

Enabling PPPoE Relay Discovery and Service Selection Functionality

The PPPoE Relay feature enables an L2TP access concentrator (LAC) to relay active discovery and service selection functionality for PPP over Ethernet (PPPoE), over a Layer 2 Tunneling Protocol (L2TP) control channel, to an L2TP network server (LNS) or tunnel switch (multihop node). The relay functionality of this feature allows the LNS or tunnel switch to advertise the services it offers to the client, thereby providing end-to-end control of services between the LNS and a PPPoE client.

Prerequisites for Enabling PPPoE Relay Discovery and Service Selection Functionality

- You must understand the concepts described in the "Preparing for Broadband Access Aggregation" module.
- PPPoE sessions must be established using the procedures in the "Providing Protocol Support for Broadband Access Aggregation of PPPoE Sessions" module.
- This document assumes you understand how to configure a virtual private dialup network (VPDN) tunnel and a tunnel switch.

Information About Enabling PPPoE Relay Discovery and Service Selection Functionality

L2TP Active Discovery Relay for PPPoE

The PPPoE protocol described in RFC 2516 defines a method for active discovery and service selection of devices in the network by an LAC. A PPPoE client uses these methods to discover an access concentrator in the network, and the access concentrator uses these methods to advertise the services it offers.

The PPPoE Relay feature allows the active discovery and service selection functionality to be offered by the LNS, rather than just by the LAC. The PPPoE Relay feature implements the Network Working Group Internet-Draft titled *L2TP Active Discovery Relay for PPPoE*. The Internet-Draft describes how to relay PPPoE Active Discovery (PAD) and Service Relay Request (SRRQ) messages over an L2TP control channel (the tunnel).

The key benefit of the PPPoE Relay feature is end-to-end control of services between the LNS and a PPPoE client.

Note When the L2TP sessions are created, the traffic does not flow without the appxk9 and ipbasek9 licenses.

How to Enable PPPoE Relay Discovery and Service Selection Functionality

Configuring the LAC and Tunnel Switch for PPPoE Relay

Perform this task to configure the LAC and tunnel switch for PPPoE Relay, which configures a subscriber profile that directs PAD messages to be relayed on an L2TP tunnel. The subscriber profile also will contain an authorization key for the outgoing L2TP tunnel.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **subscriber profile** *profile-name*
4. **service relay pppoe vpdn group** *vpdn-group-name*
5. **exit**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.

	Command or Action	Purpose
	Example: <pre>Router> enable</pre>	<ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: <pre>Router# configure terminal</pre>	Enters global configuration mode.
Step 3	subscriber profile <i>profile-name</i> Example: <pre>Router(config)# subscriber profile profile-1</pre>	Configures the subscriber profile name and enters subscriber profile configuration mode. <ul style="list-style-type: none"> <i>profile-name</i> --Is referenced from a PPPoE profile configured by the bba-group ppoe global configuration command, so that all the PPPoE sessions using the PPPoE profile defined by the bba-group ppoe command will be treated according to the defined subscriber profile.
Step 4	service relay ppoe vpdn group <i>vpdn-group-name</i> Example: <pre>Router(config-sss-profile)# service relay ppoe vpdn group Group-A</pre>	Provides PPPoE relay service using a VPDN L2TP tunnel for the relay. The VPDN group name specified is used to obtain outgoing L2TP tunnel information. <ul style="list-style-type: none"> See the What to Do Next, on page 3 section for the equivalent RADIUS profile entry.
Step 5	exit Example: <pre>Router(config-sss-profile)# exit</pre>	(Optional) Ends the configuration session and returns to privileged EXEC mode.

What to Do Next

Configure the LNS side of the configuration by performing the tasks described in the next section.

Configuring the LNS (or Multihop Node) to Respond to Relayed PAD Messages

On the router that responds to relayed PAD messages, perform this task to configure a PPPoE group and attach it to a VPDN group that accepts dial-in calls for L2TP. The relayed PAD messages will be passed from the VPDN L2TP tunnel and session to the PPPoE broadband group for receiving the PAD responses.

SUMMARY STEPS

- enable**
- configure terminal**
- vpdn-group *vpdn-group-name***
- accept-dialin**
- protocol l2tp**

Configuring the LNS (or Multihop Node) to Respond to Relayed PAD Messages

6. **virtual-template** *template-number*
7. **exit**
8. **terminate-from hostname** *host-name*
9. **relay pppoe bba-group** *pppoe-bba-group-name*
10. **exit**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 3	vpdn-group <i>vpdn-group-name</i> Example: Router (config)# vpdn-group Group-A	Creates a VPDN group and enters VPDN group configuration mode.
Step 4	accept-dialin Example: Router (config-vpdn)# accept-dialin	Configures the LNS to accept tunneled PPP connections from an LAC and creates an accept-dialin VPDN subgroup.
Step 5	protocol l2tp Example: Router (config-vpdn-req-in)# protocol l2tp	Specifies the L2TP tunneling protocol.
Step 6	virtual-template <i>template-number</i> Example: Router (config-vpdn-req-in)# virtual-template 2	Specifies which virtual template will be used to clone virtual access interfaces.
Step 7	exit Example: Router (config-vpdn-req-in)# exit	Exits to VPDN group configuration mode.
Step 8	terminate-from hostname <i>host-name</i> Example: Router (config-vpdn)# terminate-from hostname LAC-1	Specifies the LAC hostname that will be required when the VPDN tunnel is accepted.

	Command or Action	Purpose
Step 9	relay pppoe bba-group <i>pppoe-bba-group-name</i> Example: <pre>Router(config-vpdn)# relay pppoe bba-group group-2</pre>	Specifies the PPPoE BBA group that will respond to the PAD messages. <ul style="list-style-type: none"> The PPPoE BBA group name is defined with the bba-group pppoe <i>group-name</i> global configuration command.
Step 10	exit Example: <pre>Router(config-vpdn)# exit</pre>	Exits to global configuration mode.

Monitoring PPPoE Relay

Perform this task to monitor PPPoE Relay.

SUMMARY STEPS

1. **enable**
2. **show pppoe session**
3. **show pppoe relay context all**
4. **clear pppoe relay context**

DETAILED STEPS

Step 1 enable

Enables privileged EXEC mode.

- Enter your password if prompted.

Example:

```
Router> enable
```

Step 2 show pppoe session

Displays information about currently active PPPoE sessions.

Example:

```
Router# show pppoe session
 1 session in FORWARDED (FWDED) State
 1 session total
Uniq ID  PPPoE  RemMAC          Port          VT  VA          State
      SID  LocMAC
    26    19  0001.96da.a2c0  Et0/0.1      5  N/A  RELFWD
      000c.8670.1006  VLAN:3434
```

Step 3 show pppoe relay context all

Displays the PPPoE relay context created for relaying PAD messages.

Example:

```
Router# show pppoe relay context all
Total PPPoE relay contexts 1
UID      ID      Subscriber-profile      State
25       18      cisco.com               RELAYED
```

Example:

Step 4 **clear pppoe relay context**

This command clears the PPPoE relay context created for relaying PAD messages.

Example:

```
Router(config)# clear pppoe relay context
```

Troubleshooting Tips

Use the following commands in privileged EXEC mode to help you troubleshoot the PPPoE Relay feature:

- **debug ppp forwarding**
- **debug ppp negotiation**
- **debug pppoe events**
- **debug pppoe packets**
- **debug vpdn l2x-events**
- **debug vpdn l2x-packets**

Configuration Examples for Enabling PPPoE Relay Discovery and Service Selection Functionality

PPPoE Relay on LAC Configuration Example

The following is an example of a standard LAC configuration with the commands to enable PPPoE relay added:

```
hostname User2
!
username User1 password 0 field
username User2 password 0 field
username user-group password 0 field
username User5 password 0 field
username User2-lac-domain password 0 field
username User1-client-domain@cisco.net password 0 field
```

```

username User3-lns-domain password 0 field
!
ip domain-name cisco.com
!
vpdn enable
vpdn source-ip 10.0.195.151
!

Tunnel Switch (or Multihop Node) Configured to Respond to PAD Messages Example

The following is an example of a standard tunnel switch configuration with the commands to enable response to PPPoE relay messages added:

```

hostname User3
!
!
username User1 password 0 room1
username User2 password 0 room1
username User3 password 0 room1
username User1@domain.net password 0 room1
username User3-lns-dnis password 0 cisco
username User3-lns-domain password 0 room1
username User2-lac-dnis password 0 cisco
username User2-lac-domain password 0 room1
username User5 password 0 room1
username User5-mh password 0 room1
username user-group password 0 room1
username User3-dialout password 0 cisco
username User2-dialout password 0 cisco
username abc password 0 cisco
username dial-7206a password 0 room1
username msgbpgroup password 0 cisco
username User1-client-domain@cisco.net password 0 room1
username User4-lns-domain password 0 room1
!
ip domain-name cisco.com
!
vpdn enable
!
vpdn-group User3-mh
  accept-dialin
  protocol l2tp
  virtual-template 1
  terminate-from hostname User5-mh
  relay pppoe bba-group group-1
!
interface Loopback0
  ip address 10.4.4.2 255.255.255.0
!
interface Loopback1
  ip address 10.3.2.2 255.255.255.0
!
interface Ethernet2/0
  ip address 10.0.195.143 255.255.0.0
  half-duplex
  no cdp enable
!
interface Virtual-Template1
  mtu 1492
  ip unnumbered Loopback0
  no keepalive
  ppp mtu adaptive
  ppp authentication chap

```

```

    ppp chap hostname User3-lns-domain
    !
ip default-gateway 10.0.195.1
ip route 0.0.0.0 0.0.0.0 10.0.195.1
!
!
bba-group pppoe group-1
virtual-template 1
!

```

Tunnel Switch Configured to Relay PAD Messages Example

The following partial example shows a configuration that allows the tunnel switch to relay PAD messages:

```

subscriber profile profile-1
! Configure profile for PPPoE Relay
  service relay pppoe vpdn group Example1.net
.
.
.
vpdn-group Example2.net
! Configure L2TP tunnel for PPPoE Relay
  accept-dialin
  protocol l2tp
.
.
.
  terminate-from host Host1
  relay pppoe bba-group group-1
.
.
.
vpdn-group Example1.net
! Configure L2TP tunnel for PPPoE Relay
  request-dialin
  protocol l2tp
.
.
.
  initiate-to ip 10.17.1.3
.
.
.
! PPPoE-group configured for relay
bba-group pppoe group-1
.
.
.
service profile profile-1

```

RADIUS Subscriber Profile Entry for the LAC Example

The following example shows how to enter Subscriber Service Switch subscriber service attributes in a AAA RADIUS server profile.

```

profile-1 = profile-name.
.
.

```

```
Cisco:Cisco-Avpair = "sss:sss-service=relay-pppoe"
```

The following is an example of a typical RADIUS subscriber profile entry for an LAC:

```
cisco.com Password = "password"
Cisco:Cisco-Avpair = "sss:sss-service=relay-pppoe",
Tunnel-Type = L2TP,
Tunnel-Server-Endpoint = . . . . .,
Tunnel-Client-Auth-ID = "client-id",
Tunnel-Server-Auth-ID = "server-id",
Cisco:Cisco-Avpair = "vpdn:l2tp-tunnel-password=password",
Cisco:Cisco-Avpair = "vpdn:l2tp-nosession-timeout=never",
Tunnel-Assignment-Id = assignment-id
```

RADIUS VPDN Group User Profile Entry for the LNS Example

The following example shows how to enter the VPDN group attributes in a AAA RADIUS server profile.

```
profile-1 = profile-name.
.
.
Cisco:Cisco-Avpair = "vpdn:relay-pppoe-bba-group=group-name"
```

The following is an example of a typical RADIUS subscriber profile entry for an LNS:

```
cisco.com Password = "password"
Tunnel-Type = L2TP,
Tunnel-Server-Endpoint = . . . . .,
Tunnel-Client-Auth-ID = "client-id",
Tunnel-Server-Auth-ID = "server-id",
Cisco:Cisco-Avpair = "vpdn:l2tp-tunnel-password=password",
Cisco:Cisco-Avpair = "vpdn:l2tp-nosession-timeout=never",
Cisco:Cisco-Avpair = "vpdn:relay-pppoe-bba-group=group-name"
Tunnel-Assignment-Id = assignment-id
```

Feature Information for Enabling PPPoE Relay Discovery and Service Selection Functionality

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 1: Feature Information for Enabling PPPoE Relay Discovery and Service Selection Functionality

Feature Name	Releases	Feature Configuration Information
PPPoE Relay	Cisco IOS XE Release 2.1	The PPPoE Relay feature enables an L2TP access concentrator (LAC) to relay active discovery and service selection functionality for PPP over Ethernet (PPPoE), over a Layer 2 Tunneling Protocol (L2TP) control channel, to an L2TP network server (LNS) or tunnel switch (multihop node). This feature was integrated into Cisco IOS XE Release 2.1.
PPPoE Service Selection	Cisco IOS XE Release 2.4	This feature was integrated into Cisco IOS XE Release 2.4.
