# exit
RP/0/RSP0/CPU0:router(config)# interface gigabitethernet 0/1/0/0.1
RP/0/RSP0/CPU0:router(config-subif)# service-policy input policy2 shared-policy-instance ethernet101
```

**Note**

This example does not apply to BNG.

This example shows policy map policy 1 applied to Bundle-Ether interfaces 100.1 and 100.2.

```conf
RP/0/RSP0/CPU0:router(config)# interface Bundle-Ether 100.1
RP/0/RSP0/CPU0:router(config-if)# service-policy policy1 shared-policy-instance subscriber1
RP/0/RSP0/CPU0:router(config-if)# exit
RP/0/RSP0/CPU0:router(config)# interface Bundle-Ether 100.2
RP/0/RSP0/CPU0:router(config-if)# service-policy output policy1 shared-policy-instance subscriber1
```

**Note**

This example does not apply to BNG.
This example is specific to BNG. It shows policy map policy 1 applied in the dynamic template configuration mode.

```
RP/0/RSP0/CPU0:router(config)#dynamic-template type ppp pl
RP/0/RSP0/CPU0:router(config-dynamic-template-type)#service-policy policy1
shared-policy-instance subscriber1
RP/0/RSP0/CPU0:router(config-dynamic-template-type)#exit

RP/0/RSP0/CPU0:router(config)# dynamic-template type ipsubscriber ipsub1
RP/0/RSP0/CPU0:router(config-dynamic-template-type)# service-policy output policy1
shared-policy-instance subscriber1
```
show qos summary BNG

To view the QoS summary, use the `show qos summary` command in EXEC mode.

```
show qos summary {shared-policy-instance instance-name location node-id} [police {interface type instance | location node-location}] [policy policy-name {interface type instance | location node-location}] [queue {interface type instance | location node-location}] [input | output] [member type instance] [host-link type instance] [location node-location] [np np-location]
```

### Syntax Description

### Command Default

None

### Command Modes

EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Release 4.3.0</td>
<td>The command was supported in dynamic template configuration mode in BNG. The np keyword was introduced.</td>
</tr>
</tbody>
</table>
Release 5.1.1 PWHE interface type PW-Ether and PW-IW were added.

**Usage Guidelines**

To enter the dynamic template configuration mode, run `dynamic-template` command in the Global Configuration mode.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>qos</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

This example shows the results of the command to show interfaces at location 0/1/CPU0 for a shared-policy-instance:

```
RP/0/RSP0/CPU0:router# show qos summary shared-policy-instance bundlespi location 0/1/CPU0 output

List of interfaces/NPs retrieved
GigabitEthernet0/1/1/1 (member of Bundle-Ether1.1)
GigabitEthernet0/1/1/2 (member of Bundle-Ether1.1)
```

This example shows policer interface statistics of BVI interface at location 0/5/cpu0:

```
RP/0/RSP0/CPU0:router# show qos summary police interface bvi 1 output location 0/5/cpu0 np np1

Legend:
--------
1. Policer ID is displayed in HEX.
2. A '*' against the counter means the action is drop.
3. Conform displays match counter for non-policer leaf.

<table>
<thead>
<tr>

The following example shows how to display QoS mode information at location 0/1/CPU0:

```
RP/0/RSP0/CPU0# show qoshal qos-mode location 0/1/CPU0
L4 WRED buffer mode:Disable
Per priority buffer limit:Disable
MOD-80 4*10 Ingress queue:Disable
```
show qoshaq os-mode
Hierarchical Modular QoS Commands

This chapter provides details of the Hierarchical QoS commands.

To use commands of this module, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using any command, contact your AAA administrator for assistance.

Hierarchical QoS allows you to specify QoS behavior at multiple policy levels, which provides a high degree of granularity in traffic management. For detailed HQoS concepts, configuration tasks and examples, see the Modular QoS Configuration Guide for Cisco ASR 9000 Series Routers

- exceed-color, on page 234
- fragment, on page 236
- match dei, on page 237
- set dei, on page 239
- service-fragment, on page 241
- service-fragment-parent, on page 242
To configure preclassification of Frame Relay packets that are discard-eligible, use the `exceed-color` command in policy map police configuration mode. To remove an exceed color from the policy-map, use the `no` form of this command.

```
exceed-color class-map-name
no exceed-color class-map-name
```

**Syntax Description**

`class-map-name` Specifies the class-map to associate with the exceed-color.

**Command Default**

By default, if no preclassification is configured for a packet, the packet is not analyzed by the color-aware policer on the ingress interface, and the packet is given regular policing treatment.

**Command Modes**

Policy map police configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
</table>
| 4.1.0    | This command was introduced.

**Usage Guidelines**

Typically, frame relay packets from a previous node are marked by default as fr-de = 0 (meaning not discard eligible) or fr-de = 1 (meaning discard eligible). For discard-eligible treatment, you must create a class map for the fr-de=1 case and assign the exceed-color to that class-map.

For more information regarding the traffic policing feature, see the `police rate`, on page 129 command.

**Note**

The multi-action policer sets cannot be used for IP packets.

**Task ID**

```
qos   read, write
```

**Examples**

In this example, exceed-color is configured for preclassification of packets that are discard-eligible.

```
RP/0/RSP0/CPU0:router(config)# class-map match-all match_frde
RP/0/RSP0/CPU0:router(config-cmap)# match fr-de 1
RP/0/RSP0/CPU0:router(config-cmap)# policy-map 2R3C_exceed_example
RP/0/RSP0/CPU0:router(config-pmap)# class class-default
RP/0/RSP0/CPU0:router(config-pmap-c)# police rate 768000 burst 288000 peak-rate 1536000 peak-burst 576000
RP/0/RSP0/CPU0:router(config-pmap-c)# exceed-color match_frde
RP/0/RSP0/CPU0:router(config-pmap-c)# exceed-action set qos-group 2
RP/0/RSP0/CPU0:router(config-pmap-c)# exit
RP/0/RSP0/CPU0:router(config-pmap-c)# exit
```
RP/0/RSP0/CPU0:router(config-pmap) # exit
RP/0/RSP0/CPU0:router(config) # interface pos 0/2/0/0
RP/0/RSP0/CPU0:router(config-if) # service-policy input policy2

<table>
<thead>
<tr>

<td>Configures the action to take on packets that violate the rate limit.</td>
</tr>
</tbody>
</table>
To refer to a defined service fragment, use the `fragment` command in the policy-map configuration mode. To delete an earlier mention of the service fragment, use the `no` form of the command.

```
fragment name
no fragment name
```

**Syntax Description**
- `name` Previously defined service-fragment.

**Command Default**
None

**Command Modes**
Policy-map configuration mode

**Command History**
- **Release 4.3.1**
  - This command was introduced.

**Usage Guidelines**
The number of defined service fragments on a port policy is the same as the number of classes supported in a policy.

**Task ID**
- **Task** read, write
  - **Operation** qos

This example shows how to refer to a previously-defined service fragment:

```
RP/0/RSP0/CPU0:router (config) # policy-map p1
RP/0/RSP0/CPU0:router (config-pmap) # class c1
RP/0/RSP0/CPU0:router (config-pmap-c) # fragment sf1
```
match dei

To specify a drop eligible indicator (DEI) value as a match criteria in a class map, use the **match dei** command in class map configuration mode. To remove a specified DEI value from the matching criteria for a class map, use the **no** form of this command.

```
match dei value
no match dei
```

**Syntax Description**

- **value**  Value of the DEI bit. Can be 0 or 1.

**Command Default**

There is no default DEI value; it must be specified.

**Command Modes**

Class map configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The **match dei** command specifies a DEI value that is used as the match criteria against which packets are checked to determine if they belong to the class specified by the class map.

**Examples**

In this example, 802.1ad CoS plus DEI is derived from the incoming 802.1q CoS. Packets with a CoS value of 0 are remarked with a DEI value of 1.

```
RP/0/RSP0/CPU0:router(config) # class-map match-any remark-cos
RP/0/RSP0/CPU0:router(config-cmap) # match cos 0
RP/0/RSP0/CPU0:router(config-cmap) # end-class-map
RP/0/RSP0/CPU0:router(config) # policy-map pl
RP/0/RSP0/CPU0:router(config-pmap-c) # set dei 1
RP/0/RSP0/CPU0:router(config-pmap-c) # end-policy-map

RP/0/RSP0/CPU0:router(config) # interface GigabitEthernet0/4/0/39.1 l2transport
RP/0/RSP0/CPU0:router(config-subif) # encapsulation dot1q 1
RP/0/RSP0/CPU0:router(config-subif) # rewrite ingress tag push dot1ad 5 symmetric
RP/0/RSP0/CPU0:router(config-subif) # service-policy input pl
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>class-map, on page 47</td>
<td>Defines a traffic class and the associated rules that match packets to the class.</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>match cos, on page 57</td>
<td>Identifies specified class of service (CoS) values as a match criteria in a class map.</td>
</tr>
</tbody>
</table>
set dei

To set the drop eligible indicator (DEI) value in a policy map class, use the `set dei` command in policy map class configuration mode. To remove a specified DEI value from a policy map class, use the `no` form of this command.

```
set dei value
no set dei
```

**Syntax Description**

- `value` Value of the DEI bit. Can be 0 or 1.

**Command Default**

There is no default DEI value; it must be specified.

**Command Modes**

Policy map class configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.6.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `set dei` command specifies a DEI value in a policy map class. For example, traffic can be policed and the excess traffic can be marked with DEI value of 1, so that it can be preferentially dropped in the egress interface or further downstream, when there is congestion.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>qos</td>
<td>read,</td>
</tr>
<tr>
<td></td>
<td>write</td>
</tr>
</tbody>
</table>

**Examples**

In this example, 802.1ad CoS plus DEI is derived from the incoming 802.1q CoS. Packets with a CoS value of 0 are remarked with a DEI value of 1.

```
RP/0/RSP0/CPU0:router(config))# class-map match-any remark-cos
RP/0/RSP0/CPU0:router(config-cmap)# match cos 0
RP/0/RSP0/CPU0:router(config-cmap)# end-class-map
RP/0/RSP0/CPU0:router(config)# policy-map pl
RP/0/RSP0/CPU0:router(config-pmap-c)# set dei 1
RP/0/RSP0/CPU0:router(config-pmap-c)# end-policy-map

RP/0/RSP0/CPU0:router(config)# interface GigabitEthernet0/4/0/39.1 l2transport
RP/0/RSP0/CPU0:router(config-subif)# encapsulation dot1q 1
RP/0/RSP0/CPU0:router(config-subif)# rewrite ingress tag push dot1ad 5 symmetric
RP/0/RSP0/CPU0:router(config-subif)# service-policy input pl
```
### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>class (policy-map), on page 45</td>
<td>Specifies the name of the class whose policy you want to create or change.</td>
</tr>
<tr>
<td>class-map, on page 47</td>
<td>Defines a traffic class and the associated rules that match packets to the class.</td>
</tr>
<tr>
<td>policy-map, on page 138</td>
<td>Creates or modifies a policy map that can be attached to one or more interfaces to specify a service policy.</td>
</tr>
</tbody>
</table>
service-fragment

To define a service fragment in a class, use the service-fragment command in the policy-map configuration mode. To delete the service-fragment, use the no form of this command.

```
service-fragment name
no service-fragment name
```

**Syntax Description**

| name | Name for the service fragment. |

**Command Default**

None

**Command Modes**

Policy-map configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.3.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Service fragment names must be unique in a port policy. However, same names can be used across policies.

**Task ID**

<table>
<thead>
<tr>
<th>Task</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>qos</td>
<td>read, write</td>
</tr>
</tbody>
</table>

This example shows how to define a service fragment name:

```
RP/0/RSP0/CPU0:router (config) # policy-map p1
RP/0/RSP0/CPU0:router (config-pmap) # class c1
RP/0/RSP0/CPU0:router (config-pmap-c) # service-fragment sf1
```
service-fragment-parent

To apply a service fragment policy to an interface, use the service-fragment-parent command in the interface configuration mode. To delete the applied service fragment policy, use the no form of this command.

```
no service-fragment-parent
```

**Syntax Description**

This command has no keywords or arguments.

**Command Default**

No default behavior or value

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.3.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Do not use this command was non-service fragment policies.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>qos</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Example**

This example shows how to use the service-fragment-parent command:

```
RP/0/RSP0/CPU0:router (config-if) # service-policy input s1 service-fragment-parent
```
Link Bundles Commands

A link bundle is a group of one or more ports that are aggregated together and treated as a single link.

To use commands of this module, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using any command, contact your AAA administrator for assistance.

This chapter describes the commands used for QoS on link bundles. For detailed information on Link Bundles, related concepts and configuration tasks, see the Modular QoS Configuration Guide for Cisco ASR 9000 Series Routers.

- clear qos counters (shared-policy-instance), on page 244
- clear qos counters interface, on page 246
- encap-sequence, on page 248
- hw-module all qos-mode aggregate-bundle-mode, on page 250
- show qos aggregate-bundle-mode, on page 252
- hw-module all qos-mode bundle-agg policer, on page 253
clear qos counters (shared-policy-instance)

To clear counters of a specific shared policy instance, use the `clear qos counters (shared-policy-instance)` command in EXEC mode.

```
clear qos counters shared-policy-instance instance-name [{input | output}] location node-id
```

**Syntax Description**

- `instance-name` String of up to 32 characters to identify the shared policy instance.
- `input` (Optional) Clear the QoS counters of the shared policy instance attached to the input interface.
- `output` (Optional) Clear the QoS counters of the shared policy instance attached to the output interface.
- `location node-id` Location of the node. The node-id argument is entered in the `rack/slot/module` format. Specify the active RSP location as the `node-id` for a shared policy instance over bundle interfaces or PWHE subinterfaces.

**Command Default**

None

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>3.9.0</td>
<td>This command was updated to support shared policy instance over bundle interfaces.</td>
</tr>
<tr>
<td>5.1.1</td>
<td>This command was updated to support shared policy instance over PWHE subinterfaces.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You must be in a user group associated with a task group that includes the proper task IDs. The command reference guides include the task IDs required for each command. If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>qos</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to clear the qos counters for a specific shared policy instance:
RP/0/RSP0/CPU0:router# clear qos counters shared-policy-instance ethernet101 input location 0/1/CPU0

### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>service-policy (interface BNG), on page 226</td>
<td>Attaches a policy map to an input interface or output interface to be used as the service policy for that interface.</td>
</tr>
<tr>
<td>show policy-map shared-policy-instance, on page 174</td>
<td>Displays the statistics for all details of the shared policy instance.</td>
</tr>
</tbody>
</table>
clear qos counters interface

To clear QoS counters for a specified interface, use the `clear qos counters interface` command in EXEC mode.

```
clear qos counters interface {type | all} [{input | output} | nv | satellite satellite-id]
```

**Syntax Description**

- `type` Interface type. For more information, use the question mark (?) online help function.
- `all` Specifies all interfaces.
- `input` (Optional) Clears input QoS counters that are attached to the specified interface.
- `output` (Optional) Clears output QoS counters that are attached to the specified interface.
- `nv` Clears the statistics of the satellite access or fabric interfaces.
- `satellite` Clears the per class statistics on the inbound or outbound traffic for the specified satellite.
- `satellite-id` Clears the satellite statistics based on the specified satellite ID.

**Command Default**

No default behavior or values

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.2</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Release 3.9.0</td>
<td>The <code>interface</code> keyword was added.</td>
</tr>
<tr>
<td>Release 5.1.1</td>
<td>The <code>nv satellite</code> keywords and the <code>satellite-id</code> variable were added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `clear qos counters interface` command clears all input and output QoS counters that are attached to a specified interface, unless the `input` or `output` keyword is specified. If the `input` or `output` keyword is specified, only counters attached to the interface in a specified direction are cleared.

The MIB counters are not reset with this command.

**Note**

The `clear qos counters interface` command when executed on satellite may lead to unexpected behavior for QoS offload.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>qos</td>
<td>read, write</td>
</tr>
</tbody>
</table>
This example shows how to clear QoS counters attached to Gigabit Ethernet interface 0/1/0/9 on satellite 100:

```
RP/0/RSP0/CPU0:router# clear qos counters interface TenGigE 0/1/0/9 nv satellite 100
```

This example shows how to clear output QoS counters attached to interface 0/7/0/3 on satellite 100:

```
RP/0/RSP0/CPU0:router# clear qos counters interface 0/7/0/3 output nv satellite 100
```

This example shows how to clear output QoS counters attached to all interfaces on satellite 100:

```
RP/0/RSP0/CPU0:router# clear qos counters interface all output nv satellite 100
```
**encap-sequence**

To set the traffic class for traffic on multiclass multilink (MCMP) interfaces in the egress direction, use the **encap-sequence** command in class map configuration mode.

```
encap-sequence {class-id | none}
```

**Syntax Description**

- **class-id** (Optional) Encapsulation sequence number. Range is 1-15.
- **none** (Optional) No encapsulation sequence.

**Command Default**

No default behavior or values

**Command Modes**

Class map configuration

**Command History**

- **Release**
- **Modification**
  - Release 3.9.0  This command was introduced.

**Usage Guidelines**

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The **encap-sequence** command is not supported on class-default.

**Task ID**

```
Task ID  Operations
qos    read/write
```

**Examples**

The following example shows an encapsulation sequences set for three classes in one policy map:

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# policy-map policy1
RP/0/RSP0/CPU0:router(config-pmap)# class voice
RP/0/RSP0/CPU0:router(config-pmap-c)# priority level 1
RP/0/RSP0/CPU0:router(config-pmap-c)# police rate 128
RP/0/RSP0/CPU0:router(config-pmap-c)# encap-sequence none
RP/0/RSP0/CPU0:router(config-pmap-c)# class video
RP/0/RSP0/CPU0:router(config-pmap-c)# priority level 2
RP/0/RSP0/CPU0:router(config-pmap-c)# police 1000
RP/0/RSP0/CPU0:router(config-pmap-c)# encap-sequence 2
RP/0/RSP0/CPU0:router(config-pmap-c)# class mission-critical
```
RP/0/RSP0/CPU0:router(config-pmap-c)# bandwidth 1000
RP/0/RSP0/CPU0:router(config-pmap-c)# encap-sequence 1

### Related Commands

<tbody>
<tr>
<td><code>hw-module</code></td>
<td>Specifies the location of the hardware module</td>
</tr>
<tr>
<td><code>all</code></td>
<td>Indicates all nodes</td>
</tr>
<tr>
<td><code>qos-mode</code></td>
<td>Specifies the QoS mode</td>
</tr>
<tr>
<td><code>aggregate-bundle-mode</code></td>
<td>Specifies the bundle QoS aggregate mode as the QoS mode.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command Modes**

EXEC

**Command History**

Release 6.0.1  This command was introduced to enable aggregate bundle QoS.

**Usage Guidelines**

If the bundle has 2 Mbps policer and 4 interfaces, then each interface will have 512 Kbps policed bandwidth assigned. If one of the interfaces goes down, then the hardware policer gets modified to accommodate the remaining active interfaces, that is, it increases the policed rates of the remaining three active interfaces.

A line card reload is not required while configuring the `hw-module all qos-mode aggregate-bundle-mode` command.

The `hw-module all qos-mode aggregate-bundle-mode` and the `hw-module all qos-mode bundle-agg policer` commands cannot be executed at the same time.

**Examples**

The following example shows how to clear the qos counters for a specific shared policy instance:
RP/0/RSP0/CPU0:router# hw-module all qos-mode aggregate-bundle-mode

<table>
<thead>
<tr>
<th>Related Commands</th>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show qos aggregate-bundle-mode, on page 252</td>
<td>Shows aggregate bundle QoS.</td>
<td></td>
</tr>
</tbody>
</table>
show qos aggregate-bundle-mode

To show aggregate bundle QoS mode, use the `show qos aggregate-bundle-mode` command in EXEC mode.

```
show qos aggregate-bundle-mode
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>qos</td>
<td>Specifies the type of QoS</td>
</tr>
<tr>
<td>aggregate-bundle-mode</td>
<td>Specifies aggregate bundle QoS as the mode</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0.1</td>
<td>This command was introduced to show aggregate bundle QoS mode.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You must be in a user group associated with a task group that includes the proper task IDs. The command reference guides include the task IDs required for each command. If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>qos</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to clear the qos counters for a specific shared policy instance:

```
RP/0/RSP0/CPU0:router# show qos aggregate-bundle-mode
```

<tr>
<td>#unique_120</td>
<td></td>
</tr>
</tbody>
</table>
hw-module all qos-mode bundle-agg policer

This command enables sharing of the same policer bucket between members of the bundle interface in the same NP. To enable bundle aggregate policer QoS mode, use the `hw-module all qos-mode bundle-agg-policer` command in EXEC mode. To remove configuration of bundle QoS aggregate policer mode, use the no form of the command.

```
hw-module all qos-mode bundle-agg-policer
no hw-module all qos-mode bundle-agg-policer
```

### Syntax Description

- **hw-module**
  - Specifies the location of the hardware module

- **all**
  - Indicates all nodes

- **qos-mode**
  - Specifies the QoS mode

- **bundle-agg-policer**
  - Specifies the bundle QoS aggregate policer as the QoS mode

### Command Default

None

### Command Modes

EXEC

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 6.4.1</td>
<td>This command was introduced to enable bundle aggregate policer on QoS.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

A line card reload is required while executing the `hw-module all qos-mode bundle-agg policer` command. The `hw-module all qos-mode aggregate-bundle-mode` and the `hw-module all qos-mode bundle-agg policer` commands cannot be executed at the same time.

The `hw-module all qos-mode bundle-agg policer` and the Shared Policy Instance feature cannot be configured together.

### Examples

The following example shows how to clear the qos counters for a specific shared policy instance:

```
RP/0/RSP0/CPU0:router# hw-module all qos-mode aggregate-bundle-mode
```

### Related Commands

<td>Shows aggregate bundle QoS.</td>
</tr>
</tbody>
</table>
Deployment Scenarios Commands

This chapter provides commands used for QoS implementation of features that are described in other technology books, such as MPLS, L2VPN.

To use commands of this module, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using any command, contact your AAA administrator for assistance.

For detailed deployment scenarios, see the Modular QoS Configuration Guide for Cisco ASR 9000 Series Routers.

- random-detect discard-class, on page 256
- set cos, on page 258
random-detect discard-class

To configure the Weighted Random Early Detection (WRED) thresholds for packets with a specific discard class value, use the `random-detect discard-class` command in policy map class configuration mode. To return the thresholds to the default for the discard class, use the `no` form of this command.

```
random-detect discard-class discard-value min-threshold [units] max-threshold [units]
no random-detect discard-class discard-value min-threshold [units] max-threshold [units]
```

**Syntax Description**

- **discard-value**: Discard class value. Valid values are from 0 to 7. Up to eight values can be entered separated by commas.
- **min-threshold**: Minimum threshold in number of packets. The value range of this argument is from 0 to 1073741823 in bytes.
- **max-threshold**: Maximum threshold in number of packets. The value range of this argument is from the value of the `min-threshold` argument to 1073741823. When the average queue length exceeds the maximum threshold, WRED drops all packets with the specified discard class value.
- **units**: (Optional) Units for the threshold values. Values can be:
  - bytes—bytes
  - gbytes—gigabytes
  - kbytes—kilobytes
  - mbytes—megabytes
  - ms—milliseconds
  - packets—packets (default)
  - us—microseconds

**Command Default**

Default unit for `max-threshold` and `min-threshold` is **packets**.

**Command Modes**

Policy map class configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

WRED is a congestion avoidance mechanism that slows traffic by randomly dropping packets when congestion exists. WRED is most useful with protocols like TCP that respond to dropped packets by decreasing the transmission rate.

When you configure the `random-detect discard-class` command on an interface, packets are given preferential treatment based on the discard class of the packet.

When the value of the **units** argument is packets, packets are assumed to be 256 bytes in size.
### Examples

This example shows how to set the discard class values for discard class 3 to a minimum byte threshold of 1000000 and a maximum byte threshold of 2000000:

```
RP/0/RSP0/CPU0:router(config)# policy-map policy1
RP/0/RSP0/CPU0:router(config-pmap)# class class1
RP/0/RSP0/CPU0:router(config-pmap-c)# random-detect discard-class 3 1000000 2000000
```

### Related Commands

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td><code>class (policy-map), on page 45</code></td>
<td>Specifies the name of the class whose policy you want to create or change.</td>
</tr>
<tr>
<td><code>policy-map, on page 138</code></td>
<td>Creates or modifies a policy map that can be attached to one or more interfaces to specify a service policy.</td>
</tr>
<tr>
<td><code>random-detect precedence, on page 222</code></td>
<td>Configures the Weighted Random Early Detection (WRED) thresholds for packets with a particular IP precedence.</td>
</tr>
<tr>
<td><code>show policy-map interface, on page 166</code></td>
<td>Displays policy configuration information for all classes configured for all service policies on the specified interface.</td>
</tr>
</tbody>
</table>
set cos

To set the Layer 2 class of service (CoS) value of an outgoing packet, use the `set cos` command in policy map class configuration mode. To remove a specific CoS value setting, use the `no` form of this command.

```
set cos [inner] cos-value
no set cos [inner] cos-value
```

**Syntax Description**

- **inner** *(Optional)* Specifies the inner CoS in, for example, a QinQ configuration.
- **cos-value** Specific IEEE 802.1Q CoS value from 0 to 7.

**Command Default**

No Layer 2 CoS value of an outgoing packet is set.

**Command Modes**

Policy map class configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `set cos` command to mark a packet that is being sent to a switch. Switches can leverage Layer 2 header information, including a CoS value marking.

For Layer 3, the `set cos` command can be used only in service policies that are attached in the output direction of an interface. Packets entering an interface cannot be set with a CoS value.

**Examples**

In this example, the policy map called `cos-set` is created to assign different CoS values for different service classes, and then is attached to the output GigabitEthernet subinterface 0/1/0/9.100 VLAN.

```
RP/0/RSP0/CPU0:router(config)# policy-map cos-set
RP/0/RSP0/CPU0:router(config-pmap)# class class1
RP/0/RSP0/CPU0:router(config-pmap-c)# set cos 1
RP/0/RSP0/CPU0:router(config-pmap-c)# exit
RP/0/RSP0/CPU0:router(config-pmap)# class class2
RP/0/RSP0/CPU0:router(config-pmap-c)# set cos 2
RP/0/RSP0/CPU0:router(config-pmap-c)# exit
RP/0/RSP0/CPU0:router(config-pmap)# exit
RP/0/RSP0/CPU0:router(config)# interface gigabitethernet 0/1/0/9.100
RP/0/RSP0/CPU0:router(config-subif)# service-policy output cos-set
```
