

Configuring IP SLAs Metro-Ethernet 3.0 (ITU-T Y.1731) Operations

This module describes how to configure an IP SLAs Metro-Ethernet 3.0 (ITU-T Y.1731) operation to gather the following performance measurements for Ethernet service:

- Ethernet Delay
- Ethernet Delay Variation
- Ethernet Frame Loss Ratio
- [Finding Feature Information, on page 1](#)
- [Prerequisites for ITU-T Y.1731 Operations, on page 1](#)
- [Restrictions for IP SLAs Metro-Ethernet 3.0 \(ITU-T Y.1731\), on page 2](#)
- [How to Configure IP SLAs Metro-Ethernet 3.0 \(ITU-T Y.1731\) Operations, on page 2](#)
- [Configuration Examples for IP SLAs Metro-Ethernet 3.0 \(ITU-T Y.1731\) Operations, on page 14](#)
- [Additional References for IP SLAs Metro-Ethernet 3.0 \(ITU-T Y.1731\) Operations , on page 18](#)
- [Feature Information for IP SLAs Metro-Ethernet 3.0 \(ITU-T Y.1731\) Operations, on page 19](#)

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see [Bug Search Tool](#) and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for ITU-T Y.1731 Operations

IEEE-compliant Connectivity Fault Management (CFM) must be configured and enabled for Y.1731 performance monitoring to function.

Note Y1731 is supported on Port Channel interfaces.

Restrictions for IP SLAs Metro-Ethernet 3.0 (ITU-T Y.1731)

- Depending on your Cisco software release, SNMP is not supported for reporting threshold events or collecting performance statistics for IP SLAs Metro-Ethernet 3.0 (ITU-T Y.1731) operations.
- Continuity Check Message (CCM)-based dual-ended Ethernet frame loss operations are not supported.
- In a single-ended Ethernet operation, performance measurement statistics can be retrieved only at the device on which the sender Ethernet Connectivity Fault Management (CFM) Maintenance End Point (MEP) is configured.
- P2 IMs are to be used for CFM and Y1731.
- Do not configure rewrite on the EFPs throughout the l2 circuit to avoid losing the cos value.
- To avoid errors in RX and TX timestamping, ensure to have Y1731 sender as PTP master, and the Y1731 responder as PTP slave.
- Reconfigure IP SLA Y1731 while doing online insertion removal (OIR) of IM or router reload because local MEP is deleted during the course.
- The dot1q tag contains class of service (CoS) bits, which are used by IPSLA Y.1731 PM session to test delay or loss of packets with a specific CoS. This CoS cannot be a non-zero value when using EPM over untagged EFPs.

How to Configure IP SLAs Metro-Ethernet 3.0 (ITU-T Y.1731) Operations

Configuring a Dual-Ended Ethernet Delay or Delay Variation Operation

Perform the tasks for configuring a dual-ended operation in the order presented.

Note To remove the MEP configurations in an already-configured dual-ended operation, always remove the MEPs in the reverse order in which they were configured. That is, remove the scheduler first, then the threshold monitoring configuration, and then the sender MEP configuration on the source device before removing the scheduler, proactive threshold monitoring, and receiver MEP configuration on the destination device.

Configuring a Receiver MEP on the Destination Device

Before you begin

Time synchronization is required between the source and destination devices in order to provide accurate one-way delay (latency) or delay-variation measurements. Configure either Precision Time Protocol (PTP) or Network Time Protocol (NTP) on both the source and destination devices.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	ip sla operation-number Example: Router(config-term)# ip sla 501	Begins configuring an IP SLAs operation and enters IP SLA configuration mode.
Step 4	ethernet y1731 delay receive 1DM domain domain-name {evc evc-id vlan vlan-id} cos cos {mpid source-mp-id mac-address source-address} Example: Router(config-ip-sla)# ethernet y1731 delay receive 1DM domain xxx evc yyy cos 3 mpid 101	Begins configuring the receiver on the responder and enters IP SLA Y.1731 delay configuration mode. • The <i>source-mp-id</i> or <i>source-address</i> configured by this command corresponds to that of the MEP being configured. Note The session with mac-address will not be inactivated when there is CFM error.
Step 5	aggregate interval seconds Example: Router(config-sla-y1731-delay)# aggregate interval 900	(Optional) Configures the length of time during which the performance measurements are conducted and the results stored.
Step 6	distribution {delay delay-variation} one-way number-of-bins boundary[,...,boundary] Example:	(Optional) Specifies measurement type and configures bins for statistics distributions kept.

	Command or Action	Purpose
	Router(config-sla-y1731-delay)# distribution delay-variation one-way 5 5000,10000,15000,20000,-1	
Step 7	frame offset offset-value Example: Router(config-sla-y1731-delay)# frame offset 1	(Optional) Sets the value for calculating delay variation rates.
Step 8	history interval intervals-stored Example: Router(config-sla-y1731-delay)# history interval 2	(Optional) Sets the number of statistics distributions kept during the lifetime of an IP SLAs Ethernet operation.
Step 9	max-delay milliseconds Example: Router(config-sla-y1731-delay)# max-delay 5000	(Optional) Sets the amount of time an MEP waits for a frame.
Step 10	owner owner-id Example: Router(config-sla-y1731-delay)# owner admin	(Optional) Configures the owner of an IP SLAs operation.
Step 11	end Example: Router(config-sla-y1731-delay)# end	Exits to privileged EXEC mode.

What to do next

To add proactive threshold conditions and reactive triggering for generating traps, see the "Configuring Proactive Threshold Monitoring" module of the *IP SLAs Configuration Guide*.

When you are finished configuring proactive threshold monitoring for this MEP, see the "Scheduling IP SLAs Operations" section to schedule the operation.

Configuring the Sender MEP on the Source Router

Before you begin

- Time synchronization is required between the source and destination devices in order to provide accurate one-way delay (latency) or delay-variation measurements. Configure either Precision Time Protocol (PTP) or Network Time Protocol (NTP) on both the source and destination devices.
- The receiver MEP must be configured, including proactive threshold monitoring, and scheduled before you configure the sender MEP.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	ip sla operation-number Example: Router(config)# ip sla 500	Begins configuring an IP SLAs operation and enters IP SLA configuration mode.
Step 4	ethernet y1731 delay 1DM domain domain-name {evc evc-id vlan vlan-id} {mpid target-mp-id mac-address target-address} cos cos {source {mpid source-mp-id mac-address source-address}} Example: Router(config-ip-sla)# ethernet y1731 delay 1DM domain xxxx evc yyyy mpid 101 cos 3 source mpid 100	Begins configuring a dual-ended Ethernet delay operation and enters IP SLA Y.1731 delay configuration mode. Note The session with mac-address will not be inactivated when there is CFM error.
Step 5	aggregate interval seconds Example: Router(config-sla-y1731-delay)# aggregate interval 900	(Optional) Configures the length of time during which the performance measurements are conducted and the results stored.

	Command or Action	Purpose
Step 6	frame interval milliseconds Example: Router(config-sla-y1731-delay)# frame interval 100	(Optional) Sets the gap between successive frames.
Step 7	frame size bytes Example: Router(config-sla-y1731-delay)# frame size 64	(Optional) Sets the padding size for frames.
Step 8	history interval intervals-stored Example: Router(config-sla-y1731-delay)# history interval 2	(Optional) Sets the number of statistics distributions kept during the lifetime of an IP SLAs Ethernet operation.
Step 9	owner owner-id Example: Router(config-sla-y1731-delay)# owner admin	(Optional) Configures the owner of an IP SLAs operation.
Step 10	end Example: Router(config-sla-y1731-delay)# end	Exits to privileged EXEC mode.

What to do next

To add proactive threshold conditions and reactive triggering for generating traps, see the "Configuring Proactive Threshold Monitoring" module of the *IP SLAs Configuration Guide*.

When you are finished configuring proactive threshold monitoring for this MEP, see the "Scheduling IP SLAs Operations" section to schedule the operation.

Configuring a Sender MEP for a Single-Ended Ethernet Delay or Delay Variation Operation

Perform this task to configure a sender MEP on the source device.

Before you begin

- Time synchronization is required between the source and destination devices in order to provide accurate one-way delay (latency) or delay-variation measurements. Configure either Precision Time Protocol (PTP) or Network Time Protocol (NTP) on both the source and destination devices.

Note

To display information about remote (target) MEPs on destination devices, use the **show ethernet cfm maintenance-points remote** command.

Procedure

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: <pre>Device# configure terminal</pre>	Enters global configuration mode.
Step 3	ip sla operation-number Example: <pre>Device(config-term)# ip sla 10</pre>	Begins configuring an IP SLAs operation and enters IP SLA configuration mode.
Step 4	ethernet y1731 delay {DMM DMMv1} [burst] domain domain-name {evc evc-id vlan vlan-id} {mpid target-mp-id mac-address target-address} cos cos {source {mpid source-mp-id mac-address source-address}} Example: <pre>Device(config-ip-sla)# ethernet y1731 delay dmm domain xxx evc yyy mpid 101 cos 4 source mpid 100</pre>	Begins configuring a single-ended Ethernet delay operation and enters IP SLA Y.1731 delay configuration mode. <ul style="list-style-type: none"> • To configure concurrent operations, use the DMMv1 keyword with this command. Repeat the preceding two steps to each concurrent operation, to be added to a single IP SLA operation number. Concurrent operations are supported for a given EVC, CoS, and remote MEP combination, or for multiple MEPs for a given multipoint EVC. <p>Note The session with mac-address will not be inactivated when there is CFM error.</p>

Configuring a Sender MEP for a Single-Ended Ethernet Delay or Delay Variation Operation

	Command or Action	Purpose
Step 5	clock sync Example: <pre>Device(config-sla-y1731-delay)# clock sync</pre>	(Optional) Indicates that the end points are synchronized and thus allows the operation to calculate one-way delay measurements.
Step 6	aggregate interval seconds Example: <pre>Device(config-sla-y1731-delay)# aggregate interval 900</pre>	(Optional) Configures the length of time during which the performance measurements are conducted and the results stored.
Step 7	distribution {delay delay-variation} one-way number-of-bins boundary[,...,boundary] Example: <pre>Device(config-sla-y1731-delay)# distribution delay-variation one-way 5 5000, 10000, 15000, 20000, -1</pre>	(Optional) Specifies measurement type and configures bins for statistics distributions kept.
Step 8	frame interval milliseconds Example: <pre>Device(config-sla-y1731-delay)# frame interval 100</pre>	(Optional) Sets the gap between successive frames.
Step 9	frame offset offset-value Example: <pre>Device(config-sla-y1731-delay)# frame offset 1</pre>	(Optional) Sets value for calculating delay variation values.
Step 10	frame size bytes Example: <pre>Device(config-sla-y1731-delay)# frame size 32</pre>	(Optional) Configures padding size for frames.
Step 11	history interval intervals-stored Example: <pre>Device(config-sla-y1731-delay)# history interval 2</pre>	(Optional) Sets the number of statistics distributions kept during the lifetime of an IP SLAs Ethernet operation.

	Command or Action	Purpose
Step 12	max-delay milliseconds Example: Device(config-sla-y1731-delay)# max-delay 5000	(Optional) Sets the amount of time an MEP waits for a frame.
Step 13	owner owner-id Example: Device(config-sla-y1731-delay)# owner admin	(Optional) Configures the owner of an IP SLAs operation.
Step 14	end Example: Device(config-sla-y1731-delay)# end	Exits to privileged EXEC mode.

What to do next

To add proactive threshold conditions and reactive triggering for generating traps, see the "Configuring Proactive Threshold Monitoring" module of the *IP SLAs Configuration Guide*.

When you are finished configuring proactive threshold monitoring for this operation, see the "Scheduling IP SLAs Operations" section to schedule the operation.

Configuring a Sender MEP for a Single-Ended Ethernet Frame Loss Ratio Operation

Note To display information about remote (target) MEPs on destination devices, use the **show ethernet cfm maintenance-points remote** command.

Perform this task to configure a sender MEP on the source device.

Before you begin

- Class of Service (CoS)-level monitoring must be enabled on MEPs associated to the Ethernet frame loss operation by using the **monitor loss counter** command on the devices at both ends of the operation. See the *Cisco IOS Carrier Ethernet Command Reference* for command information. See the "Configuration Examples for IP SLAs Metro-Ethernet 3.0 (ITU-T Y.1731) Operations" section for configuration information.

Note Cisco IOS Y.1731 implementation allows monitoring of frame loss for frames on an EVC regardless of the CoS value (any CoS or Aggregate CoS cases). See the "Configuration Examples for IP SLAs Metro-Ethernet 3.0 (ITU-T Y.1731) Operations" section for configuration information.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">• Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	ip sla operation-number Example: Device(config-term)# ip sla 11	Begins configuring an IP SLAs operation and enters IP SLA configuration mode.
Step 4	ethernet y1731 loss {LMM SLM} [burst] domain domain-name {evc evc-id vlan vlan-id} {mpid target-mp-id mac-address target-address} CoS CoS {source {mpid source-mp-id mac-address source-address}} Example: Device(config-ip-sla)# ethernet y1731 loss LMM domain xxx vlan 12 mpid 34 CoS 4 source mpid 23	Begins configuring a single-ended Ethernet frame loss ratio operation and enters IP SLA Y.1731 loss configuration mode. <ul style="list-style-type: none">• To configure concurrent operations, use the SLM keyword with this command. Repeat the preceding two steps to configure each concurrent operation to be added to a single IP SLA operation number. Concurrent operations are supported for a given EVC, CoS, and remote-MEP combination, or for multiple MEPs for a given multipoint EVC. Note The session with mac-address will not be inactivated when there is CFM error.
Step 5	aggregate interval seconds Example: Device(config-sla-y1731-loss)# aggregate	(Optional) Configures the length of time during which performance measurements are conducted and the results stored.

	Command or Action	Purpose
	interval 900	
Step 6	availability algorithm {sliding-window static-window} Example: <pre>Device(config-sla-y1731-loss)# availability algorithm static-window</pre>	(Optional) Specifies availability algorithm used.
Step 7	frame consecutive value Example: <pre>Device(config-sla-y1731-loss)# frame consecutive 10</pre>	(Optional) Specifies number of consecutive measurements to be used to determine availability or unavailability status.
Step 8	frame interval milliseconds Example: <pre>Device(config-sla-y1731-loss)# frame interval 100</pre>	(Optional) Sets the gap between successive frames.
Step 9	history interval intervals-stored Example: <pre>Device(config-sla-y1731-loss)# history interval 2</pre>	(Optional) Sets the number of statistics distributions kept during the lifetime of an IP SLAs Ethernet operation.
Step 10	owner owner-id Example: <pre>Device(config-sla-y1731-delay)# owner admin</pre>	(Optional) Configures the owner of an IP SLAs operation.
Step 11	exit Example: <pre>Device(config-sla-y1731-delay)# exit</pre>	Exits to IP SLA configuration mode.
Step 12	exit Example: <pre>Device(config-ip-sla)# exit</pre>	Exits to global configuration mode.

	Command or Action	Purpose
Step 13	exit Example: Device(config)# exit	Exits to privileged EXEC mode.

What to do next

When you are finished configuring this MEP, see the "Scheduling IP SLAs Operations" section to schedule the operation.

Scheduling IP SLAs Operations

Before you begin

- All IP Service Level Agreements (SLAs) operations to be scheduled must be already configured.
- The frequency of all operations scheduled in a multioperation group must be the same.
- The list of one or more operation ID numbers to be added to a multioperation group must be limited to a maximum of 125 characters in length, including commas (,).

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	Enter one of the following commands: <ul style="list-style-type: none"> • ip sla schedule operation-number [life {forever seconds}] [start-time {[hh:mm:ss] [month day day month]} pending now after hh:mm:ss}] [ageout seconds] [recurring] • ip sla group schedule group-operation-number operation-id-numbers {schedule-period schedule-period-range schedule-together} [ageout seconds] frequency group-operation-frequency [life {forever seconds}] [start-time {hh:mm} 	<ul style="list-style-type: none"> • Configures the scheduling parameters for an individual IP SLAs operation. • Specifies an IP SLAs operation group number and the range of operation numbers for a multioperation scheduler.

	Command or Action	Purpose
	<p><code>[::ss] [month day day month] pending now after hh:mm [:ss]]}</code></p> <p>Example:</p> <pre>Device(config)# ip sla schedule 10 life forever start-time now</pre> <pre>Device(config)# ip sla group schedule 10 schedule-period frequency</pre> <pre>Device(config)# ip sla group schedule 1 3,4,6-9 life forever start-time now</pre> <pre>Device(config)# ip sla schedule 1 3,4,6-9 schedule-period 50 frequency range 80-100</pre>	
Step 4	<p>end</p> <p>Example:</p> <pre>Device(config)# end</pre>	Exits global configuration mode and returns to privileged EXEC mode.
Step 5	<p>show ip sla group schedule</p> <p>Example:</p> <pre>Device# show ip sla group schedule</pre>	(Optional) Displays IP SLAs group schedule details.
Step 6	<p>show ip sla configuration</p> <p>Example:</p> <pre>Device# show ip sla configuration</pre>	(Optional) Displays IP SLAs configuration details.

Enabling NTP Time of Day Synchronization

Perform additional NTP Time Of Day synchronization configuration when NTP is chosen for time synchronization for one-way delay or delay-variation measurements on source and destination devices.

Note PTP should *not* be configured when NTP Time Of Day synchronization is used as they are mutually-exclusive configuration options for time synchronization.

For information on configuring NTP, see Configuring NTP section in [Cisco IOS Network Management Configuration Guide](#).

Procedure

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	platform time-source ntp Example: Router(config)# platform time-source ntp	Initiates Time of Day (ToD) synchronization on the ethernet ports.
Step 4	exit Example: Router(config)# exit	Exits the configuration.

Configuration Examples for IP SLAs Metro-Ethernet 3.0 (ITU-T Y.1731) Operations

Example: Dual-Ended Ethernet Delay Operation

The following sample output shows the configuration, including default values, of a receiver MEP on the responder device for a dual-ended Ethernet delay or delay variation operation:

```
Device# show ip sla configuration 501

IP SLAs Infrastructure Engine-III
Entry number: 501
Owner: admin
Tag:
Operation timeout (milliseconds): 5000
Ethernet Y1731 Delay Operation
Frame Type: 1DM
Domain: xxx
ReceiveOnly: TRUE
Evc: yyy
Local Mpid: 101
CoS: 3
    Max Delay: 5000
Threshold (milliseconds): 5000
.

.

Statistics Parameters
Aggregation Period: 900
Frame offset: 1
```

```

Distribution Delay One-Way:
Number of Bins 10
Bin Boundaries: 5000,10000,15000,20000,25000,30000,35000,40000,45000,-1
Distribution Delay-Variation One-Way:
Number of Bins 10
Bin Boundaries: 5000,10000,15000,20000,25000,30000,35000,40000,45000,-1
History
Number of intervals: 2

```

The following sample output shows the configuration, including default values, of the sender MEP for a dual-ended IP SLAs Ethernet delay or delay variation operation:

```

Device# show ip sla configuration 500

IP SLAs Infrastructure Engine-III
Entry number: 500
Owner:
Tag:
Operation timeout (milliseconds): 5000
Ethernet Y1731 Delay Operation
Frame Type: 1DM

Example: Sender MEP for a Single-Ended Ethernet Delay Operation

The following sample output shows the configuration, including default values, of the sender MEP for a single-ended IP SLAs Ethernet delay operation:

```
Router# show ip sla configuration 10

IP SLAs Infrastructure Engine-III
Entry number: 10
Owner:
Tag:
Operation timeout (milliseconds): 5000
Ethernet Y1731 Delay Operation
Frame Type: DMM
Domain: xxx
Vlan: yyy
Target Mpid: 101
Source Mpid: 100
CoS: 4
    Max Delay: 5000
    Request size (Padding portion): 64
    Frame Interval: 1000
    Clock: Not In Sync
Threshold (milliseconds): 5000
.
.
.
Statistics Parameters
    Aggregation Period: 900
    Frame offset: 1
    Distribution Delay Two-Way:
```

```

Number of Bins 10
Bin Boundaries: 5000,10000,15000,20000,25000,30000,35000,40000,45000,-1
Distribution Delay-Variation Two-Way:
Number of Bins 10
Bin Boundaries: 5000,10000,15000,20000,25000,30000,35000,40000,45000,-1
History
Number of intervals: 2

```

Example: Sender MEP for a Single-Ended Ethernet Frame Loss Operation

The following output shows the configuration, including default values, of the sender MEP in a basic single-ended IP SLAs Ethernet frame loss ratio operation with a start-time of now:

```

Router# show ip sla configuration 11

IP SLAs Infrastructure Engine-III
Entry number: 11
Owner:
Tag:
Operation timeout (milliseconds): 5000
Ethernet Y1731 Loss Operation
Frame Type: LMM
Domain: xxx
Vlan: 12
Target Mpid: 34
Source Mpid: 23
CoS: 4
Request size (Padding portion): 0
Frame Interval: 1000
Schedule:
Operation frequency (seconds): 60 (not considered if randomly scheduled)
Next Scheduled Start Time: Start Time already passed
Group Scheduled : FALSE
Randomly Scheduled : FALSE
Life (seconds): 3600
Entry Ageout (seconds): never
Recurring (Starting Everyday): FALSE
Status of entry (SNMP RowStatus): ActiveThreshold (milliseconds): 5000
Statistics Parameters
Aggregation Period: 900
Frame consecutive: 10
Availability algorithm: static-window
History
Number of intervals: 2

```

Example: Verifying NTP Time Of Day Synchronization

Use the **show platform time-source** command to display information on the time source.

```

Router# show platform time-source
Time Source mode : NTP not Configured

Router# show platform time-source
Time Source mode : NTP
NTP State       : Not Synchronized

```

Additional References for IP SLAs Metro-Ethernet 3.0 (ITU-T Y.1731) Operations

```
Router# show platform time-source
Time Source mode : NTP
NTP State       : Synchronized
```

ITU-T Y.1731	<i>OAM functions and mechanisms for Ethernet-based networks</i>
No specific RFCs are supported by the features in this document.	--

MIBs

MIB	MIBs Link
<ul style="list-style-type: none"> • CISCO-IPSLA-ETHERNET-MIB • CISCO-RTTMON-MIB 	To locate and download MIBs for selected platforms, Cisco software releases, and feature sets, use Cisco MIB Locator found at the following URL: http://www.cisco.com/go/mibs

Technical Assistance

Description	Link
The Cisco Support and Documentation website provides online resources to download documentation, software, and tools. Use these resources to install and configure the software and to troubleshoot and resolve technical issues with Cisco products and technologies. Access to most tools on the Cisco Support and Documentation website requires a Cisco.com user ID and password.	http://www.cisco.com/cisco/web/support/index.html

Feature Information for IP SLAs Metro-Ethernet 3.0 (ITU-T Y.1731) Operations

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 1: Feature Information for IP SLAs Metro-Ethernet 3.0 (ITU-T Y.1731) Operations

Feature Name	Releases	Feature Information
IP SLAs Metro-Ethernet 3.0 (ITU-T Y.1731) Operations	Cisco IOS XE Release 3.13.0S	This feature was introduced on the Cisco ASR 920 Series Aggregation Services Router (ASR-920-12CZ-A, ASR-920-12CZ-D, ASR-920-4SZ-A, ASR-920-4SZ-D).
