L2VPN Protocol-Based CLIs

The L2VPN Protocol-Based CLIs feature provides a set of processes and an improved infrastructure for developing and delivering Cisco IOS software on various Cisco platforms. This feature introduces new commands and modifies or replaces existing commands to achieve a consistent functionality across Cisco platforms and provide cross-Operating System (OS) support.

- Information About L2VPN Protocol-Based CLIs, on page 1
- Additional References, on page 10
- Feature Information for L2VPN Protocol-Based CLI, on page 10

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About L2VPN Protocol-Based CLIs

Overview of L2VPN Protocol-Based CLIs

The L2VPN Protocol-Based CLIs feature introduces new commands and modifies or replaces existing commands to achieve a consistent functionality across Cisco platforms and provide cross-Operating System (OS) support.

Note

The new, updated, and replacement commands are available in Cisco IOS XE Release 3.7S and Cisco IOS Release 15.3(1)S. However, the legacy commands that are being replaced will be deprecated in later releases.
Benefits of L2VPN Protocol-Based CLIs

The L2VPN Protocol-Based CLIs feature provides the following benefits:

• Consistent user experience across different operating systems.

• Consistent configuration for all Layer 2 VPN (L2VPN) scenarios.

• Enhanced functionality that is achieved by configuring pseudowires as virtual interfaces and monitoring the pseudowires as physical ports.

• Feature configuration such as quality of service (QoS) service policies on individual pseudowires.

• Redundant pseudowire configuration that is independent of the primary pseudowire to provide enhanced high availability.

These benefits are achieved through the following enhancements:

• New service contexts can be created for point-to-point and multipoint Layer 2 services by using the new L2VPN cross connect and L2VPN virtual forwarding interface (VFI) contexts.

  • The L2VPN cross connect context is used for configuring point-to-point pseudowires, pseudowire stitching, and local switching (hair pinning). Ethernet interfaces, Ethernet Flow Points (EFP), ATM interfaces and WAN interfaces (PPP,HDLC,Serial), and pseudowire interfaces can be defined as members of an L2VPN cross connect context.

  • The L2VPN VFI context instantiates Virtual Private LAN Services (VPLS) VFI for multipoint scenarios. Pseudowires can be defined as members of an L2VPN VFI context.

  • Bridge domains are used for multipoint scenarios. EFPs, pseudowires, or VFIs can be configured as members of a bridge domain. Pseudowires can be configured as member of a VFI. The VFI can be configured as a member of a bridge domains.

• New port contexts can be created (dynamically or manually) for pseudowires by using the pseudowire interface.

• Pseudowire customization can be achieved using interface templates and pseudowire interfaces that are applied to L2VPN context members. Pseudowire customizations include following features:

  • Encapsulation type
  • Control word
  • Maximum Transmission Unit (MTU)
  • Pseudowire signaling type
  • Tunnel selection

• Interworking and redundancy group service attributes can be configured under the L2VPN service context. The redundancy groups are configured independently from the primary pseudowire, which helps achieve zero traffic interruptions while adding, modifying, or deleting backup pseudowires.

L2VPN Protocol-Based CLI Changes

The following commands are introduced in Cisco IOS XE Release 3.7S, Cisco IOS Release 15.3(1)S, and Cisco IOS Release 15.4(1)S:

• debug l2vpn pseudowire

• l2vpn
• l2vpn pseudowire static-oam class
• monitor event-trace l2vpn
• show interface pseudowire
• show l2vpn service
• shutdown (MPLS)
• vc

The following commands are modified in Cisco IOS XE Release 3.7S and Cisco IOS Release 15.3(1)S:

• auto-route-target
• bridge-domain parameterized vlan
• debug condition xconnect fib
• debug condition xconnect interface
• debug condition xconnect peer
• debug condition xconnect segment
• description
• encapsulation (MPLS)
• forward permit l2protocol all
• interworking
• l2vpn subscriber authorization group
• l2vpn xconnect context
• load-balance flow
• monitor event-trace ac
• monitor event-trace atom
• monitor event-trace l2tp
• monitor peer bfd
• mtu
• preferred-path
• remote circuit id
• rd (VPLS)
• route-target (VPLS)
• sequencing
• status
- status admin-down disconnect
- status control-plane route-watch
- status decoupled
- status peer topology dual-homed
- status protocol notification static
- status redundancy
- switching tlv
  - tlv
  - tlv template
- vccv
- vccv bfd status signaling
- vccv bfd template
- vpls-id
- vpn id (MPLS)

The table below lists the legacy commands that will be replaced in future releases. From Cisco IOS XE Release 3.7S and Cisco IOS Release 15.3(1)S both new and legacy commands will coexist until the legacy commands are deprecated in future releases.

MPLS L2VPN Protocol-Based CLI: Examples

The examples in this section provide the new configurations that are introduced by the MPLS L2VPN Protocol-Based CLIs feature that replace the existing (legacy) MPLS L2VPN CLIs.

**MPLS L2VPN VPWS Configuration Using Replacement (or New) Commands**

The following example shows the configuration for Virtual Private Wired Service (VPWS)—Ethernet over Multiprotocol Label Switching (EoMPLS). In this example, L2VPN members point to peer ID or virtual circuit (VC) ID. This configuration is used in most cases except when features like quality of service (QoS), need to be applied at the pseudowire level.

```
l2vpn xconnect context foo
  member GigabitEthernet2/1/1 service-instance 300
  member 10.0.0.1 888 encapsulation mpls

! interface GigabitEthernet2/1/1
  service instance 300 Ethernet
  encapsulation dot1q 30
  rewrite ingress tag pop 1 symmetric
!
  service instance 400 Ethernet
  encapsulation dot1q 40
  rewrite ingress tag pop 1 symmetric

l2vpn xconnect context faa
```
MPLS L2VPN Pseudowire Configuration Using Replacement (or New) Commands

In the following example, L2VPN members point to a pseudowire interface. The pseudowire interface is manually configured and includes peer ID and VC ID. This configuration is used in most cases except when features like quality of service (QoS), need to be applied at the pseudowire level.

```
l2vpn xconnect context foo
  member GigabitEthernet2/1/1 service-instance 300
  member Pseudowire888
!
interface Pseudowire 888
  encapsulation mpls
  neighbor 10.0.0.1 888
!
interface Pseudowire 999
  encapsulation mpls
  neighbor 10.0.0.1 999
!
interface GigabitEthernet2/1/1
  service instance 300 Ethernet
  encapsulation dot1q 30
  rewrite ingress tag pop 1 symmetric
!
service instance 400 Ethernet
  encapsulation dot1q 40
  rewrite ingress tag pop 1 symmetric
```

MPLS L2VPN Pseudowire Redundancy Configuration Using Replacement (or New) Commands

The following example shows the configuration for pseudowire redundancy. The new configuration shows concise pseudowire redundancy with no submodes or separate groups. This configuration allows the addition of redundant members to a service without service disruption. This configuration also allows modifying or deleting redundant service configurations without service disruption.

```
l2vpn xconnect context sample-pw-redundancy
  member GigabitEthernet2/1/1 service-instance 200
  member 1.1.1.1 180 encap mpls group Denver
  member 2.2.2.2 180180 encap mpls group Denver priority 1
  member 3.3.3.3 180181 encap mpls group Denver priority 2
  redundancy delay 1 20 group Denver
!
interface GigabitEthernet2/1/1
  service instance 200 Ethernet
  encapsulation dot1q 100
  rewrite ingress tag pop 1 symmetric
```

MPLS L2VPN Static Pseudowire Configuration Using Replacement (or New) Commands

The following configuration is shown for the Provider Edge (PE) 1 router in a network scheme where Customer Edge (CE) 1 and PE 1 and PE 2 and CE 2 traverse through a Provider core (P) router (CE 1—PE 1—P—PE 2—CE 2).

```
member GigabitEthernet2/1/1 service-instance 400
member 10.0.0.1 999 encapsulation mpls
!
```
interface g2/1/1
service instance 300 ethernet
encapsulation dot1q 300
no shutdown
!
interface pseudowire 100
neighbor 10.4.4.4 121
encapsulation mpls
label 200 300
signaling protocol none
no shutdown
!
l2vpn xconnect context foo
  member GigabitEthernet2/1/1 service-instance 300
  member pseudowire 100

**MPLS L2VPN Static Pseudowire Template Configuration Using Replacement (or New) Commands**

The following configuration is shown for the Provider Edge (PE) 1 router in a network scheme where Customer Edge (CE) 1 and PE 1 and PE 2 and CE 2 traverse through a Provider core (P) router (CE 1—PE 1—P—PE 2—CE 2).

```conf
template type pseudowire test
encapsulation mpls
signaling protocol none
!
interface g2/1/1
service instance 300 ethernet
encapsulation dot1q 300
no shutdown
!
interface pseudowire 100
neighbor 10.4.4.4 121
source template type pseudowire test
label 200 300
no shutdown
!
l2vpn xconnect context foo
  member GigabitEthernet2/1/1 service-instance 300
  member pseudowire 100
```

**MPLS L2VPN Dynamic Pseudowire Template Configuration Using Replacement (or New) Commands**

The following configuration is shown for the Provider Edge (PE) 1 router in a network scheme where Customer Edge (CE) 1 and PE 1 and PE 2 and CE 2 traverse through a Provider core (P) router (CE 1—PE 1—P—PE 2—CE 2).

```conf
! template type pseudowire test
  encapsulation mpls
  signaling protocol ldp
  !
  interface g2/1/1
  service instance 300 ethernet
  encapsulation dot1q 300
  no shutdown
  !
```
interface pseudowire 100
neighbor 10.4.4.4 121
source template type pseudowire test
no shutdown

! 12vpn xconnect context foo
    member GigabitEthernet2/1/1 service-instance 300
    member pseudowire 100

MPLS L2VPN Multi-segment Static-Dynamic Pseudowire Template Configuration Using Replacement (or New) Commands

The following PE router configuration is for a multi-segment static-dynamic pseudowire:

12vpn pseudowire tlv template TLV
    tlv mtu 1 4 dec 1500
! interface pseudowire401
    source template type pseudowire staticTempl
    encapsulation mpls
    neighbor 10.4.4.4 101
    signaling protocol none
    label 4401 4301
    pseudowire type 4
    tlv template TLV
    tlv 1 4 dec 1500
    tlv vccv-flags C 4 hexstr 0110
! interface pseudowire501
    source template type pseudowire dynTempl
    encapsulation mpls
    neighbor 10.2.2.2 101
    signaling protocol ldp

Displaying MPLS L2VPN Pseudowire Template Configuration Using Replacement (or New) Commands

The following example displays output from the show interface pseudowire command:

PE1#show interface pseudowire 100
pseudowire100 is up
    Description: Pseudowire Interface
    MTU 1500 bytes, BW 10000000 Kbit
    Encapsulation mpls
    Peer IP 10.4.4.4, VC ID 121
    RX
        21 packets 2623 bytes 0 drops
    TX
        20 packets 2746 bytes 0 drops

The following example displays output from the show template command:

PE1#show template
Template   class/type  Component(s)
ABC        owner       interface pseudowire
BOUND: pw1

Sourcing a Template Under an Interface Pseudowire Using Replacement (or New) Commands

The following example configures the interface pseudowire to inherit all attributes defined from a template on the PE 2 router.

PE2(config-subif)#interface pseudowire 100
PE2(config-if)#source template type pseudowire test
PE2(config-if)#neighbor 10.4.4.4 121
PE2(config-if)#no shutdown

Feature Information for L2VPN Protocol-Based CLI

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
