

RAR PPPoE IPv6 Multicast

From Cisco IOS XE 17.11.1a, IPv6 multicast configuration is available for PPPoE-based RAR sessions.

- [Prerequisites, on page 1](#)
- [Configuring VMI interface and Enabling Multicast Support, on page 1](#)
- [Configuring IPv6 PIM Bootstrap Router \(BSR\), on page 2](#)
- [Configuring IPv6 Multicast Group, on page 3](#)
- [Verifying BSR Election, on page 4](#)
- [Verifying IPv6 Multicast Configuration , on page 4](#)
- [Sample Running Configuration, on page 5](#)
- [Debug Commands, on page 9](#)

Prerequisites

For IPv6 multicast over PPPoE to function properly, the following must be configured:

- PPPoE (Virtual-template, VMI and physical interface)
- IPv6 unicast and multicast routing
- IPv6 PIM BSR
- IPv6 MLD

Configuring VMI interface and Enabling Multicast Support

Used in router-to-radio communications, the Virtual Multipoint Interface (VMI) interface provides services that map outgoing packets to the appropriate Point-to-Point Protocol over Ethernet (PPPoE) sessions based on the next-hop forwarding address for that packet. The VMI interface also provides a broadcast service that emulates a set of point-to-point connections as a point-to-multipoint interface with broadcast ability. When a packet with a multicast address is forwarded through the VMI interface, VMI replicates the packet and unicasts it to each of its neighbors.

Note VMI will map outgoing packets to the appropriate PPPoE sessions. It will use the next-hop forwarding address from each outgoing packet to perform this mapping.

Note VMI is required to have IP addresses assigned for VMI to work even though it will be shown as down/down while in bypass mode. The IPv4 address configured will not be advertised or used. Instead, the IPv4 address on the virtual-template will be used.

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 2	interface vmi <i>number</i> Example: Router(config)# interface vmi 1	Creates a VMI and enters interface configuration mode.
Step 3	ipv6 enable Example: Router(config-if)# ipv6 enable	Enable IPv6 support under VMI interface. OSPFv3 IPv4 needs to have IPv6 support enabled on the interface level.
Step 4	ip address <i>address mask</i> Example: Router(config-if)# ip address 71.0.0.1 255.255.255.0	Configures IPv4 address under VMI interface.
Step 5	ipv6 address <i>address/prefix</i> Example: Router(config-if)# ipv6 address 71::71/64	Configures IPv6 address under VMI interface.
Step 6	physical-interface <i>interface</i> Example: Router(config-if)# physical-interface gigabitEthernet {0/0/0 or 0/0/1 or 0/0/0.1}	Binds the physical interface (the interface connected to the radio client) to the VMI interface, for packet flow.
Step 7	mode <i>name</i> Example: Router(config-if)# mode bypass	Do not aggregate Virtual Access Interfaces under VMI. (Must be configured as bypass).

Configuring IPv6 PIM Bootstrap Router (BSR)

The bootstrap router (BSR) protocol for PIM-SM provides a dynamic, adaptive mechanism to distribute group-to-RP mapping information rapidly throughout a domain. With the IPv6 BSR feature, if an RP becomes

unreachable, it will be detected and the mapping tables will be modified so that the unreachable RP is no longer used, and the new tables will be rapidly distributed throughout the domain.

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 2	ipv6 pim bsr candidate bsr <i>loopback_ipv6_address</i> Example: Router(config)# ipv6 pim bsr candidate bsr 11::11	Configures a device to be a candidate BSR. Note Must use the loopback ipv6 address configured earlier.
Step 3	ipv6 pim bsr candidate rp <i>loopback_ipv6_address</i> Example: Router(config-router)# ipv6 pim bsr candidate rp 11::11	Configures a device to be a candidate Rendezvous Point (RP). Note Must use the loopback ipv6 address configured earlier.

Configuring IPv6 Multicast Group

An IPv6 multicast group is an arbitrary group of receivers that want to receive a particular data stream. This group has no physical or geographical boundaries--receivers can be located anywhere on the Internet or in any private network.

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 2	interface <i>interface_name</i> Example: Router# interface Vlan 10	Creates and enters interface configuration mode.
Step 3	ipv6 mld join-group <i>multicast_group_address</i> Example: Router(config-if)# ipv6 mld join-group FF06:6::1	Configure IPv6 mld join group under interface.

Verifying BSR Election

This section shows examples of command output to verify your setup.

```
Router-1#show ipv6 pim bsr election
PIMv2 BSR information

BSR Election Information
  Scope Range List: ff00::/8
  This system is the Bootstrap Router (BSR)
    BSR Address: 61::61
    Uptime: 00:05:20, BSR Priority: 0, Hash mask length: 126
    RPF: FE80::7E31:EFF:FE85:1E78,Loopback0
    BS Timer: 00:00:41
  This system is candidate BSR
    Candidate BSR address: 61::61, priority: 0, hash mask length: 126
Router-1#

Router-2#show ipv6 pim bsr election
PIMv2 BSR information

BSR Election Information
  Scope Range List: ff00::/8
    BSR Address: 61::61
    Uptime: 00:01:22, BSR Priority: 0, Hash mask length: 126
    RPF: FE80::7E31:EFF:FE85:1E78,Virtual-Access1.1
    BS Timer: 00:01:47
  This system is candidate BSR
    Candidate BSR address: 41::41, priority: 0, hash mask length: 126
Router-2#
```

Verifying IPv6 Multicast Configuration

This section shows examples of IPv6 multicast configuration.

Note “*” in the source address indicates MLD join request entry.

```
Router-1#show ipv6 mroute
Multicast Routing Table
Flags: D - Dense, S - Sparse, B - Bidir Group, s - SSM Group,
       C - Connected, L - Local, I - Received Source Specific Host Report,
       P - Pruned, R - RP-bit set, F - Register flag, T - SPT-bit set,

Debug Commands

This section shows debug commands for PPPoE, VMI, Virtual Template, and Subscriber Service.

PPPoE

Command or Action	Purpose
Router# debug pppoe data	PPPoE data packets
Router# debug pppoe errors	PPPoE protocol errors
Router# debug pppoe events	PPPoE protocol events
Router# debug pppoe packets	PPPoE control packets

VMI

Command or Action	Purpose
Router# debug vmi bma	Display VMI bma debug
Router# debug vmi error	Display internal VMI anomalies detected
Router# debug vmi multicast	Display VMI multicast packets
Router# debug vmi neighbor	Display VMI neighbor transaction debugging
Router# debug vmi packet	Display VMI packet trace
Router# debug vmi pppoe	Display VMI PPPoE packet/activity debug
Router# debug vmi registries	Display VMI registry calls

Virtual Template

Command or Action	Purpose
Router# debug vtemplate cloning	Virtual Template cloning information
Router# debug vtemplate error	Virtual Template errors
Router# debug vtemplate event	Virtual Template events
Router# debug vtemplate subinterface	Virtual Template subinterface command

Subscriber Service

Command or Action	Purpose
Router# debug sss errors	Subscriber Service Switch Manager errors
Router# debug ssss event	Subscriber Service Switch Manager events
