

Feature Overview

Microwave links are often used in Ethernet access ring topologies and the bandwidth provided by the microwave link depends on environmental factors like fog, rain, and snow, which can drastically affect the bandwidth.

This feature relies on the Ethernet CFM to assess the environmental conditions on either end of the microwave link and automatically change the modulation to provide optimal bandwidth. The Ethernet CFM monitors the microwave link bandwidth, and when a link degradation is detected, notifies the router to take action on the degraded microwave link.

In IP/MPLS, the nodes are unaware of any changes to the bandwidth on the microwave link and the Gigabit Ethernet connection to the nodes remain constant. To ensure optimal routing and traffic transport across the access network, a mechanism has been implemented to notify the IP/MPLS access nodes of any ACM events on the microwave links. This enables microwave radio transceivers, which support ACM, to report link bandwidth information to an upstream Ethernet switch.

The vendor-specific message (VSM) and Ethernet Bandwidth Notification Message (ETH-BNM) in Y.1731 is used to notify Cisco routers of ACM events, and the bandwidth available on the microwave link. Acting on this information, the node can change the Hierarchical Quality of Service (H-QoS), adjust the Interior Gateway Protocol (IGP) metric of the link to the new capacity or remove the degraded link.

H-QoS Policy Adjustment

H-QoS policy adjustment is the process of adjusting the egress H-QoS policy parameters on the IP/MPLS access node connected to the microwave link. This modifies the parent shaper rate to match the current bandwidth of the microwave link. It also adjusts the child class parameters to ensure correct priority and bandwidth-guaranteed traffic.

If the available bandwidth is less than the total bandwidth required by Expedited Forwarding (EF) and Assured Forwarding (AF) classes, the operator can choose to drop AF class traffic or remove the link from the service.

IGP Metric Adjustment

The IP/MPLS access node can adjust the IGP metric on the microwave link to align it with the available bandwidth. This will trigger an IGP SPF recalculation, allowing the IGP to get the correct bandwidth for routing traffic.

Link Removal

Link removal is the process of removing the microwave link from the IGP. This occurs when the bandwidth loss breaches the threshold set by the operator. It sets off the resiliency mechanisms in the network, and the

degraded link is bypassed, resulting in minimal traffic loss. The degraded link is not brought administratively down. When it is up, the microwave equipment can signal to the access node about its status and usability.

- [Benefits, on page 2](#)
- [Microwave ACM Signaling Configuration and EEM Integration, on page 2](#)
- [Configuration for Microwave ACM Signaling and EEM Integration Examples, on page 11](#)

Benefits

- The IP/MPLS access network adapts intelligently to the microwave capacity change by:
 - optimizing routing
 - controlling congestion
 - enabling loss protection.
- Microwave ACM changes are signaled through a Y.1731 VSM/G.8031/Y.1731 (ETH-BNM) to the IP/MPLS access node.
- The IP/MPLS access node adapts the IGP metric of the link to the new capacity.
- The IP/MPLS access node can change the H-QOS policy on the interface with the microwave system allowing EF traffic to survive.
- The IP/MPLS access node can remove a degraded link from SPF triggering a loss protection.

Microwave ACM Signaling Configuration and EEM Integration

This section describes how to configure Microwave ACM Signaling and EEM Integration:

Configuring Connectivity Fault Management

To configure CFM between the microwave outdoor unit (ODU) and the router, complete the following steps:

Note For a ring topology, you should configure CFM between the microwave ODU and the router. You must configure two VLANs to the two microwave ODUs, to process the vendor specific message (VSM)/Ethernet Bandwidth Notification Message (ETH-BNM) and trigger the Embedded Event Manager (EEM).

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ethernet cfm domain *domain-name* level *level-id***
4. **service *csi-id* evc *evc-name* vlan *vlan-id* direction down**
5. **continuity-check**
6. **exit**

7. **ethernet evc *evc-id***
8. **exit**
9. **interface *type number***
10. **service instance *id* ethernet**
11. **encapsulation dot1q *vlan-id***
12. **rewrite ingress tag pop 1 symmetric**
13. **bridge-domain *bridge-domain-id***
14. **exit**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: <pre>Router> enable</pre> <p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> • Enter your password if prompted. 	
Step 2	configure terminal Example: <pre>Router# configure terminal</pre> <p>Enters global configuration mode.</p>	
Step 3	ethernet cfm domain <i>domain-name</i> level <i>level-id</i> Example: <pre>Router(config)# ethernet cfm domain outer level 3</pre> <p>Defines a CFM maintenance domain at a particular maintenance level and enter Ethernet CFM configuration mode.</p> <ul style="list-style-type: none"> • <i>domain-name</i>—String of a maximum of 154 characters that identifies the domain. • <i>level-id</i>—Integer from 0 to 7 that identifies the maintenance level. 	
Step 4	service <i>csi-id</i> evc <i>evc-name</i> vlan <i>vlan-id</i> direction down Example: <pre>Router(config-ether-cfm)# service microwav1 evc V60 vlan 60 direction down</pre>	

	Command or Action	Purpose
	<p>Sets a universally unique ID for a customer service instance (CSI) within a maintenance domain.</p> <ul style="list-style-type: none"> • csi-id—String of a maximum of 100 characters that identifies the CSI. • evc—Specifies the EVC. • evc-name—String that identifies the EVC. • vlan—Specifies the VLAN. • vlan-id—String that identifies the VLAN ID. Range is from 1 to 4094. • direction—Specifies the service direction. • down—Specifies the direction towards the LAN. 	
Step 5	continuity-check Example: <pre>Router(config-ecfm-srv)# continuity-check</pre> <p>Enables the transmission of continuity check messages (CCMs).</p>	
Step 6	exit Example: <pre>Router(config-ecfm-srv)# exit</pre> <p>Exits Ethernet CFM service configuration mode and enters global configuration mode.</p>	
Step 7	ethernet evc evc-id Example: <pre>Router(config)# ethernet evc V60</pre> <p>Defines an EVC and enters EVC configuration mode.</p> <ul style="list-style-type: none"> • evc-id—String from 1 to 100 characters that identifies the EVC. 	
Step 8	exit Example: <pre>Router(config-evc)# exit</pre> <p>Exits Ethernet EVC configuration mode and enters global configuration mode.</p>	

	Command or Action	Purpose
Step 9	interface type number Example: Router(config)# interface GigabitEthernet0/0/1 Specifies an interface type and number, and enters interface configuration mode.	
Step 10	service instance id ethernet Example: Router(config-if)# service instance 60 ethernet 60 Configures an Ethernet service instance on an interface. <ul style="list-style-type: none">• id—Integer that uniquely identifies a service instance on an interface.	
Step 11	encapsulation dot1q vlan-id Example: Router(config-if)# encapsulation dot1q 60 Enables IEEE 802.1Q encapsulation of traffic on a specified interface in a VLAN. <ul style="list-style-type: none">• vlan-id—Virtual LAN identifier.	
Step 12	rewrite ingress tag pop 1 symmetric Example: Router(config-if)# rewrite ingress tag pop 1 symmetric Specifies the encapsulation adjustment to be performed on a frame ingressing a service instance. <ul style="list-style-type: none">• pop—Removes a tag from a packet.• 1—Specifies the outermost tag for removal from a packet.• symmetric—Indicates a reciprocal adjustment to be done in the egress direction. For example, if the ingress pops a tag, the egress pushes a tag and if the ingress pushes a tag, the egress pops a tag.	
Step 13	bridge-domain bridge-domain-id Example:	

	Command or Action	Purpose
	<pre>Router(config-if)# bridge-domain 60</pre> <p>Enables RFC 1483 ATM bridging or RFC 1490 Frame Relay bridging to map a bridged VLAN to an ATM permanent virtual circuit (PVC) or Frame Relay data-link connection identifier (DLCI).</p> <ul style="list-style-type: none"> bridge-domain-id—Bridge domain identifier. 	
Step 14	exit Example: <pre>Router(config-if)# exit</pre> <p>Exits interface configuration mode.</p>	

Configuring an Embedded Event Manager Applet

Before you begin

- One switch virtual interface (SVI) or bridge domain is required per physical link.
- One EEM script is required per physical link.
- A dedicated line VTY without AAA is required for the EEM script to perform without any interruption.

Note The EEM script configures the metric on the microwave link and adjusts the QoS policy based on the Ethernet event parameters.

EEM built-in environment variables are a subset of the Cisco-defined environment variables and the built-in variables are available to EEM applets only. The built-in variables can be read-only or can be read and write and these variables may apply to one specific event detector or to all event detectors. For more information about built-in environment variables, see [Embedded Event Manager Configuration Guide, Cisco IOS XE Release 3S](#).

SUMMARY STEPS

- enable**
- configure terminal**
- event manager applet *applet-name***
- event tag *event-tag* ethernet microwave clear-sd {*interface type number*}**
- event tag *event-tag* ethernet microwave sd {*interface type number*} threshold *mbps***
- action *action-id* set *variable-name* *variable-value***
- action *action-id* cli command *cli-string***
- exit**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">• Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enter global configuration mode.
Step 3	event manager applet applet-name Example: Router(config)# event manager applet ACM61	Registers an applet with the Embedded Event Manager (EEM) and enters applet configuration mode. <ul style="list-style-type: none">• <i>applet-name</i>—Name of the applet file.
Step 4	event tag event-tag ethernet microwave clear-sd {interface type number} Example: Router(config-applet)# event tag event_cd ethernet microwave clear-sd interface GigabitEthernet0/0/1	Specifies the event criteria for an EEM applet that is run by matching a Cisco IOS command-line interface (CLI). <ul style="list-style-type: none">• <i>event-tag</i>—Specifies a tag using the event-tag argument that can be used with the trigger command to support multiple event statements within an applet.
Step 5	event tag event-tag ethernet microwave sd {interface type number} threshold mbps Example: Router(config-applet)# event tag event_sd ethernet microwave sd interface GigabitEthernet0/0/1 threshold 1000	Specifies the event criteria for an EEM applet that is run by matching a Cisco IOS CLI.
Step 6	action action-id set variable-name variable-value Example: Router(config-applet)# action 110 set ifname "vlan \$_svi61"	Sets the value of a variable when an EEM applet is triggered. <ul style="list-style-type: none">• <i>action-id</i>—Unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric key sequence using the label as the sort key. If the string contains embedded blanks, enclose it in double quotation marks.• <i>variable-name</i>—Name assigned to the variable to be set.• <i>variable-value</i>—Value of the variable.
Step 7	action action-id cli command cli-string Example: Router(config-applet)# action 458 cli command "event manager applet ACM61"	Specifies the action of executing a Cisco IOS CLI when an EEM applet is triggered. <ul style="list-style-type: none">• <i>action-id</i>—Unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric key sequence using the label as the sort

Configuring Event Handler

	Command or Action	Purpose
		<p>key. If the string contains embedded blanks, enclose it in double quotation marks.</p> <ul style="list-style-type: none"> • cli command—Specifies the message to be sent to the Cisco IOS CLI. • <i>cli-string</i>—CLI string to be executed. If the string contains embedded blanks, enclose it in double quotation marks.
Step 8	exit Example: Router(config-applet)# exit	Exits applet configuration mode.

Configuring Event Handler

To configure the microwave event handler, which runs hold-off timer, loss threshold, and fading wait-to-restore (WTR) timers that are configurable per interface, complete the following steps:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface type number**
4. **ethernet event microwave hold-off seconds**
5. **ethernet event microwave loss-threshold number-of-messages**
6. **ethernet event microwave wtr seconds**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable Enables privileged EXEC mode. • Enter your password if prompted.	
Step 2	configure terminal Example: Router# configure terminal Enters global configuration mode.	

	Command or Action	Purpose
Step 3	interface type number Example: <pre>Router(config)# interface vlan 40</pre> <p>Specifies an interface type and number, and enters interface configuration mode.</p>	
Step 4	ethernet event microwave hold-off seconds Example: <pre>Router(config-if)# ethernet event microwave hold-off 30</pre> <p>Configures the settings of the Ethernet microwave event.</p> <ul style="list-style-type: none"> • hold-off—Specifies the microwave bandwidth degradation hold-off time, in seconds. This time is used to prevent changes in the state of the network node as a result of signal degradation (SD) occurrences. • seconds—Hold off time, in seconds. The valid values range from 0 to 600, with a default value of 0. 	
Step 5	ethernet event microwave loss-threshold number-of-messages Example: <pre>Router(config-if)# ethernet event microwave loss-threshold 100</pre> <p>Configures the settings of the Ethernet microwave event.</p> <ul style="list-style-type: none"> • loss-threshold—Specifies the number of bandwidth Vendor-Specific Messages (VSM)/Ethernet Bandwidth Notification Message (ETH-BNM) sent from the microwave transceiver to the Cisco device. • number-of-messages—Number of bandwidth VSMs/ETH-BNMs. The valid values range from 2 to 255, with a default value of 3. 	
Step 6	ethernet event microwave wtr seconds Example: <pre>Router(config-if)# ethernet event microwave wtr 45</pre> <p>Configures the settings of the Ethernet microwave event.</p>	

Verifying the Microwave ACM Signaling and EEM Integration Configuration

Command or Action	Purpose
<ul style="list-style-type: none"> wtr—Specifies the wtr time. This time is used to prevent changes in the state of the network node as a result of recovery events after an SD occurrence. seconds—WTR time, in seconds. The valid values range from 0 to 600, with a default value of 10. 	

Verifying the Microwave ACM Signaling and EEM Integration Configuration

To verify the microwave ACM and EEM integration configuration, use the show commands described in the following examples.

To display microwave bandwidth status information of an interface, use the following show command.

```
Router# show ethernet event microwave status [interface]
Microwave Bandwidth Status for GigabitEthernet0/0/1
  State:          SIGNAL_DEGRADED
  Hold Time:      0 seconds
  Restore Time:   10 seconds
  Loss Threshold: 3
  Total VSM Receive Count: 0
  Total VSM Drop Count: 0
  Total BNM Receive Count: 4
  Total BNM Drop Count: 0
  Sender Address 64f6.9d67.ac02
    State:          SIGNAL_DEGRADED
    Elapsed time in this state: 00:00:25
    Nominal Bandwidth: 500 Mbps
    Current Bandwidth: 100 Mbps
    Lowest Bandwidth: 100 Mbps
    Last VSM Received: Never
    VSM Receive Count: 0
    VSM Drop Count: 0
    VSM Period: 60 second
    Last BNM Received: Tue Jul 25 14:36:09.895
    BNM Receive Count: 4
    BNM Drop Count: 0
    BNM Period: 60 seconds
    Hold Timer: Not running
    Wait-to-Restore Timer: Not running
    Periodic Timer: 184 seconds remaining
    Transitions into degraded state: 4
```

To display microwave bandwidth statistics of an interface, use the following show command.

```
Router# show ethernet event microwave statistic [interface]
Microwave Bandwidth Statistics for GigabitEthernet0/0/2
  Total VSM Receive Count : 145
  Total VSM Drop Count : 0
  Number of transitions into Degraded state : 2
```

Configuration for Microwave ACM Signaling and EEM Integration Examples

Sample configurations of Microwave ACM Signaling and EEM Integration feature.

Example: Configuring CFM

The following is a sample configuration of CFM.

```
!
 ethernet cfm domain outer level 3
 service microwavel evc V60 vlan 60 direction down
 continuity-check
!
 ethernet evc V60
!
 interface GigabitEthernet0/0/1
!
 service instance 60 ethernet V60
 encapsulation dot1q 60
 rewrite ingress tag pop 1 symmetric
 bridge-domain 60
!
```

Example: Configuring EEM Applet

The following is a sample EEM script to configure metric on a microwave link and adjust a QoS policy according to the ethernet event parameters sent through OAM.

Note You should have one SVI/BD per physical link. Also, one EEM script is required per physical link. In all, there should be two EEM scripts and two SVI/BDs.

Note The threshold in the EEM script should be set to the nominal bandwidth value. If this value is unknown, we recommend setting the threshold to 1000. The EEM script adjusts the nominal bandwidth using the following vendor-specific message (VSM)/Ethernet Bandwidth Notification Message (ETH-BNM): **action 460 cli command "event tag event_sd ethernet microwave sd interface GigabitEthernet0/3/0 threshold \$nb"**

Note The EEM script supports the **bandwidth percent** command, but does not support the **bandwidth remaining percent** command.

```
no event manager applet ACM62
Router#show run | sec event manager
```

Example: Configuring EEM Applet

```

event manager environment _eem_mode 1
event manager environment _bdi60 60
event manager environment _ring_nodes 5
event manager applet ACM62
  event tag event_cd ethernet microwave clear-sd interface GigabitEthernet0/0/1
  event tag event_sd ethernet microwave sd interface GigabitEthernet0/0/1 threshold 400
    trigger
      correlate event event_cd or event event_sd
    action 100 set olc "100"
