

# **Generating and Installing Certificates**

This section describes how to generate and install certificates, and includes the following topics:

- Information About Certificates, on page 1
- Generating and Exporting Certificates, on page 2
- Installing the Certificates, on page 19
- Configuring IoT FND to Access the Keystore, on page 31
- Configuring the TPS Proxy to Access the Keystore, on page 32
- Setting Up the HSM Client, on page 33
- Configuring the HSM Group Name and Password, on page 41

# Information About Certificates

The following topics provide information on certificates:

# **Types of Certificates**

IoT FND uses the following three types of certificates:

- 1. Device Certificate
- 2. Web Certificate
- 3. CSMP Certificate

# **Role of Certificates**

All communications between the CGR1000, IR800s, C800s, ESR C5921s, IR1100, IR8100, IC3000, IXM, and the Cisco Connected IoT Field Network Director (IoT FND) must be authenticated in both directions through mutual authentication. Before mutual authentication occurs, the Cisco IoT FND and the device must each have a certificate that is signed by the same Certificate Authority (CA). You can employ either a root CA or subordinate CA (sub-CA).

For more information on generating certificates for CGRs, refer to Certificate Enrollment Guide for the Cisco 1000 Series Connected Grid Routers.

Generating certificates for IoT FND also involves generating and loading certificates on the IoT FND TPS Proxy (tpsproxy). After generating the certificates, import them into the storage location on the TPS proxy and IoT FND known as the Keystore, on page 2.

## Keystore

The keystore provides details for a specific system such as IoT FND server or TPS proxy. IoT FND server and TPS server use Java keystore to store their own device certificate and the corresponding private keys that are referenced using an alias.

The following table lists the certificate types used by IoT FND and the keystore location of the certificates:

IoT FND Certificate Type	Keystore Location
Device Certificate	cgms_keystore
Web Certificate	jbossas.keystore
CSMP Certificate	HSM or SSM

By default, the cgms keystore file does not exist, the file must be created.

The keystore must contain the following information:

- Cisco SUDI or the device manufacturing certificate (private key for the system).
- The root CA certificate of the issuing root CA or sub-CA server.
- The certificate that is generated for FND server or TPS server for TPS.

Note

The IoT FND key and the certificates are stored in cgms\_keystore file in the IoT FND server located in /opt/cgms/server/cgms/conf directory.

# **Generating and Exporting Certificates**

# Ŵ

**Note** The IoT FND certificate encrypts data in the database. **Do not lose this certificate!** Loss of this certificate results in some database data that will not be able to be decrypted.

Complete the following procedures to generate and export certificates:

# Configuring a Certificate Template for IoT FND and IoT FND TPS Proxy

On the CA (or subCA) you must create certificate templates to generate certificates for the IoT FND and TPS proxy.

To create a certificate template:

Step 1	Open the Certificate Authority application on a Windows Server 2008 R2 system operating with the Enterprise edition.
	The Certificate Authority application is standard on the above noted Windows Server version.
Step 2 Step 3 Step 4 Step 5 Step 6 Step 7	<ul> <li>Expand the menu to view the Certificate Templates folder.</li> <li>Right-click Certificate Templates and choose Manage from the context menu.</li> <li>In the right-pane, right-click Computer, choose Duplicate Template from the context menu, and enter NMS.</li> <li>In the Duplicate Template pane, select Windows Server 2008 Enterprise.</li> <li>Click OK.</li> <li>Click the NMS Properties &gt; General tab, and do the following: <ul> <li>a) Enter NMS in the Template display name and Template name fields.</li> <li>b) Enter an appropriate Validity period, which defines the lifetime of the certificate.</li> <li>c) Check the Publish certificate in Active Directory check box.</li> <li>d) Click OK.</li> </ul> </li> </ul>
Step 8	<ul> <li>Click the NMS Properties &gt; Extensions tab, and do the following:</li> <li>a) Select Application Policies in the Extensions pane.</li> <li>b) In the Application Policies pane, verify that Client Authentication and Server Authentication appear in the bottom pane.</li> <li>c) Select Key Usage in the Extensions top pane and click Edit.</li> <li>d) In the Edit Key Usage Extension pane, clear the Make this extension critical check box.</li> <li>e) Click OK.</li> </ul>
Step 9	<ul> <li>Click the NMS Properties &gt; Request Handling tab, and do the following:</li> <li>a) Choose Signature and encryption from the Purpose drop-down menu.</li> <li>b) Check the Allow private key to be exported check box.</li> <li>c) Click OK.</li> </ul>
Step 10	<ul> <li>Click the NMS Properties &gt; Security tab, and do the following:</li> <li>a) Select Administrator within the Group or user names pane.</li> <li>b) For each group or user names item listed (such as authenticated users, administrator, domain administrators, enterprise administrators) check the Allow check box for all permissions (full control, read, write, enroll, autoenroll).</li> <li>c) Click OK.</li> </ul>
Step 11	Click the <b>NMS Properties</b> > <b>Cryptography</b> tab, and retain the following default settings: • Algorithm name: RSA • Minimum key site: 2048 • Cryptographic provider: Requests can use any provider available on the subject computer • Request hash: SHA256
Step 12 Step 13	Click <b>OK</b> . Click the <b>NMS Properties &gt; Subject Name</b> tab, and retain the following default settings: • Radio button for <b>Supply in the request radio button</b> selected

Check box checked for Use subject information from existing certificates for autoenrollment renewal requests

### Step 14 Click OK.

**Note** Retain the default settings for the remaining tabs: Superseded Templates, Server, and Issuance Requirements.

# **Enabling a Certificate Template**

To enable the certificate template:

### Before you begin

Before you can create a certificate, you must enable the certificate template.

- Step 1 Configure a certificate template (see Configuring a Certificate Template for IoT FND and IoT FND TPS Proxy, on page 2).
   Step 2 Open the Certificate Authority application on the Windows Server.
   Step 3 Expand the menu to view the Certificate Templates folder.
   Step 4 Right-click Certificate Templates and choose New > Certificate Template to Issue from the context menu.
- **Step 5** In the Enable Certificate Templates window, highlight the new NMS template.
- Step 6 Click OK.

# Generating Certificates for IoT FND and the IoT FND TPS Proxy

Follow the same steps for generating a certificate for IoT FND and for the TPS proxy by using the configuration template that you previously created.

**Note** Go through the steps in this section twice: once to generate the IoT FND certificate, and once to generate the TPS proxy certificate.

In the Certificate Properties window, click the **Subject** tab, and do the following:

• In the **Value** field, add the fully-qualified domain name (FQDN): the value you enter depends on whether you are creating a certificate for the IoT FND or the TPS proxy.

After creating these two certificates, securely transfer the IoT FND certificate to the IoT FND application server, and securely copy the TPS proxy certificate to the TPS proxy server.

To generate a certificate:

- **Step 1** Configure a certificate template (see Configuring a Certificate Template for IoT FND and IoT FND TPS Proxy, on page 2).
- **Step 2** Enable the certificate template (see Enabling a Certificate Template, on page 4).

- **Step 3** From a server running Windows Server 2008, choose **Start** > **Run** and enter **mmc** to open the MMC console.
- **Step 4** In the Console 1 window, expand the **Certificates** > **Personal** folders.
- **Step 5** Right-click **Certificates** and choose **All Tasks** > **Request New Certificate** from the context menu.
- **Step 6** In the Before You Begin window, click **Next**.
- **Step 7** In the Select Certificate Enrollment Policy window, choose **Active Directory Enrollment Policy**. Click **Next**.
- **Step 8** In the Request Certificates window, do the following:
  - a. Check the NMS check box.
  - **b.** Click the **More information**... link.
- **Step 9** In the Certificate Properties window, click the **Subject** tab, and do the following:
  - a. From the Type drop-down menu, choose Common name (CN).
  - **b.** In the **Value** field, add the fully-qualified domain name (FQDN):
    - For IoT FND certificates, enter the FQDN of the IoT FND server for your deployment, for example: CN=nms.sgbu.cisco.com.
    - For TPS proxy certificates, enter the FQDN for the TPS proxy for your deployment, for example: CN= tps.sgbu.cisco.com.
  - c. Click Add and the Common Name appears in the right-pane.
  - d. From the Type drop-down menu, choose Organization (O).
  - e. In the Value field, add the company name or organization for the IoT FND or TPS proxy.
  - f. Click Add and the organization appears in the right-pane.

ertificate Pr	operties						×

- Step 10 Click Apply. Click OK.
- Step 11 In the Certificate Enrollment window, check the NMS check box and click Enroll.
- **Step 12** After enrollment completes, click **Finish**.
- **Step 13** In the MMC console (Console 1), expand the **Certificates** folder.
- **Step 14** Choose **Personal** > **Certificates**.
- **Step 15** In the Issued To pane, right-click the new certificate and choose **All Tasks** > **Export** from the context menu.

The Export Wizard window appears.

Console1 - [Console Root\Certificate	s (Local Computer)\Personal	\Certificates]

Active Directory Users and Compute	Cut Cut Copy Delete Properties Help	Open Request Certificate with New Key Renew Certificate with New Key Manage Private Keys Advanced Operations Export	9/20/2013	Client Auther

**Step 16** Initiate the Export Wizard.

Step 17 At the Export Private Key window, select the Yes, export the private key radio button. Click Next.

**Step 18** At the Export File Format window, do the following:

- a. Click the Personal Information Exchange radio button.
- b. Check the Include all certificates in the certification path if possible check box.

This option includes the full certificate chain within the certificate.

c. Click Next.

Step 19In the password window, enter keystore and re-enter to confirm.

The password is the default password that the IoT FND and the TPS proxy use to read this file.

- Step 20 Click Next.
- **Step 21** In the File to Export window, enter the file name (such as *nms\_cert* or *tps\_cert*) and click **Next**.
- **Step 22** In the Completing the Certificate Export Wizard, click **Finish**.

Files with a \*.pfx extension are automatically saved to the Desktop. PFX refers to the Personal Information Exchange format, which is also known as PKCS\_#12 format. PFX is an industry-standard format that allows certificates and their private keys to be transferred (exported) from one computer to another.

**Step 23** Securely transfer the two certificate files (such as *nms\_cert.pfx* and *tps\_cert.pfx*) from the Windows Desktop to the IoT FND (*nms\_cert.pfx*) and TPS proxy (*tps\_cert.pfx*), respectively.

**Note** For heightened security, after a successful transfer delete the \*.pfx files from the Windows Desktop and empty the Recycle bin.

## **Certificate Requirements for IoT FND Server HA Deployment**

To generate the certificate for IoT FND server HA deployment, follow the same steps as in the Generating Certificates for IoT FND and the IoT FND TPS Proxy.

Ensure that IoT FND server certificate contents for HA deployment is as given below:

• The Subject — Must have the FQDN of the VIP.

Example: FNDSERVERVIP.TEST.COM

• The Subject Alternative Name (SAN) — Added must include the FQDN of the VIP.

Example: FNDSERVERVIP.TEST.COM (same as the subject)

• The Subject Alternative Name - Must NOT have the individual server names.

Example: It must not contain FNDSERVER1.TEST.COM, FNDSERVER2.TEST.COM

## **Command Authorization Support**

The Cisco Connected Grid Routers (CGRs) are managed by IoT FND over a WAN backhaul connection such as 3G, 4G, or WiMAX. For CG-OS CGRs, you define an OID value to enable administrative privileges for IoT FND.

Attention

Defining OID value in the cgms certificate for TPS and FND is required until IoT FND release 4.7 and from IoT FND release 4.8 onwards, it is not required.

The OID for this policy is 1.3.6.1.4.1.9.21.3.3.1. This element appears in the certificate if IoT FND is authorized to issue management commands to the CGR with administrative privileges. When IoT FND communicates with the CGR over a secured session, such as TLS, the CGR can execute these commands as if they were issued by the network administrator.

## Enabling Command Authorization Using NMS/TPS Certificates

Follow this procedure to authorize the command authorization (CA) feature of the router, and complete registration with IoT FND.

- Step 1Generate new NMS/TPS certificates (see Generating Certificates for IoT FND and the IoT FND TPS Proxy, on page<br/>4) or renew the existing NMS/TPS certificate (see Renewing Certificates, on page 11).
- **Step 2** Add an OID value to the CA certificate (see Adding an OID Value to the CA Certificate, on page 9).

**Step 3** Generate a new.pfx file for the NMS/TPS certificate (see Generating Certificates for IoT FND and the IoT FND TPS Proxy, on page 4).

**Step 4** Stop IoT FND by running the following command:

RHEL Version	Command
8.x	systemctl stop cgms
7.x	service cgms stop

- **Note** The application typically takes approximately 10 seconds to stop. Run ps | grep java to verify that no Java processes are running.
- **Step 5** Rename the existing cgms\_keystore file (for example, cgms\_keystore\_no\_oid).
- **Step 6** Export the.pfx file to IoT FND and create a new cgms\_keystore file (see Using Keytool to Create the cgms\_keystore File, on page 20).
- **Step 7** Install the new certificates (see Installing the Certificates, on page 19).
- **Step 8** Add the new cgms\_keystore file to IoT FND (see Copying the cgms\_keystore File to IoT FND, on page 21).
- **Step 9** Restart IoT FND by running the following command:

RHEL Version	Command
8.x	systemctl restart cgms
7.x	service cgms restart

**Step 10** Register the routers with IoT FND.

## Adding an OID Value to the CA Certificate

Note The procedure is applicable only for CG-OS devices and not for Cisco IOS and Cisco IOS-XE devices.

You must add an OID value to the CA certificate to allow IoT FND to use the admin role for command authorization on the router.

To add an OID value to the CA certificate:

On the CA server, open a cmd console and type:				
1.3.3.1				
1 click Next.				
C				

- **Step 5** In the Certificate Properties window, click the **Subject** tab and complete the fields.
- **Step 6** In the Certificate Properties window, click the **Extensions** tab and click the **Custom extension definition** button to expand the section.

Subject General and sons Private key Ceruicatori Adulonty Sig	nature
Extended Key Usage (application policies)	<u>ہ</u> ک
Basic constraints	۲
Include Symmetric algorithm	۲
Custom extension definition Sustom extensions can be defined by specifying object identifiers (OIDs).	8

Value:							
Make this custom extension critical		< Remov	/e				
Make this custom extension critical		< Remov	/e	<b>ر</b>		Þ	

**Step 10** Ensure that these values are correct, and then click **Apply**.

# **Renewing Certificates**

To renew certificates and add the OID value:

Step 1	From the RSA CA server with the original NMS/TPS certificate, type the following open command at the command prompt:
	certutil -setreg policy\EnableRequestExtensionList +1.3.6.1.4.1.9.21.3.3.1
Step 2	Restart the CA server.
Step 3	Open the certificate console in the MMC.
Step 4	Locate the issued NMS/TPS certificate in the Personal folder on the CA server.
Step 5	Right-click on the server icon, and select All Tasks > Advanced Operations > Renew This Certificate with the

- Same Key option from the context menu.
- **Step 6** In the Certificate Enrollment window, click **Next**.

- Step 7 Click Details.
- Step 8 Click Properties.
- **Step 9** Enter the OID and its value, and click **OK**.
- **Step 10** Click **Add**, and then click **OK**.
- **Step 11** At Request Certificates panel, click **Enroll**.
- Step 12 Click Finish.

**Step 13** Verify that the certificate contains the OID value.

# **Configuring a Custom CA for HSM**

This section describes configuring a custom CA for the hardware security module (HSM) for signing CSMP messages sent from IoT FND to mesh devices.

To configure a custom CA for generating HSM certificates:

### Before you begin

- Ensure that you install the SafeNet client software version listed in the "System Requirements" in IoT FND Release Notes on the IoT-FND server.
- You must have your own CA (for example, Microsoft or OpenSSL).
- **Step 1** Create a new partition on the HSM and assign it to your IoT FND client (see Setting Up the HSM Client).
- Step 2 Generate a key pair on the HSM and export a CSR for that key pair (see Keystore, on page 2).

All commands run from the Luna client on the IoT FND server. You do not have to log in to the HSM machine.

[root@<user>-scaledb bin]# cd /usr/safenet/lunaclient/bin/

# Generate a Key Pair (a set of private and public keys. You MUST provide explicit labels to the private and public keys) [root@<user>-scaledb bin]#./cmu generatekeypair -sign=T -verify=T -labelpublic="nms\_public\_key" -labelprivate="nms\_private\_key" Please enter password for token in slot 1 : \*\*\*\*\*\*\* Enter key type - [1] RSA [2] DSA [3] ECDSA : 3 <--- Choose option 3 Enter curve type [1] NISTP 192 [2] NISTP 224 [3] NISTP 256 [4] NISTP 384 [5] NISTP 521 Enter curve type [1] NISTP 192 [2] NISTP 224 [3] NISTP 256 <--- Choose option 3 [4] NISTP 384 [5] NISTP 521 (1 to 5) 3 [root@<user>-scaledb bin]# # Test if the keypair exists on the HSM partition [root@<user>-scaledb bin]#./cmu list Please enter password for token in slot 1 : \*\*\*\*\*\*\*\* handle=2000001 label=nms public key handle=2000002 label=nms\_private\_key # Now, export a certificate signing request for this keypair. Note that the specific fields for DN and handle may be different for your HSM. Fill appropriately. [root@<user>-scaledb bin]#./cmu requestcertificate Please enter password for token in slot 1 : \*\*\*\*\*\*\*\* Select the private key for the request : Handler Label 2000002 nms private key Enter handler (or 0 for exit) : 2000002 Enter Subject 2-letter Country Code (C) : US Enter Subject State or Province Name (S) : CA Enter Subject Locality Name (L) : San Jose Enter Subject Organization Name (O) : Cisco Systems Inc. Enter Subject Organization Unit Name (OU) : IOTSSG Enter Subject Common Name (CN) : IOT-FND-HSM Enter EMAIL Address (E) : Enter output filename : hsm.csr [root@<user>-scaledb bin]# # Verify the file exists and has properly formatted content [root@<user>-scaledb bin]# ls hsm.csr hsm.csr [root@<user>-scaledb bin]# cat hsm.csr ----BEGIN NEW CERTIFICATE REQUEST----MIIBKzCB0QIBADBvMQswCQYDVQQGEwJVUzELMAkGA1UECBMCQ0ExETAPBgNVBAcT CFNhbiBKb3N1MRowGAYDVQQKExFDaXNjbyBTeXN0ZW1zIEluYzEPMA0GA1UECxMG SW9UU1NHMRMwEQYDVQQDEwpDRy1OTVMtSFNNMFkwEwYHKoZIzj0CAQYIKoZIzj0D AQcDQgAESfdlrrcVtzN3Yexj9trlI5qd0w5Sdu8Vj2s17JAF/vPFUOYIw/uXwD6+ bb8vq3WH1A6tmgRbj+FU6G3Bmt/vCqAAMAsGByqGSM49BAEFAANIADBFAiEAroJO qz3dHA2GLrGzBmU01vYys642Nkb4B4qyEoUZIGsCIFs0iTUyGQreM1BaSDEPHArZ RvFlrKo/Zi3c8O4gzFZW -----END NEW CERTIFICATE REQUEST----

## **Step 3** Save the generated CSR to your CA and sign the certificate.

**Note** For CR-Mesh release earlier than 6.2.34 MR or 6.3.20, it is recommended to obtain a 30-year certificate.

Starting from CR-Mesh release 6.2.34 MR or 6.3.20 and later, the EST feature is supported, which automates the certificate renewal process. Therefore, it is not required to obtain a 30-year certificate. For more information on EST, see Configuring Enrollment over Secure Transport. You can use the root CA for IEEE 802.1X authentication for node admission.

**Step 4** Copy the signed certificate to the IoT FND server and import it to the HSM.

[root@<user>-scaledb bin]#./cmu import
Please enter password for token in slot 1 : \*\*\*\*\*\*\*
Enter input filename : <your file name with signed certificate>

# Verify that the certificate was imported

[root@<user>-scaledb bin]#./cmu list
Please enter password for token in slot 1 : \*\*\*\*\*\*\*
handle=2000001 label=nms\_public\_key
handle=2000002 label=nms\_private\_key
handle=2000003 label=IOT-FND-HSM <--- This is my certificate with label = CN</pre>

**Step 5** Run the following commands to configure IoT FND to use the new certificate:

RHEL Version	Commands	
8.x	<b>a.</b> systemctl stop cgms	
	<pre>b. systemctl start cgms</pre>	
7.x	<b>a.</b> service cgms stop	
	<b>b.</b> service cgms start	

### **Example Output:**

[root@kartven2-nms ~]# service cgms stop [root@kartven2-nms ~]# cd /opt/cgms/server/cgms/conf/

# Add following properties to the cgms.properties file

hsm-private-key-label=nms\_private\_key <--- private key label you gave to your public key hsm-public-key-label=nms\_public\_key <--- public key label you gave to your public key hsm-cert-label=IOT-FND-HSM <--- label for your signed certificate hsm-keystore-name=customca-group <--- your HA partition group hsm-keystore-password=2bVvZsq+vsq94YxuAKdaag== <--- encrypted password for the partition</pre>

[root@kartven2-nms conf]# service cgms start
[root@kartven2-nms conf]#

**Step 6** Verify that the certificate appears on the **Certificates for CSMP** tab (**ADMIN** > **System Management** > **Certificates**).

cisco FIELD NETWORK DIRECTOR		CONFIG 🗸	ADMIN 🗸
ADMIN > SYSTEM MANAGEMENT > CERT	IFICATES		
Certificate for CSMP Certificate for Routers	Certificate for Web		
Certificate: Data: Version: 1 Serial Number: 1399618661 Signature Algorithm: SHA256withECDSA Issuer: CN=CGNMS, OU=CENBU, O=Cisco Validity Not Affer: Mon May 09 06:57:41 UTC 204 Subject: CN=CGNMS, OU=CENBU, O=Cisc Fingerprints: MD5: 08:50:51:66:27:01:89:07:14:C9:29: SHA1: E5:4A:71:B7:C4:81:56:20:51:A4:B! 	Binary     Base64     Download		

**Step 7** Configure your mesh nodes to use this certificate for signatures.

# **Configuring a Custom CA for SSM**

This section describes configuring a custom CA for the software security module (SSM) for signing CSMP messages sent from IoT FND to mesh devices.

To configure a custom CA for generating SSM certificates:

## Before you begin

- Ensure that you install the SafeNet client software version listed in the "System Requirements" in the IoT FND Release Notes on the IOT-FND server.
- Only SSM versions 2.2.0-37 and above are supported.
- You must have your own CA (for example, Microsoft or OpenSSL).

**Step 1** Run the following command to stop the ssm service.

RHEL Version	Command
8.x	systemctl stop ssm
7.x	service ssm stop

**Step 2** Use the ssm\_setup.sh script to configure a new keypair with a specific alias and generate a CSR:

[root@nms-rhel-6-6 ~] # cd /opt/cgms-ssm/bin/ [root@nms-rhel-6-6 bin]# ./ssm\_setup.sh Software Security Module Server a. Generate a new keyalias with self signed certificate for CSMP b. Generate a new keypair & certificate signing request for CSMP <--- Choose option 2 C. Import a trusted certificate d. Change CSMP keystore password e. Print CG-NMS configuration for SSM f. Change SSM server port g. Change SSM-Web keystore password Select available options. Press any other key to exit. Enter your choice : 2 Warning: This action will modify ssm\_csmp\_keystore file. Backup the file before performing this action. Do you want to proceed (y/n): y Enter current ssm csmp keystore password : Enter a new key alias name (8-16): ssmcustomca Enter key password (8-12): Enter certificate issuer details Enter common name CN [Unknown]: IOT-FND-SSM Enter organizational unit name OU [Unknown]: IOTSSG Enter organization name O [Unknown]: Cisco Systems Inc. Enter city or locality name L [Unknown]: San Jose Enter state or province name ST [Unknown]: CA Enter country code for this unit C [Unknown]: US Is [CN=IOT-FND-SSM, OU=IOTSSG, O=Cisco Systems Inc., L=San Jose, ST=CA, C=US] correct (y/n)? :y Certificate Signing Request file name: /opt/ssmcustomca.csr Succefully generated keypair with alias ssmcustomca. You can use the CSR from /opt/ssmcustomca.csr for signature by certificate authority

**Step 3** Save the generated CSR to your CA and sign the certificate.

[root@nms-rhel-6-6 bin]#

**Note** For CR-Mesh release earlier than 6.2.34 MR or 6.3.20, it is recommended to obtain a 30-year certificate.

Starting from CR-Mesh release 6.2.34 MR or 6.3.20 and later, the EST feature is supported, which automates the certificate renewal process. Therefore, it is not required to obtain a 30-year certificate. For more information on EST, see Configuring Enrollment over Secure Transport. You can use the root CA for IEEE 802.1X authentication for node admission.

- **Step 4** Copy the signed certificate to the IoT FND server and import it to the SSM.
- **Step 5** Use the ssm\_setup.sh script to import the two certificates to the SSM keystore:

[root@nms-rhel-6-6 bin]# ./ssm setup.sh Software Security Module Server **a.** Generate a new keyalias with self signed certificate for CSMP **b.** Generate a new keypair & certificate signing request for CSMP C. Import a trusted certificate <--- Choose option 3 d. Change CSMP keystore password e. Print CG-NMS configuration for SSM f. Change SSM server port g. Change SSM-Web keystore password Select available options. Press any other key to exit Enter your choice : 3 Enter current ssm csmp keystore password : Enter the alias for import: root Certificate file name: /opt/ca.crt Certificate reply was installed in keystore Succefully imported certificate into alias root Use the ssm\_setup.sh script to import the signed certificate for the alias: [root@nms-rhel-6-6 bin]# ./ssm\_setup.sh Software Security Module Server **a.** Generate a new keyalias with self signed certificate for CSMP **b.** Generate a new keypair & certificate signing request for CSMP C. Import a trusted certificate <--- Choose option 3 d. Change CSMP keystore password e. Print CG-NMS configuration for SSM f. Change SSM server port g. Change SSM-Web keystore password Select available options. Press any other key to exit Enter your choice : 3

Enter current ssm\_csmp\_keystore password : Enter the alias for import: ssmcustomca Certificate file name: /opt/ssmcustomca.crt Certificate reply was installed in keystore Succefully imported certificate into alias ssmcustomca

**Step 7** Update the cgms.properties file with the following parameters to configure IoT FND to use this certificate on the SSM for signatures:

security-module=ssm
ssm-host=172.27.163.153
ssm-port=8445
ssm-keystore-alias=ssmcustomca

Step 6

```
ssm-keystore-password=GgeQJAOk3fSIH97qJARGRA==
ssm-key-password=GgeQJAOk3fSIH97qJARGRA==
```

Step 8 Verify that the certificate appears on the Certificates for CSMP > ADMIN > System Management > Certificates tab.
 Step 9 Configure your mesh nodes to use this certificate for signatures.

# **Exporting the CA Certificate**

To export the certificate from the Certificate Authority or subordinate CA to the IoT FND:

Step 1	Open the Certificate Authority application on a Windows Server 2008 R2 system operating with the Enterprise Edition.		
Step 2	Expand the menu to view the Certificates (Local Computer) > Personal > Certificates folder.		
Step 3	Locate the certificate whose fingerprint matches that in use by the Cisco CGR 1000 and Cisco ASR.		
Step 4	Right-click the certificate and choose All Tasks > Export from the context menu.		
Step 5	In the Certificate Export Wizard window, click Next.		
Step 6	In the Export Private Key window, select the No, do not export the private key radio button. Click Next.		
Step 7	In the Export File Format window, select the Base-64 encoded X.509 (.CER) radio button. Click Next.		
Step 8	In the File to Export window, assign a name for the file that you want to export. Click Next.		
Step 9	In the File to Export window, enter the file name (such as <i>ca_cert</i> or <i>subca_cert</i> ) and click Next.		
Step 10	In the Completing the Certificate Export Wizard, click Finish.		
	Files with a	*.cer extension are automatically saved to the Desktop.	
Step 11	Securely transfer the certificate file (such as <i>ca_cert.cer</i> ) from the Windows Desktop to IoT FND.		
	Note	For heightened security, after a successful transfer delete the *.cer file from the Windows Desktop and empty the Recycle bin.	

# **Installing the Certificates**

You must create a cgms\_keystore file on both the servers running IoT FND and IoT FND TPS Proxy.

- **IoT FND** When creating the cgms\_keystore file, you import the IoT FND certificate, its private key, and the certificate chain. After creating the cgms\_keystore file, you copy it into a specific directory on the server.
- **IOT FND TPS Proxy** When you create the cgms\_keystore file, you import the IoT FND TPS Proxy certificate, its private key, and the certificate chain. After you create the cgms\_keystore file, you copy it into a specific directory on the TPS proxy.

To create the cgms\_keystore file for the TPS proxy and IoT FND, use Keytool and complete the following procedures:

Determine the password to use for the keystore. The examples in this chapter refer to this password as keystore\_password.

## Using Keytool to Create the cgms\_keystore File

To create the cgms\_keystore file for both IoT FND and the TPS proxy:

 Step 1
 As root, view the contents of the.pfx file by entering the following command on the server (IoT FND and TPS proxy):

 [root@ tps\_server
 ~]# keytool -list -v -keystore nms\_cert.pfx -srcstoretype pkcs12

 Note
 Viewing the.pfx provides the Alias Name required during the import.

**Step 2** Enter the keystore password when prompted.

This is the same password entered when creating the.pfx file.

The information that displays (see the following Example) includes the alias\_name needed for entering the following command to import the certificates into the cgms\_keystore file:

**Step 3** Enter the following command to import the certificates into the cgms\_keystore file:

```
keytool -importkeystore -v -srckeystore
filename.pfx -srcstoretype pkcs12
-destkeystore cgms_keystore -deststoretype jks -srcalias alias_name
-destalias cgms
-destkeypass
keystore_password
```

- **Step 4** At the prompt, enter the destination keystore password.
- **Step 5** Re-enter the keystore password when prompted.
- **Step 6** Enter the password used when creating the.pfx file (either *nms\_cert.pfx* or *tps\_cert.pfx*) when prompted for the source keystore password.
  - **Note** In this example, **keystore** was the password when we created the *.pfx* file.

### Example

To view the *nms\_cert.pfx* file and access the Alias name, enter the following commands as root:

**Note** This example shows the steps for the *nms\_cert.pfx*. To view the details on the *tps\_cert.pfx* and import the certificates to the TPS proxy, use the same commands but replace the references to *nms\_cert.pfx* with *tps\_cert.pfx*, and use the Alias name from the *tps\_cert.pfx* file.

```
# keytool -list -v -keystore nms_cert.pfx -srcstoretype pkcs12
Enter keystore password: keystore
Keystore type: PKCS12
Keystone provider: SunJSSE
Your keystore contains 1 entry
Alias name: le-cgnms-75eddle3-7e65-41b4-97f1-a913ebf21c8b
Creation date: March 29.2018
Entry type: PrivateKey Entry
Certificate chain length: 3
Certificate[1]:
Owner: CN=nms.sgbu.cisco.com
Issuer: CN=cisco-RSA-SUBCA-CA, DC=cisco, DC=com
...
```

To import the certificates to the **cgms\_keystore** file on IoT FND, enter the following commands as root:

```
# keytool -importkeystore -v
-srckeystore nms_cert.pfx -srcstoretype pkcs12
-destkeystore cgms_keystore -deststoretype jks -srcalias
le-cgnms-75edd1e3-7e65-41b4-97f1-a913ebf21c8b -destalias cgms
-destkeypass
keystore_password
Enter destination keystore password: keystore_password
Re-enter new password: keystore_password
Enter source keystore password: keystore
...Storing cgms_keystore
```

**Note** The storing *cgms*\_keystore text indicates successful completion.

# Copying the cgms\_keystore File to IoT FND

To copy the cgms\_keystore file into the following IoT FND and TPS proxy directories:

Step 1	For IoT FND,	copy the cgms_	keystore file to	this directory:	opt/cgms/	/server/cgms/c	conf/
--------	--------------	----------------	------------------	-----------------	-----------	----------------	-------

**Step 2** For the TPS proxy, copy the cgms\_keystore file to this directory: /opt/cgms-tpsproxy/conf/

**Note** For these certificates to be active and enforceable, they must be in the correct directory.

## Extracting cgms.pem and cgms.key file from \*.pfx file

To extract the cgms.pem and cgms.key file:

Step 1 Enter the following command to import the certificates into the cgms.pem file.
 # openssl pkcs12 -in cgms.pfx -nokeys -out cgms.pem
 Step 2 Enter the following command to import the certificates into the cgms.key file.
 # openssl pkcs12 -in cgms.pfx -nocerts -out cgms.key -nodes
 Note Enter the keystore password when prompted. This is the same password entered when creating the.pfx file.

## Copying the cgms.pem and cgms.key Files to IoT FND

For IoT FND, copy the cgms.pem and cgms.key file to this directory: /opt/cgms/server/cgms/conf/

## Importing the CA Certificate

In addition to importing the NMS certificate, you must import the CA or (subCA) certificate to the cgms\_keystore.

To import the CA certificate into the cgms\_keystore:

- **Step 1** On the IoT FND application server, log in as root.
- **Step 2** Change directory to /opt/cgms/server/cgms/conf, where you have placed the cgms keystore file:
  - # cd /opt/cgms/server/cgms/conf
- **Step 3** Import the CA certificate:

```
# keytool -import -trustcacerts -alias
root -keystore cgms_keystore -file ca_cert.cer
```

A script displays on the screen.

- **Step 4** Enter the keystore password when prompted.
- **Step 5** Re-enter the password.
- **Step 6** Enter **yes** when prompted to trust the certificate.

The certificate is added to the Keystore.

### Example

To import the CA certificate, enter the following commands as root:

```
# keytool -import -trustcacerts -alias root -keystore
cgms_keystore -file ca_cert.cer
```

```
Enter keystore password: keystore password
Owner: CN=SGBUNMSCA-WIN-4BGS4M94L66-CA, DC=SGBUNMSCA, DC=lab, DC=co
Issuer: CN=SGBUNMSCA-WIN-4BGS4M94L66-CA, DC=SGBUNMSCA, DC=lab, DC=co

## Importing the CA Certificate into TPS Proxy Keystore

Follow the same steps as in Importing the CA Certificate, on page 22 to import the CA certificate into cgms\_keystore on the TPS proxy.

# Importing the SUDI Certificate

To import the SUDI certificate into cgms\_keystore

# **Installing Custom Browser Certificates**

Default IoT FND installations use a self-signed certificate for HTTP(S) communication using either a client Web browser or the NB API client. If required, you can use certificates signed by your CA servers. This section presents installation procedures for these custom certificates.

This section covers the following topics:

- Installing Custom Certificates in the Browser Client, on page 24
- Importing Custom Certificates with the North Bound API Client (Windows), on page 27
- Importing Custom Certificates with Windows IE, on page 27
- Managing Custom Certificates, on page 30
- Managing North Bound API Events, on page 30

## **BEFORE YOU BEGIN**

- Clear the client browser cache.
- Remove existing certificates for the NMS server (by IP and DNS) on the client browser
- In Firefox for example, select **Preferences** > **Advanced** > **Encryption** > **View Certifications**. Remove the certificates in the list for the respective server.
- Choose a common name to use in the signed certificate.

This name requires a DNS entry that resolves to the NMS server IP address.

• Generate the new certificates and export them to a.PFX file.

This file must contain the private keys, public certificate, and CA server certificates.

See Using Keytool to Create the cgms\_keystore File, on page 20 for the procedure to generate the private and public keys for the cgms\_keystore file and export them to a.PFX file.

## Installing Custom Certificates in the Browser Client

These steps assume that the Java environment has been set to use the Java bundled with FND in /opt/cgms/jre.

- **Step 1** On the NMS server, copy the existing jbossas.keystore, jbossas.keystore.password, vault.keystore, and VAULT.dat files from the /opt/cgms/server/cgms/conf/ directory to a safe location.
- **Step 2** Delete the existing jbossas.keystore, jbossas.keystore.password, vault.keystore, and VAULT.dat files from the /opt/cgms/server/cgms/conf/ directory.
- **Step 3** Determine the alias in the PFX file that you plan to import into the new jbossas.keystore file:

#keytool -list -v -keystore newcert.pfx -storetype pkcs12

Enter the keystore password: keystore\_password\_when\_pfx\_file\_was\_created

Keystore type: PKCS12
Keystore provider: SunJSSE
Your keystore contains 1 entry
Alias name: le-nms-a88ef13a-a519-457f-a2e1-0540f5453ee0
Creation date: Feb 23, 2018
Entry type: PrivateKeyEntry
Certificate chain length: 2
Certificate[1]:

**Step 4** Import the new custom certificate, in.pfx file format into a new jbossas.keystore file; and, at the same time change the alias name to **jboss**. Follow the prompts:

```
# keytool -importkeystore -v -srckeystore newcert.pfx -srcstoretype pkcs12
-destkeystore/opt/cgms/server/cgms/conf/jbossas.keystore -deststoretype jks
-srcalias le-nms-a88ef13a-a519-457f-a2e1-0540f5453ee0 -destalias
jboss -destkeypass your_keystore_password
Enter destination keystore password: your_keystore_password
Enter source keystore password: keystore_password_when_pfx_file_was_created
[Storing /opt/cgms/server/cgms/conf/jbossas.keystore]
```

**Step 5** The keystore password is stored in the /opt/cgms/server/cgms/conf/VAULT.dat file.

Perform the following steps to update the keystore password to match the one entered in Step 4 (your\_keystore\_password).

IoT FND releases 4.9.x and earlier

• IoT FND releases 4.10.x and later

### IoT FND releases 4.9.x and earlier

a) Create a new vault.keystore file.

```
keytool -genseckey -alias vault -storetype jceks -keyalg AES -keysize 128 -storepass
your_keystore_password -keypass your_keystore_password -keystore
/opt/cgms/server/cgms/conf/vault.keystore
```

b) Update the VAULT.dat file with the new password:

```
/opt/cgms/bin/vault.sh -k /opt/cgms/server/cgms/conf/vault.keystore -p your_keystore_password
-e /opt/cgms/server/cgms/conf -i 50 -s 12345678 -v vault -b keystore_pass -a password -x
your_keystore_password
```

Optionally, the iteration and salt values can be modified if desired.

#### **Example Output:**

```
JBoss Vault
JBOSS_HOME:/opt/cgms
JAVA: java
```

```
Dec 20, 2018 3:25:29 PM org.picketbox.plugins.vault.PicketBoxSecurityVault init
INFO: PBOX000361: Default Security Vault Implementation Initialized and Ready
Secured attribute value has been stored in vault.
Please make note of the following:
Vault Block:keystore pass
Attribute Name:password
Configuration should be done as follows:
VAULT::keystore_pass::password::1
Vault Configuration in AS7 config file:
. . .
</extensions>
<vault>
<vault-option name=="KEYSTORE URL"
value="/opt/cqms/server/cqms/conf/vault.keystore"/>
<vault-option name="KEYSTORE PASSWORD" value="MASK-
VKsAwH928fwt.3H2qUwOG"/>
<vault-option name="KEYSTORE ALIAS" value="vault"/>
<vault-option name="SALT" value="12345678"/>
<vault-option name="ITERATION COUNT" value="50"/>
<vault-option name="ENC FILE DIR" value="/opt/cgms/server/cgms/conf/"/>
</vault><management>...
```

where vault.keystore contains the reference to VAULT.dat and VAULT.dat stores and hides the jboss keystore password. This command creates a new VAULT.dat file that contains the new jboss.keytsore password.

### IoT FND releases 4.10.x and later

a) Create a new vault.keystore file:

```
/opt/cgms/jre/bin/keytool -genseckey -alias vault -storetype jceks
-keyalg AES -keysize 256 -storepass keystore -dname "CN=IoTFND, OU=IoT, O=Cisco Systems,
L=San Jose, ST=CA, C=US" -keypass keystore -validity 730 -keystore vault.keystore
```

b) Update the VAULT.dat file with the new password:

```
/opt/cgms/bin/vault.sh --keystore /opt/cgms/server/cgms/conf/vault.keystore
  --keystore-password keystore --alias vault --vault-block keystore_pass
  --attribute password --sec-attr keystore --enc-dir /opt/cgms/server/cgms/conf/
  --iteration 50 --salt 12345678 -n
```

Optionally, the iteration and salt values can be modified if desired.

#### Expected Output:

\_\_\_\_\_ JBoss Vault JBOSS HOME: /opt/cgms JAVA: /opt/cgms/jre/bin/java \_\_\_\_\_ WFLYSEC0047: Secured attribute value has been stored in Vault. Please make note of the following: Vault Block:keystore pass Attribute Name:password Configuration should be done as follows: VAULT::keystore pass::password::1 WFLYSEC0048: Vault Configuration commands in WildFly for CLI: \*\*\*\*\* For standalone mode: /core-service=vault:add(vault-options=[("KEYSTORE URL" => "/opt/cqms/server/cqms/conf/vault.keystore"), ("KEYSTORE PASSWORD" => "MASK-OVKsAwH928fwt.3H2qUwOG"),("KEYSTORE ALIAS" => "vault"), ("SALT" => "12345678"), ("ITERATION COUNT" => "50"), ("ENC FILE DIR" => "/opt/cqms/server/cqms/conf/")]) \*\*\*\*\* For domain mode: /host=the host/core-service=vault:add(vault-options=[("KEYSTORE URL" => "/opt/cgms/server/cgms/conf/vault.keystore"), ("KEYSTORE PASSWORD" => "MASK-0VKsAwH928fwt.3H2qUwOG"), ("KEYSTORE ALIAS" => "vault"), ("SALT" => "12345678"),("ITERATION COUNT" => "50"),("ENC FILE DIR" => "/opt/cgms/server/cgms/conf/")]) \* \* \* \* \* \* \* \* \* \* \* \* \* \* \* \* \* \* \*

where vault.keystore contains the reference to VAULT.dat and VAULT.dat stores and hides the jboss keystore password. This command creates a new VAULT.dat file that contains the new jboss.keytsore password.

**Step 6** Copy /opt/cgms/standalone/configuration/standalone.xml and standalone-cluster.xml to a safe location.

**Step 7** Update the /opt/cgms/standalone/configuration/standalone.xml or standalone-cluster.xml file.

Depending on whether the FND server is standalone or clustered, update the respective file accordingly.

a) Replace the keystore password with the output in step 5.

```
<vault>
<vault>
<vault-option name="KEYSTORE_URL"
value="/opt/cgms/server/cgms/conf/vault.keystore"/>
<vault-option name="KEYSTORE_PASSWORD" value="MASK-VKsAwH928fwt.3H2qUwOG"/>
<vault-option name="KEYSTORE_ALIAS" value="vault"/>
<vault-option name="SALT" value="12345678"/>
<vault-option name="ITERATION_COUNT" value="50"/>
<vault-option name="ENC_FILE_DIR" value="/opt/cgms/server/cgms/conf/"/>
</vault>
```

b) Edit the standalone.xml or standalone-cluster.xml and replace the existing <vault> section with the above. Save and exit.

**Step 8** Restart IoT FND by running the following command:

RHEL Version	Command
8.x	systemctl restart cgms
7.x	service cgms restart

- **Step 9** Use your browser to connect to the NMS server.
- **Step 10** Accept and add the new certificates.
- **Step 11** Use your browser to log in to IoT FND.

## Importing Custom Certificates with the North Bound API Client (Windows)

For an NB API client running on a Windows Server, import the CA public certificate to the Certificate Store on your local computer. Matching CA public certificates ensures that the client machine communicates with IoT FND using the NB API client.

## Importing Custom Certificates with Windows IE

To import custom certificates with windows IE:

**Step 1** In IE, enter the https URL address of the NMS server.

The URL name must match the Common Name on the NMS Server certificate.

- **Step 2** In the Security Alert window, click **OK**.
- **Step 3** In the security certificate warning window, click the **Continue to this Website** (Not Recommended) link.
- **Step 4** In the Security Alert window, click **OK**.
- **Step 5** Click the **Certificate error** section of the address bar.

General Details Certification P	Path
Certification path	
	Tiew Cettricate
Certificate status: This CA Root certificate is not t Certification Authorities store.	trusted because it is not in the Trusted Root
Certificate status: This CA Root certificate is not t Certification Authorities store. Learn more about certification p	trusted because it is not in the Trusted Root

**Step 6** In the Certificate Invalid window, click **View certificates**.

The Certificate window lists the device certificate issued to the NMS server and signed by the issuing CA (or sub CA) server.

- **Step 7** Select the **Certification Path** tab, and look for the invalid certificate (that is, the one with a red cross).
- **Step 8** Select the invalid certificate, and select the **General** tab.
- Step 9 Click Install Certificate.
- **Step 10** In the Certificate Install Wizard window, click **Next**.
- Step 11 Select the Place all certificates in the Following Store option, and then click Browse.

Certificate Import Wizard	
Certificate Store	
Certificate stores are system areas wh	ere certificates are kapt.
Windows can automatically select a certificate.	tificate store, or you can specify a location for
C Automatically select the certification	te store based on the type of certificate
Bace all certificates in the follow	ng store
Certificate store:	
	Egonse
Learn more about certificate stores	
	< Back Rext > Cauca

**Step 12** In the Certificate Store window, check the **Show physical stores** check box, open the Trusted Root Certification Authorities folder, select **Local Computer**, and then click **OK**.

Select the cert	ificate store you want	to use.
Perso Trust	nal ed Root Certification egistry ocal Computer mart Card	Authorities
i Fote	nrice Truct III	•
Show phys	ical stores	

- Step 13 Click Next.
- Step 14 Click Finish.
- Step 15 Click OK.
- **Step 16** In the Certificate window, click **Install Certificate**.
- Step 17 Select the Place all certificates in the Following Store option, and then click Browse.
- Step 18In the Certificate Store window, check the Show physical stores check box, open the Trusted Root Certification<br/>Authorities folder, select Local Computer, and then click OK.
- Step 19 Click Next.
- Step 20 Click Finish.
- Step 21 Click OK.
- **Step 22** In the Certificate window, click **OK**.

**Step 23** Repeat the previous steps if the Certificate error section of the address bar still appears.

- Ensure that the device certificate issued to the NMS server and signed by the issuing CA (or sub CA) displays server in the Certificate window.
- Select the Certification Path tab and verify that all certificates in the path are valid (that is, there are no red crosses on the certificates).
- **Step 24** Close and restart the browser.
- **Step 25** Enter the IoT FND server secure URL in the address bar.

The IoT FND login page displays without the security screen.

# **Managing Custom Certificates**

**Step 1** Back up the following files that are overwritten when you upgrade or perform a fresh installation of IoT FND:

- a) In the /opt/cgms/server/cgms/conf/ directory:
  - jbossas.keystore.password
  - jbossas.keystore
- b) In the /opt/cgms/server/cgms/deploy/ directory:
  - security-service.xml file

This is the file where you added the salt value in Installing Custom Certificates in the Browser Client, on page 24).

- c) In the /opt/cgms/server/cgms/conf directory:
  - VAULT.dat
  - vault.keystore
- Step 2Perform the IoT FND upgrade or new installation. Refer to the appropriate installation chapter within this guide:Installing Cisco IoT FND-RPM for the First Time Oracle Deployment
- **Step 3** Copy the above files to their respective folders, and restart IoT FND.

## **Managing North Bound API Events**

The North Bound (NB) API client can send events using HTTPS. NB API clients must subscribe to IoT FND by providing a valid HTTPS URL over which IoT FND sends events.

The NB API HTTPS communication uses either Self-Signed Certificate or Custom CA Certificate.

## **Self-Signed Certificate**

By default, a new self-signed FND Web certificate is generated in jbossas.kesytore everytime when FND is upgraded or installed.

If you are using self-signed certificates, then navigate to **ADMIN** > **SYSTEM MANAGEMENT** > **CERTIFICATES** and check the **Allow self-signed certificate for Northbound Event Receivers** check box.

cisco FIELD NETWORK DI	RECTOR	DASHBOARD	DEVICES 🗸	OPERATIONS ~	CONFIG 🗸	ADMIN 🗸
ADMIN > SYSTEM MANAGEME	NT > CERTIFICATES					
Certificate for Routers Certificate	for Web Certificate Settings					
	Allow self-signed certificate for Northbound Event Receivers:					

## **Custom CA Certificate**

NB API HTTPS communication with FND can also be done using custom CA certificates. In this case, the custom CA certificate for FND Web installed in jbossas.keystore is used.

The jbossas.keystore must contain the following entries:

- Issuing CA Certificate:
  - If the FND Web certificate is issued by the sub CA server, then the certificate of the sub CA server is installed in the keystore.
  - If the certificate is issued by the root CA server, then the certificate of the root CA server is installed in the keystore.
- The root CA certificate of the sub-CA server.
- The certificate that is generated for FND Web server by issuing sub CA server or root CA server.

Note

Starting from IoT FND 4.4.0 release, the issuer CA certificate also needs to be installed in the jbossas.keystore in addition to the Web certificate installed for FND from custom CA.

# **Configuring IoT FND to Access the Keystore**

After you create cgms\_keystore and import the NMS and CA certificates to it, configure IoT FND to access the cgms keystore file.

To set the keystore password:

```
Step 1 Stop IoT FND.
```

**Step 2** Run the setupCgms.sh script:

```
pwd
/opt/cgms/bin ./setupCgms.sh
06-12-2018 10:21:39 PDT: INFO: ====== CG-NMS Setup Started - 2018-06-12-10-21-39 =====
```

06-12-2018 10:21:39 PDT: INFO: Log file: /opt/cgms/bin/../server/cgms/log/cgms\_setup.log Are you sure you want to setup CG-NMS (y/n)? y 06-12-2018 10:21:39 PDT: INFO: User response: y ... Do you want to change the keystore password (y/n)? y 06-12-2018 10:21:52 PDT: INFO: User response: y Enter keystore password: keystore\_password Re-enter keystore password: keystore\_password 06-12-2018 10:21:59 PDT: INFO: Configuring keystore password. This may take a while. Please wait... 06-12-2018 10:22:00 PDT: INFO: Keystore password configured. ...

This script saves the password set in the cgms.properties file.

**Step 3** Start IoT FND.

- **Tip** To protect the cgms\_keystore and cgms.properties files, set their permissions to root read only.
- **Caution** Protect your system! Ensure that only root has access to the IoT FND server. Your firewall should only allow SSH access from internal hosts.

# **Configuring the TPS Proxy to Access the Keystore**

To configure the TPS proxy to access the keystore:

**Step 1** Change to the tpsproxy bin directory:

cd /opt/cgms-tpsproxy/bin

**Step 2** Convert your chosen password into encrypted form:

[root@fndnms bin]#./encryption\_util.sh
Usage: EncryptionUtil <encrypt|decrypt> <data>

[root@fndnms bin]#./encryption\_util.sh encrypt test
Kq+bA+oLBlo=

- **Step 3** Copy the encrypted password into the tpsproxy.properties file:
  - a) Open the file for editing.

cd /opt/cgms-tpsproxy/conf emacs tpsproxy.properties

b) Add this line to the file:

cgms-keystore-password-hidden=keystore password

In this example, the encrypted keystore\_password is "7jlxPniVpMvat+TrDWqh1w=="

**Step 4** Restart the TPS proxy by running the following command:

RHEL Version	Command
8.x	systemctl restart tpsproxy

RHEL Version	Command
7.x	service tpsproxy restart

# **Setting Up the HSM Client**

Complete the following procedures to set up the HSM client:

- Installing the HSM Client on the IoT FND Server, on page 33
- Configuring the HSM HA Client, on page 39

**Note** If your installation uses SSM for CSMP-based messaging, see chapter, "Installing Cisco IoT FND-RPM for the First Time - Oracle Deployment".

# Installing the HSM Client on the IoT FND Server

The Hardware Security Module (HSM) works as a security server listening at port 1792. For IoT FND to communicate with HSM:

- 1. Install the HSM client on the IoT FND server.
- 2. Configure the HSM client to have the certificate for HSM.
- **3.** Upload the certificate to HSM.

This section describes how to install and configure the HSM client, assuming that HSM is at 172.16.0.1 and the client at 172.31.255.254.

To install and set up an HSM client:

Step 1	Get the HSM client package, unpack it, and run the installation script:
	sh install.sh
Step 2	Create the client certificate:
	cd /usr/safenet/lunaclient/bin/
Step 3	Create the client certificate:
	./vtl createCert -n ip_address_of_hsm_client
Step 4	Download the HSM certificate from the HSM server:
	<pre>scp admin@ip_address_of_hsm_server :server.pem.</pre>

**Step 5** Upload the client certificate to the HSM server:

```
scp../cert/client/ip address of hsm client.pem
            admin@ip_address_of_hsm_server:.
            Load the HSM certificate:
Step 6
            vtl addServer -n
            ip_address_of_hsm_server -c server.pem.
Step 7
            Ensure that the HSM server is added:
            vtl listServer
            From the HSM client, use SSH to log in to the HSM server:
Step 8
            ssh admin@ip_address_of_hsm_server
            Last login: Mon Aug 15 15:36:43 2018 from 10.27.164.171
            Luna SA 5.0.1-2 Command Line Shell - Copyright (c) 2001-2010 SafeNet, Inc. All rights reserved.
            [TestLunaSA1] lunash:>
Step 9
            Use SSH to perform these steps on the HSM server:
            a) Add the client to the HSM server:
                [TestLunaSA1] lunash:>client register -c hsm_client_name -i ip_address_of_hsm_client
                'client register' successful. Command Result : 0 (Success)
            b) List the clients that are defined on the server and ensure that the client was added:
                [TestLunaSA1] lunash:>client list
                registered client 1: cg-nms
                registered client 2: hsm client name
               Command Result : 0 (Success)
            c) Assign the client to a partition:
                [TestLunaSA1] lunash:>client assignPartition -c hsm_client_name
                -p partition name
                'client assignPartition' successful.
                Command Result : 0 (Success)
            d) Log out of HSM.
Step 10
            On the server running the HSM client, verify the HSM client installation:
            vtl verifv
```

For a fresh install of IoT FND and HSM integration, the CSMP certificate appears in the IoT FND UI only when an endpoint/meter is added to IoT FND, irrespective of whether the meter/endpoint is registered to IoT FND or not.

**Note** You can also add a dummy entry for meter/endpoint, if there is no real endpoint or meter to add at the point of testing CSMP certificate display.

Apart from the CSMP certificate displayed in the GUI, you can also use the following methods to verify if IoT FND can access and retrieve the CSMP certificate from HSM:

#### Method 1

Run the following command:

cat /opt/cgms/server/cgms/log/server.log | grep -i HSM

If you get the below message, then IoT FND and HSM communication is successful, and IoT FND can retrieve the public key.

%IOTFND-6-UNSPECIFIED: %[ch=HSMKeyStore][sev=INFO] [tid=MSC service thread 1-3]: Retrieved public key: 3059301306072a8648ce3d020106082a8648ce3d03010703 420004d914167514ec0a110 f3170eef742a000572cea6f0285a3074db87e43da398ab016e40ca4be5b888c26c4 fe91106cbf685a04b0f61d599826bdbcff25cf065d24

#### Method 2

Run the following command. The cmu list command checks if IoT FND can see two objects stored in HSM partition, namely private keys and CSMP certificate.

```
[root@iot-fnd ~]# cd /usr/safenet/lunaclient/bin
[root@iot-fnd bin]# ./cmu list

```

## **Step 11** After the HSM client installation completes, run the test suite ckdemo.

#### ckdemo

# **Configuring the HSM HA Client**

**Note** You must perform the steps in this section even if you only have one HSM server. You must also create a group that contains the HSM server.

To configure the HSM HA client:

- **Step 1** Configure the HSM client so that it connects with both HSM servers, as described in Installing the HSM Client on the IoT FND Server, on page 33.
- Step 2 Change to the /usr/safenet/lunaclient/bin/ directory:

/usr/safenet/lunaclient/bin/

**Step 3** Create a group that contains only the partition of the first HSM server by running this command and providing the serial number (*serial\_num*) of the HSM server obtained by running the ./vtl verify command (Installing the HSM Client

on the IoT FND Server, on page 33), the name of the group (*group\_name*), and the password (*prtn\_password*) for accessing the partition:

```
./vtl haAdmin newGroup -serialNum serial_num
-label group name -password prtn password
```

For example:

./vtl haAdmin newGroup -serialNum 151285008
-label testGroup1 -password TestPart1

Warning: There are 2 objects currently on the new member. Do you wish to propagate these objects within the HA group, or remove them? Type 'copy' to keep and propagate the existing objects, 'remove' to remove them before continuing, or 'quit' to stop adding this new group member. > copy

New group with label "testGroup1" created at group number 1151285008. Group configuration is:

HA Group Label: testGroup1 HA Group Number: 1151285008 Synchronization: enabled Group Members: 151285008 Needs sync: no

### **Step 4** Add the partition of the second HSM to the group.

For example:

```
./vtl haAdmin addMember -group testGroup1
-serialNum 151268008 -password TestPart1
Member 151268008 successfully added to group testGroup1. New group
configuration is:
```

HA Group Label: testGroup1 HA Group Number: 1151285008 Synchronization: enabled Group Members: 151285008, 151268008 Needs sync: yes

Please use the command 'vtl haAdmin -synchronize' when you are ready to replicate data between all members of the HA group. (If you have additional members to add, you may wish to wait until you have added them before synchronizing to save time by avoiding multiple synchronizations.)

### **Step 5** Verify that both partitions can be listed:

```
./vtl haAdmin -listGroups
```

```
If you would like to see synchronization data for group testGroup1,
please enter the password for the group members. (Press enter to
skip the synchronization check):
> *********
HA Group Label: testGroup1
HA Group Number: 1151285008
Synchronization: enabled
Group Members: 151285008, 151268008
Needs sync: yes
HA auto recovery: disabled
HA logging: disabled
```

**Step 6** Enable HA auto recovery:

[root@localhost bin]#./vtl haAdmin -autoRecovery
vtl haAdmin -autoRecovery [ -retry
<count> | -interval <seconds> ] -retry
<retry count>-interval <seconds>

- Set the retry value between -1 and 500 where, -1 is an infinite number of retries and 0 disables auto recovery.
- Specify the auto recovery poll interval in seconds.

## **Step 7** Enable HA.

./vtl haAdmin -HAOnly -enable

# **Configuring the HSM Group Name and Password**

The HSM Group name and password is provided by Cisco at manufacture.

To allow the HSM Group name and password to be configured by the user:

**Step 1** Edit the **cgms.properties** file to add the following properties:

- a) hsm-keystore-name <name>
- b) hsm-keystore-password <encrypted password>
- **Tip** You can use the same HSM server for multiple IoT FND installations by creating multiple partitions on the HSM server, configuring the HSM client, and specifying the partition name and partition password in the cgms.properties file.
- **Step 2** Save the cgms.properties file.
- **Step 3** To apply these changes, start the cgms service:

RHEL Version	Command
8.x	systemctl start cgms
7.x	service cgms start
