

OSPF Support for Forwarding Adjacencies over MPLS TE Tunnels

The OSPF Support for Forwarding Adjacencies over MPLS Traffic Engineered Tunnels feature adds Open Shortest Path First (OSPF) support to the Multiprotocol Label Switching (MPLS) Traffic Engineering (TE) Forwarding Adjacency feature, which allows a network administrator to handle a traffic engineering, label-switched path (LSP) tunnel as a link in an Interior Gateway Protocol (IGP) network based on the shortest path first (SPF) algorithm. An OSPF forwarding adjacency can be created between routers in the same area.

History for the OSPF Support for Forwarding Adjacencies over MPLS Traffic Engineered Tunnels Feature

- [Information About OSPF Forwarding Adjacency, on page 1](#)
- [How to Configure OSPF Forwarding Adjacency, on page 2](#)
- [Configuration Examples for OSPF Forwarding Adjacency, on page 4](#)
- [Additional References, on page 6](#)

Prerequisites for OSPF Forwarding Adjacency

- OSPF must be configured in your network.
- Cisco Express Forwarding (CEF) must be enabled.
- You should understand MPLS TE tunnels for forwarding adjacency as described in the "MPLS Traffic Engineering Forwarding Adjacency" module.

Information About OSPF Forwarding Adjacency

OSPF includes MPLS TE tunnels in the OSPF link-state database in the same way that other links appear for purposes of routing and forwarding traffic. When an MPLS TE tunnel is configured between networking devices, that link is considered a forwarding adjacency. The user can assign a cost to the tunnel to indicate the link's preference. Other networking devices will see the tunnel as a link in addition to the physical link.

How to Configure OSPF Forwarding Adjacency

Configuring OSPF Forwarding Adjacency

Note Configure a forwarding adjacency on two LSP tunnels bidirectionally, from A to B and B to A. Otherwise, the forwarding adjacency is advertised, but not used in the IGP network.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `ip cef distributed`
4. `mpls traffic-eng tunnels`
5. `interface loopback number`
6. `ip address ip-address mask`
7. `no shutdown`
8. `exit`
9. `interface tunnel number`
10. `tunnel mode mpls traffic-eng`
11. `tunnel mpls traffic-eng forwarding-adjacency {holdtime value}`
12. `ip ospf cost cost`
13. `exit`
14. `router ospf process-id`
15. `mpls traffic-eng router-id interface`
16. `mpls traffic-eng area number`
17. `end`

DETAILED STEPS

Procedure

	Command or Action	Purpose
Step 1	enable Example: <pre>Router> enable</pre>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: <pre>Router# configure terminal</pre>	Enters global configuration mode.

	Command or Action	Purpose
Step 3	ip cef distributed Example: <pre>Router(config)# ip cef distributed</pre>	Enables Cisco Express Forwarding (CEF).
Step 4	mpls traffic-eng tunnels Example: <pre>Router(config)# mpls traffic-eng tunnels</pre>	Enables MPLS traffic engineering tunnel signaling on a device.
Step 5	interface loopback <i>number</i> Example: <pre>Router(config)# interface loopback0</pre>	Configures a loopback interface and enters interface configuration mode. <ul style="list-style-type: none"> Set up a loopback interface with a 32-bit mask, enable CEF, enable MPLS traffic engineering, and set up a routing protocol (OSPF) for the MPLS network.
Step 6	ip address <i>ip-address mask</i> Example: <pre>Router(config-if)# ip address 10.1.1.1 255.255.255.255</pre>	Configures the IP address and subnet mask of the loopback interface.
Step 7	no shutdown Example: <pre>Router(config-if)# no shutdown</pre>	Enables the interface.
Step 8	exit Example: <pre>Router(config-if)# exit</pre>	Exits interface configuration mode.
Step 9	interface tunnel <i>number</i> Example: <pre>Router(config)# interface tunnel 1</pre>	Designates a tunnel interface for the forwarding adjacency and enters interface configuration mode.
Step 10	tunnel mode mpls traffic-eng Example: <pre>Router(config-if)# tunnel mode mpls traffic-eng</pre>	Sets the mode of a tunnel to MPLS for traffic engineering.
Step 11	tunnel mpls traffic-eng forwarding-adjacency {holdtime <i>value</i>} Example:	Advertises a TE tunnel as a link in an IGP network. <ul style="list-style-type: none"> The holdtime <i>value</i> keyword argument combination is the time in milliseconds (ms) that a TE tunnel waits after going down before informing the network. The

	Command or Action	Purpose
	Router(config-if)# tunnel mpls traffic-eng forwarding-adjacency holdtime 10000	range is 0 to 4,294,967,295 ms. The default value is 0.
Step 12	ip ospf cost cost Example: Router(config-if)# ip ospf cost 4	(Optional) Configures the cost metric for a tunnel interface to be used as a forwarding adjacency.
Step 13	exit Example: Router(config-if)# exit	Exits interface configuration mode.
Step 14	router ospf process-id Example: Router(config)# router ospf 1	Configures an OSPF routing process and enters router configuration mode.
Step 15	mpls traffic-eng router-id interface Example: Router(config-router)# mpls traffic-eng router-id ethernet 1/0	Specifies that the traffic engineering router identifier for the node is the IP address associated with a given interface.
Step 16	mpls traffic-eng area number Example: Router(config-router)# mpls traffic-eng area 1	Configures a router running OSPF MPLS so that it floods traffic engineering for the indicated OSPF area.
Step 17	end Example: Router(config-router)# end	Exits router configuration mode.

Configuration Examples for OSPF Forwarding Adjacency

Example OSPF Forwarding Adjacency

In the following example, the tunnel destination is the loopback interface on the other router. The router is configured with OSPF TE extensions and it floods traffic engineering link-state advertisements (LSAs) in OSPF area 0. The traffic engineering router identifier for the node is the IP address associated with Loopback 0. The last five lines of the example set up the routing protocol for the MPLS network, which is OSPF in this case.

Note Do not use the **mpls traffic-eng autoroute announce** command if you configure a forwarding adjacency in the tunnel.

```
ip routing
ip cef distributed
mpls traffic-eng tunnels
!
interface Loopback0
 ip address 127.0.0.1 255.255.255.255
 no shutdown
!
interface Tunnel1
 ip unnumbered Loopback0
 no ip directed-broadcast
 tunnel destination 10.1.1.1
 tunnel mode mpls traffic-eng
 tunnel mpls traffic-eng forwarding-adjacency holdtime 10000
 ip ospf cost 4
 tunnel mpls traffic-eng priority 2 2
 tunnel mpls traffic-eng bandwidth 10
 tunnel mpls traffic-eng path-option 2 dynamic
router ospf 5
 log-adjacency-changes
 network 10.1.1.1 0.0.0.0 area 0
 mpls traffic-eng router-id loopback0
 mpls traffic-eng area 0
```

When you look at the self-generated router LSA, you will see it as one of the links in router LSA (shown in bold in the following output).

```
Router# show ip ospf database route self-originate
OSPF Router with ID (10.5.5.5) (Process ID 5)
