# **Restrictions for Flexible Netflow - Layer 2**

• Flexible NetFlow is not supported on L2 interface.

# Information About Flexible NetFlow Layer 2 Fields

# Flexible NetFlow - Layer 2 Fields Overview

The Flexible NetFlow - Layer 2 Fields feature enables collecting statistics for Layer 2 fields such as MAC addresses and virtual LAN (VLAN) IDs from traffic.

# **How to Configure Flexible NetFlow Layer 2 Fields**

# **Creating a Flow Record**

Perform this task to configure a customized flow record.

Customized flow records are used to analyze traffic data for a specific purpose. A customized flow record must have at least one **match** criterion for use as the key field and typically has at least one **collect** criterion for use as a nonkey field.

There are hundreds of possible permutations of customized flow records. This task shows the steps that are used to create one of the possible permutations. Modify the steps in this task as appropriate to create a customized flow record for your requirements.

## **SUMMARY STEPS**

- 1. enable
- 2. configure terminal
- **3. flow record** *record-name*
- 4. description description
- 5. match {ip | ipv6} {destination | source} address
- **6.** Repeat Step 5 as required to configure additional key fields for the record.
- 7. match flow cts {source | destination} group-tag
- 8.
- **9.** Repeat the above step as required to configure additional nonkey fields for the record.
- **10**. end
- 11. show flow record record-name
- 12. show running-config flow record record-name

### **DETAILED STEPS**

### **Procedure**

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Device> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 3	flow record record-name	Creates a flow record and enters Flexible NetFlow flow record configuration mode.
	Example:  Device(config)# flow record FLOW-RECORD-1	This command also allows you to modify an existing flow record.
Step 4	description description	(Optional) Creates a description for the flow record.
	Example:	
	Device(config-flow-record)# description Used for basic traffic analysis	
Step 5	match {ip   ipv6} {destination   source} address	Note

	Command or Action	Purpose
	Example:  Device(config-flow-record) # match ipv4 destination address	This example configures the IPv4 destination address as a key field for the record. For information about the other key fields available for the <b>match ipv4</b> command, and the other <b>match</b> commands that are available to configure key fields.
Step 6	Repeat Step 5 as required to configure additional key fields for the record.	_
Step 7	<pre>match flow cts {source   destination} group-tag Example:  Device(config-flow-record) # match flow cts source group-tag  Device(config-flow-record) # match flow cts destination group-tag</pre>	Note This example configures the CTS source group tag and destination group tag as a key field for the record. For information about the other key fields available for the match ipv4/ipv6 command, and the other match commands that are available to configure key fields.  Note Ingress: In an incoming packet, if a header is present, SGT will reflect the same value as the header. If no value is present, it will show zero. The DGT value will not depend on the ingress port SGACL configuration.
		<ul> <li>If either propagate SGT or CTS is disabled on the egress interface, then SGT will be zero.</li> <li>In an outgoing packet, if SGACL configuration that corresponds to the (SGT, DGT) exists, DGT will be non-zero.</li> <li>If SGACL is disabled on the egress port/VLAN or if global SGACL enforcement is disabled, then DGT will be zero</li> </ul>
Step 8	Example:	Configures the input interface as a nonkey field for the record.  Note This example configures the input interface as a nonkey field for the record.
Step 9	Repeat the above step as required to configure additional nonkey fields for the record.	_

	Command or Action	Purpose
Step 10	end Example:	Exits Flexible NetFlow flow record configuration mode and returns to privileged EXEC mode.
	Device(config-flow-record)# end	
Step 11	show flow record record-name  Example:	(Optional) Displays the current status of the specified flow record.
	Device# show flow record FLOW_RECORD-1	
Step 12	show running-config flow record record-name	(Optional) Displays the configuration of the specified flow
	Example:	record.
	Device# show running-config flow record FLOW_RECORD-1	

# **Creating a Flow Monitor**

Perform this required task to create a customized flow monitor.

Each flow monitor has a separate cache assigned to it. Each flow monitor requires a record to define the contents and layout of its cache entries. These record formats can be a user-defined format. An advanced user can create a customized format using the **flow record** command.

## Before you begin

If you want to use a customized record, you must create the customized record before you can perform this task. If you want to add a flow exporter to the flow monitor for data export, you must create the exporter before you can complete this task.

Note

You must use the **no ip flow monitor** command to remove a flow monitor from all of the interfaces to which you have applied it before you can modify the parameters for the **record** command on the flow monitor.

### **SUMMARY STEPS**

- 1. enable
- 2. configure terminal
- **3. flow monitor** *monitor-name*
- 4. **description** description
- **5. record** {*record-name*}
- **6.** cache {timeout {active} seconds | { normal }
- **7.** Repeat Step 6 as required to finish modifying the cache parameters for this flow monitor.
- **8. exporter** *exporter-name*
- **9**. end
- **10.** show flow monitor [[name] monitor-name [cache [format {csv | record | table} ]]]]

## **11. show running-config flow monitor** *monitor-name*

## **DETAILED STEPS**

## **Procedure**

	Command or Action	Purpose	
Step 1	enable	Enables privileged EXEC mode.	
	Example:	• Enter your password if prompted.	
	Device> enable		
Step 2	configure terminal	Enters global configuration mode.	
	Example:		
	Device# configure terminal		
Step 3	flow monitor monitor-name	Creates a flow monitor and enters Flexible NetFlow flow	
	Example:	monitor configuration mode.	
	Device(config)# flow monitor FLOW-MONITOR-1	This command also allows you to modify an existing flow monitor.	
Step 4	description description	(Optional) Creates a description for the flow monitor.	
	Example:		
	Device(config-flow-monitor)# description Used for basic ipv4 traffic analysis		
Step 5	record {record-name}	Specifies the record for the flow monitor.	
	Example:		
	Device(config-flow-monitor)# record FLOW-RECORD-1		
Step 6	cache {timeout {active} seconds   { normal }		
	Example:		
Step 7	Repeat Step 6 as required to finish modifying the cache parameters for this flow monitor.		
Step 8	exporter exporter-name	(Optional) Specifies the name of an exporter that was	
	Example:	created previously.	
	Device(config-flow-monitor)# exporter EXPORTER-1		
Step 9	end	Exits Flexible NetFlow flow monitor configuration mode	
	Example:	and returns to privileged EXEC mode.	

	Command or Action	Purpose	
	Device(config-flow-monitor)# end		
Step 10	show flow monitor [[name] monitor-name [cache [format {csv   record   table} ]]]	(Optional) Displays the status for a Flexible NetFlow flow monitor.	
	Example:		
	Device# show flow monitor FLOW-MONITOR-2 cache		
Step 11	show running-config flow monitor monitor-name	(Optional) Displays the configuration of the specified flow	
	Example:	monitor.	
	Device# show running-config flow monitor FLOW_MONITOR-1		

# **Applying a Flow Monitor to an Interface**

Before it can be activated, a flow monitor must be applied to at least one interface. Perform this required task to activate a flow monitor.

While running the **ip flow monitor** command for the first interface to enable FNF monitor, you may see the following warning message displaying a GLOBAL memory allocation failure. This log is triggered by enabling FNF monitoring with a large cache size.

```
Jul 4 01:45:00.255: %CPPEXMEM-3-NOMEM: F0/0: cpp_cp_svr: QFP: 0, GLOBAL memory allocation of 90120448 bytes by FNF failed

Jul 4 01:45:00.258: %CPPEXMEM-3-TOPUSER: F0/0: cpp_cp_svr: QFP: 0, Top User: CPR STILE

EXMEM GRAPH, Allocations: 877, Type: GLOBAL

Jul 4 01:45:00.258: %CPPEXMEM-3-TOPUSER: F0/0: cpp_cp_svr: QFP: 0, Top User: SBC, Bytes

Allocated: 53850112, Type: GLOBAL
```

The warning message does not necessarily indicate a flow monitor application failure. The warning message can indicate internal steps that FNF uses for applying memory from the EXMEM infrastructure.

To ensure that the FNF monitor is enabled successfully, use the **show flow monitor** *monitor-name* command to check **Status** (**allocated** or **not allocated**) of a flow monitor. For more information, see Displaying the Current Status of a Flow Monitor.

#### **SUMMARY STEPS**

- 1. enable
- 2. configure terminal
- **3. interface** *type number*
- **4.** {ip | ipv6} flow monitor monitor-name {input | output}
- **5.** Repeat Steps 3 and 4 to activate a flow monitor on any other interfaces in the device over which you want to monitor traffic.
- 6. end
- **7. show flow interface** *type number*
- 8. show flow monitor name monitor-name cache format record

## **DETAILED STEPS**

## **Procedure**

	Command or Action	Purpose	
Step 1	enable	Enables privileged EXEC mode.	
	Example:	• Enter your password if prompted.	
	Device> enable		
Step 2	configure terminal	Enters global configuration mode.	
	Example:		
	Device# configure terminal		
Step 3	interface type number	Specifies an interface and enters interface configuration	
	Example:	mode.	
	Device(config)# interface GigabitEthernet 0/0/0		
Step 4	{ip   ipv6} flow monitor monitor-name {input   output} Activates a flow monitor that was created		
	Example:	assigning it to the interface to analyze traffic.	
	Device(config-if)# ip flow monitor FLOW-MONITOR-1 input		
Step 5	Repeat Steps 3 and 4 to activate a flow monitor on any other interfaces in the device over which you want to monitor traffic.		
Step 6	end	Exits interface configuration mode and returns to privileged	
	Example:	EXEC mode.	
	Device(config-if)# end		
Step 7	show flow interface type number	Displays the status of Flexible NetFlow (enabled or	
	Example:	disabled) on the specified interface.	
	Device# show flow interface GigabitEthernet 0/0/0		
Step 8	show flow monitor name monitor-name cache format record	Displays the status, statistics, and flow data in the cache for the specified flow monitor.	
	Example:		
	Device# show flow monitor name FLOW_MONITOR-1 cache format record		

# **Configuration Examples for Flexible NetFlow Layer 2 Fields**

# Example: Configuring Flexible NetFlowfor Monitoring MAC and VLAN Statistics

The following example shows how to configure Flexible NetFlow for monitoring MAC and VLAN statistics. This example starts in global configuration mode.

```
flow record LAYER-2-FIELDS-1
match ipv4 source address
match ipv4 destination address
match datalink dotlq vlan output
match datalink mac source address input
match datalink mac source address output
match datalink mac destination address input
match flow direction
exit
flow monitor FLOW-MONITOR-4
record LAYER-2-FIELDS-1
exit
ip cef
interface GigabitEthernet0/0/1
ip address 172.16.6.2 255.255.255.0
ip flow monitor FLOW-MONITOR-1 input
```

# Feature Information for Flexible NetFlow - Layer 2 Fields

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <a href="https://www.cisco.com/go/cfn">www.cisco.com/go/cfn</a>. An account on Cisco.com is not required.

Table 1: Feature Information for Flexible NetFlow - Layer 2 Fields

Feature Name	Releases	Feature Information
Flexible NetFlow - Layer 2 Fields	12.2(33)SRE 12.4(22)T Cisco IOS XE Release 3.2SE	Enables collecting statistics for Layer 2 fields such as MAC addresses and virtual LAN (VLAN) IDs from traffic.  Support for this feature was added for Cisco 7200 and 7300 Network Processing Engine (NPE) series routers in Cisco IOS Release 12.2(33)SRE.  The following commands were introduced or modified: collect datalink dot1q vlan, collect datalink mac, match datalink dot1q vlan, match datalink mac.
