

Dynamic PCC

The Stateful Path Computation Element Protocol (PCEP) enables a router to report and optionally delegate Label Switched Paths (LSPs) which is established using either Resource Reservation Protocol (RSVP) protocol or Segment Routing Traffic Engineering (SR-TE) to a stateful Path Computation Element (PCE).

An LSP delegated to a PCE can be updated by the PCE and a stateful PCE can compute and provide the path of an LSP to the Path Computation Client (PCC).

SR-TE and RSVP-TE LSPs require link-state routing protocols such as OSPF or ISIS to distribute and learn traffic engineering topology. A stateful PCE can learn the traffic engineering topology through BGP Link-State protocol. You can use the verbatim path option in the case when all or some of the intermediate nodes in a network do not support IGP extensions for TE.

Information About Dynamic PCC

Path Computation Element Protocol Functions

A Path Computation Element Protocol (PCEP) session is a TCP session between a PCC and a PCE with protocol messages. The PCEP functions are verified based on the PCC functions. The configuration and verification show that the request is accepted and path computation is provided based on PCReq message from the client. The passive reporting enables a router to report a tunnel instead of delegating it to a PCE. The PCE is aware of the tunnel even though it cannot modify the tunnel.

PCEP functions are useful when a network has both router-controlled and PCE delegated tunnels. The PCE is aware of both the tunnels and can make an accurate decision on path computation.

Redundant Path Computation Elements

For redundancy it may be required to deploy redundant PCE servers. A PCC uses precedence to select stateful PCEs for delegating LSPs. Precedence can take any value between 0 and 255. The default precedence value is 255. When there are multiple stateful PCEs with active PCEP session, PCC chooses the PCE with the lowest

precedence value. In case where primary PCE server session goes down, PCC router re-delegates all tunnels to next available PCE server. You can use the following CLIs in the case of redundant PCEs:

```
R2(config)#mpls traffic-eng pcc peer 10.77.77.77 source 10.22.22.22 precedence 255
R2(config)#mpls traffic-eng pcc peer 10.88.88.88 source 10.22.22.22 precedence 100
!
end
```

In the above example PCE server with IP address 10.88.88.88 is the primary PCE server since it has lower precedence value.

How to Configure Dynamic PCC

Configuring Dynamic PCC Globally

Perform the following task to configure dynamic PCC globally

```
enable
configure terminal
mpls traffic-eng tunnels
mpls traffic-eng pcc peer 10.0.0.1 ----(10.0.0.1 is the PCE server address)
mpls traffic-eng pcc report-all
end
```

Note **`mpls traffic-eng pcc report-all`** is not mandatory for PCE/PCC basic operational delegated tunnels. It is required to report locally calculated LSPs to the PCE server.

Configuring Dynamic PCC on an Interface

Perform the following task to configure dynamic PCC on an interface

```
interface Tunnel1
ip unnumbered Loopback0
tunnel mode mpls traffic-eng
tunnel destination 10.7.7.7
tunnel mpls traffic-eng autoroute announce
tunnel mpls traffic-eng priority 5 5
tunnel mpls traffic-eng bandwidth 200
tunnel mpls traffic-eng path-option 10 dynamic pce segment-routing
end
```

Configuring Dynamic PCC With Verbatim Path Option

To enable Dynamic PCC with verbatim path option, use the following CLI under the SR-TE tunnel interface:

```
R1#
interface Tunnel2
ip unnumbered Loopback11
```

```
tunnel mode mpls traffic-eng
tunnel destination 10.66.66.66
tunnel mpls traffic-eng autoroute destination
tunnel mpls traffic-eng path-option 1 dynamic segment-routing pce verbatim
```

Verifying Dynamic PCC

The following sample output is from the **show pce client peer detail** command.

```
Device# show pce client peer detail

PCC's peer database:
-----

Peer address: 10.1.1.1
  State up
  Capabilities: Stateful, Update, Segment-Routing
  PCEP has been up for: 23:44:58
  PCEP session ID: local 1, remote: 0
  Sending KA every 30 seconds
  Minimum acceptable KA interval: 20 seconds
  Peer timeout after 120 seconds
  Statistics:
    Keepalive messages: rx      2798 tx      2112
    Request messages:   rx         0 tx        32
    Reply messages:    rx       32 tx         0
    Error messages:    rx         0 tx         0
    Open messages:     rx         1 tx         1
    Report messages:   rx         0 tx        57
    Update messages:   rx       72 tx         0
```

The following sample output is from the **show mpls traffic-eng tunnels tunnel 1** command which shows the LSP details.

```
Device# show mpls traffic-eng tunnels tunnel 1

Name: dl_t1                               (Tunnell) Destination: 10.7.7.7
Status:
  Admin: up          Oper: up          Path: valid          Signalling: connected

Verifying Verbatim Path Option With Dynamic PCC

To verify proper operation with verbatim path option, use the following command:

```

R1#sh mpls tr tun tun 2
Name: R1_t2 (Tunnel2) Destination: 10.66.66.66
Status:
  Admin: up      Oper: up      Path: valid      Signalling: connected
  path option 1, (SEGMENT-ROUTING) (PCE) type dynamic (verbatim) (Basis for Setup)

Config Parameters:
  Bandwidth: 0      kbps (Global)  Priority: 7 7  Affinity: 0x0/0xFFFF
  Metric Type: TE (interface)
  Path Selection:
    Protection: any (default)
  Path-selection Tiebreaker:
    Global: not set  Tunnel Specific: not set  Effective: min-fill (default)
  Hop Limit: disabled [ignore: Verbatim Path Option]
  Cost Limit: disabled
  Path-invalidation timeout: 10000 msec (default), Action: Tear
  AutoRoute: disabled LockDown: disabled Loadshare: 0 [0] bw-based
  AutoRoute destination: enabled
  auto-bw: disabled
  Fault-OAM: disabled, Wrap-Protection: disabled, Wrap-Capable: No
Active Path Option Parameters:
  State: dynamic path option 1 is active
  BandwidthOverride: disabled LockDown: disabled Verbatim: enabled

PCEP Info:
  Delegation state: Working: yes  Protect: no
  Delegation peer: 10.77.77.77
Working Path Info:
  Request status: processed
  Created via PCRep message from PCE server: 10.77.77.77
  PCE metric: 4, type: TE
Reported paths:
  Tunnel Name: Tunnel2_w

end

```

Feature Information for Dynamic PCC

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 1: Feature Information for Dynamic PCC

Feature Name	Releases	Feature Information
Dynamic PCC	Cisco IOS XE Amsterdam 17.3.2	<p>The Dynamic Path Computation Client (PCC) feature supports an LSP delegated to a Path Computation Element (PCE). Dynamic PCC supports both RSVP-TE and SR-TE.</p> <p>The following commands were added or modified:</p> <p>show pce client peer detail, show mpls traffic-eng tunnels tunnel 1, show pce client lsp detail, show pce lsp detail.</p>
