**Flex LSP Overview**

Flex LSP also known as Associated Bidirectional LSPs is the combination of static bidirectional MPLS-TP and dynamic MPLS-TE. Flex LSP provides bidirectional label switched paths (LSPs) set up dynamically through Resource Reservation Protocol–Traffic Engineering (RSVP-TE). It does not support non-co routed LSPs.

Flex Label Switched Paths are LSP instances where the forward and the reverse direction paths are setup, monitored and protected independently and associated together during signaling. You use a RSVP Association object to bind the two forward and reverse LSPs together to form either a co-routed or non co-routed associated bidirectional TE tunnel.

You can associate a protecting MPLS-TE tunnel with either a working MPLS-TE LSP, protecting MPLS-TE LSP, or both. The working LSP is the primary LSP backed up by the protecting LSP. When a working LSP goes down, the protecting LSP is automatically activated. You can configure a MPLS-TE tunnel to operate without protection as well.

Effective Cisco IOS XE Release 3.18.1SP, Flex LSP supports inter-area tunnels with non co-routed mode.

**Signaling Methods and Object Association for Flex LSPs**

This section provides an overview of the association signaling methods for the bidirectional LSPs. Two unidirectional LSPs can be bound to form an associated bidirectional LSP in the following scenarios:

- No unidirectional LSP exists, and both must be established.
- Both unidirectional LSPs exist, but the association must be established.
- One unidirectional LSP exists, but the reverse associated LSP must be established.
Associated Bidirectional Non Co-routed and Co-routed LSPs

This section provides an overview of associated bidirectional non co-routed and co-routed LSPs. Establishment of MPLS TE-LSP involves computation of a path between a head-end node to a tail-end node, signaling along the path, and modification of intermediate nodes along the path. The signaling process ensures bandwidth reservation (if signaled bandwidth is lesser than 0 and programming of forwarding entries).

Path computation is performed by the head-end nodes of both the participating LSPs using Constrained Shortest Path First (CSPF). CSPF is the shortest path (measured in terms of cost) that satisfies all relevant LSP TE constraints or attributes, such as required bandwidth, priority and so on.

Associated Bidirectional Non Co-routed LSPs: A non co-routed bidirectional TE LSP follows two different paths, that is, the forward direction LSP path is different than the reverse direction LSP path. Here is an illustration.

In the above topology:
- The outer paths (in green) are working LSP pairs.
- The inner paths (in red) are protecting LSP pairs.
- Router 1 sets up working LSP to Router 3 and protecting LSP to Router 3 independently.
- Router 3 sets up working LSP to Router 1 and protecting LSP to Router 1 independently.

Non co-routed bidirectional TE LSP is available by default, and no configuration is required.

Note: In case of non co-routed LSPs, the head-end nodes relax the constraint on having identical forward and reverse paths. Hence, depending on network state you can have identical forward and reverse paths, though the bidirectional LSP is co-routed.
Associated Bidirectional Co-routed LSPs: A co-routed bidirectional TE LSP denotes a bidirectional tunnel where the forward direction LSP and reverse direction LSP must follow the same path, for example, the same nodes and paths. Here is an illustration.

In the above topology:

- Paths at the top of the figure (in green) indicate working co-routed LSP pairs.
- Paths at the bottom of the figure (in red) indicate protecting co-routed LSP pairs.
- Router 1 sets up working LSP to Router 3 (in red) after performing bidirectional CSPF and sends reverse explicit route object (ERO) to Router 3. Node Router 3 uses the received reverse ERO to set up reverse red working LSP to Router 1.
- Router 3 sets up protecting LSP to Router 1 (in green) after performing bidirectional CSPF and sends reverse ERO to Router 1. Node Router 1 uses the received reverse ERO to set up reverse green protecting LSP to Router 3.

Restrictions for Flex LSP

- Exp-null over Flex-LSP is not supported.
- Flex-LSP does not support tunnel statistics.
- VC (layer 2 VPN chts) statistics are not supported.
- It is recommended to configure for the following timers for Flex-LSP deployments:
  mpls traffic-eng reoptimize timers frequency 120
  mpls traffic-eng reoptimize timers delay installation 30
  mpls traffic-eng reoptimize timers delay cleanup 90
- The no mpls ip propagate-tel command is not recommended with Flex-LSP. The PREC value of BFD control packet is set to "0". Therefore, packet prioritization cannot be done at mid-points and BFD flap can occur with traffic congestions.
- It is recommended to configure BFD timers as 10x3 during cable pull testing or in Flex LSP feature deployments.
- 50 msec convergence is not guaranteed for local shut on Cisco ASR 920 routers without BFD.
- 50 msec convergence is not guaranteed without WRAP protection. WRAP protection is mandatory to achieve 50 msec convergence for remote failures.
- With scale and multiple other feature mix-up, it is possible to see higher convergence.
- TE NSR and IGP NSR are mandatory for RSP switchover.
• Flex LSP is supported with the IPv4 template.
• The `ip rsvp signalling hello` command is not mandatory and it can cause a large punt during the cutover and can lead to unexpected results like BFD flapping.
• VPLS over Flex-LSP is not supported.
• Both IGP and FRR must be configured as clients for single-hop BFD when the WRAP protection is enabled; only FRR cannot be the only client configured at midpoint.
• Layer 3 VPN over Flex-LSP is not supported.

**Restrictions for Non Co-routed Inter-Area Flex LSP Tunnels**

• The dynamic path option feature for TE tunnels (`tunnel mpls traffic-eng path-option number dynamic`) is not supported for inter-area tunnels. An explicit path identifying the area border routers (ABRs) is required.
• The MPLS TE AutoRoute feature (`tunnel mpls traffic-eng autoroute announce`) is not supported for inter-area tunnels.
• Tunnel affinity (`tunnel mpls traffic-eng affinity`) is not supported for inter-area tunnels.
• Tunnel metric (`tunnel mpls traffic-eng path-selection metric`) is not supported for inter-area tunnels.
• The re-optimization of tunnel paths is not supported for inter-area tunnels.

**How to Configure Co-routed Flex LSPs**

A co-routed bidirectional packet LSP is a combination of two LSPs (one in the forward direction and the other in reverse direction) sharing the same path between a pair of ingress and egress nodes. It is established using the extensions to RSVP-TE. This type of LSP can be used to carry any of the standard types of MPLS-based traffic, including Layer 2 VPNs and Layer 2 circuits. You can configure a single BFD session for the bidirectional LSP (that is, you do not need to configure a BFD session for each LSP in each direction). You can also configure a single standby bidirectional LSP to provide a backup for the primary bidirectional LSP.

The configuration includes the following steps:

1. Enable basic MPLS Traffic Engineering on hostname PE1.
2. Map L2VPN pseudowire to a specific FLEX LSP tunnel.
3. Configure Flex LSP.
4. Enable BFD.
5. Enable Wrap and Fault OAM.
6. Enable BDIs on a core-facing interface.
Configuring Co-routed Flex LSPs

Before you begin

- You must have symmetric source and destination TE router IDs in order for bidirectional LSPs to be associated.
- Tunnels attributes must be configured identically on both sides of co-routed bidirectional LSP.

Note

Up to 250 Flex LSP tunnels are supported.

Procedure

1. Enable basic MPLS Traffic Engineering on hostname PE1:

   mpls traffic-eng tunnels
   mpls traffic-eng fault-oam
   mpls traffic-eng nsr
   router ospf 100
   router-id 1.1.1.1
   nsr
   mpls traffic-eng router-id Loopback0
   mpls traffic-eng area 0

2. Map L2VPN pseudowire to a specific Flex LSP tunnel:

   template type pseudowire mpls-te1 (mpls-te1 can be any name)
   encapsulation mpls
   preferred-path interface Tunnel1 disable-fallback
   bandwidth 100

   template type pseudowire mpls-te4
   encapsulation mpls
   preferred-path interface Tunnel4 disable-fallback
   bandwidth 100

3. Configure Flex LSP:

   interface Tunnel1
   bandwidth 1000
   ip unnumbered Loopback0
   tunnel mode mpls traffic-eng
   tunnel destination 22.22.22.22
   tunnel mpls traffic-eng autoroute announce
   tunnel mpls traffic-eng bandwidth 1000
   tunnel mpls traffic-eng path-option 1 explicit name BDI1 bandwidth 1000
   tunnel mpls traffic-eng path-option protect 1 explicit name BACKUP1 bandwidth 1000
   tunnel mpls traffic-eng bidirectional association id 1 source-address 11.11.11.11 global-id 1

   NOTE: To bring up the bi-directional tunnels, association ID, source address and global ID
   must match on both sides of the tunnel.

   tunnel mpls traffic-eng bidirectional association type co-routed
   ip explicit-path name BDI1 enable
   next-address 1.11.1.1
   next-address 10.1.2.2
   next-address 2.22.1.22
   ip explicit-path name BACKUP1 enable
   next-address 10.3.11.10
   next-address 10.4.22.22

4. Enable BFD
Verifying the Co-routed Flex LSP Configuration

To verify the FLEX LSP tunnel summary, use the `show mpls traffic-eng tunnels bidirectional-associated concise` command in MPLS tunnel-te interface.

```
Router# show mpls traffic-eng tunnels summary
RP/0/RSP0/CPU0:NCX4K-R1# show mpls traffic-eng tunnels summary
Path Selection Tiebreaker: Min-fill (default)
LSP Tunnels Process: running
RSVP Process: running
Forwarding: enabled
Periodic reoptimization: every 3600 seconds, next in 1716 seconds
Periodic FRR Promotion: every 300 seconds, next in 201 seconds
Periodic auto-bw collection: 5 minute(s) (disabled)

Signalling Summary:
Head: 1 interfaces, 1 active signalling attempts, 1 established
  0 explicit, 1 dynamic
  14 activations, 13 deactivations
  0 recovering, 0 recovered
Mid: 0
Tails: 1

Fast ReRoute Summary:
Head: 0 FRR tunnels, 0 protected, 0 rerouted
Mid: 0 FRR tunnels, 0 protected, 0 rerouted
```
Summary: 0 protected, 0 link protected, 0 node protected, 0 bw protected
Backup: 0 tunnels, 0 assigned
Interface: 0 protected, 0 rerouted

Path Protection Summary:
1 configured, 1 Up, 0 ready
0 link-diverse, 0 node-diverse, 0 node-link-diverse, 0 user defined

Bidirectional Tunnel Summary:
Tunnel Head: 1 total, 1 connected, 1 associated, 1 co-routed To check how many tunnels are connected
Tunnel Tail: 1 total, 1 connected, 1 associated, 1 co-routed
LSPs Head: 1 established, 0 proceeding, 1 associated, 0 standby
LSPs Mid: 0 established, 0 proceeding, 0 associated, 0 standby
LSPs Tail: 1 established, 0 proceeding, 1 associated, 0 standby

GMPLS UNI Summary:
Heads: 0 up, 0 down
Tails: 0 up, 0 down

GMPLS NNI Summary:
Heads: 0 up, 0 down
Mids: 0 up, 0 down
Tails: 0 up, 0 down

To verify the co-routed LSP, use the Show mpls traffic-eng tunnel bidirectional co-routed command.

Router#Show mpls traffic-eng tunnel bidirectional co-routed
Name: tunnel-te2 Destination: 192.168.0.3
Status:
Admin: up Oper: up Path: valid Signalling: connected
path option 1, type dynamic (Basis for Setup, path weight 3 (reverse 3))
Bandwidth Requested: 80000 kbps CT0

Config Parameters:
Association Type: Single Sided Bidirectional LSPs, Co-routed: Yes
Association ID: 100, Source: 9.9.9.9[, Global ID: 9]
Reverse Bandwidth: 2 kbps CT0, Standby: 2 kbps CT0
BFD Fast Detection: Enabled
BFD Parameters: Min-interval 10000 ms, Multiplier 3 (default)
BFD Bringup Timeout: Interval 60 seconds (default)
BFD Initial Dampening: 16000 ms (default)
BFD Maximum Dampening: 600000 ms (default)
BFD Secondary Dampening: 20000 ms (default)
Periodic LSP Ping: Interval 120 seconds (default)
BFD Encap Mode: IP (default) | GAL
Soft Preemption: Enabled, Current Status: Preemption not pending

To verify the RSVP session details, use the show rsvp session detail command.

Router# show rsvp session detail
RP/0/RSP0/CP00:NC54K-R1#show rsvp session detail dst-port 2
SESSION: IPv4=LSP Addr: 192.168.0.3, TunID: 2, ExtID: 192.168.0.1

How to Configure Non Co-routed Inter-area Flex LSP Tunnels

The working and protect LSPs for PE1 (head-end) is different from PE2 (tail-end).

At PE1 (head-end):

```
interface Tunnel1001
 ip unnumbered Loopback0
 mpls ip
 tunnel mode mpls traffic-eng
 tunnel destination 1.1.1.1
 tunnel mpls traffic-eng priority 7 7
 tunnel mpls traffic-eng bandwidth 200
 tunnel mpls traffic-eng path-option 1 explicit name ThruHunG verbatim
 tunnel mpls traffic-eng path-option protect 1 explicit name PROT1 verbatim
 tunnel mpls traffic-eng bidirectional association id 1001 source-address 1.1.1.1 global-id 1001
!
interface Tunnel1002
 ip unnumbered Loopback0
 mpls ip
 tunnel mode mpls traffic-eng
 tunnel destination 1.1.1.1
 tunnel mpls traffic-eng priority 7 7
 tunnel mpls traffic-eng bandwidth 200
 tunnel mpls traffic-eng path-option 1 explicit name ThruHunG verbatim
 tunnel mpls traffic-eng path-option protect 1 explicit name PROT1 verbatim
 tunnel mpls traffic-eng bidirectional association id 1002 source-address 1.1.1.1 global-id 1002
!
```

```
ip explicit-path name ThruTenG enable
 next-address loose 22.1.1.2
 next-address loose 10.1.1.1
 next-address loose 1.1.1.1
!
ip explicit-path name ThruHunG enable
 next-address loose 23.1.1.2
 next-address loose 10.1.1.1
 next-address loose 1.1.1.1
!
ip explicit-path name PROT2 enable
 next-address loose 30.1.1.2
 next-address loose 40.1.1.1
 next-address loose 1.1.1.1
```

At PE2 (tail-end):

```
interface Tunnel1001
 ip unnumbered Loopback0
 mpls ip
 tunnel mode mpls traffic-eng
 tunnel destination 4.4.4.4
 tunnel mpls traffic-eng priority 7 7
 tunnel mpls traffic-eng bandwidth 200
 tunnel mpls traffic-eng path-option 1 explicit name ThruTenG verbatim
 tunnel mpls traffic-eng path-option protect 1 explicit name PROT2 verbatim
 tunnel mpls traffic-eng bidirectional association id 1001 source-address 1.1.1.1 global-id 1001
!
interface Tunnel1002
 ip unnumbered Loopback0
 mpls ip
 tunnel mode mpls traffic-eng
 tunnel destination 4.4.4.4
 tunnel mpls traffic-eng priority 7 7
 tunnel mpls traffic-eng bandwidth 200
 tunnel mpls traffic-eng path-option 1 explicit name ThruTenG verbatim
```
Configuring OSFP for Non Co-routed Flex LSP

**Note**
Add the new area into OSPF based on where you want the Inter-area to run.

```conf
router ospf 1
  router-id 3.3.3.3
  nsr
  nsf cisco
  microloop avoidance
  passive-interface Loopback0
  network 3.3.3.3 0.0.0.0 area 0
  mpls traffic-eng router-id Loopback0
  mpls traffic-eng area 0
  mpls traffic-eng area 1
```

Verifying the Non Co-routed Inter-area Flex LSP Tunnels

At the PE1

```conf
Router# show mpls traffic-eng tunnels tunnel 1001
Name: PE1_t1001 (Tunnel1001) Destination: 4.4.4.4
Status:
  Admin: up  Oper: up  Path: valid  Signalling: connected
  path option 1, type explicit (verbatim) ThruTenG (Basis for Setup, path weight 0)
  Path Protection: Requested
    path protect option 1, type explicit (verbatim) PROT2 (Basis for Protect, path weight 0)
Config Parameters:
  Bandwidth: 200 kbps (Global) Priority: 7 7 Affinity: 0x0/0xFFFF
  Metric Type: TE (default)
  auto-bw: disabled
  Association Type: Double Sided Bidirectional LSPs, Co-routed: NO
  Association ID: 1001, Source: 1.1.1.1, Global ID: 1001
  Fault-OAM: disabled, Wrap-Protection: disabled, Wrap-Capable: No

    Locked Out: No
  Path Protection: Backup lsp in use.
  Prior Working LSP details:
    LSP ID: 33 (Delayed Clean)
    Deactivates In: (2796) ms
    InLabel : -
    OutLabel : Ethernet0/1, 16
    Next Hop : 10.1.4.2
  Reverse Associated LSP Information:
    Signaled Name: 10.255.255.8 15
    Tunnel: 15, Source: 10.255.255.8, Dest: 10.255.255.1, LSP: 29 State: Up
  Lockout Info:
    Locked out: No
    Lockout Originated By: None
  Association:
    Association Type: Single Sided Bidirectional LSPs
    Association ID: 1 Source: 1.1.1.1

MPLS Basic Configuration Guide, Cisco IOS XE Release 3S (Cisco ASR 920 Series)
Step 6: Verifying that Pseudowire is in UP State

Router# `show mpls 12transport vc vcid 1`

<table>
<thead>
<tr>
<th>Local intf</th>
<th>Local circuit</th>
<th>Dest address</th>
<th>VC ID</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gi6</td>
<td>Eth VLAN 30</td>
<td>53.0.0.1</td>
<td>1</td>
<td>UP</td>
</tr>
</tbody>
</table>

#show mpls 12transport vc vcid 1 detail

Local interface: Gi6 up, line protocol up, Eth VLAN 30 up
Interworking type is Ethernet
Destination address: 53.0.0.1, VC ID: 1, VC status: up
Output interface: Tu10, imposed label stack {29 29780}
Preferred path: Tunnel10, active
Required BW = 15000, Admitted BW = 15000
Default path: ready
Next hop: point2point
Create time: 00:01:13, last status change time: 00:01:13
Last label FSM state change time: 00:01:13
Signaling protocol: LDP, peer 53.0.0.1:0 up
Targeted Hello: 53.0.0.1(LDP Id) -> 53.0.0.1, LDP is UP
Graceful restart: configured and enabled
Non stop routing: configured and not enabled

--------Full Output not provided--------

Use the `show adjacency tunnel internal` command to view the software forwarding of the tunnel:

Router# `show adjacency tunnel1 internal | i lsp-num`

GigabitEthernet0/5/2 55.0.0.1 label 21 lsp-num 20
Path protected by GigabitEthernet0/5/3 label 22 lsp-num 21
Reopt of working: Null0 0.0.0.0 label none lsp-num 0
Reopt of protect: Null0 label none lsp-num 0
