Resource Summary for NAT

The attribute “pat” (port address translation) in the REST API is equivalent to the Cisco IOS NAT term “overload”.

Static NAT Rule Resource

A static NAT resource models static address translation where there is a one-to-one mapping between local and global IP addresses.
There are three types of one-to-one mapping NAT: static NAT, port static NAT, and network static NAT.

**History**

<table>
<thead>
<tr>
<th>Release</th>

<td>Introduced for ASR1001-X and ASR1002-X platforms</td>
</tr>
</tbody>
</table>

**Properties**

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>kind</td>
<td>string</td>
<td>Object type. Always “nat-static-rule”</td>
</tr>
<tr>
<td>nat-rule-id</td>
<td>string</td>
<td>Unique NAT rule id</td>
</tr>
</tbody>
</table>
| mode              | string     | Indicates the source/destination IP field and the direction of traffic to apply NAT to. Allowed values are: “inside-source” and “outside-source”.  

- “inside-source” refers to translating the source IP address for packets that enter the router from the inside interface, or to translating the destination address for packets that enter the router from the outside interface.

- “outside-source” refers to translating the source IP address for packets that enter the router through the outside interface, or to translating the destination IP address of packets that enter the router from the inside interface.

“mode” is optional for ip-network-mapping as the mode can only be “inside-source”.
