

Flexible Netflow - Ingress VRF Support

The Flexible Netflow - Ingress VRF Support feature enables collecting the virtual routing and forwarding (VRF) ID from incoming packets on a router by applying an input flow monitor having a flow record that collects the VRF ID as a key or a nonkey field.

Information About Flexible NetFlow Ingress VRF Support

Flexible NetFlow—Ingress VRF Support Overview

This feature enables collecting the virtual routing and forwarding (VRF) ID from incoming packets on a router by applying an input flow monitor having a flow record that collects the VRF ID as a key or a nonkey field.

How to Configure Flexible NetFlow Ingress VRF Support

Creating a Flow Record

Perform this task to configure a customized flow record.

Customized flow records are used to analyze traffic data for a specific purpose. A customized flow record must have at least one **match** criterion for use as the key field and typically has at least one **collect** criterion for use as a nonkey field.

There are hundreds of possible permutations of customized flow records. This task shows the steps that are used to create one of the possible permutations. Modify the steps in this task as appropriate to create a customized flow record for your requirements.

SUMMARY STEPS

1. enable

- 2. configure terminal
- **3. flow record** *record-name*
- 4. description description
- 5. match $\{ip \mid ipv6\}$ {destination | source} address
- **6.** Repeat Step 5 as required to configure additional key fields for the record.
- 7. match flow cts {source | destination} group-tag
- 8.
- **9.** Repeat the above step as required to configure additional nonkey fields for the record.
- **10**. end
- **11. show flow record** *record-name*
- 12. show running-config flow record record-name

DETAILED STEPS

	Command or Action	Purpose	
Step 1	enable	Enables privileged EXEC mode.	
	Example:	• Enter your password if prompted.	
	Device> enable		
Step 2	configure terminal	Enters global configuration mode.	
	Example:		
	Device# configure terminal		
Step 3	flow record record-name	Creates a flow record and enters Flexible NetFlow flow	
	Example:	record configuration mode.	
	Device(config)# flow record FLOW-RECORD-1	This command also allows you to modify an existing flow record.	
Step 4	description description	(Optional) Creates a description for the flow record.	
	Example:		
	Device(config-flow-record)# description Used for basic traffic analysis		
Step 5	match {ip ipv6} {destination source} address	Note This example configures the IPv4 destination	
	Example:	address as a key field for the record. For information about the other key fields	
	Device(config-flow-record) # match ipv4 destination address	available for the match inv4 command and	
Step 6	Repeat Step 5 as required to configure additional key fields for the record.		

	Command or Action	Purpose	
Step 7	match flow cts {source destination} group-tag Example: Device(config-flow-record) # match flow cts source group-tag Device(config-flow-record) # match flow cts destination group-tag	Note	This example configures the CTS source group tag and destination group tag as a key field for the record. For information about the other key fields available for the match ipv4/ipv6 command, and the other match commands that are available to configure key fields.
		Note	 Ingress: In an incoming packet, if a header is present, SGT will reflect the same value as the header. If no value is present, it will show zero. The DGT value will not depend on the ingress port SGACL configuration.
			 Egress: If either propagate SGT or CTS is disabled on the egress interface, then SGT will be zero. In an outgoing packet, if SGACL configuration that corresponds to the (SGT, DGT) exists, DGT will be non-zero. If SGACL is disabled on the egress port/VLAN or if global SGACL enforcement is disabled, then DGT will be zero
Step 8	Example:	Configures record.	s the input interface as a nonkey field for the This example configures the input interface
Step 9	Repeat the above step as required to configure additional nonkey fields for the record.	_	as a nonkey field for the record.
Step 10	<pre>end Example: Device(config-flow-record)# end</pre>		ible NetFlow flow record configuration mode is to privileged EXEC mode.

	Command or Action	Purpose
Step 11	show flow record record-name	(Optional) Displays the current status of the specified flow
	Example:	record.
	Device# show flow record FLOW_RECORD-1	
Step 12	show running-config flow record record-name	(Optional) Displays the configuration of the specified flow
	Example:	record.
	Device# show running-config flow record FLOW_RECORD-1	

Creating a Flow Monitor

Perform this required task to create a customized flow monitor.

Each flow monitor has a separate cache assigned to it. Each flow monitor requires a record to define the contents and layout of its cache entries. These record formats can be a user-defined format. An advanced user can create a customized format using the **flow record** command.

Before you begin

If you want to use a customized record, you must create the customized record before you can perform this task. If you want to add a flow exporter to the flow monitor for data export, you must create the exporter before you can complete this task.

Note

You must use the **no ip flow monitor** command to remove a flow monitor from all of the interfaces to which you have applied it before you can modify the parameters for the **record** command on the flow monitor.

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- **3. flow monitor** *monitor-name*
- 4. description description
- **5. record** {*record-name*}
- **6.** cache {timeout {active} seconds | { normal }
- 7. Repeat Step 6 as required to finish modifying the cache parameters for this flow monitor.
- 8. exporter exporter-name
- **9**. end
- **10.** show flow monitor [[name] monitor-name [cache [format {csv | record | table}]]]]
- 11. **show running-config flow monitor** *monitor-name*

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	Enter your password if prompted.
	Device> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 3	flow monitor monitor-name	Creates a flow monitor and enters Flexible NetFlow flow
	Example:	monitor configuration mode.
	Device(config)# flow monitor FLOW-MONITOR-1	This command also allows you to modify an existing flow monitor.
Step 4	description description	(Optional) Creates a description for the flow monitor.
	Example:	
	Device(config-flow-monitor)# description Used for basic ipv4 traffic analysis	
Step 5	record {record-name}	Specifies the record for the flow monitor.
	Example:	
	Device(config-flow-monitor)# record FLOW-RECORD-1	
Step 6	cache {timeout {active} seconds { normal }	
	Example:	
Step 7	Repeat Step 6 as required to finish modifying the cache parameters for this flow monitor.	_
Step 8	exporter exporter-name	(Optional) Specifies the name of an exporter that was
	Example:	created previously.
	Device(config-flow-monitor)# exporter EXPORTER-1	
Step 9	end	Exits Flexible NetFlow flow monitor configuration mode
	Example:	and returns to privileged EXEC mode.
	Device(config-flow-monitor)# end	
Step 10	show flow monitor [[name] monitor-name [cache [format {csv record table}]]]	(Optional) Displays the status for a Flexible NetFlow flow monitor.
	Example:	

	Command or Action	Purpose	
	Device# show flow monitor FLOW-MONITOR-2 cache		
Step 11 show running-config flow monitor monitor-name Example:		(Optional) Displays the configuration of the specified flow monitor.	
	Device# show running-config flow monitor FLOW_MONITOR-1		

Applying a Flow Monitor to an Interface

Before it can be activated, a flow monitor must be applied to at least one interface. Perform this required task to activate a flow monitor.

While running the **ip flow monitor** command for the first interface to enable FNF monitor, you may see the following warning message displaying a GLOBAL memory allocation failure. This log is triggered by enabling FNF monitoring with a large cache size.

```
Jul 4 01:45:00.255: %CPPEXMEM-3-NOMEM: F0/0: cpp_cp_svr: QFP: 0, GLOBAL memory allocation of 90120448 bytes by FNF failed

Jul 4 01:45:00.258: %CPPEXMEM-3-TOPUSER: F0/0: cpp_cp_svr: QFP: 0, Top User: CPR STILE

EXMEM GRAPH, Allocations: 877, Type: GLOBAL

Jul 4 01:45:00.258: %CPPEXMEM-3-TOPUSER: F0/0: cpp_cp_svr: QFP: 0, Top User: SBC, Bytes

Allocated: 53850112, Type: GLOBAL
```

The warning message does not necessarily indicate a flow monitor application failure. The warning message can indicate internal steps that FNF uses for applying memory from the EXMEM infrastructure.

To ensure that the FNF monitor is enabled successfully, use the **show flow monitor** *monitor-name* command to check **Status** (**allocated** or **not allocated**) of a flow monitor. For more information, see Displaying the Current Status of a Flow Monitor.

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- **3. interface** *type number*
- **4.** {ip | ipv6} flow monitor monitor-name {input | output}
- **5.** Repeat Steps 3 and 4 to activate a flow monitor on any other interfaces in the device over which you want to monitor traffic.
- 6. end
- **7. show flow interface** *type number*
- 8. show flow monitor name monitor-name cache format record

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	Enter your password if prompted.

	Command or Action	Purpose	
	Device> enable		
Step 2	configure terminal	Enters global configuration mode.	
	Example:		
	Device# configure terminal		
Step 3	interface type number	Specifies an interface and enters interface configuration	
	Example:	mode.	
	Device(config)# interface GigabitEthernet 0/0/0		
Step 4	{ip ipv6} flow monitor monitor-name {input output}	Activates a flow monitor that was created previously by	
	Example:	assigning it to the interface to analyze traffic.	
	Device(config-if)# ip flow monitor FLOW-MONITOR-1 input		
Step 5	Repeat Steps 3 and 4 to activate a flow monitor on any other interfaces in the device over which you want to monitor traffic.		
Step 6	end	Exits interface configuration mode and returns to privileged	
	Example:	EXEC mode.	
	Device(config-if)# end		
Step 7	show flow interface type number	Displays the status of Flexible NetFlow (enabled or	
	Example:	disabled) on the specified interface.	
	Device# show flow interface GigabitEthernet 0/0/0		
Step 8	show flow monitor name monitor-name cache format record	Displays the status, statistics, and flow data in the cache for the specified flow monitor.	
	Example:		
	Device# show flow monitor name FLOW_MONITOR-1 cache format record		

Configuration Examples for Flexible NetFlow Ingress VRF Support

Example: Configuring Flexible NetFlow for Ingress VRF Support

The following example configures the collection of the virtual routing and forwarding (VRF) ID from incoming packets on a router by applying an input flow monitor having a flow record that collects the VRF ID as a key field.

This example starts in global configuration mode.

```
!
flow record rm_1
match routing vrf input
match ipv4 source address
match ipv4 destination address
collect interface input
collect interface output
collect counter packets
!
flow monitor mm_1
record rm_1
!
interface GigabitEthernet 0/0/0
ip vrf forwarding green
ip address 172.16.2.2 255.255.252
ip flow monitor mm_1 input
!
end
```

Feature Information for Flexible NetFlow—Ingress VRF Support

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 1: Feature Information for Flexible NetFlow—Ingress VRF Support

Feature Name	Releases	Feature Information
Flexible NetFlowIngress VRF Support	12.2(33)SRE 12.2(50)SY 15.0(1)M 15.0(1)SY 15.0(1)SY1	Enables collecting the virtual routing and forwarding (VRF) ID from incoming packets on a router by applying an input flow monitor having a flow record that collects the VRF ID as a key or a nonkey field. Support for this feature was added for Cisco 7200 and 7300 Network Processing Engine (NPE) series routers in Cisco IOS Release 12.2(33)SRE. The following commands were introduced or modified: collect routing, match routing, option (Flexible NetFlow), show flow monitor.
