This document describes the Cisco IOS XR software commands used to configure and monitor the Virtual Router Redundancy Protocol (VRRP).

For detailed information about VRRP concepts, configuration tasks, and examples, refer to the *IP Addresses and Services Configuration Guide for Cisco CRS Routers*.

- accept-mode, on page 3
- accept-mode(slave), on page 5
- address-family, on page 6
- address (VRRP), on page 7
- address global, on page 9
- address linklocal, on page 11
- address secondary, on page 13
- bfd minimum-interval (VRRP), on page 15
- bfd multiplier (VRRP), on page 16
- clear vrrp statistics, on page 17
- delay (VRRP), on page 19
- interface (VRRP), on page 20
- message state disable, on page 22
- router vrrp, on page 23
- session name(vrrp), on page 24
- show vrrp, on page 25
- slave follow(vrrp), on page 30
- slave primary virtual IPv4 address(vrrp), on page 31
- slave secondary virtual IPv4 address(vrrp), on page 32
- snmp-server traps vrrp events, on page 33
- track object(vrrp), on page 34
- vrrp, on page 35
- vrrp assume-ownership disable, on page 37
- vrrp bfd fast-detect, on page 39
- vrrp bfd minimum-interval, on page 41
- vrrp bfd multiplier, on page 42
- vrrp delay, on page 43
- vrrp ipv4, on page 45
- vrrp preempt, on page 46
• vrrp priority, on page 48
• vrrp text-authentication, on page 49
• vrrp timer, on page 50
• vrrp track interface, on page 51
accept-mode

To disable the installation of routes for the Virtual Router Redundancy Protocol (VRRP) virtual addresses, use the `accept-mode` command in the VRRP virtual router submode. To enable the installation of routes for the VRRP virtual addresses, use the `no` form of this command.

```
accept-mode disable

no accept-mode disable
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>disable</strong> Disables the accept mode.</td>
</tr>
</tbody>
</table>

**Command Default**

By default, the accept mode is enabled.

**Command Modes**

VRRP virtual router configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 4.1.0</td>
<td>This command was introduced. This command replaced the <code>vrrp assume-ownership disable</code> command.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrrp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Example**

This example shows how to disable the installation of routes for the VRRP virtual addresses:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router vrrp
RP/0/RP0/CPU0:router(config-vrrp)# interface TenGigE 0/4/0/4
RP/0/RP0/CPU0:router(config-vrrp-if)# address-family ipv4
RP/0/RP0/CPU0:router(config-vrrp-address-family)# vrrp 3 version 2
RP/0/RP0/CPU0:router(config-vrrp-virtual-router)# accept-mode disable
RP/0/RP0/CPU0:router(config-vrrp-virtual-router)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>address (VRRP), on page 7</td>
<td>Sets the primary virtual IPv4 address for a virtual router.</td>

</tr>
<tr>
<td>message state disable, on page 22</td>
<td>Disables the task of logging the VRRP state change events.</td>
</tr>
</tbody>
</table>
accept-mode(slave)

To disable the installation of routes for the Virtual Router Redundancy Protocol (VRRP) virtual addresses, use the `accept-mode` command in the VRRP slave submode. To enable the installation of routes for the VRRP virtual addresses, use the `no` form of this command.

```
accept-mode disable

no accept-mode disable
```

**Syntax Description**

- `disable` Disables the accept mode.

**Command Default**

By default, the accept mode is enabled.

**Command Modes**

VRRP slave submode configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrrp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Example**

This example shows how to disable the installation of routes for the VRRP virtual addresses:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router vrrp
RP/0/RP0/CPU0:router(config-vrrp)# interface tenGigE 0/4/0/4
RP/0/RP0/CPU0:router(config-vrrp-if)# address-family ipv4
RP/0/RP0/CPU0:router(config-vrrp-address-family)# vrrp 3 slave
RP/0/RP0/CPU0:router(config-vrrp-virtual-router)# accept-mode disable
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>accept-mode</code>, on page 3</td>
<td>Disable the installation of routes for the Virtual Router Redundancy Protocol (VRRP) virtual addresses.</td>
</tr>
</tbody>
</table>
address-family

To enable address-family mode, use the **address-family** command in interface configuration mode. To terminate address-family mode, use the **no** form of this command.

```
address-family {ipv4 |ipv6}
no address-family {ipv4 |ipv6}
```

**Syntax Description**
- **ipv4** IPv4 address-family.
- **ipv6** IPv6 address-family.

**Command Default**
None.

**Command Modes**
Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.1.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrrp</td>
<td>read,</td>
</tr>
<tr>
<td></td>
<td>write</td>
</tr>
</tbody>
</table>

**Example**
The following example shows how to enable address-family mode:

```
RP/0/RP0/CPU0:router # config
RP/0/RP0/CPU0:router(config)# router vrrp
RP/0/RP0/CPU0:router(config-vrrp)# interface tenGigE 0/4/0/4
RP/0/RP0/CPU0:router(config-vrrp-if)# address-family ipv4
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface (VRRP), on page 20</td>
<td>Enables VRRP interface configuration mode.</td>
</tr>
</tbody>
</table>
address (VRRP)

To configure the primary virtual IPv4 address for a virtual router, use the **address** command in the Virtual Router Redundancy Protocol (VRRP) virtual router submode. To deconfigure the primary virtual IPv4 address for the virtual router, use the **no** form of this command.

```
address address
no address address
```

**Syntax Description**

- `address`  VRRP IPv4 address.

**Command Default**

None

**Command Modes**

VRRP virtual router

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.1.0</td>
<td>This command was introduced. This command replaced the <code>vrrp ipv4</code> command.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

```
<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrrp</td>
<td>read, write</td>
</tr>
</tbody>
</table>
```

**Example**

This example shows how to set the primary virtual IPv4 address for the virtual router:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router vrrp
RP/0/RP0/CPU0:router(config-vrrp)# interface TenGigE 0/4/0/4
RP/0/RP0/CPU0:router(config-vrrp-if)# address-family ipv4
RP/0/RP0/CPU0:router(config-vrrp-address-family)# vrrp 3 version 3
RP/0/RP0/CPU0:router(config-vrrp-virtual-router)# address 192.168.18.1
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>accept-mode, on page 3</td>
<td>Disables the installation of routes for the VRRP virtual addresses.</td>
</tr>
<tr>
<td>address global, on page 9</td>
<td>Configures the global virtual IPv6 address for a virtual router.</td>
</tr>
<tr>
<td>address linklocal, on page 11</td>
<td>Sets the virtual link-local IPv6 address for a virtual router.</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------------------</td>
<td>-------------------------------------------------------</td>
</tr>
<tr>
<td>address secondary, on page 13</td>
<td>Sets the secondary virtual IPv4 address for a virtual router.</td>
</tr>
<tr>
<td>message state disable, on page 22</td>
<td>Disables the task of logging the VRRP state change events.</td>
</tr>
</tbody>
</table>
address global

To configure the global virtual IPv6 address for a virtual router, use the `address global` command in the Virtual Router Redundancy Protocol (VRRP) virtual router submode. To deconfigure the global virtual IPv6 address for a virtual router, use the `no` form of this command.

```
address global ipv6-address

no address global ipv6-address
```

**Syntax Description**
- `ipv6-address`: Global VRRP IPv6 address.

**Command Default**
None

**Command Modes**
VRRP virtual router

**Command History**
- **Release**
  - 4.1.0
  - This command was introduced.

**Usage Guidelines**
No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrrp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Example**

This example shows how to add a global virtual IPv6 address for the virtual router:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router vrrp
RP/0/RP0/CPU0:router(config-vrrp)# interface TenGigE 0/4/0/4
RP/0/RP0/CPU0:router(config-vrrp-if)# address-family ipv6
RP/0/RP0/CPU0:router(config-vrrp-address-family)# vrrp 3 version 3
RP/0/RP0/CPU0:router(config-vrrp-address-family)# address global 4000::1000
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>address (VRRP), on page 7</td>
<td>Sets the primary virtual IPv4 address for a virtual router.</td>
</tr>
<tr>
<td>accept-mode, on page 3</td>
<td>Disables the installation of routes for the VRRP virtual addresses.</td>
</tr>
<tr>
<td>address linklocal, on page 11</td>
<td>Sets the virtual link-local IPv6 address for a virtual router.</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>address secondary, on page 13</td>
<td>Sets the secondary virtual IPv4 address for a virtual router.</td>
</tr>
<tr>
<td>message state disable, on page 22</td>
<td>Disables the task of logging the VRRP state change events.</td>
</tr>
</tbody>
</table>
address linklocal

To either configure the virtual link-local IPv6 address for a virtual router or to specify that the virtual link-local IPv6 address should be enabled and calculated automatically from the virtual router virtual Media Access Control (MAC) address, use the `address linklocal` command in the Virtual Router Redundancy Protocol (VRRP) virtual router submode. To deconfigure the virtual link-local IPv6 address for a virtual router, use the `no` form of this command.

```plaintext
address linklocal [{ipv6-address|autoconfig}]

no address linklocal [{ipv6-address|autoconfig}]
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ipv6-address</code></td>
<td>VRRP IPv6 link-local address.</td>
</tr>
<tr>
<td><code>autoconfig</code></td>
<td>Autoconfigures the VRRP IPv6 link-local address.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command Modes**

VRRP virtual router

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.1.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrrp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Example**

This example shows how to autoconfigure the VRRP IPv6 link-local address:

```plaintext
RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#router vrrp
RP/0/RP0/CPU0:router(config-vrrp)#interface TenGigE 0/4/0/4
RP/0/RP0/CPU0:router(config-vrrp-if)#address-family ipv6
RP/0/RP0/CPU0:router(config-vrrp-address-family)#vrrp 3
RP/0/RP0/CPU0:router(config-vrrp-virtual-router)#address linklocal autoconfig
RP/0/RP0/CPU0:router(config-vrrp-virtual-router)#
```

This example shows how to configure the virtual link-local IPv6 address for the virtual router:

```plaintext
RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#router vrrp
```
RP/0/RP0/CPU0:router(config-vrrp)#interface TenGigE 0/4/0/4
RP/0/RP0/CPU0:router(config-vrrp-if)#address-family ipv6
RP/0/RP0/CPU0:router(config-vrrp-address-family)#vrrp 3
RP/0/RP0/CPU0:router(config-vrrp-virtual-router)#address linklocal FE80::260:3EFF:FE11:6770

The version keyword is available only if IPv4 address-family is selected. By default, version is set to 3 for IPv6 address families.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>address (VRRP), on page 7</td>
<td>Sets the primary virtual IPv4 address for a virtual router.</td>
</tr>
<tr>
<td>address global, on page 9</td>
<td>Configures the global virtual IPv6 address for a virtual router.</td>
</tr>
<tr>
<td>accept-mode, on page 3</td>
<td>Disables the installation of routes for the VRRP virtual addresses.</td>

<td>Disables the task of logging the VRRP state change events.</td>
</tr>
</tbody>
</table>
address secondary

To configure the secondary virtual IPv4 address for a virtual router, use the `address secondary` command in the Virtual Router Redundancy Protocol (VRRP) virtual router submode. To deconfigure the secondary virtual IPv4 address for a virtual router, use the `no` form of this command.

**Syntax Description**

```
address address secondary
no address address secondary
```

- `secondary` Sets the secondary VRRP IP address.
- `address` VRRP IPv4 address.

**Command Default**

None

**Command Modes**

VRRP virtual router

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.1.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrrp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Example**

This example shows how to set the secondary virtual IPv4 address for the virtual router:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router vrrp
RP/0/RP0/CPU0:router(config-vrrp)# interface TenGigE 0/4/0/4
RP/0/RP0/CPU0:router(config-vrrp-if)# address-family ipv4
RP/0/RP0/CPU0:router(config-vrrp-address-family)# vrrp 3 version 2
RP/0/RP0/CPU0:router(config-vrrp-virtual-router)# address 192.168.18.1 secondary
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>address (VRRP), on page 7</code></td>
<td>Sets the primary virtual IPv4 address for a virtual router.</td>
</tr>
<tr>
<td><code>address global, on page 9</code></td>
<td>Configures the global virtual IPv6 address for a virtual router.</td>
</tr>
<tr>

</tr>
<tr>
<td>message state disable, on page 22</td>
<td>Disables the task of logging the VRRP state change events.</td>
</tr>
</tbody>
</table>
bdf minimum-interval (VRRP)

To configure the BFD minimum interval to be used for all VRRP BFD sessions on a given interface, use the `bdf minimum-interval` command in the interface configuration mode. To remove the configured minimum-interval period and set the minimum-interval period to the default period, use the `no` form of this command.

```
bfd minimum-interval interval
no bfd minimum-interval interval
```

**Syntax Description**
- `interval` Specify the minimum-interval in milliseconds. Range is 15 to 30000.

**Command Default**
Default minimum interval is 15 ms.

**Command Modes**
VRRP interface configuration

**Command History**
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.1.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Minimum interval determines the frequency of sending BFD packets to BFD peers. It is the time between successive BFD packets sent for the session. Minimum interval is defined in milliseconds. The configured minimum interval applies to all BFD sessions on the interface.

**Examples**
The following example shows how to configure a minimum interval of 100 milliseconds:

```
RP/0/RP0/CPU0:router(config)# router vrrp
RP/0/RP0/CPU0:router(config-vrrp)# interface gig 0/1/1/0
RP/0/RP0/CPU0:router(config-vrrp-if)# bfd minimum-interval 100
```

**Task ID**
- **Task ID**: vrrp
- **Operations**: read, write

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrrp bfd fast-detect, on page 39</td>
<td>Enables BFD on a VRRP interface.</td>
</tr>
</tbody>
</table>
**bfd multiplier (VRRP)**

To set the BFD multiplier value, use the `bfd multiplier` command in the interface configuration mode. To remove the configured multiplier value and set the multiplier to the default value, use the `no` form of this command.

```
bf_multiplier multiplier
no bfd multiplier multiplier
```

**Syntax Description**

- `multiplier` Specifies the BFD multiplier value. Range is 2 to 50.

**Command Default**

Default value is 3.

**Command Modes**

VRRP interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.1.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The multiplier value specifies the number of consecutive BFD packets that, if not received as expected, cause a BFD session to go down. The BFD multiplier applies to all configured BFD sessions on the interface.

**Task ID**

- **Task ID**
  - vrrp read, write

**Examples**

The following example shows how to configure a BFD multiplier with multiplier value of 10:

```
RP/0/RP0/CPU0:router(config)# router vrrp
RP/0/RP0/CPU0:router(config-vrrp)# interface gig 0/1/0
RP/0/RP0/CPU0:router(config-vrrp-if)# bfd multiplier 10
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrrp bfd fast-detect, on page 39</td>
<td>Enables BFD on a VRRP interface.</td>
</tr>
</tbody>
</table>
# clear vrrp statistics

To reset the Virtual Router Redundancy Protocol (VRRP) statistics (to zero or default value), use the `clear vrrp statistics` command in EXEC mode.

```
clear vrrp statistics {ipv4 | ipv6}[interface type interface-path-id [vrid]]
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipv4</td>
<td>(Optional) Resets the IPv4 information.</td>
</tr>
<tr>
<td>ipv6</td>
<td>(Optional) Resets the IPv6 information.</td>
</tr>
<tr>
<td>interface type</td>
<td>(Optional) Interface type. For more information, use the question mark (?) online help function.</td>
</tr>
<tr>
<td>interface-path-id</td>
<td>(Optional) Either a physical interface instance or a virtual interface instance as follows:</td>
</tr>
<tr>
<td></td>
<td>• Physical interface instance. Naming notation is <code>rack/slot/module/port</code> and a slash between values is required as part of the notation.</td>
</tr>
<tr>
<td></td>
<td>• <code>rack</code>: Chassis number of the rack.</td>
</tr>
<tr>
<td></td>
<td>• <code>slot</code>: Physical slot number of the modular services card or line card.</td>
</tr>
<tr>
<td></td>
<td>• <code>module</code>: Module number. A physical layer interface module (PLIM) is always 0.</td>
</tr>
<tr>
<td></td>
<td>• <code>port</code>: Physical port number of the interface.</td>
</tr>
<tr>
<td>vrid</td>
<td>(Optional) Virtual router identifier, which is the number identifying the virtual router for which status is displayed.</td>
</tr>
</tbody>
</table>

**Note**

In references to a Management Ethernet interface located on a route processor card, the physical slot number is alphanumeric (RP0 or RP1) and the module is CPU0. Example: `interface mgmtEth 0/ RP1/CPU0/0`. For more information about the syntax for the router, use the question mark (?) online help function.

**Command Default**

No default behavior or values

**Command Modes**

EXEC mode
clear vrrp statistics

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.7.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

If no interface is specified, the statistics for all virtual routers on all interfaces are cleared.

If no value for vrid is specified, the statistics for all virtual routers on the specified interface are cleared.

Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrrp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

Examples

The following example shows how to clear vrrp statistics:

```
RP/0/RP0/CPU0:router# clear vrrp statistics
```
# delay (VRRP)

To configure the activation delay for a VRRP router, use the `delay` command in HSRP interface configuration mode. To delete the activation delay, use the `no` form of this command.

```
delay minimum value reload value
no delay
```

## Syntax Description

<table>
<thead>
<tr>
<th>Command Default</th>
<th>Syntax Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>minimum</strong> value</td>
<td>Sets the minimum delay in seconds for every interface up event. Range is 0 to 10000.</td>
</tr>
<tr>
<td><strong>reload</strong> value</td>
<td>Sets the reload delay in seconds for first interface up event. Range is 0 to 10000.</td>
</tr>
</tbody>
</table>

## Command Default

- **minimum** value: 1
- **reload** value: 5

## Command Modes

VRRP interface configuration

## Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 4.1.0</td>
<td>This command was introduced. This command replaced the <code>vrrp delay</code> command.</td>
</tr>
</tbody>
</table>

## Usage Guidelines

The `vrrp delay` command delays the start of the VRRP finite state machine (FSM) on an interface up event to ensure that the interface is ready to pass traffic. This ensures that there are no mistaken state changes due to loss of hello packets. The minimum delay is applied on all interface up events and the reload delay is applied on the first interface up event.

The values of zero must be explicitly configured to turn this feature off.

## Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrrp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

## Examples

The following example shows how to configure a minimum delay of 10 seconds with a reload delay of 100 seconds:

```
RP/0/RP0/CPU0:router(config)# router vrrp
RP/0/RP0/CPU0:router(config-vrrp)# interface mgmtEth 0/RP0/CPU0/0
RP/0/RP0/CPU0:router(config-vrrp-if)# delay minimum 10 reload 100
```

## Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>show vrrp</strong></td>
<td>Displays a brief or detailed status of one or all Virtual Router Redundancy Protocol (VRRP) virtual routers.</td>
</tr>
</tbody>
</table>
To enable VRRP interface configuration mode, use the `interface (VRRP)` command in VRRP configuration mode. To terminate VRRP interface configuration mode, use the `no` form of this command.

```
interface type interface-path-id
no interface type interface-path-id
```

### Syntax Description

**type**

Interface type. For more information, use the question mark (?) online help function.

**interface-path-id**

Physical interface or virtual interface.

**Note**

Use the `show interfaces` command to see a list of all interfaces currently configured on the router.

For more information about the syntax for the router, use the question mark (?) online help function.

### Command Default

VRRP is disabled.

### Command Modes

VRRP configuration

### Command History

<table>

<tr>
<td>3.6.0</td>
<td>The <code>interface (VRRP)</code> command is used in VRRP configuration mode.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use the `interface (VRRP)` command to enter VRRP interface configuration mode.

You must configure all VRRP configuration commands in VRRP interface configuration mode.

### Task ID

<table>

</tbody>
</table>

### Examples

The following example shows how to configure VRRP and a virtual router 1 on 10-Gigabit Ethernet interface 0/3/0/0:

```
RP/0/RP0/CPU0:router(config)# router vrrp
RP/0/RP0/CPU0:router(config-vrrp)# interface TenGigE 0/3/0/0
RP/0/RP0/CPU0:router(config-vrrp-if)# vrrp 1 ipv4 192.168.18.1
```

```
RP/0/RP0/CPU0:router# config
RP/0/RP0/CPU0:router(config)# router vrrp
RP/0/RP0/CPU0:router(config-vrrp)# interface TenGigE 0/4/0/4
```
RP/0/RP0/CPU0:router(config-vrrp-if)# address-family ipv4
RP/0/RP0/CPU0:router(config-vrrp-address-family)# vrrp 3 version 2
RP/0/RP0/CPU0:router(config-vrrp-virtual-router)#

<table>

</thead>
<tbody>
<tr>
<td>router vrrp, on page 23</td>
<td>Configures a VRRP redundancy process.</td>
</tr>
</tbody>
</table>
message state disable

To disable the task of logging the Virtual Router Redundancy Protocol (VRRP) state change events via syslog, use the `message state disable` command in the VRRP virtual router submode. To re-enable the task of logging the VRRP state change events, use the `no` form of this command.

```plaintext
message state disable
no message state disable
```

**Syntax Description**

This command has no keywords or arguments.

**Command Default**

By default, the task of logging the VRRP state change events is enabled.

**Command Modes**

VRRP global

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 4.1.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>

<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrrp</td>
<td>read,</td>
</tr>
<tr>
<td></td>
<td>write</td>
</tr>
</tbody>
</table>

**Example**

This example shows how to disable the logging of VRRP state change events:

```
RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#router vrrp
RP/0/RP0/CPU0:router(config-vrrp)#message state disable
RP/0/RP0/CPU0:router(config-vrrp)#
```

<tr>
<td>ipv6</td>
<td>(Optional) Displays the IPv6 information.</td>
</tr>
<tr>
<td>interface</td>
<td>(Optional) Displays the status of the virtual router interface.</td>
</tr>
<tr>
<td>type</td>
<td>Interface type. For more information, use the question mark (?) online help function.</td>
</tr>
<tr>
<td>interface-path-id</td>
<td>Physical interface or virtual interface.</td>
</tr>
<tr>
<td>vrid</td>
<td>(Optional) Virtual router identifier, which is the number identifying the virtual router for which status is displayed. The virtual router identifier is configured with the <code>vrrp ipv4</code> command. Range is 1 to 255.</td>
</tr>
<tr>
<td>brief</td>
<td>(Optional) Provides a summary view of the virtual router information.</td>
</tr>
<tr>
<td>detail</td>
<td>(Optional) Displays detailed running state information.</td>
</tr>
<tr>
<td>statistics</td>
<td>(Optional) Displays total statistics.</td>
</tr>
</tbody>
</table>
show vrrp

| all | (Optional) Displays statistics for each virtual router. |

**Command Default**
None

**Command Modes**
EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>2.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
If no interface is specified, all virtual routers on all interfaces are displayed. If no vrid is specified, all vrids on the given interface are displayed.

**Examples**
The following sample output is from the `show vrrp` command:

```
RP/0/RP0/CPU0:router# show vrrp

A indicates IP address owner
| P indicates configured to preempt

<table>
<thead>
<tr>
<th>Interface</th>
<th>vrID</th>
<th>Prio</th>

</tbody>
</table>
slave follow(vrrp)

To instruct the slave group to inherit its state from a specified group, use the `slave follow` command in VRRP slave submode.

```
follow mgo-session-name
```

**Syntax Description**

- `mgo-session-name` Name of the MGO session from which the slave group will inherit the state.

**Command Default**

None

**Command Modes**

VRRP slave submode configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>4.3</td>
<td></td>
</tr>
</tbody>
</table>

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrrp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Example**

This example shows how to instruct the slave group to inherit its state from a specified group.

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router vrrp
RP/0/RP0/CPU0:router(config-vrrp)# interface tengig 0/4/0/4
RP/0/RP0/CPU0:router(config-vrrp-if)# address-family ipv4
RP/0/RP0/CPU0:router(config-vrrp-address-family)# vrrp 2 slave
RP/0/RP0/CPU0:router(config-vrrp-slave)# follow m1
```

**Note**

Before configuring a slave group to inherit its state from a specified group, the group must be configured with the `session name` command on another vrrp group.

**Related Commands**

</tbody>
</table>
To configure the secondary virtual IPv4 address for the slave group, use the **slave secondary virtual IPv4 address** command in the VRRP slave submode.

```
address ip-address secondary
```

**Syntax Description**

- `ip-address`: IP address of the Hot Standby router interface.
- `secondary`: Sets the secondary hot standby IP address.

**Command Default**

None

**Command Modes**

VRRP slave submode configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Before configuring secondary virtual IPv4 address, the primary virtual IPv4 address for the slave group must be configured.

**Example**

This example shows how to configure the secondary virtual IPv4 address for the slave group.

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router vrrp
RP/0/RP0/CPU0:router(config-vrrp)# interface tenGigE 0/4/0/4
RP/0/RP0/CPU0:router(config-vrrp-if)# address-family ipv4
RP/0/RP0/CPU0:router(config-vrrp-address-family)# vrrp 2 slave
RP/0/RP0/CPU0:router(config-vrrp-slave)# address 192.168.10.4 secondary
```

</table>
To enable the Simple Network Management Protocol (SNMP) server notifications (traps) available for VRRP, use the `snmp-server traps vrrp events` command in Global Configuration mode. To disable all available VRRP SNMP notifications, use the `no` form of this command.

**snmp-server traps vrrp events**

**Syntax Description**

- **events** Specifies all VRRP SNMP server traps.

**Command Default**

None

**Command Modes**

Global Configuration mode

**Command History**

- **Release** Modification
  - Release 3.9.0  This command was introduced.

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

- **Task** ID
  - snmp  read, write

**Examples**

The following example shows how to enable snmpserver notifications for VRRP:

```
RP/0/RP0/CPU0:router>configure terminal
Router(config)# snmp-server traps vrrp events
```
**track object(vrrp)**

To enable tracking of a named object with the specified decrement, use the `track object` command in VRRP virtual router submode. To remove the tracking, use the `no` form of this command.

```
track object name[priority-decrement]
no track object name[priority-decrement]
```

**Syntax Description**
- `object name`  Object tracking. Name of the object to be tracked.
- `priority-decrement` (Optional) Amount by which the VRRP priority for the router is decremented when the interface goes down (or comes back up). Range is 1 to 255.

**Command Default**
The default priority-decrement is 10.

**Command Modes**
VRRP virtual router configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
No specific guidelines impact the use of this command.

**Task ID**
- **Task ID**: vrrp
  - **Operation**: read, write

**Example**

This example shows how to configure object tracking under the VRRP virtual router submode.

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router vrrp
RP/0/RP0/CPU0:router(config-vrrp)# interface tenGigE 0/4/0/4
RP/0/RP0/CPU0:router(config-vrrp-if)# address-family ipv4
RP/0/RP0/CPU0:router(config-vrrp-ipv4)# vrrp 1
RP/0/RP0/CPU0:router(config-vrrp-ipv4)# track object t1 2
RP/0/RP0/CPU0:router(config-vrrp-ipv4)#
```

**Related Commands**

vrrp

To enable Virtual Router Redundancy Protocol (VRRP) virtual router mode, use the vrrp command in address-family mode. To terminate VRRP virtual router mode, use the no form of this command.

```
vrrp  vrid version version-no
novrrp vrid version version-no
```

**Syntax Description**

- **vrid** (Optional) Virtual router identifier, which is the number identifying the virtual router for which status is displayed. The virtual router identifier is configured with the vrrp ipv4 command. Range is 1 to 255.
- **version version-no** The VRRP version number. Range is 2-3.

**Note** The version keyword is available only for the ipv4 address family. By default, version is set to 3 for IPv6 address families.

**Command Default**
None.

**Command Modes**
address-family

**Command History**

<table>

<td>read, write</td>
</tr>
</tbody>
</table>

**Example**
The following example shows how to enable VRRP virtual router mode:

```
RP/0/RP0/CPU0:router# config
RP/0/RP0/CPU0:router(config)# router vrrp
RP/0/RP0/CPU0:router(config-vrrp)# interface tenGigE 0/4/0/4
RP/0/RP0/CPU0:router(config-vrrp-if)# address-family ipv4
RP/0/RP0/CPU0:router(config-vrrp-address-family)# vrrp 3 version 2
RP/0/RP0/CPU0:router(config-vrrp-virtual-router)#
```
### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface (VRRP), on page 20</td>
<td>Enables VRRP interface configuration mode.</td>
</tr>
</tbody>
</table>
The VRRP router assumes ownership of the virtual IP Address in the master state by default. To disable this feature, use the `vrrp assume-assumption ownership disable` command in VRRP interface configuration mode. To restore the default setting (assumed ownership), use the `no` form of this command.

### Syntax Description

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>vrrp vrid assume-ownership disable</code></td>
<td>Virtual router identifier, which is the number identifying the virtual router for which virtual IP address ownership is being configured. The virtual router identifier is configured with the <code>vrrp ipv4</code> command. Range is 1 to 255.</td>
</tr>
<tr>
<td><code>no vrrp vrid assume-ownership disable</code></td>
<td>(Optional) Does not accept IP packets sent to the Virtual IP address.</td>
</tr>
</tbody>
</table>

### Command Default

The master router assumes ownership by default and accepts IP packets sent to the Virtual IP address.

### Command Modes

VRRP interface configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 2.0</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Release 4.1.0</td>
<td>This command has been deprecated. This command was replaced with the <code>accept-mode</code>, on page 3 command.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

By default, a router that is not the IP address owner, but is the master router for another IP address, accepts and responds to pings and accepts a Telnet to that router. Accepting packets sent to the other IP address is a useful tool during verification of network configuration. The `vrrp assume-ownership disable` command specifies that the router should not assume ownership of the virtual IP address if it is the master router regardless of whether it is the IP address owner, which means that it will not accept packets sent to that IP address during verification of network configuration. This command is ignored (irrelevant) when the router is the IP address owner (section 6.4.3 of RFC 2338, Virtual Router Redundancy Protocol).

<table>

### Examples

The following example shows how the configuration disables the `vrrp assume-ownership` command on 10-Gigabit Ethernet interface 0/3/0/0:

```
RP/0/RP0/CPU0:router(config)# router vrrp
RP/0/RP0/CPU0:router(config-vrrp)# interface TenGigE 0/3/0/0
RP/0/RP0/CPU0:router(config-vrrp-if)# vrrp 1 ipv4 10.0.0.101 secondary
RP/0/RP0/CPU0:router(config-vrrp-if)# vrrp 1 assume-ownership disable
```
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrrp ipv4, on page 45</td>
<td>Enables VRRP on an interface and specifies the IP address of</td>
</tr>
<tr>
<td></td>
<td>the virtual router.</td>
</tr>
</tbody>
</table>
vrrp bfd fast-detect

To enable bidirectional forwarding detection (BFD) fast detection on a VRRP interface, use the `vrrp bfd fast-detect` command in the interface configuration mode. This creates a BFD session between the Virtual Router Redundancy Protocol (VRRP) router and its peer, and if the session goes down while the VRRP is in the backup state, a VRRP failover is initiated. To disable BFD fast-detection, use the `no` form of this command.

```
vrrp vrid bfd fast-detect peer {ipv4 | ipv6} address
no vrrp vrid bfd fast-detect peer {ipv4 | ipv6} address
```

**Syntax Description**

- `vrid` Virtual Router Identifier.
- `peer` VRRP peer for BFD monitoring.
- `ipv4 address` IPv4 address of the BFD peer interface.
- `ipv6 address` IPv6 address of the BFD peer interface.

**Command Default**

BFD is disabled.

**Command Modes**

VRRP interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.9.0</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>4.1.0</td>
<td>The IPv6 keyword was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

BFD is supported only on systems with exactly two redundant VRRP routers.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrrp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to enable `bfd fast-detect` for an IPv4 address:

```
RP/0/RP0/CPU0:router# config
RP/0/RP0/CPU0:router(config)# router vrrp
RP/0/RP0/CPU0:router(config-vrrp)# interface gig 0/1/1/0
RP/0/RP0/CPU0:router(config-vrrp-if)# vrrp 1 bfd fast-detect peer ipv4 10.1.1.1
```

**Examples**

The following example shows how to enable `bfd fast-detect` for an IPv6 address:
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router vrrp
RP/0/RP0/CPU0:router(config-vrrp)# interface tenGigE 0/4/0/4
RP/0/RP0/CPU0:router(config-vrrp-if)# address-family ipv6
RP/0/RP0/CPU0:router(config-vrrp-address-family)# vrrp 3 version 3
RP/0/RP0/CPU0:router(config-vrrp-address-family)# bfd fast-detect peer ipv6
   fe80::211:bcff:fea5:28bb

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrrp bfd minimum-interval, on page 41</td>
<td>Configures the BFD minimum interval value for a given interface.</td>
</tr>
<tr>
<td>vrrp bfd multiplier, on page 42</td>
<td>Configures the BFD multiplier value for a given interface.</td>
</tr>
</tbody>
</table>
vrrp bfd minimum-interval

To configure the BFD minimum interval to be used for all VRRP BFD sessions on a given interface, use the `vrrp bfd minimum-interval` command in the interface configuration mode. To remove the configured minimum-interval period and set the minimum-interval period to the default period, use the `no` form of this command.

```
vrrp bfd minimum-interval interval
no vrrp bfd minimum-interval interval
```

**Syntax Description**

- `interval` Specify the minimum-interval in milliseconds. Range is 15 to 30000.

**Command Default**

Default minimum interval is 15 ms.

**Command Modes**

VRRP interface configuration

**Command History**

- **Release 3.9.0** This command was introduced.
- **Release 4.1.0** This command has been deprecated. This command was replaced with the `bfd minimum-interval (VRRP)`, on page 15 command.

**Usage Guidelines**

Minimum interval determines the frequency of sending BFD packets to BFD peers. It is the time between successive BFD packets sent for the session. Minimum interval is defined in milliseconds. The configured minimum interval applies to all BFD sessions on the interface.

**Task ID**

- **Task ID**
  - `vrrp` read, write

**Examples**

The following example shows how to configure a minimum interval of 100 milliseconds:

```
RP/0/RP0/CPU0:router(config)# router vrrp
RP/0/RP0/CPU0:router(config-vrrp)# interface gig 0/1/0
RP/0/RP0/CPU0:router(config-vrrp-if)# vrrp bfd minimum-interval 100
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrrp bfd fast-detect, on page 39</td>
<td>Enables BFD on a VRRP interface.</td>
</tr>
</tbody>
</table>
vrrp bfd multiplier

To set the BFD multiplier value, use the `vrrp bfd multiplier` command in the interface configuration mode. To remove the configured multiplier value and set the multiplier to the default value, use the `no` form of this command.

```
    vrrp bfd multiplier multiplier
    no vrrp bfd multiplier multiplier
```

**Syntax Description**

- `multiplier` Specifies the BFD multiplier value. Range is 2 to 50.

**Command Default**

Default value is 3.

**Command Modes**

VRRP interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.9.0</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Release 4.1.0</td>
<td>This command has been deprecated. This command was replaced with the <code>bfd multiplier (VRRP), on page 16</code> command.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The multiplier value specifies the number of consecutive BFD packets that, if not received as expected, cause a BFD session to go down. The BFD multiplier applies to all configured BFD sessions on the interface.

**Examples**

The following example shows how to configure a BFD multiplier with multiplier value of 10:

```
RP/0/RP0/CPU0:router(config)# router vrrp
RP/0/RP0/CPU0:router(config-vrrp)# interface gig 0/1/1/0
RP/0/RP0/CPU0:router(config-vrrp-if)# vrrp bfd multiplier 10
```

**Related Commands**

vrrp delay

To configure the activation delay for a VRRP router, use the vrrp delay command in HSRP interface configuration mode. To delete the activation delay, use the no form of this command.

vrrp delay minimum value reload value
no vrrp delay

Syntax Description

<table>
<thead>
<tr>
<th>Command Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>minimum value: 1</td>
</tr>
<tr>
<td>reload value: 5</td>
</tr>
</tbody>
</table>

Command Modes

VRRP interface configuration

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.4.0</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Release 3.6.0</td>
<td>The range was changed from 1 to 10000 to 0 to 10000.</td>
</tr>
<tr>
<td>Release 4.1.0</td>
<td>This command has been deprecated. This command was replaced with the delay (VRRP), on page 19 command.</td>
</tr>
</tbody>
</table>

Usage Guidelines

The vrrp delay command delays the start of the VRRP finite state machine (FSM) on an interface up event to ensure that the interface is ready to pass traffic. This ensures that there are no mistaken state changes due to loss of hello packets. The minimum delay is applied on all interface up events and the reload delay is applied on the first interface up event.

The values of zero must be explicitly configured to turn this feature off.

Task ID

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrrp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

Examples

The following example shows how to configure a minimum delay of 10 seconds with a reload delay of 100 seconds:

RP/0/RP0/CPU0:router(config)# router vrrp
RP/0/RP0/CPU0:router(config-vrrp)# interface mgmtEth 0/RP0/CPU0/0
RP/0/RP0/CPU0:router(config-vrrp-if)# vrrp delay minimum 10 reload 100
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show vrrp, on page 25</td>
<td>Displays a brief or detailed status of one or all Virtual Router Redundancy Protocol (VRRP) virtual routers.</td>
</tr>
</tbody>
</table>
vrrp ipv4

To enable the Virtual Router Redundancy Protocol (VRRP) on an interface and specify the IP address of the virtual router, use the **vrrp ipv4** command in VRRP interface configuration mode. To disable VRRP on the interface and remove the IP address of the virtual router, use the **no** form of this command.

```
vrrp vrid ipv4 ip-address [secondary]
no vrrp vrid ipv4 ip-address [secondary]
```

**Syntax Description**
- **vrid**: Virtual router identifier, which is the number identifying the virtual router. Range is 1 to 255.
- **ip-address**: IP address of the virtual router.
- **secondary**: (Optional) Indicates additional IP addresses supported by this group.

**Command Default**
VRRP is not configured on the interface.

**Command Modes**
VRRP interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>2.0</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>4.1.0</td>
<td>This command has been deprecated. This command was replaced with the <strong>address (VRRP)</strong>, on page 7 command.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Configure the **vrrp ipv4** command once without the **secondary** keyword to indicate the virtual router IP address. If you want to indicate additional IP addresses supported by the virtual router, include the **secondary** keyword.

Removing the VRRP configuration from the IP address owner and leaving the IP address of the interface active is considered a misconfiguration because this results in duplicate IP addresses on the LAN.

**Task ID**
- **vrrp**: read, write

**Examples**
The following example shows how to enable VRRP on 10-Gigabit Ethernet interface 0/3/0/0. The VRRP virtual router identifier is 1, and 10.0.1.20 is the IP address of the virtual router.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show vrrp, on page 25</td>
<td>Displays a brief or detailed status of one or all Virtual Router Redundancy Protocol (VRRP) virtual routers.</td>
</tr>
</tbody>
</table>
**vrrp preempt**

VRRP preempt is enabled by default. This means, a VRRP router with higher priority than the master VRRP router will take over as master router. To disable this feature, use the `preempt disable` command. To delay preemption, so that the higher priority router waits for a period of time before taking over, use the `preempt delay` command. To restore the default behavior (preempt enabled with no delay), use the `no` form of the command.

```
preempt {delay seconds|disable}
no preempt {delay seconds|disable}
```

**Syntax Description**

- `delay seconds` (Optional) Specifies the number of seconds the router delays before issuing an advertisement claiming virtual IP address ownership to be the master router. Range is 1 to 3600 seconds (1 hour).
- `disable` (Optional) Disables preemption.

**Command Default**

VRRP preempt is enabled.

`seconds : 0` (no delay)

**Command Modes**

VRRP virtual router

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 2.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Using the `delay` keyword, you can configure a delay, which causes the VRRP router to wait the specified number of seconds before issuing an advertisement claiming virtual IP address ownership to be the master router.

**Note**

The router that is the virtual IP address owner preempts, regardless of the setting of this command.

**Task ID**

```
<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrrp</td>
<td>read, write</td>
</tr>
</tbody>
</table>
```

**Examples**

The following example shows how to configure the router to preempt the current master router when its priority of 200 is higher than that of the current master router. If the router preempts the current master router, it waits 15 seconds before issuing an advertisement claiming that it is the master router.

```
RP/0/RP0/CPU0:router(config)# router vrrp
RP/0/RP0/CPU0:router(config-vrrp)# interface TenGigE 0/3/0/0
RP/0/RP0/CPU0:router(config-vrrp-if)# address-family ipv4
```
RP/0/RP0/CPU0:router(config-vrrp-address-family)# vrrp 1 version 3
RP/0/RP0/CPU0:router(config-vrrp-virtual-router)# preempt delay 15
RP/0/RP0/CPU0:router(config-vrrp-virtual-router)# priority 200

<table>
<thead>

</tbody>
</table>
vrrp priority

To set the priority of the virtual router, use the **priority** command in VRRP virtual router submode. To remove the priority of the virtual router, use the **no** form of this command.

```
priority priority
nopriority priority
```

**Syntax Description**

- `priority` Priority of the virtual router. Range is 1 to 254.

**Command Default**

- `priority`: 100

**Command Modes**

VRRP virtual router

**Command History**

- **Release Modification**
  - Release 2.0  This command was introduced.

**Usage Guidelines**

Use this command to control which router becomes the master router. This command is ignored while the router is the virtual IP address owner.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrrp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to configure the router with a priority of 254:

```
RP/0/RP0/CPU0:router(config)# router vrrp
RP/0/RP0/CPU0:router(config-vrrp)# interface TenGigE 0/3/0/0
RP/0/RP0/CPU0:router(config-vrrp-if)# address-family ipv4
RP/0/RP0/CPU0:router(config-vrrp-address-family)# vrrp 1 version 3
RP/0/RP0/CPU0:router(config-vrrp-virtual router)# priority 254
```

**Related Commands**

<table>

</tbody>
</table>
vrrp text-authentication

To configure the simple text authentication used for Virtual Router Redundancy Protocol (VRRP) packets received from other routers running VRRP, use the **text-authentication** command in VRRP virtual router submode. To disable VRRP authentication, use the no form of this command.

```
text-authentication string
no text-authentication [string]
```

**Syntax Description**

| string | Authentication string (up to eight alphanumeric characters) used to validate incoming VRRP packets. |

**Command Default**

No authentication of VRRP messages occurs.

**Command Modes**

VRRP virtual router

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 2.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When a VRRP packet arrives from another router in the VRRP group, its authentication string is compared to the string configured on the local system. If the strings match, the message is accepted. If they do not match, the packet is discarded.

All routers within the group must be configured with the same authentication string.

---

**Note**

Plain text authentication is not meant to be used for security. It simply provides a way to prevent a misconfigured router from participating in VRRP.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrrp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to configure an authentication string of x30dn78k:

```
RP/0/RP0/CPU0:router(config)# router vrrp
RP/0/RP0/CPU0:router(config-vrrp)# interface TenGigE 0/3/0/0
RP/0/RP0/CPU0:router(config-vrrp-if)# address-family ipv4
RP/0/RP0/CPU0:router(config-vrrp-address-family)# vrrp 1 version 2
RP/0/RP0/CPU0:router(config-vrrp-virtual-router)# text-authentication x30dn78k
```

---

**Note**

Text authentication is only valid for VRRP version 2 routers.
vrrp timer

To configure the interval between successive advertisements by the master router in a Virtual Router Redundancy Protocol (VRRP) virtual router, use the `timer` command in VRRP virtual router submode. To restore the default value, use the `no` form of this command.

```
timer |msec| interval |force|
no timer |msec| interval |force|
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>msec</code></td>
<td>(Optional) Changes the unit of the advertisement time from seconds to milliseconds. Without this keyword, the advertisement interval is in seconds. Range is 20 to 3000 milliseconds.</td>
</tr>
<tr>
<td><code>interval</code></td>
<td>Time interval between successive advertisements by the master router. The unit of the interval is in seconds, unless the <code>msec</code> keyword is specified. Range is 1 to 255 seconds.</td>
</tr>
<tr>
<td><code>force</code></td>
<td>(Optional) Forces the configured value to be used. This keyword is required if milliseconds is specified.</td>
</tr>
</tbody>
</table>

**Command Default**

`interval: 1 second`

**Command Modes**

VRRP virtual router

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 2.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrrp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to configure the master router to send advertisements every 4 seconds:

```
RP/0/RP0/CPU0:router(config)# router vrrp
RP/0/RP0/CPU0:router(config-vrrp)# interface TenGigE 0/3/0/0
RP/0/RP0/CPU0:router(config-vrrp-if)# address-family ipv4
RP/0/RP0/CPU0:router(config-vrrp-address-family)# vrrp 1 version 3
RP/0/RP0/CPU0:router(config-vrrp-virtual-router)# timer 4
```
vrrp track interface

To configure the Virtual Router Redundancy Protocol (VRRP) to track an interface, use the `track interface` command in VRRP virtual router submode. To disable the tracking, use the `no` form of this command.

```
track interface type interface-path-id [priority-decrement]
no track interface type interface-path-id [priority-decrement]
```

**Syntax Description**

- `vrid` Virtual router identifier, which is the number identifying the virtual router to which tracking applies.
- `type` Interface type. For more information, use the question mark (?) online help function.
- `interface-path-id` Physical interface or virtual interface.
  
**Note** Use the `show interfaces` command to see a list of all interfaces currently configured on the router.

For more information about the syntax for the router, use the question mark (?) online help function.

- `priority-decrement` (Optional) Amount by which the priority for the router is decremented (or incremented) when the tracked interface goes down (or comes back up). Decrements can be set to any value between 1 and 254. Default value is 10.

**Command Default**

The default decrement value is 10. Range is 1 to 254.

**Command Modes**

VRRP virtual router

**Command History**

- **Release 2.0** This command was introduced.

**Usage Guidelines**

The `vrrp track interface` command ties the priority of the router to the availability of its interfaces. It is useful for tracking interfaces that are not configured for VRRP. Only IP interfaces are tracked. A tracked interface is up if IP on that interface is up. Otherwise, the tracked interface is down.

You can configure VRRP to track an interface that can alter the priority level of a virtual router for a VRRP virtual router. When the IP protocol state of an interface goes down or the interface has been removed from the router, the priority of the backup virtual router is decremented by the value specified in the `priority-decrement` argument. When the IP protocol state on the interface returns to the up state, the priority is restored.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrrp</td>
<td>read, write</td>
</tr>
</tbody>
</table>
In the following example, 10-Gigabit Ethernet interface 0/3/0/0 tracks interface 0/3/0/3 and 0/3/0/2. If one or both of these two interfaces go down, the priority of the router decreases by 10 (default priority decrement) for each interface. The default priority decrement is changed using the priority-decrement argument. In this example, because the default priority of the virtual router is 100, the priority becomes 90 when one of the tracked interfaces goes down and the priority becomes 80 when both go down. See the priority command for details on setting the priority of the virtual router.

RP/0/RP0/CPU0:router(config)# router vrrp
RP/0/RP0/CPU0:router(config-vrrp)# interface TenGigE 0/3/0/0
RP/0/RP0/CPU0:router(config-vrrp-if)# address-family ipv4
RP/0/RP0/CPU0:router(config-vrrp-address-family)# vrrp 1 version 3
RP/0/RP0/CPU0:router(config-vrrp-virtual-router)# track interface TenGigE 0/3/0/3
RP/0/RP0/CPU0:router(config-vrrp-virtual-router)# track interface TenGigE 0/3/0/2
