Obtaining Documentation and Submitting a Service Request

For information on obtaining documentation, using the Cisco Bug Search Tool (BST), submitting a service request, and gathering additional information, see What's New in Cisco Product Documentation.

To receive new and revised Cisco technical content directly to your desktop, you can subscribe to the What's New in Cisco Product Documentation RSS feed. RSS feeds are a free service.
Configuring Secure Domain Routers on the Cisco IOS XR Software

Secure domain routers (SDRs) are a means of dividing a single physical system into multiple logically separated routers. SDRs are isolated from each other in terms of their resources, performance, and availability.

For complete descriptions of the SDR commands listed in this module, see Related Documents, on page 24. To locate documentation for other commands that might appear in the course of performing a configuration task, search online in Cisco IOS XR Commands Master List for the Cisco CRS Router.

This module contains the following topics:

- Prerequisites for Working with Secure Domain Routers, page 2
- Information About Configuring Secure Domain Routers, page 2
- How to Configure Secure Domain Routers, page 9
- Configuration Examples for Secure Domain Routers, page 22
- Additional References, page 23
Prerequisites for Working with Secure Domain Routers

Before configuring SDRs, the following conditions must be met:

Initial Setup

- The router must be running the Cisco IOS XR software, including a designated shelf controller (DSC).
- The root-system username and password must be assigned as part of the initial configuration.
- For more information on booting a router and performing initial configuration, see *Cisco IOS XR Getting Started Guide for the Cisco CRS Router*.

Required Cards for Each SDR

- Additional route processor (RP) pair, DRP or DRP pair must be installed in each line card (LC) chassis to manage each SDR in the system.
- For additional information on DRPs, refer to *Cisco CRS-1 Carrier Routing System 16-Slot Line Card Chassis System Description*. For instructions on installing DRPs, see *Installing the Cisco CRS-1 Carrier Routing System 16-Slot Line Card Chassis*.

Task ID Requirements

- You must be in a user group associated with a task group that includes the proper task IDs. The command reference guides include the task IDs required for each command. If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Software Version Requirements

- Cisco IOS XR Software Releases 2.0, 3.0, and 3.2 support only one owner SDR. Multiple (non-owner) SDRs are not supported in these releases. The owner SDR cannot be added or removed from the configuration.
- Multiple SDRs, including non-owner SDRs, are supported on Cisco IOS XR Software Release 3.3.0 or higher.

Maximum SDR Configurations

- A maximum of eight SDRs are supported, including one owner SDR and up to seven non-owner SDRs.

Information About Configuring Secure Domain Routers

Review the sections in this module before configuring secure domain routers.
What Is a Secure Domain Router?

Cisco routers running the Cisco IOS XR software can be partitioned into multiple, and independent routers known as secure domain routers (SDRs). SDRs are a means of dividing a single physical system into multiple logically separated routers. They perform routing functions similar to a physical router, but they share resources with the rest of the system. For example, the software, the configurations, the protocols, and the routing tables, which are assigned, are unique to a particular SDR. Other functions, such as chassis-control and switch fabric, are shared with the rest of the system.

Owner SDR and Administration Configuration Mode

The owner SDR is created at system startup and cannot be removed. This owner SDR performs system-wide functions, including the creation of additional non-owner SDRs. You cannot create the owner SDR because it always exists, nor can you completely remove the owner SDR because it is necessary to manage the router. By default, all nodes in the system belong to the owner SDR.

The owner SDR also provides access to the administration EXEC and administration configuration modes. Only users with root-system privileges can access the administration modes by logging in to the primary route processor (RP) for the owner SDR (called the designated shelf controller, or DSC).

Administration modes are used for the following purposes:

• Create and remove additional non-owner SDRs.
• Assign nodes to the non-owner SDRs.
• View the configured SDRs in the system.
• View and manage system-wide resources and logs.

Note

Administration modes cannot be used to configure the features within a non-owner SDR, or view the router configuration for a non-owner SDR. After the SDR is created, users must log into the non-owner SDR directly to change the local configuration and manage the SDR.

Non-Owner SDRs

To create a new non-owner SDR, the root-system user enters administration configuration mode, defines a new SDR name, and assigns a set of cards to that SDR. Only a user with root-system privileges can access the commands in administration configuration mode. Therefore, users without root-system privileges cannot create SDRs or assign cards to the SDRs.

After a non-owner SDR is created, the users configured on the non-owner SDR can log in and manage the router. The configuration for each non-owner SDR is separate from the owner SDR and can be accessed only by logging in to the non-owner SDR.
SDR Access Privileges

For information regarding support for non-owner SDRs in Cisco IOS XR software releases before release 3.9.0, see Related Topics.

SDR Access Privileges

Each SDR in a router has a separate AAA configuration that defines usernames, passwords, and associated privileges.

- Only users with root-system privileges can access the administration EXEC and administration configuration modes.
- Users with root-lr privileges can access only the non-owner SDR in which that username was created.
- Users with other access privileges can access features according to their assigned privileges for a specific SDR.

For more information about AAA policies, see the Configuring AAA Services on the Cisco IOS XR Software module of Cisco IOS XR System Security Configuration Guide for the Cisco CRS Router.

Root-System Users

Users with root-system privileges have access to system-wide features and resources, including the ability to create and remove secure domain routers. The root-system user is created during the initial boot and configuration of the router.

The root-system user has the following privileges:

- Access to administration EXEC and administration configuration commands.
- Ability to create and delete non-owner SDRs.
- Ability to assign nodes (RPs, distributed route processors [DRPs], and line cards) to SDRs.
- Ability to create other users with similar or lower privileges.
- Complete authority over the chassis.
- Ability to log in to non-owner SDRs using admin plane authentication. Admin plane authentication allows the root-system user to log in to a non-owner SDR regardless of the configuration set by the root-lr user.
- Ability to install and activate software packages for all SDRs or for a specific SDR.
- Ability to view the following administration (admin) plane events (owner SDR logging system only):
  - Software installation operations and events.
  - System card boot operations, such as card booting notifications and errors, heartbeat-missed notifications, and card reloads.
  - Card alphanumeric display changes.
  - Environment monitoring events and alarms.
Fabric control events.
Upgrade progress information.

root-lr Users

Users with root-lr privileges can log in to an SDR only and perform configuration tasks that are specific to that SDR. The root-lr group has the following privileges:

- Ability to configure interfaces and protocols.
- Ability to create other users with similar or lower privileges on the SDR.
- Ability to view the resources assigned to their particular SDR.

The following restrictions apply to root-lr users:

- Users with root-lr privileges cannot enter administration EXEC or configuration modes.
- Users with root-lr privileges cannot create or remove SDRs.
- Users with root-lr privileges cannot add or remove nodes from an SDR.
- Users with root-lr privileges cannot create root-system users.
- The highest privilege a non-owner SDR user can have is root-lr.

Other SDR Users

Additional usernames and passwords can be created by the root-system or root-lr users to provide more restricted access to the configuration and management capabilities of the owner SDR or non-owner SDRs.

Designated Secure Domain Router Shelf Controller (DSDRSC)

In a router running Cisco IOS XR software, one RP is assigned the role of DSC. The DSC provides system-wide administration and control capability, including access to the administration EXEC and administration configuration modes. For more information on DSCs, refer to Cisco IOS XR Getting Started Guide for the Cisco CRS Router.

In each SDR, similar administration and control capabilities are provided by the designated secure domain router system controller (DSDRSC). Each SDR must include a DSDRSC to operate, and you must assign an RP or DRP to act as the DSDRSC.

Note

In the owner SDR, the DSC also provides DSDRSC functionality.
DSCs and DSDRSCs

Designated Shelf Controller (DSC)

The primary and standby DSC is always an RP pair. By default, the DSC is also the DSDRSC for the owner SDR. The owner DSDRSCs cannot be removed from the SDR configuration, or assigned to a non-owner SDR.

For information on DSC assignment and initial router configuration, refer to Cisco IOS XR Getting Started Guide for the Cisco CRS Router.

Using a DRP or DRP Pair as the DSDRSC

Cisco Systems recommends the use of DRPs as the DSDRSC in non-owner SDRs. An SDR without an RP must designate a DRP or DRP as the potential DSDRSC.

To create a DRP DSDRSC in a non-owner SDR, you must configure a DRP or DRP pair as the primary node for that SDR. The following guidelines apply:

- Although a single DRP can be used as the DSDRSC, we recommend the use of a redundant DRP pair.
- To create a DRP pair and configure it as the DSDRSC, complete the instructions in Creating SDRs
- DRPs cannot be used as the DSC in the owner SDR. Only RPs can be used as the DSC in the owner SDR.
- DRPs cannot be assigned as the DSDRSC if an RP is present in the SDR. To assign a DRP as the DSDRSC, you must first remove any RPs from the SDR configuration, and then add the DRP or DRP pair as the primary node. After the DRP is assigned as the DSDRSC, the RPs can be added to the SDR. For more information, see Related Topics.

Note

DRPs can also be used to provide additional processing capacity. For additional information on DRPs, see Cisco CRS-1 Carrier Routing System 16-Slot Line Card Chassis System Description. For instructions on installing DRPs, see Installing the Cisco CRS-1 Carrier Routing System 16-Slot Line Card Chassis. For information on using DRPs for additional processing capacity, see the Process Placement on Cisco IOS XR Software module in Cisco IOS XR System Management Configuration Guide for the Cisco CRS Router.

Using an RP Pair as the DSDRSC

RP pairs can also be used as the DSDRSC in non-owner SDRs.

- Single RPs cannot be used as the DSDRSC.
- Redundant RPs are installed in slots RP0 and RP1 of each line card chassis.
- To assign an RP pair as the DSDRSC, complete the instructions in How to Configure Secure Domain Routers, on page 9.
Although an RP pair can be used as the DSDRSC in non-owner SDRs, we recommend the use of a redundant DRP pair.

Removing a DSDRSC Configuration

There are two ways to remove a DSDRSC from an SDR:

- First remove all other nodes from the SDR configuration, and then remove the DSDRSC node. You cannot remove the DSDRSC node when other nodes are in the SDR configuration.
- Remove the entire SDR. Removing an SDR name deletes the SDR and moves all nodes back to the owner SDR inventory.

Default Configuration for New Non-Owner SDRs

By default, the configuration of a new SDR is blank. The first configuration step after creating an SDR is to log in to the new non-owner SDR using admin plane authentication and create a username and password. You can then log out of the SDR and log back in using the new username and password.

When logged in to a non-owner SDR using admin plane authentication, the admin configuration is displayed. However, admin plane authentication should be only used to configure a username and password for the non-owner SDR. To perform additional configuration tasks, log in with the username for the non-owner SDR.

Default Software Profile for SDRs

When a new non-owner SDR is created, the nodes assigned to that SDR are activated with the default software package profile. The default software profile is defined by the last install operation that did not specify an SDR.

To view the default software profile, use the `show install active summary` command in administration EXEC mode. Any new nodes that are configured to become a part of an SDR will boot with the default software profile listed in the output of this command.

```
RP/0/RP0/CPU0:router# show install active summary

Wed Dec 24 01:47:02.076 PST
Active Packages:
disk1:hfr-infra-test-3.8.0.25I
disk1:hfr-fpd-3.8.0.25I
disk1:hfr-doc-3.8.0.25I
disk1:hfr-diags-3.8.0.25I
disk1:hfr-mgbl-3.8.0.25I
disk1:hfr-mcast-3.8.0.25I
disk1:comp-hfr-mini-3.8.0.25I
```
High Availability Implications

The sections in this module describe various high availability implications.

Fault Isolation

Because the CPU and memory of an SDR are not shared with other SDRs, configuration problems that cause out-of-resources conditions in one SDR do not affect other SDRs.

Rebooting an SDR

Each non-owner SDR can be rebooted independently of the other SDRs in the system. If you reboot the owner SDR, however, then all non-owner SDRs in the system automatically reboot, because the non-owner SDRs rely on the owner SDR for basic chassis management functionality.

Note

The DSDRSC of the owner SDR is also the DSC of the entire system.

DSDRSC Redundancy

To achieve full redundancy, each SDR must be assigned two cards: one to act as the primary DSDRSC and one RP or DRP to act as a standby DSDRSC.

We recommend the use of DRP pairs as DSDRSC for all non-owner SDRs the system.

Cisco IOS XR Software Package Management

Software packages are added to the DSC of the system from administration EXEC mode. Once added, a package can be activated for all SDRs in the system or for a specific SDR. For detailed instructions regarding software package management, see the Upgrading and Managing Cisco IOS XR Software module of Cisco IOS XR System Management Configuration Guide for the Cisco CRS Router. See also the Software Package Management Commands on the Cisco IOS XR Software module of Cisco IOS XR System Management Command Reference for the Cisco CRS Router.
SDR-specific activation is supported for specific packages and upgrades, such as optional packages and SMUs. Packages that do not support SDR-specific activation can only be activated for all SDRs in the system.

Note
- To access `install` commands, you must be a member of the root-system user group with access to the administration EXEC mode.
- Most `show install` commands can be used in the EXEC mode of an SDR to view the details of the active packages for that SDR.

**Restrictions For SDR Creation and Configuration**

The following restrictions apply to SDR creation and configuration:

- DRPs are supported for the DSDRSC.
- We recommend the configuration of DRP pairs as the DSDRSC for all non-owner SDRs, as described in Using a DRP or DRP Pair as the DSDRSC, on page 6.
- Single RPs are not supported for the DSDRSC. RPs must be installed and configured in redundant pairs.
- Admin plane events are displayed only on the non-owner SDR.
- Some admin plane debug events are not displayed on the owner SDR. For example, a non-owner card cannot send debug events to the DSC, which limits the debugging of administration processes to the non-owner SDR.

**How to Configure Secure Domain Routers**

To create an SDR, configure an SDR name and then add nodes to the configuration. At least one node in each SDR must be explicitly configured as the DSDRSC. After the SDR is created, you can add or remove additional nodes and create a username and password for the SDR.

**Creating SDRs**

To create a non-owner SDR, create an SDR name, add a DSDRSC, and then add additional nodes to the configuration. After the SDR is created, you can create a username and password for the SDR to allow additional configuration.

Note
- The Cisco CRS-1 supports a maximum of eight SDRs, including one owner SDR and up to seven non-owner SDRs.
- The 4-slot line card chassis does not support the creation of multiple SDRs.
Before You Begin

The procedures in this section can be performed only on a router that is already running Cisco IOS XR software. For instructions to boot a router and perform the initial configuration, see *Cisco IOS XR Getting Started Guide for the Cisco CRS Router*. When a router is booted, the owner SDR is automatically created, and cannot be removed. This also includes instructions to create the owner SDR username and password.

SUMMARY STEPS

1. admin
2. configure
3. pairing *pair-name*
4. location *partially-qualified-nodeid* *partially-qualified-nodeid*
5. exit
6. sdr *sdr-name*
7. Do one of the following:
   - *pair *pair-name* primary*
   - *location *partially-qualified-nodeid* primary*

8. Do one of the following:
   - *location *partially-qualified-nodeid*
   - *location *pair-name* *

9. Repeat Step 8, on page 12 as needed to add nodes to an SDR.
10. exit
11. Repeat Step 3, on page 11 through Step 10, on page 12 through as needed.
12. commit
13. Create a username and password for the new SDR.

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> admin</td>
<td>Enters administration EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> RP/0/RP0/CPU0:router# admin</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure</td>
<td>Enters administration configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> RP/0/RP0/CPU0:router(admin)# configure</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>------------------</td>
<td>---------</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>pairing pair-name &lt;br&gt;<strong>Example:</strong> &lt;br&gt;RP/0/RP0/CPU0:router(admin-config)# pairing drp1</td>
</tr>
<tr>
<td></td>
<td>(Optional) Enter DRP pairing configuration mode. If the DRP name does not exist, the DRP pair is created when you add nodes, as described in the following step. &lt;br&gt;• pair-name can be between 1 and 32 alphanumeric characters. The characters '_' or '-' are also allowed. All other characters are invalid. &lt;br&gt;DRP pairs are used as the DSDRSC for a non-owner SDR. &lt;br&gt;Note Although a single DRP can be used as the DSDRSC in a non-owner SDR, Cisco systems recommends that two redundant DRPs be installed and assigned to the SDR. &lt;br&gt;Note DRPs can also be added to an SDR to provide additional processing capacity. See Related Topics for more information on DRP installation and configuration.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>location partially-qualified-nodeid &lt;br&gt;<strong>Example:</strong> &lt;br&gt;RP/0/RP0/CPU0:router(admin-config-pairing:drp1)# location 0/3/* 0/4/*</td>
</tr>
<tr>
<td></td>
<td>(Optional) Specifies the location of the DRPs in a DRP pair. &lt;br&gt;The partially-qualified-nodeid argument is entered in the rack/slot/* notation. Node IDs are always specified at the slot level, so the wildcard (*) is used to specify the CPU.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>exit &lt;br&gt;<strong>Example:</strong> &lt;br&gt;RP/0/RP0/CPU0:router(admin-config-pairing:drp1)# exit</td>
</tr>
<tr>
<td></td>
<td>(Optional) Exits the DRP pairing configuration mode and returns to Administration configuration mode. &lt;br&gt;Complete this step only if you created a DRP pair.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>sdr sdr-name &lt;br&gt;<strong>Example:</strong> &lt;br&gt;RP/0/RP0/CPU0:router(admin-config)# sdr rname</td>
</tr>
<tr>
<td></td>
<td>Enters the SDR configuration sub-mode for the specified SDR. &lt;br&gt;• If this SDR does not yet exist, it is created when you add a node, as described in step 7. &lt;br&gt;• If this SDR existed previously, you can add additional slots as described in step 7 and step 8. &lt;br&gt;• Only alphanumeric characters, &quot;,&quot;, and &quot;_&quot; are valid characters to include in the sdr-name argument.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>Do one of the following: &lt;br&gt;• pair pair-name primary &lt;br&gt;• location partially-qualified-nodeid primary &lt;br&gt;<strong>Example:</strong></td>
</tr>
<tr>
<td></td>
<td>Specifies a DSDRSC for the non-owner SDR. You can assign a redundant DRP pair, an RP pair, or a single DRP as the DSDRSC. You cannot assign a single RP as the DSDRSC. Every SDR must contain a DSDRSC. &lt;br&gt;• We recommend the use of DRP pairs as the DSDRSC for all non-owner SDRs.</td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>RP/0/RP0/CPU0:router (admin-config-sdr:rname) # pair drp1 primary or RP/0/RP0/CPU0:router (admin-config-sdr:rname) # location 0/0/* primary or RP/0/RP0/CPU0:router (admin-config-sdr:rname) # location 0/RP/<em>/</em> primary</td>
<td>• The <strong>primary</strong> keyword configures the RPs, DRP pair, or DRP as the DSDRSC. If the <strong>primary</strong> keyword is not used, the node is assigned to the SDR, but it is not be the DSDRSC. • If an RP is already assigned to the SDR, it must be removed before a DRP or DRP pair can be assigned as the DSDRSC.</td>
</tr>
</tbody>
</table>

### Step 8

Do one of the following:

- **location** partially-qualified-nodeid
- **location** pair-name

**Example:**

RP/0/RP0/CPU0:router (admin-config-sdr:rname) # location 0/0/* or RP/0/RP0/CPU0:router (admin-config-sdr:rname) # location drp1 or RP/0/RP0/CPU0:router (admin-config-sdr:rname) # location 0/RP/*/*

Adds additional nodes, DRP pairs, or RP pairs to the SDR.

### Step 9

Repeat **Step 8**, on page 12 as needed to add nodes to an SDR.

Adds additional nodes to the SDR.

### Step 10

**exit**

**Example:**

RP/0/RP0/CPU0:router (admin-config-sdr:rname) # exit

(Optional) Exits the SDR configuration submode and returns to Administration configuration mode.

**Note** Complete this step only if you need to create additional SDRs.

### Step 11

Repeat **Step 3**, on page 11 through **Step 10**, on page 12 through as needed.

Creates additional SDRs.

### Step 12

**commit**

### Step 13

Create a username and password for the new SDR.
Adding Nodes to a Non-Owner SDR

When adding nodes to an existing non-owner SDR, the following rules apply:

- By default, all nodes in a new system belong to the owner SDR. When a node is assigned to a non-owner SDR, the node is removed from the owner SDR inventory and added to the non-owner SDR.
- When a node is removed from a non-owner SDR, it is automatically returned to the owner SDR inventory.
- To add a node that already belongs to another non-owner SDR, you must first remove the node from the other SDR, and then reassign it to the new SDR.
- You cannot assign the DSC or standby DSC to a non-owner SDR. The DSC and standby DSC can not be removed and assigned to a non-owner SDR.
- Note the following points about DSDRSC support:
  - DRPs and DRP pairs are supported.
  - RPs can only be added in redundant pairs.

Adding Nodes to an SDR

This task explains how add nodes to an SDR.

SUMMARY STEPS

1. admin
2. configure
3. sdr sdr-name
4. Do one of the following:
   - location partially-qualified-nodeid
   - location pair-name
5. Use one of the following commands:
   - end
   - commit

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>

<td>• Entering <strong>yes</strong> saves configuration changes to the running configuration file, exits the configuration session, and returns the router to EXEC mode.</td>
<td></td>
</tr>
<tr>
<td>• Entering <strong>no</strong> exits the configuration session and returns the router to EXEC mode without committing the configuration changes.</td>
<td></td>
</tr>
<tr>
<td>• Entering <strong>cancel</strong> leaves the router in the current configuration session without exiting or committing the configuration changes.</td>
<td></td>
</tr>
</tbody>
</table>
Removing Nodes and SDRs

When removing a node or an entire SDR, the following rules apply:

- When a node is removed from a non-owner SDR, it is automatically returned to the owner SDR inventory.
- To remove a DSDRSC, first remove the other nodes in the SDR and then remove the DSDRSC. This rule does not apply when the entire SDR is removed.
- If all nodes are removed from a non-owner SDR, the SDR name is also removed.
- To remove all nodes, including the DSDRSC, remove the SDR name. All nodes are returned to the owner SDR inventory.
- You must first remove a node from a non-owner SDR before it can be reassigned to another non-owner SDR.
- To remove a node from the owner SDR inventory, assign the node to a non-owner SDR.
- The owner SDR cannot be removed, and the owner DSDRSC (DSC) cannot be removed.

Removing Nodes from an SDR

This task explains how remove nodes from an SDR.

**SUMMARY STEPS**

1. `admin`
2. `configure`
3. `sdr sdr-name`
4. Do one of the following:
   - `no location partially-qualified-nodeid`
   - `no location pair-name`
5. Use one of the following commands:
   - `end`
   - `commit`
## DETAILED STEPS

<table>

</tbody>
</table>

- When a node is removed from an SDR, it is automatically added to the owner SDR inventory. This node may now be assigned to a different SDR, as described in Adding Nodes to a Non-Owner SDR, on page 13.
- Removing all the slots from an SDR deletes that SDR.

- When you issue the **commit** command, the system prompts you to commit changes:

  Uncommitted changes found, commit them before exiting(yes/no/cancel)? [cancel]:

  * Entering yes saves configuration changes to the running configuration file, exits the configuration session, and returns the router to EXEC mode.
  * Entering no exits the configuration session and returns the router to EXEC mode without committing the configuration changes.
Removing an SDR

This section provides instructions to remove a secure domain router from your router. To remove an SDR, you can either remove all the nodes in the SDR individually or remove the SDR name. This section contains instructions to remove the SDR name and return all nodes to the owner SDR inventory.

SUMMARY STEPS

1. admin
2. configure
3. no sdr sdr-name
4. commit

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>

</tbody>
</table>
### Configuring a Username and Password for a Non-Owner SDR

After you create an SDR, you can create a username and password on that SDR. When you assign root-lr privileges to that username, the user can administer the non-owner SDR and create additional users if necessary.

**Note**

Only users with root-system privileges can access administration modes to add or remove SDRs. SDR users cannot add or remove SDRs.

To create a username and password for the new non-owner SDR.

1. On the owner SDR, enable admin plane authentication. This allows you to log in to the non-owner SDR and create local usernames and passwords.
2. Log in to the non-owner SDR.
3. Configure a new username and password on the non-owner SDR. Assign the username to the root-lr group to allow the creation of additional usernames on that SDR.
4. To verify the new username, log out and log back in to the non-owner SDR using the new username and password.
5. Provide the username and password to the SDR user.

Complete the following steps to create usernames and passwords on a non-owner SDR.

### Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>RP/0/RP0/CPU0:router(admin-config)# no sdr name</td>
<td></td>
</tr>
</tbody>
</table>
SUMMARY STEPS

1. Connect a terminal to the console port of the DSC (DSDRSC of the owner SDR).
2. `admin`
3. `configure`
4. `aaa authentication login remote local`
5. `commit`
6. Connect a terminal to the console port of the non-owner SDR DSDRSC.
7. Log in to the non-owner SDR using admin plane authentication.
8. `configure`
9. `username username`
10. `secret password`
11. `group root-lr`
12. `commit`
13. `exit`
14. Log back in with the SDR administrator username and password you created.
15. Provide the new username and password to the user.

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Connect a terminal to the console port of the DSC (DSDRSC of the owner SDR). Note: If an IP address has not yet been assigned to the Management Ethernet port, you must connect a terminal directly to the console port of the DSC.</td>
</tr>
<tr>
<td><code>admin</code></td>
<td>Enters administration EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td><code>RP/0/RP0/CPU0:router# admin</code></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters administration configuration mode.</td>
</tr>
<tr>
<td><code>configure</code></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td><code>RP/0/RP0/CPU0:router(admin)# configure</code></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Enables admin plane authentication.</td>
</tr>
<tr>
<td><code>aaa authentication login remote local</code></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td><code>RP/0/RP0/CPU0:router(admin-config)# aaa authentication login remote local</code></td>
</tr>
</tbody>
</table>

- The `remote` keyword specifies a method list that uses remote non-owner SDR for authentication.
- The `local` keyword specifies a method list that uses the local username database method for authentication. The local authentication cannot fail because the system always ensures that at least one user is present in the local database, and a rollover cannot happen beyond the local method.
### Command or Action | Purpose
---|---
**Note** You can also use other methods to enable AAA system accounting, such as TACACS+ or RADIUS servers. See the Configuring AAA Services on the Cisco IOS XR Software module of Cisco IOS XR System Security Configuration Guide for the Cisco CRS Router for more information.
**Note** When logged into a non-owner SDR using admin plane authentication, the admin configuration is displayed. However, admin plane authentication should only be used to configure a username and password for the non-owner SDR. To perform additional configuration tasks, log in with the username for the non-owner SDR, as described in the following steps.

**Step 5** commit

**Step 6** Connect a terminal to the console port of the non-owner SDR DSDRSC.

**Step 7** Log in to the non-owner SDR using admin plane authentication.

**Example:**
Username:xxxx@admin
Password:pppp

**Step 8** configure

**Step 9** username username

**Example:**
RP/0/RP0/CPU0:router(config)# username user1

**Step 10** secret password

**Example:**
RP/0/RP0/CPU0:router(config-un)# secret 5 XXXX

**Step 11** group root-lr

**Example:**
RP/0/RP0/CPU0:router(config-un)# group root-lr

**Step 12** commit

**Step 13** exit

**Example:**
RP/0/RP0/CPU0:router# exit
Purpose

**Command or Action**

**Step 14** Log back in with the SDR administrator username and password you created.

*Example:*
Press RETURN to get started.
Username:xxxx
Password:ppppp

Logs back in with the SDR administrator username and password you created. This username is used to configure the secure domain router and create other users with fewer privileges.

- This step verifies proper SDR administrator username and password configuration.
- After you create the SDR username and password, you need to provide the SDR username and password to the operators who will use that SDR.

**Step 15** Provide the new username and password to the user.

—

**Step 16** Disable admin plane authentication.

See *Related Topics* for more information.

### Disabling Remote Login for SDRs

When you disable admin plane authentication, the admin username cannot be used to log in to non-owner SDRs. Only local SDR usernames can be used to log into the SDR.

**SUMMARY STEPS**

1. admin
2. configure
3. no aaa authentication login remote local
4. commit

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> admin</td>
<td>Enters administration EXEC mode.</td>
</tr>
<tr>
<td>Example: RP/0/RP0/CPU0:router# admin</td>

<tr>
<td><strong>Step 2</strong> configure</td>
<td>Enters administration configuration mode.</td>
</tr>
<tr>
<td>Example: RP/0/RP0/CPU0:router/admin# configure</td>
<td></td>
</tr>
</tbody>
</table>
### Step 3

**Command or Action:**

```
no aaa authentication login remote local
```

**Purpose:** Disables remote login.

**Example:**

```
RP/0/RP0/CPU0:router(admin-config)# no aaa authentication login remote local
```

### Step 4

**Command or Action:**

```
commit
```

---

## Configuration Examples for Secure Domain Routers

### Creating a New SDR: Example

The following example shows how to create a new SDR:

```
admin
    configure
        pairing drp1
            location 0/3/* 0/4/*
        exit
    sdr rname2
        pair pair1 primary
            location 0/0/*
        end
```

### Adding Nodes to an SDR: Example

The following example shows how to add nodes to an SDR:

```
admin
    configure
        sdr rname2
            location 0/0/*
        end
```

### Removing Notes from an SDR: Example

The following example shows how to remove nodes from an SDR:

```
admin
    configure
        sdr rname2
            no location 0/0/*
        end
```
Removing an SDR from the Router: Example

The following example shows how to remove an SDR from the router:

```
admin
  configure
  no sdr rname2
  end
```

Configuring a Username and Password for a Non-Owner SDR: Example

The following example shows how to connect to the DSC of the owner SDR:

```
admin
  configure
  aaa authentication login remote local
  end
```

To continue, connect a terminal to the console port of the non-owner SDR DSDRSC.

Username:xxxx@admin
Password:xxxx

```
configure
  username user1
  secret 5 XXXX
  group root-lr
  end
  exit
```

Press RETURN to get started.
Username:user1
Password:xxxxx

Disabling Remote Login for SDRs: Example

The following example shows how to disable remote login for an SDR:

```
admin
  configure
  no aaa authentication login remote local
  end
```

Upgrading and Managing Cisco IOS XR Software

The Cisco IOS XR software is divided into software packages so that you can select which features run on your router. This module describes the concepts and tasks necessary to add feature packages, upgrade the active set of packages, roll back to a previously active set of packages, and perform other related package management tasks.

For complete descriptions of the commands listed in this module, see Related Documents, on page 80. To locate documentation for other commands that might appear in the course of performing a configuration task, search online in Cisco IOS XR Commands Master List for the Cisco CRS Router.

</table>
| Release 3.7.0 | Support was added for activating software packages by specifying the operation ID of the `install add` command operation that added the packages. Simultaneous activation of multiple SMUs was streamlined to minimize disruption, with fewer cases requiring reloads. The `install verify packages` command was enhanced so that it checks for corruptions of installation state files and MBI image files as well as software files. Support was added for the following commands:  
  - `install boot-options`  
  - `clear boot-options`  
  - `show boot-options`                                                                                                                                                                                                                                                                                                                                 |
| Release 3.8.0 | Support was added for the `pause sw-change` keywords in the following commands:  
  - `install activate`  
  - `install add`  
  - `install deactivate`  
  - `install rollback`                                                                                                                                                                                                                                                                                                                                 |
| Release 4.0.0 | A procedure to upgrade software from Cisco IOS XR Release 3.x was introduced. See Upgrading to Cisco IOS XR Software Release 4.0, on page 65. Support for installation commands was removed from EXEC mode. The ability to install software on a specific SDR was removed.                                                                                                                                                                                                                     |

This module contains the following topics:

- Overview of Cisco IOS XR Software Packages, page 28
- Information About Package Management, page 33
- Package Management Procedures, page 43
- Rolling Back to a Previous Software Set, page 77
- Additional References, page 79

Overview of Cisco IOS XR Software Packages

Cisco IOS XR software is divided into software packages so that you can select which features run on your router. Each package contains the components to perform a specific set of router functions, such as routing, security, or modular services card (MSC) support. Bundles are groups of packages that can be downloaded as a set. For example, Cisco IOS XR Unicast Routing Core Bundle (known as mini) provides the main packages for use on every router.
Adding a package to the router does not affect the operation of the router—it only copies the package files to a local storage device on the router, known as the boot device (such as the internal flash disk0:). To make the package functional on the router, you must activate it for one or more cards.

To upgrade a package, you activate a newer version of the package. When the automatic compatibility checks have been passed, the new version is activated, and the old version is deactivated.

---

**Note**  
Activating a software maintenance upgrade (SMU) does not cause any earlier SMUs or the package to which the SMU applies to be automatically deactivated.

---

To downgrade a package, you activate an older version of the package. When the automatic compatibility checks have been passed, the older version is activated, and the newer version is deactivated.

---

**Note**  
For more information on the features and components included in each package, refer to the release notes.

---

### Package Installation Envelopes

Package Installation Envelopes (PIEs) are nonbootable files that contain a single package or a set of packages (called a composite package or bundle). Because the files are nonbootable, they are used to add software package files to a running router.

PIE files have a .pie extension. When a PIE file contains software for a specific bug fix, it is called a software maintenance upgrade (SMU).

---

**Note**  
Files with the .vm extension are bootable installation files used only to replace all current Cisco IOS XR software. These files are installed from ROM Monitor mode, which causes significant router downtime. Cisco Systems recommends installing or upgrading software packages only using PIE files as described in this document. For more information on .vm files, see Cisco IOS XR ROM Monitor Guide for the Cisco CRS Router.

---

### Summary of Cisco IOS XR Software Packages

Every router includes a basic set of required packages contained in the Cisco IOS XR Unicast Routing Core Bundle. Additional optional packages can be added and activated on the router to provide specific features.

---

### Packages in the Cisco IOS XR Unicast Routing Core Bundle

The packages contained in the Cisco IOS XR Unicast Routing Core Bundle are as follows:

- Operating system (OS) and minimum boot image (MBI)—Kernel, file system, memory management, and other slow changing core components.

- Base—Interface manager, system database, checkpoint services, configuration management, other slow-changing components.
**Software Maintenance Upgrades**

A software maintenance upgrade (SMU) is a PIE file that contains fixes for a specific defect. A composite SMU is a PIE file that contains SMUs for more than one package. SMUs are added and activated using the same procedures as other PIE files. SMUs are created to respond to immediate issues and do not include new features. Typically, SMUs do not have a large impact on router operations. SMU versions are synchronized to the package major, minor, and maintenance versions they upgrade.

The affect of an SMU depends on its type:

- **Process Restart SMU** — Causes a process or group of processes to restart on activation.
- **Reload SMU** — Causes a parallel reload (of RPs and line cards).

SMUs are not an alternative to maintenance releases. They provide quick resolution of immediate issues. All bugs fixed by SMUs are integrated into the maintenance releases. For information on available SMUs, contact Cisco Technical Support, as described in *Obtaining Technical Assistance* in the monthly *What’s New in Cisco Product Documentation*.

**Note**

Activating a software maintenance upgrade (SMU) does not cause any earlier SMUs, or the package to which the SMU applies, to be automatically deactivated.

---

**PIE Filenames and Version Numbers**

PIE filenames have two formats: one for composite-package PIEs (bundles) and one for single-package PIEs. A *composite-package file* is a PIE file that contains multiple packages.

**Note**

Hyphens in the filename are part of the filename.

*Table 4: PIE Filenames,* on page 30 shows the filenames for available PIE types.

**Table 4: PIE Filenames**

### Component

<table>
<thead>
<tr>
<th>Component</th>
<th>Description</th>
</tr>
</thead>
</table>
| **major** | Identifies the major release of this package.  
- A major release occurs when there is a major architectural change to the product (for example, a major new capability is introduced).  
- All packages operating on the router must be at the same major release level.  
- A major release is the least frequent release and may require a router reboot. |
| **minor** | Identifies the minor release of this package.  
- A minor release contains one or more of the following:  
  - New features  
  - Bug fixes  
- The minor release version does not have to be identical for all software packages operating on the router, but the operating packages must be certified by Cisco as compatible with each other.  
- A minor release may require a router reboot. |
| **maintenance** | Identifies the maintenance release of this package.  
- A maintenance release contains a collection of bug fixes for a package.  
- The maintenance release version does not have to be identical for all software packages operating on the router, but the major and minor versions of the maintenance release must match those of the package being updated.  
- A maintenance release does not usually require a router reboot. |
| **ddts** | SMUs only. Identifies a DDTS number that describes the problem this SMU addresses.  
DDTS is the method used to track known bugs and the resolutions or workarounds for those issues. |
In Cisco IOS XR Software Release 4.0, the software packages were reorganized into functionally well-defined and independently-releasable packages that support the hardware with the PPC architecture. These reorganized packages are identified by the -p in the filename. These packages are not compatible with packages released prior to Release 4.0. When upgrading to Release 4.0 or above, special upgrade instructions must be followed.

Copying the PIE File to a Local Storage Device or Network Server

To add an optional package or upgrade or downgrade a package, you must copy the appropriate PIE file to a local storage device or to a network file server to which the router has access.

If you need to store PIE files on the router, we recommended storing PIE files on the hard disk. Flash disk0: serves as the boot device for packages that have been added or activated on the system. Flash disk1: is used as a backup for disk0:.

Tip

Before copying PIE files to a local storage device, use the dir command to check to see if the required PIE files are already on the device.

Information About Package Management

Summary of Package Management

The general procedure for adding optional packages, upgrading a package or package set, or downgrading packages on the router is as follows:

1. Copy the package file or files to a local storage device or file server.
2. Add the package or packages on the router using the command install add.
3. Activate the package or packages on the router using the install activate command.
4. Commit the current set of packages using the install commit command.
Adding Packages

Use the `install add` command to unpack the package software files from a PIE file and copy them to the boot device (usually disk0:) of your router.

From administration EXEC mode, the package software files are added to the boot device of the designated secure domain router system controller (DSDRSC) for all SDRs on the router, as well as all active and standby Route Processors (RPs), DRPs and fabric shelf controllers (SCs) installed on the router.

**Note**
The disk that holds the unpacked software files is also known as the `boot device`. By default, flash disk0: is used as the boot device. To use an alternate storage device, such as flash disk1:, see the *Router Recovery with ROM Monitor* module of *Cisco IOS XR ROM Monitor Guide for the Cisco CRS Router*. Remember that all RPs in a system must use the same boot device. If the boot device on the primary RP is flash disk0:, then the standby RP or DRP must also have a flash disk0:.

Activating Packages

Software packages remain inactive until activated with the `install activate` command.

After a package has been added to the router, use the `install activate` command to activate the package or SMUs for all valid cards. Information within the package is used to verify compatibility with the target cards and with the other active software. Actual activation is performed only after the package compatibility and application programming interface (API) compatibility checks have been passed.

Activating a Package on the Router

To activate a package on your router, use the `install activate` command in administration EXEC mode. The `install activate` command also activates the package on all administration plane nodes and resources, including service processors (SPs), fabric SCs, fan controllers, alarm modules, and power modules.
To enter administration EXEC mode, you must be logged in to the owner secure domain router (SDR) and have root-system access privileges.

**Activating Multiple Packages or SMUs**

To install multiple packages or software maintenance upgrades (SMUs) with a single command, use the `install activate` command and either specify up to 16 packages by repeating `device: package` arguments or use wildcard syntax to specify multiple packages. Some SMUs may require a reload. If the operation requires a node reload, the user is prompted before the installation operation occurs.

For considerations related to activating multiple SMUs that use in-service software upgrades (ISSU), refer to the ISSU sections.

**Activating All Packages Added in a Specific Operation**

To install all packages that were added in a specific `install add` operation, use the `install activate` command with the `id add-id` keyword and argument, specifying the operation ID of the `install add` operation. You can specify up to 16 operations in a single command.

**Adding and Activating a Package with a Single Command**

To add and activate a package with a single command, use the `install add` command with the `activate` keyword from administration EXEC mode.

**Upgrading and Downgrading Packages**

To upgrade a package, activate the latest version of the package; the previous version is automatically deactivated. To downgrade a package, activate the previous version of the package; the latest version is automatically deactivated.

Actual activation is performed only after compatibility checks have been passed.

**Committing the Active Software Set**

When a package is activated on the router, it becomes part of the current running configuration for those SDRs. To make the package activation persistent across reloads, enter the `install commit` command in administration EXEC mode. On startup, the designated secure domain router shelf controller (DSDRSC) of the secure domain router (SDR) loads the committed software set.
If the system is restarted before the active software set is saved with the `install commit` command, the previously committed software set is used.

---

**Rolling Back to a Previous Installation Operation**

Although the term *commit* sounds final, the Cisco IOS XR software provides the flexibility to roll back the selected package set to previously saved package sets. Each time a package is activated or deactivated, a rollback point is created that defines the package set that is active after the package activation or deactivation. The software also creates a rollback point for the last committed package set. If you find that you prefer a previous package set over the currently active package set, you can use the `install rollback` command to make a previously active package set active again.

**Related Topics**

- Rolling Back to a Previous Software Set, on page 77

---

**Multiple Disks Support during Installations**

In installations on platforms where Cisco IOS XR Software is supported, only a single disk is used as an install device; that is, either disk0 or disk1. When multiple packages are installed on a single disk, it results in space constraints. To resolve this space limitation, the disk supported for the install operations has been extended to another disk called the disk1. When installing multiple packages, this feature enables you to choose between disk0 and disk1.

To add packages to a specific disk name, use the `install media` command in the admin configuration mode.

```
RP/0/RSP0/CPU0: router (admin) # install media disk1
```

**Restrictions**

- Before enabling the addition of disk1 through the `install media` command, the disk mirroring feature should be explicitly disabled. For details regarding disk mirroring, see the Disk Mirroring chapter.
- All single version packages should be installed into one disk; that is, either disk0 or disk1.
- When downgrading to an image that does not support extended disk, the rollback points of the extended disk will not be available on the downgraded image. For example, assume a case where the version1 (V1) image does not support the extended disk functionality and version2 (V2) image supports the functionality. Upgrading from V1(disk0) to V2(disk1), in such a case, makes the rollback points of V1 available on V2. However, when downgrading from V2(disk1) to V1(disk0), the rollback points of V2 will not be available on V1. For more information about the rollback feature and rollback points, see the Upgrading and Managing Software chapter.
- In-Service Software Upgrade (ISSU) is not supported across multiple disks.
Deactivation of fully superseded SMUs

Cisco IOS XR Software will accumulate a set of Software Maintenance Upgrades (SMUs) over time, where an older SMU gets superseded by the latest SMU. For example, if SMU A was initially delivered to you, and subsequently, as a result of a bug resolution, SMU B was delivered, then SMU A becomes the subset of SMU B and SMU A is superseded by SMU B. In this case, SMU A is redundant and can be deactivated to clean up the software package.

To deactivate all the fully superseded SMUs, use the `install deactivate superseded` command in the admin mode.

```
RP/0/RSP0/CPU0: router(admin) # install deactivate superseded
```

To display the details of the SMUs that are superseded, use the `show install superseded` command in the EXEC mode.

```
RP/0/RSP0/CPU0: router # show install superseded
Thu Feb 3 17:37:20.379 UTC
disk0:asr9k-px-4.3.0.CSCud93518-1.0.0 is fully superseded by
disk0:asr9k-px-4.3.0.CSCue23747-1.0.0
```

Support for the Ignore Package Presence Check Option

During any software package upgrade in Cisco IOS XR Software, two versions of the packages get stored, both the previous version and the upgraded version. In Route Switch Processor 2 (RSP2), the disk space is insufficient to hold all packages of these two versions. To address this, a new optional keyword, `ignore-pkg-presence-check`, is added to the `install activate` command, which allows upgrading with lesser number of packages. For example, assume a case where version1 (V1) of the software consists of packages A, B, C, and D, and you want to upgrade to the version2 (V2) with only 3 packages (A, B, and C). The ignore-pkg-presence-check option allows only packages A, B, and C to be upgraded to V2 and deactivates package D of V1. Thus, an explicit deactivation of package D is not required and the user can add package D of V1 after upgrading to V2.

To upgrade software with lesser number of packages, use the `install activate [ignore-pkg-presence-check]` command in the admin mode.

```
RP/0/RSP0/CPU0: router@admin) # install activate [ignore-pkg-presence-check] V2 packages
```

Restrictions

The restrictions for this option are:

- The ignore-pkg-presence-check keyword is supported only with the `install activate` command and is not supported with the `install add activate` command.
- When you upgrade using the ignore-pkg-presence-check option, the deactivation of packages always happens synchronously, using the synchronous keyword in the `install deactivate` command.

Managing Software Packages in a Multishelf System

Software operations in a multishelf system are the same as in a single-shelf system: software packages are added and activated on the router from administration EXEC mode. The DSC keeps track of software operations for the entire system, while the DSDDRC of each SDR manages the software operations for that specific SDR. The software packages and related configurations are synchronized throughout a multishelf system by the designated shelf controller (DSC), using the Ethernet control network, as shown in Figure 2: DSC in a...
CRS-1/M-F1 Multishelf System, on page 38. The DSC maintains an inventory of the packages, versions, and configurations for each node in the system.

Note

Whenever a new chassis or node is added to the system, the DSC verifies that the software configuration for that chassis is correct and downloads any required packages and configurations. The active RP in each chassis then distributes and manages the software and configurations for the cards and equipment in that chassis.

Figure 2: DSC in a CRS-1/M-F1 Multishelf System

Default Software Profile for New SDRs

When a new non-owner SDR is created, the nodes assigned to that SDR are activated with the default software profile. The default profile is the active software set for the owner SDR. The owner SDR is the default SDR accessed by logging into the DSC of the system.

To view the default software profile, use the show install active summary command in administration EXEC mode. Any new nodes that are configured to become a part of an SDR will boot with the default software profile listed in the output of this command.

```
RP/0/RP0/CPU0:router(admin)# show install active summary

Default Profile:
SDRs:
```
Upgrading Packages

To upgrade a package that is currently active on your SDR, add and activate a newer version of the same package (see Figure 3: Example of a Maintenance Release Package Upgrade, on page 39). The older version of the software package is deactivated automatically. These actions are permitted only after the package compatibility checks and API version compatibility checks have been passed.

Deactivated packages are not removed from the router. To remove inactive package files, use the `install remove` command.

Caution
Upgrading or downgrading a software package can cause a process to restart or a new process to start. Use the `test` option to preview the impact of the package activation.

Figure 3: Example of a Maintenance Release Package Upgrade

```
+----------------+   +----------------+
| MPLS 2.0.0     | -> | MPLS 2.0.0     |
| Routing 2.0.0  |   | Routing 2.0.1  |
| Forwarding 2.0.0|   | Forwarding 2.0.0|
| Base 2.0.0     |   | Base 2.0.0     |
```

Downgrading Packages

To downgrade a software package, activate an older version on one or more cards for which that package is already active. The newer version of the same software package is deactivated automatically. These actions are performed only after the package compatibility checks and API version compatibility checks have been passed.

Deactivated packages are not removed from the router. To remove inactive package files, use the `install remove` command. See the Related Topics section for links to more information.
Downgrading to Cisco IOS XR Software Release 3.7.0 or earlier releases is not supported if you are using a FAT32 flash disk. If you are using a FAT32 flash disk, and you must downgrade, convert the flash disk to FAT16 before downgrading. If you do not convert the flash disk to FAT16 before the downgrade, the disk becomes unreadable and the router does not boot. Converting from FAT32 to FAT16 is a complex procedure. If you need to convert a FAT32 disk to FAT16, contact Cisco technical support for guidance.

**Note**

**Related Topics**

- Deactivating and Removing Cisco IOS XR Software Packages, on page 71

### Impact of Package Version Changes

Each package version change has a different impact on the operation of the router, depending on the type of package and whether the upgrade is for a major, minor, or maintenance release. The following resources can provide more information on the impact of a package version change:

- See Related Topics for more information on the typical impact for major, minor, and maintenance releases.
- For specific information about the impact of an upgrade, consult the release notes for the package release, and test the impact of the package activation by adding the test option to the `install activate` command.
- The Cisco IOS XR Software Selector tool also contains information on package version compatibility.

**Related Topics**

- PIE Filenames and Version Numbers, on page 30
- Obtaining and Placing Cisco IOS XR Software, on page 45

### Impact of Package Activation and Deactivation

Activation or deactivation of a package can have an immediate impact on the system. The system can be affected in the following ways:

- When a new package is activated, any new CLI commands for the package are added to the SDRs impacted by the new software. The router need not be restarted or reloaded.
- When a package is deactivated, the commands associated with the features being deactivated are removed from any SDR impacted by the operation. The commands are no longer available to the user.
- During a software package deactivation, upgrade, or downgrade, any incompatible configurations are removed from the running configuration of any SDR impacted by the operation, and saved to a file. Messages for incompatible configurations are displayed. Incompatible configurations are those configurations that are not supported by the new version of the software package.

**Note**

You must address any issues that result from the revised configuration and reapply the configuration, if necessary.
• New processes may be started.
• Running processes may be stopped or restarted.
• All processes in the cards may be restarted. Restarting processes in the cards is equivalent to a soft reset.
• The cards may reload.
• No impact: no processes in the card may be affected.

Tip
When activating and deactivating packages, use the **test** option to test the effects of a command without impacting the running system. After the activation or deactivation process completes, enter the **show install log** command to display the process results.

### Delaying the Return of the CLI Prompt

By default, the CLI prompt is returned to the screen before the installation operation is complete, which allows you to enter other commands that are not installation commands. If additional installation requests are attempted before the first operation is complete, they are not run.

To delay the return of the CLI prompt until an installation operation is complete, enter the **install** command with the **synchronous** keyword. For example:

```
install add disk1:pie-file synchronous
install activate disk0:package synchronous
```

To determine if an **install** command is currently running, enter the **show install request** command.

### Displaying Installation Log Information

The install log provides information on the history of the installation operations. Each time an installation operation is run, a number is assigned to that operation.

• Use the **show install log** command to display information about both successful and failed installation operations.

• The **show install log** command with no arguments displays a summary of all installation operations. Specify the **request-id** argument to display information specific to an operation. Use the **detail** or **verbose** keywords to display details for specific operation.

• Use the **detail** or **verbose** keywords to display detailed information, including file changes, nodes that could be reloaded, impact to processes, and impact to Dynamic Link Libraries (DLLs).

Tip
By default, the install log stores up to 50 entries. Use the **clear install log-history** command to reset the number of entries to any value from 0 to 255.
### Examples

#### Displaying Install Log Entries: Example

The following example displays information for the install requests. Use the `verbose` keyword to display detailed information, including files changes, impact to processes, and impact to DLLs.

```
RP/0/RP0/CPU0:router(admin)# show install log verbose

Install operation 1 started by user 'labuser' at 17:48:51 UTC Sat Jun 03 2006.

### Package Management Procedures

Review the concepts about package management before performing the tasks described in this module.

**Related Topics**

- Information About Package Management, on page 33
Activation and Deactivation Prerequisites

These prerequisites must be met for a package to be activated or deactivated:

- You must be in a user group associated with a task group that includes the proper task IDs. The command reference guides include the task IDs required for each command. If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

- Verify that all cards are installed and operating properly. For example, do not activate or deactivate packages while cards are booting, while cards are being upgraded or replaced, or when you anticipate an automatic switchover activity.

- If a ROM Monitor upgrade is required for the software package, the upgrade must be completed before the package is activated. For ROM Monitor upgrade information and procedures, see Cisco IOS XR ROM Monitor Guide for the Cisco CRS Router.

- Check the sanity of the configuration file system and recover from any internal inconsistencies by using the `cfs check` command.

```
RP/0/RP0/CPU0:router# cfs check
Tue Sep 20 07:22:03.374 DST
Creating any missing directories in Configuration File system...OK
Initializing Configuration Version Manager...OK
Syncing commit database with running configuration...OK
```

- Clear any inconsistency alarms and remove any failed configurations using the `clear configuration inconsistency` command.

An inconsistency alarm is set when there is a failure to restore the configuration; this can occur during router startup, or when a line card, modular services card (MSC), or route processor (RP) card is inserted or removed. If an inconsistency alarm is set, a message similar to the one in this example is displayed:

```
RP/0/0/CPU0:May 26 11:58:40.662 : cfgmgr-rp[130]: %MGBL-CONFIGCLI-3
       BATCH_CONFIG_FAIL : 28 config(s) failed during startup. To view
       failed config(s) use the command - "show configuration failed startup"
```

When the inconsistency alarm is set, all configuration commit operations fail until the alarm is cleared.

- Although more than one version of a software package can be added to a storage device, only one version of a package can be active for any card.

- Some packages require the activation or deactivation of other packages.

- The package being activated must be compatible with the current active software set.

Activation is performed only after the package compatibility checks and API version compatibility checks have been passed. If a conflict is found, an on-screen error message is displayed.

While a software package is being activated, other requests are not allowed to run on any of the impacted nodes. Package activation is completed when a message similar to this one appears:

```
Install operation 2 completed successfully at 20:30:29 UTC Mon Nov 14 2005.
```

Each CLI install request is assigned a request ID, which can be used later to review the events.
Obtaining and Placing Cisco IOS XR Software

This section contains information to locate the available software packages and to transfer them either to a local storage device or to a network server. When this is done, the package or packages can be added and activated on the router.

There are two primary ways to obtain packages in Cisco IOS XR software:

- Request the software from Cisco on a flash disk that you can insert into the removable flash disk slot (usually flash disk1:). Flash disk1: is optional. When it is installed, flash disk1: can be used to store PIE files, which can then be used to add new software to the boot device (usually flash disk0:).
- Download the Cisco IOS XR software packages to a local storage device of the DSC, such as flash disk1:, or to a remote server, such as a tftp or rcp server.

The boot device is the local disk on the DSC where Cisco IOS XR software is added and activated. PIE files should not be stored on this boot device. The default boot device is disk0:. All PIE files should be stored on flash disk1:.

Transferring Installation Files from a Network File Server to a Local Storage Device

If the Cisco IOS XR software PIE files are located on a remote TFTP, FTP, SFTP, or rcp server, you can copy the files to a local storage device such as disk1:. When the PIE files are located on a local storage device, the software packages can be added and activated on the router from that storage device. Table 6: Download Protocols Supported by Cisco IOS XR Software, on page 45 describes the supported server protocols, and the CLI syntax used copy files from each server type to the local storage device.

Tip
Cisco IOS XR software PIE files can also be added to the router boot device directly from the remote server.

Note
Consult your system administrator for the location and availability of your network server.

Table 6: Download Protocols Supported by Cisco IOS XR Software

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Trivial File Transfer Protocol</td>
<td>TFTP allows files to be transferred from one computer to another over a network, usually without the use of client authentication (for example, username and password). It is a simplified version of FTP.</td>
</tr>
<tr>
<td>Note</td>
<td>Some Cisco IOS XR software images may be larger than 32 MB, and the TFTP services provided by some vendors may not support a file this large. If you do not have access to a TFTP server that supports files larger than 32 MB, download the software image using FTP or rcp.</td>
</tr>
</tbody>
</table>
FTP is part of the TCP/IP protocol stack and requires a username and password.

The rcp protocol uses TCP to ensure the reliable delivery of data, and rcp downloads require a usernames.

SFTP is part of the SSHv2 feature in the Security package and provides for secure file transfers. For more information, see the *Cisco IOS XR System Security Configuration Guide for the Cisco CRS Router*.

The router commands listed in Table 7: Commands for Copying Package Files to the Router, on page 46 show how to copy package files to the router using three types of file transfer protocols.

### Table 7: Commands for Copying Package Files to the Router

<table>
<thead>
<tr>
<th>Server Type</th>
<th>Command and Examples</th>
</tr>
</thead>
</table>
| **TFTP**      | The following command syntax is used:  
  
  `copy tftp://hostname_or_ipaddress/directory-path/pie-name disk1:`  
  
  Example:  
  
  `RP/0/RP0/CPU0:router# copy tftp://10.1.1.1/images/comp-hfr-mini.pie disk1:`  |
| **FTP**       | The following command syntax is used:  
  
  `copy ftp://username:password@hostname_or_ipaddress/directory-path/pie-name disk1:`  
  
  Example:  
  
  `RP/0/RP0/CPU0:router# copy ftp://john:secret@10.1.1.1/images/comp-hfr-mini.pie disk1:`  |
| **rcp**       | The following command syntax is used:  
  
  `copy rcp://username@hostname_or_ipaddress/directory-path/pie-name disk1:`  
  
  Example:  
  
  `RP/0/RP0/CPU0:router# copy rcp://john@10.1.1.1/images/comp-hfr-mini.pie disk1:` |
Table 8: Command Variables for Copying and Adding Packages from a Network Server, on page 47 describes the command variables for copying packages from a network server.

### Table 8: Command Variables for Copying and Adding Packages from a Network Server

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostname_or_ipaddress</td>
<td>Host name or IP address of the server that stores the source file.</td>
</tr>
<tr>
<td>pie-name</td>
<td>Name of the PIE file (package). See the Overview of Cisco IOS XR Software Packages, on page 28 for descriptions of the available packages.</td>
</tr>
<tr>
<td>username</td>
<td>Required for FTP and rcp only and must be a valid username on the FTP or rcp server.</td>
</tr>
<tr>
<td>password</td>
<td>Required for FTP only. If a password is not provided, the networking device accepts anonymous FTP.</td>
</tr>
<tr>
<td>directory-path</td>
<td>The specified directory should be a directory under the home directory of the user. In the rcp and FTP examples in Table 7: Commands for Copying Package Files to the Router, on page 46, the file being downloaded is in a subdirectory called &quot;images&quot; in the home directory of the user &quot;john.&quot;</td>
</tr>
</tbody>
</table>

**Note:** For FTP and rcp services, `directory-path` is the directory relative to the `username` home directory. If you want to specify an absolute path for the directory, you must add a "/" following the server address.

When the installation files have been transferred to a network file server or the router, you are ready to activate or upgrade the software.

**Note:** Files with the `vm` extension are bootable installation files used only to replace all current Cisco IOS XR software. These files are installed from ROM monitor mode and cause significant router downtime. We recommend installing or upgrading software packages using PIE files only, as described in this chapter. See Cisco IOS XR ROM Monitor Guide for the Cisco CRS Router for information on installing from `vm` files.

Preparing for Software Installation Operations

This section includes instructions to prepare for software installation operations.

---

**Note**

Activation is performed only after the automatic package compatibility and API version compatibility checks have been passed. If a conflict is found, an on-screen error message is displayed.

---

**Before You Begin**

Before adding or activating Cisco IOS XR software:

- Update the ROM Monitor software, if necessary.
- Determine if a software change is required.
- Verify that the new package is supported on your system. Some software packages require that other packages or package versions be activated, and some packages only support specific cards.
- Review the release notes for important information related to that release and to help determine the package compatibility with your router configuration.
- Verify that the system is stable and prepared for the software changes.

---

**SUMMARY STEPS**

1. admin
2. show diag
3. Update the ROMMON software if necessary.
4. show install active
5. show install pie-info *device:package* [ brief | detail | verbose ]
6. verify packages
7. exit
8. (Optional) show system verify start
9. (Optional) show system verify [ detail | report ]
10. show clock

---

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>admin</td>
<td>Enters administration EXEC mode.</td>
</tr>
</tbody>
</table>

**Examples**

**Verifying That the ROM Monitor Version Is Correct: Example**

In the following example, the ROM Monitor software version is displayed in the “ROMMON:” field for each card.

```
RP/0/RP0/CPU0:router# admin
RP/0/RP0/CPU0:router(admin)# show diag
CARD 0/1/* : Cisco CRS-1 Series Modular Services Card
   MAIN: board type 500060
```

**Note**

For instructions to upgrade the ROM Monitor software, see *Cisco IOS XR ROM Monitor Guide for the Cisco CRS Router*. 
Displaying the Active Software for All SDRs or for a Specific SDR: Example

The following example displays the active packages for all SDRs in the system. Use this information to determine if a software change is required:

```
RP/0/RP1/CPU0:router(admin)# show install active summary
```

**Default Profile:**

**SDRs:**

Owner

CE1b

**Active Packages:**

- disk0:hfr-diags-3.3.30
- disk0:hfr-mgbl-3.3.30
- disk0:hfr-k9sec-3.3.30
- disk0:comp-hfr-mini-3.3.30

The following example displays a summary of active packages for a specific SDR:

```
RP/0/RP1/CPU0:router(admin)# show install active summary sdr owner
```

**Active Packages:**

- disk0:hfr-diags-3.3.30
- disk0:hfr-mgbl-3.3.30
- disk0:hfr-k9sec-3.3.30
- disk0:comp-hfr-mini-3.3.30
Displaying Information About the Contents of a PIE File: Example

In the following example, information is displayed about the manageability PIE. This command displays the expiry date of the package, the cards supported by the package, and other details. Use this information to verify the compatibility of the package with your system and other software packages.

```
A software activation is performed only after the automatic package compatibility and API version compatibility checks have been passed. If a conflict is found, an on-screen error message is displayed.
```

```
RP/0/RP0/CPU0:router(admin)# show install pie-info disk1:/hfr-mgbl-p.pie-3.8.0 detail

Contents of pie file '/disk1:/hfr-mgbl-p.pie-3.8.0':
  Expiry date  : Jan 19, 2007 02:55:56 UTC

**Verifying That the System Clock Is Correct: Example**

The following example displays the current system clock setting:

```
RP/0/RP0/CPU0:router# show clock
02:14:51.474 PST Wed Jan 28 2009
```

**Adding and Activating Packages**

The procedure in this section describes how to upgrade or add Cisco IOS XR software PIE files that are stored on a local storage device, such as a flash disk, or on a remote TFTP, FTP, SFTP, or rcp server. The PIE software file can include any of the following:

- The Cisco IOS XR Unicast Routing Core Bundle (six packages in one composite PIE file)
- Any of the optional packages (one package per PIE file)
- Software maintenance upgrades (SMUs)

When you need to add and activate two or more of the preceding package types, you should add and activate them in the order listed above.
When adding and activating two or more packages, optional packages can be activated together. Also, if the operation is a reload, multiple packages can be activated together. For example, five reload SMUs can be activated together or the Cisco IOS XR Unicast Routing Core Bundle plus the SMUs and optional packages can be activated together.

For a description of the software management process, see the Related Topics section.

These instructions are also used to downgrade software packages.

Note

By default, installation operations are performed asynchronously: the CLI prompt is returned before the operation is complete, allowing the operator to continue work while the installation is completed in the background. Use the synchronous keyword at the end of install commands to delay the return of the CLI prompt until an installation operation is complete. See the Related Topics section for more information.

Before You Begin

Before upgrading or adding packages, verify that these prerequisites have been met:

- Verify that the ROMMON version is correct. For instructions on upgrading ROM Monitor, see Cisco IOS XR ROM Monitor Guide for the Cisco CRS Router.
- All packages to be upgraded or added are present on a local storage device (for example a flash disk), or a network file server.
- Prerequisites for the activation of packages are met as described in the Prerequisites section.
- Complete the procedures described in the Preparing for Software Installation Operations, on page 48 section.

Note

To use the automatic FPD upgrade feature, the fpd auto-upgrade command must be enabled in administration configuration mode.
### SUMMARY STEPS

1. Connect to the console port and log in.
2. (Optional) `dir flash-disk`:
3. `admin`
4. `install add [source source-path | tar] file [activate ]`
5. (Optional) `show install inactive summary`
6. `install activate [id add-id | device package] [test] [location node-id] [pause sw-change] [prompt-level {all | none}] [auto-abort-timer time`
7. Repeat Step 4, on page 56 through Step 6, on page 58 until all packages are activated.
8. (Optional) `show install active summary`
9. (Optional) `install verify packages`
10. (Optional) `exit`
11. (Optional) `show system verify start`
12. `admin`
13. (Optional) `install commit`
14. Upgrade the field-programmable device (FPD) software, if necessary.

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> Connect to the console port and log in.</td>
<td>Establishes a CLI management session with the SDR. Connect to the console port for the active DSC. For more information on console connections, see <em>Cisco IOS XR Getting Started Guide for the Cisco CRS Router</em>.</td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>dir flash-disk</code> :</td>
<td>(Optional) Displays the package files that are available for package upgrades and additions. <strong>Note</strong> Only PIE files can be added and activated using this procedure.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>RP/O/RP0/CPU0:router# dir disk1:</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> <code>admin</code></td>
<td>Enters administration EXEC mode. <strong>Note</strong> Some <code>show install</code> commands can be entered in EXEC mode on an SDR.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>RP/O/RP0/CPU0:router# admin</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> `install add [source source-path</td>
<td>tar] file [activate ]`</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>RP/O/RP0/CPU0:router (admin)# install add disk1:hfr-mgbl.pie-3.8.30.11</code></td>
<td>• If the <code>source</code> keyword is used, the <code>source-path</code> specifies the directory path that is used for multiple filenames in the same directory.</td>
</tr>
<tr>
<td><code>or</code></td>
<td></td>
</tr>
<tr>
<td><code>RP/O/RP0/CPU0:router (admin)# install add source</code></td>
<td></td>
</tr>
</tbody>
</table>
If the `tar` keyword is used, all PIE files contained in the tar file are unpacked.

The `file` argument can take any of these formats:

- `device filename`
- `tftp://hostname_or_ipaddress/directory-path/filename`
- `ftp://username:password@hostname_or_ipaddress/directory-path/filename`
- `rcp://username@hostname_or_ipaddress/directory-path/filename`

These are descriptions for each of the terms used here:

- `device`—Name of the local storage device where the PIE file is stored, such as `disk1:`.
- `filename`—Name of the PIE file you want to add. If the `tar` keyword is used, the `file` argument is the name of a tar file containing one or more PIE files, or directories containing PIE files.
- `rcp://`—Unpacks the PIE file from a network server using Remote Copy Protocol
- `hostname_or_ipaddress`—Host name or IP address of the network file server.
- `directory-path`—Network file server path that leads to the PIE file to be added.
- `username`—Username of user that has access privileges to the directory in which the PIE file is stored.
- `password`—Password associated with the username of user that has access privileges to the directory in which the PIE file is stored.
- `activate`—Automatically activates the software package after it is successfully added.

**Note** Multiple versions of a software package can be added to the storage device without impacting the running configuration, but only one version of a package can be activated for a card.
### Purpose

The automatic FPD upgrade occurs only when the FPD pie is added and activated together with the install PIE.

#### Tip (Optional)

Displays the inactive packages on the router. Verify that the package added in the previous step appears in the display.

### Step 5

**show install inactive summary**

**Example:**

```
RP/0/RP0/CPU0:router(admin)# show install inactive summary
```

### Step 6

**install activate {id add-id | device package} [test] [location node-id] [pause sw-change] [prompt-level {all | none}] [auto-abort-timer time]**

**Example:**

```
RP/0/RP0/CPU0:router(admin)# install activate disk0:hfr-mini-px-4.3.99
```

Activates a package that was added to one or more SDRs. (Skip this step if the package was activated earlier with the `install add` command.)

- **id add-id**—Specifies the package using the operation ID of the `install add` operation in which you added the package. The operation ID is provided in the output of the `install add` command. You can also use `show install log` to display installation operation IDs.

- **device:package**—Specifies the package by name. Replace the `device:package` argument with the name of the boot device and inactive package, which can be displayed as described in the previous step.  

**Note** Press ? after a partial package name to display all possible matches available for activation. If there is only one match, press [TAB] to fill in the rest of the package name.

- **location node-id**—Activates a package for a specific card (node). To display a list of node IDs for the entire system, enter the `show platform` command in administration EXEC mode. A package cannot be activated on a single node unless some version of the package being activated is already active on all nodes.  

**Note** By default, packages are activated for all cards supported by that package.

- **pause sw-change**—Pauses the operation after preparatory checks and before the configuration is locked for the actual activation. This action enables you to hold the operation while you perform configuration changes, and proceed with the activation whenever you choose. This operation is useful, for example, if your workflow involves configuring a router out of the network during software installation and you want to minimize the time that the router is out of the network. Follow onscreen instructions to control the pausing and completion of the operation.

- **prompt-level**—Use a prompt-level of `all` to view all stages of the installation process and to specify whether to continue, or not.
### Adding and Activating Packages

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>auto-abort-timer</strong>—Specifies an abort timer value, in minutes, which when expired loads the last committed loadpath. The default is 60. The timer is disabled by default. After the installation, if the activated software is working correctly, use the <strong>install commit</strong> command to cancel the timer and commit the new loadpath.</td>
<td></td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>The package being activated must be compatible with the currently active software to operate. When an activation is attempted, the system runs an automatic compatibility check to ensure that the package is compatible with the other active software on the router. The activation is permitted only after all compatibility checks have been passed.</td>
</tr>
<tr>
<td><strong>Tip</strong></td>
<td>When activating packages, use the <strong>test</strong> option to test the effects of a command without impacting the running system. After the activation process finishes, enter the <strong>show install log</strong> command to display the process results.</td>
</tr>
<tr>
<td><strong>Tip</strong></td>
<td>The automatic FPD upgrade occurs only when the FPD pie is added and activated together with the install PIE.</td>
</tr>
<tr>
<td><strong>Step 7</strong> Repeat Step 4, on page 56 through Step 6, on page 58 until all packages are activated.</td>
<td>Activates additional packages as required.</td>
</tr>
<tr>
<td><strong>Step 8</strong> <strong>show install active summary</strong></td>
<td>(Optional) Displays all active packages. Use this display to determine if the correct packages are active:</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>RP/0/RP0/CPU0:router(admin)# show install active</td>
</tr>
<tr>
<td><strong>Step 9</strong> <strong>install verify packages</strong></td>
<td>(Optional) Verifies the consistency of a installed software set with the package file from which it originated. This command can be used as a debugging tool to verify the validity of the files that constitute the packages, to determine whether there are any corrupted files. This command also checks for corruptions of installation state files and MBI image files. This command is particularly useful when issued after the activation of a package or upgrading the Cisco IOS XR software to a major release.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>RP/0/RP0/CPU0:router(admin)# install verify packages</td>
</tr>
<tr>
<td><strong>Step 10</strong> <strong>exit</strong></td>
<td>(Optional) Exits administration EXEC mode and returns to EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>RP/0/RP0/CPU0:router(admin)# exit</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>----------------------</td>
<td>--------------------------</td>
</tr>
<tr>
<td><strong>Step 11</strong> show system verify start</td>
<td>(Optional) Starts the system status check.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>RP/0/RP0/CPU0:router# show system verify start</td>
<td></td>
</tr>
<tr>
<td><strong>Step 12</strong> admin</td>
<td>Enters administration EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>RP/0/RP0/CPU0:router# admin</td>
<td></td>
</tr>
<tr>
<td><strong>Step 13</strong> install commit</td>
<td>(Optional) Commits the current set of packages on the router so that these packages are used if the router is restarted. For more information, see the Related Topics section.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>RP/0/RP0/CPU0:router# dir disk1:</td>
<td></td>
</tr>
<tr>
<td>RP/0/RP0/CPU0:router(admin)# install commit</td>
<td></td>
</tr>
<tr>
<td><strong>Step 14</strong> Upgrade the field-programmable device (FPD) software, if necessary.</td>
<td>Whenever a Cisco IOS XR software image that supports SPAs and SIPs is released, a companion SPA or SIP FPD image is bundled with the Cisco IOS XR software release. Generally, the FPD image is not automatically upgraded. You must manually upgrade the FPD image running on the SPA or SIP when you upgrade the Cisco IOS XR software image. FPD versions must be compatible with the Cisco IOS XR software that is running on the router. <strong>Note</strong> If you have enabled the fpd auto-upgrade command and add and activate the FPD PIE together with the software installation PIE, the FPD image is automatically upgraded before the router is rebooted. For information on FPDs, including instructions to upgrade FPD images, see the Upgrading FPD Cisco IOS XR Software section.</td>
</tr>

Examples

Adding a Package: Example
The following example shows how to add the contents of a PIE file on disk1: to the boot device. Because the software package is added to the boot device by default, it is not necessary to specify the destination device in the CLI.

RP/0/RP0/CPU0:router(admin)# install add disk1:hfr-mpls-p.pie-3.7.2 synchronous
Install operation 4 'install add /disk1:hfr synchronous' started by user 'cisco' at 18:10:18 UTC Sat Apr 08 2009.
Info: The following package is now available to be activated:
Info: disk0:hfr-mpls-3.7.2
Info: Install operation 4 completed successfully at 18:14:11 UTC Sat Apr 08 2009.

The following example shows how to add the contents of a PIE file on a TFTP server to the boot device:

RP/0/RP0/CPU0:router(admin)# install add tftp://209.165.201.1/hfr-mpls.pie synchronous
Install operation 4 '(admin) install add /tftp://209.165.201.1/hfr-mpls.pie synchronous' started by user 'cisco' at 18:16:18 UTC Thu Jan 03 2009.
Info: The following package is now available to be activated:
Info: disk0:hfr-mpls-3.7.2
Info: Install operation 4 completed successfully at 18:19:10 UTC Thu Jan 03 2009.

Activating a Package: Example
The following example shows the activation of the MPLS package. The package is activated on the boot device disk0:.

RP/0/RP0/CPU0:router(admin)# install activate disk0: hfr-mpls-3.7.2 synchronous
Install operation 15 'install activate disk0:hfr-mpls-3.7.2 synchronous' started by user 'lab' at 19:15:33 UTC Sat Apr 08 2009.
Info: The changes made to software configurations will not be persistent
Info: across system reloads. Use the command 'admin install commit' to make
Info: changes persistent.
Info: Please verify that the system is consistent following the software
Info: change using the following commands:
Info: show system verify
Info: install verify packages
Install operation 5 completed successfully at 19:16:18 UTC Sat Apr 08 2009.

Activating a Package by Specifying an Operation ID: Example
The following example shows the activation of the MPLS package using the operation ID of the install add operation that added the package:

RP/0/RP0/CPU0:router(admin)# install activate id 4
Install operation 5 '(admin) install activate id 4' started by user 'lab' via CLI at 18:20:17 UTC Thu Jan 03 2009.
Info: This operation will activate the following package:
Adding and Activating a Package from an FTP File Server with One Command: Example

To add and activate a package with a single command, enter the install add command with the activate keyword. In the following example, the Manageability PIE located on disk1: is verified, unpacked, and added to the boot device disk0. Because this operation is performed in administration EXEC mode, the package is activated for all SDRs in the system.

```
RP/0/RP0/CPU0:router# install add disk1:
hfr-mgbl-p.pie-3.7.2 activate
```

Part 1 of 2 (add software): Started
Part 1 of 2 (add software): Completed successfully
Part 2 of 2 (activate software): Started
Part 2 of 2 (activate software): Completed successfully
Part 1 of 2 (add software): Completed successfully
Part 2 of 2 (activate software): Completed successfully
Install operation 4 completed successfully at 08:00:24 UTC Wed Mar 01 2009.

Displaying the Active Packages: Example

The following example displays a summary of the active packages on a router. Because this operation is performed in administration EXEC mode, the active packages for all SDRs are displayed.

```
RP/0/RP0/CPU0:router# show install active summary
Active Packages:
disk0:hfr-mpls-3.7.2
disk0:hfr-mgbl-3.7.2
disk0:hfr-mcast-3.7.0
disk0:hfr-k9sec-3.7.0
disk0:hfr-fpd-3.7.0
disk0:hfr-doc-3.7.0
disk0:hfr-diags-3.7.0
disk0:comp-hfr-mini-3.7.0
```
You can also display the active packages for a specific SDR, or for a specific node. Enter the `show install active` command in EXEC mode, or use the `sdr` keyword in administration EXEC mode, as shown in the following example:

```
RP/0/RP0/CPU0:router(admin)# show install active sdr owner
```

Secure Domain Router: Owner

Node 0/1/CPU0 [LC] [SDR: Owner]
Boot Device: bootflash:
Boot Image: /disk0/hfr-os-mbi-3.7.0/mbihfr-lc.vm
Committed Packages:
  disk0:hfr-fpd-3.7.0

  disk0:hfr-doc-3.7.0
  disk0:hfr-diags-3.7.0
  disk0:hfr-mgbl-3.7.0
  disk0:hfr-mcast-3.7.0
  disk0:hfr-mpls-3.7.0
  disk0:hfr-k9sec-3.7.0
  disk0:comp-hfr-mini-3.7.0

Committing the Active Package Set

When a package is activated, it becomes part of the current running configuration. To make the package activation persistent across system-wide reloads, enter the `install commit` command. On startup, the DSDRSC of the SDR loads this committed software set. If the system is reloaded before the current active software is committed with the `install commit` command, the previously committed software set is used.
If the SDR reloads and the committed SDR software is incompatible with the current software running on the rest of the system, the committed software of the SDR will not be used and the current running SDR software is used.

If the system is reloaded before the current active software is committed with the `install commit` command, the previously committed software set is used.

**Tip**
Before committing a package set, verify that the SDR is operating correctly and is forwarding packets as expected.

**SUMMARY STEPS**

1. `admin`
2. `install commit`
3. `show install committed [detail | summary | verbose] [location node-id]`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>

    disk0:comp-hfr-mini-3.3.30

Node 0/6/SP [SP] [SDR: Owner]
  Boot Image: /disk0/hfr-os-mbi-3.3.30/sp/mbihfr-sp.vm
  Committed Packages:
    disk0:hfr-diags-3.3.30
    disk0:comp-hfr-mini-3.3.30

Node 0/6/CP00 [LC] [SDR: Owner]
  Boot Image: /disk0/hfr-os-mbi-3.3.30/lc/mbihfr-lc.vm
  Committed Packages:
    --More--

As with the show install active command, the show install committed command may display a composite package that represents all packages in the Cisco IOS XR Unicast Routing Core Bundle.

Upgrading to Cisco IOS XR Software Release 4.0

In Cisco IOS XR Software Release 4.0, the software packages were reorganized into functionally well-defined and independently-releasable packages. For this reason, when you upgrade from a software release prior to Release 4.0, you must perform the following procedure in order to synchronize all of the software packages according to the reorganized structure. General information regarding the addition and activation of software packages is not covered in this procedure.

The main difference between the standard upgrade procedure and the procedure required to upgrade from Release 3.x to 4.x is that the later requires the addition of one additional software package, known as the upgrade package (hfr-upgrade-p.pie).

Before You Begin

Before performing this procedure, see the adding and activating software package procedures described in this module.
SUMMARY STEPS

1. admin
2. install add tftp://hostname_or_ipaddress/directory-path/mandatory-bundle-pie
3. install add tftp://hostname_or_ipaddress/directory-path/hfr-upgrade-p.pie
4. install activate device:mandatory-bundle-pie device:upgrade-package
5. install deactivate device:upgrade-package
6. (Optional) install commit
7. install remove device:upgrade-package

Deactivating and Removing Cisco IOS XR Software Packages

When a package is deactivated, it is no longer active on the SDR, but the package files remain on the boot disk. The package files can be reactivated later, or they can be removed from the disk.

A package is deactivated using the following methods:

• When a newer version of a package is activated, the earlier version of the package is automatically deactivated. See Related Topics for more information.

**Note**

Activating a software maintenance upgrade (SMU) does not cause any earlier SMUs or the package to which the SMU applies to be automatically deactivated.

• When an earlier version of a package is activated, the newer version is deactivated automatically. See Related Topics for more information.

• A specific package is deactivated using the `install deactivate` command. This command turns off the package features for a card or card type.
Before You Begin

The following are the restrictions when deactivating and removing Cisco IOS XR Software packages:

- A package cannot be deleted if it is part of the running or committed software of the SDR.
- A package cannot be deactivated if that package is required by another active package. When a deactivation is attempted, the system runs an automatic check to ensure that the package is not required by other active packages. The deactivation is permitted only after all compatibility checks have been passed.
- Router reloads: If the deactivation requires a router reload, a confirmation prompt appears. Use the `install deactivate` command with the `prompt-level none` keywords to automatically ignore any reload confirmation prompts and proceed with the package deactivation. The router reloads if required.
- Node reloads: If a software operation requires a node reload, the configuration register for that node should be set to autoboot. If the config-register for the node is not set to autoboot, then the system automatically changes the setting and the node reloads. A message describing the change is displayed.
- FPD versions must be compatible with the Cisco IOS XR software that is running on the router; if an incompatibility exists between an FPD version and the Cisco IOS XR software, the device with the field-programmable gate array (FPGA) may not operate properly until the incompatibility is resolved. For information on FPDs, including instructions to upgrade FPD images, see the Upgrading FPD Cisco IOS XR Software module of Cisco IOS XR Interface and Hardware Component Configuration Guide for the Cisco CRS Router.

SUMMARY STEPS

1. Connect to the console port and log in.
2. `admin`
3. `install deactivate { id add-id | device: package } [ location node-id ][ test ] [ pause sw-change ]`
4. (Optional) `show install inactive summary`
5. (Optional) `install verify packages`
6. `exit`
7. (Optional) `show system verify start`
8. (Optional) `show system verify [ detail | report ]`
9. `admin`
10. (Optional) `install commit`
11. (Optional) `install remove { id add-id | device: package | inactive }[ test ]`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> Connect to the console port and log in.</td>
<td>Establishes a CLI management session with the SDR. Connect to the console port for the active DSC. For more information on console connections, see Cisco IOS XR Getting Started Guide for the Cisco CRS Router.</td>
</tr>
</tbody>
</table>
### Command or Action | Purpose
--- | ---
**Step 2** | Enters administration EXEC mode.

<table>
<thead>
<tr>
<th>PurposeCommand or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>admin</td>
<td>Enters administration EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>RP/0/RP0/CPU0:router# admin</td>
<td></td>
</tr>
</tbody>
</table>

**Step 3** | Deactivates a package on all SDRs.

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>install deactivate</td>
<td>Deactivates a package on all SDRs.</td>
</tr>
<tr>
<td>{</td>
<td></td>
</tr>
<tr>
<td>id add-id</td>
<td></td>
</tr>
<tr>
<td>device :</td>
<td></td>
</tr>
<tr>
<td>package</td>
<td></td>
</tr>
<tr>
<td>} [</td>
<td></td>
</tr>
<tr>
<td>location node-id ] [</td>
<td></td>
</tr>
<tr>
<td>test ] [</td>
<td></td>
</tr>
<tr>
<td>pause sw-change ]</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>RP/0/RP0/CPU0:router(admin)# install deactivate disk0:hfr-diags-3.8.30</td>
<td></td>
</tr>
</tbody>
</table>

- To deactivate all packages that were added in one or more specific install add operations, or specify packages by name, use the `id add-id` keyword and argument. The operation ID of an install add operation is indicated in the syslog displayed during the operation and in the output of the `show install log` command.

- Use the `location node-id` keyword and argument to deactivate the package for a specific node, if supported.

- Use the `pause sw-change` keywords to pause the operation after preparatory checks and before the configuration is locked for the actual deactivation. This enables you to hold the operation while you perform configuration changes, and proceed with the deactivation whenever you choose. This is useful, for example, if your workflow involves configuring a router out of the network during software changes and you want to minimize the time that the router is out of the network. Follow the onscreen instructions to control the pausing and completion of the operation.

**Note** Press ? after a partial package name to display all possible matches available for deactivation. If there is only one match, press [TAB] to fill in the rest of the package name.

When a package is deactivated for an SDR from administration EXEC mode, a notification message appears on the console for that SDR, with information on the impact of the deactivation.

**Step 4** | (Optional) Displays the inactive packages on the router.

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show install inactive summary</td>
<td>(Optional)</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>RP/0/RP0/CPU0:router(admin)# show install inactive summary</td>
<td></td>
</tr>
</tbody>
</table>

**Step 5** | (Optional) Verifies the consistency of an installed software set with the package file from which it originated. This command can be used as a debugging tool to verify the validity of the files that constitute the packages, to determine if there are any corrupted files. This command also checks for corruptions of installation state files and MBT image files. This command is particularly useful when issued after the activation of a package or upgrading the Cisco IOS XR software to a major release.

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>install verify packages</td>
<td>(Optional)</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>RP/0/RP0/CPU0:router(admin)# install verify packages</td>
<td></td>
</tr>
</tbody>
</table>

**Note** The `install verify packages` command can take up to two minutes per package to process.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 6</strong> exit</td>
<td>Exits administration EXEC mode and returns to EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RP0/CPU0:router(admin)# exit</td>
</tr>
<tr>
<td><strong>Step 7</strong> show system verify start</td>
<td>(Optional) Starts the system status check.</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RP0/CPU0:router# show system verify start</td>
</tr>
<tr>
<td><strong>Step 8</strong> show system verify [ detail</td>
<td>report ]</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RP0/CPU0:router# show system verify</td>
</tr>
<tr>
<td><strong>Step 9</strong> admin</td>
<td>Enters administration EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RP0/CPU0:router# admin</td>
</tr>
<tr>
<td><strong>Step 10</strong> install commit</td>
<td>(Optional) Commits the current set of packages so that these packages are used if the router is restarted. Packages can be removed only if the deactivation operation is committed.</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RP0/CPU0:router(admin)# install commit</td>
</tr>
<tr>
<td><strong>Step 11</strong> install remove { id</td>
<td>add-id</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RP0/CPU0:router(admin)# install remove disk0:hfr-diags-3.8.30</td>
</tr>
</tbody>
</table>

**Note** Although most of the output should display the status "OK," some processes may show other output, such as "Warning." This does not specifically indicate a problem. Contact your Cisco technical support representative for more information on the output of this command.

**Note** This command is entered in administration EXEC mode.
<table>

Examples
In the following examples, a package is deactivated from all SDRs in a router. The changes are committed and the inactive package is removed from the router.

Deactivating the Package: Example

RP/0/RP0/CPU0:router(admin)# install deactivate disk0:hfr -diags-.7.2
Install operation 27 'install deactivate disk0:hfr-diags-3.7.2' started by user 'lab' at 23:29:37 UTC Sat Apr 15 2009.
The install operation will continue asynchronously.
Info: The changes made to software configuration
Info: across system reloads. Use the command 'admin install commit' to make
Info: changes persistent.
Info: Please verify that the system is consistent following the software
Info: change using the following commands:
Info: show system verify
Info: install verify packages
Install operation 27 completed successfully at 23:30:22 UTC Sat Apr 15 2009.

Committing the Active Software Set: Example

RP/0/RP0/CPU0:router(admin)# install commit
Install operation 29 'install commit' started by user 'lab' at 23:39:21 UTC Sat Apr 15 2009.
Displaying the Inactive Packages: Example

RP/0/RP0/CPU0:router(admin)# show install inactive summary

Default Profile:
SDRs:
Owner
Inactive Packages:
disk0:hfr-diags-3.7.2

Removing the Inactive Package from the Router: Example

The following example shows how to remove an inactive package. In this example, the operation is run in test mode. The operation is confirmed and the package is removed.

RP/0/RP0/CPU0:router(admin)# install remove disk0:hfr-diags-3.7.2 test

Install operation 30 'install remove disk0:hfr-diags-3.7.2 test' started by user 'lab' at 23:40:22 UTC Sat Apr 15 2009.
Warning: No changes will occur due to 'test' option being specified. The following is the predicted output for this install command.
Info: This operation will remove the following package:
disk0:hfr-diags-3.7.2
Info: After this install remove the following install rollback points will no longer be reachable, as the required packages will not be present:
4, 9, 10, 14, 15, 17, 18
Proceed with removing these packages? [confirm] y

The install operation will continue asynchronously.
Install operation 30 completed successfully at 23.

Pausing Before Configuration Lock: Example

The following example shows how to deactivate a package, pausing the operation before locking the configuration for the actual software deactivation. While the operation is paused, you can enter a configuration mode and perform configurations. When you want to complete the operation, enter the install operation id complete command, or the install operation id attach synchronous command.

RP/0/RP0/CPU0:router(admin)# install deactivate disk0:comp-hfr-3.7.2.07I.CSCsr09575-1.0.0 pause sw-change

Install operation 12 '(admin) install deactivate disk0:comp-hfr-3.7.2.07I.CSCsr09575-1.0.0 pause sw-change' started by user 'admin' via CLI at 09:06:26 BST Mon Jul 07 2009.
Info: This operation will reload the following nodes in parallel:
0/0/CPU0 (RP) (SDR: Owner)
0/1/CPU0 (LC(E3-GE-4)) (SDR: Owner)
0/5/CPU0 (LC(E3-OC3-POS-4)) (SDR: Owner)
Proceed with this install operation (y/n)? [y]
The install operation will continue asynchronously.
Info: Install Method: Parallel Reload
Info: Install operation 12 is pausing before the config lock is applied for the software change as requested by the user.
Info: No further install operations will be allowed until the operation is resumed.
Info: Please continue the operation using one of the following steps:
Info: - run the command '(admin) install operation 12 complete'.
Info: - run the command '(admin) install operation 12 attach synchronous' and then answer the query.
Rolling Back to a Previous Software Set

Cisco IOS XR software allows you to roll back one or more SDRs to a previous committed or uncommitted software set. Use the `show install rollback ?` command to view the available rollback points and use the `install rollback to` command to roll back the SDR to a previous software set. You can also use the `install rollback to committed` command to roll back to the most recent committed software set.

**Note**
Rollback operations can be performed for all SDRs by running the command in administration EXEC or for a single SDR by running the command in either administration EXEC or EXEC mode.

Displaying Rollback Points

A rollback point is created every time a software package is activated, deactivated, or committed. Use the `show install rollback ?` command to display the eligible rollback points.

```
RP/0/RP0/CPU0:router# admin
RP/0/RP0/CPU0:router(admin)# show install rollback ?
   0 ID of the rollback point to show package information for
   2 ID of the rollback point to show package information for
```

In this example, the rollback points are 0 and 2. The rollback point with the highest number is the current software point. For example, if the last installation operation was operation 3 (activating the MPLS package) then the highest rollback point is 3, which is the same as the current software (MPLS package activated).

To easily identify specific rollback points, you can assign a label or description to a rollback point using the `install label` command.

Enter the command in administration EXEC mode to display rollback points for all SDRs. Enter the command in EXEC mode to display rollback points for the SDR to which you are currently logged in. You can also display rollback points for a specific SDR in administration EXEC mode by using the `sdr sdr-name` keyword and argument.

Displaying the Active Packages Associated with a Rollback Point

To display the active packages associated with a rollback point, use the `show install rollback` command with the `point-id` argument. This command displays the packages that are active if you roll back one or more SDRs to that installation point. For example, the `show install rollback 2` command displays the packages that are active if you roll back to rollback point 2.

```
RP/0/RP0/CPU0:router(admin)# show install rollback 2
Secure Domain Router: Owner
   Node 0/1/SP [GP] [SDR: Owner]
   Boot Image: /disk0/hfr-os-mbi-3.8.84/sp/mbihfr-sp.vm
   Rollback Packages:
      disk0:hfr-diags-3.8.84
      disk0:comp-diags-3.8.84
```
Node 0/1/CPU0 [LC] [SDR: Owner]
Boot Image: /disk0/hfr-os-mbi-3.8.84/lc/mbihfr-lc.vm
Rollback Packages:
disk0:hfr-diags-3.8.84
disk0:comp-hfr-mini-3.8.84

Node 0/RP0/CPU0 [RP] [SDR: Owner]
Boot Image: /disk0/hfr-os-mbi-3.8.84/mbihfr-rp.vm
Rollback Packages:
disk0:hfr-diags-3.8.84
disk0:hfr-mgbl-3.8.84
disk0:hfr-k9sec-3.8.84
disk0:comp-hfr-mini-3.8.84

Node 0/RP1/CPU0 [RP] [SDR: Owner]
Boot Image: /disk0/hfr-os-mbi-3.8.84/mbihfr-rp.vm
Rollback Packages:
disk0:hfr-diags-3.8.84
disk0:hfr-mgbl-3.8.84
disk0:hfr-k9sec-3.8.84
disk0:comp-hfr-mini-3.8.84

Node 0/SM0/SP [SP] [SDR: Owner]
Boot Image: /disk0/hfr-os-mbi-3.8.84/sp/mbihfr-sp.vm
Rollback Packages:
disk0:hfr-diags-3.8.84
disk0:comp-hfr-mini-3.8.84

Node 0/SM1/SP [SP] [SDR: Owner]
Boot Image: /disk0/hfr-os-mbi-3.8.84/sp/mbihfr-sp.vm
Rollback Packages:
disk0:hfr-diags-3.8.84
disk0:comp-hfr-mini-3.8.84

Node 0/SM2/SP [SP] [SDR: Owner]
Boot Image: /disk0/hfr-os-mbi-3.8.84/sp/mbihfr-sp.vm
Rollback Packages:
disk0:hfr-diags-3.8.84
disk0:comp-hfr-mini-3.8.84

Node 0/SM3/SP [SP] [SDR: Owner]
Boot Image: /disk0/hfr-os-mbi-3.8.84/sp/mbihfr-sp.vm
Rollback Packages:
disk0:hfr-diags-3.8.84
disk0:comp-hfr-mini-3.8.84

Enter the command in administration EXEC mode to view the rollback points for all SDRs. Enter the command in EXEC mode to display the rollback points for the SDR to which you are currently logged in. You can also display rollback points for a specific SDR in administration EXEC mode by using the `sdr sdr-name` keyword and argument.

For more information on the command options, see the Software Package Management Commands on Cisco IOS XR Software module of Cisco IOS XR System Management Command Reference for the Cisco CRS Router.

## Rolling Back to a Specific Rollback Point

You can roll back to a specific rollback point, including a noncommitted software set:

- If you roll back to the most recent noncommitted rollback point (with the highest number), you do not need to reload the router.
• You can repeat the rollback process one rollback point at a time without reloading if you always choose the most recent rollback point.

• If you choose a rollback point that is older than the most recent point, the impacted nodes reload, interrupting data traffic on those nodes. Before the reload occurs, you are prompted to confirm the install rollback operation.

In the following example, the system is rolled back to noncommitted rollback point 8:

RP/0/RP0/CPU0:router(admin)# install rollback to 8

Install operation 10 'install rollback to 8' started by user 'cisco' at 07:49:26 UTC Mon Nov 14 2009.
The install operation will continue asynchronously.
Info: The changes made to software configurations will not be persistent
Info: changes persistent.
Info: Please verify that the system is consistent following the software
Info: change using the following commands:
Info: show system verify
Info: install verify packages

The currently active software is the same as the committed software.
Install operation 10 completed successfully at 07:51:24 UTC Mon Nov 14 2009.

Rolling Back to the Last Committed Package Set

Use the **install rollback to committed** command to roll back to the last committed package set.

In the following example, all SDRs in the system are rolled back to the last committed package set:

RP/0/RP0/CPU0:router(admin)# install rollback to committed

Install operation 27 'install rollback to committed' started by user 'lab' at 16:41:38 UTC Sat Nov 19 2009.
Info: The rollback to committed software will require a reload of impacted
Info: nodes because it is over multiple activation & deactivation
Info: operations.
Info: This operation will reload the following node:
Info: 0/RP1/CPU0 (RP) (SDR: Owner)
Info: This operation will reload all RPs in the Owner SDR, and thereby
Info: indirectly cause every node in the router to reload.
Proceed with this install operation? [confirm]

Updating Commit Database. Please wait...[OK]
Info: The changes made to software configurations will not be persistent
Info: changes persistent.
Info: Please verify that the system is consistent following the software
Info: change using the following commands:
Info: show system verify
Info: install verify packages

CHAPTER 3

Configuring Disk Backups and Disk Mirroring on the Cisco IOS XR Software

This module describes the process to configure disk mirroring and create a backup disk of the packages and configurations in Cisco IOS XR software.

Note

The disk backup feature is also known as Golden Disk.

For complete descriptions of the commands listed in this module, see Related Documents, on page 100. To locate documentation for other commands that might appear in the course of performing a configuration task, search online in Cisco IOS XR Commands Master List for the Cisco CRS Router.

</tr>
</tbody>
</table>

This module contains the following topics:

- Disk Backup Prerequisites, page 84
- Disk Mirroring Prerequisites, page 84
- Information About the Backup Disk, page 85
- Information About Disk Mirroring, page 85
- How to Create a Backup Disk, page 86
- How to Enable Disk Mirroring, page 89
- Configuration Examples for Creating a Backup Disk, page 95
- Configuration Examples for Enabling Disk Mirroring, page 98
Disk Backup Prerequisites

Before performing a system backup, the following conditions must be met:

- You must be in a user group associated with a task group that includes the proper task IDs. The command reference guides include the task IDs required for each command. If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.
- Local storage device specified for the backup must be installed. The supported storage devices are disk0: and disk1: (if installed).
- Disk mirroring must not be enabled.

Disk Mirroring Prerequisites

Before enabling disk mirroring, the following conditions must be met:

- You must be in a user group associated with a task group that includes the proper task IDs. The command reference guides include the task IDs required for each command. If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.
- The secondary storage device specified for the mirroring must be installed in the same node as the primary boot device. The supported storage devices are disk0: and disk1:.
- The secondary storage device must be the same size or larger than the designated primary storage device.
- The secondary storage device must be partitioned.
- After disk mirroring is enabled, you cannot configure the backup disk feature.

Note

The primary partition on the secondary storage device must be large enough to contain all data on the primary boot device. This can be an issue if the primary boot device has not yet been partitioned. For example, in the situation where both the primary boot device and the secondary storage device are 1 GB in size, the primary boot device contains 950 MB of data, and the secondary storage device is already partitioned to 800 MB in the primary partition and 200 MB in the secondary partition. In such a case, the 950 MB of data from the primary boot device does not fit on the secondary storage device because of the partition. Such a configuration is rejected and an error is displayed. You need to replace the secondary storage device with a higher capacity device. For information about disk partition sizes, see Related Topics.

Note

Although compactflash: can be used as the secondary device on a Performance Route Processor (PRP–2), there is an issue with the ROM Monitor not being able to boot the minimum boot image (MBI) from the secondary device if the device is not disk0: or disk1:. In such a situation, you would need to go into ROMMON mode and boot the PRP-2 manually using the MBI on the compactflash:.
Information About the Backup Disk

A system backup disk is created when you back up the system files to a local storage device for the first time. This process formats the selected device, and copies the software packages and system configurations to that device. If the backup operation is performed from EXEC mode, then the files from that specific secure domain router (SDR) are backed up. If the backup operation is performed from administration EXEC mode, then the files from the administration plane and from all SDRs are backed up.

Before you create a backup disk of the Cisco IOS XR software packages and configurations, you need to determine which device is being used as the primary boot device. The boot device is displayed using the following commands:

- `show version`
- `show install active`
- `show install committed`

See Cisco IOS XR System Management Command Reference for the Cisco CRS Router for information on using the commands to determine the boot device.

Information About Disk Mirroring

The route processor (RP) card has a primary storage device that is used to store installation packages and configuration files. This primary storage device is referred to as the primary boot device and is essential for booting the RP and its normal operation.

Disk mirroring replicates the critical data on the primary boot device onto another storage device on the same RP, henceforth referred to as the secondary device. If the primary boot device fails, applications continue to be serviced transparently by the secondary device, thereby avoiding a switchover to the standby RP. The failed primary storage device can be replaced or repaired without disruption of service.

Disk mirroring should only mirror critical data on the primary boot device onto a secondary storage device and not any noncritical data such as logging data. To separate critical data from noncritical data, the disk devices need to be partitioned. Disk0: is partitioned to disk0: and disk0a:; disk1: is partitioned to disk1: and disk1a:. Disk0: and disk1: are used for critical data, whereas disk0a: and disk1a: are used for logging data and other noncritical data. Before you can configure disk mirroring on the RP, you must have partitioned the secondary storage device. The sizes of disk partitions are related to the total disk size, and are provided in Table 10: Size of Disk Partitions in Relation to Size of Disk, on page 85.

How to Create a Backup Disk

Creating a New or Revised Backup Disk

Complete the following instructions to create a new backup disk, or to back up the most recent software and configuration files onto an existing backup disk.

Note

If disk mirroring is enabled, you will not be able to configure a backup disk.

SUMMARY STEPS

1. `admin`
2. (Optional) `show system backup [target-dev] [details | diff] [verify] [location {all | node-id}]`
3. (Optional) `system boot-sequence primary-device [secondary-device] [location {all | node-id}]`
4. `system backup [target-dev] [format] [location {all | node-id}] [synchronous | asynchronous]`
5. (Optional) `show system backup [target-dev] [details | diff] [verify] [location {all | node-id}]`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> admin</td>
<td>Enters administration EXEC mode.</td>
</tr>
<tr>
<td>Example: <code>RP/0/RP0/CPU0:router# admin</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> `show system backup [target-dev] [details</td>
<td>diff] [verify] [location {all</td>
</tr>
<tr>
<td>Example: <code>RP/0/RP0/CPU0:router# show system backup disk1:</code></td>
<td></td>
</tr>
<tr>
<td>• <code>target-dev</code>—Displays backup information for a specified RP node.</td>
<td></td>
</tr>
<tr>
<td>• <code>details</code>—Lists information about the software packages and configuration files stored on the backup device.</td>
<td></td>
</tr>
<tr>
<td>• <code>diff</code>—Displays the differences between the software and configurations on the backup device and the software and configurations on the currently active boot disk.</td>
<td></td>
</tr>
<tr>
<td>• <code>location node-id</code>—Displays information for a backup on a specific node. Use the <code>location all</code> keywords to display information for backups on all nodes in the system.</td>
<td></td>
</tr>
</tbody>
</table>

If no backup exists, an error message is displayed.
### Command or Action

**Step 3**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`system boot-sequence primary-device [secondary-device] [location {all</td>
<td>node-id}]`</td>
</tr>
</tbody>
</table>

**Example:**

```
RP/0/RP0/CPU0:router(admin)#
system boot-sequence disk0: disk1:
```

- The boot devices specified in this command must be installed in the card, or the command will fail.
- `primary-device`—Defines the default device where software packages are installed and run. This device is also the default location for router configurations. We recommend disk0: as the primary boot device in the boot sequence.
- `secondary-device`—Defines the device used by the `system backup` command to back up system software and configurations. The value of the `secondary-device` argument must be different from the value of the `primary-device` argument. We recommend disk1: as the secondary boot device in the boot sequence. This field is optional.
- `location node-id`—Defines the boot sequence for a specific RP.
- `location all`—Defines the boot sequence for all RPs in the SDR. Use this command in administration EXEC mode to define the boot sequence for all RPs in all SDRs. The `node-id` argument is expressed in rack/slot/module notation.

**Step 4**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`system backup [target-dev] [format] [location {all</td>
<td>node-id}] [synchronous</td>
</tr>
</tbody>
</table>

**Example:**

```
RP/0/RP0/CPU0:router(admin)#
system backup disk0: disk1:
```

- By default, the backup disk is the secondary device defined with the `system boot-sequence` command in Step 3, on page 87.
- To define a backup device for the current backup operation only, use the `system backup` command with the `target-dev` argument.
- If a target device is not specified with either the `system backup target-dev` command or the `system boot-sequence` command, then the backup operation is not allowed.

**Note**

- The `target-dev` argument can be any local storage device except the current boot device, and must be large enough to store the current software set and configuration.
- `location node-id`—Specifies an alternate node for the system backup, such as the standby DSDRSC.
- `location all`—Performs the backup on all RPs installed in a specific SDR, when used in EXEC mode; performs the backup on all RPs in all SDRs installed in the system, when used in administration EXEC mode.
- Default is `synchronous`.  

---

**Creating a New or Revised Backup Disk**

---

**Cisco IOS XR System Management Configuration Guide for the Cisco CRS Router, Release 4.2.x**
### Purpose
Command or Action

**Step 5**

```
show system backup [target-dev] 
[details | diff] [verify] [location 
{all | node-id}]
```

(Optionalal)
Displays information for the backup performed on the active RP where you are logged in, including the date, time, and status of the last backup. Use this information to determine if a backup is required. The following options display specific information:

- **target-dev**—Displays backup information for a specified RP node.
- **details**—Lists information about the software packages and configuration files stored on the backup device.
- **diff**—Displays the differences between the software and configurations on the backup device and the software and configurations on the currently active boot disk.
- **location node-id**—Displays information for a backup on a specific node. Use the `location all` keywords to display information for backups on all nodes in the system.

If no backup exists, an error message is displayed.

---

### Using the Backup Disk to Boot a Router

Complete the following instructions to use the backup disk to boot a router.

**SUMMARY STEPS**

1. Enter ROM Monitor mode.
2. `dir disk1:`
3. Locate the hfr-os-mbi-X.Y.Z directory.
5. Locate the mbihfr- xx .vm file.
6. `unset BOOT`
7. `sync`
8. `confreg 0x102`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>

<td><code>boot disk1: hfr-os-mbi-X.Y.Z/mbi hfr</code></td>
</tr>
<tr>
<td></td>
<td>Example: <code>rommon6&gt; boot disk1:hfr-os-mbi-3.8.0/mbihfr-rp.vm</code></td>
</tr>
</tbody>
</table>

How to Enable Disk Mirroring

The tasks in this section describe how to enable and manage disk mirroring.

Enabling Disk Mirroring

Complete the following instructions to enable disk mirroring. After disk mirroring is configured, if there is a fault on the primary boot drive or it cannot be accessed for any reason, control is automatically transferred to the secondary storage device.
**SUMMARY STEPS**

1. `format secondary-device partition [ location node-id ]`
2. Remove any noncritical data from the primary boot device.
3. `configure`
4. `mirror location node-id Primary-device Secondary-device`
5. `commit`
6. `show mirror [ location node-id ]`
7. `mirror verify location node-id`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Partitions the secondary storage device into two partitions.</td>
</tr>
</tbody>
</table>
| `format secondary-device partition [ location node-id ]` | - If the device is already partitioned, you do not need to perform this step.  
| | - On multishelf systems, specify the node of the primary boot device with the `location` keyword.  
| **Example:** | When you partition a FAT16 disk, the file system changes to FAT32. If you might need to downgrade to Cisco IOS XR Software Release 3.7.0 or earlier, consider carefully before partitioning the disk. Software downgrades to Cisco IOS XR Software Release 3.7.0 or earlier are not supported for FAT32 disks. The procedure for converting a FAT32 disk to FAT16 is complex and requires the assistance of Cisco technical support. |
| `RP/0/RP0/CPU0:router# format disk1: partition` | **Note** The primary boot device should contain installation packages and configuration files only. Log files can be copied to the “a” partition of the secondary device, for example `disk1a:`. |
| **Step 2** | Remove any noncritical data from the primary boot device. |
| **Step 3** | Enables disk mirroring of the `primary-device` to the `secondary-device`. On multishelf systems, specify the node of the primary boot device with the `location` keyword. |
| `configure` | If the primary boot device is not partitioned, the following occurs: |
| **Step 4** | - The contents of the primary device are replicated to the secondary device  
| `mirror location node-id Primary-device Secondary-device` | - Control of the mirroring server switches to the secondary storage device.  
<p>| <strong>Example:</strong> | - The primary device is partitioned. |
| <code>RP/0/RP0/CPU0:router(config)# mirror location 0/rp 0/cpu0 disk0:disk1:</code> | - Data is replicated back to the primary boot device. |</p>

### Replacing the Secondary Mirroring Device

Follow this procedure if you need to replace the secondary boot device used in the disk mirroring process.

#### SUMMARY STEPS

1. show mirror [location node-id]  
2. mirror pause [location node-id]  
3. show mirror [location node-id]  
4. unmount secondary-device [location node-id]  
5. Remove the device and insert a new device.  
6. format secondary-device partition [location node-id]  
7. show media [location node-id]  
8. mirror resume [location node-id]  
9. show mirror [location node-id]  

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 show mirror [location node-id]</td>
<td>Verifies that mirroring is active. In the output, the Current Mirroring State should be redundant. Use the location node-id keyword and argument to view the mirror status on other line card and fabric card chassis. The default display is the mirror status of the card to which the console is connected.</td>
</tr>
<tr>
<td>Example: RP/0/RP0/CPU0:router# show mirror</td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>mirror pause [location node-id]</td>
<td>Temporarily pauses disk mirroring.</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RP0/CPU0:router# mirror pause</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>show mirror [location node-id]</td>
<td>Verifies that mirroring has paused. In the output, the <em>Current Mirroring State</em> should be paused.</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RP0/CPU0:router# show mirror</td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td>unmount secondary-device [location node-id]</td>
<td>Unmounts the secondary device.</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RP0/CPU0:router# unmount disk1:</td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td>Remove the device and insert a new device.</td>
<td></td>
</tr>
<tr>
<td>Step 6</td>
<td>format secondary-device partition [location node-id]</td>
<td>Formats the device.</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RP0/CPU0:router# format disk1: partition</td>
<td></td>
</tr>
<tr>
<td>Step 7</td>
<td>show media [location node-id]</td>
<td>Verifies that the device is formatted. The output should display the device that you formatted.</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RP0/CPU0:router# show media</td>
<td></td>
</tr>
<tr>
<td>Step 8</td>
<td>mirror resume [location node-id]</td>
<td>Resumes mirroring.</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RP0/CPU0:router# mirror resume</td>
<td></td>
</tr>
<tr>
<td>Step 9</td>
<td>show mirror [location node-id]</td>
<td>Verifies that mirroring has restarted. In the output, the <em>Current Mirroring State</em> should be Syncing. It can take 15 to 30 minutes for the mirroring process to complete. The exact time depends on the number of packages or files on the boot device. When the mirroring is complete, the <em>Current Mirroring State</em> should be Redundant.</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RP0/CPU0:router# show mirror</td>
<td></td>
</tr>
</tbody>
</table>

### Replacing the Primary Mirroring Device

In the event that your primary boot disk is defective and you need to replace it while disk mirroring is enabled, perform this task.
SUMMARY STEPS

1. show mirror [location node-id]
2. configure
3. mirror location node-id Primary-device Secondary-device
4. commit
5. show mirror [location node-id]
6. mirror pause [location node-id]
7. show mirror
8. unmount secondary-device [location node-id]
9. Remove the device and insert a new device.
10. show media [location node-id]
11. (Optional) format secondary-device partition [location node-id]
12. mirror resume [location node-id]
13. show mirror [location node-id]
14. configure
15. mirror location node-id Primary-device Secondary-device
16. show mirror [location node-id]

### Configuration Examples for Creating a Backup Disk

#### Defining the Boot Disk Sequence: Example

The following example shows how to define the primary and secondary boot device for the active RP (or DSC). The secondary device is also the default location for system backups. In this example, the default location for software and configurations is disk0:. The location for backups of software and configurations is disk1:.

```
admin
    system boot-sequence disk0: disk1:
    Info: node0_0_CPU0: command succeeded.
```

#### Creating a Backup Disk for All SDRs: Example

The following example shows how to back up the software and configuration files:

- The command is run in administration EXEC mode, which backs up both the administration and SDR configurations.

- The target device is defined by the value entered with the `system boot-sequence` command, as shown in Defining the Boot Disk Sequence: Example, on page 95.

- Because this is the first backup on the device, the disk is formatted.

```
admin
    system backup location all
    Info: node0_0_CPU0: formatting target device
    Info: node0_1_CPU0: formatting target device
```
Creating a Backup Disk for a Single SDR: Example

In the following example, the backup disk is created for a non-owner SDR.

- The command is run in EXEC mode, which backs up only the current SDR files and configuration.
- The target device is defined as disk1:
- Because this is the first backup on the device, the disk is formatted.

```
<table>
<thead>
<tr>
<th>System</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disk</td>
<td>Format</td>
</tr>
<tr>
<td>Disk</td>
<td>Copy</td>
</tr>
<tr>
<td>Disk</td>
<td>Complete</td>
</tr>
<tr>
<td>Disk</td>
<td>Verify</td>
</tr>
<tr>
<td>Disk</td>
<td>Complete</td>
</tr>
<tr>
<td>Disk</td>
<td>Command succeeded</td>
</tr>
</tbody>
</table>
```

Showing the Backup Information: Examples

In the following example, the `show system backup` command displays the status of the last system backup:

```
RP/0/RP0/CPU0:router# admin
RP/0/RP0/CPU0:router(admin)# show system backup
```

System Backup information for node0_0_CPU0 on disk1:

```
Last Backup Successful
Backup started at Sat Jun 24 12:22:10 2009
ended at Sat Jun 24 12:42:11 2009
Verify started at Sat Jun 24 12:42:12 2009
ended at Sat Jun 24 12:48:47 2009
BOOT_DEV_SEQ_CONF=disk0:;disk1:
BOOT_DEV_SEQ_OPER=disk0:;disk1:
```
In the following example, the `show system backup` command is entered with the `details` keyword to display additional information on the configuration and software package files stored on the backup device. Because this command is entered in administration EXEC mode, the backup information for both the administration and SDR configurations is displayed.

```
RP/0/RP0/CPU0:router(admin)# show system backup details
System Backup information for node0_0_CPU0 on disk1:
-----------------------------------------------
Last Backup Successful

Configuration Examples for Enabling Disk Mirroring

Enabling Disk Mirroring: Example

In the following example, disk mirroring is enabled on a router:

```
format disk1: partition
This operation will destroy all data on "disk1:" and partition device.
Continue? [confirm] y
Device partition disk1: is now formatted and is available for use.

configure
mirror location 0/0/cpu0 disk0:disk1:
commit
```

show mirror Command Output: Example

```
RP/0/RP0/CPU0:router# show mirror location all

Software Entitlement on the Cisco IOS XR Software

Cisco IOS XR software contains all the supported features for a given release. Before the introduction of software entitlement on Cisco IOS XR software, you could freely activate all available software packages on your network devices and could enable all the bundled features. The same was true for hardware, as well. For example, modular services cards (MSCs) can be programmed to run in 20-Gbps or 40-Gbps modes. Before Release 3.5.0 of Cisco IOS XR software, all MSCs ran in 40-Gbps mode. Software entitlement has been introduced so you pay only for the features that you need today, but can upgrade when necessary while keeping your investment safe. Licensing enables you to purchase individual software features and upgrade hardware capacity in a safe and reliable way.

For complete descriptions of the commands listed in this module, see Related Documents, on page 114. To locate documentation for other commands that might appear in the course of performing a configuration task, search online in Cisco IOS XR Commands Master List for the Cisco CRS Router.

</tbody>
</table>

This model contains the following topics:

- What Is Software Entitlement?, page 103
- Implementing Default Licensing, page 104
- Additional References, page 114

What Is Software Entitlement?

Software entitlement is a system that consists of a license manager on a Cisco IOS XR device that manages licenses for various software and hardware features. The license manager parses and authenticates a license before accepting it. The software features on the router use the license manager APIs to check out and release licenses. Licenses are stored in persistent storage on the router.
Core routing features are available for use without any license. The following features can be enabled on your router using licenses:

**Layer 3 VPN**

Layer 3 (virtual private network) VPN can be configured only if there is an available Layer 3 VPN license for the modular services card (MSC) slot on which the feature is being configured. The Layer 3 VPN license is included with the MSC, but it must be purchased separately to use with the 40G forwarding processor (CRS-FP40).

See the following modules in *Cisco IOS XR MPLS Configuration Guide for the Cisco CRS Router* for information about Layer 3 VPN configurations:

- Implementing MPLS Layer 3 VPNs on the Cisco IOS XR Software
- Implementing Virtual Private LAN Services on the Cisco IOS XR Software

**Performance Netflow**

The CRS-FP40 card can support down to 1:360 netflow sample rate running 45 Mpps at a 40-Gbps line rate. Without this license, the CRS-FP40 can support down to 1:1500 netflow sample rate. The MSC includes this license.

**Advanced Features**

Lawful Interception, GRE tunnel, and L2TPv3. The MSC includes this license.

**Modular Services Card Bandwidth**

Modular services cards (MSCs) can operate at 40-Gbps throughput when a license is enabled. You must use the `hw-module linecard throughput` command to enable 40-Gbps throughput once a license is available.

**Related Topics**

Enabling 40-Gbps Throughput on an MSC, on page 110

**Implementing Default Licensing**

**Prerequisites for Configuring Software Entitlement**

You must be in a user group associated with a task group that includes the proper task IDs. The command reference guides include the task IDs required for each command. If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

**Information About Default (Traditional) Licensing**

To configure software license entitlements using the default mode of licensing, you need to understand the concepts described in this module.
Types of Licenses

The following types of licenses are currently defined:

- Permanent licenses—Licenses that enable a designated feature permanently, as long as the license resides on the router.
- Implicit evaluation licenses—Set of evaluation licenses that are included with the software image (upgrade or initial install). Like regular evaluation licenses, these are valid for a period of ninety days, but the countdown to expiry starts as soon as the router is booted with an image containing these licenses.

SDR License Pools

License pools are maintained according to secure domain router (SDR). By default, all added licenses are allocated to the owner SDR license pool, and they can be freely allocated to any slot in any SDR. Features on cards belonging to the owner SDR are granted licenses based on availability in the owner SDR license pool.

You can create SDR-specific license pools by using the `license pool create` command. License requests for features running on cards belonging to SDRs with SDR-specific pools are not served from the owner license pool, even if the owner SDR license pool has licenses available. You must allocate licenses from the owner SDR to other SDRs explicitly for these license requests to succeed. Similarly, if a slot in the owner SDR had a feature license and subsequently was moved to some other SDR with an SDR-specific license pool, the feature license stays with the original SDR license pool.

You can explicitly add new licenses to a particular SDR license pool or move available licenses from the owner SDR license pool to any other SDR.

Chassis-Locked Licenses

Licenses are locked to a unique device identifier (UDI). The UDI is comprised of the chassis serial number, along with an additional identifier. The complete set of UDI information can be displayed using the `show license udi` command. The license manager parses the user-provided license and verifies that it is valid for the chassis it is running on and determines if the license is being readded.

Multiple single-chassis Cisco CRS-1 routers can be connected using a fabric chassis to form a multishelf system. In multishelf systems, licenses are locked to the UDI of the individual chassis, but can be used to enable features on any chassis. The list of available licenses for a multishelf system is a collection of all licenses on each contributing chassis.

Slot-Based Licenses

Feature licenses are allocated to router slots and not cards. Therefore, if a card is replaced, the existing license is applied to the newly inserted card. For example, if you have eight licenses for Layer 3 VPN in the system, you can configure Layer 3 VPN features on any eight cards in an SDR, and the licenses are allocated to the slots within which the cards are installed. If a card is removed from one of these licensed slots, say slot 3, and entered into an empty slot with no license, say slot 5, the license remains with slot 3 and the feature cannot be activated on slot 5 with the permanent license entered earlier by the user. In this case, you can release the license to the appropriate license pool by removing the configuration of the card (while it is inserted), or by using the `license move slot` command. When you configure the feature on slot 5, the license is checked out.
Using Implicit Licenses After a Software Image Upgrade

When you upgrade your Cisco IOS XR software image from a release that does not support software entitlement to one that does, you are provided with implicit licenses to use for all configured features in your original configuration. This enables you to upgrade your software without worrying about the implications of software entitlement.

Implicit licenses are good for a period of 90 days. As soon as the new image boots, the license manager displays a syslog message to the console once a day, indicating that an implicit license is being used and must be replaced with a permanent license. This frequency increases to once an hour on the last day before the expiry of the implicit licenses, to ensure that you do not miss it.

Before your implicit licenses expire, you should purchase licenses for all features that you want to keep running.

Features that Require Licenses After a Software Image Upgrade

When you upgrade your Cisco IOS XR software image from a release that does not support software entitlement to one that does, a warning message is displayed to the console port for each feature that requires a license. You must acquire either an evaluation license or a permanent license in order to continue using any features that require a license.

During an install activate operation, if the installation fails to acquire a license (through the license manager) for a package that requires licensing then the install operation is allowed but a warning message similar to the following is displayed:

Fri Nov 20 15:26:52.311 UTC
Install operation 3 started by user 'lab' via CLI at 15:21:18
UTC Fri Nov 20 2009.
(admin) install activate disk0:hfr-mcast-p-4.0.0.3P disk0:hfr-mgbl-p-4.0.0.3P
Install operation 3 completed successfully at 15:25:21 UTC Fri Nov 20 2009.
Install logs:
  Install operation 3 ' (admin) install activate disk0:hfr-mcast-p-4.0.0.3P
  disk0:hfr-mgbl-p-4.0.0.3P' started by user 'lab' via CLI at 15:21:18 UTC
  Fri Nov 20 2009.
  Warning: There is no valid license for the following packages:

Adding a License for a New Feature, on page 108
Configure Licenses Using Default Licensing

Adding a License for a New Feature

This task describes how to acquire a permanent license for a feature that you have purchased or an evaluation license for a feature that you have arranged with your sales representative to try. Use this procedure to replace implicit or evaluation licenses with permanent licenses.

Evaluation licenses cannot be installed if permanent licenses for the same feature are valid on the chassis. Also note that if you add a permanent license to a chassis, all evaluation or implicit licenses of the same type are disabled.

Before You Begin

You must have purchased the feature for which you are adding the license. When you purchase the feature, you are provided with a product authorization key (PAK) that you use to download the license.

All implicit or evaluation licenses for a feature are disabled when at least one permanent license for a feature is added to the router. This is true even if you had more evaluation licenses than permanent licenses.

SUMMARY STEPS

1. admin
2. show license udi
4. Copy the license to your TFTP server.
5. admin
6. license add license-name [ sdr sdr-name ]
7. configure
8. license license-name location { all | node-id }
9. exit

DETAILED STEPS

</tbody>
</table>

**What to Do Next**

To use the feature associated with the added license, you must configure it on your router. To configure Layer 3 VPN, see the *Implementing MPLS Layer 3 VPNs on Cisco IOS XR Software* module in *Cisco IOS XR MPLS Configuration Guide for the Cisco CRS Router*.

To verify that your MSC is operating at 40-Gbps throughput, use the `show hw-module linecard throughput` command. To verify that your Layer 3 VPN configuration is operational, use the `show rsi interface all global` command.

**Related Topics**

- Enabling 40-Gbps Throughput on an MSC, on page 110

**Enabling 40-Gbps Throughput on an MSC**

To configure a modular services card (MSC) to operate at 40-Gbps throughput, perform the following task. This must be performed when you add permanent licenses to your router to replace implicit licenses. It also must be performed if you are purchasing a new license for 40-Gbps throughput after using the MSC with the default 20-Gbps throughput.

**Note**

When you upgrade your image from an image that does not support software entitlement to one that does, all existing MSCs default to the 40-Gbps configuration as long as there are active implicit licenses. When the implicit licenses expire, the configuration reverts to the default 20-Gbps.

**Before You Begin**

You must have a license on your system for 40-Gbps throughput to enable this feature. This could be an implicit license, evaluation license, or permanent license.

**SUMMARY STEPS**

1. `configure`
2. `hw-module linecard throughput 40 location node-id`
3. `commit`
4. `show hw-module linecard throughput`
DETAILED STEPS

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>configure</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>

**Example:**

RP/0/RP0/CPU0:router# configure

<table>
<thead>
<tr>
<th>Step 2</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>hw-module linecard throughput 40 location node-id</td>
<td>Enables 40-Gbps throughput on the MSC in the specified node-id. If this command is not added to your hw-module linecard throughput 40 location 0/6/0 configuration, the MSC continues to work at 20 Gbps, even if you have a valid license.</td>
</tr>
</tbody>
</table>

**Example:**

RP/0/RP0/CPU0:router(config)# hw-module linecard throughput 40 location 0/6/0

<table>
<thead>
<tr>
<th>Step 3</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>commit</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 4</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>show hw-module linecard throughput</td>
<td>Displays the operational throughput on the MSCs in the router.</td>
</tr>
</tbody>
</table>

**Example:**

RP/0/RP0/CPU0:router# show hw-module linecard throughput

```
-------------------- Throughput --------------------
Location           Throughput  Configured Lic Acquired Operating
0/6/CPU0            no config   No      20G
0/1/CPU0            no config   Yes     40G
```

Examples

The following example shows sample output from the `show hw-module linecard throughput` command. In this example, the MSC in slot 6 has no license to run at 40 Gbps, while the MSC in slot 1 has a license and is operating at 40 Gbps.

```
RP/0/RP0/CPU0:router# show hw-module linecard throughput
```

Back up Licenses

When your router is configured with the licenses that you require, you should perform this task to back up all licenses. Backing up licenses makes it easier to restore them if there is a problem.

SUMMARY STEPS

1. admin
2. license backup backup-file
3. show license backup backup-file
DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>admin</strong></td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RP0/CPU0:router# admin</td>
</tr>
<tr>
<td></td>
<td>Enters administration EXEC mode.</td>
</tr>
</tbody>
</table>

**Step 2**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>license backup backup-file</strong></td>
<td>Backs up all licenses on the router to a backup file in the specified location. The backup file can be a local file or a remote file on a TFTP or RCP server.</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RP0/CPU0:router(admin)# license backup disk1:/license_back</td>
</tr>
<tr>
<td></td>
<td>License command &quot;license backup disk1:/license_back&quot; completed successfully.</td>
</tr>
</tbody>
</table>

**Step 3**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>show license backup backup-file</strong></td>
<td>Displays the contents of the backup file.</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RP0/CPU0:router(admin)# show license backup disk1:/license_back</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows sample output from the **show license backup** command.

RP/0/RP0/CPU0:router(admin)# show license backup disk1:/license_back

Local Chassis UDI Information:
S/N : TBA09370035
Operation ID: 5
Licenses :
FeatureID Type #installed
CRS-MSC-40G Slot based, Permanent 2
XC-L3VPN Slot based, Permanent 1

**Restoring Licenses**

If your licenses become corrupted, and you have previously created a backup of your licenses, you can perform this task to restore the licenses to your router.

**Before You Begin**

You must have created a backup file of your licenses before you can restore them on your router.
SUMMARY STEPS

1. admin
2. show license backup backup-file
3. license restore backup-file

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>admin</td>
<td>Enters administration EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td>RP/0/RP0/CPU0:router# admin</td>
</tr>
<tr>
<td>Step 2</td>
<td>show license backup backup-file</td>
<td>Displays the contents of the backup file. You should verify the contents of the backup file before you restore your licenses.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td>RP/0/RP0/CPU0:router(admin)# show license backup disk1:/license_back</td>
</tr>
<tr>
<td>Step 3</td>
<td>license restore backup-file</td>
<td>Restores all licenses on the router from a backup file in the specified location. This can be a local file, or a remote file on a TFTP or RCP server.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td>RP/0/RP0/CPU0:router(admin)# license restore disk1:/license_back</td>
</tr>
</tbody>
</table>

Examples

This example shows sample output from the license restore command.

```
RP/0/RP0/CPU0:router(admin)# license restore disk1:/license_back
Info: This command will erase all existing licenses.
Info: It is strongly recommended to backup existing licenses first.
Do you wish to proceed? [yes/no]: y
License command "license restore disk1:/license_back" completed successfully.
```

Troubleshooting License Issues after a Software Upgrade

In the instance that you were running Cisco IOS XR Release 3.9.0 and had the optic feature enabled on an interface and the A9K-ADV-OPTIC-LIC license was active on a particular slot, when you upgrade to Cisco IOS XR Release 4.0.0, the A9K-ADV-OPTIC-LIC license is still active, but you may get the following warning message:

```
RP/0/RSP0/CPU0:Jul 27 14:22:22.594 : licmgr[236]: %LICENSE-LICMGR-4-PACKAGE_LOCATION_LICENSE_INVALID : Feature associated to package A9K-ADV-OPTIC-LIC configured
```
on node 0/4/CPU0 without a valid license

To solve this issue, configure the `license` command in administration EXEC mode. This binds the A9K-ADV-OPTIC-LIC license to the slot on which you are using the license. For example:

```
RP/0/RSP0/CPU0:router (admin-config) # license A9K-ADV-OPTIC-LIC location 0/4/CPU0
RP/0/RSP0/CPU0:router (admin-config) # commit
```

CHAPTER 5

Managing the Router Hardware

This chapter describes the command-line interface (CLI) techniques and commands used to manage and configure the hardware components of a router running the Cisco IOS XR software.

For complete descriptions of the commands listed in this module, see Additional References, on page 168. To locate documentation for other commands that might appear in the course of performing a configuration task, search online in Cisco IOS XR Commands Master List for the Cisco CRS Router.

Prerequisites for Managing Router Hardware

You must be in a user group associated with a task group that includes the proper task IDs. The command reference guides include the task IDs required for each command. If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Displaying Hardware Status

This section describes how to display different types of hardware status information.

Displaying SDR Hardware Version Information

To display hardware version information for the components assigned to a secure domain router (SDR), connect to the appropriate designated secure domain router shelf controller (DSDRSC) and enter the `show diag` command in EXEC mode. The displayed information includes the card serial number and the ROMMON software version.

The syntax for the `show diag` command in EXEC mode is:

```
show diag [node-id | details | summary]
```

In the following example, the `show diag` command displays information for all nodes in the SDR:

```
RP/0/RP0/CPU0:router# show diag

PLIM 0/1/CPU0 : JACKET CARD
  MAIN: board type 580070
        800-23819-03 rev C0

```

### Displaying System Hardware Version Information

To display hardware version information for all or some of the components assigned in a system, connect to the designated shelf controller (DSC) and enter the `show diag` command in administration EXEC mode. When this command is entered in administration EXEC mode, you can display information on RPs, MSCs or line cards, fabric cards, and system components such as the chassis, fan trays, and power supplies.

**Note**

If you enter the `show diag` command in EXEC mode, the software displays only the hardware assigned to the SDR to which you are connected.

The syntax for the `show diag` command in administration EXEC mode is:

```
show diag [node-id | chassis | details | fans | memory | power-supply | summary]
```

**Tip**

For information on the software version, use the `show version` command.

In the following example, the `show diag` command displays information for all nodes in the system:

```
RP/0/RP0/CPU0:router@admin)# show diag

NODE 0/1/SP : MSC(SP)

PID: CRS-8-LCC
VID: V01
CLEI: IPMEZ10BRA
ECI: 446387
RACK NUM: 0
```
Displaying the Chassis Serial Numbers

Each chassis serial number must be defined during the configuration of multishelf routers. To view the actual serial number for each chassis in the system, enter the command `show diag chassis` in administration EXEC mode.

- Chassis serial numbers are displayed in the “Main” category for each chassis.
- “Rack Num” field displays the rack number assigned to that serial number.

For example:
```
RP/0/RP0/CPU0:router# admin
RP/0/RP0/CPU0:router (admin)# show diag chassis

RACK 0:
  MAIN: board type 0001e0
         800-24872

  PCA: 73-7640-05 rev 20
  PID: CRS-16-LCC
  VID: V01
  Clei: IFM6700DRA
  ECI: 445022
  RACK NUM: 1
```

Displaying the Configured Chassis Serial Numbers

Enter the command `show running-config | include dsc` in administration EXEC mode to display the serial number configured for each rack number.

This command is used to verify that the configuration is correct. The serial numbers displayed are those entered by an operator. If this number is wrong because of an entry error, the number is still displayed, but the DSC does not recognize the chassis.

**Note**

This command can also be entered in administration configuration mode.

For example:
```
RP/0/RP0/CPU0:router# admin
RP/0/RP0/CPU0:router (admin)# show running-config | include dsc

Building configuration...
dsc serial TBA00000003 rack F0
```
Displaying Software and Hardware Information

The **show version** command displays a variety of system information, including the hardware and software versions, router uptime, boot settings (including the configuration register), and active software.

The following is sample output from the **show version** command:

```
RP/0/RP0/CPU0:router# show version
Cisco IOS XR Software, Version 3.4.0[2I]
Copyright (c) 2006 by cisco Systems, Inc.
ROM: System Bootstrap, Version 1.40(20050525:193559) [CRS-1 ROMMON],

```

Displaying SDR Node IDs and Status

In EXEC mode, the **show platform** command displays information for all nodes assigned to a secure domain router (SDR). For each node, this information includes the host card type, the operational state, and the configuration state. To display information on a single node, enter the command with a node ID.

The syntax for the **show platform** command is:

```
show platform [node-id]
```
The following example displays the status for all nodes in the SDR to which you are connected:

```
RP/0/RP0/CPU0:router# show platform
```

<table>
<thead>
<tr>
<th>Node</th>
<th>Type</th>
<th>PLIM</th>
<th>State</th>
<th>Config State</th>
</tr>
</thead>
<tbody>
<tr>
<td>0/0/CPU0</td>
<td>MSC</td>
<td>16OC48-POS/DPT</td>
<td>IOS XR RUN</td>
<td>PWR, NSHUT, MON</td>
</tr>
<tr>
<td>0/2/CPU0</td>
<td>MSC</td>
<td>16OC48-POS/DPT</td>
<td>IOS XR RUN</td>
<td>PWR, NSHUT, MON</td>
</tr>
<tr>
<td>0/RP0/CPU0</td>
<td>RP(Standby)</td>
<td>N/A</td>

</tr>
<tr>
<td>0/RP1/CPU0</td>
<td>RP(Active)</td>
<td>N/A</td>
<td>IOS XR RUN</td>
<td>PWR, NSHUT, MON</td>
</tr>
</tbody>
</table>

Line cards are called modular services cards (MSCs).

The node-id appears in the rack/slot/module notation, and the node-id components are as follows:

- **rack** — In a single-shelf system the rack number is always “0.” In a multishelf system, the LCC rack number range is 0 to 255 and the FCC rack number range is F0 to F7.
- **slot** — Number of the physical slot in which the card is installed.
- **module** — Subslot number of a system hardware component.

Table 13: Node ID Components, on page 126 summarizes the node-id for each type of card.

**Table 13: Node ID Components**

<table>
<thead>
<tr>
<th>Card Type (the card to which your are issuing commands)</th>
<th>Rack (always “0” in a single-shelf system)</th>

</tbody>
</table>
Displaying Router Node IDs and Status

In administration EXEC mode, the `show platform` command displays information for all router nodes, which include nodes in all chassis and SDRs. In administration EXEC mode, the command display also includes additional node IDs such as those for fabric cards, alarm modules, and fan controllers. For each node, this information includes the host card type, the operational state, and the configuration state. To display information on a single node, enter the command with a node ID.

The syntax for the `show platform` command is:

```
show platform [node-id]
```

The following example displays the status for all nodes in a Cisco CRS-1 Multishelf System:

```
RP/0/RP0/CPU0:router(admin)# show platform

Node Type PLIM State Config State
-----------------------------------------------
0/5/SP MSC(SP) N/A IOS XR RUN PWR,NSHUT,MON
0/5/CPU0 MSC 4OC192-POS/DPT IOS XR RUN PWR,NSHUT,MON
0/7/SP DRP(SP) N/A IOS XR RUN PWR,NSHUT,MON
0/7/CPU0 DRP(Active) DRP-ACC IOS XR RUN PWR,NSHUT,MON
0/7/CPU1 DRP(Active) DRP-ACC IOS XR RUN PWR,NSHUT,MON
0/14/SP MSC(SP) N/A IOS XR RUN PWR,NSHUT,MON
0/14/CPU0 MSC 8-10GbE IOS XR RUN PWR,NSHUT,MON
0/RP0/CPU0 RP(Active) N/A IOS XR RUN PWR,NSHUT,MON
```
Line cards are called modular services cards (MSCs).

The node-id appears in the rack/slot/module notation, and the node-id components are as follows:

- **rack** — In a single-shelf system the rack number is always "0." In a multishelf system, the LCC rack number range is 0 to 255 and the FCC rack number range is F0 to F7.

- **slot** — Number of the physical slot in which the card is installed.

- **module** — Subslot number of a system hardware component.

Table 13: Node ID Components, on page 126 summarizes the node-id argument for each type of card.

### Displaying Router Environment Information

The show environment command displays hardware information for the system, including fan speeds, LED indications, power supply voltage and current information, and temperatures.

The syntax for the show environment command is:

```
show environment [options]
```
You can use the `show environment` command options to limit the detail in the command display. To view the command options, enter the `show environment ?` command. The following example shows the full environment status report:

```markdown
RP/0/RP0/CPU0:router# show environment

Temperature Information
---------------------------------------------
```

<table>

Displaying RP Redundancy Status

The `show redundancy` command displays the redundancy status of the route processors (RPs). This command also displays the boot and switch-over history for the RPs.

The `show redundancy` operates in EXEC and administration EXEC mode.

In the following example, the `show redundancy` command displays the redundancy status for a redundant RP pair:

```
RP/0/RP0/CPU0:router# show redundancy

This node (0/RP0/CPU0) is in ACTIVE role
Partner node (0/RP1/CPU0) is in STANDBY role
Standby node in 0/RP1/CPU0 is ready

Reload and boot info
----------------------
RP reloaded Fri Apr 9 03:44:28 2004: 16 hours, 51 minutes ago
This node booted Fri Apr 9 06:19:05 2004: 14 hours, 16 minutes ago
Last switch-over Fri Apr 9 06:53:18 2004: 13 hours, 42 minutes ago
Standby node boot Fri Apr 9 06:54:25 2004: 13 hours, 41 minutes ago
Standby node last not ready Fri Apr 9 20:35:23 2004: 0 minutes ago
Standby node last ready Fri Apr 9 20:35:23 2004: 0 minutes ago
There have been 2 switch-overs since reload
```

Displaying Field-Programmable Device Compatibility

The `show hw-module fpd` command displays field-programmable device (FPD) compatibility for all modules or a specific module.

The syntax for the `show hw-module fpd` command is:

```
show hw-module fpd location {all | node-id}
```

The `show hw-module fpd` operates in EXEC and administration EXEC mode.

The following example shows how to display FPD compatibility for all modules in the router:

```
RP/0/RP0/CPU0:router# show hw-module fpd location all

Existing Field Programmable Devices

<td>2.2</td>
<td>spa</td>
<td>fpga</td>
<td>5</td>
<td>1.8</td>
<td>No</td>
</tr>
</tbody>
</table>

NOTES:
```
1. One or more FPD needs an upgrade or a downgrade. This can be accomplished using the "admin upgrade hw-module fpd" CLI.

RP/0/RP0/CPU0:router# show hw-module fpd location 0/6/cpu0

Sun Apr 18 03:18:24.903 DST

```
+-------------------------------+-------------------------------------+-------------------------------------+
<table>
<thead>
<tr>
<th>Location</th>
<th>Card Type</th>
<th>HW Current SW Upg/Inst</th>
<th>Type</th>
<th>Subtype</th>
<th>Version</th>
<th>Dng?</th>
</tr>
</thead>
<tbody>
<tr>
<td>0/6/CPU0</td>
<td>CRSI-SIP-800</td>
<td>0.96 lc fpga1 6 0 6.00</td>

<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>lc</td>
<td>rommon</td>
<td>2.100 No</td>
<td></td>
</tr>
</tbody>
</table>
```

If the cards in the system do not meet the minimum requirements, the output contains a “NOTES” section that states how to upgrade the FPD image.

Currently running FPD image version. Specifies whether an FPD upgrade or downgrade is required. A downgrade is required in rare cases when the version of the FPD image has a higher major revision than the version of the FPD image in the current Cisco IOS XR software package.

### RP Redundancy and Switchover

This section describes RP redundancy and switchover commands and issues.

#### Establishing RP Redundancy

Your router has two slots for RPs: RP0 and RP1 (see Figure 4: Redundant Set of RPs Installed in Slots RP0 and RP1 in an 8-Slot Chassis, on page 133). These slots are configured for redundancy by default, and the redundancy cannot be eliminated. To establish RP redundancy, install RPs into both slots.

![Figure 4: Redundant Set of RPs Installed in Slots RP0 and RP1 in an 8-Slot Chassis](image)

Note: Illustration not to scale
Determining the Active RP in a Redundant Pair

During system startup, one RP in each redundant pair becomes the active RP. You can tell which RP is the active RP in the following ways:

- The active RP can be identified by the green Primary LED on the faceplate of the card. The active RP is indicated when the Primary LED is on. The alphanumeric LED display on the RP displays ACTV RP.

- The slot of the active RP is indicated in the CLI prompt. For example:

  ```
  RP/0/RP1/CPU0:router# show redundancy
  This node (0/RP0/CPU0) is in ACTIVE role
  Partner node (0/RP1/CPU0) is in STANDBY role
  Standby node in 0/RP1/CPU0 is ready
  Reload and boot info
  ----------------------
  RP reloaded Fri Apr 9 03:44:28 2004: 16 hours, 51 minutes ago
  This node booted Fri Apr 9 06:19:05 2004: 14 hours, 16 minutes ago
  Last switch-over Fri Apr 9 06:53:18 2004: 13 hours, 42 minutes ago
  Standby node boot Fri Apr 9 06:54:25 2004: 13 hours, 41 minutes ago
  Standby node last not ready Fri Apr 9 20:35:23 2004: 0 minutes ago
  Standby node last ready Fri Apr 9 20:35:23 2004: 0 minutes ago
  There have been 2 switch-overs since reload
  ```

Role of the Standby RP

The second RP to boot in a redundant pair automatically becomes the standby RP. While the active RP manages the system and communicates with the user interface, the standby RP maintains a complete backup of the software and configurations for all cards in the system. If the active RP fails or goes off line for any reason, the standby RP immediately takes control of the system.

Summary of Redundancy Commands

RP redundancy is enabled by default in the Cisco IOS XR software, but you can use the commands described in Table 15: RP Redundancy Commands, on page 135 to display the redundancy status of the cards or force a manual switchover.
Table 15: RP Redundancy Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show redundancy</td>
<td>Displays the redundancy status of the RPs. This command also displays the boot and switch-over history for the RPs.</td>
</tr>
<tr>
<td>redundancy switchover</td>
<td>Forces a manual switchover to the standby RP. This command works only if the standby RP is installed and in the &quot;ready&quot; state.</td>
</tr>
<tr>
<td>show platform</td>
<td>Displays the status for node, including the redundancy status of the RP cards. In EXEC mode, this command displays status for the nodes assigned to the SDR. In administration EXEC mode, this command displays status for all nodes in the system.</td>
</tr>
</tbody>
</table>

**Automatic Switchover**

Automatic switchover from the active RP to the standby RP occurs only if the active RP encounters a serious system error, such as the loss of a mandatory process or a hardware failure. When an automatic switchover occurs, the RPs respond as follows:

- If a standby RP is installed and "ready" for switchover, the standby RP becomes the active RP. The original active RP attempts to reboot.
- If the standby RP is not in "ready" state, then both RPs reboot. The first RP to boot successfully assumes the role of active RP.

**RP Redundancy During RP Reload**

The `reload` command causes the active RP to reload the Cisco IOS XR software. When an RP reload occurs, the RPs respond as follows:

- If a standby RP is installed and "ready" for switchover, the standby RP becomes the active RP. The original active RP reboots and becomes the standby RP.
- If the standby RP is not in the "ready" state, then both RPs reboot. The first RP to boot successfully assumes the role of active RP.

---

**Caution**

You should not use the `reload` command to force an RP switchover because the result could be a significant loss of router operations. Instead, use the `redundancy switchover` command to fail over to the standby RP, then use the `hw-module location node-id reload` command to reload the new standby RP.
Manual Switchover

You can force a manual switchover from the active RP to the standby RP using the `redundancy switchover` command.

If a standby RP is installed and ready for switchover, the standby RP becomes the active RP. The original active RP becomes the standby RP. In the following example, partial output for a successful redundancy switchover operation is shown:

```
RP/0/RP0/CPU0:router# show redundancy
  This node (0/RP0/CPU0) is in ACTIVE role
  Partner node (0/RP1/CPU0) is in STANDBY role
  Standby node in 0/RP1/CPU0 is ready
```

```
RP/0/RP0/CPU0:router# redundancy switchover
  Updating Commit Database. Please wait...[OK]
  Proceed with switchover 0/RP0/CPU0 -> 0/RP1/CPU0? [confirm]
  Initiating switch-over.

RP/0/RP1/CPU0:router#
```

In the preceding example, the Telnet connection is lost when the previously active RP resets. To continue management of the router, you must connect to the newly activated RP as shown in the following example:

```
User Access Verification
  Username: xxxxx
  Password: xxxxx
  Last switch-over Sat Apr 15 12:26:47 2009: 1 minute ago
```

```
RP/0/RP1/CPU0:router#
```

If the standby RP is not in "ready" state, the switchover operation is not allowed. In the following example, partial output for a failed redundancy switchover attempt is shown:

```
RP/0/RP0/CPU0:router# show redundancy
  Redundancy information for node 0/RP1/CPU0:
  Node 0/RP0/CPU0 is in ACTIVE role
  Partner node (0/RP1/CPU0) is in UNKNOWN role
  Reload and boot info
  --------------------------------
  RP reloaded Wed Mar 29 17:22:08 2009: 2 weeks, 2 days, 19 hours, 14 minutes ago
  Active node booted Sat Apr 15 12:27:58 2009: 8 minutes ago
  Last switch-over Sat Apr 15 12:35:42 2009: 1 minute ago
  There have been 4 switch-overs since reload
```

```
RP/0/RP0/CPU0:router# redundancy switchover
  Switchover disallowed: Standby node is not ready.
```
Communicating with a Standby RP

The active RP automatically synchronizes all system software, settings, and configurations with the standby RP.

If you connect to the standby RP through the console port, you can view the status messages for the standby RP. The standby RP does not display a CLI prompt, so you cannot manage the standby card while it is in standby mode.

If you connect to the standby RP through the management Ethernet port, the prompt that appears is for the active RP, and you can manage the router the same as if you had connected through the management Ethernet port on the active RP.

Reloading, Shutting Down, or Power Cycling a Node

Use the commands described in this section to reload the Cisco IOS XR software on the active RP or on any specified node in the system. This section also describes the commands used to administratively shut down a node and power a node on or off.

Table 16: Commands to Reload, Shut Down, or Power Cycle a Node, on page 137 summarizes the commands described in this section.

Table 16: Commands to Reload, Shut Down, or Power Cycle a Node

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>hw-module location node-id power disable</strong></td>
<td>This command administratively turns the power off for a node. It is entered in administration configuration mode. The changes do not take effect until you enter the <strong>commit</strong> command. To power on a node, use the <strong>no</strong> form of this command. <strong>Note</strong> This command cannot be used to disable power on the RP from which the command is entered.</td>
</tr>
<tr>
<td><strong>hw-module location node-id reload</strong></td>
<td>This command works in EXEC mode and reloads the Cisco IOS XR software on a specific node or all nodes. To specify all nodes, enter the <strong>all</strong> keyword in place of the <strong>node-id</strong> argument. The node reloads with the current running configuration and active software set for that node.</td>
</tr>
</tbody>
</table>
Reloading the Active RP

The `reload` command causes the active RP to reload the Cisco IOS XR software according to the configuration register setting. This setting determines how the active RP acts when reloaded.

This section contains instructions to reload the Cisco IOS XR software and return to EXEC mode. For instructions to use the `reload` command for entering ROM Monitor bootstrap mode, see *Cisco IOS XR ROM Monitor Guide for the Cisco CRS Router*.

⚠️ **Caution**

Because the `reload` command causes the active RP to go off line and either reload the Cisco IOS XR software or enter ROM Monitor mode, the router experiences a loss of service unless a redundant standby RP is installed and in “ready” state. To display the status of the standby RP, use the `show redundancy` command in EXEC mode.

**SUMMARY STEPS**

1. `show redundancy`
2. `admin`
3. `show variables boot`
4. (Optional) `config-register register-value`
5. `admin`
6. `reload`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>show redundancy</code></td>
<td>Displays the RP redundancy status.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>RP/0/RP0/CPU0:router# show redundancy</td>
</tr>
<tr>
<td></td>
<td>• If a standby RP is in “ready” redundancy state, the <code>reload</code> command also causes the router to gracefully fail over to the standby RP.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Command or Action</td>
</tr>
<tr>
<td>--------</td>
<td>------------------</td>
</tr>
<tr>
<td></td>
<td>admin</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RP0/CPU0:router# admin</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 3</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>show variables boot</td>
<td>Displays the configuration register setting.</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RP0/CPU0:router{admin)# show variables boot</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Enter this command in administration EXEC mode.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• For normal operations, the configuration register setting is 0x102 or 0x2102, which causes the active RP to reload the Cisco IOS XR software.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Verify that the configuration register setting is 0x102 or 0x2102. If it is not, complete Step 4, on page 139 to reset the configuration register to 0x102 or 0x2102.</td>
</tr>
<tr>
<td>Note</td>
<td>For instructions on how to enter ROM Monitor bootstrap mode, see Cisco IOS XR ROM Monitor Guide for the Cisco CRS Router.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 4</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>config-register register-value</td>
<td>(Optional) Sets the configuration register to the respective value. This step is necessary only if the register is not set to the respective value (0x102 or 0x2102) in the running configuration. You can use either 0x102 or 0x2102. Both these values specify the same functionality, as bit 13 in 0x2102 is not significant for Cisco IOS XR software.</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RP0/CPU0:router{admin)# config-register 0x102</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 5</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>admin</td>
<td>Enters administration EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RP0/CPU0:router# admin</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 6</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>reload</td>
<td>Reloads the active RP according to the configuration register setting.</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RP0/CPU0:router# reload</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• If the setting is 0x102 or 0x2102 , then the RP reloads the Cisco IOS XR software.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• If the standby RP is in &quot;ready&quot; redundancy state, the router switches over to the standby RP.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• If a standby RP is not installed or not in a &quot;ready&quot; state, the router experiences a loss of service while the active RP is reloading the Cisco IOS XR software.</td>
</tr>
</tbody>
</table>

**Flash Disk Recovery**

When an RP or DRP is power cycled or experiences an ungraceful reset, the boot disk (PCMCIA flash disk used to boot the card) may experience a file-system corruption. If this occurs, an error message is displayed.
and the RP or DRP fails to boot. The corrupted flash disk is automatically reformatted and the Cisco IOS XR software is restored from the designated system controller (DSC) for the system.

For example, if a flash disk for an RP or DRP is corrupted, the RP or DRP fails to boot and the following error message is displayed:

```
Unable to mount /disk0:, filesystem is corrupted.
Check fsck log at /tmp/chkfs_fd0.log
init: special_commands:wait for disk0: failed
```

If this occurs, then the flash disk is automatically reformatted and the Cisco IOS XR software is restored to the flash disk.

---

**Note**

If the flash disk is badly damaged and cannot be reformatted, the disk must be replaced.

If the corrupted flash disk is the DSC, then the router fails over to the standby DSC. If no standby DSC is installed, then the system fails to boot.

---

### Using Controller Commands to Manage Hardware Components

The `controller`, `controllers`, and `show controllers` commands are used to manage and display settings for various hardware components, including the switch fabric management, Ethernet control plane, and interface manager. These commands are primarily diagnostic and related to driver-level details. The information available with these commands varies widely and is hardware specific.

For information on the use of these commands, see *Cisco IOS XR Interface and Hardware Component Command Reference for the Cisco CRS Router*.

### Formatting Hard Drives, Flash Drives, and Other Storage Devices

To format a storage device on the router, use the `format` command in EXEC mode.

**Caution**

Formatting a storage device deletes all data on that device.

The following command syntax is used:

```
format filesystem: [options]
```

Table 17: format command Syntax Description, on page 141 describes the `format` command syntax.
### Table 17: format command Syntax Description

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filesystem</td>
<td>Specifies the memory device to format. The supported file systems are:</td>
</tr>
<tr>
<td></td>
<td>• bootflash:</td>
</tr>
<tr>
<td></td>
<td>• compactflash:</td>
</tr>
<tr>
<td></td>
<td>• flash:</td>
</tr>
<tr>
<td></td>
<td>• harddisk:</td>
</tr>
<tr>
<td></td>
<td>• harddiska:</td>
</tr>
<tr>
<td></td>
<td>• disk0:</td>
</tr>
<tr>
<td></td>
<td>• disk1:</td>
</tr>
<tr>
<td></td>
<td>Enter <code>format ?</code> to see the devices supported on your router.</td>
</tr>
<tr>
<td>options</td>
<td>Enter <code>format filesystem: ?</code> to see the available options.</td>
</tr>
<tr>
<td></td>
<td>For more information, see <em>Cisco IOS XR System Management Command Reference for the Cisco CRS Router</em>.</td>
</tr>
</tbody>
</table>

In the following example, the `format` command is used to format the hard disk:

```
RP/0/RP0/CPU0:router# format harddisk:
```

### Removing and Replacing Cards

This section describes card replacement issues and procedures.

### Removing Line Cards, MSCs, or PLIMs

Line cards, modular services cards (MSCs), and physical layer interface modules (PLIMs) are designed for online insertion and removal (OIR). The service processing functions are provided on the MSC, and the physical line interface is provided on a separate card that connects the physical lines to the MSC.

The OIR feature allows you to remove and replace cards without removing power to the card or chassis. Removing a card interrupts all traffic passing through the card, but it does not remove the card configuration.

When you remove a card, the configuration remains for all interfaces, but the interfaces do not appear in the output of the `show interfaces` command. You can view interface configurations by entering the `show`
running-config command. The following example shows how the configuration appears when a card is removed:

```
RP/0/RP0/CPU0:router# show running-config

Building configuration...
hostname router
router ospf 3269
area 0
    interface POS0/3/0/0
cost 20
!
interface preconfigure POS0/3/0/0
ipv4 address 10.10.50.1 255.255.255.0
!
interface preconfigure POS0/3/0/1
description POS0/3/0/1
shutdown
!
interface preconfigure POS0/3/0/2
description POS0/3/0/2
shutdown
!
interface preconfigure POS0/3/0/3
description POS0/3/0/3
shutdown
!
```

In this example, the MSC in slot 3 is removed, and the interface configuration for all four interfaces changes to "interface preconfigure." However, the "router ospf" reference to a slot 3 interface does not change. If you replace a PLIM with another PLIM that uses the same media type and port count, the configuration becomes active on the replacement card.

To remove the configuration for a slot after a card is removed, use the `no interface preconfigure` command to remove all interface configuration statements for that card in the running configuration. In addition, search the configuration for any references to the removed interfaces, such as the "router ospf" reference to slot 3 in the preceding example.

To remove the configuration for a slot when a card is installed, use the `no interface` command to remove all interface configuration statements for that card in the running configuration. In addition, search the configuration for any references to the removed interfaces.

Each PLIM supports a specific media type (Packet over SONET/SDH [POS] or Ethernet, for example) and port count. If you replace a PLIM with one that supports a different media type or port count, you should review the configuration and revise it to support the replacement PLIM.

### Replacing an MSC

When you replace an MSC, the guidelines in the Removing Line Cards, MSCs, or PLIMs, on page 141 apply. Because only one type of MSC exists, no special procedures are required for card removal and replacement.

### Replacing a Line Card or PLIM with the Same Media Type and Port Count

When you replace a line card or PLIM with a card that is of the same media type and has the same port count as the replaced card, the guidelines in the Removing Line Cards, MSCs, or PLIMs, on page 141 apply. Because the replacement card is of the same media type and port count, no special procedures are required for card removal and replacement.
Replacing a Line Card or PLIM with the Same Media Type and a Different Port Count

When you replace a line card or PLIM with a card that is of the same media type with a different port count, the guidelines in Removing Line Cards, MSCs, or PLIMs, on page 141 apply.

If the new card has a greater port count than the replaced card, the configuration applies to the corresponding lower port numbers, and the ports that did not exist on the replaced card have no configuration and come up in the shutdown state.

If the new card supports fewer ports, the existing configuration for the corresponding number of ports on the new card set is applied. The previous configuration for the removed ports remains in interface preconfigure state, as shown in the following example:

```
RP/0/RP0/CPU0:router# show running-config
Building configuration...
hostname rtp-gsr1
interface POS0/3/0/0
  ipv4 address 10.10.50.1 255.255.255.0
!
interface preconfigure POS0/3/0/1
  description POS0/3/0/1
  shutdown
!
interface preconfigure POS0/3/0/2
  description POS0/3/0/2
  shutdown
!
interface preconfigure POS0/3/0/3
  description POS0/3/0/3
  shutdown
!
```

In the preceding example, a four-port card has been replaced with a single-port card. The configuration from port 1 on the four-port card is applied to the single port on the replacement card, and the remaining port configurations change to “interface preconfigure.” To remove the configuration for the missing interfaces, use the `no interface preconfigure` command. In addition, search for and remove any configuration references to the removed interfaces.

Whenever you replace a line card or PLIM with the same media type and a different port count, review the running configuration in the router and revise the configuration as necessary.

Replacing a Line Card or PLIM with a Different Media Type

When you replace a line card or PLIM with a card that is of a different media type (for example, if you replace a POS PLIM with an Ethernet PLIM), the guidelines in Removing Line Cards, MSCs, or PLIMs, on page 141 apply. Review the running configuration in the router and revise the configuration as necessary for the new media type.

Real Time Power Monitoring

Real Time Power monitoring feature consolidates the power consumption values into a common interface. The user can now know the real time power being consumed on the individual slots and the router as a whole.
Advantages

With real time power monitoring, power consumption is maintained at slot level granularity. The user can identify to which power consuming slab the system belongs to, and can take business decisions accordingly.

Card support

Real Time Power is supported on the following cards:

- Cisco CRS Modular Services card 400G
- Cisco CRS Modular Services card 200G
- Cisco CRS Series 16 Slots Fabric Card / Multi (400G)
- Cisco CRS Series 16 Slots Fabric Card / Multi (200G)
- Cisco CRS Series 16 Slots Fabric Card / Single (400G)
- Cisco CRS Series 8 Slots Fabric Card / Single (400G)
- Cisco CRS Series 40x10GE Interface Module
- Cisco CRS Series 4x100GE Interface Module
- Cisco CRS Series 20x10GE (SFP+) + 5x40GE (QSFP+) Interface Module
- Cisco CRS Series 20x10GE (SFP+) + 2x100GE (CPA) Interface Module

Removing and Replacing Cisco 16-Slot Line Card Chassis Switch Fabric Cards

16-slot LCCs support two switch fabric cards: the CRS-16-FC/S and the CRS-16-FC/M. The CRS-16-FC/S switch fabric card provides the Stage 1, 2, and 3 switch fabric for one fabric plane in a standalone Cisco CRS-1 Carrier Routing System 16-Slot Line Card Chassis. The CRS-16-FC/M switch fabric card provides the Stage 1 and 3 switch fabric for one fabric plane in a Cisco CRS-1 LCC within a multishelf system.

The Cisco CRS-1 16-Slot LCC can support the maximum throughput with seven of the eight fabric planes. To prevent traffic loss, we recommend that you shut the power down on a fabric plane for a switch fabric card before you remove it. If a switch fabric card is removed with the power on, the card is not harmed, but some traffic may be lost. When the replacement card is inserted, you can restore the power to the fabric plane and bring up the replacement card. This section describes how to properly remove and replace Cisco CRS-16-FC/S and Cisco CRS-16-FC/M cards for upgrades or repairs.

Note

The process of removing and replacing cards while the router power is on is called online insertion and removal (OIR). This procedure removes power to a specific slot before the switch fabric card is replaced. The power remains on for all other slots.

Tip

For more information about switch fabric cards, see Related Topics.
This procedure does not apply when starting the router for the first time or after a power cycle or reload.

**Before You Begin**

- You must be in a user group associated with a task group that includes the proper task IDs. The command reference guides include the task IDs required for each command. If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

- You must log in as root-system before starting the procedure. To confirm your login status, use the **show user group** command:

```
RP/0/RP0/CPU0:router# show user group
root-system, cisco-support
```

To confirm your login status including root, use the **show user all | include root** command:

```
RP/0/RP0/CPU0:router# show user all | include root
Groups: root-system, cisco-support
Task: root-lr : READ WRITE EXECUTE DEBUG (reserved)
Task: root-system : READ WRITE EXECUTE DEBUG (reserved)
```

**SUMMARY STEPS**

1. admin
2. show platform
3. show controllers fabric plane all
4. admin
5. controllers fabric plane *plane_number* shutdown
6. commit
7. end
8. show controllers fabric plane all
9. admin
10. hw-module power disable location *node-id*
11. show platform
12. When the fabric card state changes to UNPOWERED, replace the fabric card.
13. admin
14. no hw-module power disable location *node-id*
15. show platform
16. admin
17. no controllers fabric plane *plane_number* shutdown
18. show controllers fabric plane all

Managing the Router Hardware
Removing and Replacing Cisco 16-Slot Line Card Chassis Switch Fabric Cards
Removing and Replacing 8-Slot Line Card Chassis Switch Fabric Cards

Each CRS-8-FC/S switch fabric card provides the Stage 1, 2, and 3 switch fabric for two fabric planes in a Cisco CRS-1 8-Slot Line Card Chassis.

The 8-Slot LCC can support the maximum throughput with seven of the eight fabric planes. However, because each CRS-8-FC/S switch fabric card hosts two fabric planes, replacing a fabric card does reduce the maximum throughput and impacts router traffic if the router is operating at maximum capacity. To minimize traffic loss, we recommend that you shut the power down for the switch fabric card before you remove it. If a switch fabric card is removed with power on, the card is not harmed, but the traffic impact may be greater than if the card power were removed. When the replacement card is inserted, you can restore the power and bring up the replacement card. This section describes how to properly remove and replace a Cisco CRS-8-FC/S switch fabric card for upgrades or repairs.

The process of removing and replacing cards while the router power is on is called *online insertion and removal (OIR)*. This procedure removes power to a specific slot before the switch fabric card is replaced. The power remains on for all other slots.

For more information about switch fabric cards, see *Related Topics*.

---

**Note**
This procedure does not apply when starting the router for the first time or after a power cycle or reload.

**Before You Begin**

- You must be in a user group associated with a task group that includes the proper task IDs. The command reference guides include the task IDs required for each command. If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

- You must log in as root-system before starting the procedure. To confirm your login status, use the `show user group` command:

  ```
  RP/0/RP0/CPU0:router# show user group
  root-system, cisco-support
  ```

  To confirm your login status including root, use the `show user all | include root` command:

  ```
  RP/0/RP0/CPU0:router# show user all | include root
  Groups: root-system, cisco-support
  Task: root-lr : READ WRITE EXECUTE DEBUG (reserved)
  Task: root-system : READ WRITE EXECUTE DEBUG (reserved)
  ```
### SUMMARY STEPS

1. admin
2. show platform
3. show controllers fabric plane all
4. admin
5. controllers fabric plane \textit{plane\_number} shutdown
6. controllers fabric plane \textit{plane\_number} shutdown
7. commit
8. end
9. show controllers fabric plane all
10. admin
11. hw-module power disable location \textit{node-id}
12. commit
13. end
14. show platform
15. When the fabric card state changes to UNPOWERED, replace the fabric card.
16. admin
17. no hw-module power disable location \textit{node-id}
18. commit
19. end
20. show platform
21. admin
22. no controllers fabric plane \textit{plane\_number} shutdown
23. no controllers fabric plane \textit{plane\_number} shutdown
24. commit
25. end
26. show controllers fabric plane all

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters administration EXEC mode.</td>
</tr>
<tr>
<td>admin</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>RP/0/RP0/CPU0:router# admin</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Displays all cards on the router.</td>
</tr>
<tr>
<td>show platform</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>RP/0/RP0/CPU0:router(admin)# show platform</td>
</tr>
<tr>
<td></td>
<td>• Allows you to identify a fabric card (identified with an SM prefix).</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td><strong>Step 3</strong> show controllers fabric plane all</td>
<td>Displays the status of each fabric plane.</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RP0/CPU0:router(admin)# show controllers fabric plane all</td>
</tr>
<tr>
<td><strong>Step 4</strong> admin</td>
<td>Enters administration EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RP0/CPU0:router# admin</td>
</tr>
<tr>
<td><strong>Step 5</strong> controllers fabric plane <code>plane_number</code> shutdown</td>
<td>Shuts down one of the two fabric planes on a CRS-8-FC/S card.</td>
</tr>
<tr>

<td>RP/0/RP0/CPU0:router(admin-config)# controllers fabric plane 0 shutdown</td>
</tr>
<tr>
<td><strong>Step 6</strong> controllers fabric plane <code>plane_number</code> shutdown</td>
<td>Shuts down one of the two fabric planes on a CRS-8-FC/S card.</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RP0/CPU0:router(admin-config)# controllers fabric plane 1 shutdown</td>
</tr>
<tr>
<td><strong>Step 7</strong> commit</td>
<td>Commits the target configuration to the router running configuration.</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RP0/CPU0:router(admin-config)# commit</td>
</tr>
<tr>
<td><strong>Step 8</strong> end</td>
<td>Exits administration configuration mode and returns to administration EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RP0/CPU0:router(admin-config)# end</td>
</tr>
</tbody>
</table>

- The number following the SM prefix identifies the corresponding fabric planes, as follows:
  - Slot SM0: fabric planes 0 and 1
  - Slot SM1: fabric planes 2 and 3
  - Slot SM2: fabric planes 4 and 5
  - Slot SM3: fabric planes 6 and 7

- Before removing a CRS-8-FC/S card, shut down both planes for the fabric card. The fabric planes are assigned to fabric cards as follows:
  - Slot SM0: fabric planes 0 and 1
  - Slot SM1: fabric planes 2 and 3
  - Slot SM2: fabric planes 4 and 5
  - Slot SM3: fabric planes 6 and 7

- Shut down the companion plane to the plane shut down in the previous step.

<td><strong>Example:</strong>&lt;br&gt;RP/0/RP0/CPU0:router(admin-config)# commit</td>
<td></td>
</tr>
<tr>
<td><strong>Step 25</strong></td>
<td><strong>end</strong>&lt;br&gt;Exits administration configuration mode and returns to administration EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong>&lt;br&gt;RP/0/RP0/CPU0:router(admin-config)# end</td>
<td></td>
</tr>
</tbody>
</table>
Step 26

### Command or Action

**show controllers fabric plane all**

### Purpose

Displays the fabric plane status.

The *Admin State* and *Oper State* columns should read *UP* for both fabric planes on the fabric card.

---

**Examples**

The following example shows the commands and command responses for replacing an 8-slot LCC fabric card:

```
RP/0/RP1/CPU0:router# admin
RP/0/RP1/CPU0:router(admin)# show platform

Cisco IOS XR System Management Configuration Guide for the Cisco CRS Router, Release 4.2.x
Removing and Replacing Cisco 4-Slot Line Card Chassis Switch Fabric Cards

The Cisco CRS-4-FC switch fabric card provides the Stage 1, 2, and 3 switch fabric for one fabric plane in a Cisco CRS-1 4-Slot Line Card Chassis.

The Cisco CRS-1 4-Slot LCC can support the maximum throughput with three of the four fabric planes. To prevent traffic loss, we recommend that you shut the power down on a fabric plane for a switch fabric card before you remove it. If a switch fabric card is removed with the power on, the card is not harmed, but some traffic may be lost. When the replacement card is inserted, you can restore the power to the fabric plane and bring up the replacement card. This section describes how to properly remove and replace Cisco CRS-4-FC switch fabric cards for upgrades or repairs.

At least two planes of the switch fabric (an even plane and an odd plane) must be active at all times for the Cisco CRS-1 4-slot line card chassis to operate. Otherwise, the switch fabric fails, causing a system failure.

The process of removing and replacing cards while the router power is on is called online insertion and removal (OIR). This procedure removes power to a specific slot before the switch fabric card is replaced. The power remains on for all other slots.

For more information about switch fabric cards, see the hardware documentation listed in the Related Documents, on page 168.

This procedure does not apply when starting the router for the first time or after a power cycle or reload.

Before You Begin

• You must be in a user group associated with a task group that includes the proper task IDs. The command reference guides include the task IDs required for each command. If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.
• You must log in as root-system before starting the procedure. To confirm your login status, use the `show user group` command:

```
RP/0/RP0/CPU0:router# show user group
root-system, cisco-support
```

To confirm your login status including root, use the `show user all | include root` command:

```
RP/0/RP0/CPU0:router# show user all | include root
Groups: root-system, cisco-support
Task: root-lr : READ WRITE EXECUTE DEBUG (reserved)
Task: root-system : READ WRITE EXECUTE DEBUG (reserved)
```

**SUMMARY STEPS**

1. admin
2. show platform
3. show controllers fabric plane all
4. configure
5. controllers fabric plane `plane_number` shutdown
6. commit
7. end
8. show controllers fabric plane all
9. configure
10. hw-module power disable location `node-id`
11. commit
12. end
13. show platform
14. When the fabric card state changes to UNPOWERED, replace the fabric card.
15. configure
16. no hw-module power disable location `node-id`
17. commit
18. end
19. show platform
20. configure
21. no controllers fabric plane `plane_number` shutdown
22. commit
23. end
24. show controllers fabric plane all
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters administration EXEC mode.</td>
</tr>
<tr>
<td>admin</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RP0/CPU0:router# admin</td>
</tr>
</tbody>
</table>

**Step 2**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show platform</td>
<td>Displays all cards on the router.</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RP0/CPU0:router(admin)# show platform</td>
</tr>
</tbody>
</table>

- Allows you to identify a fabric card (identified with an SM prefix).
- The number following the SM prefix identifies the corresponding fabric plane, as follows:
  - Slot SM0: fabric plane 0
  - Slot SM1: fabric plane 1
  - Slot SM2: fabric plane 2
  - Slot SM3: fabric plane 3

**Step 3**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show controllers fabric plane all</td>
<td>Displays the status of each fabric plane.</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RP0/CPU0:router(admin)# show controllers fabric plane all</td>
</tr>
</tbody>
</table>

**Step 4**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure</td>
<td>Enters administration configuration mode.</td>
</tr>
<tr>
<td>Example:</td>

### Managing the Router Hardware

#### Removing and Replacing Cisco 4-Slot Line Card Chassis Switch Fabric Cards

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong> RP/0/RP0/CPU0:router(admin)# show controllers fabric plane all</td>
<td>• The <em>Admin State</em> and <em>Oper State</em> columns should read DOWN.</td>
</tr>
</tbody>
</table>

##### Step 9

configure

**Example:** RP/0/RP0/CPU0:router(admin)# configure

Enters administration configuration mode.

##### Step 10

**Example:**

```plaintext
RP/0/RP0/CPU0:router(admin-config)# hw-module power disable location 0/SM0/SP
```

Sets the target configuration to remove power from the fabric card.

##### Step 11

commit

**Example:** RP/0/RP0/CPU0:router(admin-config)# commit

Commits the target configuration to the router running configuration.

##### Step 12

end

**Example:** RP/0/RP0/CPU0:router(admin-config)# end

Exits administration configuration mode and returns to administration EXEC mode.

##### Step 13

**Example:**

```plaintext
RP/0/RP0/CPU0:router(admin)# show platform
```

Displays the status of all cards on the router.

- Check the *State* column for the status of the fabric card.
- Do not continue to the next step until the status in the *State* column changes to UNPOWERED.
- It takes some time for the card to shut down. Repeat the *show platform* command to check the card state.

##### Step 14

When the fabric card state changes to UNPOWERED, replace the fabric card.

Replaces the physical card.

##### Step 15

configure

**Example:** RP/0/RP0/CPU0:router(admin)# configure

Enters administration configuration mode.

##### Step 16

**Example:**

```plaintext
RP/0/RP0/CPU0:router(admin-config)# no hw-module power disable location 0/SM0/SP
```

Sets the target configuration to restore power to the fabric card.
### Command or Action

Removing and Replacing Cisco 4-Slot Line Card Chassis Switch Fabric Cards

Managing the Router Hardware

When the state of the fabric card changes to UNPOWERED, replace the fabric card.

Cisco IOS XR System Management Configuration Guide for the Cisco CRS Router, Release 4.2.x
Upgrading the CPU Controller Bits

Use this procedure to upgrade the CPU controller bits on all nodes that are installed in the router or on a specific node.

Upgrading the CPU Controller Bits

Use this procedure to upgrade the CPU controller bits on all nodes that are installed in the router or on a specific node.
SUMMARY STEPS

1. admin
2. upgrade cpuctrlbits {all | location node-id}

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Enters administration EXEC mode.</td>
</tr>
<tr>
<td>admin</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RP0/CPU0:router# admin</td>
</tr>
</tbody>
</table>

Step 2 | Upgrades the CPU controller bits on all nodes in the router. Use the location node-id keyword and argument to upgrade the CPU controller bits on a specific node. |
| upgrade cpuctrlbits {all | location node-id} | |
| Example: | RP/0/RP0/CPU0:router(admin)# upgrade cpuctrlbits all |

Examples

The following example shows how to upgrade the CPU controller bits on all nodes in a router:

RP/0/RP0/CPU0:router# admin
RP/0/RP0/CPU0:router(admin)# upgrade cpuctrlbits all

Please do not power cycle, reload the router or reset any nodes until all upgrades are completed. Please check the syslog to make sure that all nodes are upgraded successfully. If you need to perform multiple upgrades, please wait for current upgrade to be completed before proceeding to another upgrade. Failure to do so may render the cards under upgrade to be unusable.

In general terms, field-programmable devices (FPDs) are hardware devices implemented on router cards that support separate software upgrades. A field-programmable gate array (FPGA) is a type of programmable memory device that exists on most hardware components of the router. The term FPD has been introduced to collectively and generically describe any type of programmable hardware device on SIPS and shared port adapters (SPAs), including FPGAs. Cisco IOS XR software provides the Cisco FPD upgrade feature to manage the upgrade of FPD images on SIPS and SPAs.

This chapter describes the information that you must know to verify image versions and to perform an upgrade for SPA or SIP FPD images when incompatibilities arise.

For complete descriptions of the FPD commands listed in this module, see Related Documents, on page 186. To locate documentation for other commands that might appear in the course of performing a configuration task, search online in Cisco IOS XR Commands Master List for the Cisco CRS Router.

Prerequisites for FPD Image Upgrades

Before upgrading the FPD on your router you must install and activate the fpd.pie.

Overview of FPD Image Upgrade Support

An FPD image is used to upgrade the software on an FPD.

Whenever an image is released that supports SIPs and SPAs, a companion SIP and SPA FPD image is bundled. Generally, the FPD image is not automatically upgraded. You must manually upgrade the FPD image running on the SPA or SIP when you upgrade the Cisco IOS XR software image.

FPD versions must be compatible with the Cisco IOS XR software that is running on the router; if an incompatibility exists between an FPD version and the Cisco IOS XR software, the device with the FPGA may not operate properly until the incompatibility is resolved. An FPGA incompatibility on a SPA does not necessarily affect the running of the SPA interfaces; an FPD incompatibility on a SIP disables all interfaces for all SPAs in the SIP until the incompatibility is addressed.

Use the `show hw-module fpd` command to determine if an FPD upgrade is required. A value of ‘Yes’ in the Upg/Dng? (upgrade/downgrade) column indicates that an upgrade or downgrade is required.

The Cisco CRS Router supports upgrades for FPGA devices on its SIPs and SPAs. FPGA and ROMMON software upgrades are part of an FPD image package that corresponds to a Cisco IOS XR software image. SIPs and SPAs support manual upgrades for FPGA devices using the Cisco FPD upgrade feature that is further described in this chapter.

Related Topics

- `show hw-module fpd` Command Output: Example, on page 177

Automatic FPD Upgrade

By default, the FPD image is not automatically upgraded. You must manually upgrade the FPD image running on the SPA or SIP when you upgrade the Cisco IOS XR software image.

However, if you enable the `fpd auto-upgrade` command in administration configuration mode, FPD images are automatically updated in the following instance.

- Software upgrade is carried out.

For the automatic FPD upgrade to work, the following conditions must be met:

- The FPD package installation envelope (PIE) must already be installed on the router.
- The FPD PIE must be activated together with the new Cisco IOS XR image.
- The `fpd auto-upgrade` command must be enabled.
Although the FPD upgrade is performed during the install operation, there is no install commit performed. Therefore, once the FPD has been upgraded, if the image is rolled back to the original version, the FPD version is not downgraded to the previous version.

The automatic FPD upgrade is not performed in the following instances:

- Line cards or other cards such as RPs, SPAs or alarm cards are added to an existing router.
- A line card chassis is added to an existing CRS multi-chassis router.
- A non-reload software maintenance upgrade (SMU) or PIE installation is performed, even where the FPD image version changes. Since a non-reload installation is, by definition, not supposed to reload the router, and an FPD upgrade requires a router reload, the automatic FPD upgrade is repressed.

In all cases where the automatic FPD upgrade is not performed, you must perform a manual FPD upgrade using the `upgrade hw-module fpd` command.

**How to Upgrade FPD Images**

You must determine if an FPD image upgrade is needed using the `show hw-module fpd` command and perform the upgrade, if needed, under the following circumstances:

- You migrate the software to a later Cisco IOS XR software release.
- You swap SPAs or SIPS from a system running a different Cisco IOS XR software release.
- You insert a new SPA or SIP.

In the event that there is an FPD incompatibility with your card, you may receive an error message. If you upgrade to a newer version of the Cisco IOS XR software and there is an FPD incompatibility, you receive the following message:

```
LC/0/1/CPU0:Dec 23 16:33:47.945 : spa_192_jacket_v2[203]: %PLATFORM-UPGRADE_FPD-4-DOWN_REV : spa fpga2 instance 0 is down-rev (V0.6), upgrade to (V1.0). Use the "upgrade hw-module fpd" CLI in admin mode.
```

If the FPD image on the card is newer then what is required by the currently running Cisco IOS XR software image on the router, you receive the following error message:

```
LC/0/1/CPU0:Dec 23 16:33:47.955 : spa_192_jacket_v2[203]: %PLATFORM-UPGRADE_FPD-4-UP_REV : spa fpga instance 1 is severely up-rev (V2.1), downgrade to (V1.6). Use the "upgrade hw-module fpd" CLI in admin mode.
```

You should perform the FPD upgrade procedure if you receive such messages. Cards may not function properly if FPD incompatibilities are not resolved.
An error message is displayed (as shown below) when version-34 of FPGA is upgraded to version-37. This is only for CRS-X linecards. However, when the user upgrades to version-37, from any other lower version (other than version-34), this failure message is not displayed. Even though we see this failure message, FPD upgrade will complete successfully and after a power cycle/reload it will properly reflect the upgraded version. There is no functionality impact.

```
FAILED to upgrade fpga3 for 4-100Gbe on location1/1/CPU0 from 34.00 to 37.00
LC/1/1/CPU0:Nov 12 15:28:40.057 : lc_fpd_upgrade[244]: %PLATFORM-UPGRADE_FPD-3-OPERATION_FAILED : Failed to update FPD : FPD Programming action failed on this card.
```

Note

The use of the **force** option when performing a FPD upgrade is not recommended except under explicit direction from Cisco engineering or TAC.

**Before You Begin**

- Before upgrading the FPD, you must install and activate the hfr-fpd.pie. For information about performing this task, see the *Upgrading and Managing Cisco IOS XR Software* module.

- The FPD upgrade procedure is performed while the card is online. At the end of the procedure the card must be reloaded before the FPD upgrade is complete. To automatically reload the card, you can use the `hw-module reload` command during your next maintenance window. The upgrade procedure is not complete until the card is reloaded.

- During the FPD upgrade, you *must not* do the following:

  - Reload, perform an online insertion and removal (OIR) of a line card (LC), or power down the chassis. Doing so may cause the node to enter an unusable state.
  
  - Press *Ctrl-C* if the console appears to hang without any output. Doing so may abort the upgrade.

- If you are not sure whether a card requires an FPD upgrade, you can install the card and use the `show hw-module fpd` command to determine if the FPD image on the card is compatible with the currently running Cisco IOS XR software release.

**SUMMARY STEPS**

1. `show hw-module fpd location {all | node-id}`
2. `admin`
3. *(Optional) `show fpd package`*
4. `upgrade hw-module fpd {all | fpga-type} [force] location {all | node-id}`
5. `exit`
6. *(Optional) `hw-module {location node-id | subslot subslot-id} reload`*
7. `show platform`
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Displays the current FPD image versions for the specified card or all cards installed in the router. Use this command to determine if you must upgrade the FPD image on your card.</td>
</tr>
<tr>
<td>*show hw-module fpd location {all</td>
<td>node-id}*</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>RP/0/RP0/CPU0:router# show hw-module fpd location all or RP/0/RP0/CPU0:router# show hw-module fpd location 0/4/cpu0</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters administration EXEC mode.</td>
</tr>
<tr>
<td><em>admin</em></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>RP/0/RP0/CPU0:router# admin</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Displays which cards are supported with your current Cisco IOS XR software release, which FPD image you need for each card, and what the minimum hardware requirements are for the various modules. (A minimum hardware requirement version of 0.0 indicates that all hardware can support this FPD image version.)</td>
</tr>
<tr>
<td><em>show fpd package</em></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>RP/0/RP0/CPU0:router(admin)# show fpd package</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Upgrades all the current FPD images that must be upgraded on the specified card with new images.</td>
</tr>
<tr>
<td>*upgrade hw-module fpd {all</td>
<td>fpga-type} [{force}] location {all</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>RP/0/RP0/CPU0:router(admin)# upgrade hw-module fpd all location 0/3/1 . . Successfully upgraded 1 FPD for SPA-2XOC48POS/RPR on location 0/3/1</td>
<td></td>
</tr>
</tbody>
</table>

Before continuing to the next step, wait for confirmation that the FPD upgrade has successfully completed. Status messages, similar to these, are displayed to the screen until the FPD upgrade is completed:

- FPD upgrade started.
- FPD upgrade in progress..
- FPD upgrade sent to location xxxx
- FPD upgrade sent to location yyyy
- FPD upgrade in progress..
- FPD upgrade finished for location xxx
- FPD upgrade in progress..
- FPD upgrade finished for location yyyy
- FPD upgrade completed.

The "FPD upgrade in progress." message is printed every minute. These logs are information logs, and as such, are displayed if the `logging console informational` command is configured.
If Ctrl-C is pressed while the FPD upgrade is in progress, the following warning message is displayed:

FPD upgrade in progress on some hardware, aborting now is not recommended as it might cause HW programming failure and result in RMA of the hardware.
Do you want to continue? [Confirm(y/n)]

If you confirm that you want to abort the FPD upgrade procedure, this message is displayed:

FPD upgrade process has been aborted, please check the status of the hardware and reissue the upgrade command if required.

### Note
If your card supports multiple FPD images, you can use the `show fpd package` admin command to determine what specific image to upgrade in the `upgrade hw-module fpd` command.

#### Step 5
**exit**
Example:
RP/0/RP0/CPU0:router(admin)# exit

Exits administration EXEC mode and returns to EXEC mode.

#### Step 6
**hw-module [location node-id | subslot subslot-id] reload**

Example:
RP/0/RP0/CPU0:router# hw-module subslot 0/3/1 reload
or
RP/0/RP0/CPU0:router# hw-module location 0/3/cpu0 reload

(Optional)
Use the `hw-module subslot reload` command to reload a SPA and the `hw-module location reload` command to reload a SIP or line card.

#### Step 7
**show platform**
Example:
RP/0/RP0/CPU0:router# show platform

Verifies that the FPD image on the card has been successfully upgraded by displaying the status of all cards in the system.

---

**Configuration Examples for FPD Image Upgrade**

The following examples indicate the use of commands associated with the FPD image upgrade procedure.
**show hw-module fpd Command Output: Example**

Use the **show hw-module fpd** command to display the current version of FPD images on the SPAs, SIPs and other cards installed on your router.

This command can be used to identify information about FPDs on any card. If you enter the location of a line card that is not a SPA, the output displays information about any programmable devices on that line card.

The following example shows how to display FPD compatibility for all modules in the router:

```
RP/0/RP0/CPU0:router# show hw-module fpd location all
```

<table>
<thead>
<tr>
<th>Location</th>
<th>Card Type</th>
<th>HW Version</th>
<th>Type</th>
<th>Subtype</th>
<th>Inst</th>
<th>Current SW</th>
<th>Upg/ Dng?</th>
</tr>
</thead>
<tbody>

<td>2.2</td>
<td>spa</td>
<td>fpga</td>
<td>5</td>
<td>1.8</td>
<td>No</td>
</tr>
</tbody>
</table>

**NOTES:**
1. One or more FPD needs an upgrade or a downgrade. This can be accomplished using the "admin upgrade hw-module fpd" CLI.

```
RP/0/RP0/CPU0:router# show hw-module fpd location 0/6/cpu0
```

Sun Apr 18 03:18:24.903 DST

<table>
<thead>
<tr>
<th>Location</th>
<th>Card Type</th>
<th>HW Version</th>
<th>Type</th>
<th>Subtype</th>
<th>Inst</th>
<th>Current SW</th>

</tbody>
</table>

### show fpd package Command Output: Example

Use the `show fpd package` command in administration EXEC mode to find out which SPAs and SIPs are supported with your current Cisco IOS XR software release, which FPD image package you need for each SPA or SIP, and what the minimum hardware requirements are for each module. If multiple FPD images are available for your card, they are listed as Subtype fpga2, fpga3, and so on.

The following example shows sample output from the `show fpd package` command:

```plaintext
RP/0/RP0/CPU0:Router# admin
RP/0/RP0/CPU0:Router(admin)# show fpd package
Thu Jun 24 10:58:49.319 UTC
```

</tr>
<tr>
<td>Min Req HW Vers</td>
<td>Minimum required hardware version for the associated FPD image. A minimum hardware requirement of version 0.0 indicates that all hardware can support this FPD image version.</td>
</tr>
</tbody>
</table>
In the **show fpd package** command output, the “subtype” column shows the FPDs that correspond with each SPA image. To upgrade a specific FPD with the **upgrade hw-module fpd** command, replace the *fpga-type* argument with the appropriate FPD from the “subtype” column, as shown in the following example:

```
RP/0/RP0/CPU0:router(admin)# upgrade hw-module fpd fpga2 location 0/3/1 reload
```

### upgrade hw-module fpd Command Output: Example

Use the **upgrade hw-module fpd** command to upgrade the FPD image on a SPA, SIP or line card.

#### Example

```
RP/0/RP0/CPU0:router(admin)@# admin
RP/0/RP0/CPU0:router(admin)# upgrade hw-module fpd fpga location 0/1/4

% RELOAD REMINDER:
- The upgrade operation of the target module will not interrupt its normal operation. However, for the changes to take effect, the target module will need to be manually reloaded after the upgrade operation. This can be accomplished with the use of "hw-module <target> reload" command.
- If automatic reload operation is desired after the upgrade, please use the "reload" option at the end of the upgrade command.
- The output of "show hw-module fpd location" command will not display correct version information after the upgrade if the target module is not reloaded.

Continue? [confirm] y
```

The following example shows how to upgrade the FPD image on a PLIM. Note that this upgrade does not upgrade the SPAs installed in the PLIM.

```
RP/0/RP0/CPU0:router(admin)# upgrade hw-module fpd all location 0/RP0/CPU0

Wed Mar 23 12:55:17.141 DST

***** UPGRADE WARNING MESSAGE: *****
* This upgrade operation has a maximum timeout of 90 minutes. *
* If you are executing the cmd for one specific location and *
* card in that location reloads or goes down for some reason *
* you can press CTRL-C to get back the RP's prompt. *
* If you are executing the cmd for all locations and a node *
* reloads or is down please allow other nodes to finish the *
* upgrade process before pressing CTRL-C. *

% RELOAD REMINDER:
- The upgrade operation of the target module will not interrupt its normal operation. However, for the changes to take effect, the target module will need to be manually reloaded after the upgrade operation. This can be accomplished with the use of "hw-module <target> reload" command.
- If automatic reload operation is desired after the upgrade, please use the "reload" option at the end of the upgrade command.
- The output of "show hw-module fpd location" command will not display correct version information after the upgrade if the target module is not reloaded.

NOTE: Chassis CLI will not be accessible while upgrade is in progress.
```
Continue? [confirm]

FPD upgrade in progress on some hardware, reload/configuration change on those is not recommended as it might cause HW programming failure and result in RMA of the hardware.

Starting the upgrade/download of following FPDs:

Troubleshooting Problems with FPD Image Upgrades

This section contains information to help troubleshoot problems that can occur during the upgrade process.

Power Failure or Removal of a SPA During an FPD Image Upgrade

If the FPD upgrade operation is interrupted by a power failure or the removal of the SPA, it could corrupt the FPD image. This corruption of the FPD image file makes the SPA unusable by the router and the system displays the following messages when it tries to power up the SPA. When it cannot successfully power up the SPA, it places it in the failed state, as shown in the following example:

LC/0/3/CPU0:Feb 4 08:23:16.672: spa_192_jacket[188]: %L2-SPA-5-OIR_INSERTED: SPA discovered in bay 0
LC/0/3/CPU0:Feb 4 08:23:23.349: spa_192_jacket[188]: %L2-SPA-5-OIR_ERROR: SPA (0): An error occurred (0x1002), error recovery action: reset SPA
LC/0/3/CPU0:Feb 4 08:23:26.431: spa_192_jacket[188]: %L2-SPA-5-OIR_INSERTED: SPA discovered in bay 0
LC/0/3/CPU0:Feb 4 08:23:32.593: spa_192_jacket[188]: %L2-SPA-5-OIR_ERROR: SPA (0): Too many retries, error recovery stopped
LC/0/3/CPU0:Feb 4 08:23:32.593: spa_192_jacket[188]: %L2-SPA-5-OIR_ERROR: SPA (0): An error occurred (0x1002), error recovery action: hold SPA in reset
When a SPA is in the failed state, it may not register itself with the FPD upgrade mechanism. In this case, you do not see the SPA listed when you use the `show hw-module fpd` command. To verify the state of a SPA, use the `show hw-module subslot error` command and the `show hw-module subslot status` command.

### Performing a SPA FPD Recovery Upgrade

To recover a SPA from the failed state because of a corrupted FPD image, you must manually shut down the SPA. Use the `hw-module subslot subslot-id shutdown` command in Global Configuration mode to administratively shutdown the SPA. After the SPA is shut down, you can use the `upgrade hw-module fpd` command in administration EXEC mode:

```bash
RP/0/RP0/CPU0:router# admin
RP/0/RP0/CPU0:router(admin)# upgrade hw-module fpd fpga location 0/3/0
```

### Performing a SIP FPD Recovery Upgrade

If a SIP upgrade fails for whatever reason, do not reload the SIP. Try to perform the upgrade procedure again. You can perform the upgrade procedure multiple times, as long as you do not reload the SIP. The FPD upgrade procedure takes several minutes to complete; do not interrupt the procedure. If you reload the SIP when the FPD image is corrupted, the SIP malfunctions and you must contact Cisco technical support for assistance.

To recover a SIP from the failed state because of a corrupted FPD image, you must contact Cisco technical support.

To recover a SIP from the failed state because of a corrupted FPD image, you must turn off the automatic reset of the SIP card. Use the `hw-module reset auto disable` command in administration configuration mode, as shown in the following example:

```bash
RP/0/RP0/CPU0:router(config)# hw-module reset auto disable location 0/1/4
```

This module describes conceptual information and configuration tasks for process placement on your router. Process Placement on Cisco IOS XR software balances application processes between the available route processors (RPs) and distributed route processors (DRPs) based on memory usage and other criteria. Use the procedures described in this document to reoptimize the placement of processes, or override the default placement policies.

For complete descriptions of the process placement commands listed in this module, see Related Documents, on page 203. To locate documentation for other commands that might appear in the course of performing a configuration task, search online in Cisco IOS XR Commands Master List for the Cisco CRS Router.

This module contains the following topics:

- Prerequisites for Configuring Cisco IOS XR Process Placement, page 190
- Information About Cisco IOS XR Process Placement, page 190
- How to Configure Cisco IOS XR Process Placement, page 194
- Configuration Examples for Process Placement, page 202
- Additional References, page 203
Prerequisites for Configuring Cisco IOS XR Process Placement

Only processes that are identified in Cisco IOS XR software as placeable can be controlled through process placement configuration. Nonplaceable processes are not affected by placement policy. To learn the processes that are placeable, issue the `show placement program all` command.

You must be in a user group associated with a task group that includes the proper task IDs. The command reference guides include the task IDs required for each command. If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Information About Cisco IOS XR Process Placement

What Is a Process?

To achieve high availability and performance, the Cisco IOS XR software is built on a modular system of processes. Each process provides specific functionality for the system and runs in a protected memory space to ensure that problems with one process cannot impact the entire system. Multiple instances of a process can run on a single node, and multiple threads of execution can run on each process instance.

Under normal operating conditions, processes are managed automatically by the Cisco IOS XR software. Processes are started, stopped, or restarted as required by the running configuration of the router. In addition, processes are checkpointed to optimize performance during process restart and automatic switchover.

What Is Process Placement?

Process placement is the assignment of placeable processes to specific locations, such as an RP or DRP installed in the router. Process placement is configured and managed for each Secure Domain Router (SDR) in the system.

Placeable processes include all routing processes, such as Open Shortest Path First Protocol (OSPF), Border Gateway Protocol (BGP), and multicast routing.

Default Placement Policy

In a new system, processes are distributed according to their affinity values among the available RP and DRP nodes and node pairs in a SDR.

The default process policy that is shipped on the system upon startup is suitable for general purposes. While customizing is possible, there is no requirement to change the process placement. If you believe the change is required, you should work closely with Cisco personnel to ensure that the impact to your system is contained to just an instance of a process to avoid any undesirable results.

Following is the default placement policy:
• Processes have a preference to run on paired nodes (nodes that have an associated standby node).

• Processes have a preference to remain on their current node. Therefore, processes do not move automatically, unless the unpaired node (or both nodes in a node pair) on which they are running fails. If the node fails, and there is no standby node, the processes are restarted on a different node.

• When a new node pair is added, the following rules apply:
  ◦ The currently running processes are not automatically moved to the new cards.
  ◦ The general preference is for new processes (such as a new ISIS instance) to start on the new node pair, which contains the most available CPU and memory resources in the system.
  ◦ Other affinity settings may override the general preference. For example, if the IS-IS process has a strong affinity to run on the same node where ipv4_io is running, then IS-IS would be started on that node, and not the new node-pair.

### Reasons to Change the Default Process Placement

Although the default process policy that is shipped on the system upon startup is suitable for general purposes, changes to the router configuration can result in the need for processes to be rebalanced among the available CPU and memory resources.

When a system is initially booted, the system assumes that all processes use the same amount of memory, thereby treating each process as equivalent. As the configuration grows, however, the CPU load and memory requirements of some application processes increase. Centralized applications may need a larger portion of the RP and DRP resources, or distributed applications may require additional instances of processes to be started on new DRPs.

In addition, when a new RP or DRP is added to a system, only new processes or process instances are added to the node. This could result in some processes with too few resources, while the newer RP and DRP cards are underutilized.

Therefore, as the software configuration changes, or hardware is added, it may become necessary to rebalance processes among the available RPs and DRPs in an SDR.

### Reoptimizing Process Placements

The easiest and most reliable method for users to redistribute processes among the available RPs and DRPs in an SDR is with the `placement reoptimize` command.

During router operation, the actual resource usage of each process is collected and compared to the router configuration and network topology. An ideal configuration for process placement is created and updated in real time.

To implement this ideal process placement configuration, enter the `placement reoptimize` command in EXEC mode. Before the changes are made, the system displays a summary of the predicted changes. You can either accept the changes or cancel the operation.

See Reoptimizing Process Placement, on page 194 for detailed instructions.
Reconfiguring Process Placements

You can also change the process placement *affinities*, or preferences, to override the default policies. For example, you may learn that some processes perform better on the primary node pair of the SDR, or that some processes have better high-availability characteristics when running on a paired node (a node with a standby partner). Other processes might benefit from co-location or by being assigned to nodes far apart from each other.

Consult with your technical support representative before changing the default process placement configuration. Incorrect configurations can cause system error, poor performance or downtime.

Recommended Guidelines for Process Placement

The following are a few recommended guidelines for changes to the process placement configuration:

- Generally, the process placement feature functions well upon system startup; fine tuning is seldom required.
- Use the EXEC mode command `placement reoptimize`, as described in the Reoptimizing Process Placements, on page 191 to automatically redistribute the processes among the available RPs and DRPs.
- Keep process placement policy changes to a minimum, and always consult technical support personnel before implementation.

Process Placement Based on Memory Consumption

You can change process placements based on memory use of processes in an SDR. Memory use is expressed in terms of the memory "footprint of the placeable process. The system attempts to spread the load among the nodes without exceeding their memory capacity. In addition, the system computes the affinity values to determine the best placement.

Cisco IOS XR software assumes that every placeable process uses one megabyte of memory.

For detailed instructions, see Setting Memory Consumption Thresholds, on page 195.

Changing Process Affinities

Process placement can also be controlled by changing the *affinities*, or preferences, of a process or process group. The following types of process affinities are operator configurable:

- affinity location set
- affinity location type
- affinity program
- affinity self
**affinity location set**

This affinity specifies a preference for a process to run on a specific node pair or set of node pairs. A node pair is either an active and standby pair of nodes [hosted on route processors (RPs) or distributed RPs], or a single active node on an RP or DRP that does not have a standby.

By containing references to specific location identifiers, location set affinities are more specific to the individual SDR in which they are used than other affinity types.

**affinity location type**

This affinity specifies a preference for a process to run on a particular location type. Available location types are as follows:

- **paired**—RP nodes that have an associated standby node
- **primary**—Primary RP node for the SDR (also known as the DSDRSC)
- **current**—Current node. A process’s affinity to its current node characterizes its preference to remain on the same node where possible.

You configure the placement policy to allow certain processes to stay where they are (current) or move by specifying the various affinity values. The higher the positive value of an affinity, the stronger the requirement that the process run at a location, and so on. A low or zero point value indicates a weaker requirement (or no preference) that a process run at a location.

**affinity program**

This affinity specifies a preference for a process to run on the same node as another process, or to run on a different node than another process. You would want to use this affinity in the case that certain processes perform better when they are running together on the same node (attract); or on different nodes, apart from each other (repulse).

**affinity self**

This affinity adjusts placement decisions when multiple instances of a process are started. An attract (positive) affinity indicates a preference to have all instances of a process run on the same node, while a repulse (negative) affinity indicates a preference to have each instance of a process run on different nodes.

**Hierarchical Placement Policy**

When you configure placement policies, you must remember that affinities are applied to the software in a hierarchical way.

Affinities applied to process instances take precedence over affinities applied to a process class. In the following example, all OSPF instances have a preference to run on the primary RP of the SDR, but only OSPF instance 10 has a preference to run on a paired node:

```
RP/0/RP0/CPU0:router(config)# placement program ospf
RP/0/RP0/CPU0:router(config-place)# affinity location-type primary attract 200
RP/0/RP0/CPU0:router(config)# placement program ospf instance 10
```
How to Configure Cisco IOS XR Process Placement

Reoptimizing Process Placement

This task reoptimizes the placeable processes among the available RP and DRP nodes according to memory and CPU usage.

**SUMMARY STEPS**

1. placement reoptimize
2. Use one of the following commands:
   - yes
   - no

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1: placement reoptimize</td>
<td>Displays the predicted changes of the optimization.</td>
</tr>
<tr>
<td>Example: RP/0/RP0/CPU0:router# placement reoptimize</td>
<td></td>
</tr>
<tr>
<td>Step 2: Use one of the following commands: yes no</td>
<td>Accepts or rejects the changes.</td>
</tr>
<tr>
<td>Example: RP/0/RP0/CPU0:router# yes</td>
<td></td>
</tr>
</tbody>
</table>
Setting Memory Consumption Thresholds

SUMMARY STEPS

1. show placement policy global
2. configure
3. placement memory \{maximum | threshold\} value
4. Use one of the following commands:
   - end
   - commit

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>show placement policy global</td>
<td>Displays the current memory settings.</td>
</tr>
<tr>
<td></td>
<td>Example: RP/0/RP0/CPU0:router# show placement policy global</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>configure</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>placement memory {maximum</td>
<td>threshold} value</td>
</tr>
<tr>
<td></td>
<td>Example: RP/0/RP0/CPU0:router(config)# placement memory maximum 80</td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td>Use one of the following commands:</td>
<td>Saves configuration changes.</td>
</tr>
<tr>
<td></td>
<td>• end</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• commit</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Example: RP/0/RP0/CPU0:router(config-place)# end or RP/0/RP0/CPU0:router(config-place)# commit</td>
<td></td>
</tr>
</tbody>
</table>

* When you issue the end command, the system prompts you to commit changes:

Uncommitted changes found, commit them before exiting (yes/no/cancel)?[cancel]:

- Entering yes saves configuration changes to the running configuration file, exits the configuration session, and returns the router to EXEC mode.
- Entering no exits the configuration session and returns the router to EXEC mode without committing the configuration changes.
- Entering cancel leaves the router in the current configuration session without exiting or committing the configuration changes.
Creating a Location Set Affinity

This task sets the affinity of a placement program (process) to or from node pairs.

SUMMARY STEPS

1. configure
2. placement program \{program \[instance instance\] | default\}
3. affinity location-set node-id1 \[node-id2\] \{attract strength | repulse strength | default | none\}
4. Use one of the following commands:
   * end
   * commit

5. show placement location \{node-id | all\}
6. show placement program \{program | all\}

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>

</tbody>
</table>

### Step 5

**show placement location**

*node-id | all*  

Displays the location of a placement process.

**Example:**  
RP/0/RP0/CPU0:router# show placement location all

### Step 6

**show placement program**

*program | all*  

Displays the operational state for each placement program.

**Example:**  
RP/0/RP0/CPU0:router# show placement program ospf

---

**Creating a Location Type Affinity**

This task sets affinity of a placement program (process) to or from a location type.
**SUMMARY STEPS**

1. **configure**
2. **placement program** `{program [instance instance] | default}`
3. **affinity location-type** `{current | paired | primary} {attract strength | repulse strength | default | none}`
4. Use one of the following commands:
   - end
   - commit
5. **show placement location** `{node-id | all}`
6. **show placement program** `{program | all}`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>

<td>RP/0/RP0/CPU0:router# show placement program all</td>
</tr>
</tbody>
</table>
Creating a Self Affinity

This task sets the affinity of a placement program (process) to or from one of its own instances.

**SUMMARY STEPS**

1. configure
2. placement program `program {instance instance | default}`
3. affinity self `{attract strength | repulse strength | default | none}`
4. Use one of the following commands:
   - end
   - commit
5. show placement location `{node-id | all}`
6. show placement program `{program | all}`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>placement program `program {instance instance</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>RP/0/RP0/CPU0:router(config)# placement program bgp</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>affinity self `{attract strength</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>RP/0/RP0/CPU0:router(config-place)# affinity self repulse 200</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Use one of the following commands:</td>
</tr>
<tr>
<td>- end</td>
<td>Saves configuration changes.</td>
</tr>
<tr>
<td>- commit</td>
<td>- When you issue the <code>end</code> command, the system prompts you to commit changes:</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Uncommitted changes found, commit them before exiting (yes/no/cancel)?[cancel]:</td>
</tr>
<tr>
<td></td>
<td>• Entering <code>yes</code> saves configuration changes to the running configuration file, exits the configuration session, and returns the router to EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>• Entering <code>no</code> exits the configuration session and returns the router to EXEC mode without committing the configuration changes.</td>
</tr>
<tr>
<td>or</td>
<td>RP/0/RP0/CPU0:router(config-place)# end</td>
</tr>
<tr>
<td></td>
<td>RP/0/RP0/CPU0:router(config-place)# commit</td>
</tr>
</tbody>
</table>
Purpose

- Entering `cancel` leaves the router in the current configuration session without exiting or committing the configuration changes.
- Use the `commit` command to save the configuration changes to the running configuration file and remain within the configuration session.

### Step 5

**show placement location** `{node-id | all}`

Displays the location of a placement process.

**Example:**
```
RP/0/RP0/CPU0:router# show placement location all
```

### Step 6

**show placement program** `{program | all}`

Displays the operational state for each placement program.

**Example:**
```
RP/0/RP0/CPU0:router# show placement program bgp
```

---

### Configuration Examples for Process Placement

This section contains examples to view the processes that are placeable in an SDR.

If you believe that a custom reconfiguration of the processes on your system is required, you should work closely with Cisco personnel to ensure that the impact to your system is contained to just an instance of a process to avoid any undesirable results.

To learn the processes that are placeable, enter the `show placement program all` command in EXEC mode.

```
RP/0/RP0/CPU0:router# show placement program all
```

Mon Aug 18 17:13:15.155 PST DST

If a program is shown as having 'rejected locations' (i.e., locations on which it cannot be placed), the locations in question can be seen using the "show placement policy program" command.

If a program has been placed but not yet started, the amount of time elapsed since the program was placed is shown in the 'waiting to start' field.

Parentheses around the node indicate that the node has not yet fully booted. This will be true of standby nodes.

<table>

Configuring Manageability

This module describes the configuration required to enable the Extensible Markup Language (XML) agent services. The XML Parser Infrastructure provides parsing and generation of XML documents with Document Object Model (DOM), Simple Application Programming Interface (API) for XML (SAX), and Document Type Definition (DTD) validation capabilities:

- DOM allows customers to programmatically create, manipulate, and generate XML documents.
- SAX supports user-defined functions for XML tags.
- DTD allows for validation of defined document types.

Information About XML Manageability

The Cisco IOS XR Extensible Markup Language (XML) API provides a programmable interface to the router for use by external management applications. This interface provides a mechanism for router configuration and monitoring utilizing XML formatted request and response streams. The XML interface is built on top of the Management Data API (MDA), which provides a mechanism for Cisco IOS XR components to publish their data models through MDA schema definition files.

Cisco IOS XR software provides the ability to access the router via XML using a dedicated TCP connection, Secure Socket Layer (SSL), or a specific VPN routing and forwarding (VRF) instance.

How to Configure Manageability

Configuring the XML Agent

SUMMARY STEPS

1. xml agent [ssl]
2. iteration on size iteration-size
3. session timeout timeout
4. throttle {memory size | process-rate tags}
5. vrf { default | vrf-name } [access-list access-list-name]

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables Extensible Markup Language (XML) requests over a dedicated TCP connection and enters XML agent configuration mode. Use the ssl keyword to enable XML requests over Secure Socket Layer (SSL).</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>RP/0/RP0/CPU0:router# xml agent</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Configures the iteration size for large XML agent responses in KBytes. The default is 48.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>RP/0/RP0/CPU0:router(config)# iteration on size 500</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Configures an idle timeout for the XML agent in minutes. By default, there is no timeout.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>RP/0/RP0/CPU0:router(config)# session timeout 5</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Configures the XML agent processing capabilities.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

**Example:**

RP/0/RP0/CPU0:router:router(config-xml-agent)# throttle memory 300

**Purpose:**

- Specify the memory size in Mbytes. Values can range from 100 to 600. The default is 300.
- Specify the process-rate as the number of tags that the XML agent can process per second. Values can range from 1000 to 30000. By default the process rate is not throttled.

### Step 5

**vrf { default | vrf-name} [access-list access-list-name]**

**Example:**

RP/0/RP0/CPU0:router:router(config-xml-agent)# vrf my-vrf

Configures the dedicated agent or SSL agent to receive and send messages via the specified VPN routing and forwarding (VRF) instance.

## Configuration Examples for Manageability

### Enabling VRF on an XML Agent: Examples

The following example illustrates how to configure the dedicated XML agent to receive and send messages via VRF1, VRF2 and the default VRF:

RP/0/RP0/CPU0:router:router(config)# xml agent

RP/0/RP0/CPU0:router:router(config-xml-agent)# vrf VRF1

RP/0/RP0/CPU0:router:router(config-xml-agent)# vrf VRF2

The following example illustrates how to remove access to VRF2 from the dedicated agent:

RP/0/RP0/CPU0:router:router(config)# xml agent

RP/0/RP0/CPU0:router:router(config-xml-agent)# no vrf VRF2

The following example shows how to configure the XML SSL agent to receive and send messages through VRF1, VRF2 and the default VRF:

RP/0/RP0/CPU0:router:router(config)# xml agent ssl

RP/0/RP0/CPU0:router:router(config-xml-agent)# vrf VRF1

RP/0/RP0/CPU0:router:router(config-xml-agent)# vrf VRF2

The following example removes access for VRF2 from the dedicated XML agent:

RP/0/RP0/CPU0:router:router(config)# xml agent ssl

RP/0/RP0/CPU0:router:router(config-xml-agent)# no vrf VRF2

- Manually sending command output message for a Command List, page 228
- Configuring a HTTP Proxy Server, page 229
- Configuring Snapshot alert group, page 230
About Call Home

Call Home provides an email and http/https based notification for critical system policies. A range of message formats are available for compatibility with pager services or XML-based automated parsing applications. You can use this feature to page a network support engineer, email a Network Operations Center, or use Cisco Smart Call Home services to generate a case with the Technical Assistance Center. The Call Home feature can deliver alert messages containing information about diagnostics and environmental faults and events.

The Call Home feature can deliver alerts to multiple recipients, referred to as Call Home destination profiles. Each profile includes configurable message formats and content categories. A predefined destination is provided for sending alerts to the Cisco TAC, but you also can define your own destination profiles. When you configure Call Home to send messages, the appropriate CLI show command is executed and the command output is attached to the message. Call Home messages are delivered in the following formats:

- Short text format which provides a one or two line description of the fault that is suitable for pagers or printed reports.
- Full text format which provides fully formatted message with detailed information that is suitable for human reading.

Destination Profiles

A destination profile includes the following information:

- One or more alert groups—The group of alerts that trigger a specific Call Home message if the alert occurs.
- One or more e-mail or http destinations—The list of recipients for the Call Home messages generated by alert groups assigned to this destination profile.
- Message format—The format for the Call Home message (short text, full text, or XML).
- Message severity level—The Call Home severity level that the alert must meet before a Call Home message is sent to all e-mail and http url addresses in the destination profile. An alert is not generated if the Call Home severity level of the alert is lower than the message severity level set for the destination profile.

You can also configure a destination profile to allow periodic inventory update messages by using the inventory alert group that will send out periodic messages daily, weekly, or monthly.

The following predefined destination profiles are supported:

- CiscoTAC-1—Supports the Cisco-TAC alert group in XML message format.
Call Home Alert Groups

An alert group is a predefined subset of alerts or events that Call Home detects and reports to one or more destinations. Alert groups allow you to select the set of alerts that you want to send to a predefined or custom destination profile. Alerts are sent to e-mail destinations in a destination profile only if that alert belongs to one of the alert groups associated with that destination profile and if the alert has a Call Home message severity at or above the message severity set in the destination profile.

The following table lists supported alert groups and the default CLI command output included in Call Home messages generated for the alert group.

<table>
<thead>
<tr>
<th>Alert Group</th>
<th>Description</th>
<th>Executed Commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>Environmental</td>
<td>Events related to power, fan, and environment-sensing elements such as temperature alarms.</td>
<td>show environment show logging show inventory show environment trace show diag</td>
</tr>
</tbody>
</table>
| Inventory | Inventory status that is provided whenever a unit is cold booted, or when FRUs are inserted or removed. This alert is considered a noncritical event, and the information is used for status and entitlement. | Full-inventory messages:  
• admin show diag  
• admin show diag chassis eeprom  
• admin show install active summary  
• admin show inventory  
• admin show sdr summary  
• admin show version  
Delta OIR messages:  
• admin show diag [location] details  
• admin show version  
• admin show inventory location [location]  
• admin show inventory active summary  
• admin show sdr summary |
Alert Group | Description | Executed Commands |
--- | --- | --- |
Syslog | Events generated by specific interesting syslog messages | admin show version  
admin show logging  
admin show inventory |
Configuration | User-generated request for configuration or configuration change event. | show version  
show running config all  
show inventory  
show configuration history last 30  
show configuration commit changes last 1 |
Snapshot | This alert group can be configured for periodic notifications | By default, this alert group has no commands to be run. You can add the required commands that need to be run. |

Call Home maps the syslog severity level to the corresponding Call Home severity level for syslog port group messages.

### Call Home Message Levels

Call Home allows you to filter messages based on their level of urgency. You can associate each destination profile (predefined and user-defined) with a Call Home message level threshold. The Call Home message level ranges from 0 (lowest level of urgency) to 9 (highest level of urgency). Call Home messages are generated if they have a severity level equal to or greater than the Call Home message level threshold for the destination profile.

Call Home messages that are sent for syslog alert groups have the syslog severity level mapped to the Call Home message level.

**Note**

Call Home does not change the syslog message level in the message text.

The following table lists each Call Home message level keyword and the corresponding syslog level for the syslog port alert group.

<table>
<thead>
<tr>
<th>Call Home Level</th>
<th>Keyword</th>
<th>syslog Level</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9</td>
<td>Catastrophic</td>
<td>N/A</td>
<td>Network-wide catastrophic failure.</td>
</tr>
</tbody>
</table>

**Table 25: Severity and syslog Level Mapping**
### Obtaining Smart Call Home

If you have a service contract directly with Cisco Systems, you can register your devices for the Smart Call Home service. Smart Call Home provides fast resolution of system problems by analyzing Call Home messages sent from your devices and providing background information and recommendations. For issues that can be identified as known, particularly GOLD diagnostics failures, Automatic Service Requests will be generated with the Cisco-TAC.

Smart Call Home offers the following features:

- Continuous device health monitoring and real-time diagnostic alerts.

- Analysis of Call Home messages from your device and, where appropriate, Automatic Service Request generation, routed to the appropriate TAC team, including detailed diagnostic information to speed problem resolution.

- Secure message transport directly from your device or through a downloadable Transport Gateway (TG) aggregation point. You can use a TG aggregation point in cases that require support for multiple devices or in cases where security requirements mandate that your devices may not be connected directly to the Internet.

- Web-based access to Call Home messages and recommendations, inventory and configuration information for all Call Home devices. Provides access to associated field notices, security advisories and end-of-life information.
You need the following items to register:

- The SMARTnet contract number for your device
- Your e-mail address
- Your Cisco.com ID

For more information about Smart Call Home, see the Smart Call Home page at this URL: https://supportforums.cisco.com/community/netpro/solutions/smart_services/smartcallhome

Anonymous Reporting

Smart Call Home is a service capability included with many Cisco service contracts and is designed to assist customers resolve problems more quickly. If you decide not to use Smart Call Home, you can still enable Anonymous Reporting to allow Cisco to securely receive minimal error and health information from the device. If you enable Anonymous Reporting, your customer identity will remain anonymous, and no identifying information is sent.

When Call Home is configured for anonymous reporting, only inventory, and test messages are sent to Cisco. No identifying information is sent.

When you enable Anonymous Reporting, you acknowledge your consent to transfer the specified data to Cisco or to vendors operating on behalf of Cisco (including countries outside the United States). Cisco maintains the privacy of all customers. For information about how Cisco treats personal information, see the Cisco Privacy Statement.

Configuring Call Home

The tasks in this module describe how to configure the sending of Call Home messages. The following steps are involved:

1. Assign contact information.
2. Configure and enable one or more destination profiles.
3. Associate one or more alert groups to each profile.
4. Configure the email server options.
5. Enable Call Home.

Configuring Contact Information

Each router must include a contact e-mail address. You can optionally include other identifying information for your system installation.
SUMMARY STEPS

1. configure
2. call-home
3. contact-email-addr email-address
4. (Optional) contract-id contract-id-string
5. (Optional) customer-id customer-id-string
6. (Optional) phone-number phone-number-string
7. (Optional) street-address street-address
8. (Optional) site-id site-id-string
9. commit
10. show call-home

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure</td>
<td>Enters call home configuration mode.</td>
</tr>
<tr>
<td>Step 2 call-home</td>
<td>Configures the customer email address. Enter up to 200 characters in email address format with no spaces.</td>
</tr>
<tr>

Configuring Call Home on the Cisco IOS XR Software

### Configuring and Activating Destination Profiles

You must have at least one activated destination profile for Call Home messages to be sent. The CiscoTAC-1 profile exists by default but is not active.

#### SUMMARY STEPS

1. configure
2. call-home
3. profile profile-name
4. destination address email email-address
5. destination message-size-limit max-size
6. destination preferred-msg-format {short-text | long-text | xml}
7. destination transport-method [ email | http ]
8. active
9. commit
10. show call-home profile { all | profile-name }
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>call-home</td>
</tr>
</tbody>
</table>
| **Example:**      |          | RP/0/RP0/CPU0:router(config)# call-home  
|                   |          | RP/0/RP0/CPU0:router(config-call-home)# |
| **Step 3**        | profile profile-name | Configures an email address to which Call Home messages are sent for this profile. |
| **Example:**      |          | RP/0/RP0/CPU0:router(config-call-home)# profile my_profile  
|                   |          | RP/0/RP0/CPU0:router(config-call-home-profile)# |
| **Step 4**        | destination address email email-address | Configures the message format for this profile. The default is xml. |
| **Example:**      |          | RP/0/RP0/CPU0:router(config-call-home-profile)# destination address email support_me@cisco.com |
| **Step 5**        | destination message-size-limit max-size | Configures the maximum size of Call Home messages for this profile. Values can be between 50 and 3145728 characters. |
| **Example:**      |          | RP/0/RP0/CPU0:router(config-call-home-profile)# destination message-size-limit 1000 |
| **Step 6**        | destination preferred-msg-format {short-text | long-text | xml} | Configures the transport method for this profile. |
| **Example:**      |          | RP/0/RP0/CPU0:router(config-call-home-profile)# destination preferred-msg-format xml |
| **Step 7**        | destination transport-method [ email | http ] | Configures the transport method for this profile. |
| **Example:**      |          | RP/0/RP0/CPU0:router(config-call-home-profile)# destination transport-method email |
| **Step 8**        | active | Activates the destination profile. |
| **Example:**      |          | RP/0/RP0/CPU0:router(config-call-home-profile)# active |

**Note**  
At least one destination profile must be active for Call Home messages to be sent.
### Associating an Alert Group with a Destination Profile

An alert is sent only to destination profiles that have subscribed to the Call Home alert group.

**Before You Begin**

Use the `show call-home alert-group` command to view available alert groups.

**SUMMARY STEPS**

1. configure
2. call-home
3. profile `profile-name`
4. subscribe-to-alert-group inventory [periodic {daily | monthly day-of-month | weekly day-of-week}] `hh:mm`
5. subscribe-to-alert-group syslog severity `severity-level` pattern `string`
6. subscribe-to-alert-group snapshot severity `severity-level` pattern `string`
7. subscribe-to-alert-group configuration severity `severity-level` pattern `string`
8. commit

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure</td>
<td>Enters call home configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>call-home</td>
<td>Enters call home profile configuration mode to configure a new or existing profile.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>RP/0/RP0/CPU0:router(config)# call-home</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>RP/0/RP0/CPU0:router(config-call-home)#</code></td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>profile <code>profile-name</code></td>
<td>Enters call home profile configuration mode to configure a new or existing profile.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>RP/0/RP0/CPU0:router(config-call-home)# profile</code></td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

```
my_profile
RP/0/RP0/CPU0:router(config-call-home-profile)#
```

### Purpose

Configures a destination profile to receive messages for the `inventory` alert group. Either alerts are sent periodically, or any non-normal event triggers an alert.

#### Step 4

```
subscribe-to-alert-group inventory [periodic {daily | monthly day-of-month | weekly day-of-week} hh:mm
```

**Example:**

```
RP/0/RP0/CPU0:router(config-call-home-profile)#
subscribe-to-alert-group
inventory periodic monthly 1 10:00
```

Configures a destination profile to receive messages for the `syslog` alert group. Alerts with a severity the same or greater than the specified severity level are sent.

#### Step 5

```
subscribe-to-alert-group syslog severity severity-level pattern [string]
```

**Example:**

```
RP/0/RP0/CPU0:router(config-call-home-profile)#
subscribe-to-alert-group
syslog severity major pattern
```

- **catastrophic**—Includes network-wide catastrophic events in the alert. This is the highest severity.
- **critical**—Includes events requiring immediate attention (system log level 1).
- **disaster**—Includes events with significant network impact.
- **fatal**—Includes events where the system is unusable (system log level 0).
- **major**—Includes events classified as major conditions (system log level 2).
- **minor**—Includes events classified as minor conditions (system log level 3)
- **normal**—Specifies the normal state and includes events classified as informational (system log level 6). This is the default.
- **notification**—Includes events informational message events (system log level 5).
- **warning**—Includes events classified as warning conditions (system log level 4).

You can specify a pattern to be matched in the syslog message. If the pattern contains spaces, you must enclose it in quotes ("").

#### Step 6

```
subscribe-to-alert-group snapshot severity severity-level pattern [string]
```

**Example:**

```
RP/0/RP0/CPU0:router(config-call-home-profile)#
subscribe-to-alert-group
snapshot severity major pattern
```

Configures a destination profile to receive messages for the `snapshot` alert group. Alerts with a severity the same or greater than the specified severity level are sent.

You can specify a pattern to be matched in the syslog message. If the pattern contains spaces, you must enclose it in quotes ("").
### Configuring Call Home on the Cisco IOS XR Software

#### Configuring Email

Call Home messages are sent via email. You must configure your email server before Call Home messages can be sent.

**SUMMARY STEPS**

1. configure
2. call-home
3. (Optional) sender from email-address
4. (Optional) sender reply-to email-address
5. mail-server address priority priority
6. rate-limit events-count
7. commit
8. show call-home mail-server status

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure</td>
<td>Enters call home configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> call-home</td>
<td></td>
</tr>
</tbody>
</table>

**Example:**

```
RP/0/RP0/CPU0:router(config)# call-home
RP/0/RP0/CPU0:router(config-call-home)#
```
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>sender from</strong> email-address</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><strong>(Optional)</strong> Specifies the email message “from” address.</td>
</tr>
<tr>
<td></td>
<td>RP/0/RP0/CPU0:router(config-call-home)# sender from <a href="mailto:my_email@cisco.com">my_email@cisco.com</a></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><strong>sender reply-to</strong> email-address</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><strong>(Optional)</strong> Specifies the email message “reply-to” address.</td>
</tr>
<tr>
<td></td>
<td>RP/0/RP0/CPU0:router(config-call-home)# sender reply-to <a href="mailto:my_email@cisco.com">my_email@cisco.com</a></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><strong>mail-server</strong> address priority priority</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Specifies the mail server to use to send Call Home messages. You can specify an IP address or mail server name. You can specify up to five mail servers to use. The server with the lower priority is tried first.</td>
</tr>
<tr>
<td></td>
<td>RP/0/RP0/CPU0:router(config-call-home)# mail-server 198.51.100.10 priority 1</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td><strong>rate-limit</strong> events-count</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Specifies the maximum trigger rate per minute. The default is five events per minute and the maximum is also five.</td>
</tr>
<tr>
<td></td>
<td>RP/0/RP0/CPU0:router(config-call-home)# rate-limit 4</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td><strong>commit</strong></td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td><strong>show call-home mail-server status</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Displays the status of the specified mail server.</td>
</tr>
<tr>
<td></td>
<td>RP/0/RP0/CPU0:router# show call-home mail-server status</td>
</tr>
</tbody>
</table>

### Enabling Call Home

By default the sending of Call Home messages is disabled. You must perform this task to enable the sending of Call Home messages.

**Before You Begin**

Before enabling the sending of Call Home messages, you should complete the configuration tasks described in this module. Specifically, you must have enabled a destination profile for any Call Home messages to be sent.
SUMMARY STEPS

1. configure
2. call-home
3. service active
4. commit

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure</td>
<td>Enters call home configuration mode.</td>
</tr>
</tbody>
</table>

Step 2 call-home

Example:
RP/0/RP0/CPU0:router(config)# call-home
RP/0/RP0/CPU0:router(config-call-home)#

Step 3 service active

Example:
RP/0/RP0/CPU0:router(config-call-home)# service active

Step 4 commit

Configuring Smart Call Home (single command)

SUMMARY STEPS

1. configure
2. call-home reporting { anonymous | contact-email email-address } [ http-proxy { address } port port-number ]

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure</td>
<td>Enables all call home basic configurations using a single command.</td>
</tr>
</tbody>
</table>

Step 2 call-home reporting { anonymous | contact-email email-address } [ http-proxy { address } port port-number ]

Example:
RP/0/RP0/CPU0:router (config) # call-home reporting contact-email email@company.com
# Configuring Call Home Data Privacy

## SUMMARY STEPS

1. configure
2. call-home
3. data-privacy { level { normal | high } | hostname }

## DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>call-home</td>
<td>Enters the call home configuration submode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>RP/0/RP0/CPU0:router(config) # call-home</td>
</tr>
<tr>
<td>Step 3</td>
<td>data-privacy { level { normal</td>
<td>high }</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>RP/0/RP0/CPU0:router(config-call-home) # data-privacy level high</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Note** Enabling the data-privacy command can affect CPU utilization when scrubbing a large amount of data.

# Configuring Syslog Throttling

This task is used to enable or disable Call Home syslog message throttling and avoid sending repetitive Call Home syslog messages.
Enabling AAA Authorization

This task is used to enable AAA authorization for Call Home messages.

SUMMARY STEPS

1. configure
2. call-home
3. aaa-authorization [ username username]

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure</td>
<td></td>
</tr>
<tr>
<td>Step 2 call-home</td>
<td>Enters Call Home configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>RP/0/RP0/CPU0:router (config) # call-home</td>
<td></td>
</tr>
<tr>
<td>Step 3 syslog-throttling</td>
<td>Enables or disables Call Home syslog message throttling and avoids sending repetitive Call Home syslog messages. By default, syslog message throttling is enabled.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>RP/0/RP0/CPU0:router (config-call-home) # syslog-throttling</td>
<td></td>
</tr>
</tbody>
</table>
### Sending Call Home Alert group Messages Manually

This task is used to manually trigger Call Home alert group messages.

You can use the `call-home send` command to manually send a specific alert group message. Guidelines for the CLI options of the command:

- Only the snapshot, configuration, and inventory alert groups can be sent manually. Syslog alert groups cannot be sent manually.
- When you manually trigger a snapshot, configuration, or inventory alert group message and you specify a destination profile name, a message is sent to the destination profile regardless of the profile’s active status, subscription status, or severity setting.
- When you manually trigger a snapshot, configuration, or inventory alert group message and do not specify a destination profile name, a message is sent to all active profiles that have either a normal or periodic subscription to the specified alert group.

**SUMMARY STEPS**

1. `call-home send alert-group snapshot [ profile name ]`
2. `call-home send alert-group configuration [ profile name ]`
3. `call-home send alert-group inventory [ profile name ]`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Sends a snapshot alert group message to one destination profile if specified or to all subscribed destination profiles.</td>
</tr>
<tr>
<td><code>call-home send alert-group snapshot [ profile name ]</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>RP/0/RP0/CPU0:router # call-home send alert-group snapshot profile p1</code></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Sends a configuration alert group message to one destination profile if specified or to all subscribed destination profiles.</td>
</tr>
<tr>
<td><code>call-home send alert-group configuration [ profile name ]</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>RP/0/RP0/CPU0:router # call-home send alert-group configuration profile p1</code></td>
</tr>
</tbody>
</table>
### Manually sending command output message for a Command List

You can use the `call-home send` command to execute a command or a list of commands and send the command output through HTTP or email protocol.

**Guidelines when sending the output of a command:**

- The specified command or list of commands can be any run command, including commands for all modules. The command must be contained in quotes ("").
- If the email option is selected using the “email” keyword and an email address is specified, the command output is sent to that address.
- If neither the email nor the HTTP option is specified, the output is sent in long-text format with the specified service request number to the Cisco TAC (attach@cisco.com).
- If neither the “email” nor the “http” keyword is specified, the service request number is required for both long-text and XML message formats and is provided in the subject line of the email.
- If the HTTP option is specified, the CiscoTAC-1 profile destination HTTP or HTTPS URL is used as the destination. The destination email address can be specified so that Smart Call Home can forward the message to the email address. The user must specify either the destination email address or an SR number but they can also specify both.

This task enables you to execute command and send the command output.

**SUMMARY STEPS**

1. `call-home send { cli command | cli list } [ email email msg-format { long-text | xml } | http { destination-email-address email } ] [ tac-request SR# ]`
Configuring Call Home on the Cisco IOS XR Software

Configuring a HTTP Proxy Server

This task enables the user to configure a HTTP Proxy Server.

SUMMARY STEPS

1. configure
2. call-home
3. http-proxy proxy-server-name port port-number

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure</td>
<td></td>
</tr>
</tbody>
</table>
### Configuring Call Home configuration mode

#### Step 2

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>call-home</code></td>
<td>Enters Call Home configuration mode.</td>
</tr>
</tbody>
</table>

**Example:**

```
RP/0/RP0/CPU0:router (config) # call-home
```

### Configuring HTTP proxy server configuration

#### Step 3

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>http-proxy proxy-server-name port port-number</code></td>
<td>Configures the port for the specified HTTP proxy server. Range is 1 to 65535.</td>
</tr>
</tbody>
</table>

**Example:**

```
RP/0/RP0/CPU0:router (config) # http-proxy p1 port 100
```

### Configuring Snapshot alert group

#### SUMMARY STEPS

1. `configure`
2. `call-home`
3. `alert-group-configuration snapshot`
4. `add-command "command string"`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>configure</code></td>
<td></td>
</tr>
<tr>
<td><code>call-home</code></td>
<td>Enters Call Home configuration mode.</td>
</tr>
</tbody>

Implementing NTP

Network Time Protocol (NTP) is a protocol designed to time-synchronize devices within a network. Cisco IOS XR software implements NTPv4. NTPv4 retains backwards compatibility with the older versions of NTP, including NTPv3 and NTPv2 but excluding NTPv1, which has been discontinued due to security vulnerabilities.

The Cisco implementation of NTP supports both IPv4 and IPv6 addresses and supports VRF.

This module describes the tasks you need to implement NTP on the Cisco IOS XR software. For more information about NTP on the Cisco IOS XR software and complete descriptions of the NTP commands listed in this module, see Related Documents, on page 254. To locate documentation for other commands that might appear in the course of running a configuration task, search online in Cisco IOS XR Commands Master List for the Cisco CRS Router.

Table 26: Feature History for Implementing NTP on Cisco IOS XR Software

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 2.0</td>
<td>This feature was introduced.</td>
</tr>
<tr>
<td>Release 3.8.0</td>
<td>Support was added for IPv6 addresses, VRFs, multicast-based associations, and burst and iburst modes for poll-based associations.</td>
</tr>
</tbody>
</table>

This module contains the following topics:

- Prerequisites for Implementing NTP on Cisco IOS XR Software, page 234
- Information About Implementing NTP, page 234
- How to Implement NTP on Cisco IOS XR Software, page 235
- Configuration Examples for Implementing NTP, page 251
- Additional References, page 254
Prerequisites for Implementing NTP on Cisco IOS XR Software

You must be in a user group associated with a task group that includes the proper task IDs. The command reference guides include the task IDs required for each command. If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Information About Implementing NTP

NTP synchronizes timekeeping among a set of distributed time servers and clients. This synchronization allows events to be correlated when system logs are created and other time-specific events occur.

NTP uses the User Datagram Protocol (UDP) as its transport protocol. All NTP communication uses Coordinated Universal Time (UTC). An NTP network usually receives its time from an authoritative time source, such as a radio clock or an atomic clock attached to a time server. NTP distributes this time across the network. NTP is extremely efficient; no more than one packet per minute is necessary to synchronize two machines to within a millisecond of each other.

NTP uses the concept of a "stratum" to describe how many NTP "hops" away a machine is from an authoritative time source. A "stratum 1" time server typically has an authoritative time source (such as a radio or atomic clock, or a GPS time source) directly attached, a "stratum 2" time server receives its time via NTP from a "stratum 1" time server, and so on.

NTP avoids synchronizing to a machine whose time may not be accurate, in two ways. First, NTP never synchronizes to a machine that is not synchronized itself. Second, NTP compares the time reported by several machines and does not synchronize to a machine whose time is significantly different than the others, even if its stratum is lower. This strategy effectively builds a self-organizing tree of NTP servers.

The Cisco implementation of NTP does not support stratum 1 service; in other words, it is not possible to connect to a radio or atomic clock (for some specific platforms, however, you can connect a GPS time-source device). We recommend that time service for your network be derived from the public NTP servers available in the IP Internet.

If the network is isolated from the Internet, the Cisco implementation of NTP allows a machine to be configured so that it acts as though it is synchronized via NTP, when in fact it has determined the time using other means. Other machines can then synchronize to that machine via NTP.

Several manufacturers include NTP software for their host systems, and a publicly available version for systems running UNIX and its various derivatives is also available. This software also allows UNIX-derivative servers to acquire the time directly from an atomic clock, which would subsequently propagate time information along to Cisco routers.

The communications between machines running NTP (known as associations) are usually statically configured; each machine is given the IP address of all machines with which it should form associations. Accurate timekeeping is made possible by exchanging NTP messages between each pair of machines with an association.

The Cisco implementation of NTP supports three ways that a networking device can obtain NTP time information on a network:

- By polling host servers
- By listening to NTP broadcasts
- By listening to NTP multicasts
In a LAN environment, NTP can be configured to use IP broadcast or multicast messages. As compared to polling, IP broadcast or multicast messages reduce configuration complexity, because each machine can simply be configured to send or receive broadcast or multicast messages. However, the accuracy of timekeeping is marginally reduced because the information flow is one-way only.

An NTP broadcast client listens for broadcast messages sent by an NTP broadcast server at a designated IPv4 address. The client synchronizes the local clock using the first received broadcast message.

An NTP multicast server periodically sends a message to a designated IPv4 or IPv6 local multicast group address. An NTP multicast client listens on this address for NTP messages.

The time kept on a machine is a critical resource, so we strongly recommend that you use the security features of NTP to avoid the accidental or malicious setting of incorrect time. Two mechanisms are available: an access list-based restriction scheme and an encrypted authentication mechanism.

When multiple sources of time (VINES, hardware clock, manual configuration) are available, NTP is always considered to be more authoritative. NTP time overrides the time set by any other method.

### How to Implement NTP on Cisco IOS XR Software

#### Configuring Poll-Based Associations

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>No specific command enables NTP; the first NTP configuration command that you issue enables NTP.</td>
</tr>
</tbody>
</table>

You can configure the following types of poll-based associations between the router and other devices (which may also be routers):

- Client mode
- Symmetric active mode

The client and the symmetric active modes should be used when NTP is required to provide a high level of time accuracy and reliability.

When a networking device is operating in the client mode, it polls its assigned time serving hosts for the current time. The networking device then picks a host from all the polled time servers to synchronize with.

Because the relationship that is established in this case is a client-host relationship, the host does not capture or use any time information sent by the local client device. This mode is most suited for file-server and workstation clients that are not required to provide any form of time synchronization to other local clients.

Use the `server` command to individually specify the time-serving hosts that you want your networking device to consider synchronizing with and to set your networking device to operate in the client mode.

When a networking device is operating in the symmetric active mode, it polls its assigned time-serving hosts for the current time and it responds to polls by its hosts. Because this is a peer-to-peer relationship, the host also retains time-related information about the local networking device that it is communicating with.

This mode should be used when there are several mutually redundant servers that are interconnected via diverse network paths. Most stratum 1 and stratum 2 servers on the Internet today adopt this form of network setup.

Use the `peer` command to individually specify the time-serving hosts that you want your networking device to consider synchronizing with and to set your networking device to operate in the symmetric active mode.

When the router polls several other devices for the time, the router selects one device with which to synchronize.
To configure a peer-to-peer association between the router and another device, you must also configure the router as a peer on the other device.

You can configure multiple peers and servers, but you cannot configure a single IP address as both a peer and a server at the same time.

To change the configuration of a specific IP address from peer to server or from server to peer, use the no form of the peer or server command to remove the current configuration before you perform the new configuration. If you do not remove the old configuration before performing the new configuration, the new configuration does not overwrite the old configuration.

### SUMMARY STEPS

1. configure
2. ntp
3. server ip-address [version number] [key key-id] [minpoll interval] [maxpoll interval] [source type interface-path-id] [prefer] [burst] [iburst]
4. peer ip-address [version number] [key key-id] [minpoll interval] [maxpoll interval] [source type interface-path-id] [prefer]
5. Use one of the following commands:
   - end
   - commit

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure</td>
<td>Enters NTP configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> ntp</td>
<td></td>
</tr>
<tr>
<td>Example: RP/0/RP0/CPU0:router(config)# ntp</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> server ip-address [version number] [key key-id] [minpoll interval] [maxpoll interval] [source type interface-path-id] [prefer] [burst] [iburst]</td>
<td>Forms a server association with another system. This step can be repeated as necessary to form associations with multiple devices.</td>
</tr>
<tr>
<td>Example: RP/0/RP0/CPU0:router(config-ntp)# server 172.16.22.44 minpoll 8 maxpoll 12</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> peer ip-address [version number] [key key-id] [minpoll interval] [maxpoll interval] [source type interface-path-id] [prefer]</td>
<td>Forms a peer association with another system. This step can be repeated as necessary to form associations with multiple systems.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>To complete the configuration of a peer-to-peer association between the router and the remote device, the router must also be configured as a peer on the remote device.</td>
</tr>
<tr>
<td>RP/0/RP0/CPU0:router(config-ntp)# peer 192.168.22.33</td>
<td>Note</td>
</tr>
<tr>
<td>minpoll 8 maxpoll 12 source tengige 0/0/0/1</td>
<td></td>
</tr>
</tbody>
</table>

Step 5 Use one of the following commands:

- end
- commit

Example:

RP/0/RP0/CPU0:router(config-ntp)# end
or
RP/0/RP0/CPU0:router(config-ntp)# commit

Saves configuration changes.

- When you issue the end command, the system prompts you to commit changes:

Uncommitted changes found, commit them before exiting(yes/no/cancel)? [cancel]:

- Entering yes saves configuration changes to the running configuration file, exits the configuration session, and returns the router to EXEC mode.
- Entering no exits the configuration session and returns the router to EXEC mode without committing the configuration changes.
- Entering cancel leaves the router in the current configuration session without exiting or committing the configuration changes.

- Use the commit command to save the configuration changes to the running configuration file and remain within the configuration session.

---

### Configuring Broadcast-Based NTP Associates

In a broadcast-based NTP association, an NTP server propagates NTP broadcast packets throughout a network. Broadcast clients listen for the NTP broadcast packets propagated by the NTP server and do not engage in any polling.

Broadcast-based NTP associations should be used when time accuracy and reliability requirements are modest and if your network is localized and has a large number of clients (more than 20). Broadcast-based NTP associations also are recommended for use on networks that have limited bandwidth, system memory, or CPU resources. Time accuracy is marginally reduced in broadcast-based NTP associations because information flows only one way.

Use the broadcast client command to set your networking device to listen for NTP broadcast packets propagated through a network. For broadcast client mode to work, the broadcast server and its clients must be located on the same subnet. The time server that is transmitting NTP broadcast packets must be enabled on the interface of the given device using the broadcast command.
Use the `broadcast` command to set your networking device to send NTP broadcast packets.

**Note**
No specific command enables NTP; the first NTP configuration command that you issue enables NTP.

**SUMMARY STEPS**

1. `configure`
2. `ntp`
3. (Optional) `broadcastdelay microseconds`
4. `interface type interface-path-id`
5. `broadcast client`
6. `broadcast [destination ip-address] [key key-id] [version number]`
7. Use one of the following commands:
   - `end`
   - `commit`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure</td>
<td>Enters NTP configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> ntp</td>
<td>Enters NTP configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> RP/0/RP0/CPU0:router(config)# ntp</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> broadcastdelay microseconds</td>
<td>(Optional) Adjusts the estimated round-trip delay for NTP broadcasts.</td>
</tr>
<tr>
<td><strong>Example:</strong> RP/0/RP0/CPU0:router(config-ntp)# broadcastdelay 5000</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> interface type interface-path-id</td>
<td>Enters NTP interface configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> RP/0/RP0/CPU0:router(config-ntp)# interface POS 0/1/0/0</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> broadcast client</td>
<td>Configures the specified interface to receive NTP broadcast packets.</td>
</tr>
<tr>
<td><strong>Example:</strong> RP/0/RP0/CPU0:router(config-ntp-int)# broadcast client</td>
<td><strong>Note</strong> Go to <strong>Step 6</strong>, on page 239 to configure the interface to send NTP broadcast packets.</td>
</tr>
</tbody>
</table>
### Configuring Multicast-Based NTP Associations

Multicast-based NTP associations should be used when time accuracy and reliability requirements are modest and if your network is localized and has a large number of clients (more than 20). Multicast-based NTP associations also are recommended for use on networks that have limited bandwidth, system memory, or CPU resources.

When the router operates as an NTP multicast client, it listens for NTP multicast packets that are sent by an NTP multicast server to a designated IPv4 or IPv6 multicast group IP address.

When the router operates as an NTP multicast server, it sends NTP multicast messages to a designated IPv4 or IPv6 multicast group IP address.

---

**Command or Action**

<table>
<thead>
<tr>
<th>Step 6</th>
<th>broadcast [destination ip-address] [key key-id] [version number]</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Configures the specified interface to send NTP broadcast packets.</td>
</tr>
</tbody>
</table>

**Example:**

```
RP/0/RP0/CPU0:router(config-ntp-int)# broadcast
destination 10.50.32.149
```

**Note:** Go to Step 5, on page 238 to configure the interface to receive NTP broadcast packets.

**Step 7**

Use one of the following commands:
- `end`
- `commit`

**Example:**

```
RP/0/RP0/CPU0:router(config-ntp-int)# end
```

Saves configuration changes.

- When you issue the `end` command, the system prompts you to commit changes:

  Uncommitted changes found, commit them before exiting(yes/no/cancel)?
  [cancel]:

  * Entering `yes` saves configuration changes to the running configuration file, exits the configuration session, and returns the router to EXEC mode.

  * Entering `no` exits the configuration session and returns the router to EXEC mode without committing the configuration changes.

  * Entering `cancel` leaves the router in the current configuration session without exiting or committing the configuration changes.

- Use the `commit` command to save the configuration changes to the running configuration file and remain within the configuration session.
No specific command enables NTP; the first NTP configuration command that you issue enables NTP.

SUMMARY STEPS

1. configure
2. ntp
3. interface type interface-path-id [vrf vrf-name]
4. multicast client [ip-address]
5. multicast destination ip-address [key key-id] [version number] [ttl ttl]
6. Use one of the following commands:
   - end
   - commit

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure</td>
<td>Enters NTP configuration mode.</td>
</tr>
<tr>
<td>Step 2 ntp</td>
<td>Enters NTP interface configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RP0/CPU0:router(config)# ntp</td>
</tr>
<tr>
<td>Step 3 interface type interface-path-id [vrf vrf-name]</td>
<td>Enters NTP interface configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RP0/CPU0:router(config-ntp)# interface POS 0/1/0/0</td>
</tr>
<tr>
<td>Step 4 multicast client [ip-address]</td>
<td>Configures the specified interface to listen for NTP multicast packets on the specified IPv4 or IPv6 address. If no IP address is specified, the interface listens on the default IPv4 address 224.0.1.1.</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RP0/CPU0:router(config-ntp-int)# multicast client</td>
</tr>
<tr>
<td>Step 5 multicast destination ip-address [key key-id] [version number] [ttl ttl]</td>
<td>Configures the specified interface to send NTP multicast packets to a specified IPv4 or IPv6 multicast group address.</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RP0/CPU0:router(config-ntp-int)# multicast destination 224.0.1.1</td>
</tr>
<tr>
<td>Step 6</td>
<td>Saves configuration changes.</td>
</tr>
</tbody>
</table>

Note: To configure the interface to listen for NTP multicast packets, go to Step 5, on page 240.

Note: To configure the interface to listen for NTP multicast packets, go to Step 4, on page 240.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>• end</td>
<td>When you issue the <strong>end</strong> command, the system prompts you to commit changes:</td>
</tr>
<tr>
<td>• commit</td>
<td>Uncommitted changes found, commit them before exiting(yes/no/cancel)? [cancel]:</td>

<td>• Use the <strong>commit</strong> command to save the configuration changes to the running configuration file and remain within the configuration session.</td>
</tr>
</tbody>
</table>

### Configuring NTP Access Groups

**Note**

No specific command enables NTP; the first NTP configuration command that you issue enables NTP.

The access list-based restriction scheme allows you to grant or deny certain access privileges to an entire network, a subnet within a network, or a host within a subnet. NTP communication consists of time requests and control queries. A time request is a request for time synchronization from an NTP server. A control query is a request for configuration information from an NTP server.

The access group options are scanned in the following order, from least restrictive to most restrictive:

1 **peer**—Allows time requests and NTP control queries and allows the system to synchronize itself to a system whose address passes the access list criteria.
2 **serve**—Allows time requests and NTP control queries, but does not allow the system to synchronize itself to a system whose address passes the access list criteria.
3 **serve-only**—Allows only time requests from a system whose address passes the access list criteria.
4 **query-only**—Allows only NTP control queries from a system whose address passes the access list criteria.

If the source IP address matches the access lists for more than one access type, the first type is granted. If no access groups are specified, all access types are granted to all systems. If any access groups are specified, only the specified access types are granted.
For details on NTP control queries, see RFC 1305 (NTP version 3).

**SUMMARY STEPS**

1. `configure`
2. `ntp`
3. `access-group {peer | query-only | serve | serve-only} access-list-name`
4. Use one of the following commands:
   - `end`
   - `commit`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>configure</code></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>ntp</code></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>RP/0/RP0/CPU0:router(config)# ntp</code></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>`access-group {peer</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>RP/0/RP0/CPU0:router(config-ntp)# access-group peer access1</code></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Use one of the following commands:</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>RP/0/RP0/CPU0:router(config-ntp)# end</code> or <code>RP/0/RP0/CPU0:router(config-ntp)# commit</code></td>
</tr>
<tr>
<td><em>end</em></td>
<td>When you issue the <code>end</code> command, the system prompts you to commit changes:</td>

<td></td>
</tr>
<tr>
<td><em>Exiting no exits the configuration session and returns the router to EXEC mode without committing the configuration changes.</em></td>
<td></td>
</tr>
<tr>
<td><em>Exiting cancel leaves the router in the current configuration session without exiting or committing the configuration changes.</em></td>
<td></td>
</tr>
</tbody>
</table>
### Configuring NTP Authentication

This task explains how to configure NTP authentication.

**Note**

No specific command enables NTP; the first NTP configuration command that you issue enables NTP.

The encrypted NTP authentication scheme should be used when a reliable form of access control is required. Unlike the access-list-based restriction scheme that is based on IP addresses, the encrypted authentication scheme uses authentication keys and an authentication process to determine if NTP synchronization packets sent by designated peers or servers on a local network are deemed as trusted, before the time information that it carries along is accepted.

The authentication process begins from the moment an NTP packet is created. A message authentication code (MAC) is computed using the MD5 Message Digest Algorithm and the MAC is embedded into an NTP synchronization packet. The NTP synchronization packet together with the embedded MAC and key number are transmitted to the receiving client. If authentication is enabled and the key is trusted, the receiving client computes the MAC in the same way. If the computed MAC matches the embedded MAC, the system is allowed to sync to the server that uses this key in its packets.

After NTP authentication is properly configured, your networking device only synchronizes with and provides synchronization to trusted time sources.

### SUMMARY STEPS

1. `configure`
2. `ntp`
3. `authenticate`
4. `authentication-key key-number md5 [clear | encrypted] key-name`
5. `trusted-key key-number`
6. Use one of the following commands:
   - `end`
   - `commit`
## DETAILED STEPS

<table>
<thead>
<tr>

</tbody>
</table>
| • commit | | Uncommitted changes found, commit them before exiting(yes/no/cancel)?
| Example: | RP/0/RP0/CPU0:router(config-ntp)# end | [cancel]:
| or | RP/0/RP0/CPU0:router(config-ntp)# commit | • Entering **yes** saves configuration changes to the running configuration file, exits the configuration session, and returns the router to EXEC mode. |
| | | • Entering **no** exits the configuration session and returns the router to EXEC mode without committing the configuration changes. |
| | | • Entering **cancel** leaves the router in the current configuration session without exiting or committing the configuration changes. |
Disabling NTP Services on a Specific Interface

NTP services are disabled on all interfaces by default. NTP is enabled globally when any NTP commands are entered. You can selectively prevent NTP packets from being received through a specific interface by turning off NTP on a given interface.

SUMMARY STEPS

1. configure
2. ntp
3. Use one of the following commands:
   • no interface type interface-path-id
   • interface type interface-path-id disable
4. Use one of the following commands:
   • end
   • commit

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure</td>
<td>Enters NTP configuration mode.</td>
</tr>
<tr>
<td>Step 2 ntp</td>
<td>Enters NTP configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Enters NTP configuration mode.</td>
</tr>
<tr>
<td>RP/0/RP0/CPU0:router(config)# ntp</td>
<td>Enters NTP configuration mode.</td>
</tr>
<tr>
<td>Step 3 Use one of the following commands:</td>
<td>Disables NTP services on the specified interface.</td>
</tr>
<tr>
<td>• no interface type interface-path-id</td>
<td>Disables NTP services on the specified interface.</td>
</tr>
<tr>
<td>• interface type interface-path-id disable</td>
<td>Disables NTP services on the specified interface.</td>
</tr>
</tbody>
</table>

Purpose

• Use the commit command to save the configuration changes to the running configuration file and remain within the configuration session.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong> RP/0/RP0/CPU0:router(config-ntp)# no interface pos 0/0/0/1 or RP/0/RP0/CPU0:router(config-ntp)# interface POS 0/0/0/1 disable</td>
<td>Saves configuration changes.</td>
</tr>
</tbody>
</table>

**Step 4**

Use one of the following commands:

- `end`
- `commit`

**Example:**

RP/0/RP0/CPU0:router(config-ntp)# end or RP/0/RP0/CPU0:router(config-ntp)# commit

- When you issue the **end** command, the system prompts you to commit changes:

  Uncommitted changes found, commit them before exiting(yes/no/cancel)? [cancel]:

  - Entering **yes** saves configuration changes to the running configuration file, exits the configuration session, and returns the router to EXEC mode.
  - Entering **no** exits the configuration session and returns the router to EXEC mode without committing the configuration changes.
  - Entering **cancel** leaves the router in the current configuration session without exiting or committing the configuration changes.

- Use the **commit** command to save the configuration changes to the running configuration file and remain within the configuration session.

---

**Configuring the Source IP Address for NTP Packets**

By default, the source IP address of an NTP packet sent by the router is the address of the interface through which the NTP packet is sent. Use this procedure to set a different source address.

---

**Note**

No specific command enables NTP; the first NTP configuration command that you issue enables NTP.
### SUMMARY STEPS

1. **configure**
2. **ntp**
3. **source** *type* *interface-path-id*
4. Use one of the following commands:
   - **end**
   - **commit**

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>configure</strong></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>ntp</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><strong>RP/0/RP0/CPU0:router(config)# ntp</strong></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>source</strong> <em>type</em> <em>interface-path-id</em>**</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><strong>RP/0/RP0/CPU0:router(config-ntp)# source POS 0/0/0/1</strong></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Use one of the following commands:</td>
</tr>
<tr>
<td></td>
<td>• <strong>end</strong></td>
</tr>
<tr>
<td></td>
<td>• <strong>commit</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><strong>RP/0/RP0/CPU0:router(config-ntp)# end</strong></td>
</tr>
<tr>
<td></td>
<td><strong>or</strong></td>
</tr>
<tr>
<td></td>
<td><strong>RP/0/RP0/CPU0:router(config-ntp)# commit</strong></td>
</tr>
</tbody>
</table>

**Note**

This interface is used for the source address for all packets sent to all destinations. If a source address is to be used for a specific association, use the **source** keyword in the **peer** or **server** command shown in Configuring Poll-Based Associations, on page 235.

**Purpose**

- Enters NTP configuration mode.
- Configures an interface from which the IP source address is taken.
- Saves configuration changes.
- When you issue the **end** command, the system prompts you to commit changes:
  - Entering **yes** saves configuration changes to the running configuration file, exits the configuration session, and returns the router to EXEC mode.
  - Entering **no** exits the configuration session and returns the router to EXEC mode without committing the configuration changes.
  - Entering **cancel** leaves the router in the current configuration session without exiting or committing the configuration changes.
  - Use the **commit** command to save the configuration changes to the running configuration file and remain within the configuration session.
Configuring the System as an Authoritative NTP Server

You can configure the router to act as an authoritative NTP server, even if the system is not synchronized to an outside time source.

**Note**

No specific command enables NTP; the first NTP configuration command that you issue enables NTP.

**SUMMARY STEPS**

1. configure
2. ntp
3. master stratum
4. Use one of the following commands:
   - end
   - commit

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure</td>
<td></td>
</tr>
<tr>
<td>Step 2 ntp</td>
<td>Enters NTP configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>RP/0/RP0/CPU0:router(config)# ntp</td>
<td></td>
</tr>
<tr>
<td>Step 3 master stratum</td>
<td>Makes the router an authoritative NTP server.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>RP/0/RP0/CPU0:router(config-ntp)# master 9</td>
<td></td>
</tr>
<tr>
<td>Step 4 Use one of the following commands:</td>
<td>Saves configuration changes.</td>
</tr>
<tr>
<td>• end</td>
<td>• When you issue the end command, the system prompts you to commit changes:</td>
</tr>
<tr>
<td>• commit</td>
<td>Uncommitted changes found, commit them before</td>
</tr>
</tbody>
</table>

**Note**

Use the master command with caution. It is very easy to override valid time sources using this command, especially if a low stratum number is configured. Configuring multiple machines in the same network with the master command can cause instability in time keeping if the machines do not agree on the time.
### Implementing NTP

#### Updating the Hardware Clock

On devices that have hardware clocks (system calendars), you can configure the hardware clock to be periodically updated from the software clock. This is advisable for devices using NTP, because the time and date on the software clock (set using NTP) is more accurate than the hardware clock. The time setting on the hardware clock has the potential to drift slightly over time.

### SUMMARY STEPS

1. **configure**
2. **ntp**
3. **update-calendar**
4. Use one of the following commands:
   - **end**
   - **commit**

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure</td>
</tr>
</tbody>
</table>
## Implementing NTP

### Purpose
- **Command or Action**: `ntp`
- **Purpose**: Enters NTP configuration mode.

**Example:**
```
RP/0/RP0/CPU0:router(config)# ntp
```

### Step 2
Configure the router to update its system calendar from the software clock at periodic intervals.

**Command or Action**: `update-calendar`

**Example:**
```
RP/0/RP0/CPU0:router(config-ntp)# update-calendar
```

### Step 3
Saves configuration changes.

**Command**
- `end`
- `commit`

**Example:**
```
RP/0/RP0/CPU0:router(config-ntp)# end
```
```
RP/0/RP0/CPU0:router(config-ntp)# commit
```

- When you issue the `end` command, the system prompts you to commit changes:

  Uncommitted changes found, commit them before exiting(yes/no/cancel)?
  [cancel]:

  - Entering **yes** saves configuration changes to the running configuration file, exits the configuration session, and returns the router to EXEC mode.
  - Entering **no** exits the configuration session and returns the router to EXEC mode without committing the configuration changes.
  - Entering **cancel** leaves the router in the current configuration session without exiting or committing the configuration changes.

  - Use the **commit** command to save the configuration changes to the running configuration file and remain within the configuration session.

### Verifying the Status of the External Reference Clock

This task explains how to verify the status of NTP components.

**Note**
The commands can be entered in any order.

**SUMMARY STEPS**

1. `show ntp associations [detail] [location node-id]`
2. `show ntp status [location node-id]`
DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show ntp associations [detail] [location node-id]</td>
<td>Displays the status of NTP associations.</td>
</tr>
<tr>
<td>Example: RP/0/RP0/CPU0:router# show ntp associations</td>
<td></td>
</tr>
<tr>
<td>show ntp status [location node-id]</td>
<td>Displays the status of NTP.</td>
</tr>
<tr>
<td>Example: RP/0/RP0/CPU0:router# show ntp status</td>
<td></td>
</tr>
</tbody>
</table>

Examples

The following is sample output from the `show ntp associations` command:

```
RP/0/RP0/CP00:router# show ntp associations
Tue Oct 7 11:22:46.839 JST
    address    ref clock    st when poll reach delay offset  disp
*~192.168.128.5 10.81.254.131  2 1 64 377 7.98 -0.560  0.108
+~dead:beef::2 vrf testAA
     171.68.10.80  3 20 64 377 6.00 -2.832  0.046
* sys_peer, # selected, + candidate, - outlayer, x falseticker, ~ configured
```

The following is sample output from the `show ntp status` command:

```
RP/0/RP0/CP00:router# show ntp status
Tue Oct 7 11:22:54.023 JST
    Clock is synchronized, stratum 3, reference is 192.168.128.5
    nominal freq is 1000.0000 Hz, actual freq is 1000.2725 Hz, precision is 2**24
    reference time is CC95463C.9B964367 (11:21:48.607 JST Tue Oct 7 2008)
    clock offset is -1.738 msec, root delay is 186.050 msec
    root dispersion is 53.86 msec, peer dispersion is 0.09 msec
    loopfilter state is 'CTRL' (Normal Controlled Loop), drift is -0.0002724105 s/s
    system poll interval is 64, last update was 66 sec ago
```

Configuration Examples for Implementing NTP

Configuring Poll-Based Associations: Example

The following example shows an NTP configuration in which the router’s system clock is configured to form a peer association with the time server host at IP address 192.168.22.33, and to allow the system clock to be synchronized by time server hosts at IP address 10.0.2.1 and 172.19.69.1:

```
ntp
```
server 10.0.2.1 minpoll 5 maxpoll 7
peer 192.168.22.33
server 172.19.69.1

Configuring Broadcast-Based Associations: Example

The following example shows an NTP client configuration in which interface 0/2/0/0 is configured to receive NTP broadcast packets, and the estimated round-trip delay between an NTP client and an NTP broadcast server is set to 2 microseconds:

```
ntp
  interface tengige 0/2/0/0
    broadcast client
  exit
  broadcastdelay 2
```

The following example shows an NTP server configuration where interface 0/2/0/2 is configured to be a broadcast server:

```
ntp
  interface tengige 0/2/0/2
    broadcast
```

Configuring Multicast-Based Associations: Example

The following example shows an NTP multicast client configuration where 10-Gigabit Ethernet interface 0/1/1/0 is configured to be a multicast client and to join the default multicast group (IPv4 address 224.0.1.1):

```
ntp interface TenGigE 0/1/1/0
  multicast client
```

The following example shows an NTP multicast server configuration where 10-Gigabit Ethernet interface 0/1/1/0 is configured to be a multicast server:

```
ntp interface TenGigE 0/1/1/0
  multicast destination 224.0.1.1
```

Configuring NTP Access Groups: Example

The following example shows a NTP access group configuration where the following access group restrictions are applied:

- Peer restrictions are applied to IP addresses that pass the criteria of the access list named peer-acl.
- Serve restrictions are applied to IP addresses that pass the criteria of access list named serve-acl.
- Serve-only restrictions are applied to IP addresses that pass the criteria of the access list named serve-only-acl.
- Query-only restrictions are applied to IP addresses that pass the criteria of the access list named query-only-acl.

```
ntp
  peer 10.1.1.1
  peer 10.2.2.2
  peer 10.3.3.3
```
peer 10.4.4.4
peer 10.5.5.5
peer 10.6.6.6
peer 10.7.7.7
peer 10.8.8.8
access-group peer peer-acl
access-group serve serve-acl
access-group serve-only serve-only-acl
access-group query-only query-only-acl
exit
ipv4 access-list peer-acl
10 permit ip host 10.1.1.1 any
20 permit ip host 10.8.8.8 any
exit
ipv4 access-list serve-acl
10 permit ip host 10.4.4.4 any
20 permit ip host 10.5.5.5 any
exit
ipv4 access-list query-only-acl
10 permit ip host 10.2.2.2 any
20 permit ip host 10.3.3.3 any
exit
ipv4 access-list serve-only-acl
10 permit ip host 10.6.6.6 any
20 permit ip host 10.7.7.7 any
exit

Configuring NTP Authentication: Example

The following example shows an NTP authentication configuration. In this example, the following is configured:

- NTP authentication is enabled.
- Two authentication keys are configured (key 2 and key 3).
- The router is configured to allow its software clock to be synchronized with the clock of the peer (or vice versa) at IP address 10.3.32.154 using authentication key 2.
- The router is configured to allow its software clock to be synchronized with the clock by the device at IP address 10.32.154.145 using authentication key 3.
- The router is configured to synchronize only to systems providing authentication key 3 in their NTP packets.

ntp authenticate
authentication-key 2 md5 encrypted 06120A2D40031D1008124
authentication-key 3 md5 encrypted 1311121E074110232621
trusted-key 3
server 10.3.32.154 key 3
peer 10.32.154.145 key 2

Disabling NTP on an Interface: Example

The following example shows an NTP configuration in which 0/2/0/0 interface is disabled:

ntp
interface tengige 0/2/0/0
disable
exit
authentication-key 2 md5 encrypted 06120A2D40031D1008124
authentication-key 3 md5 encrypted 1311121E074110232621
authenticate
traded-key 3
server 10.3.32.154 key 3
peer 10.32.154.145 key 2

Configuring the Source IP Address for NTP Packets: Example
The following example shows an NTP configuration in which Ethernet management interface 0/0/CPU0/0 is configured as the source address for NTP packets:

```
ntp
  authentication-key 2 md5 encrypted 06120A2D40031D1008124
  authentication-key 3 md5 encrypted 1311121E074110232621
  authenticate
  trusted-key 3
  server 10.3.32.154 key 3
  peer 10.3.32.154.145 key 2
  source MgmtEth0/0/CPU0/0
```

Configuring the System as an Authoritative NTP Server: Example
The following example shows a NTP configuration in which the router is configured to use its own NTP master clock to synchronize with peers when an external NTP source becomes unavailable:

```
ntp
  master 6
```

Updating the Hardware Clock: Example
The following example shows an NTP configuration in which the router is configured to update its hardware clock from the software clock at periodic intervals:

```
ntp
  server 10.3.32.154
  update-calendar
```

Implementing Object Tracking on the Cisco IOS XR Software

This module describes the configuration of object tracking on your Cisco IOS XR network. For complete descriptions of the commands listed in this module, see Related Documents, on page 268. To locate documentation for other commands that might appear in the course of performing a configuration task, search online in Cisco IOS XR Commands Master List for the Cisco CRS Router.

- Information About Object Tracking, page 258
- How to Implement Object Tracking, page 258
- Configuration Examples for Configuring Object Tracking, page 268
- Additional References, page 268

Prerequisites for Implementing Object Tracking

You must be in a user group associated with a task group that includes the proper task IDs. The command reference guides include the task IDs required for each command. If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.
Information About Object Tracking

Object tracking is a mechanism to track an object and to take an action on another object with no relationship to the tracked objects, based on changes to the properties of the object being tracked.

Each tracked object is identified by a unique name specified on the tracking command-line interface (CLI). Cisco IOS XR processes then use this name to track a specific object.

The tracking process periodically polls the tracked object and reports any changes to its state in terms of its being up or down, either immediately or after a delay, as configured by the user.

Multiple objects can also be tracked by means of a list, using a flexible method for combining objects with Boolean logic. This functionality includes:

- **Boolean AND function**—When a tracked list has been assigned a Boolean AND function, each object defined within a subset must be in an up state, so that the tracked object can also be in the up state.

- **Boolean OR function**—When the tracked list has been assigned a Boolean OR function, it means that at least one object defined within a subset must also be in an up state, so that the tracked object can also be in the up state.

How to Implement Object Tracking

This section describes the various object tracking procedures.

Tracking the Line Protocol State of an Interface

Perform this task in global configuration mode to track the line protocol state of an interface.

A tracked object is considered up when a line protocol of the interface is up.

After configuring the tracked object, you may associate the interface whose state should be tracked and specify the number of seconds to wait before the tracking object polls the interface for its state.

**SUMMARY STEPS**

1. configure
2. track track-name
3. type line-protocol state
4. interface type interface-path-id
5. exit
6. (Optional) delay {up seconds|down seconds}
7. Use one of the following commands:
   - end
   - commit

</tr>
<tr>
<td><strong>Commit</strong></td>
<td>Use the <strong>commit</strong> command to save the configuration changes to the running configuration file and remain within the configuration session.</td>
</tr>
</tbody>
</table>

### Tracking IP Route Reachability

When a host or a network goes down on a remote site, routing protocols notify the router and the routing table is updated accordingly. The routing process is configured to notify the tracking process when the route state changes due to a routing update.

A tracked object is considered up when a routing table entry exists for the route and the route is accessible.

### SUMMARY STEPS

1. **configure**
2. **track** *track-name*
3. **type route reachability**
4. Use one of the following commands:
   - **vrf** *vrf-table-name*
   - **route ipv4** *IP-prefix/mask*
5. **exit**
6. (Optional) **delay** 
   
   - **up seconds**
   - **down seconds**
7. **commit**

</tbody>
</table>

**Building a Track Based on a List of Objects**

Perform this task in the global configuration mode to create a tracked list of objects (which, in this case, are lists of interfaces or prefixes) using a Boolean expression to determine the state of the list.

A tracked list contains one or more objects. The Boolean expression enables two types of calculations by using either AND or OR operators. For example, when tracking two interfaces, using the AND operator, up means that *both* interfaces are up, and down means that *either* interface is down.
An object must exist before it can be added to a tracked list.

The NOT operator is specified for one or more objects and negates the state of the object.

After configuring the tracked object, you must associate the interface whose state should be tracked and you may optionally specify the number of seconds to wait before the tracking object polls the interface for its state.

**SUMMARY STEPS**

1. configure
2. track track-name
3. type list boolean \{ and | or \}
4. object object-name \{ not \}
5. exit
6. (Optional) delay \{ up seconds|down seconds \}
7. Use one of the following commands:
   - end
   - commit

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure</td>
<td>Enters track configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> track track-name</td>
<td>Enter track configuration mode.</td>
</tr>
</tbody>
</table>
| **Example:** 
  RP/0/RP0/CPU0:router(config)# track track1 | |
| **Step 3** type list boolean \{ and | or \} | Configures a Boolean list object and enters track list configuration mode. |
| **Example:** 
  RP/0/RP0/CPU0:router(config-track-list)# type list boolean and | |
### Building a Track Based on a List of Objects - Threshold Percentage

Perform this task in the global configuration mode to create a tracked list of objects (which, in this case, are lists of interfaces or prefixes) using a threshold percentage to determine the state of the list.

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 4** object object-name [ not ] | Specifies the object to be tracked by the list  
• object-name—Name of the object to track.  
• not—Negates the state of the object.  
**Example:**  
RP/0/RP0/CPU0:router(config-track-list)# object 3 not |
| **Step 5** exit | Exits the track line protocol configuration mode.  
**Example:**  
RP/0/RP0/CPU0:router(config-track-line-prot)# exit |
| **Step 6** delay \{ up seconds | down seconds \} | (Optional) Schedules the delay that can occur between tracking whether the object is up or down.  
**Example:**  
RP/0/RP0/CPU0:router(config-track)# delay up 10 |
| **Step 7** Use one of the following commands:  
• end  
• commit | Saves configuration changes.  
• When you issue the **end** command, the system prompts you to commit changes:  

Uncommitted changes found, commit them before exiting(yes/no/cancel)?  
[cancel]:  

• Entering **yes** saves configuration changes to the running configuration file, exits the configuration session, and returns the router to EXEC mode.  
• Entering **no** exits the configuration session and returns the router to EXEC mode without committing the configuration changes.  
• Entering **cancel** leaves the router in the current configuration session without exiting or committing the configuration changes.  
• Use the **commit** command to save the configuration changes to the running configuration file and remain within the configuration session.  
**Example:**  
RP/0/RP0/CPU0:router(config-track)# end  
or  
RP/0/RP0/CPU0:router(config-track)# commit |
### SUMMARY STEPS

1. configure
2. track track-name
3. type list threshold percentage
4. object object-name
5. threshold percentage up percentage down percentage
6. Use one of the following commands:
   - end
   - commit

### DETAILED STEPS

</table>
### Building a Track Based on a List of Objects - Threshold Weight

Perform this task in the global configuration mode to create a tracked list of objects (which, in this case, are lists of interfaces or prefixes) using a threshold weight to determine the state of the list.

**SUMMARY STEPS**

1. configure
2. track *track-name*
3. type list threshold weight
4. object *object-name* weight *weight*
5. threshold weight up *weight* down *weight*
6. Use one of the following commands:
   - end
   - commit

---

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>• end</td>
<td>When you issue the <code>end</code> command, the system prompts you to commit changes: Uncommitted changes found, commit them before exiting (yes/no/cancel)? [cancel]:</td>
</tr>
<tr>
<td>• commit</td>
<td>• Entering <code>yes</code> saves configuration changes to the running configuration file, exits the configuration session, and returns the router to EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Entering <code>no</code> exits the configuration session and returns the router to EXEC mode without committing the configuration changes.</td>
</tr>
<tr>
<td>RP/0/RP0/CPU0:router(config-track)# end or RP/0/RP0/CPU0:router(config-track)# commit</td>
<td>• Entering <code>cancel</code> leaves the router in the current configuration session without exiting or committing the configuration changes.</td>
</tr>
<tr>
<td></td>
<td>• Use the <code>commit</code> command to save the configuration changes to the running configuration file and remain within the configuration session.</td>
</tr>
</tbody>
</table>

### Tracking IPSLA Reachability

Use this task to enable the tracking of the return code of IP service level agreement (SLA) operations.

#### SUMMARY STEPS

1. `configure`
2. `track track-name`
3. `type rtr ipsla-no reachability`
4. `commit`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>configure</code> Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>RP/0/RP0/CPU0:router# <code>configure</code></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>track track-name</code> Enter track configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>RP/0/RP0/CPU0:router(config)# <code>track t1</code></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>type rtr ipsla-no reachability</code> Specifies the IP SLA operation ID to be tracked for reachability. Values for the <code>ipsla-no</code> can range from 1 to 2048.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>RP/0/RP0/CPU0:router(config-track)# <code>type rtr 100 reachability</code></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><code>commit</code></td>
</tr>
</tbody>
</table>

### Configuring IPSLA Tracking: Example

This example shows the configuration of IPSLA tracking:

```
RP/0/RP0/CPU0:router(config)# `track track1`
RP/0/RP0/CPU0:router(config-track)# `type rtr 1 reachability`
RP/0/RP0/CPU0:router(config-track)# `delay up 5`
```
Configuration Examples for Configuring Object Tracking

Configuring IPSLA Tracking: Example
This example shows the configuration of IPSLA tracking, including the ACL and IPSLA configuration:

ACL configuration:

```
RP/0/RP0/CPU0:router(config)# ipv4 access-list abf-track
RP/0/RP0/CPU0:router(config-ipv4-acl)# 10 permit any any nexthop track track1 1.2.3.4
```

Object tracking configuration:

```
RP/0/RP0/CPU0:router(config)# track track1
RP/0/RP0/CPU0:router(config-track)# type rtr 1 reachability
RP/0/RP0/CPU0:router(config-track)# delay up 5
RP/0/RP0/CPU0:router(config-track)# delay down 10
```

IPSLA configuration:

```
RP/0/RP0/CPU0:router(config)# ipsla
RP/0/RP0/CPU0:router(config-ipsla)# operation 1
RP/0/RP0/CPU0:router(config-ipsla-op)# type icmp echo
RP/0/RP0/CPU0:router(config-ipsla-icmp-echo)# source address 2.3.4.5
RP/0/RP0/CPU0:router(config-ipsla-icmp-echo)# destination address 1.2.3.4
RP/0/RP0/CPU0:router(config-ipsla-icmp-echo)# frequency 60
RP/0/RP0/CPU0:router(config-ipsla-icmp-echo)# exit
RP/0/RP0/CPU0:router(config-ipsla-op)# exit
RP/0/RP0/CPU0:router(config-ipsla)# schedule operation 1
RP/0/RP0/CPU0:router(config-ipsla-sched)# start-time now
RP/0/RP0/CPU0:router(config-ipsla-sched)# life forever
```

Additional References
The following sections provide references related to implementing object tracking for IPSec network security.

Implementing Physical and Virtual Terminals

Line templates define standard attribute settings for incoming and outgoing transport over physical and virtual terminal lines (vtys). Vty pools are used to apply template settings to ranges of vtys.

Before creating or modifying the vty pools, enable the telnet server using the `telnet server` command in Global Configuration mode. See Cisco IOS XR IP Addresses and Services Configuration Guide for the Cisco CRS Router and Cisco IOS XR IP Addresses and Services Command Reference for the Cisco CRS Router for more information.

This module describes the new and revised tasks you need to implement physical and virtual terminals on your Cisco IOS XR network.

For more information about physical and virtual terminals on the Cisco IOS XR software and complete descriptions of the terminal services commands listed in this module, see Related Documents, on page 280. To locate documentation for other commands that might appear in the course of running a configuration task, search online in Cisco IOS XR Commands Master List for the Cisco CRS Router.

Prerequisites for Implementing Physical and Virtual Terminals

You must be in a user group associated with a task group that includes the proper task IDs. The command reference guides include the task IDs required for each command. If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Information About Implementing Physical and Virtual Terminals

To implement physical and virtual terminals, you need to understand the concepts in this section.

Line Templates

The following line templates are available in the Cisco IOS XR software.

- Default line template—The default line template that applies to a physical and virtual terminal lines.
- Console line template—The line template that applies to the console line.
- User-defined line templates—User-defined line templates that can be applied to a range of virtual terminal lines.

Line Template Configuration Mode

Changes to line template attributes are made in line template configuration mode. To enter line template configuration mode, issue the `line` command from Global Configuration mode, specifying the template to be modified. These line templates can be configured with the `line` command:

- `console`—console template
- `default`—default template
- `template`—user-defined template

After you specify a template with the `line` command, the router enters line template configuration mode where you can set the terminal attributes for the specified line. This example shows how to specify the attributes for the console:

```
RP/0/RP0/CPU0:router(config)# line console
RP/0/RP0/CPU0:router(config-line)#
```

From line template configuration mode, use the online help feature ( `?` ) to view all available options. Some useful options include:

- `absolute-timeout`—Specifies a timeout value for line disconnection.
- `escape-character`—Changes the line escape character.
- `exec-timeout`—Specifies the EXEC timeout.
- `length`—Sets the number of lines displayed on the screen.
• **session-limit**—Specifies the allowable number of outgoing connections.
• **session-timeout**—Specifies an interval for closing the connection if there is no input traffic.
• **timestamp**—Displays the timestamp before each command.
• **width**—Specifies the width of the display terminal.

## Line Template Guidelines

The following guidelines apply to modifying the console template and to configuring a user-defined template:

- Modify the templates for the physical terminal lines on the router (the console port) from line template configuration mode. Use the `line console` command from Global Configuration mode to enter line template configuration mode for the console template.
- Modify the template for virtual lines by configuring a user-defined template with the `line template-name` command, configuring the terminal attributes for the user-defined template from line template configuration, and applying the template to a range of virtual terminal lines using the `vty pool` command.

Attributes not defined in the console template, or any virtual template, are taken from the default template.

### Note

## Terminal Identification

The physical terminal lines for the console port is identified by its location, expressed in the format of `rack/slot/module`, on the active or standby route processor (RP) where the respective console port resides. For virtual terminals, physical location is not applicable; the Cisco IOS XR software assigns a vty identifier to vty according to the order in which the vty connection has been established.

## vty Pools

Each virtual line is a member of a pool of connections using a common line template configuration. Multiple vty pools may exist, each containing a defined number of vty as configured in the vty pool. The Cisco IOS XR software supports the following vty pools by default:

- **Default vty pool**—The default vty pool consists of five vty (vty 0 through 4) that each reference the default line template.
- **Default fault manager pool**—The default fault manager pool consists of six vty (vty 100 through 105) that each reference the default line template.
In addition to the default vty pool and default fault manager pool, you can also configure a user-defined vty pool that can reference the default template or a user-defined template.

When configuring vty pools, follow these guidelines:

- The vty range for the default vty pool must start at vty 0 and must contain a minimum of five vtys.
- The vty range from 0 through 99 can reference the default vty pool.
- The vty range from 5 through 99 can reference a user-defined vty pool.
- The vty range from 100 is reserved for the fault manager vty pool.
- The vty range for fault manager vty pools must start at vty 100 and must contain a minimum of six vtys.
- A vty can be a member of only one vty pool. A vty pool configuration will fail if the vty pool includes a vty that is already in another pool.
- If you attempt to remove an active vty from the active vty pool when configuring a vty pool, the configuration for that vty pool will fail.

How to Implement Physical and Virtual Terminals on Cisco IOS XR Software

Modifying Templates

This task explains how to modify the terminal attributes for the console and default line templates. The terminal attributes that you set will modify the template settings for the specified template.

SUMMARY STEPS

1. configure
2. line {console | default}
3. Configure the terminal attribute settings for the specified template using the commands in line template configuration mode.
4. Use one of the following commands:
   • end
   • commit

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure</td>
<td></td>
</tr>
<tr>
<td>Step 2 line {console</td>
<td>default}</td>
</tr>
</tbody>
</table>
### Creating and Modifying vty Pools

This task explains how to create and modify vty pools.

You can omit Step 3, on page 276 to Step 5, on page 276 if you are configuring the default line template to reference a vty pool.
### SUMMARY STEPS

1. `configure`
2. `telnet {ipv4 | ipv6} server max-servers limit`
3. `line template template-name`
4. Configure the terminal attribute settings for the specified line template using the commands in line template configuration mode.
5. `exit`
6. `vty-pool {default | pool-name | eem} first-vty last-vty [line-template {default | template-name}]`
7. `commit`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> `telnet {ipv4</td>
<td>ipv6} server max-servers limit`</td>
</tr>
<tr>
<td><strong>Example:</strong> RP/0/RP0/CPU0:router(config)# telnet ipv4 server max-servers 10</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> <code>line template template-name</code></td>
<td>Enters line template configuration mode for a user-defined template.</td>
</tr>
<tr>
<td><strong>Example:</strong> RP/0/RP0/CPU0:router(config)# line template 1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> Configure the terminal attribute settings for the specified line template using the commands in line template configuration mode.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> <code>exit</code></td>
<td>Exits line template configuration mode and returns the router to global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> RP/0/RP0/CPU0:router(config-line)# exit</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> `vty-pool {default</td>
<td>pool-name</td>
</tr>
<tr>
<td><strong>Example:</strong> RP/0/RP0/CPU0:router(config)# vty-pool default 0 5 line-template default or RP/0/RP0/CPU0:router(config)# vty-pool pool1 5 50 line-template template1</td>
<td>Creates or modifies vty pools.</td>
</tr>
</tbody>
</table>

- If you do not specify a line template with the `line-template` keyword, a vty pool defaults to the default line template.

- `default`—Configures the default vty pool.
  - The default vty pool must start at vty 0 and must contain a minimum of five vts (vty 0 through 4).
  - You can resize the default vty pool by increasing the range of vts that compose the default vty pool.
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| `vty-pool` | - `pool-name` — Creates a user-defined vty pool.  
  * A user-defined pool must start at least at vty 5, depending on whether the default vty pool has been resized.  
  * If the range of vtys for the default vty pool has been resized, use the first range value free from the default line template. For example, if the range of vtys for the default vty pool has been configured to include 10 vtys (vty 0 through 9), the range value for the user-defined vty pool must start with vty 10.  
- `eem` — Configures the embedded event manager pool.  
  * The default embedded event manager vty pool must start at vty 100 and must contain a minimum of six vtys (vtys 100 through 105).  
- `line-template template-name` — Configures the vty pool to reference a user-defined template. |
| `commit` | |

---

### Monitoring Terminals and Terminal Sessions

This task explains how to monitor terminals and terminal sessions using the `show` EXEC commands available for physical and terminal lines.

#### Note

The commands can be entered in any order.

----------

**SUMMARY STEPS**

1. (Optional) `show line [aux location node-id | console location node-id | vty number]`
2. (Optional) `show terminal`
3. (Optional) `show users`

----------

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> `show line [aux location node-id</td>
<td>console location node-id</td>
</tr>
</tbody>
</table>
### Purpose

**Command or Action**
- **Example:**

  ```
  RP/0/RP0/CPU0:router# show line
  ```

**Purpose**
- • Specifying the `show line aux location node-id` EXEC command displays the terminal parameters of the auxiliary line.
- • Specifying the `show line console location node-id` EXEC command displays the terminal parameters of the console.
  - For the `location node-id` keyword and argument, enter the location of the Route Processor (RP) on which the respective auxiliary or console port resides.
  - The `node-id` argument is expressed in the format of `rack/slot/module`.
- • Specifying the `show line vty number` EXEC command displays the terminal parameters for the specified vty.

#### Step 2

**show terminal**

**Example:**

```
RP/0/RP0/CPU0:router# show terminal
```

(Optional) Displays the terminal attribute settings for the current terminal line.

#### Step 3

**show users**

**Example:**

```
RP/0/RP0/CPU0:router# show users
```

(Optional) Displays information about the active lines on the router.

---

### Craft Panel Interface

The Craft Panel is an easily-accessible and user-friendly interface which assists the field operator in troubleshooting the router. It consists of a LCD display and three LEDs. The LEDs indicate minor, major and critical alarms.

For more details of the Craft Panel Interface, refer the *Hardware and System set-up guides*.

### Configuration Examples for Implementing Physical and Virtual Terminals

**Modifying the Console Template: Example**

This configuration example shows how to modify the terminal attribute settings for the console line template:

```
line console
  exec-timeout 0 0
  escape-character 0x5a
```
In this configuration example, the following terminal attributes are applied to the console line template:

- The EXEC timeout for terminal sessions is set to 0 minutes, 0 seconds. Setting the EXEC timeout to 0 minutes and 0 seconds disables the EXEC timeout function; thus, the EXEC session for the terminal session will never time out.
- The escape character is set to the 0x5a hexadecimal value (the 0x5a hexadecimal value translates into the “Z” character).
- The session limit for outgoing terminal sessions is set to 10 connections.
- The disconnect character is set to 0x59 hexadecimal value (the 0x59 hexadecimal character translates into the “Y” character).
- The session timeout for outgoing terminal sessions is set to 100 minutes (1 hour and 40 minutes).
- The allowed transport protocol for incoming terminal sessions is Telnet.
- The allowed transport protocol for outgoing terminal sessions is Telnet.

To verify that the terminal attributes for the console line template have been applied to the console, use the show line command:

```
RP/0/RP0/CPU0# show line console location 0/0/CPU0
```

```
 Tty   Speed  Modem  Uses  Noise Overruns  Acc I/O
* con0/0/CPU0 9600   -   -     -     0/0    -/-
```

Line con0_0_CPU0, Location "Unknown", Type "Unknown"
Length: 24 lines, Width: 80 columns
Baud rate (TX/RX) is 9600, 1 parity, 2 stopbits, 8 databits
Template: console
Config:
Allowed transports are telnet.

**Modifying the Default Template: Example**

This configuration example shows how to override the terminal settings for the default line template:

```
line default
exec-timeout 0 0
width 512
length 512
```

In this example, the following terminal attributes override the default line template default terminal attribute settings:

- The EXEC timeout for terminal sessions is set to 0 minutes and 0 seconds. Setting the EXEC timeout to 0 minutes and 0 seconds disables the EXEC timeout function; thus, the EXEC session for the terminal session will never time out (the default EXEC timeout for the default line template is 10 minutes).
- The width of the terminal screen for the terminals referencing the default template is set to 512 characters (the default width for the default line template is 80 characters).
- The length, the number of lines that will display at one time on the terminal referencing the default template, is set to 512 lines (the default length for the default line template is 24 lines).
Configuring a User-Defined Template to Reference the Default vty Pool: Example

This configuration example shows how to configure a user-defined line template (named test in this example) for vty's and to configure the line template test to reference the default vty pool:

```
line template test
  exec-timeout 100 0
  width 100
  length 100
  exit
vty-pool default 0 4 line-template test
```

Configuring a User-Defined Template to Reference a User-Defined vty Pool: Example

This configuration example shows how to configure a user-defined line template (named test2 in this example) for vty's and to configure the line template test to reference a user-defined vty pool (named pool1 in this example):

```
line template test2
  exec-timeout 0 0
  session-limit 10
  session-timeout 100
  transport input all
  transport output all
  exit
vty-pool pool1 5 50 line-template test2
```

Configuring a User-Defined Template to Reference the Fault Manager vty Pool: Example

This configuration example shows how to configure a user-defined line template (named test3 in this example) for vty's and to configure the line template test to reference the fault manager vty pool:

```
line template test3
  width 110
  length 100
  session-timeout 100
  exit
vty-pool eem 100 106 line-template test3
```

CHAPTER 13

Implementing SNMP

Simple Network Management Protocol (SNMP) is an application-layer protocol that provides a message format for communication between SNMP managers and agents. SNMP provides a standardized framework and a common language used for the monitoring and management of devices in a network.

This module describes the new and revised tasks you need to implement SNMP on your Cisco IOS XR network.

For detailed conceptual information about SNMP on the Cisco IOS XR software and complete descriptions of the SNMP commands listed in this module, see Related Documents, on page 307. For information on specific MIBs, refer to Cisco CRS and Cisco XR 12000 Series Router MIB Overview. To locate documentation for other commands that might appear in the course of performing a configuration task, search online in Cisco IOS XR Commands Master List for the Cisco CRS Router.

Table 29: Feature History for Implementing SNMP on Cisco IOS XR Software

<table>

<tr>
<td>Release 2.0</td>
<td>This feature was introduced.</td>
</tr>
<tr>
<td>Release 3.6.0</td>
<td>Support was added for encrypted community strings.</td>
</tr>
<tr>
<td></td>
<td>Support was added for setting IPv4 precedence and DSCP values.</td>
</tr>
<tr>
<td></td>
<td>The <strong>clear snmp counters</strong> command was added.</td>
</tr>
<tr>
<td>Release 3.8.0</td>
<td>Support was added for SNMP contexts.</td>
</tr>
<tr>
<td>Release 3.9.0</td>
<td>Support was added for packet loss monitoring.</td>
</tr>
<tr>
<td></td>
<td>Support was added for 3DES and AES encryption.</td>
</tr>
<tr>
<td></td>
<td>The ability to preserve ENTITY-MIB and CISCO-CLASS-BASED-QOS-MIB data was added.</td>
</tr>
<tr>
<td>Release 4.2.0</td>
<td>Support was added for SNMP over IPv6.</td>
</tr>
</tbody>
</table>

This module contains the following topics:

- Prerequisites for Implementing SNMP, page 284
Prerequisites for Implementing SNMP

You must be in a user group associated with a task group that includes the proper task IDs. The command reference guides include the task IDs required for each command. If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Restrictions for SNMP Use on Cisco IOS XR Software

SNMP outputs are only 32-bits wide and therefore cannot display any information greater than \(2^{32}\). \(2^{32}\) is equal to 4.29 Gigabits. Note that a 10 Gigabit interface is greater than this and so if you are trying to display speed information regarding the interface, you might see concatenated results.

Information About Implementing SNMP

To implement SNMP, you need to understand the concepts described in this section.

SNMP Functional Overview

The SNMP framework consists of three parts:

- SNMP manager
- SNMP agent
- Management Information Base (MIB)

SNMP Manager

The SNMP manager is the system used to control and monitor the activities of network hosts using SNMP. The most common managing system is called a network management system (NMS). The term NMS can be applied to either a dedicated device used for network management, or the applications used on such a device. A variety of network management applications are available for use with SNMP. These features range from simple command-line applications to feature-rich graphical user interfaces (such as the CiscoWorks 2000 line of products).
**SNMP Agent**

The SNMP agent is the software component within the managed device that maintains the data for the device and reports these data, as needed, to managing systems. The agent and MIB reside on the router. To enable the SNMP agent, you must define the relationship between the manager and the agent.

**MIB**

The *Management Information Base* (MIB) is a virtual information storage area for network management information, which consists of collections of managed objects. Within the MIB there are collections of related objects, defined in MIB modules. MIB modules are written in the SNMP MIB module language, as defined in STD 58, RFC 2578, RFC 2579, and RFC 2580. Note that individual MIB modules are also referred to as MIBs; for example, the Interfaces Group MIB (IF-MIB) is a MIB module within the MIB on your system.

The SNMP agent contains MIB variables whose values the SNMP manager can request or change through Get or Set operations. A manager can get a value from an agent or store a value into that agent. The agent gathers data from the MIB, the repository for information about device parameters and network data. The agent can also respond to manager requests to get or set data.

Figure 5: Communication Between an SNMP Agent and Manager, on page 285 illustrates the communications relationship between the SNMP manager and agent. A manager can send the agent requests to get and set MIB values. The agent can respond to these requests. Independent of this interaction, the agent can send unsolicited notifications (traps) to the manager to notify the manager of network conditions.

**SNMP Notifications**

A key feature of SNMP is the ability to generate notifications from an SNMP agent. These notifications do not require that requests be sent from the SNMP manager. On Cisco IOS XR software, unsolicited (asynchronous) notifications can be generated only as traps. Traps are messages alerting the SNMP manager to a condition on the network. Notifications can indicate improper user authentication, restarts, the closing of a connection, loss of connection to a neighbor router, or other significant events.

---

**Note**

Inform requests (inform operations) are not supported in Cisco IOS XR software.

Traps are less reliable than informs because the receiver does not send any acknowledgment when it receives a trap. The sender cannot determine if the trap was received. An SNMP manager that receives an inform request acknowledges the message with an SNMP response protocol data unit (PDU). If the manager does not receive an inform request, it does not send a response. If the sender never receives a response, the inform request can be sent again. Thus, informs are more likely to reach their intended destination.
However, traps are often preferred because informs consume more resources in the router and in the network. Unlike a trap, which is discarded as soon as it is sent, an inform request must be held in memory until a response is received or the request times out. Also, traps are sent only once, and an inform may be retried several times. The retries increase traffic and contribute to a higher overhead on the network. Thus, traps and inform requests provide a trade-off between reliability and resources.

In this illustration, the agent router sends a trap to the SNMP manager. Although the manager receives the trap, it does not send any acknowledgment to the agent. The agent has no way of knowing that the trap reached its destination.

Figure 6: Trap Received by the SNMP Manager

In this illustration, the agent sends a trap to the manager, but the trap does not reach the manager. Because the agent has no way of knowing that the trap did not reach its destination, the trap is not sent again. The manager never receives the trap.

Figure 7: Trap Not Received by the SNMP Manager

### SNMP Versions

Cisco IOS XR software supports the following versions of SNMP:

- Simple Network Management Protocol Version 1 (SNMPv1)
- Simple Network Management Protocol Version 2c (SNMPv2c)
- Simple Network Management Protocol Version 3 (SNMPv3)

Both SNMPv1 and SNMPv2c use a community-based form of security. The community of managers able to access the agent MIB is defined by an IP address access control list and password.

SNMPv2c support includes a bulk retrieval mechanism and more detailed error message reporting to management stations. The bulk retrieval mechanism supports the retrieval of tables and large quantities of
information, minimizing the number of round-trips required. The SNMPv2c improved error handling support includes expanded error codes that distinguish different kinds of error conditions; these conditions are reported through a single error code in SNMPv1. Error return codes now report the error type. Three kinds of exceptions are also reported: no such object exceptions, no such instance exceptions, and end of MIB view exceptions.

SNMPv3 is a security model. A security model is an authentication strategy that is set up for a user and the group in which the user resides. A security level is the permitted level of security within a security model. A combination of a security model and a security level will determine which security mechanism is employed when an SNMP packet is handled. See Table 31: SNMP Security Models and Levels, on page 288 for a list of security levels available in SNMPv3. The SNMPv3 feature supports RFCs 3411 to 3418.

You must configure the SNMP agent to use the version of SNMP supported by the management station. An agent can communicate with multiple managers; for this reason, you can configure the Cisco IOS-XR software to support communications with one management station using the SNMPv1 protocol, one using the SNMPv2c protocol, and another using SNMPv3.

### Comparison of SNMPv1, v2c, and v3

SNMP v1, v2c, and v3 all support the following operations:

- **get-request**—Retrieves a value from a specific variable.
- **get-next-request**—Retrieves the value following the named variable; this operation is often used to retrieve variables from within a table. With this operation, an SNMP manager does not need to know the exact variable name. The SNMP manager searches sequentially to find the needed variable from within the MIB.
- **get-response**—Operation that replies to a get-request, get-next-request, and set-request sent by an NMS.
- **set-request**—Operation that stores a value in a specific variable.
- **trap**—Unsolicited message sent by an SNMP agent to an SNMP manager when some event has occurred.

Table 30: SNMPv1, v2c, and v3 Feature Support, on page 287 identifies other key SNMP features supported by the SNMP v1, v2c, and v3.

### Table 30: SNMPv1, v2c, and v3 Feature Support

### Security Models and Levels for SNMPv1, v2, v3

The security level determines if an SNMP message needs to be protected from disclosure and if the message needs to be authenticated. The various security levels that exist within a security model are as follows:

- noAuthNoPriv — Security level that does not provide authentication or encryption.
- authNoPriv — Security level that provides authentication but does not provide encryption.
- authPriv — Security level that provides both authentication and encryption.

Three security models are available: SNMPv1, SNMPv2c, and SNMPv3. The security model combined with the security level determine the security mechanism applied when the SNMP message is processed.

Table 31: SNMP Security Models and Levels, on page 288 identifies what the combinations of security models and levels mean.

<table>
<thead>
<tr>

<td>HMAC-MD5 or HMAC-SHA</td>
<td>AES</td>
<td>Provides authentication based on the HMAC-MD5 or HMAC-SHA algorithms. Provides 128-bit AES level of encryption.</td>
</tr>
</tbody>
</table>

Use of 3DES and AES encryption standards requires that the security package (k9sec) be installed. For information on installing software packages, see *Upgrading and Managing Cisco IOS XR Software*.

**SNMPv3 Benefits**

SNMPv3 provides secure access to devices by providing authentication, encryption and access control. These added security benefits secure SNMP against the following security threats:

- Masquerade—The threat that an SNMP user may assume the identity of another SNMP user to perform management operations for which that SNMP user does not have authorization.
• Message stream modification—The threat that messages may be maliciously reordered, delayed, or replayed (to an extent that is greater than can occur through the natural operation of a subnetwork service) to cause SNMP to perform unauthorized management operations.

• Disclosure—The threat that exchanges between SNMP engines could be eavesdropped. Protecting against this threat may be required as a matter of local policy.

In addition, SNMPv3 provides access control over protocol operations on SNMP managed objects.

### SNMPv3 Costs

SNMPv3 authentication and encryption contribute to a slight increase in the response time when SNMP operations on MIB objects are performed. This cost is far outweighed by the security advantages provided by SNMPv3.

**Table 32: Order of Response Times from Least to Greatest** on page 290 shows the order of response time (from least to greatest) for the various security model and security level combinations.

<table>

<td>authPriv</td>
</tr>
</tbody>
</table>

### User-Based Security Model

SNMPv3 User-Based Security Model (USM) refers to SNMP message-level security and offers the following services:

• Message integrity—Ensures that messages have not been altered or destroyed in an unauthorized manner and that data sequences have not been altered to an extent greater than can occur nonmaliciously.

• Message origin authentication—Ensures that the claimed identity of the user on whose behalf received data was originated is confirmed.

• Message confidentiality—Ensures that information is not made available or disclosed to unauthorized individuals, entities, or processes.

SNMPv3 authorizes management operations only by configured users and encrypts SNMP messages.

USM uses two authentication protocols:

• HMAC-MD5-96 authentication protocol

• HMAC-SHA-96 authentication protocol
USM uses Cipher Block Chaining (CBC)-DES (DES-56) as the privacy protocol for message encryption.

**View-Based Access Control Model**

The View-Based Access Control Model (VACM) enables SNMP users to control access to SNMP managed objects by supplying read, write, or notify access to SNMP objects. It prevents access to objects restricted by views. These access policies can be set when user groups are configured with the `snmp-server group` command.

**MIB Views**

For security reasons, it is often valuable to be able to restrict the access rights of some groups to only a subset of the management information within the management domain. To provide this capability, access to a management object is controlled through MIB views, which contain the set of managed object types (and, optionally, the specific instances of object types) that can be viewed.

**Access Policy**

Access policy determines the access rights of a group. The three types of access rights are as follows:

- **read-view access**—The set of object instances authorized for the group when objects are read.
- **write-view access**—The set of object instances authorized for the group when objects are written.
- **notify-view access**—The set of object instances authorized for the group when objects are sent in a notification.

**IP Precedence and DSCP Support for SNMP**

SNMP IP Precedence and differentiated services code point (DSCP) support delivers QoS specifically for SNMP traffic. You can change the priority setting so that SNMP traffic generated in a router is assigned a specific QoS class. The IP Precedence or IP DSCP code point value is used to determine how packets are handled in weighted random early detection (WRED).

After the IP Precedence or DSCP is set for the SNMP traffic generated in a router, different QoS classes cannot be assigned to different types of SNMP traffic in that router.

The IP Precedence value is the first three bits in the type of service (ToS) byte of an IP header. The IP DSCP code point value is the first six bits of the differentiate services (DiffServ Field) byte. You can configure up to eight different IP Precedence markings or 64 different IP DSCP markings.

**How to Implement SNMP on Cisco IOS XR Software**

This section describes how to implement SNMP.

The `snmp-server` commands enable SNMP on Management Ethernet interfaces by default. For information on how to enable SNMP server support on other inband interfaces, see the `Implementing Management Plane Protection on Cisco IOS XR Software` module in *Cisco IOS XR System Security Configuration Guide for the Cisco CRS Router*. 
Configuring SNMPv3

This task explains how to configure SNMPv3 for network management and monitoring.

Note
No specific command enables SNMPv3; the first `snmp-server` global configuration command (config), that you issue enables SNMPv3. Therefore, the sequence in which you issue the `snmp-server` commands for this task does not matter.

SUMMARY STEPS

1. configure
2. `snmp-server view view-name oid-tree {included | excluded}`
3. `snmp-server group name {v1 | v2c | v3 {auth | noauth | priv}} {read view} {write view} {notify view} {access-list-name}`
4. `snmp-server user username groupname {v1 | v2c | v3 {auth md5 | sha} {clear | encrypted} auth-password [priv des56 {clear | encrypted} priv-password]} {access-list-name}`
5. commit

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure</td>
</tr>
<tr>
<td>Step 2</td>
<td>`snmp-server view view-name oid-tree {included</td>
</tr>
<tr>
<td>Step 3</td>
<td>`snmp-server group name {v1</td>
</tr>
<tr>
<td>Step 4</td>
<td>`snmp-server user username groupname {v1</td>
</tr>
<tr>
<td>Step 5</td>
<td>commit</td>
</tr>
</tbody>
</table>
Configuring SNMP Trap Notifications

This task explains how to configure the router to send SNMP trap notifications.

You can omit Step 3, on page 292 if you have already completed the steps documented under the Configuring SNMPv3, on page 292 task.

### SUMMARY STEPS

1. `configure`
2. `snmp-server group name {v1 | v2c | v3 {auth | noauth | priv}} [read view] [write view] [notify view] [access-list-name]`
3. `snmp-server user username groupname {v1 | v2c | v3 [auth {md5 | sha} {clear | encrypted}] auth-password [priv des56 {clear | encrypted} priv-password]} [access-list-name]`
4. `snmp-server host address [traps] [version {1 | 2c | 3 [auth | noauth | priv]}] community-string [udp-port port] [notification-type]`
5. `snmp-server traps [notification-type]`
6. `commit`
7. (Optional) `show snmp host`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td><code>configure</code></td>
<td></td>
</tr>
<tr>
<td>2.</td>
<td>`snmp-server group name {v1</td>
<td>v2c</td>
</tr>
</tbody>
</table>

**Example:**
```
RP/0/RP0/CPU0:router(config)# snmp-server group group_name v3 noauth read view_name1 write view_name2
```

<table>
<thead>
<tr>
<th>Step 3</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.</td>
<td>`snmp-server user username groupname {v1</td>
<td>v2c</td>
</tr>
</tbody>
</table>

**Example:**
```
RP/0/RP0/CPU0:router(config)# snmp-server user noauthuser group_name v3
```
### Setting the Contact, Location, and Serial Number of the SNMP Agent

This task explains how to set the system contact string, system location string, and system serial number of the SNMP agent.

**Note**

The sequence in which you issue the `snmp-server` commands for this task does not matter.

**SUMMARY STEPS**

1. `configure`
2. (Optional) `snmp-server contact system-contact-string`
3. (Optional) `snmp-server location system-location`
4. (Optional) `snmp-server chassis-id serial-number`
5. `commit`
DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td><strong>snmp-server contact</strong> system-contact-string</td>
<td>(Optional) Sets the system contact string.</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RP0/CPU0:router(config)# snmp-server contact Dial System Operator at beeper # 27345</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td><strong>snmp-server location</strong> system-location</td>
<td>(Optional) Sets the system location string.</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RP0/CPU0:router(config)# snmp-server location Building 3/Room 214</td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td><strong>snmp-server chassis-id</strong> serial-number</td>
<td>(Optional) Sets the system serial number.</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RP0/CPU0:router(config)# snmp-server chassis-id 1234456</td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td>commit</td>
<td></td>
</tr>
</tbody>
</table>

Defining the Maximum SNMP Agent Packet Size

This task shows how to configure the largest SNMP packet size permitted when the SNMP server is receiving a request or generating a reply.

*Note*  
The sequence in which you issue the **snmp-server** commands for this task does not matter.

SUMMARY STEPS

1. configure
2. (Optional) **snmp-server packetsize** byte-count
3. commit

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure</td>
</tr>
</tbody>
</table>
Changing Notification Operation Values

After SNMP notifications have been enabled, you can specify a value other than the default for the source interface, message queue length, or retransmission interval.

This task explains how to specify a source interface for trap notifications, the message queue length for each host, and the retransmission interval.

**Note**

The sequence in which you issue the `snmp-server` commands for this task does not matter.

**SUMMARY STEPS**

1. configure
2. (Optional) `snmp-server trap-source type interface-path-id`
3. (Optional) `snmp-server queue-length length`
4. (Optional) `snmp-server trap-timeout seconds`
5. commit

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>snmp-server trap-source type interface-path-id</code></td>
<td>(Optional) Specifies a source interface for trap notifications.</td>
</tr>
</tbody>
</table>

**Example:**

```bash
RP/0/RP0/CPU0:router(config)# snmp-server packetsize 1024
```
### Setting IP Precedence and DSCP Values

This task describes how to configure IP Precedence or IP DSCP for SNMP traffic.

**Before You Begin**
- SNMP must be configured.

#### SUMMARY STEPS

1. configure
2. Use one of the following commands:
   - `snmp-server ipv4 precedence value`
   - `snmp-server ipv4 dscp value`
3. commit

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> Use one of the following commands:</td>
<td>Configures an IP precedence or IP DSCP value for SNMP traffic.</td>
</tr>
<tr>
<td>• <code>snmp-server ipv4 precedence value</code></td>
<td></td>
</tr>
<tr>
<td>• <code>snmp-server ipv4 dscp value</code></td>
<td></td>
</tr>
</tbody>
</table>
### Displaying SNMP Context Mapping

The SNMP agent serves queries based on SNMP contexts created by the client features. There is a context mapping table. Each entry in the context mapping table includes a context name, the name of the feature that created the context, and the name of the specific instance of the feature.

**SUMMARY STEPS**

1. `show snmp context-mapping`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td><code>show snmp context-mapping</code></td>
<td>Displays the SNMP context mapping table.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>RP/0/RP0/CPU0:router# show snmp context-mapping</code></td>
<td></td>
</tr>
</tbody>
</table>

### Monitoring Packet Loss

It is possible to monitor packet loss by configuring the generation of SNMP traps when packet loss exceeds a specified threshold. The configuration described in this task enables the creation of entries in the MIB tables of the EVENT-MIB. This can then be monitored for packet loss using SNMP GET operations.

**Before You Begin**

Entries created in the EVENT-MIB MIB tables using the configuration described in this task cannot be altered using an SNMP SET.

Entries to the EVENT-MIB MIB tables created using an SNMP SET cannot be altered using the configuration described in this task.
### SUMMARY STEPS

1. `snmp-server mibs eventmib packet-loss` type `interface-path-id` falling `lower-threshold` interval `sampling-interval` rising `upper-threshold`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>snmp-server mibs eventmib packet-loss</code> type <code>interface-path-id</code> falling <code>lower-threshold</code> interval <code>sampling-interval</code> rising <code>upper-threshold</code></td>
<td>Generates SNMP EVENT-MIB traps for the interface when the packet loss exceeds the specified thresholds. Up to 100 interfaces can be monitored. <strong>falling <code>lower-threshold</code></strong> — Specifies the lower threshold. When packet loss between two intervals falls below this threshold and an mteTriggerRising trap was generated previously, a SNMP mteTriggerFalling trap is generated. This trap is not generated until the packet loss exceeds the upper threshold and then falls back below the lower threshold. <strong>interval <code>sampling-interval</code></strong> — Specifies how often packet loss statistics are polled. This is a value between 5 and 1440 minutes, in multiples of 5. <strong>rising <code>upper-threshold</code></strong> — Specifies the upper threshold. When packet loss between two intervals increases above this threshold, an SNMP mteTriggerRising trap is generated. This trap is not generated until the packet loss drops below the lower threshold and then rises above the upper threshold.</td>
</tr>
</tbody>
</table>

### Configuring MIB Data to be Persistent

Many SNMP MIB definitions define arbitrary 32-bit indices for their object tables. MIB implementations often do a mapping from the MIB indices to some internal data structure that is keyed by some other set of data. In these MIB tables the data contained in the table are often other identifiers of the element being modelled. For example, in the ENTITY-MIB, entries in the entPhysicalTable are indexed by the 31-bit value, entPhysicalIndex, but the entities could also be identified by the entPhysicalName or a combination of the other objects in the table.

Because of the size of some MIB tables, significant processing is required to discover all the mappings from the 32-bit MIB indices to the other data which the network management station identifies the entry. For this reason, it may be necessary for some MIB indices to be persistent across process restarts, switchovers, or device reloads. The ENTITY-MIB entPhysicalTable and CISCO-CLASS-BASED-QOS-MIB are two such MIBs that often require index values to be persistent.

Also, because of query response times and CPU utilization during CISCO-CLASS-BASED-QOS-MIB statistics queries, it is desirable to cache service policy statistics.
SUMMARY STEPS

1. (Optional)  snmp-server entityindex persist
2. (Optional)  snmp-server mibs cbqosmib persist
3. (Optional)  snmp-server cbqosmib cache refresh time time
4. (Optional)  snmp-server cbqosmib cache service-policy count count
5. snmp-server ifindex persist

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>snmp-server entityindex persist</td>
<td>(Optional) Enables the persistent storage of ENTITY-MIB data.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>RP/0/RP0/CPU0:router(config)# snmp-server entityindex persist</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2**        |         |
| snmp-server mibs cbqosmib persist | (Optional) Enables persistent storage of the CISCO-CLASS-BASED-QOS-MIB data. |
| Example:           |         |
| RP/0/RP0/CPU0:router(config)# snmp-server mibs cbqosmib persist |         |

| **Step 3**        |         |
| snmp-server cbqosmib cache refresh time time | (Optional) Enables QoS MIB caching with a specified cache refresh time. |
| Example:           |         |
| RP/0/RP0/CPU0:router(config)# snmp-server mibs cbqosmib cache refresh time 45 |         |

| **Step 4**        |         |
| snmp-server cbqosmib cache service-policy count count | (Optional) Enables QoS MIB caching with a limited number of service policies to cache. |
| Example:           |         |
| RP/0/RP0/CPU0:router(config)# snmp-server mibs cbqosmib cache service-policy count 50 |         |

| **Step 5**        |         |
| snmp-server ifindex persist | Enables ifIndex persistence globally on all Simple Network Management Protocol (SNMP) interfaces. |
| Example:           |         |
| RP/0/RP0/CPU0:router(config)# snmp-server ifindex persist |         |
Configuring LinkUp and LinkDown Traps for a Subset of Interfaces

By specifying a regular expression to represent the interfaces for which you are interested in setting traps, you can enable or disable linkUp and linkDown traps for a large number of interfaces simultaneously.

Before You Begin
SNMP must be configured.

SUMMARY STEPS

1. **configure**
2. **snmp-server interface subset subset-number regular-expression expression**
3. **notification linkupdown disable**
4. **commit**
5. **(Optional) show snmp interface notification subset subset-number**
6. **(Optional) show snmp interface notification regular-expression expression**
7. **(Optional) show snmp interface notification type interface-path-id**

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure</td>
<td>Enters snmp-server interface mode for the interfaces identified by the regular expression.</td>
</tr>
<tr>
<td><strong>Step 2</strong> snmp-server interface subset subset-number regular-expression expression</td>
<td>The subset-number argument identifies the set of interfaces, and also assigns a priority to the subset in the event that an interface is included in more than one subset. Lower numbers have higher priority and their configuration takes precedent over interface subsets with higher numbers.</td>
</tr>
<tr>
<td>Example:</td>
<td>The expression argument must be entered surrounded by double quotes.</td>
</tr>
<tr>
<td>RP/0/RP0/CPU0:router(config)# snmp-server interface subset 10 regular-expression &quot;^Gig[a-zA-Z]+[0-9/]+.&quot;</td>
<td>Refer to the Understanding Regular Expressions, Special Characters, and Patterns module in Cisco IOS XR Getting Started Guide for the Cisco CRS Router for more information regarding regular expressions.</td>
</tr>
<tr>
<td><strong>Step 3</strong> notification linkupdown disable</td>
<td>Disables linkUp and linkDown traps for all interfaces being configured. To enable previously disabled interfaces, use the no form of this command.</td>
</tr>
<tr>

### Configuration Examples for Implementing SNMP

#### Configuring SNMPv3: Examples

##### Setting an Engine ID

This example shows how to set the identification of the local SNMP engine:

```
snmp-server engineID local 00:00:09:00:00:00:00:a1:61:6c:20:61
```

**Note**

After the engine ID has been configured, the SNMP agent restarts.

##### Verifying the Identification of the Local SNMP Engines

This example shows how to verify the identification of the local SNMP engine:

```
config
    show snmp engineid
```
Creating a View

There are two ways to create a view:

- You can include the object identifier (OID) of an ASN.1 subtree of a MIB family from a view by using the `included` keyword of the `snmp-server view` command.
- You can exclude the OID subtree of the ASN.1 subtree of a MIB family from a view by using the `excluded` keyword of the `snmp-server view` command.

This example shows how to create a view that includes the `sysName` (1.3.6.1.2.1.1.5) object:

```config
snmp-server view SNMP_VIEW1 1.3.6.1.2.1.1.5 included
```

This example shows how to create a view that includes all the OIDs of a system group:

```config
snmp-server view SNMP_VIEW1 1.3.6.1.2.1.1 included
```

This example shows how to create a view that includes all the OIDs under the system group except the `sysName` object (1.3.6.1.2.1.1.5), which has been excluded:

```config
snmp-server view SNMP_VIEW1 1.3.6.1.2.1.1 included
snmp-server view SNMP_VIEW1 1.3.6.1.2.1.1.5 excluded
```

Verifying Configured Views

This example shows how to display information about the configured views:

```
RP/0/RP0/CPU0:router# show snmp view
v1default 1.3.6.1 - included nonVolatile active
SNMP_VIEW1 1.3.6.1.2.1.1 - included nonVolatile active
SNMP_VIEW1 1.3.6.1.2.1.1.5 - excluded nonVolatile active
```

Creating Groups

If you do not explicitly specify a notify, read, or write view, the Cisco IOS XR software uses the `v1 default` (1.3.6.1). This example shows how to create a group that utilizes the default view:

```
RP/0/RP0/CPU0:router(config)# snmp-server group group-name v3 auth
```

The following configuration example shows how to create a group that has read access to all the OIDs in the system except the `sysUpTime` object (1.3.6.1.2.1.1.3), which has been excluded from the view applied to the group, but write access only to the `sysName` object (1.3.6.1.2.1.1.5):

```
! snmp-server view view_name1 1.3.6.1.2.1.1 included
snmp-server view view_name1 1.3.6.1.2.1.1.3 excluded
snmp-server view view_name2 1.3.6.1.2.1.1.5 included
snmp-server group group_name1 v3 auth read view_name1 write view_name2
!```
Verifying Groups

This example shows how to verify the attributes of configured groups:

RP/0/RP0/CPU0:router# show snmp group

<table>
<thead>
<tr>
<th>Groupname: group_name1</th>
<th>Security model: usm</th>
</tr>
</thead>
<tbody>
<tr>
<td>Readview: view_name1</td>
<td>Writeview: view_name2</td>
</tr>
<tr>
<td>Notifyview: v1default</td>
<td></td>
</tr>
<tr>
<td>Row status: nonVolatile</td>
<td></td>
</tr>
</tbody>
</table>

Creating and Verifying Users

Given the following SNMPv3 view and SNMPv3 group configuration:

```
! snmp-server view view_name 1.3.6.1.2.1.1 included
snmp-server group group_name v3 noauth read view_name write view_name
!
```

This example shows how to create a noAuthNoPriv user with read and write view access to a system group:

```
config
snmp-server user noauthuser group_name v3
```

**Note**

The user must belong to a noauth group before a noAuthNoPriv user can be created.

This example shows how to verify the attributes that apply to the SNMP user:

RP/0/RP0/CPU0:router# show snmp user

User name: noauthuser
Engine ID: localSnmpID
storage-type: nonvolatile active

Given the following SNMPv3 view and SNMPv3 group configuration:

```
! snmp-server view SNMP_VIEW1 1.3.6.1.2.1.1 included
snmp-server group SNMP_GROUP1 v3 auth notify SNMP_VIEW1 read SNMP_VIEW1 write SNMP_VIEW1
!
```

This example shows how to create a user with authentication (including encryption), read, and write view access to a system group:

```
config
snmp-server user userv3authpriv SNMP_GROUP1 v3 auth md5 password123 priv aes 128 password123
```

Given the following SNMPv3 view and SNMPv3 group configuration:

```
! snmp-server view view_name 1.3.6.1.2.1.1 included
snmp-group group_name v3 priv read view_name write view_name
!
```

This example shows how to create authNoPriv user with read and write view access to a system group:

RP/0/RP0/CPU0:router(config)# snmp-server user authuser group_name v3 auth md5 clear auth_passwd
Because the group is configured at a security level of Auth, the user must be configured as "auth" at a minimum to access this group ("priv" users could also access this group). The authNoPriv user configured in this group, authuser, must supply an authentication password to access the view. In the example, auth_passwd is set as the authentication password string. Note that clear keyword is specified before the auth_passwd password string. The clear keyword indicates that the password string being supplied is unencrypted.

This example shows how to verify the attributes that apply to SNMP user:

```
RP/0/RP0/CPU0:router# show snmp user
User name: authuser
  Engine ID: localSnmpID
  storage-type: nonvolatile active
```

Given the following SNMPv3 view and SNMPv3 group configuration:

```
! 
  snmp view view_name 1.3.6.1.2.1.1 included
  snmp group group_name v3 priv read view_name write view_name
!
```

This example shows how to create an authPriv user with read and write view access to a system group:

```
config
  snmp-server user privuser group_name v3 auth md5 clear auth_passwd priv des56 clear priv_passwd
```

Because the group has a security level of Priv, the user must be configured as a "priv" user to access this group. In this example, the user, privuser, must supply both an authentication password and privacy password to access the OIDs in the view.

This example shows how to verify the attributes that apply to the SNMP user:

```
RP/0/RP0/CPU0:router# show snmp user
User name: privuser
  Engine ID: localSnmpID
  storage-type: nonvolatile active
```

## Configuring Trap Notifications: Example

The following example configures an SNMP agent to send out different types of traps. The configuration includes a v2c user, a noAuthNoPriv user, an authNoPriv user, and an AuthPriv user.

The default User Datagram Protocol (UDP) port is 161. If you do not specify a UDP port with the `udp-port` keyword and `port` argument, then the configured SNMP trap notifications are sent to port 161.
This example shows how to verify the configuration SNMP trap notification recipients host, the recipients of SNMP trap notifications. The output displays the following information:

- IP address of the configured notification host
- UDP port where SNMP notification messages are sent
- Type of trap configured
- Security level of the configured user
- Security model configured

```
config
show snmp host
```

```
Notification host: 10.50.32.170 udp-port: 2345 type: trap
user: userV3auth security model: v3 auth
```

```
Notification host: 10.50.32.170 udp-port: 2345 type: trap
user: userV3noauth security model: v3 noauth
```

```
Notification host: 10.50.32.170 udp-port: 2345 type: trap
user: userV3priv security model: v3 priv
```

```
Notification host: 10.50.32.170 udp-port: 2345 type: trap
user: userv2c security model: v2c
```

### Setting an IP Precedence Value for SNMP Traffic: Example

The following example shows how to set the SNMP IP Precedence value to 7:

```
configure
snmp-server ipv4 precedence 7
exit
```

```
Uncommitted changes found, commit them before exiting(yes/no/cancel)? [cancel]: y
```

### Setting an IP DSCP Value for SNMP Traffic: Example

The following example shows how to set the IP DSCP value of SNMP traffic to 45:

```
configure
```

CHAPTER 14

Configuring Periodic MIB Data Collection and Transfer on the Cisco IOS XR Software

This document describes how to periodically transfer selected MIB data from your router to a specified Network Management System (NMS). The periodic MIB data collection and transfer feature is also known as bulk statistics.

Table 33: Feature History for Periodic MIB Data Collection and Transfer

<table>

</tbody>
</table>

This module contains the following topics:

- Prerequisites for Periodic MIB Data Collection and Transfer, page 311
- Information About Periodic MIB Data Collection and Transfer, page 312
- How to Configure Periodic MIB Data Collection and Transfer, page 313
- Periodic MIB Data Collection and Transfer: Example, page 320

Prerequisites for Periodic MIB Data Collection and Transfer

To use periodic MIB data collection and transfer, you should be familiar with the Simple Network Management Protocol (SNMP) model of management information. You should also know what MIB information you want to monitor on your network devices, and the OIDs or object names for the MIB objects to be monitored.
Information About Periodic MIB Data Collection and Transfer

SNMP Objects and Instances

A type (or class) of SNMP management information is called an object. A specific instance from a type of management information is called an object instance (or SNMP variable). To configure a bulk statistics collection, you must specify the object types to be monitored using a bulk statistics object list and the specific instances of those objects to be collected using a bulk statistics schema.

MIBs, MIB tables, MIB objects, and object indices can all be specified using a series of numbers called an object identifier (OID). OIDs are used in configuring a bulk statistics collection in both the bulk statistics object lists (for general objects) and in the bulk statistics schemas (for specific object instances).

Bulk Statistics Object Lists

To group the MIB objects to be polled, you need to create one or more object lists. A bulk statistics object list is a user-specified set of MIB objects that share the same MIB index. Object lists are identified using a name that you specify. Named bulk statistics object lists allow the same configuration to be reused in different bulk statistics schemas.

All the objects in an object list must share the same MIB index. However, the objects do not need to be in the same MIB and do not need to belong to the same MIB table. For example, it is possible to group ifInOctets and a CISCO-IF-EXTENSION-MIB object in the same schema, because the containing tables for both objects are indexed by the ifIndex.

Bulk Statistics Schemas

Data selection for the Periodic MIB Data Collection and Transfer Mechanism requires the definition of a schema with the following information:

- Name of an object list.
- Instance (specific instance or series of instances defined using a wild card) that needs to be retrieved for objects in the specified object list.
- How often the specified instances need to be sampled (polling interval). The default polling interval is 5 minutes.

A bulk statistics schema is also identified using a name that you specify. This name is used when configuring the transfer options.

Bulk Statistics Transfer Options

After configuring the data to be collected, a single virtual file (VFile or bulk statistics file) with all collected data is created. This file can be transferred to a network management station using FTP or TFTP. You can specify how often this file should be transferred. The default transfer interval is once every 30 minutes. You can also configure a secondary destination for the file to be used if, for whatever reason, the file cannot be transferred to the primary network management station.
The value of the transfer interval is also the collection period (collection interval) for the local bulk statistics file. After the collection period ends, the bulk statistics file is frozen, and a new local bulk statistics file is created for storing data. The frozen bulk statistics file is then transferred to the specified destination.

By default, the local bulk statistics file is deleted after successful transfer to an network management station.

**Benefits of Periodic MIB Data Collection and Transfer**

Periodic MIB data collection and transfer (bulk statistics feature) allows many of the same functions as the bulk file MIB (CISCO-BULK-FILE-MIB.my), but offers some key advantages. The main advantage is that this feature can be configured through the CLI and does not require an external monitoring application.

Periodic MIB data collection and transfer is mainly targeted for medium to high-end platforms that have sufficient local storage (volatile or permanent) to store bulk statistics files. Locally storing bulk statistics files helps minimize loss of data during temporary network outages.

This feature also has more powerful data selection features than the bulk file MIB; it allows grouping of MIB objects from different tables into data groups (object lists). It also incorporates a more flexible instance selection mechanism, where the application is not restricted to fetching an entire MIB table.

**How to Configure Periodic MIB Data Collection and Transfer**

**Configuring a Bulk Statistics Object List**

The first step in configuring the Periodic MIB Data Collection and Transfer Mechanism is to configure one or more object lists.

**SUMMARY STEPS**

1. configure
2. snmp-server mib bulkstat object-list list-name
3. add {oid | object-name}
4. commit

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> snmp-server mib bulkstat object-list list-name</td>
<td>Defines an SNMP bulk statistics object list and enters bulk statistics object list configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>snmp-server mib bulkstat object-list ifMib</td>
<td></td>
</tr>
</tbody>
</table>
### Configuring a Bulk Statistics Schema

The second step in configuring periodic MIB data collection and transfer is to configure one or more schemas.

#### Before You Begin

The bulk statistics object list to be used in the schema must be defined.

#### SUMMARY STEPS

1. configure
2. snmp-server mib bulkstat schema schema-name
3. object-list list-name
4. Do one of the following:
   - instance exact {interface interface-id [sub-if] | oid oid}
   - instance wild {interface interface-id [sub-if] | oid oid}
   - instance range start oid end oid
   - instance repetition oid max repeat-number
5. poll-interval minutes
6. commit
## Detailed Steps

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> snmp-server mib bulkstat schema <em>schema-name</em></td>
<td>Names the bulk statistics schema and enters bulk statistics schema mode.</td>
</tr>
<tr>
<td>Example: RP/0/RP0/CPU0:router(config)# snmp-server mib bulkstat schema intE0 RP/0/RP0/CPU0:router(config-bulk-sc)#</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> object-list <em>list-name</em></td>
<td>Specifies the bulk statistics object list to be included in this schema. Specify only one object list per schema. If multiple object-list commands are executed, the earlier ones are over-written by newer commands.</td>
</tr>
<tr>
<td>Example: RP/0/RP0/CPU0:router(config-bulk-sc)# object-list ifMib</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> Do one of the following:</td>
<td>Specifies the instance information for objects in this schema:</td>
</tr>
<tr>
<td>• instance exact {interface interface-id [sub-if]</td>
<td>oid oid}</td>
</tr>
<tr>
<td>• instance wild {interface interface-id [sub-if]</td>
<td>oid oid}</td>
</tr>
<tr>
<td>• instance range start <em>oid</em> end <em>oid</em></td>
<td>• The instance range command indicates a range of instances on which to collect data.</td>
</tr>
<tr>
<td>• instance repetition <em>oid</em> max <em>repeat-number</em></td>
<td>• The instance repetition command indicates data collection to repeat for a certain number of instances of a MIB object.</td>
</tr>
<tr>
<td>Example: RP/0/RP0/CPU0:router(config-bulk-sc)# instance wild oid 1 or RP/0/RP0/CPU0:router(config-bulk-sc)# instance exact interface FastEthernet 0/1.25 or RP/0/RP0/CPU0:router(config-bulk-sc)# instance range start 1 end 2 or RP/0/RP0/CPU0:router(config-bulk-sc)# instance repetition 1 max 4</td>
<td>Note Only one instance command can be configured per schema. If multiple instance commands are executed, the earlier ones are over-written by new commands.</td>
</tr>
<tr>
<td><strong>Step 5</strong> poll-interval <em>minutes</em></td>
<td>Sets how often data should be collected from the object instances specified in this schema, in minutes. The default is once every 5 minutes. The valid range is from 1 to 20000.</td>
</tr>
<tr>
<td>Example: RP/0/RP0/CPU0:router(config-bulk-sc)# poll-interval 10</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> commit</td>
<td></td>
</tr>
</tbody>
</table>

---

*Cisco IOS XR System Management Configuration Guide for the Cisco CRS Router, Release 4.2.x*
What to Do Next
Configure the bulk statistics transfer options.

Configuring Bulk Statistics Transfer Options

The final step in configuring periodic MIB data collection and transfer is to configure the transfer options. The collected MIB data are kept in a local file-like entity called a VFile (virtual file, referred to as a bulk statistics file in this document). This file can be transferred to a remote network management station at intervals you specify.

Before You Begin
The bulk statistics object lists and bulk statistics schemas must be defined before configuring the bulk statistics transfer options.

SUMMARY STEPS

1. configure
2. snmp-server mib bulkstat transfer-id transfer-id
3. buffer-size bytes
4. format {bulkBinary | bulkASCII | schemaASCII}
5. schema schema-name
6. transfer-interval minutes
7. url primary url
8. url secondary url
9. retry number
10. retain minutes
11. enable
12. commit

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step 2</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>snmp-server mib bulkstat transfer-id transfer-id</td>
<td>Identifies the transfer configuration with a name (transfer-id argument) and enters bulk statistics transfer configuration mode.</td>
</tr>
</tbody>
</table>

Example:
RP/0/RP0/CPU0:router(config)# snmp-server mib bulkstat transfer bulkstat1
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 3</strong></td>
<td>buffer-size <em>bytes</em></td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RP0/CPU0:router(config-bulk-tr)# buffersize 3072</td>
</tr>
<tr>
<td><strong>Purpose</strong></td>
<td>(Optional) Specifies the maximum size for the bulk statistics data file, in bytes. The valid range is from 1024 to 2147483647 bytes. The default buffer size is 2048 bytes.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>If the maximum buffer size for a bulk statistics file is reached before the transfer interval time expires, all additional data received is deleted. To correct this behavior, you can decrease the polling frequency, or increase the size of the bulk statistics buffer.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>format {bulkBinary</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RP0/CPU0:router(config-bulk-tr)# format schemaASCII</td>
</tr>
<tr>
<td><strong>Purpose</strong></td>
<td>(Optional) Specifies the format of the bulk statistics data file (VFile). The default is schemaASCII.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>Transfers can only be performed using schemaASCII (cdcSchemaASCII) format. SchemaASCII is a human-readable format that contains parser-friendly hints for parsing data values.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>schema <em>schema-name</em></td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RP0/CPU0:router(config-bulk-tr)# schema ATM2/0-IFMIB RP/0/RP0/CPU0:router(config-bulk-tr)# schema ATM2/0-CAR RP/0/RP0/CPU0:router(config-bulk-tr)# schema Ethernet2/1-IFMIB</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>transfer-interval <em>minutes</em></td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RP0/CPU0:router(config-bulk-tr)# transfer-interval 20</td>
</tr>
<tr>
<td><strong>Purpose</strong></td>
<td>(Optional) Specifies how often the bulk statistics file are transferred, in minutes. The default value is once every 30 minutes. The transfer interval is the same as the collection interval.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>url primary <em>url</em></td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RP0/CPU0:router(config-bulk-tr)# url primary ftp://user:password@host/folder/bulkstat1</td>
</tr>
<tr>
<td><strong>Purpose</strong></td>
<td>Specifies the network management system (host) that the bulk statistics data file is transferred to, and the protocol to use for transfer. The destination is specified as a Uniform Resource Locator (URL). FTP or TFTP can be used for the bulk statistics file transfer.</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>url secondary <em>url</em></td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RP0/CPU0:router(config-bulk-tr)# url secondary tftp://10.1.0.1/tftpboot/user/bulkstat1</td>
</tr>
<tr>
<td><strong>Purpose</strong></td>
<td>(Optional) Specifies a backup transfer destination and protocol for use in the event that transfer to the primary location fails. FTP or TFTP can be used for the bulk statistics file transfer.</td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td>retry <em>number</em></td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RP0/CPU0:router(config-bulk-tr)# retry 1</td>
</tr>
<tr>
<td><strong>Purpose</strong></td>
<td>(Optional) Specifies the number of transmission retries. The default value is 0 (in other words, no retries). If an attempt to send the bulk statistics file fails, the system can be configured to attempt to send the file again using this command.</td>
</tr>
</tbody>
</table>
### Configuring Bulk Statistics Transfer Options

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>One retry includes an attempt first to the primary destination then, if the transmission fails, to the secondary location. For example, if the retry value is 1, an attempt is made first to the primary URL, then to the secondary URL, then to the primary URL again, then to the secondary URL again. The valid range is from 0 to 100. If all retries fail, the next normal transfer occurs after the configured transfer-interval time.</td>
<td></td>
</tr>
</tbody>
</table>

#### Step 10

<table>
<thead>
<tr>
<th>retain minutes</th>
</tr>
</thead>
<tbody>
<tr>
<td>(Optional) Specifies how long the bulk statistics file should be kept in system memory, in minutes, after the completion of the collection interval and a transmission attempt is made. The default value is 0. Zero (0) indicates that the file is deleted immediately after the transfer is attempted. The valid range is from 0 to 20000.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
</tr>
<tr>
<td>```</td>
</tr>
<tr>
<td>RP/0/RP0/CPU0:router(config-bulk-tr)# retain 60</td>
</tr>
<tr>
<td>```</td>
</tr>
</tbody>
</table>

**Note**

If the retry command is used, you should configure a retain interval larger than 0. The interval between retries is the retain interval divided by the retry number. For example, if `retain 10` and `retry 2` are configured, two retries are attempted once every 5 minutes. Therefore, if `retain 0` is configured, no retries are attempted.

#### Step 11

<table>
<thead>
<tr>
<th>enable</th>
</tr>
</thead>
<tbody>
<tr>
<td>Begins the bulk statistics data collection and transfer process for this configuration.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
</tr>
<tr>
<td>```</td>
</tr>
<tr>
<td>RP/0/RP0/CPU0:router(config-bulk-tr)# enable</td>
</tr>
<tr>
<td>```</td>
</tr>
</tbody>
</table>

- For successful execution of this action, at least one schema with non-zero number of objects must be configured.
- Periodic collection and file transfer begins only if this command is configured. Conversely, the `no enable` command stops the collection process. A subsequent `enable` starts the operations again.
- Each time the collection process is started using the `enable` command, data is collected into a new bulk statistics file. When the `no enable` command is used, the transfer process for any collected data immediately begins (in other words, the existing bulk statistics file is transferred to the specified management station).

#### Step 12

<table>
<thead>
<tr>
<th>commit</th>
</tr>
</thead>
</table>
What to Do Next

If the maximum buffer size for a bulk statistics file is reached before the transfer interval time expires, the transfer operation is still initiated, but any bulk statistics data received after the file was full, and before it was transferred, are deleted. To correct this behavior, you can decrease the polling frequency, or increase the size of the bulk statistics buffer.

If `retain 0` is configured, no retries are attempted. This is because the interval between retries is the `retain` value divided by the `retry` value. For example, if `retain 10` and `retry 2` are configured, retries are attempted once every 5 minutes. Therefore, if you configure the `retry` command, you should also configure an appropriate value for the `retain` command.

Monitoring Periodic MIB Data Collection and Transfer

SUMMARY STEPS

1. `show snmp mib bulkstat transfer transfer-name`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>show snmp mib bulkstat transfer transfer-name</strong></td>
</tr>
<tr>
<td>(Optional)</td>
<td>(Optional) The <code>show</code> command for this feature lists all bulk statistics virtual files (VFiles) on the system that have finished collecting data. (Data files that are not complete are not displayed.)</td>
</tr>
<tr>
<td></td>
<td>The output lists all of the completed local bulk statistics files, the remaining time left before the bulk statistics file is deleted (remaining retention period), and the state of the bulk statistics file.</td>
</tr>
<tr>
<td></td>
<td>The “STATE” of the bulk statistics file is one of the following:</td>
</tr>
<tr>
<td></td>
<td>• Queued--Indicates that the data collection for this bulk statistics file is completed (in other words, the transfer interval has been met) and that the bulk statistics file is waiting for transfer to the configured destination(s).</td>
</tr>
<tr>
<td></td>
<td>• Retry--Indicates that one or more transfer attempts have failed and that the file transfer will be attempted again. The number of retry attempts remaining are displayed in parenthesis.</td>
</tr>
<tr>
<td></td>
<td>• Retained--Indicates that the bulk statistics file has either been successfully transmitted or that the configured number of retries have been completed.</td>
</tr>
<tr>
<td></td>
<td>To display only the status of a named transfer (as opposed to all configured transfers), specify the name of the transfer in the <code>transfer-name</code> argument.</td>
</tr>
</tbody>
</table>

**show snmp mib bulkstat transfer Sample Output**

```
RP/0/RP0/CPU0:router# show snmp mib bulkstat transfer

Transfer Name : ifmib
```
Retained files

File Name : Time Left (in seconds) :STATE
---------------------------------------------------------------------
ifmib_Router_020421_100554683 : 173 : Retry (2 Retry attempt(s) Left)

**Periodic MIB Data Collection and Transfer: Example**

This example shows how to configure periodic MIB data collection and transfer:

```plaintext
snmp-server mib bulkstat object-list cempo
   add cempMemPoolName
   add cempMemPoolType

snmp-server mib bulkstat schema cempWild
   object-list cempo
   instance wild old 8695772
   poll-interval 1

snmp-server mib bulkstat schema cempRepeat
   object-list cempo
   instance repetition 8695772.1 max 4294967295
   poll-interval 1

snmp-server mib bulkstat transfer-id cempt1
   enable
      schema cempWild
      schema cempRepeat
      transfer-interval 2
```

This example shows sample bulk statistics file content:

```plaintext
Schema-def cempt1.cempWild "%u, %s, %s, %d" Epochtime instanceoid
   1.3.6.1.4.1.9.9.221.1.1.1.1.3 1.3.6.1.4.1.9.9.221.1.1.1.1.2

```
Implementing CDP

Cisco Discovery Protocol (CDP) is a media- and protocol-independent protocol that runs on all Cisco-manufactured equipment including routers, bridges, access and communication servers, and switches. Using CDP, you can view information about all the Cisco devices that are directly attached to the device.

This module describes the new and revised tasks you need to implement CDP on your Cisco IOS XR network. For more information about CDP on the Cisco IOS XR software and complete descriptions of the CDP commands listed in this module, refer to Related Documents, on page 328. To locate documentation for other commands that might appear in the course of running a configuration task, search online in Cisco IOS XR Commands Master List for the Cisco CRS Router.

Table 34: Feature History for Implementing CDP on Cisco IOS XR Software

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 2.0</td>
<td>This feature was introduced.</td>
</tr>
</tbody>
</table>

This module contains the following topics:

- Prerequisites for Implementing CDP, page 321
- Information About Implementing CDP, page 322
- How to Implement CDP on Cisco IOS XR Software, page 323
- Configuration Examples for Implementing CDP, page 328
- Additional References, page 328

Prerequisites for Implementing CDP

You must be in a user group associated with a task group that includes the proper task IDs. The command reference guides include the task IDs required for each command. If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.
Information About Implementing CDP

CDP is primarily used to obtain protocol addresses of neighboring devices and discover the platform of those devices. CDP can also be used to display information about the interfaces your router uses. CDP is media- and protocol-independent, and runs on all equipment manufactured by Cisco, including routers, bridges, access servers, and switches.

Use of SNMP with the CDP MIB allows network management applications to learn the device type and the SNMP agent address of neighboring devices and to send SNMP queries to those devices. CDP uses the CISCO-CDP-MIB.

CDP runs on all media that support Subnetwork Access Protocol (SNAP), including LAN, Frame Relay, and ATM physical media. CDP runs over the data link layer only. Therefore, two systems that support different network-layer protocols can learn about each other.

Each device configured for CDP sends periodic messages, known as advertisements, to a multicast address. Each device advertises at least one address at which it can receive SNMP messages. The advertisements also contain time-to-live, or hold-time, information, which indicates the length of time a receiving device holds CDP information before discarding it. Each device also listens to the periodic CDP messages sent by others to learn about neighboring devices and determine when their interfaces to the media go up or down.

CDP Version-2 (CDPv2) is the most recent release of the protocol and provides more intelligent device tracking features. These features include a reporting mechanism that allows for more rapid error tracking, thereby reducing costly downtime. Reported error messages can be sent to the console or to a logging server, and can cover instances of unmatching native VLAN IDs (IEEE 802.1Q) on connecting ports, and unmatching port duplex states between connecting devices.

CDPv2 show commands can provide detailed output on VLAN Trunking Protocol (VTP) management domain and duplex modes of neighbor devices, CDP-related counters, and VLAN IDs of connecting ports.

Type-length-value fields (TLVs) are blocks of information embedded in CDP advertisements. Table 35: Type-Length-Value Definitions for CDPv2, on page 322 summarizes the TLV definitions for CDP advertisements.

Table 35: Type-Length-Value Definitions for CDPv2

<table>
<thead>
<tr>
<th>TLV</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device-ID TLV</td>
<td>Identifies the device name in the form of a character string.</td>
</tr>
<tr>
<td>Address TLV</td>
<td>Contains a list of network addresses of both receiving and sending devices.</td>
</tr>
<tr>
<td>Port-ID TLV</td>
<td>Identifies the port on which the CDP packet is sent.</td>
</tr>
<tr>
<td>Capabilities TLV</td>
<td>Describes the functional capability for the device in the form of a device type; for example, a switch.</td>
</tr>
<tr>
<td>Version TLV</td>
<td>Contains information about the software release version on which the device is running.</td>
</tr>
<tr>
<td>Platform TLV</td>
<td>Describes the hardware platform name of the device, for example, Cisco 4500.</td>

</tbody>
</table>
How to Implement CDP on Cisco IOS XR Software

Enabling CDP

To enable CDP, you must first enable CDP globally on the router and then enable CDP on a per-interface basis. This task explains how to enable CDP globally on the router and then enable CDP on an interface.

SUMMARY STEPS

1. configure
2. cdp
3. interface type interface-path-id
4. cdp
5. commit

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>cdp</td>
<td>Enables CDP globally.</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RP0/CPU0:router(config)# cdp</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>interface type interface-path-id</td>
<td>Enters interface configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>RP/0/RP0/CPU0:router(config)# interface pos 0/0/0/1</td>
<td></td>
</tr>
</tbody>
</table>
### Modifying CDP Default Settings

This task explains how to modify the default version, hold-time setting, and timer settings.

**Note**
The commands can be entered in any order.

**SUMMARY STEPS**

1. `configure`
2. `cdp advertise v1`
3. `cdp holdtime seconds`
4. `cdp timer seconds`
5. `commit`
6. (Optional) `show cdp`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td><code>cdp advertise v1</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> &lt;br&gt;RP/0/RP0/CPU0:router(config)# cdp advertise v1</td>
<td>Configures CDP to use only version 1 (CDPv1) in communicating with neighboring devices.</td>
</tr>
<tr>
<td></td>
<td>• By default, when CDP is enabled, the router sends CDPv2 packets. CDP also sends and receives CDPv1 packets if the device with which CDP is interacting does not process CDPv2 packets.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• In this example, the router is configured to send and receive only CDPv1 packets.</td>
<td></td>
</tr>
</tbody>
</table>
### Implementing CDP

#### Step 3

**Command or Action:** `cdp holdtime seconds`

**Purpose:** Specifies the amount of time that the receiving networking device will hold a CDP packet sent from the router before discarding it.

- By default, when CDP is enabled, the receiving networking device holds a CDP packet for 180 seconds before discarding it.

  **Note:** The CDP hold time must be set to a higher number of seconds than the time between CDP transmissions, which is set with the `cdp timer` command.

  - In this example, the value of hold-time for the `seconds` argument is set to 30.

**Example:**

```
RP/0/RP0/CPU0:router(config)# cdp holdtime 30
```

#### Step 4

**Command or Action:** `cdp timer seconds`

**Purpose:** Specifies the frequency at which CDP update packets are sent.

- By default, when CDP is enabled, CDP update packets are sent at a frequency of once every 60 seconds.

  **Note:** A lower timer setting causes CDP updates to be sent more frequently.

- In this example, CDP update packets are configured to be sent at a frequency of once every 20 seconds.

**Example:**

```
RP/0/RP0/CPU0:router(config)# cdp timer 20
```

#### Step 5

**Command or Action:** `commit`

- **Purpose:** (Optional) Displays global CDP information.

**Example:**

```
RP/0/RP0/CPU0:router# show cdp
```

#### Step 6

**Command or Action:** `show cdp`

- **Purpose:** Displays global CDP information.

  The output displays the CDP version running on the router, the hold time setting, and the timer setting.

**Example:**

```
RP/0/RP0/CPU0:router# show cdp
```

### Monitoring CDP

This task shows how to monitor CDP.

**Note**

The commands can be entered in any order.

### SUMMARY STEPS

1. `show cdp entry { * | entry-name } [ protocol | version ]`
2. `show cdp interface { type interface-path-id | location node-id }`
3. `show cdp neighbors { type interface-path-id | location node-id } [ detail ]`
4. `show cdp traffic { location node-id }`
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><code>show cdp entry {</code>*`</td>
<td>entry-name`</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>RP/0/RSP0/CPU0:router# show cdp entry *</code></td>
<td></td>
</tr>
<tr>
<td>2</td>
<td><code>show cdp interface [</code>type interface-path-id`</td>
<td>location</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>RP/0/RSP0/CPU0:router# show cdp interface pos 0/0/0/1</code></td>
<td></td>
</tr>
<tr>
<td>3</td>
<td><code>show cdp neighbors [</code>type interface-path-id`</td>
<td>location</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>RP/0/RSP0/CPU0:router# show cdp neighbors</code></td>
<td></td>
</tr>
<tr>
<td>4</td>
<td><code>show cdp traffic [location node-id</code></td>
<td>Displays information about the traffic gathered between devices using CDP.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>RP/0/RSP0/CPU0:router# show cdp traffic</code></td>
<td></td>
</tr>
</tbody>
</table>

### Examples

The following is sample output for the `show cdp neighbors` command:

```
RP/0/RP0/CPU0:router# show cdp neighbors

Capability Codes: R - Router, T - Trans Bridge, B - Source Route Bridge
S - Switch, H - Host, I - IGMP, r - Repeater

Device ID Local Intrfce Holdtme Capability Platform Port ID
router1 Mg0/0/CPU0/0 177 T S WS-C2924M Fa0/12
router2 Po0/4/0/0 157 R 12008/GRP Po0/4/0/1
```

The following is sample output for the `show cdp neighbors` command. In this example, the optional `type instance` arguments are used in conjunction with the `detail` optional keyword to display detailed information about a CDP neighbor. The output includes information on both IPv4 and IPv6 addresses.

```
RP/0/RP0/CPU0:router# show cdp neighbors POS 0/4/0/0 detail

-------------------------
Device ID: uut-user
SysName : uut-user
Entry address(es):
IPv4 address: 1.1.1.1
IPv6 address: 1::1
IPv6 address: 2::2
```
Platform: cisco 12008/GRP, Capabilities: Router
Interface: POS0/4/0/3
Port ID (outgoing port): POS0/2/0/3
Holdtime : 177 sec

Version :
Cisco IOS XR Software, Version 0.0.0[Default]
Copyright (c) 2005 by cisco Systems, Inc.
advertisement version: 2

The following is sample output for the `show cdp entry` command. In this example, the optional `entry` argument is used to display entry information related to a specific CDP neighbor.

RP/0/RP0/CPU0:router# show cdp entry router2

advertisement version: 2

-------------------------
Device ID: router2
SysName : router2
Entry address(es): Platform: cisco 12008/GRP, Capabilities: Router
Interface: POS0/4/0/0
Port ID (outgoing port): POS0/4/0/1
Holdtime : 145 sec

Version :
Cisco IOS XR Software, Version 0.48.0[Default]
Copyright (c) 2004 by cisco Systems, Inc.
advertisement version: 2

The following is sample output for the `show cdp interface` command. In this example, CDP information related to Packet over SONET/SDH (POS) interface 0/4/0/0 is displayed.

RP/0/RP0/CPU0:router# show cdp interface pos 0/4/0/0

POS0/4/0/0 is Up
Encapsulation HDLC
Sending CDP packets every 60 seconds
Holdtime is 180 seconds

The following is sample output for the `show cdp traffic` command:

RP/0/RP0/CPU0:router# show cdp traffic

CDP counters :
Packets output: 194, Input: 99
Hdr syntax: 0, Chksum error: 0, Encaps failed: 0
No memory: 0, Invalid packet: 0, Truncated: 0
CDP version 2 advertisements output: 194, Input: 99
Unrecognize Hdr version: 0, File open failed: 0

The following is sample output for the `show cdp traffic` command. In this example, the optional `location` keyword and `node-id` argument are used to display information about the traffic gathered between devices using CDP from the specified node.

RP/0/RP0/CPU0:router# show cdp traffic location 0/4/cpu0

CDP counters :
Packets output: 16, Input: 13
Hdr syntax: 0, Chksum error: 0, Encaps failed: 0
No memory: 0, Invalid packet: 0, Truncated: 0
CDP version 1 advertisements output: 0, Input: 0
Configuration Examples for Implementing CDP

Enabling CDP: Example

The following example shows how to configure CDP globally and then enable CDP on Packet over SONET/SDH (POS) interface 0/3/0/0:

```plaintext
cdp
interface POS0/3/0/0
cdp
```

Modifying Global CDP Settings: Example

The following example shows how to modify global CDP settings. In this example, the timer setting is set to 20 seconds, the hold-time setting is set to 30 seconds, and the version of CDP used to communicate with neighboring devices is set to CDPv1:

```plaintext
cdp timer 20
    cdp holdtime 30
    cdp advertise v1
```

The following example shows how to use the `show cdp` command to verify the CDP global settings:

```
RP/0/RP0/CPU0:router# show cdp
Global CDP information:
Sending CDP packets every 20 seconds
Sending a holdtime value of 30 seconds
Sending CDPv2 advertisements is not enabled
```
