

# Process and Memory Management Commands

---

This chapter describes the Cisco IOS XR software commands used to manage processes and memory.

For more information about using the process and memory management commands to perform troubleshooting tasks, see *Cisco IOS XR Getting Started Guide for the Cisco CRS Router*.

# clear context

To clear core dump context information, use the **clear context** command in the appropriate mode.

**clear context location** {*node-id* | **all**}

<b>Syntax Description</b>	<b>location</b> { <i>node-id</i>   <b>all</b> }	(Optional) Clears core dump context information for a specified node. The <i>node-id</i> argument is expressed in the <i>rack/slot/module</i> notation. Use the <b>all</b> keyword to indicate all nodes.
---------------------------	---	---

<b>Command Default</b>	No default behavior or values
------------------------	-------------------------------

<b>Command Modes</b>	Administration EXEC EXEC mode
----------------------	----------------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	Release 2.0	This command was introduced.
	Release 3.2	The command was made available in administration EXEC mode.

<b>Usage Guidelines</b>	To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.
-------------------------	---

Use the **clear context** command to clear core dump context information. If you do not specify a node with the **location** *node-id* keyword and argument, this command clears core dump context information for all nodes.

Use the **show context** command to display core dump context information.

<b>Task ID</b>	<b>Task ID</b>	<b>Operations</b>
	diag	execute

The following example shows how to clear core dump context information:

```
RP/0/RP0/CPU0:router# clear context
```

# dumpcore

To manually generate a core dump, use the **dumpcore** command in EXEC mode Admin EXEC mode.

**dumpcore** {**running** | **suspended**} *job-id* **location** *node-id*

Syntax Description		
<b>running</b>		Generates a core dump for a running process.
<b>suspended</b>		Suspends a process, generates a core dump for the process, and resumes the process.
<i>job-id</i>		Process instance identifier.
<b>location</b> <i>node-id</i>		Generates a core dump for a process running on the specified node. The <i>node-id</i> argument is expressed in the <i>rack/slot/module</i> notation.

**Command Default** No default behavior or values

**Command Modes** Admin EXEC mode  
EXEC mode

Command History	Release	Modification
	Release 2.0	This command was introduced.
	Release 3.2	The command was made available in administration EXEC mode.

**Usage Guidelines** When a process crashes on the Cisco IOS XR software, a core dump file of the event is written to a designated destination without bringing down the router. Upon receiving notification that a process has terminated abnormally, the Cisco IOS XR software then respawns the crashed process. Core dump files are used by Cisco Technical Support Center engineers and development engineers to debug the Cisco IOS XR software.

Core dumps can be generated manually for a process, even when a process has not crashed. Two modes exist to generate a core dump manually:

- **running** —Generates a core dump for a running process. This mode can be used to generate a core dump on a critical process (a process whose suspension could have a negative impact on the performance of the router) because the core dump file is generated independently, that is, the process continues to run as the core dump file is being generated.
- **suspended** —Suspends a process, generates a core dump for the process, and resumes the process. Whenever the process is suspended, this mode ensures data consistency in the core dump file.

Core dump files contain the following information about a crashed process:

- Register information
- Thread status information
- Process status information
- Selected memory segments

The following scenarios are applicable for creating full or sparse core dumps:

- Without the **exception sparse** configuration or exception sparse OFF, and default core size (4095 MB), a full core is created till the core size. Beyond this, only stack trace is collected.
- With non-default core size and without the **exception sparse** configuration, or exception sparse OFF , a full core is created until the core size limit is reached. Beyond the core size limit, only the stack trace is collected.
- With the exception sparse ON and default core size (4095 MB), a full core is created until the sparse size limit is reached, and a sparse core is created thereafter till the core size. Beyond this, only stack trace is collected.
- With non-default core size and with the exception sparse ON, a full core is created until the sparse size limit is reached. Beyond the sparse size limit, only the stack trace is collected.

**Note** By default, full core dumps are created irrespective of the **exception sparse** configuration. If there is not enough free shared memory available, then the core dump process fails.

Task ID	Task ID	Operations
	diag	read, write

The following example shows how to generate a core dump in suspended mode for the process instance 52:

```
RP/0/RP0/CPU0:router# dumpcore suspended 52

# exception coresize

Halts the creation of the core file beyond the configured core file size limit.

**exception coresize** *size*  
**no exception coresize**

<b>Syntax Description</b>	<p><b>coresize</b> <i>size</i> Defines the maximum limit of the core file size beyond which the core file creation is halted and only the stack trace output is printed on the screen.</p> <p>The core file size limit can range from 1 to 4095 MB.</p>
---------------------------	---

**Command Default** This command has no default behavior.

**Command Modes** Global configuration

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	Release 5.1.1	This command was introduced.

**Usage Guidelines** To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The following scenarios are applicable for creating full or sparse core dumps:

- Without the **exception sparse** configuration or exception sparse OFF, and default core size (4095 MB), a full core is created till the core size. Beyond this, only stack trace is collected.
- With non-default core size and without the **exception sparse** configuration, or exception sparse OFF , a full core is created until the core size limit is reached. Beyond the core size limit, only the stack trace is collected.
- With the exception sparse ON and default core size (4095 MB), a full core is created until the sparse size limit is reached, and a sparse core is created thereafter till the core size. Beyond this, only stack trace is collected.
- With non-default core size and with the exception sparse ON, a full core is created until the sparse size limit is reached. Beyond the sparse size limit, only the stack trace is collected.

**Note** By default, full core dumps are created irrespective of the **exception sparse** configuration. If there is not enough free shared memory available, then the core dump process fails.

Task ID	Task ID	Operations
	diag	read, write

The following example shows how you can disable the creation of core dump files by specifying the limit for core file size.

```
RP/0/RP0/CPU0:router(config)# exception coresize 1024  
RP/0/RP0/CPU0:router(config)# commit
```

## exception filepath

To modify core dump settings, use the **exception filepath** command in the appropriate configuration mode. To remove the configuration, use the **no** form of this command.

**exception** [**choice** *preference*] [**compress** {**on** | **off**}] **filename** *filename lower-limit-higher-limit*  
**filepath** *filepath-name*

**no exception** [**choice** *preference*] [**compress** {**on** | **off**}] **filename** *filename lower-limit-higher-limit*  
**filepath** *filepath-name*

### Syntax Description

<b>choice</b> <i>preference</i>	(Optional) Configures the order of preference for the destination of core dump files. Up to the three destinations can be defined. Valid values are 1 to 3.
<b>compress</b> { <b>on</b>   <b>off</b> }	(Optional) Specifies whether or not the core dump file should be sent compressed. By default, core dump files are sent compressed. If you specify the <b>compress</b> keyword, you must specify one of the following required keywords: <ul style="list-style-type: none"> <li>• <b>on</b>—Compresses the core dump file before sending it.</li> <li>• <b>off</b>—Does not compress the core dump file before sending it.</li> </ul>
<b>filename</b> <i>filename lower-limit-higher-limit</i>	(Optional) Specifies the filename to be appended to core dump files and the lower and higher limit range of core dump files to be sent to a specified destination before being recycled by the circular buffer. <p><b>filename</b> <i>filename lower-limit-higher-limit</i> See <a href="#">Table 1: Default Core Dump File Naming Convention Description, on page 10</a> for a description of the default core dump file naming convention.</p> <p>Valid <b>filename</b> <i>filename lower-limit-higher-limit</i> values for the <i>lower-limit</i> argument are 0 to 4. Valid values for the <i>higher-limit</i> argument are 5 to 64. A hyphen ( - ) must immediately follow the <i>lower-limit</i> argument.</p> <p><b>Note</b> To uniquely identify each core dump file, a value is appended to each core dump file, beginning with the lower limit value configured for the <i>lower-limit</i> argument and continuing until the higher limit value configured for the <i>higher-limit</i> argument has been reached. After the higher limit value has been reached, the Cisco IOS XR software begins to recycle the values appended to core dump files, beginning with the lower limit value.</p>
<i>filepath-name</i>	Local file system or network protocol, followed by the directory path. All local file systems are supported. The following network protocols are supported: TFTP and FTP.

### Command Default

If you do not specify the order of preference for the destination of core dump files using the **choice** *preference* keyword and argument, the default preference is the primary location or 1.

Core dump files are sent compressed.

The default file naming convention used for core dump files is described in [Table 1: Default Core Dump File Naming Convention Description, on page 10](#).

**Command Modes** Administration configuration  
Global configuration

Command History	Release	Modification
	Release 2.0	This command was introduced.

**Usage Guidelines** To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **exception filepath** command to modify core dump settings, such as the destination file path to store core dump files, file compression, and the filename appended to core dumps.

Up to three user-defined locations may be configured as the preferred destinations for core dump files:

- Primary location—The primary destination for core dump files. Enter the **choice** keyword and a value of **1** (that is, **choice 1**) for the *preference* argument to specify a destination as the primary location for core dump files.
- Secondary location—The secondary fallback choice for the destination for core dump files, if the primary location is unavailable (for example, if the hard disk is set as the primary location and the hard disk fails). Enter the **choice** keyword and a value of **2** (that is, **choice 2**) for the *preference* argument to specify a destination as the secondary location for core dump files.
- Tertiary location—The tertiary fallback choice as the destination for core dump files, if the primary and secondary locations fail. Enter the **choice** keyword and a value of 3 (that is, **choice 3**) for the *preference* argument to specify a destination as the tertiary location for core dump files.

When specifying a destination for a core dump file, you can specify an absolute file path on a local file system or on a network server. The following network protocols are supported: TFTP and FTP.

**Note** We recommend that you specify a location on the hard disk as the primary location.

In addition to the three preferred destinations that can be configured, Cisco IOS XR software provides three default fallback destinations for core dump files in the event that user-defined locations are unavailable.

The default fallback destinations are:

- harddisk:/dumper
- disk1:/dumper
- disk0:/dumper

**Note** If a default destination is a boot device, the core dump file is not sent to that destination.

We recommend that you configure at least one preferred destination for core dump files as a preventive measure if the default fallback paths are unavailable. Configuring at least one preferred destination also ensures

that core dump files are archived because the default fallback destinations store only the first and last core dump files for a crashed process.

**Note** Cisco IOS XR software does not save a core file on a local storage device if the size of the core dump file creates a low-memory condition.

By default, Cisco IOS XR software assigns filenames to core dump files according to the following format:

```
process [.by. requester |.abort][.sparse]. date-time . node . processor-type [.Z]
```

For example:

```
packet.by.dumper_gen.20040921-024800.node0_RP0_CPU0.ppc.Z
```

[Table 1: Default Core Dump File Naming Convention Description, on page 10](#) describes the default core dump file naming convention.

**Table 1: Default Core Dump File Naming Convention Description**

Field	Description
<i>process</i>	Name of the process that generated the core dump.
.by. <i>requester</i>   .abort	If the core dump was generated because of a request by a process (requester), the core filename contains the string “.by. <i>requester</i> ” where the <i>requester</i> variable is the name or process ID (PID) of the process that requested the core dump. If the core dump was due to a self-generated abort call request, the core filename contains the string “.abort” instead of the name of the requester.
.sparse	If a sparse core dump was generated instead of a full core dump, “sparse” appears in the core dump filename.
. <i>date-time</i>	Date and time the dumper process was called by the process manager to generate the core dump. The <i>.date-time</i> time-stamp variable is expressed in the <i>yyyy.mm.dd-hh.mm.ss</i> format. Including the time stamp in the filename uniquely identifies the core dump filename.
. <i>node</i>	Node ID, expressed in the <i>rack/slot/module</i> notation, where the process that generated the core dump was running.
. <i>processor-type</i>	Type of processor (mips or ppc).
.Z	If the core dump was sent compressed, the filename contains the .Z suffix.

You can modify the default naming convention by specifying a filename to be appended to core dump files with the optional **filename** *filename* keyword and argument and by specifying a lower and higher limit ranges of values to be appended to core dump filenames with the *lower-limit* and *higher-limit* arguments, respectively. The filename that you specify for the *filename* argument is appended to the core dump file and the lower and higher limit ranges of core dump files to be sent to a specified destination before the filenames are recycled. Valid values for the *lower-limit* argument are 0 to 4. Valid values for the *higher-limit* argument are 5 to 64. A hyphen (-) must immediately follow the *lower-limit* argument. In addition, to uniquely identify each core dump file, a value is appended to each core dump file, beginning with the lower-limit value specified

with the *lower-limit* argument and continuing until the higher-limit value specified with the *higher-limit* argument has been reached. When the configured higher-limit value has been reached, Cisco IOS XR software begins to recycle the values appended to core dump files, beginning with the lower-limit value.

Task ID	Task ID	Operations
	diag	read, write

The following example shows how to configure the core dump setting for the primary user-defined preferred location. In this example, core files are configured to be sent uncompressed; the filename of core dump files is set to “core” (that is, all core filenames will be named core); the range value is set from 0 to 5 (that is, the values 0 to 5 are appended to the filename for the first five generated core dump files, respectively, before being recycled); and the destination is set to a directory on the hard disk.

```
RP/0/RP0/CPU0:router(config)# exception choice 1 compress off
                             filename core 0-5 filepath /harddisk:/corefile
```

# exception pakmem

To configure the collection of packet memory information in core dump files, use the **exception pakmem** command in administration configuration mode or in global configuration mode. To remove the configuration, use the **no** form of this command.

```
exception pakmem {on | off}
no exception pakmem {on | off}
```

## Syntax Description

**on** Enables the collection of packet memory information in core dump files.

**off** Disables the collection of packet memory information in core dump files.

## Command Default

Packet memory information is not included in core dump files.

## Command Modes

Administration configuration

Global configuration

## Command History

Release	Modification
Release 2.0	This command was introduced.

## Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **exception pakmem** command with the **on** keyword to configure the collection of packet memory information in core dump files. Cisco Technical Support Center engineers and development engineers use packet memory information to debug packet memory issues related to a process.

**Caution** Including packet memory information in core dump files significantly increases the amount of data generated in the core dump file, which may delay the restart time for the process.

## Task ID

Task ID	Operations
diag	read, write

The following example shows how to configure core dumps to include packet memory information:

```
RP/0/RP0/CPU0:router (config) # exception pakmem on
```

- [show exception](#), on page 42

## exception sparse

To enable or disable sparse core dumps, use the **exception sparse** command in administration configuration mode or in global configuration mode. To remove the configuration, use the **no** form of this command.

```
exception sparse {on | off}
no exception sparse
```

<b>Syntax Description</b>	<b>on</b> Enables sparse core dumps.
	<b>off</b> Disables sparse core dumps.

<b>Command Default</b>	Sparse core dumps are disabled.
------------------------	---------------------------------

<b>Command Modes</b>	Administration configuration Global configuration
----------------------	--

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	Release 2.0	This command was introduced.

<b>Usage Guidelines</b>	To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.
-------------------------	---

Use the **exception sparse** command to reduce the amount of data generated in the core dump file. Sparse core dumps reduce the amount of time required to generate the core dump file because only referenced data is generated in the core file (at the cost of lost information in the core file). Reducing the time required to generate core dump files corresponds to faster process restart times.

<b>Note</b>	Use the <b>exception sparse off</b> command in administration configuration mode to get a complete core dump of the transient processes on the RP.
-------------	--

Sparse core dumps contain the following information about crashed processes:

- Register information for all threads, and any memory pages referenced in these register values
- Stack information for all threads, and any memory pages referenced in these threads
- All memory pages referenced by a loaded dynamic loadable library (DLL) data section, if the final program counter falls in a DLL data section
- Any user-specified marker pages from the lib\_dumper\_marker DLL

The **exception sparse** command dumps memory pages based on trigger addresses found in the previously listed dump information, according to the following criteria:

- If the trigger address in the memory page is in the beginning 128 bytes of the memory page, the previous memory page in the continuous address region is dumped also.

- If the trigger address in the memory page is in the final 128 bytes of the memory page, the next memory page in the continuous address region is dumped also.
- In all other instances, only the memory page that includes the trigger address is dumped.

The following scenarios are applicable for creating full or sparse core dumps:

- Without the **exception sparse** configuration or exception sparse OFF, and default core size (4095 MB), a full core is created till the core size. Beyond this, only stack trace is collected.
- With non-default core size and without the **exception sparse** configuration, or exception sparse OFF, a full core is created until the core size limit is reached. Beyond the core size limit, only the stack trace is collected.
- With the exception sparse ON and default core size (4095 MB), a full core is created until the sparse size limit is reached, and a sparse core is created thereafter till the core size. Beyond this, only stack trace is collected.
- With non-default core size and with the exception sparse ON, a full core is created until the sparse size limit is reached. Beyond the sparse size limit, only the stack trace is collected.

**Note** By default, full core dumps are created irrespective of the **exception sparse** configuration. If there is not enough free shared memory available, then the core dump process fails.

Task ID	Task ID	Operations
	diag	read, write

The following example shows how to enable sparse core dumps:

```
RP/0/RP0/CPU0:router(config)# exception sparse on
```

## exception sprsize

To specify the maximum file size for core dumps, use the **exception sprsize** command in administration configuration mode or in global configuration mode. To remove the configuration, use the **no** form of this command.

**exception sprsize** *megabytes*  
**no exception sprsize**

<b>Syntax Description</b>	<i>megabytes</i> Size in megabytes (MB).
---------------------------	--

<b>Command Default</b>	<i>megabytes</i> : 192
------------------------	------------------------

<b>Command Modes</b>	Administration configuration Global configuration
----------------------	--

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	Release 2.0	This command was introduced.

**Usage Guidelines** To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **exception sprsize** command to specify the maximum file size for core dumps. The maximum file size configured for the *megabytes* argument is used with the configuration set for the [exception sparse, on page 14](#) command to determine whether or not to generate a sparse core dump file. If sparse core dumps are disabled and a core dump file is predicted to exceed the default value (192 MB) uncompressed or the value specified for the *megabytes* argument uncompressed, a sparse core dump file is generated. If sparse core dumps are enabled, a sparse core dump file is generated, regardless of the size of the core dump file.

The following scenarios are applicable for creating full or sparse core dumps:

- Without the **exception sparse** configuration or exception sparse OFF, and default core size (4095 MB), a full core is created till the core size. Beyond this, only stack trace is collected.
- With non-default core size and without the **exception sparse** configuration, or exception sparse OFF , a full core is created until the core size limit is reached. Beyond the core size limit, only the stack trace is collected.
- With the exception sparse ON and default core size (4095 MB), a full core is created until the sparse size limit is reached, and a sparse core is created thereafter till the core size. Beyond this, only stack trace is collected.
- With non-default core size and with the exception sparse ON, a full core is created until the sparse size limit is reached. Beyond the sparse size limit, only the stack trace is collected.

---

**Note** By default, full core dumps are created irrespective of the **exception sparse** configuration. If there is not enough free shared memory available, then the core dump process fails.

---

Task ID	Task ID	Operations
	diag	read, write

The following example shows how to set the file size of sparse core dumps to 300 MB:

```
RP/0/RP0/CPU0:router(config)# exception sprsize 300
```

# follow

To unobtrusively debug a live process or a live thread in a process, use the **follow** command in EXEC modeAdmin EXEC mode.

**follow** {**job** *job-id* | **process** *pid* | **location** *node-id*} [**all**] [**blocked**] [**debug** *level*] [**delay** *seconds*] [**dump** *address size*] [**iteration** *count*] [**priority** *level*] [**stackonly**] [**thread** *tid*] [**verbose**]

## Syntax Description

<b>job</b> <i>job-id</i>	Follows a process by job ID.
<b>process</b> <i>pid</i>	Follows the process with the process ID (PID) specified for the <i>pid</i> argument.
<b>location</b> <i>node-id</i>	Follows the target process on the designated node. The <i>node-id</i> argument is expressed in the <i>rack/slot/module</i> notation.
<b>all</b>	(Optional) Follows all threads.
<b>blocked</b>	(Optional) Follows the chain of thread IDs (TIDs) or PIDs that are blocking the target process.
<b>debug</b> <i>level</i>	(Optional) Sets the debug level for the following operation. Valid values for the <i>level</i> argument are 0 to 10.
<b>delay</b> <i>seconds</i>	(Optional) Sets the delay interval between each iteration. Valid values for the <i>seconds</i> argument are 0 to 255 seconds.
<b>dump</b> <i>address size</i>	(Optional) Dumps the memory segment starting with the specified memory address and size specified for the <i>address</i> and <i>size</i> arguments.
<b>iteration</b> <i>count</i>	(Optional) Specifies the number of times to display information. Valid values for the <i>count</i> argument are 0 to 255 iterations.
<b>priority</b> <i>level</i>	(Optional) Sets the priority level for the following operation. Valid values for the <i>level</i> argument are 1 to 63.
<b>stackonly</b>	(Optional) Displays only stack trace information.
<b>thread</b> <i>tid</i>	(Optional) Follows the TID of a process or job ID specified for the <i>tid</i> argument.
<b>verbose</b>	(Optional) Displays register and status information pertaining to the target process.

## Command Default

Entering the **follow** command without any optional keywords or arguments performs the operation for five iterations from the local node with a delay of 5 seconds between each iteration. The output includes information about all live threads. This command uses the default scheduling priority from where the command is being run.

## Command Modes

EXEC mode  
Admin EXEC mode

Command History	Release	Modification
	Release 3.2	This command was introduced.

**Usage Guidelines**

Use this command to unintrusively debug a live process or a live thread in a process. This command is particularly useful for debugging deadlock and livelock conditions, for examining the contents of a memory location or a variable in a process to determine the cause of a corruption issue, or in investigating issues where a thread is stuck spinning in a loop. A livelock condition is one that occurs when two or more processes continually change their state in response to changes in the other processes.

The following actions can be specified with this command:

- Follow all live threads of a given process or a given thread of a process and print stack trace in a format similar to core dump output.
- Follow a process in a loop for a given number of iterations.
- Set a delay between two iterations while invoking the command.
- Set the priority at which this process should run while this command is being run.
- Dump memory from a given virtual memory location for a given size.
- Display register values and status information of the target process.

Take a snapshot of the execution path of a thread asynchronously to investigate performance-related issues by specifying a high number of iterations with a zero delay.

Task ID	Task ID	Operations
	basic-services	read

The following example shows how to use the **follow** command to debug the process associated with job ID 257 for one iteration:

```
RP/0/RP0/CPU0:router# follow job 257 iteration 1
```

```
Attaching to process pid = 28703 (pkg/bin/packet)
No tid specified, following all threads
```

```

# monitor threads

To display auto-updating statistics on threads in a full-screen mode, use the **monitor threads** command in administration EXEC mode or in EXEC mode.

**monitor threads** [**dumbtty**] [**iteration** *number*] [**location** *node-id*]

## Syntax Description

<b>dumbtty</b>	(Optional) Displays the output of the command as if on a dumb terminal (the screen is not refreshed).
<b>iteration</b> <i>number</i>	(Optional) Number of times the statistics display is to be updated, in the range from 0 to 4294967295.
<b>location</b> <i>node-id</i>	(Optional) Displays the output from the command from the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

## Command Default

When all keywords are omitted, the **monitor threads** command displays the first ten threads for the local node, sorted in descending order by the time used. The display is cleared and updated every 5 seconds until you quit the command.

## Command Modes

EXEC, Admin EXEC

## Command History

Release	Modification
Release 2.0	This command was introduced.
Release 3.2	The command was made available in administration EXEC mode.

## Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **monitor threads** command to show the top ten threads based on CPU usage. The display refreshes every 10 seconds.

- To change the parameters displayed by the **monitor threads** command, enter one of the key commands described in [Table 2: Interactive Display Commands for the monitor threads Command, on page 26](#).
- To terminate the display and return to the system prompt, enter the **q** key.
- To list the interactive commands, type **?** during the display.

[Table 2: Interactive Display Commands for the monitor threads Command, on page 26](#) describes the available interactive display commands.

**Table 2: Interactive Display Commands for the monitor threads Command**

Command	Description
<b>?</b>	Displays the available interactive commands.
<b>d</b>	Changes the delay interval between updates.
<b>k</b>	Kills a process.
<b>l</b>	Refreshes the screen.
<b>n</b>	Changes the number of threads to be displayed.
<b>q</b>	Quits the interactive display and returns the prompt to EXEC mode.

**Task ID****Task ID      Operations**

---

```
basic-services  execute
```

```

[Table 3: monitor threads Field Descriptions, on page 27](#) describes the significant fields shown in the display.

**Table 3: monitor threads Field Descriptions**

Field	Description
JID	Job ID.
TIDS	Thread ID.
LAST_CPU	Number of open channels.
PRI	Priority level of the thread.
STATE	State of the thread.
HH:MM:SS	Run time of process since last restart.
CPU	Percentage of CPU used by process thread.
COMMAND	Process name.

### Using Interactive Commands

When the **n** or **d** interactive command is used, the **monitor threads** command prompts for a number appropriate to the specific interactive command. The following example shows sample output from the **monitor threads** command using the interactive **n** command after the first display cycle to change the number of threads:

```

RP/0/RP0/CPU0:router# monitor threads

Computing times... 87 processes; 249 threads;
CPU states: 84.8% idle, 4.2% user, 10.9% kernel
Memory: 256M total, 175M avail, page size 4K

   JID   TID  PRI  STATE  HH:MM:SS      CPU  COMMAND
   ---   ---  ---  ---    ---:---:---   ---  ---
    1     6   10  Run    0:00:10     10.92% kernel
553049   1   10  Rply   0:00:00      4.20% top
    58    3   10  Rcv    0:00:24      0.00% sysdsbvr
    1     3   10  Rcv    0:00:21      0.00% kernel
    69    1   10  Rcv    0:00:20      0.00% wdsysmon
    1     5   10  Rcv    0:00:20      0.00% kernel
   159    2   10  Rcv    0:00:05      0.00% qnet
   160    1   10  Rcv    0:00:05      0.00% netio
   157    1   10  NSlp   0:00:04      0.00% envmon_periodic
   160    9   10  Intr   0:00:04      0.00% netio

n

Enter number of threads to display: 3
Please enter a number between 5 and 40
Enter number of threads to display: 8

```

```
87 processes; 249 threads;
CPU states: 95.3% idle, 2.9% user, 1.7% kernel
Memory: 256M total, 175M avail, page size 4K
```

JID	TID	PRI	STATE	HH:MM:SS	CPU	COMMAND
1	6	10	Run	0:00:11	1.76%	kernel
69	1	10	Rcv	0:00:20	1.11%	wdsysmon
58	3	10	Rcv	0:00:24	0.40%	sysdsbr

[monitor processes](#)

# process

To start, terminate, or restart a process, use the **process** command in admin EXEC mode.

```
process {crash | restart | shutdown | start} {executable-namejob-id} location {node-id | all}
```

## Syntax Description

<b>crash</b>	Crashes a process.
<b>restart</b>	Restarts a process.
<b>shutdown</b>	Stops a process. The process is not restarted (even if considered “mandatory ◆?”).
<b>start</b>	Starts a process.
<i>executable-name</i>	Executable name of the process to be started, terminated, or restarted. Supplying an executable name for the <i>executable-name</i> argument performs the action for all the simultaneously running instances of the process, if applicable.
<i>job-id</i>	Job ID of the process instance to be started, terminated, or restarted. Supplying a job ID for the <i>job-id</i> argument performs the action for only the process instance associated with the job ID.
<b>location</b> { <i>node-id</i>   <b>all</b> }	Starts, terminates, or restarts a process on the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation. The <b>all</b> keyword specifies all nodes.

## Command Default

None

## Command Modes

Admin EXEC

## Command History

Release	Modification
Release 2.0	This command was introduced.
Release 3.2	The <b>shutdown</b> keyword was introduced to replace the <b>kill</b> keyword. Support for the <b>crash</b> keyword was added to crash a process.
Release 3.5.0	This command was removed from EXEC mode.
Release 3.8.0	The <b>blocked</b> keyword was not supported.

## Usage Guidelines

Under normal circumstances, processes are started and restarted automatically by the operating system as required. If a process crashes, it is automatically restarted.

Use this command to manually start, stop, or restart individual processes.

**Caution** Manually stopping or restarting a process can seriously impact the operation of a router. Use these commands only under the direction of a Cisco Technical Support representative.

### process shutdown

The **process shutdown** command shuts down (terminates) the specified process and copies associated with the specified process. The process is not restarted, even if considered “mandatory.” Use the **show processes** command to display a list of executable processes running on the system.

**Caution** Stopping a process can result in an RP switchover, system failure or both. This command is intended for use only under the direct supervision of a Cisco Technical Support representative.

### process restart

The **process restart** command restarts a process, such as a process that is not functioning optimally.

### process start

The **process start** command starts a process that is not currently running, such as a process that was terminated using the **process kill** command. If multiple copies are on the system, all instances of the process are started simultaneously.

## Task ID

### Task Operations ID

root-lr execute

The following example shows how to restart a process. In this example, the IS-IS process is restarted:

```
RP/0/RP0/CPU0:router# process restart isis

RP/0/RP0/CPU0:router#RP/0/RP0/CPU0:Mar 30 15:24:41 : isis[343]: %ISIS-6-INFO_ST
RTUP_START : Cisco NSF controlled start beginning
RP/0/RP0/CPU0:router#RP/0/RP0/CPU0:Mar 30 15:24:52 : isis[352]: %ISIS-6-INFO_ST
RTUP_FINISH : Cold controlled start completed
```

The following example shows how to terminate a process. In this example, the IS-IS process is stopped:

```
RP/0/RP0/CPU0:router# process shutdown isis
RP/0/RP0/CPU0:router#
```

The following example shows how to start a process. In this example, the IS-IS process is started:

```
RP/0/RP0/CPU0:router# process start isis
```

```
RP/0/RP0/CPU0:router#RP/0/RP0/CPU0:Mar 30 15:27:19 : isis[227]:  
  %ISIS-6-INFO_STARTUP_START : Cold controlled start beginning  
RP/0/RP0/CPU0:Mar 30 15:27:31 : isis[352]: %ISIS-6-INFO_STARTUP_FINISH :  
  Cold controlled start completed
```

This example shows how to restart a process:

## process core

To modify the core dump options for a process, use the **process core** command in administration EXEC mode.

**process** {*executable-name**job-id*} **core** {**context** | **copy** | **fallback** | **iomem** | **mainmem** | **off** | **sharedmem** | **sparse** | **sync** | **text**} [**maxcore** *value*] **location** *node-id*

### Syntax Description

<i>executable-name</i>	Executable name of the process for which you want to change core dump options. Specifying a value for the <i>executable-name</i> argument changes the core dump option for multiple instances of a running process.
<i>job-id</i>	Job ID associated with the process instance. Specifying a <i>job-id</i> value changes the core dump option for only a single instance of a running process.
<b>context</b>	Dumps only context information for a process.
<b>copy</b>	Copies a core dump locally before performing the core dump.
<b>fallback</b>	Sets the core dump options to use the fallback options (if needed).
<b>iomem</b>	Dumps the I/O memory of a process.
<b>mainmem</b>	Dumps the main memory of a process.
<b>off</b>	Indicates that a core dump is not taken on the termination of the specified process.
<b>sharedmem</b>	Dumps the shared memory of a process.
<b>sparse</b>	Enables sparse core dumps of a process.
<b>sync</b>	Enables only synchronous core dumping.
<b>text</b>	Dumps the text of a process.
<b>maxcore</b> <i>value</i>	(Optional) Specifies the maximum number of core dumps allowed for the specified process on its creation.
<b>location</b> <i>node-id</i>	Sets the core dump options for a process on a designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

### Command Default

By default, processes are configured to dump shared memory, text area, stack, data section, and heap information.

### Command Modes

Administration EXEC

### Command History

Release	Modification
Release 2.0	This command was introduced.

Release	Modification
Release 3.2	<p>The command was made available in administration EXEC mode.</p> <p>The <b>mainmem-sharedmem</b> , <b>mainmem-text</b> , and <b>mainmem-text-sharedmem</b> keywords were removed.</p> <p>The <b>context</b> , <b>fallback</b> , <b>iomem</b> , <b>sync</b> , and <b>text</b> keywords were introduced.</p>

### Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The modular architecture of Cisco IOS XR software allows core dumps for individual processes. By default, processes are configured to dump shared memory, text area, stack, data section, and heap information.

Specifying an executable name for the *executable-name job-id* argument changes the core dump option for all instances of the process. Specifying a job ID for the value changes the core dump option for a single instance of a running process.

### Task ID

Task ID	Operations
root-lr	execute

The following example shows how to enable the collection of shared memory of a process:

```
RP/0/RP0/CPU0:router# process ospf core sharedmem
```

The following example shows how to turn off core dumping for a process:

```
RP/0/RP0/CPU0:router# process media_ether_config_di core off
```

## process mandatory

To set the mandatory reboot options for a process, use the **process mandatory** command in the appropriate mode.

### process mandatory

**process mandatory** {**on** | **off**} {*executable-name**job-id*} **location** *node-id*

### process mandatory reboot

**process mandatory reboot** {**enable** | **disable**}

### process mandatory toggle

**process mandatory toggle** {*executable-name**job-id*} **location** *node-id*

### Syntax Description

<b>on</b>	Turns on mandatory process attribute.
<b>off</b>	Turns off the mandatory process attribute. The process is not considered mandatory.
<b>reboot</b> { <b>enable</b>   <b>disable</b> }	Enables or disables the reboot action when a mandatory process fails.
<b>toggle</b>	Toggles a mandatory process attribute.
<i>executable-name</i>	Executable name of the process to be terminated. Specifying an executable name for the <i>executable-name</i> argument terminates the process and all the simultaneously running copies, if applicable.
<i>job-id</i>	Job ID associated with the process to be terminated. Terminates only the process associated with the job ID.
<b>location</b> <i>node-id</i>	Sets the mandatory settings for a process on a designated node. The <i>node-id</i> argument is expressed in the <i>rack/slot/module</i> notation.

### Command Default

No default behavior or values

### Command Modes

Administration EXEC

EXEC

### Command History

Release	Modification
Release 2.0	This command was introduced.
Release 3.2	The command was made available in administration EXEC mode.

### Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

If a process unexpectedly goes down, the following action occurs based on whether the process is considered mandatory.

- If the process is mandatory and the process cannot be restarted, the node automatically reboots.
- If the process is not mandatory and cannot be restarted, it stays down and the node does not reboot.

Task ID	Task ID	Operations
	root-lr	execute

The following example shows how to turn on a mandatory attribute. In this example, the mandatory attribute is turned on for the `media_ether_config_di` process.

```
RP/0/RP0/CPU0:router# process mandatory on media_ether_config_di
```

The following example shows how to turn the reboot option on. In this example, the router is set to reboot the node if a mandatory process goes down and cannot be restarted.

```
RP/0/RP0/CPU0:router# process mandatory reboot enable
```

```
RP/0/RP00/CPU0:Mar 19 19:28:10 : sysmgr[71]: %SYSMGR-4-MANDATORY_REBOOT_ENABLE :
mandatory reboot option enabled by request
```

The following example shows how to turn off the reboot option. In this example, the router is set *not* to reboot the node if a mandatory process goes down and cannot be restarted. In this case, the mandatory process is restarted, but the node is not rebooted.

```
RP/0/RP0/CPU0:router# process mandatory reboot disable
```

```
RP/0/RP00/CPU0:Mar 19 19:31:20 : sysmgr[71]: %SYSMGR-4-MANDATORY_REBOOT_OVERRIDE :
mandatory reboot option overridden by request
```

# show context

To display core dump context information, use the **show context** command in administration EXEC mode or in EXEC mode.

**show context** [*coredump-occurrence* | **clear**] [**location** {*node-id* | **all**}]

## Syntax Description

<i>coredump-occurrence</i>	(Optional) Core dump context information to be displayed based on the occurrence of the core dump. Valid values are 1 to 10.
<b>clear</b>	(Optional) Clears the current context information.
<b>location</b> { <i>node-id</i>   <b>all</b> }	Displays core dump information that occurred on the designated node. The <i>node-id</i> argument is expressed in the <i>rack/slot/module</i> notation. The <b>all</b> keyword specifies to display information for all nodes.

## Command Default

If no *coredump-occurrence* value is specified, core dump context information for all core dumps is displayed.

## Command Modes

EXEC, Administration EXEC

## Command History

Release	Modification
Release 2.0	This command was introduced.
Release 3.2	The command was made available in administration EXEC mode.

## Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **show context** command to display core dump context information. This command displays context information for the last ten core dumps. Cisco Technical Support Center engineers and development engineers use this command for post-analysis in the debugging of processes.

Use the [clear context, on page 2](#) command to clear core dump context information.

## Task ID

Task ID	Operations
diag	read

The following example shows sample output from the **show context** command:

```
RP/0/RP0/CPU0:router# show context

Crashed pid = 20502 (pkg/bin/mbi-hello)
Crash time: Thu Mar 25, 2004: 19:34:14
```

```
Core for process at disk0:/mbi-hello.20040325-193414.node0_RP0_CPU0
```

```

```

[Table 4: show context Field Descriptions, on page 37](#) describes the significant fields shown in the display.

**Table 4: show context Field Descriptions**

Field	Description
Crashed pid	Process ID (PID) of the crashed process followed by the executable path.
Crash time	Time and date the crash occurred.
Core for process at	File path to the core dump file.

Field	Description
Stack Trace	Stack trace information.
Registers Info	Register information related to crashed threads.
DLL Info	Dynamically loadable library (DLL) information used to decode the stack trace.

**Related Topics**

[clear context](#), on page 2

# show dll

To display dynamically loadable library (DLL) information, use the **show dll** command in administration EXEC mode or in EXEC mode.

**show dll** [{**jobid** *job-id* [**virtual**] | [**symbol**]**address** *virtual-address* | **dllname** *dll-virtual-path* | **memory** | **virtual**}] [**location** *node-id*]

Syntax Description		
<b>jobid</b> <i>job-id</i>		(Optional) Displays DLL information for the specified job identifier.
<b>virtual</b>		(Optional) Displays the virtual path of DLLs. The virtual path is expressed in the /pkg/lib/library-name.dll format where the library name is the name of the DLL followed by the .dll suffix.
<b>symbol</b>		(Optional) Displays the symbol at the virtual address specified for the <i>virtual-address</i> argument.
<b>address</b> <i>virtual-address</i>		(Optional) Displays the DLL that is mapped at the virtual address specified for the <i>virtual-address</i> argument.
<b>dllname</b> <i>dll-virtual-path</i>		(Optional) Displays the process IDs (PIDs) of the process that have downloaded the DLL specified for the <i>dll-virtual-path</i> argument.
<b>memory</b>		(Optional) Displays a summary of DLL memory usage.
<b>location</b> <i>node-id</i>		(Optional) Displays DLLs for the specified node. The <i>node-id</i> argument is expressed in the <i>rack/slot/module</i> notation.

**Command Default** No default behavior or values

**Command Modes** EXEC, Administration EXEC

Command History	Release	Modification
	Release 2.0	This command was introduced.
	Release 3.2	The command was made available in administration EXEC mode.

Table 5: [show dll Field Descriptions, on page 41](#) describes the significant fields shown in the display.

**Table 5: show dll Field Descriptions**

Field	Description
DLL path	Physical path of the DLL on the router.
Text VA	Virtual address of the text segment of the DLL.
Text Sz	Size of the text segment of the DLL.
Data VA	Virtual address of the data segment of the DLL.
Data Sz	Size of the data segment of the DLL.
Refcount	Number of clients using the DLL.

The following example shows sample output from the **show dll** command with the optional **dllname** *dll-virtual-path* keyword and optional argument:

```
RP/0/RP0/CPU0:router# show dll dllname /pkg/lib/libinst_mem.dll

PID:      4102  Refcount: 1
PID:      4105  Refcount: 1
PID:     24600  Refcount: 1
PID:     86111  Refcount: 1
```

[Table 6: show dll dllname Field Descriptions, on page 41](#) describes the significant fields shown in the display.

**Table 6: show dll dllname Field Descriptions**

Field	Description
PID:	Process ID of the process.
Refcount	Number of references to the DLL by the process.

The following example shows sample **show dll** output from the command with the optional **memory** keyword:

```
RP/0/RP0/CPU0:router# show dll memory
-----
Total DLL Text - 14778896 bytes  Total DLL Data - 12688500 bytes
Total DLL Memory - 27467396 bytes
```

# show exception

To display the configured core dump settings, use the **show exception** command in administration EXEC mode or in EXEC mode.

**show exception** [**core-options** [**process** *process-name*] **location** *node-id*]

## Syntax Description

<b>core-options</b>	(Optional) Displays process core option values.
<b>process</b> <i>process-name</i>	(Optional) Specifies the process for which to display the information.
<b>location</b> <i>node-id</i>	(Optional) Displays configured settings for a specified node. The <i>node-id</i> argument is expressed in the <i>rack/slot/module</i> notation.

## Command Default

None

## Command Modes

EXEC, Administration EXEC

## Command History

Release	Modification
Release 2.0	This command was introduced.
Release 3.9.0	Support for the <b>core-options</b> keyword was added.

## Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **show exception** command to display the configured core dump settings. The output from this command displays the core dump settings configured with the following commands:

- [exception filepath](#), on page 8
- [exception pakmem](#), on page 12
- [exception sparse](#), on page 14
- [exception sprsize](#), on page 16

## Task ID

# show memory

To display the available physical memory and memory usage information of processes on the router, use the **show memory** command in EXEC or administration EXEC mode.

**show memory** [{*jobid* | **summary** [{**bytes** | **detail**}]}] **location** *node-id*

Syntax Description	
<i>job id</i>	(Optional) Job ID associated with a process instance. Specifying a job ID for the <i>job-id</i> argument displays the memory available and memory usage information for only the process associated with the specified job ID. If the <i>job-id</i> argument is not specified, this command displays information for all running processes.
<b>summary</b>	(Optional) Displays a summary of the physical memory and memory usage information.
<b>bytes</b>	(Optional) Displays numbers in bytes for an exact count.
<b>detail</b>	(Optional) Displays numbers in the format “nnn.dddM” for more detail.
<b>location</b> <i>node-id</i>	Displays the available physical memory from the designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.

**Command Default** None

**Command Modes** Administration EXEC  
EXEC

Command History	Release	Modification
	Release 2.0	This command was introduced.
	Release 3.2	The command was made available in administration EXEC mode.

**Usage Guidelines** To display detailed memory information for the entire router, enter the **show memory** command without any parameters.

Task ID	Task ID	Operations
	basic-services	read

This example shows partial sample output from the **show memory** command entered without keywords or arguments. This command displays details for the entire router.

```
RP/0/RP0/CPU0:router# show memory

Physical Memory:2048M total

# show memory compare

To display details about heap memory usage for all processes on the router at different moments in time and compare the results, use the **show memory compare** command in EXEC or administration EXEC mode.

**show memory compare** {start | end | report}

<b>Syntax Description</b>	<p><b>start</b> Takes the initial snapshot of heap memory usage for all processes on the router and sends the report to a temporary file named /tmp/memcmp_start.out.</p> <p><b>end</b> Takes the second snapshot of heap memory usage for all processes on the router and sends the report to a temporary file named /tmp/memcmp_end.out. This snapshot is compared with the initial snapshot when displaying the heap memory usage comparison report.</p> <p><b>report</b> Displays the heap memory comparison report, comparing heap memory usage between the two snapshots of heap memory usage.</p>
---------------------------	--

**Command Default** None

**Command Modes** Administration EXEC  
EXEC

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	Release 2.0	This command was introduced.
	Release 3.2	The command was made available in administration EXEC mode.

**Usage Guidelines** Use the **show memory compare** command to display details about the heap memory usage of all processes on the router at different moments in time and compare the results. This command is useful for detecting patterns of memory usage during events such as restarting processes or configuring interfaces.

Use the following steps to create and compare memory snapshots:

1. Enter the **show memory compare** command with the **start** keyword to take the initial snapshot of heap memory usage for all processes on the router.

**Note** The snapshot is similar to that resulting from entry of the [show memory heap, on page 50](#) command with optional **summary** keyword.

2. Perform the test you want to analyze.
3. Enter the **show memory compare** command with the **end** keyword to take the snapshot of heap memory usage to be compared with the initial snapshot.
4. Enter the **show memory compare** command with the **report** keyword to display the heap memory usage comparison report.

Task ID	Task ID	Operations
	basic-services	read

This example shows sample output from the **show memory compare** command with the **report** keyword:

```
RP/0/RP0/CPU0:router# show memory compare report
```

**Table 8: show memory compare report Field Descriptions**

Field	Description
JID	Process job ID.
name	Process name.
mem before	Heap memory usage at start (in bytes).

Field	Description
mem after	Heap memory usage at end (in bytes).
difference	Difference in heap memory usage (in bytes).
mallocs	Number of unfreed allocations made during the test period.
restarted	Indicates if the process was restarted during the test period.

# show memory heap

To display information about the heap space for a process, use the **show memory heap** command in EXEC or administration EXEC mode.

**show memory heap** [**allocated**] [**dllname**] [**failure**] [**free**] {*jobid* | **all**}

Syntax Description		
<b>allocated</b>	(Optional)	Displays a list of all allocated heap blocks.
<b>dllname</b>	(Optional)	Displays heaps with dynamic link library (DLL) names.
<b>failure</b>	(Optional)	Displays a summary of heap failures.
<b>free</b>	(Optional)	Displays a list of all free heap blocks.
<b>summary</b>	(Optional)	Displays a summary of the information about the heap space.
<i>job-id</i>		Job ID associated with the process instance.
<b>all</b>	(Optional)	Displays information about the heap space for all processes. The <b>all</b> keyword is only available when the <b>failure</b> or <b>summary</b> keywords are used.

**Command Default** None

**Command Modes** Administration EXEC  
EXEC

Command History	Release	Modification
	Release 2.0	This command was introduced.
	Release 3.2	The command was made available in administration EXEC mode.

**Usage Guidelines** To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Task ID	Task ID	Operations
	basic-services	read

This example shows sample output from the **show memory heap** command, specifying a job ID for the *job-id* argument:

```
RP/0/RP0/CPU0:router# show memory heap 111
```

```

Malloc summary for pid 16433:

**Table 9: show memory heap Field Descriptions**

Field	Description
Malloc summary for pid	System-defined process ID (PID).
Heapsize	Size of the heap as allocated from the system by the malloc library.
allocd	Bytes allocated to the process.
free	Bytes available in the heap.
overhead	Malloc library overhead in bytes.
mallocs	Number of malloc calls.
reallocs	Number of realloc calls.
frees	Number of invocations to the caller interface provided in the malloc library for deallocating the memory.
[core-allocs 1; core-frees 0]	Number of core memory units, the memory units in the malloc library allocated by the system for the heap, allocated, and freed.

The following example shows sample output from the **show memory heap** command, specifying the **summary job-id** keyword and argument:

```

RP/0/RP0/CPU0:router# show memory heap summary 65

Malloc summary for pid 20495 process pcmciad:

**Table 10: show memory heap summary Field Descriptions**

Field	Description
Malloc summary for pid	System-defined process ID (pid).
Heapsize	Size of the heap as allocated from the system by the malloc library.
allocd	Bytes allocated to the process.
free	Bytes available in the heap.
overhead	Malloc library overhead in bytes.
mallocs	Number of malloc calls.

Field	Description
reallocs	Number of realloc calls.
frees	Number of invocations to the caller interface provided in the malloc library for deallocating the memory.
[core-allocs 1; core-frees 0]	Number of core memory units, the memory units in the malloc library allocated by the system for the heap, allocated and freed.
Band size	Small memory elements are arranged in bands. The band size specifies the size of elements within the band.
element per block	Number of elements per block in the band.
nbunit	Number of memory unit one block consists of. Any block in any band should be of a size that is an integer multiple of this basic unit.
Completely free blocks	Number of blocks in the band completely free (available for allocation).
Block alloced	Number of blocks currently allocated for the band.
allocs	Number of allocations currently performed from the band.
frees	Number of free calls that resulted in memory being returned to the band.
allocmem	Amount of memory currently allocated from the band.
overhead	Amount of memory in bytes as overhead for managing the band.
blocks	Number of blocks currently in the band.
blknodes	Number of nodes (elements) in all the blocks in the band.

# show processes

To display information about active processes, use the **show processes** command in EXEC or administration EXEC mode.

**show processes** {*job-id**process-name* | **aborts** | **all** | **blocked** | **boot** | **cpu** | **distribution** *process-name* | **dynamic** | **failover** | **family** | **files** | **location** *node-id* | **log** | **mandatory** | **memory** | **pidin** | **searchpath** | **signal** | **startup** | **threadname**} [**location** *node-id*] [**detail**] [**run**]

## Syntax Description

<i>job-id</i>	Job identifier for which information for only the process instance associated with the <i>job-id</i> argument is displayed.
<i>process-name</i>	Process name for which all simultaneously running instances are displayed, if applicable.
<b>aborts</b>	Displays process abort information.
<b>all</b>	Displays summary process information for all processes.
<b>blocked</b>	Displays details about reply, send, and mutex blocked processes.
<b>boot</b>	Displays process boot information.
<b>cpu</b>	Displays CPU usage for each process.
<b>distribution</b>	Displays the distribution of processes.
<b>dynamic</b>	Displays process data for dynamically created processes.
<b>failover</b>	Displays process switchover information.
<b>family</b>	Displays the process session and family information.
<b>files</b>	Displays information about open files and open communication channels.
<b>location</b> <i>node-id</i>	Displays information about the active processes from a designated node. The <i>node-id</i> argument is entered in the <i>rack/slot/module</i> notation.
<b>log</b>	Displays process log.
<b>mandatory</b>	Displays process data for mandatory processes.
<b>memory</b>	Displays information about the text, data, and stack usage for processes.
<b>pidin</b>	Displays all processes using the QNX command.
<b>searchpath</b>	Displays the search path.
<b>signal</b>	Displays the signal options for blocked, pending, ignored, and queued signals.
<b>startup</b>	Displays process data for processes created at startup.
<b>threadname</b>	Displays thread names.

<b>detail</b>	(Optional) Displays more detail. This option is available only with the <i>process-name</i> argument.
<b>run</b>	(Optional) Displays information for only running processes. This option is available only with the <i>process-name</i> argument.

**Command Default** None

**Command Modes** Administration EXEC  
EXEC

Command History	Release	Modification
	Release 2.0	This command was introduced.
	Release 3.2	The command was made available in administration EXEC mode.
	Release 3.5.0	The use of this command with no keywords or arguments was not supported.

**Usage Guidelines** Use the **show processes** command to display general information about the active processes. To display more detailed information for a process, specify a job ID or process for the *job-id* argument or *process-name* argument, respectively.

You can also use the **monitor processes** command to determine the top processes and threads based on CPU usage.

Task ID	Task ID	Operations
	basic-services	read

The **show processes** command with the *process-name* argument displays detailed information about a process:

```
RP/0/RP0/CPU0:router# show processes ospf

      Job Id: 261
        PID: 139453
Executable path: /crs-rout-0.44.0/bin/ospf
      Instance #: 1
      Version ID: 00.00.0000
        Respawn: ON
      Respawn count: 1
Max. spawns per minute: 12
      Last started: Wed Mar 17 07:46:26 2004
      Process state: Run
      Package state: Normal
Started on config: cfg/gl/ipv4-ospf/proc/100/ord_a/routerid
      core: TEXT SHAREDMEM MAINMEM
      Max. core: 0
      Mandatory: ON
      Placement: ON
      startup_path: /pkg/startup/ospf.startup
```

## show processes

```

Process cpu time: 0.410 user, 0.183 kernel, 0.593 total
JID   TID  LastCPU  Stack  pri  state      HR:MM:SS:MSEC  NAME
261   1    0        40K   10  Receive    0:00:00:0397  ospf

--More--

```

Table 11: show processes Field Descriptions

Field	Description
Job id	Job ID. This field remains constant over process restarts.
PID	Process ID. This field changes when process is restarted.
Executable path	Path for the process executable.
Instance	There may be more than one instance of a process running at a given time (each instance may have more than one thread).
Version ID	API version.
Respawn	ON or OFF. The field indicates if this process restarts automatically in case of failure.
Respawn count	Number of times this process has been started or restarted (that is, the first start makes this count 1).
Max. spawns per minute	Number of respawns not to be exceeded in 1 minute. If this number is exceeded, the process stops restarting.
Last started	Date and time the process was last started.
Process state	Current state of the process.
Started on config	Configuration command that started (or would start) this process.
core	Memory segments to include in core file.
Max. core	Number of times to dump a core file. 0 = infinity.

The **show processes** command with the **memory** keyword displays details of memory usage for a given process or for all processes, as shown in the following example:

```

RP/0/RP0/CPU0:router# show processes memory

JID   Text      Data      Stack     Dynamic  Process
55    28672    4096     69632    17072128 eth_server

-b
--More--

```

**Table 13: show processes all Field Description**

Field	Description
JID	Job ID.
Last Started	Date when the process was last started.
State	State of the process.

Field	Description
Restart	Number of times the process has restarted since the node was booted. If a node is reloaded, the restart count for all processes is reset. Normally, this value is 1, because usually processes do not restart. However, if you restart a process using the <b>process restart</b> command, the restart count for the process increases by one.
Placement	Indicates whether the process is a placeable process or not. Most processes are not placeable, so the value is blank. ISIS, OSPF, and BGP are examples of placeable processes.
Mandatory	M indicates that the process is mandatory. A mandatory process must be running. If a mandatory process cannot be started (for example, sysmgr starts it but it keeps crashing), after five attempts the sysmgr causes the node to reload in an attempt to correct the problem. A node cannot function properly if a mandatory process is not running.
Maint Mode	Indicates processes that should be running when a node is in maintenance mode. Maintenance mode is intended to run as few processes as possible to perform diagnostics on a card when a problem is suspected. However, even the diagnostics require some services running.
Name (IID)	Name of the process followed by the instance ID. A process can have multiple instances running, so the IID is the instance ID.
Args	Command-line arguments to the process.
