

# Packet Classification Commands

This chapter describes the commands used for QoS packet classification.

To use commands of this module, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using any command, contact your AAA administrator for assistance.

For detailed information about Packet Classification concepts, configuration tasks and examples, see the Configuring Modular QoS Service Packet Classification and Marking chapter in the *Modular QoS Configuration Guide for Cisco ASR 9000 Series Routers*.

## class (policy-map)

To specify the name of the class whose policy you want to create or change, use the **class** command in policy map configuration mode. To remove a class from the policy map, use the **no** form of this command.

```
class [type qos] {class-name | class-default}
no class [type qos] {class-name | class-default}
```

### Syntax Description

<b>type qos</b>	(Optional) Specifies a quality-of-service (QoS) class.
<i>class-name</i>	Name of the class for which you want to configure or modify policy.
<b>class-default</b>	Configures the default class.

### Command Default

No class is specified.  
Type is QoS when not specified.

### Command Modes

Policy map configuration

### Command History

Release	Modification
Release 3.7.2	This command was introduced.

### Usage Guidelines

Within a policy map, the **class (policy-map)** command can be used to specify the name of the class whose policy you want to create or change. The policy map must be identified first.

To identify the policy map (and enter the required policy map configuration mode), use the **policy-map** command before you use the **class (policy-map)** command. After you specify a policy map, you can configure the policy for new classes or modify the policy for any existing classes in that policy map.

### Usage Guidelines

The class name that you specify in the policy map ties the characteristics for that class—that is, its policy—to the class map and its match criteria, as configured using the **class-map** command.

The **class-default** keyword is used for configuring default classes. It is a reserved name and cannot be used with user-defined classes. It is always added to the policy map (type qos) even if the class is not configured. For example, the following configuration shows that the class has not been configured, but the running configuration shows 'class class-default'.

```
RP/0/RSP0/CPU0:router(config)# policy-map pm1
RP/0/RSP0/CPU0:router(config-pmap)# end-policy-map
RP/0/RSP0/CPU0:router(config)# end
!
RP/0/RSP0/CPU0:router# show running-config
!
policy-map pm1
  class class-default
  !
end-policy-map
!
```

Task ID	Task ID	Operations
	qos	read, write

### Examples

This example shows how to create a policy map called policy1, which is defined to shape class1 traffic at 30 percent and default class traffic at 20 percent.

```
RP/0/RSP0/CPU0:router(config)# class-map class1
RP/0/RSP0/CPU0:router(config-cmap)# match precedence 3
RP/0/RSP0/CPU0:router(config)# policy-map policy1
RP/0/RSP0/CPU0:router(config-pmap)# class class1
RP/0/RSP0/CPU0:router(config-pmap-c)# shape average 100 mbps
RP/0/RSP0/CPU0:router(config-pmap-c)# exit
RP/0/RSP0/CPU0:router(config-pmap)# class class-default
RP/0/RSP0/CPU0:router(config-pmap-c)# shape average 50 mbps
```

The default class is used for packets that do not satisfy configured match criteria for class1. Class1 must be defined before it can be used in policy1, but the default class can be directly used in a policy map, as the system defines it implicitly.

Related Commands	Command	Description
	<a href="#">class-map, on page 5</a>	Defines a traffic class and the associated rules that match packets to the class.
	<a href="#">policy-map</a>	Creates or modifies a policy map that can be attached to one or more interfaces to specify a service policy.

# class-map

To define a traffic class and the associated rules that match packets to the class, use the **class-map** command in Global Configuration mode. To remove an existing class map from the router, use the **no** form of this command.

```
class-map [type [traffic | qos]] [match-all] [match-any] class-map-name
no class-map [type [traffic | qos]] [match-all] [match-any] class-map-name
```

<b>Syntax Description</b>	<b>type qos</b>	(Optional) Specifies a quality-of-service (QoS) class-map.
	<b>traffic</b>	(Optional) Specifies traffic type class-map.
	<b>match-all</b>	(Optional) Specifies a match on all of the match criteria.
	<b>match-any</b>	(Optional) Specifies a match on any of the match criteria. This is the default.
	<i>class-map-name</i>	Name of the class for the class map. The class name is used for the class map and to configure policy for the class in the policy map. The class name can be a maximum of 63 characters, must start with an alphanumeric character, and in addition to alphanumeric characters, can contain any of the following characters: . _ @ \$ % +   # : ; - =

**Command Default** Type is QoS when not specified.

**Command Modes** Global Configuration mode

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	Release 3.7.2	This command was introduced.

**Usage Guidelines** The **class-map** command specifies the name of the class for which you want to create or modify class map match criteria. Use of this command enables class map configuration mode in which you can enter any **match** command to configure the match criteria for this class. Packets arriving on the interface are checked against the match criteria configured for a class map to determine if the packet belongs to that class.

These commands can be used in a class map:

- **match access-group**
- **match atm**
- **match [not] cos**
- **match destination-address**
- **match [not] discard-class**
- **match [not] dscp**
- **match frame-relay dlci**
- **match [not] mpls experimental topmost**
- **match [not] precedence**
- **match precedence**
- **match [not] protocol**
- **match [not] qos-group**

- **match source-address**
- **match vlan** *vlan-id*
- **match vpls**

Task ID	Task ID	Operations
	qos	read, write

Examples

This example shows how to specify class101 as the name of a class and defines a class map for this class. The packets that match the access list 101 are matched to class class101.

```
RP/0/RSP0/CPU0:router(config)# class-map class101
RP/0/RSP0/CPU0:router(config-cmap)# match access-group ipv4 101
```

# end-class-map

To end the configuration of match criteria for the class and to exit class map configuration mode, use the **end-class-map** command in class map configuration mode.

## end-class-map

<b>Syntax Description</b>	This command has no keywords or arguments.
---------------------------	--

<b>Command Default</b>	No default behavior or values
------------------------	-------------------------------

<b>Command Modes</b>	Class map configuration
----------------------	-------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	Release 3.7.2	This command was introduced.

<b>Usage Guidelines</b>	No specific guidelines impact the use of this command.
-------------------------	--

<b>Task ID</b>	<b>Task ID</b>	<b>Operations</b>
	qos	read, write

<b>Examples</b>	This example shows how to end the class map configuration and exit class map configuration mode:
-----------------	--

```
RP/0/RSP0/CPU0:router(config)# class-map class101
RP/0/RSP0/CPU0:router(config-cmap)# match access-group ipv4 101
RP/0/RSP0/CPU0:router(config-cmap)# end-class-map
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<a href="#">class-map, on page 5</a>	Defines a traffic class and the associated rules that match packets to the class.

# end-policy-map

To end the configuration of a policy map and to exit policy map configuration mode, use the **end-policy-map** command in policy map configuration mode.

## end-policy-map

<b>Syntax Description</b>	This command has no keywords or arguments.
---------------------------	--

<b>Command Default</b>	No default behavior or values
------------------------	-------------------------------

<b>Command Modes</b>	Policy map configuration
----------------------	--------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	Release 3.7.2	This command was introduced.

<b>Usage Guidelines</b>	No specific guidelines impact the use of this command.
-------------------------	--

<b>Task ID</b>	<b>Task ID</b>	<b>Operations</b>
	qos	read, write

<b>Examples</b>	This example shows how to end the policy map configuration and exit policy map configuration mode.
-----------------	--

```
RP/0/RSP0/CPU0:router(config)# policy-map policy1
RP/0/RSP0/CPU0:router(config-pmap)# class class1
RP/0/RSP0/CPU0:router(config-pmap-c)# police rate 250
RP/0/RSP0/CPU0:router(config-pmap-c)# set precedence 3
RP/0/RSP0/CPU0:router(config-pmap)# end-policy-map
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<a href="#">policy-map</a>	Creates or modifies a policy map that can be attached to one or more interfaces to specify a service policy.

# exceed-action

To configure the action to take on packets that exceed the rate limit, use the **exceed-action** command in policy map police configuration mode. To remove an exceed action from the policy-map, use the **no** form of this command.

**exceed-action** [{**drop** | **set** *options* | **transmit**}]  
**no exceed-action** [{**drop** | **set** *options* | **transmit**}]

<b>Syntax Description</b>	<p><b>drop</b> (Optional) Drops the packet.</p> <hr/> <p><b>set options</b> Configures the specified packet properties. Replace <i>options</i> with one of the following keywords or keyword arguments:</p> <ul style="list-style-type: none"> <li>• <b>atm-clp value</b> —Sets the cell loss priority (CLP) bit.</li> <li>• <b>cos [inner] value</b> —Sets the class of service value. Range is 0 to 7.</li> <li>• <b>cos value</b> —Sets the class of service value. Range is 0 to 7.</li> <li>• <b>dei</b> —Sets the drop eligible indicator (DEI). Can be 0 or 1.</li> <li>• <b>discard-class value</b> —Sets the discard class value. Range is 0 to 7.</li> <li>• <b>dscp value</b> —Sets the differentiated services code point (DSCP) value and sends the packet. See <a href="#">Table 1: IP DSCP Reserved Keywords, on page 33</a> for a list of valid values.</li> <li>• <b>dscp [tunnel] value</b> —Sets the differentiated services code point (DSCP) value and sends the packet. See <a href="#">Table 1: IP DSCP Reserved Keywords, on page 33</a> for a list of valid values. With the <b>tunnel</b> keyword, the DSCP is set in the outer header.</li> <li>• <b>fr-de value</b> —Sets the Frame Relay discard eligible (DE) bit on the Frame Relay frame then transmits that packet. In congested environments, frames with the DE bit set to 1 are discarded before frames with the DE bit set to 0. The frame relay DE bit has only one bit and has only two settings, 0 or 1. The default DE bit setting is 0.</li> <li>• <b>mpls experimental {topmost   imposition} value</b> —Sets the experimental (EXP) value of the Multiprotocol Label Switching (MPLS) packet topmost label or imposed label. Range is 0 to 7.</li> <li>• <b>precedence precedence</b> —Sets the IP precedence and sends the packet. See <a href="#">Table 2: IP Precedence Values and Names, on page 38</a> for a list of valid values.</li> <li>• <b>precedence [tunnel] precedence</b> —Sets the IP precedence and sends the packet. See <a href="#">Table 2: IP Precedence Values and Names, on page 38</a> for a list of valid values. With the <b>tunnel</b> keyword, the precedence is set in the outer header.</li> <li>• <b>qos-group value</b> —Sets the QoS group value.</li> <li>• <b>qos-group value</b> —Sets the QoS group value. Range is 0 to 63.</li> <li>• <b>srp-priority value</b> —Sets the Spatial Reuse Protocol (SRP) priority. Range is 0 to 7.</li> </ul> <hr/> <p><b>transmit</b> (Optional) Transmits the packets.</p> <hr/>
<b>Command Default</b>	By default, if no action is configured on a packet that exceeds the rate limit, the packet is dropped.
<b>Command Modes</b>	Policy map police configuration

Command History	Release	Modification
	Release 3.7.2	This command was introduced.
	Release 4.0.0	The <b>set dei</b> keyword was added.

**Usage Guidelines** For more information regarding the traffic policing feature, see the [police rate](#) command. The **set dei** action in policy maps is supported on 802.1ad packets for:

- Ingress and egress
- Layer 2 subinterfaces
- Layer 2 main interfaces
- Layer 3 main interfaces

**Note** The set DEI action is ignored for traffic on interfaces that are not configured for 802.1ad encapsulation.

Task ID	Task ID	Operations
	qos	read, write

## Examples

In this example for MPLS, traffic policing is configured to drop traffic that exceeds the rate limit:

```
RP/0/RSP0/CPU0:router(config)# class-map class1
RP/0/RSP0/CPU0:router(config-cmap)# match mpls experimental topmost 0
RP/0/RSP0/CPU0:router(config-cmap)# exit

RP/0/RSP0/CPU0:router(config)# policy-map policy1
RP/0/RSP0/CPU0:router(config-pmap)# class class1
RP/0/RSP0/CPU0:router(config-pmap-c)# police rate 250 kbps burst 50
RP/0/RSP0/CPU0:router(config-pmap-c-police)# exceed-action drop
RP/0/RSP0/CPU0:router(config-pmap-c-police)# exit
RP/0/RSP0/CPU0:router(config-pmap-c)# exit
RP/0/RSP0/CPU0:router(config-pmap)# exit

RP/0/RSP0/CPU0:router(config)# interface pos 0/5/0/0
RP/0/RSP0/CPU0:router(config-if) service-policy input policy1
```

In this example, the police rate is set to 5 Mbps. Conforming traffic is marked with a DEI value of 0; traffic that exceeds the police rate is marked with a DEI value of 1.

```
RP/0/RSP0/CPU0:router(config)# policy-map lad-mark-dei
RP/0/RSP0/CPU0:router(config-pmap)# class cl
RP/0/RSP0/CPU0:router(config-pmap-c)# police rate 5 mbps
RP/0/RSP0/CPU0:router(config-pmap-c-police)# conform-action set dei 0
```

```
RP/0/RSP0/CPU0:router(config-pmap-c-police)# exceed-action set dei 1  
RP/0/RSP0/CPU0:router(config-pmap-c-police)# end-policy-map
```

Related Commands	Command	Description
	<a href="#">conform-action</a>	Configures the action to take on packets that conform to the rate limit.
	<a href="#">police rate</a>	Configures traffic policing and enters policy map police configuration mode.
	<a href="#">policy-map</a>	Creates or modifies a policy map that can be attached to one or more interfaces to specify a service policy.
	<a href="#">show policy-map interface</a>	Displays policy configuration information for all classes configured for all service policies on the specified interface.
	<a href="#">violate-action</a>	Configures the action to take on packets that violate the rate limit.

# hw-module qos-mode pwhe-aggregate-shaper

To enable co-existence mode, use the **hw-module qos-mode pwhe-aggregate-shaper** command in Global Configuration mode. To disable co-existence mode, use the **no** form of this command.

**Note** If you are running either on Cisco IOS XR or Cisco IOS XR 64 bit, use the **hw-module qos-mode pwhe-aggregate-shaper** command in Global configuration mode.

```
hw-module {all | location node-id} qos-mode pwhe-aggregate-shaper sub-interface {egress | ingress}
{non-queuing | queuing}
no hw-module {all | location node-id} qos-mode pwhe-aggregate-shaper sub-interface {egress |
ingress}
```

## Syntax Description

<b>all</b>	Specifies all location.
<b>location</b> <i>node-id</i>	Specifies location of a particular node. The <i>node-id</i> argument is entered in the rack/slot/module notation.
<b>qos-mode</b>	Configures QoS mode in hardware module ports. For more information on various QoS modes, use the question mark (?) online help function.
<b>pwhe-aggregate-shaper</b>	Configures PWHE aggregate shaper parameters.
<b>sub-interface</b>	Configures PWHE subinterface QoS policy co-existence mode.
<b>egress</b>	Configures PWHE co-existence mode in egress direction.
<b>ingress</b>	Configures PWHE co-existence mode in ingress direction.
<b>non-queuing</b>	Configures co-existence non-queuing mode.
<b>queuing</b>	Configures co-existence queuing mode.

## Command Default

None.

## Command Modes

Global Configuration mode

## Command History

Release	Modification
Release 6.1.2	Support for Cisco IOS XR 64 bit was added.
Release 5.1.1	This command was introduced.

## Usage Guidelines

This command indicates that the PWHE main interface policies can co-exist with subinterface policies.

The mode change takes effect immediately on a line card (LC) if there is no PWHE main or subinterface policy on the LC, otherwise LC reload is required.

**Note** To avoid LC reload we recommend that the mode change is performed when there is no policy applied on any PWHE main or subinterfaces.

The co-existence mode with subinterface queuing policies is known as co-existence queuing mode.

The co-existence mode with subinterface non-queuing policies is known as co-existence non-queuing mode.

Adding, deleting and in-place modification of the PWHE aggregate shaper are allowed regardless of presence of subinterface policies.

**hw-module { all | location *node-id* } qos-mode pwhe-aggregate-shaper sub-interface ingress queuing** will not be rejected if there are LCs in the chassis which do not support ingress queuing.

Use the **show qos pwhe-aggregate-shaper** command to view current configured mode and operating mode.

#### Task ID

Task ID	Operation
root-lr	read, write

#### Example

This example shows how to configure co-existence queuing mode in egress direction for all the line cards.

```
RP/0/RSP0/CPU0:router(config)# hw-module all qos-mode pwhe-aggregate-shaper sub-interface egress queuing
```

# match cac

To identify specified call admission control (CAC) fields as a match criteria in a class map, use the **match cac** command in class map configuration mode. To remove a specified CAC field from the matching criteria for a class map, use the **no** form of this command.

```
match cac {admitted | unadmitted} [ local ]
no match cac {admitted | unadmitted}
```

Syntax Description	<b>admitted</b>	Specifies the packets admitted by CAC action as the match criteria in a class map.
	<b>unadmitted</b>	Specifies the packets unadmitted by CAC action as the match criteria in a class map.
	<b>local</b>	Specified the CAC local.

**Command Default** No match criteria are specified.

**Command Modes** Class map configuration

Command History	<b>Release</b>	<b>Modification</b>
	Release 5.1.1	This command was introduced.

**Usage Guidelines** The **match cac** command specifies a call admission control field or action that is used as the match criteria against which packets are checked to determine if they belong to the class specified by the class map.

To use the **match cac** command, you must first enter the **class-map** command to specify the name of the class whose match criteria you want to establish.

Task ID	<b>Task ID</b>	<b>Operation</b>
	qos	read, write

This example shows how to configure admit class for CAC.

```
RP/0/RSP0/CPU0:router(config)# class-map match-all video
RP/0/RSP0/CPU0:router(config-cmap)# match cac admitted local
RP/0/RSP0/CPU0:router(config-cmap)# exit
```

# match cos

To identify specified class of service (CoS) values as a match criteria in a class map, use the **match cos** command in class map configuration mode. To remove a specified CoS class value from the matching criteria for a class map, use the **no** form of this command.

```
match [not] cos {cos-value [cos-value1 . . . cos-value7] | inner inner-cos-value [inner cos-value1 . . . inner cos-value7]}
```

```
no match [not] cos {cos-value [cos-value1 . . . cos-value7] | inner inner-cos-value [inner cos-value1 . . . inner cos-value7]}
```

<b>Syntax Description</b>	<b>not</b>	(Optional) Negates the specified match result.
	<i>cos-value</i>	Identifier that specifies the exact value from 0 to 7. Up to eight CoS identifiers can be specified to match packets.
	<b>inner</b>	(Optional) Specifies the inner CoS value in, for example, a QinQ configuration.
	<i>inner-cos-value</i>	Identifier that specifies the exact value from 0 to 7. Up to eight inner CoS identifiers can be specified to match packets.

<b>Command Default</b>	No match criteria are specified.
------------------------	----------------------------------

<b>Command Modes</b>	Class map configuration
----------------------	-------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	Release 3.7.2	This command was introduced.

<b>Usage Guidelines</b>	The <b>match cos</b> command specifies a class of service that is used as the match criteria against which packets are checked to determine if they belong to the class specified by the class map.
-------------------------	---

To use the **match cos** command, you must first enter the **class-map** command to specify the name of the class whose match criteria you want to establish. If you specify more than one **match cos** command in a class map, the values of subsequent match statements are added to the first **match cos** command.

The **match cos** command is supported on egress Layer 2 interfaces, Layer 2 subinterfaces, and Layer 3 physical interfaces. Layer 3 physical interfaces are supported, because it is possible for a Layer 3 interface to have underlying Layer 2 subinterfaces.

<b>Task ID</b>	<b>Task ID</b>	<b>Operations</b>
	qos	read, write

## Examples

This example shows how to configure the service policy called policy1 and attach service policy policy1 to an interface. In this example, class map cos146 evaluates all packets entering HundredGigE interface 0/7/0/0.100 for class of service values of 1, 4, or 6. If the incoming packet has been marked

with any of these CoS values, the packet is queued to the class queue with the bandwidth setting of 300 kbps.

```
RP/0/RSP0/CPU0:router(config)# class-map cos146
RP/0/RSP0/CPU0:router(config-cmap)# match cos 1 4 6
RP/0/RSP0/CPU0:router(config-cmap)# exit

RP/0/RSP0/CPU0:router(config)# policy-map policy1
RP/0/RSP0/CPU0:router(config-pmap)# class cos146
RP/0/RSP0/CPU0:router(config-pmap-c)# bandwidth 300
RP/0/RSP0/CPU0:router(config-pmap-c)# exit
RP/0/RSP0/CPU0:router(config-pmap)# exit

RP/0/RSP0/CPU0:router(config)# interface HundredGigE 0/7/0/0
RP/0/RSP0/CPU0:router(config-if)# service-policy input policy1
```

Related Commands	Command	Description
	<a href="#">class-map, on page 5</a>	Defines a traffic class and the associated rules that match packets to the class.
	<a href="#">policy-map</a>	Creates or modifies a policy map that can be attached to one or more interfaces to specify a service policy.
	<a href="#">set cos</a>	Sets the Layer 2 class of service (CoS) value of an outgoing packet.

# match vlan

To identify selected VLAN IDs as the match criteria for a class map, use the **match vlan** command in class map configuration mode. To remove VLAN ID match criteria from a class map, use the **no** form of this command.

```
match vlan [inner] vlanid [vlanid1 ... vlanid7]  
no match vlan [inner] vlanid [vlanid1 ... vlanid7]
```

Syntax Description	inner	(Optional) Specifies the inner VLAN for the match in, for example, a QinQ configuration.
	vlanid	VLAN identifier that specifies the exact value from 1 to 4094 or a range of values from 1 to 4094. Up to eight values can be specified in a match statement.
Command Default	No match criteria are specified.	
Command Modes	Class map configuration	
Command History	Release	Modification
	Release 3.7.2	This command was introduced.

**Usage Guidelines** The **match vlan** command specifies a VLAN ID that is used as the match criteria against which packets are checked to determine if they belong to the class specified by the class map.

To use the **match vlan** command, you must first enter the **class-map** command to specify the name of the class whose match criteria you want to establish. If you specify more than one **match vlan** command in a class map, up to eight values of the subsequent match statements are added to the first **match vlan** command, exceeding which, the statement is rejected.

This command is supported only on Layer 3 ingress.

<b>Task ID</b>	<b>Task ID</b>	<b>Operations</b>
	qos	read, write

## Examples

This example shows how to configure the service policy called policy1 and attach service policy policy1 to an interface. In this example, class map vlan1 evaluates all packets entering GigabitEthernet interface 0/1/0/0 for VLAN IDs of 1234, 1698, and all the VLAN IDs in the range 3000 to 4000. If the incoming packet has been marked with any of these VLAN IDs, the packet is queued to the class queue with the bandwidth setting of 300 kbps.

```
RP/0/RSP0/CPU0:router(config)# class-map vlan1  
RP/0/RSP0/CPU0:router(config-cmap)# match vlan 1234 1698 3000-4000  
RP/0/RSP0/CPU0:router(config-cmap)# exit  
RP/0/RSP0/CPU0:router(config)# policy-map policy1  
RP/0/RSP0/CPU0:router(config-pmap)# class vlan1
```

```

RP/0/RSP0/CPU0:router(config-pmap-c)# bandwidth 300
RP/0/RSP0/CPU0:router(config-pmap-c)# exit
RP/0/RSP0/CPU0:router(config-pmap)# exit
RP/0/RSP0/CPU0:router(config)# interface gigabitethernet 0/1/0/0
RP/0/RSP0/CPU0:router(config-if)# service-policy input policy1

```

## Related Commands

Command	Description
<a href="#">class-map, on page 5</a>	Defines a traffic class and the associated rules that match packets to the class.

# match ethertype

To identify selected Ethernet type fields as the match criteria for a class map, use the **match ethertype** command in class map configuration mode. To remove the Ethernet type fields match criteria from a class map, use the **no** form of this command.

**match ethertype** *ethertype\_field*  
**no match ethertype** *ethertype\_field*

<b>Syntax Description</b>	<p><i>ethertype_field</i> Ethernet type field that specifies the Ethernet service. Values can be:</p> <ul style="list-style-type: none"> <li>• &lt;1536-65535&gt;—Ethertype value; only 2054 (the value representing ARP) is supported.</li> <li>• <b>arp</b> —Match on address resolution protocol.</li> <li>• ipv4 (not supported).</li> <li>• ipv6 (not supported).</li> </ul> <p><b>Caution</b> If you specify any value other than the supported values, the system allows you to commit the configuration. However, if you try to commit a configuration that applies the policy-map (containing the invalid ethertype match) to an interface, the system rejects the commit action.</p>				
<b>Command Default</b>	No match criteria are specified.				
<b>Command Modes</b>	Class map configuration				
<b>Command History</b>	<table> <tr> <th>Release</th><th>Modification</th></tr> <tr> <td>Release 4.1.0</td><td>This command was introduced.</td></tr> </table>	Release	Modification	Release 4.1.0	This command was introduced.

## Example

This example shows how to configure Ethernet type:

```
RP/0/RSP0/CPU0:router(config)# class-map match-any arp_1
RP/0/RSP0/CPU0:router(config-cmap)# match ethertype arp
RP/0/RSP0/CPU0:router(config-cmap)# exit
```

 match ethertype**Related Commands**

Command	Description
<a href="#">class-map, on page 5</a>	Defines a traffic class and the associated rules that match packets to the class.

# match flow-key

To identify specified flow keys as a match criteria in a class map, use the **match flow-key** command in class map configuration mode. To remove a specified flow key from the matching criteria for a class map, use the **no** form of this command.

**match flow-key** [**5-tuple** | **dst-ip** | **src-ip** ] [**flow-cache**{**idle-timeout***period* | **none**} ]  
**no match flow-key**

<b>Syntax Description</b>	<b>5-tuple</b>	Specifies the 5 tuples to identify a flow. The 5 tuples required to define a flow are: source IP address, destination IP address, source port number, destination port number, and protocol.
	<b>dst-ip</b>	Specifies the destination IP address of the flow mask.
	<b>src-ip</b>	Specifies the source IP address of the flow mask.
	<b>flow-cache</b>	Configures the flow-cache parameters.
	<b>idle-timeout</b>	Specifies the maximum time of inactivity for a flow.
	<i>period</i>	Specifies the idle timeout period in seconds.
	<b>none</b>	Specifies that the flow does not expire.

<b>Command Default</b>	<ul style="list-style-type: none"> <li>• Default flow mask is 5-tuple.</li> <li>• Default idle timeout is 30s.</li> </ul>
------------------------	---

<b>Command Modes</b>	Class map configuration
----------------------	-------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	Release 5.1.1	This command was introduced.

<b>Usage Guidelines</b>	The <b>match flow-key</b> command specifies a flow mask that is used as the match criteria against which packets are checked to determine if they belong to the class specified by the class map.
-------------------------	---

<b>Task ID</b>	<b>Task ID</b>	<b>Operation</b>
	qos	read, write

This example shows how to configure the source IP address of the flow mask as the only flow tuple and a flow idle timeout of 200 seconds.

```
RP/0/RSP0/CPU0:router(config)# class-map match-all video1
RP/0/RSP0/CPU0:router(config-cmap)# match precedence 5
```

**match flow-key**

```
RP/0/RSP0/CPU0:router(config-cmap)# match flow-key src-ip flow-cache idle-timeout 200  
RP/0/RSP0/CPU0:router(config-cmap)# exit
```

## match fr-de

To match packets on the basis of the Frame Relay discard eligibility (DE) bit setting, use the **match fr-de** command in class-map configuration mode. To remove the match criterion, use the **no** form of this command.

**match fr-de** *fr-de-bit-value*  
**no match fr-de** *fr-de-bit-value*

Syntax Description	<div><div><div>not</div><div>(Optional) Negates the specified match result.</div></div><div><div>fr-de-bit-value</div><div>Specifies the Frame Relay DE bit. Value can be 1.</div></div></div>					
Command Default	Packets are not matched on the basis of the Frame Relay DE bit setting.					
Command Modes	Class map configuration mode					
Command History	<table><thead><tr><th>Release</th><th>Modification</th></tr></thead><tbody><tr><td>Release 4.0.0</td><td>This command was introduced</td></tr></tbody></table>		Release	Modification	Release 4.0.0	This command was introduced
Release	Modification					
Release 4.0.0	This command was introduced					
Usage Guidelines	This match criterion can be used under a subinterface (L2 PVC) using the <b>service-policy</b> command, and it is supported in the ingress direction only. This match criterion can also be used in hierarchical policy maps.					
Task ID	<table><thead><tr><th>Task ID</th><th>Operations</th></tr></thead><tbody><tr><td>qos</td><td>read, write</td></tr></tbody></table>		Task ID	Operations	qos	read, write
Task ID	Operations					
qos	read, write					
Examples	<p>The following example shows how to create a class called match-fr-de and match packets on the basis of the Frame Relay DE bit setting. Packets match Frame Relay DE bit 1.</p> <pre>RP/0/RSP0/CPU0:router(config)# class-map match-fr-de RP/0/RSP0/CPU0:router(config-cmap)# match fr-de 1 RP/0/RSP0/CPU0:router(config-cmap)# end</pre> <p>To match Frame Relay DE bit 0, use this configuration:</p> <pre>RP/0/RSP0/CPU0:router(config)# class-map match-not-fr-de RP/0/RSP0/CPU0:router(config-cmap)# match not fr-de 1 RP/0/RSP0/CPU0:router(config-cmap)# end</pre>					
Related Commands	Command	Description				
	<a href="#">set fr-de, on page 44</a>	Changes the discard eligible (DE) bit setting in the address field of a Frame Relay frame to 1 for all traffic leaving an interface.				

# match frame-relay dlci

To specify a Frame Relay packet data-link connection identifier (DLCI) number or number range as a match criterion in a class map, use the **match frame-relay dlci** command in class map configuration mode. To remove a previously specified DLCI number as a match criterion, use the **no** form of this command.

**match frame-relay dlci** [{*DlciStartDlci-EndDlci*}]  
**no match frame-relay dlci** [{*DlciStartDlci-EndDlci*}]

<b>Syntax Description</b>	<i>Dlci</i>	A DLCI number associated with the packet. Range is from 16 to 1007.
	<i>StartDlci-EndDlci</i>	A DLCI number range from 16 to 1007. Numbers are separated by a hyphen.
<b>Command Default</b>	No DLCI number is specified.	
<b>Command Modes</b>	Class map configuration	
<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	Release 4.0.0	This command was introduced.
<b>Usage Guidelines</b>	The match criterion for the <b>match frame-relay dlci</b> command can be used only on hierarchical policy maps.	
<b>Task ID</b>	<b>Task ID</b>	<b>Operations</b>
	qos	read, write

## Examples

The following example shows how to create the fr-dlci class map, and specify the Frame Relay DLCI number range 100-200 as a match criterion. Packets with DLCIs matching this criterion are placed in fr-dlci. In this example, class map fr-dlci evaluates all packets entering Packet-over-SONET/SDH (POS) interface 0/1/0/0.1 for DLCIs in the range from 100 through 200. If the incoming packet has been marked with the DLCI in the range from 100 through 200, the packet is queued to the class queue with the bandwidth setting of 300 kbps.

```
RP/0/RSP0/CPU0:router(config)# class-map fr-dlci
RP/0/RSP0/CPU0:router(config-cmap)# match frame-relay dlci 100-200
RP/0/RSP0/CPU0:router(config-cmap)# end
RP/0/RSP0/CPU0:router(config)# policy-map policy1
RP/0/RSP0/CPU0:router(config-pmap)# class fr-dlci
RP/0/RSP0/CPU0:router(config-pmap-c)# bandwidth 300
RP/0/RSP0/CPU0:router(config-pmap-c)# exit
RP/0/RSP0/CPU0:router(config-pmap)# exit

RP/0/RSP0/CPU0:router(config)# interface pos 0/1/0/0.1
RP/0/RSP0/CPU0:router(config)# service-policy output policy1

RP/0/RSP0/CPU0:router(config)# interface pos 0/1/0/0.1 point-to-point pvc 16
```

```
RP/0/RSP0/CPU0:router(config-subif)# pvc 16  
RP/0/RSP0/CPU0:router(config-fr-vc)# service-policy output policy1
```

**Related Commands**

Command	Description
<a href="#">class-map, on page 5</a>	Defines a traffic class and the associated rules that match packets to the class.
<a href="#">match dscp, on page 32</a>	Configures a DSCP value as a match criterion.
<a href="#">policy-map</a>	Creates or modifies a policy map that can be attached to one or more interfaces to specify a service policy.
show frame-relay pvc	Displays statistics about Frame Relay permanent virtual circuits (PVCs).

# match access-group

To identify a specified access control list (ACL) number as the match criteria for a class map, use the **match access-group** command in class map configuration mode. To remove ACL match criteria from a class map, use the **no** form of this command.

```
match [not] access-group {ipv4 | ipv6 | ethernet-service} access-group-name
no match [not] access-group {ipv4 | ipv6 | ethernet-service} access-group-name
```

Syntax Description	<b>not</b>	(Optional) Negates the specified match result.
	<b>ipv4</b>	Specifies the name of the IPv4 access group to be matched.
	<b>ipv6</b>	Specifies the name of the IPv6 access group to be matched.
	<b>ethernet-service</b>	Specifies the name of the ethernet-service access group to be matched.
	<i>access-group-name</i>	ACL whose contents are used as the match criteria against which packets are checked to determine if they belong to this class.
Command Default	By default, if neither IPv6 nor IPv4 is specified as the match criteria for a class map, IPv4 addressing is used.	
Command Modes	Class map configuration	
Command History	<b>Release</b>	<b>Modification</b>
	Release 3.7.2	This command was introduced.
	Release 4.2.1	Support for IPv6 ACLs with source port matching was added in MQC policy maps.
	Release 6.0.1	The <b>ethernet-service</b> keyword was introduced.
Usage Guidelines	For class-based features (such as marking, Modified Deficit Round Robin [MDRR], and policing), you define traffic classes based on match criteria, including ACLs and input interfaces. Packets satisfying the match criteria for a class constitute the traffic for that class.	
	The <b>match access-group</b> command specifies an ACL whose contents are used as the match criteria against which packets are checked to determine if they belong to the class specified by the class map.	

Access Control Entries with TCP fields such as, SYN, ACK and FIN in the corresponding ACL are not supported.

To use the **match access-group** command, you must first enter the **class-map** command to specify the name of the class whose match criteria you want to establish. You can specify up to eight IPv4 and IPv6 ACLs in a match statement.

QoS classification based on the packet length or TTL (time to live) field in the IPv4 and IPv6 headers is not supported.

When an ACL list is used within a class-map, the deny action of the ACL is ignored and the traffic is classified based on the specified ACL match parameters.

#### Note

- You can provide multiple values in a configuration; only the first value is considered for the match criteria. Subsequent values indicated in the match statement are ignored for classification.
- The capture statements in an ethernet-service ACL are ignored.
- An ethernet-service ACL should have only permit statements. If there are any deny statements, the policy is rejected.
- If you specify a value for the **Ether-Type** keyword using the **match access-group ethernet-service** command, the value is ignored.

#### Task ID

Task ID	Operations
qos	read, write

#### Examples

This example shows how to specify a class map called map1 and configures map1 to be used as the match criteria for this class:

```
RP/0/RSP0/CPU0:router(config)# class-map map1
RP/0/RSP0/CPU0:router(config-cmap)# match access-group ipv4 map1
```

```
RP/0/RSP0/CPU0:router(config-cmap)# match access-group ethernet-service map1
```

#### Related Commands

Command	Description
<a href="#">class-map, on page 5</a>	Defines a traffic class and the associated rules that match packets to the class.
<a href="#">policy-map</a>	Creates or modifies a policy map that can be attached to one or more interfaces to specify a service policy.

# match destination-address

To identify a specific destination MAC address explicitly as a match criterion in a class map, use the **match destination-address** command in class map configuration mode. To remove a specific destination MAC address from the matching criteria for a class map, use the **no** form of this command.

**match destination-address** **mac** *address*  
**no match destination-address** **mac** *address*

<b>Syntax Description</b>	<b>mac</b>	Specifies a MAC address.
	<i>address</i>	Specifies a destination MAC address.
<b>Command Default</b>	No default behavior or values	
<b>Command Modes</b>	Class map configuration	
<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	Release 3.7.2	This command was introduced.

**Usage Guidelines** The **match destination-address** command specifies a destination address that is used as the match criteria against which packets are checked to determine if they belong to the class specified by the class map.

To use the **match destination-address** command, you must first enter the **class-map** command to specify the name of the class whose match criteria you want to establish. If you specify more than one **match destination-address** command in a class map, only the last command entered applies.

The **match destination-address** command is supported only on an output service policy.

Layer 2 match criteria on a Layer 3 target, or Layer 3 match criteria on a Layer 2 target, is not allowed. The **match destination-address** command is supported on egress Layer 2 interfaces, Layer 2 subinterfaces, and Layer 3 physical interfaces. Layer 3 physical interfaces are supported, because it is possible for a Layer 3 interface to have underlying Layer 2 subinterfaces.

The command is allowed on a policy map that is attached to an Ethernet interface. The command is invalid on a policy that is attached to a Packet-over-SONET/SDH (POS) interface or a routed VLAN subinterface.

The match 48-bit MAC address is specified in xxxx.xxxx.xxxx format on L2VPN PE interfaces.

<b>Task ID</b>	<b>Task ID</b>	<b>Operations</b>
	qos	read, write

**Examples** This example shows how to match a destination MAC address:

```
RP/0/RSP0/CPU0:router(config)#class-map match-any A
RP/0/RSP0/CPU0:router(config-cmap)# match destination-address mac 000.f0d0.2356
```

**Related Commands**

Command	Description
<a href="#">class-map, on page 5</a>	Defines a traffic class and the associated rules that match packets to the class.

# match discard-class

To identify specific discard class values as a match criteria for a class map, use the **match discard-class** command in class map configuration mode. To remove specified discard class values from the matching criteria for a class map, use the **no** form of this command.

**match** [**not**] **discard-class** *discard-class-value* [*discard-class-value1* . . . *discard-class-value7*]  
**no match** [**not**] **discard-class** *discard-class-value* [*discard-class-value1* . . . *discard-class-value7*]

<b>Syntax Description</b>	<b>not</b>	(Optional) Negates the specified match result.
	<i>discard-class-value</i>	Discard class identifier. You can specify up to eight discard class identifiers to match packets. Class identifiers are separated by spaces. Range is 0 to 7.
<b>Command Default</b>	No default behavior or values	
<b>Command Modes</b>	Class map configuration	
<b>Command History</b>	<b>Command</b>	<b>Description</b>
	Release 3.7.2	This command was introduced.
<b>Usage Guidelines</b>	The <b>match discard-class</b> command specifies a discard class that is used as the match criteria against which packets are checked to determine if they belong to the class specified by the class map.	
	To use the <b>match discard-class</b> command, you must first enter the <b>class-map</b> command to specify the name of the class whose match criteria you want to establish. If you specify more than one <b>match discard-class</b> command in a class map, the new values are added to the existing match statement.	
	The <b>match discard-class</b> command sets the match criteria for examining discard classes marked on the packet. Up to eight discard class values can be matched in one match statement. For example, <b>match discard-class 0 1 2 3 4 5 6 7</b> returns matches for discard class values 0, 1, 2, 3, 4, 5, 6, and 7. Only one of the seven values is needed to yield a match (OR operation).	
	The discard class value is used as a matching criterion only. The value has no mathematical significance. For instance, the discard class value 2 is not greater than 1. The value simply indicates that a packet marked with the discard class of 2 should be treated differently than a packet marked with a discard class value of 1.	
	The <b>match discard-class</b> command is not supported on the Asynchronous Transfer Mode (ATM) interfaces.	

**Note** The **match discard-class** command is applied only for egress policies.

Task ID	Task ID	Operations
	qos	read, write

## Examples

This example shows a service policy called policy1 attached to an interface. In this example, class map discard class5 is created to evaluate all packets leaving GigabitEthernet 0/1/0/9 interface for a discard-class value of 5. Packets marked with the discard class value of 5 are queued to a class queue with the bandwidth setting 300 kbps.

```
RP/0/RSP0/CPU0:router(config)# class-map discard-class5
RP/0/RSP0/CPU0:router(config-cmap)# match discard-class 5
RP/0/RSP0/CPU0:router(config-cmap)# exit
RP/0/RSP0/CPU0:router(config)# policy-map policy1
RP/0/RSP0/CPU0:router(config-pmap)# class discard-class5
RP/0/RSP0/CPU0:router(config-pmap-c)# bandwidth 300
RP/0/RSP0/CPU0:router(config-pmap-c)# exit
RP/0/RSP0/CPU0:router(config-pmap)# exit
RP/0/RSP0/CPU0:router(config)# interface gigabitethernet 0/1/0/9
RP/0/RSP0/CPU0:router(config-if)# service-policy output policy1
```

# match dscp

To identify specific IP differentiated services code point (DSCP) values as match criteria for a class map, use the **match dscp** command in class map configuration mode. To remove a DSCP value from a class map, use the **no** form of this command.

```
match dscp [{ipv4 | ipv6}] dscp-value [dscp-value1 . . . dscp-value7] |[min-value - max-value]}
no match dscp [{ipv4 | ipv6}] dscp-value [dscp-value1 . . . dscp-value7] |[min-value - max-value]}

```

## Syntax Description

**not** (Optional) Negates the specified match result.

**ipv4** (Optional) Specifies the IPv4 DSCP value.

**ipv6** (Optional) Specifies the IPv6 DSCP value.

*dscp-value* IP DSCP value identifier that specifies the exact value or a range of values. Range is 0 - 63. Up to eight IP DSCP values can be specified to match packets. Reserved keywords can be specified instead of numeric values. [Table 1: IP DSCP Reserved Keywords, on page 33](#) describes the reserved keywords.

*min-value* Lower limit of DSCP range to match. Value range is 0 - 63.

*max-value* Upper limit of DSCP range to match. Value range is 0 - 63.

## Command Default

Matching on IP Version 4 (IPv4) and IPv6 packets is the default.

## Command Modes

Class map configuration

## Command History

Release	Modification
Release 3.7.2	This command was introduced.
Release 5.2.0	The <i>min-value</i> and <i>max-value</i> variables were added.

## Usage Guidelines

The **match dscp** command specifies a DSCP value that is used as the match criteria against which packets are checked to determine if they belong to the class specified by the class map.

To use the **match dscp** command, you must first enter the **class-map** command to specify the name of the class whose match criteria you want to establish. If you specify more than one **match dscp** command in a class map, only the last command entered applies.

The **match dscp** command examines the higher-order six bits in the type of service (ToS) byte of the IP header. Only one of the eight values is needed to yield a match (OR operation).

The command supports only eight IP DSCP values. If you try to configure more match statements after all the eight values are matched, the statements get rejected.

The IP DSCP value is used as a matching criterion only. The value has no mathematical significance. For instance, the IP DSCP value 2 is not greater than 1. The value simply indicates that a packet marked with the

IP DSCP value of 2 should be treated differently than a packet marked with an IP DSCP value of 1. The treatment of these marked packets is defined by the user through the setting of policies in policy map class configuration mode.

**Table 1: IP DSCP Reserved Keywords**

<b>DSCP Value</b>	<b>Reserved Keyword</b>
0	default
10	AF11
12	AF12

### Examples

This example shows how to configure the service policy called policy1 and attach service policy policy1 to an interface. In this example, class map dscp14 evaluates all packets entering Packet-over-SONET/SDH (POS) interface 0/1/0/0 for an IP DSCP value of 14. If the incoming packet has been marked with the IP DSCP value of 14, the packet is queued to the class queue with the bandwidth setting of 300 kbps.

```
RP/0/RSP0/CPU0:router(config)# class-map dscp14
RP/0/RSP0/CPU0:router(config-cmap)# match dscp ipv4 14
RP/0/RSP0/CPU0:router(config-cmap)# exit

RP/0/RSP0/CPU0:router(config)# policy-map policy1
RP/0/RSP0/CPU0:router(config-pmap)# class dscp14
RP/0/RSP0/CPU0:router(config-pmap-c)# bandwidth 300
RP/0/RSP0/CPU0:router(config-pmap-c)# exit
RP/0/RSP0/CPU0:router(config-pmap)# exit

RP/0/RSP0/CPU0:router(config)# interface pos 0/1/0/0
RP/0/RSP0/CPU0:router(config-if)# service-policy input policy1
```

# match mpls experimental topmost

To identify specific three-bit experimental (EXP) field values in the topmost Multiprotocol Label Switching (MPLS) label as match criteria for a class map, use the **match mpls experimental topmost** command in class map configuration mode. To remove experimental field values from the class map match criteria, use the **no** form of the command.

```
match [not] mpls experimental topmost exp-value [exp-value1 . . . exp-value7]  
no match [not] mpls experimental topmost exp-value [exp-value1 . . . exp-value7]
```

<b>Syntax Description</b>	<table> <tr> <td><b>not</b></td><td><b>not</b></td></tr> <tr> <td><i>exp-value</i></td><td>Experimental value that specifies the exact value from 0 to 7. Up to eight experimental values can be specified to match MPLS headers.</td></tr> </table>	<b>not</b>	<b>not</b>	<i>exp-value</i>	Experimental value that specifies the exact value from 0 to 7. Up to eight experimental values can be specified to match MPLS headers.
<b>not</b>	<b>not</b>

## Related Commands

Command	Description
<a href="#">class-map, on page 5</a>	Defines a traffic class and the associated rules that match packets to the class.
<a href="#">match dscp, on page 32</a>	Identifies specific IP differentiated services code point (DSCP) values as match criteria for a class map.
<a href="#">policy-map</a>	Creates or modifies a policy map that can be attached to one or more interfaces to specify a service policy.
<a href="#">set mpls experimental, on page 50</a>	Sets the experimental (EXP) value of the Multiprotocol Label Switching (MPLS) packet topmost or imposition labels.
<a href="#">show policy-map interface</a>	Displays policy configuration information for all classes configured for all service policies on the specified interface.

# match precedence

To identify IP precedence values as match criteria, use the **match precedence** command in class map configuration mode. To remove precedence values from a class map, use the **no** form of this command.

```
match [not] precedence [{ipv4 | ipv6}] precedence-value [precedence-value1 . . . precedence-value7]  
no match [not] precedence [{ipv4 | ipv6}] precedence-value [precedence-value1 . . .  
precedence-value7]
```

<b>Syntax Description</b>	<b>not</b>	(Optional) Negates the specified match result.
	<b>ipv4</b>	(Optional) Specifies the IPv4 precedence value.
	<b>ipv6</b>	(Optional) Specifies the IPv6 precedence value.
	<i>precedence-value</i>	An IP precedence value identifier that specifies the exact value. Range is from 0 to 7. Reserved keywords can be specified instead of numeric values. <a href="#">Table 2: IP Precedence Values and Names, on page 38</a> describes the reserved keywords.  Up to eight precedence values can be matched in one match statement.

**Command Default** Matching on both IP Version 4 (IPv4) and IPv6 packets is the default.

**Command Modes** Class map configuration

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	Release 3.7.2	This command was introduced.

**Usage Guidelines** The **match precedence** command specifies a precedence value that is used as the match criteria against which packets are checked to determine if they belong to the class specified by the class map.

To use the **match precedence** command, you must first enter the **class-map** command to specify the name of the class whose match criteria you want to establish. If you specify more than one **match precedence** command in a class map, only the last command entered applies.

The **match precedence** command examines the higher-order three bits in the type of service (ToS) byte of the IP header. Up to eight precedence values can be matched in one match statement. For example, **match precedence ipv4 0 1 2 3 4 5 6 7** returns matches for IP precedence values of 0, 1, 2, 3, 4, 5, 6, and 7. Only one of the eight values is needed to yield a match (OR operation).

The precedence values are used as a matching criterion only. The value has no mathematical significance. For instance, the precedence value 2 is not greater than 1. The value simply indicates that a packet marked with the precedence value of 2 is different than a packet marked with the precedence value of 1. The treatment of these different packets is defined by the user through the setting of QoS policies in policy map class configuration mode.

This table lists the IP precedence value number and associated name in descending order of importance.

Table 2: IP Precedence Values and Names

Value	Name
0	routine
1	priority
2	immediate
3	flash
4	flash-override
5	critical
6	internet
7	network
ipv4	ipv4 precedence
ipv6	ipv6 precedence

**Task ID****Task ID      Operations**

write

**Examples**

This example shows how to configure the service policy called policy1 and attach service policy policy1 to an interface. In this example, class map ipprec5 evaluates all packets entering GigabitEthernet interface 0/1/0/9 for a precedence value of 5. If the incoming packet has been marked with the precedence value of 5, the packet is queued to the class queue with the bandwidth setting 300 kbps.

```
RP/0/RSP0/CPU0:router# configure
RP/0/RSP0/CPU0:router(config)# class-map ipprec5
RP/0/RSP0/CPU0:router(config-cmap)# match precedence ipv4 5
RP/0/RSP0/CPU0:router(config-cmap)# exit
RP/0/RSP0/CPU0:router(config)# policy-map policy1
RP/0/RSP0/CPU0:router(config-pmap)# class ipprec5
RP/0/RSP0/CPU0:router(config-pmap-c)# bandwidth 300
RP/0/RSP0/CPU0:router(config-pmap-c)# exit
RP/0/RSP0/CPU0:router(config-pmap)# exit
RP/0/RSP0/CPU0:router(config)# interface gigabitethernet 0/1/0/9
RP/0/RSP0/CPU0:router(config-if)# service-policy input policy1
```

Related Commands	Command	Description
	<a href="#">class-map, on page 5</a>	Defines a traffic class and the associated rules that match packets to the class.
	<a href="#">policy-map</a>	Creates or modifies a policy map that can be attached to one or more interfaces to specify a service policy.
	<a href="#">set precedence, on page 52</a>	Sets the precedence value in the IP header.
	<a href="#">show policy-map interface</a>	Displays policy configuration information for all classes configured for all service policies on the specified interface.

# match protocol

To identify a specific protocol as the match criterion for a class map, use the **match protocol** command in class map configuration mode. To remove protocol-based match criteria from a class map, use the **no** form of this command.

**match** [**not**] **protocol** {*protocol-value* [*protocol-value1* . . . *protocol-value7*] | [*min-value* - *max-value*]}

**no match** [**not**] **protocol** {*protocol-value* [*protocol-value1* . . . *protocol-value7*] | [*min-value* - *max-value*]}

<b>Syntax Description</b>	<b>not</b>	(Optional) Negates the specified match result.
	<i>protocol-value</i>	A protocol identifier. A single value for <i>protocol-value</i> (any combination of numbers and names) can be matched in one match statement.
	<i>min-value</i>	Lower limit of protocol range to match. Value range is 0 - 255.
	<i>max-value</i>	Upper limit of protocol range to match. Value range is 0 - 255.

**Command Default** No default behavior or values

**Command Modes** Class map configuration

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	Release 3.7.2	This command was introduced.
	Release 5.2.0	The <i>min-value</i> and <i>max-value</i> variables were added.

**Usage Guidelines** Definitions of traffic classes are based on match criteria, including protocols, access control lists (ACLs), input interfaces, QoS labels, and experimental (EXP) field values. Packets satisfying the match criteria for a class constitute the traffic for that class.

The **match protocol** command specifies the name of a protocol to be used as the match criteria against which packets are checked to determine if they belong to the class specified by the class map. Available protocol names are listed in the table that follows.

The *protocol-value* argument supports a range of protocol numbers. After you identify the class, you may use the **match protocol** command to configure its match criteria.

**Table 3: Protocol Names and Descriptions**

Name	Description
ahp	Authentication Header Protocol
eigrp	Cisco Enhanced Interior Gateway Routing Protocol
esp	Encapsulation Security Payload

Name	Description
gre	Cisco Generic Routing Encapsulation Tunneling
icmp	Internet Control Message Protocol
igmp	Internet Gateway Message Protocol
igrp	Cisco IGRP Routing protocol
ipinip	IP in IP tunneling
ipv4	Any IPv4 protocol
ipv6	Any IPv6 protocol
mpls	Any MPLS packet
nos	KA9Q NOS Compatible IP over IP Tunneling
ospf	Open Shortest Path First, Routing Protocol
pcp	Payload Compression Protocol
pim	Protocol Independent Multicast
sctp	Stream Control Transmission Protocol
tcp	Transport Control Protocol
udp	User Datagram Protocol

**Task ID**

Task ID	Operations
---------	------------

qos	read, write
-----	----------------

**Examples**

In this example, all TCP packets belong to class class1:

```
RP/0/RSP0/CPU0:router(config)# class-map class1
RP/0/RSP0/CPU0:router(config-cmap)# match protocol tcp
```

# match qos-group

To identify specific quality-of-service (QoS) group values as match criteria in a class map, use the **match qos-group** command in class map configuration mode. To remove a specific QoS group value from the matching criteria for a class map, use the **no** form of this command.

**match** [**not**] **qos-group** [*qos-group-value 1* . . . *qos-group-value8*]  
**no match** [**not**] **qos-group**

<b>Syntax Description</b>	<b>not</b>	(Optional) Negates the specified match result.
	<i>qos-group-value</i>	QoS group value identifier that specifies the exact value from 0 to 63 or a range of values from 0 to 63. Up to eight values can be entered in one match statement.
<b>Command Default</b>	No match criteria are specified.	
<b>Command Modes</b>	Class map configuration	
<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	Release 3.7.2	This command was introduced.
<b>Usage Guidelines</b>	The <b>match qos-group</b> command sets the match criteria for examining QoS groups marked on the packet. Up to eight QoS group values can be matched in one match statement. For example, <b>match qos-group 4 9 11 15 16 21 30 31</b> returns matches for QoS group values of 4, 9, 11, 15, 16, 21, 30, and 31. Only one of the eight values is needed to yield a match (OR operation).	
	The QoS group value is used as a matching criterion only. The value has no mathematical significance. For instance, the QoS group value 2 is not greater than 1. The value simply indicates that a packet marked with the QoS group value of 2 should be treated differently than a packet marked with a QoS group value of 1. The treatment of these different packets is defined using the <b>service-policy</b> command in policy map class configuration mode.	
	The QoS group setting is limited in scope to the local router. Typically, the QoS group is set on the local router and is used in conjunction with WRED or MDRR to give differing levels of service based on the group identifier.	
	The <b>match qos-group</b> command is supported only on egress policies.

## Examples

This example shows a service policy called policy1 attached to an interface. In this example, class map qosgroup5 will evaluate all packets leaving GigabitEthernet interface 0/1/0/9 for a QoS group value of 5. If the packet has been marked with the QoS group value of 5, the packet is queued to the class queue with the bandwidth setting 300 kbps.

```

RP/0/RSP0/CPU0:router(config)# class-map qosgroup5
RP/0/RSP0/CPU0:router(config-cmap)# match qos-group 5
RP/0/RSP0/CPU0:router(config-cmap)# exit
RP/0/RSP0/CPU0:router(config)# policy-map policy1
RP/0/RSP0/CPU0:router(config-pmap)# class qosgroup5
RP/0/RSP0/CPU0:router(config-pmap-c)# bandwidth 300
RP/0/RSP0/CPU0:router(config-pmap-c)# exit
RP/0/RSP0/CPU0:router(config-pmap)# exit
RP/0/RSP0/CPU0:router(config)# interface gigabitethernet 0/1/0/9
RP/0/RSP0/CPU0:router(config-if)# service-policy input policy1

```

**Related Commands**

Command	Description
<a href="#">class-map, on page 5</a>	Defines a traffic class and the associated rules that match packets to the class.
<a href="#">policy-map</a>	Creates or modifies a policy map that can be attached to one or more interfaces to specify a service policy.
<a href="#">set discard-class, on page 46</a>	Sets the discard class and Quality of Service (QoS) group identifiers on IP Version 4 (IPv4) or Multiprotocol Label Switching (MPLS) packets.

## set fr-de

To change the discard eligible (DE) bit setting in the address field of a Frame Relay frame to 1 for all traffic leaving an interface, use the **set fr-de** command in policy map configuration mode. To remove the DE bit setting, use the **no** form of this command.

```
set fr-de [fr-de-bit-value]
no set fr-de [fr-de-bit-value]
```

<b>Syntax Description</b>	<b>not</b> (Optional) Negates the specified match result.
	<i>fr-de-bit-value</i> (Optional) Specifies the Frame Relay DE bit. Value can be 0 or 1. Value can be 1.
<b>Command Default</b>	The default value is 0.
<b>Command Modes</b>	Policy map configuration
<b>Command History</b>	<b>Release</b> <b>Modification</b>
	Release 4.0.0 This command was introduced.
<b>Usage Guidelines</b>	To disable this command in a traffic policy, use the <b>no set fr-de</b> command in policy map configuration mode of the traffic policy.
	If the DE bit is already set to 1, no changes are made to the frame.
<b>Task ID</b>	<b>Task ID</b> <b>Operations</b>
	qos      read, write
<b>Examples</b>	<p>The following example shows how to set the DE bit using the <b>set fr-de</b> command in the traffic policy. The router sets the DE bit of outbound packets belonging to the ip-precedence class.</p> <pre>RP/0/RSP0/CPU0:router(config)# class-map ip-precedence RP/0/RSP0/CPU0:router(config-cmap)# match precedence 0 1 RP/0/RSP0/CPU0:router(config-cmap)# exit RP/0/RSP0/CPU0:router(config)# policy-map set-de RP/0/RSP0/CPU0:router(config-pmap)# class ip-precedence RP/0/RSP0/CPU0:router(config-pmap-c)# set fr-de 1 RP/0/RSP0/CPU0:router(config-pmap-c)# exit RP/0/RSP0/CPU0:router(config-pmap)# exit RP/0/RSP0/CPU0:router(config)# interface serial 0/1/0/0/1 RP/0/RSP0/CPU0:router(config-if)# no ip address RP/0/RSP0/CPU0:router(config-if)# encapsulation frame-relay RP/0/RSP0/CPU0:router(config-if)# interface serial 0/1/0/0.1 point-to-point RP/0/RSP0/CPU0:router(config-subif)# ip address 10.1.1.1 255.255.255.252</pre>

```
RP/0/RSP0/CPU0:router(config-subif)# pvc 16
RP/0/RSP0/CPU0:router(config-fr-vc)# service-policy output set-de
```

Related Commands	Command	Description
	<a href="#">policy-map</a>	Creates or modifies a policy map that can be attached to one or more interfaces to specify a service policy.

## set discard-class

To set the discard class and Quality of Service (QoS) group identifiers on IP Version 4 (IPv4) or Multiprotocol Label Switching (MPLS) packets, use the **set discard-class** command in policy map class configuration mode. To leave the discard-class values unchanged, use the **no** form of this command.

**set discard-class** *discard-class-value*  
**no set discard-class** *discard-class-value*

<b>Syntax Description</b>	<i>discard-class-value</i> Discard class ID. An integer from 0 to 7, to be marked on the packet.				
<b>Command Default</b>	No default behavior or values				
<b>Command Modes</b>	Policy map class configuration				
<b>Command History</b>	<table> <tr> <th>Release</th><th>Modification</th></tr> <tr> <td>Release 3.7.2</td><td>This command was introduced.</td></tr> </table>	Release	Modification	Release 3.7.2	This command was introduced.
Release	Modification				
Release 3.7.2	This command was introduced.				
<b>Usage Guidelines</b>	<p>The <b>set discard-class</b> command associates a discard class ID with a packet. After the discard class is set, other QoS services such as Modified Deficit Round Robin (MDRR) and Weighted Random Early Detection (WRED) can operate on the bit settings.</p> <p>Discard-class indicates the discard portion of the per hop behavior (PHB). The <b>set discard-class</b> command is typically used in Pipe mode. Discard-class is required when the input PHB marking is used to classify packets on the output interface.</p> <p>The discard-class values can be used to specify the type of traffic that is dropped when there is congestion.</p>				

**Note** Marking of the discard class has only local significance on a node.

Task ID	Task ID	Operations
	qos	read, write

### Examples

This example shows how to set the discard class value to 5 for packets that match the MPLS experimental bits 1:

```
RP/0/RSP0/CPU0:router(config)# class-map cust1
RP/0/RSP0/CPU0:router(config-cmap)# match mpls experimental topmost 1
RP/0/RSP0/CPU0:router(config-cmap)# exit
RP/0/RSP0/CPU0:router(config)# policy-map policy2
RP/0/RSP0/CPU0:router(config-pmap)# class cust1
RP/0/RSP0/CPU0:router(config-pmap-c)# set discard-class 5
RP/0/RSP0/CPU0:router(config-pmap-c)# exit
```

```
RP/0/RSP0/CPU0:router(config-pmap)# exit
RP/0/RSP0/CPU0:router(config)# interface gigabitethernet 0/1/0/9
RP/0/RSP0/CPU0:router(config-if)# service-policy input policy2
```

**Related Commands**

Command	Description
<a href="#">class-map, on page 5</a>	Defines a traffic class and the associated rules that match packets to the class.
<a href="#">policy-map</a>	Creates or modifies a policy map that can be attached to one or more interfaces to specify a service policy.
<a href="#">service-policy (interface)</a>	Attaches a policy map to an input interface or output interface to be used as the service policy for that interface.

# set dscp

To mark a packet by setting the IP differentiated services code point (DSCP) in the type of service (ToS) byte, use the **set dscp** command in policy-map class configuration mode. To remove a previously set DSCP value, use the **no** form of this command.

**set dscp** [**tunnel**] *dscp-value*  
**no set dscp** [**tunnel**] *dscp-value*

<b>Syntax Description</b>	<b>tunnel</b>	(Optional) Sets the DSCP on the outer IP header. This command is available on Layer 3 interfaces in the ingress direction.
		(Optional) Sets the DSCP on the outer IP header for IPsec tunnels.
	<i>dscp-value</i>	Number from 0 to 63 that sets the DSCP value. Reserved keywords can be specified instead of numeric values. <a href="#">Table 1: IP DSCP Reserved Keywords, on page 33</a> describes the reserved keywords.
<b>Command Default</b>	No default behavior or values	
<b>Command Modes</b>	Policy map class configuration	
<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	Release 3.7.2	This command was introduced.
	Release 3.9.1	The <b>tunnel</b> keyword on Layer 3 interfaces in the ingress direction was added.
<b>Usage Guidelines</b>	<p>After the DSCP bit is set, other quality-of-service (QoS) services can then operate on the bit settings. The network gives priority (or some type of expedited handling) to marked traffic. Typically, you set the DSCP value at the edge of the network (or administrative domain); data then is queued based on the DSCP value. Modified Deficit Round Robin (MDRR) can speed up handling for high DSCP traffic at congestion points. Weighted Random Early Detection (WRED) ensures that high DSCP traffic has lower loss rates than other traffic during times of congestion.</p> <p>Reserved keywords can be specified instead of numeric values. <a href="#">Table 1: IP DSCP Reserved Keywords, on page 33</a> describes the reserved keywords.</p>	
<b>Task ID</b>	<b>Task ID</b>	<b>Operations</b>
	qos	read, write
<b>Examples</b>	<p>In this example, the DSCP ToS byte is set to 8 in the policy map called policy1. All packets that satisfy the match criteria of class1 are marked with the DSCP value of 8. The network configuration determines how packets are marked.</p>	

```
RP/0/RSP0/CPU0:router (config)# policy-map policy1
RP/0/RSP0/CPU0:router(config-pmap)# class class1
RP/0/RSP0/CPU0:router(config-pmap-c)# set dscp 8
```

RP/0/RSP0/CPU0:router(config-if)# service-policy output policy1
```

**Related Commands**

Command	Description
<a href="#">class-map, on page 5</a>	Defines a traffic class and the associated rules that match packets to the class.
<a href="#">policy-map</a>	Creates or modifies a policy map that can be attached to one or more interfaces to specify a service policy.
<a href="#">service-policy (interface)</a>	Attaches a policy map to an input interface or output interface to be used as the service policy for that interface.

# set precedence

To set the precedence value in the IP header, use the **set precedence** command in policy map class configuration mode. To leave the precedence value unchanged, use the **no** form of this command.

**set precedence** [**tunnel**] *value*  
**no set precedence** [**tunnel**] *value*

<b>Syntax Description</b>	<p><b>tunnel</b> (Optional) Sets the IP precedence on the outer IP header. This command is available on Layer 3 interfaces in the ingress direction.</p> <p><b>value</b> Number or name that sets the precedence bits in the IP header. Range is from 0 to 7. Reserved keywords can be specified instead of numeric values. <a href="#">Table 2: IP Precedence Values and Names, on page 38</a> describes the reserved keywords.</p>				
<b>Command Default</b>	No default behavior or values				
<b>Command Modes</b>	Policy map class configuration				
<b>Command History</b>	<p>Release 3.7.2 This command was introduced.</p> <p>Release 3.9.1 The <b>tunnel</b> keyword on Layer 3 interfaces in the ingress direction was added.</p>				
<b>Usage Guidelines</b>	<p>Precedence can be set using a number or corresponding name. After IP Precedence bits are set, other QoS services such as Modified Deficit Round Robin (MDRR) and Weighted Random Early Detection (WRED) then operate on the bit settings.</p> <p>The network gives priority (or some type of expedited handling) to the marked traffic through the application of MDRR or WRED at points downstream in the network. IP precedence can be set at the edge of the network (or administrative domain) and have queueing act on it thereafter. MDRR can speed handling for high-precedence traffic at congestion points. WRED ensures that high-precedence traffic has lower loss rates than other traffic during times of congestion.</p> <p>The mapping from keywords such as 0 (routine) and 1 (priority) to a precedence value is useful only in some instances. That is, the use of the precedence bit is evolving. You can define the meaning of a precedence value by enabling other features that use the value. In the case of high-end Internet QoS, IP precedences can be used to establish classes of service that do not necessarily correspond numerically to better or worse handling in the network.</p>

## ntp(ipv4/ipv6)

To configure DSCP for source address (IPv4/IPv6) to mark NTP packets. The NTP packets are treated according to DSCP marking.

{**ntp ipv4** | **ntp ipv6**}

<b>Syntax Description</b>	<b>DSCP</b>	Differentiated Services Code Point (DSCP) is a field in an IP packet that enables service(different levels) to be allocated to network traffic. DSCP is the combination of IP Precedence and Type of Service fields.
	<b>Set Precedence</b>	setting levels for IP packets.
<b>Command Modes</b>	NTP Configuration mode	
<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	Release 5.3.2	This command was introduced
<b>Usage Guidelines</b>	It sets NTP packets with DSCP field and NTP packets can be V4 and V6 based respectively it set DSCP/TOS field in v4 or v6 IP headers.	
<b>Task ID</b>	<b>Task ID</b>	<b>Operation</b>
	IP Services	read, write

### Example

```
RP/0/RSP0/CPU0:router(config)#ntp ipv4 ?
  dscp      Set IP DSCP (DiffServ CodePoint)
  precedence Set precedence
```

```
RP/0/RSP0/CPU0:router(config)#ntp ipv6 ?
  dscp      Set IP DSCP (DiffServ CodePoint)
  precedence Set precedence
```

## dscp(ntp)

To configure DSCP for source address (IPv4/IPv6) to mark NTP packets and these NTP packets are treated according to DSCP marking.

```
{ntp ipv4 | ipv6 } dscp
```

Syntax	Description
<0-63>	Differentiated services codepoint value
af11	Match packets with AF11 dscp (001010)
af12	Match packets with AF12 dscp (001100)
af13	Match packets with AF13 dscp (001110)
af21	Match packets with AF21 dscp (010010)
af22	Match packets with AF22 dscp (010100)

```

## dscp precedence(ntp)

To configure DSCP Precedence for the IPv4/IPv6 NTP packets, enter Network Time Protocol (NTP) configuration mode and run NTP configuration commands, use the DSCP Precedence(NTP) command.

{ntp ipv4 | ipv6} dscp

Syntax Description	<0-7>	Precedence value
	<b>critical</b>	Match packets with critical precedence (5)
	<b>flash</b>	Match packets with flash precedence (3)
	<b>flash-override</b>	Match packets with flash override precedence (4)
	<b>immediate</b>	Match packets with immediate precedence (2)
	<b>internet</b>	Match packets with internetwork control precedence (6)
	<b>network</b>	Match packets with network control precedence (7)
	<b>priority</b>	Match packets with priority precedence (1)
	<b>routine</b>	Match packets with routine precedence (0)

**Command Modes** NTP Configuration mode.

Command History	Release	Modification
	Release 5.3.2	This command was introduced.

**Usage Guidelines** Use **Precedence** values to set the configuration levels for the NTP packets at IP layer.

Task ID	Task ID	Operation
	IP Services	read, write

### Example

```
RP/0/RSP0/CPU0:router(config-ntp)#ntp ipv4 precedence ?
<0-7>          Precedence value
critical        Match packets with critical precedence (5)
flash           Match packets with flash precedence (3)
flash-override  Match packets with flash override precedence (4)
immediate       Match packets with immediate precedence (2)
internet        Match packets with internetwork control precedence (6)
network         Match packets with network control precedence (7)
priority        Match packets with priority precedence (1)
```

routine            Match packets with routine precedence (0)

RP/0/RSP0/CPU0:router(config-ntp)#ntp ipv6 precedence ?

<0-7>            Precedence value

critical          Match packets with critical precedence (5)

flash            Match packets with flash precedence (3)

flash-override   Match packets with flash override precedence (4)

immediate        Match packets with immediate precedence (2)

internet         Match packets with internetwork control precedence (6)

network          Match packets with network control precedence (7)

priority         Match packets with priority precedence (1)

routine          Match packets with routine precedence (0)

# shape average

To shape traffic to the indicated bit rate according to the algorithm specified, use the **shape average** command in policy map class configuration mode. To remove traffic shaping, use the **no** form of this command.

**shape average** {**percent** {*percentage* | *\$shape-rate = percentage*} | *rate* [*units*] | **per-thousand** *value* | **per-million** *value* | *\$shape-rate = rate* [*units*]}

## Syntax Description

<b>percent</b> <i>percentage</i>	Specifies the interface bandwidth in percentage. Values can be from 1 to 100.
<i>rate</i>	Average shaping rate in the specified units. Values can be from 1 to 4294967295.
<i>units</i>	(Optional) Units for the bandwidth. Values can be: <ul style="list-style-type: none"> <li>• <b>Excess burst size</b>—values can be from 1 to 4294967295</li> <li>• <b>bps</b>—bits per second (default)</li> <li>• <b>gbps</b>—gigabits per second</li> <li>• <b>kbps</b>—kilobits per second</li> <li>• <b>mbps</b>—megabits per second</li> </ul>
<b>per-thousand</b> <i>value</i>	Specifies shape rate as parts per thousand of the available bandwidth.
<b>per-million</b> <i>value</i>	Specifies shape rate as parts per million of the available bandwidth.
<b>\$</b>	Specifies that a QoS shaper variable is configured.
<i>shape-rate</i>	QoS shaper variable name that can be parameterized.

## Command Default

*units*: **bps**

## Command Modes

Policy map class configuration

## Command History

Release	Modification
Release 3.7.2	This command was introduced.
Release 5.2.0	<i>\$shape-rate =rate</i> option was added to support QoS shaper parameterization in BNG.

## Usage Guidelines

For **shape average** commands in the child policy, the reference used for percentage parameters is relative to the maximum rate of the parent. If shaping or policing is not configured on the parent, then the parent inherits the interface rate.

If you have both shape and bandwidth configured for a class, ensure that the shape percent value is always greater than the percent value for bandwidth.

The shaper parameters, used to override the locally-configured values in BNG, can either be sent to BNG by the RADIUS server during connection establishment, as CISCO VSAs in an Access Accept message, or can be sent to BNG as part of the CoA messages.

Task ID	Task ID	Operations
	qos	read, write

## Examples

This example sets traffic shaping to 50 percent of the parent shaper rate:

```
RP/0/RSP0/CPU0:router(config)# policy-map policy1
RP/0/RSP0/CPU0:router(config-pmap)# class class1
RP/0/RSP0/CPU0:router(config-pmap-c)# shape average percent 50
```

This example shows how to set traffic shaping to 100000 kbps:

```
RP/0/RSP0/CPU0:router(config)# policy-map policy1
RP/0/RSP0/CPU0:router(config-pmap)# class class1
RP/0/RSP0/CPU0:router(config-pmap-c)# shape average 100000 kbps
```

This example shows how to set the default value of QoS shape-rate variable (shaper4) as 100000 kbps, in BNG:

```
RP/0/RSP0/CPU0:router(config)# policy-map policy1
RP/0/RSP0/CPU0:router(config-pmap)# class class1
RP/0/RSP0/CPU0:router(config-pmap-c)# shape average $shaper4 = 100000 kbps
```

# show qos pwhe-aggregate-shaper

To display current configured coexistence mode and coexistence operating modes, use the **show qos pwhe-aggregate-shaper** command in EXEC mode.

**show qos pwhe-aggregate-shaper** { **all** | **location** *node-id* }

<b>Syntax Description</b>	<b>all</b>	Specifies all locations.
	<b>location</b> <i>node-id</i>	Specifies location of a particular node. The <i>node-id</i> argument is entered in the rack/slot/module notation.
<b>Command Default</b>	None.	
<b>Command Modes</b>	EXEC mode	
<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	Release 5.1.1	This command was introduced.
<b>Usage Guidelines</b>	No specific guidelines impact the use of this command.	
<b>Task ID</b>	<b>Task ID</b>	<b>Operation</b>
	qos	read

## Example

This example shows PW-HE coexistence mode and coexistence operating modes for location 0/1/CPU0.

```
RP/0/RSP0/CPU0:router# show qos pwhe-aggregate-shaper location 0/1/CPU0
```

Node	Configured		Operational	
	ingress	egress	ingress	egress
0/1/CPU0	disabled	disabled	disabled	disabled

This example shows PW-HE coexistence mode and coexistence operating modes for all locations.

```
RP/0/RSP0/CPU0:router# show qos pwhe-aggregate-shaper all
```

Node	Configured		Operational	
	ingress	egress	ingress	egress
0/1/CPU0	non-queuing	queuing	non-queuing	queuing

'all' line cards configured for ingress coexistence non-queuing

This example shows PW-HE coexistence mode and coexistence operating modes for all locations. In this example, line card (LC) at location 0/2/CPU0 is not in the chassis.

```
RP/0/RSP0/CPU0:router# show qos pwhe-aggregate-shaper all
```

Node	Configured		Operational	
	ingress	egress	ingress	egress
0/2/CPU0	queuing	non-queuing	?	?
0/1/CPU0	non-queuing	queuing	non-queuing	queuing

'?' means line card is offline - has not booted up or not inserted into the chassis

This example shows PW-HE coexistence mode and coexistence operating modes for all locations. In this example, LC at location 0/2/CPU0 does not support PW-HE QoS and LC at location 0/1/CPU0 supports PW-HE QoS, and both the LCs are active.

```
RP/0/RSP0/CPU0:router# show qos pwhe-aggregate-shaper all
```

Node	Configured		Operational	
	ingress	egress	ingress	egress
0/2/CPU0	queuing	non-queuing	N/A	N/A
0/1/CPU0	non-queuing	queuing	non-queuing	queuing

'N/A' means line card does not support PWHE QoS "

# show qos-ea interface

To display internal programming information for an interface, use the **show qos-ea interface** command in EXEC mode.

**show qos-ea interface** *type interface-path-id* { **input** | **output** } { **detail** | **member** } *interface-type interface-path-id* [**location** *interface-path-id*]

Syntax Description	<i>type</i>	Interface type.  For interface type <b>PW-Ether</b> or <b>PW-IW</b> provide interface handle number. The range is from 1 to 32768.
	<i>interface-path-id</i>	Physical interface or virtual interface. Use the <b>show interfaces</b> command to see a list of configured interfaces.
	<b>input</b>	Refers to policy applied in ingress direction.
	<b>output</b>	Refers to policy applied egress direction.
	<b>detail</b>	Displays detailed output.
	<b>member</b>	Specifies member of bundle interface or pin-down (generic list) interface of PWHE interface.
	<b>location</b>	(Optional) Specifies the location of the node.

**Command Default** None.

**Command Modes** EXEC mode

Command History	Release	Modification
	Release 5.1	This command was introduced.
	Release 5.1.1	The show outputs were updated for CAC and UBRL details.
		PWHE Ethernet interface type <b>PW-Ether</b> and <b>PW-IW</b> were added.

**Usage Guidelines** No specific guidelines impact the use of this command.

Task ID	Task ID	Operation
	qos	read

## Examples

This is the sample output which shows the QoS information on a Ten Gigabit Ethernet interface, applicable for the releases 5.3.2 onwards:

```
RP/0/RSP0/CPU0:tardisl-pwe-spe#show qos-ea interface tenGigE 0/0/0/0/0 output
Interface: TenGigE0_0_0_0_0 output policy: EGRESS_CHILD_POLICY
```

```

# show qos status interface

To display the status of the service-policy applied on the interface, use the **show qos status interface** command in EXEC mode.

**show qos status interface** [**interface** {*typeall*} *interface-path-id*] [{**input** | **output**}] **nv** [**satellite** *satellite-id*]

<b>Syntax Description</b>	<i>type</i>	Interface type. For more information, use the question mark (?) online help function.
	<i>interface-path-id</i>	Physical interface instance. Naming notation is <i>rack/slot/module/port</i> and a slash between values is required as part of the notation. <ul style="list-style-type: none"> <li>• <i>rack</i>—Chassis number of the rack.</li> <li>• <i>slot</i>—Physical slot number of the line card.</li> <li>• <i>module</i>—Module number. A physical layer interface module (PLIM) is always 0.</li> <li>• <i>port</i>—Physical port number of the interface.</li> </ul> <p><b>Note</b> In references to a Management Ethernet interface located on a route processor card, the physical slot number is alphanumeric (RSP0 or RSP1) and the module is CPU0.</p> <p>Example: interface MgmtEth0/RSP0/CPU0/0.</p> <p>For more information about the syntax for the router, use the question mark (?) online help function.</p>
	<b>input</b>	(Optional) Displays per class statistics on inbound traffic for the specified policy map and interface.
	<b>output</b>	(Optional) Displays per class statistics on outbound traffic for the specified policy map and interface.
	<b>nv</b>	(Optional) Displays the statistics of the satellite access or fabric interfaces.
	<b>satellite</b>	(Optional) Displays the per class statistics on the inbound or outbound traffic for the specified satellite.
	<i>satellite-id</i>	(Optional) Displays the satellite statistics based on the specified satellite ID.
<b>Command Default</b>	No default behavior or values	
<b>Command Modes</b>	EXEC mode	

Command History	Release	Modification
	Release 5.1.1	This command was introduced.

**Usage Guidelines** No specific guidelines impact the use of this command.

Task ID	Task ID	Operations
	qos	read, write

This sample output shows how to the status of the service-policy applied on the TenGigE interface 0/6/1/0 that are in the output and input direction:

```
RP/0/RSP0/CPU0:router# show qos status interface gigabitEthernet 200/0/0/0 nv
```

```
GigabitEthernet200/0/0/0  Satellite: 200 input: marking
```

```
    Last Operation Attempted :  ADD
    Status                   :  ACTIVE
```

```
GigabitEthernet200/0/0/0 direction output: Service Policy not installed
```

```
RP/0/RSP0/CPU0:router#show qos status interface gigabitEthernet 200/0/0/0 input nv
```

```
GigabitEthernet200/0/0/0  Satellite: 200 input: marking
```

```
    Last Operation Attempted :  ADD
    Status                   :  ACTIVE
```
