

# Security Configuration Guide: Storm Control, Cisco IOS XE Everest 16.6.1 (NCS 4200 Series)

---

First Published: 2017-07-31

## Configuring Storm Control

A traffic storm occurs when packets flood the LAN, creating excessive traffic and degrading network performance. The traffic broadcast and multicast suppression (or storm control) feature prevents LAN ports from being disrupted by a broadcast, multicast and unicast traffic storm on physical interfaces.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see [Bug Search Tool](#) and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

## Information on Storm Control

A broadcast storm occurs when huge amount of broadcast, multicast, or unknown unicast packets flood the LAN, creating excessive traffic and degrading network performance. Errors in the protocol-stack implementation or in the network configuration can also cause a storm. The mechanism to prevent and control such events is known as storm control or broadcast suppression.

Broadcast and Multicast Suppression monitors incoming traffic levels over a 1-second traffic storm control interval and, during the interval compares the traffic level with the traffic storm control level configured. The traffic storm control threshold level is a percentage of the total available bandwidth of the port. Each port has different storm control levels for broadcast, multicast, and unicast type of traffic.

Storm control uses rising and falling thresholds to block and then restore the forwarding of broadcast, unicast, or multicast packets.

- The rising threshold is the traffic limit after which, that particular traffic is blocked.
- The falling threshold is the traffic limit below which, that particular starts forwarding again, if it was already blocked.

---

**Note**

If a particular type of ingress traffic (unicast, broadcast and multicast) is more than the rising threshold configured on it, the interface goes to blocked state for that particular traffic.

---

Storm control prevents traffic on a LAN from being disrupted by a broadcast, multicast, or unicast storm on a port. Storm control is applicable for physical interfaces and is used to restrict the unicast, broadcast and

multicast ingress traffic on the Layer2 interfaces. The feature is disabled by default on the Cisco ASR 903 router.

## Prerequisites for Storm Control

- Port-level storm control should be configured on EVC interfaces.
- Storm control threshold value should be configured as CIR (bps, kbps, %).
- Applicable only to broadcast, multicast and unicast packets.

## Restrictions for Storm Control

- Storm control is only enabled for ports with EVC configurations.
- Storm control is specific to the Layer2 physical interfaces and port-channels; It is *not* supported on the Layer 3 interfaces or BDI.
- Storm control is supported only for unknown unicast, broadcast, and unknown multicast ingress traffic; It is *not* supported for egress traffic.
- Port-level storm control is supported on the router. EFP-level storm control is *not* supported.
- Storm control on local connect and cross-connect is *not* supported.

### Restrictions for RSP3 Module

In addition to the above, the following are applicable on the RSP3 module:

- Storm control on port channel is *not* supported.
- The BPS threshold level is 146kbps.
- The PPS threshold level is 285pps.
- Storm control interface statistics is *not* supported.
- Storm detection does *not* work with jumbo frames.
- Storm control detection is accurate with 5% deviation of configured rate.
- Broadcast storm control is detected even when there is no EFP configured or no matching EFP under interface, and the behavior is due to hardware limitation.

## Configuring Storm Control

### Before You Begin

- Configure the ports with EVC configuration.

**Note**

To disable Broadcast and Multicast Suppression feature, use the **no storm-control** command.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **interface** *interface-id*
4. **storm-control broadcast | multicast | unicast** { **level** { *rising\_threshold falling\_threshold* | **bps** *rising\_threshold falling\_threshold* | **pps** *rising\_threshold falling\_threshold* } }
5. **storm-control action** {**shutdown** | **trap**}
6. **exit**

**DETAILED STEPS**

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Router> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Router# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>interface</b> <i>interface-id</i>  <b>Example:</b> Router# <b>interface gigabitethernet 0/0/0</b>	Specifies an interface type and enters interface configuration mode.
<b>Step 4</b>	<b>storm-control broadcast   multicast   unicast</b> { <b>level</b> { <i>rising_threshold falling_threshold</i>   <b>bps</b> <i>rising_threshold falling_threshold</i>   <b>pps</b> <i>rising_threshold falling_threshold</i> } }  <b>Example:</b> Router# <b>storm-control broadcast level 1 .50</b>	Specifies the global broadcast, multicast, or unicast storm control suppression level as a percentage of total bandwidth. <ul style="list-style-type: none"> <li>• <b>broadcast</b>—Configure broadcast storm control.</li> <li>• <b>multicast</b>—Configure multicast storm control.</li> <li>• <b>unicast</b>—Configure unknown unicast storm control.</li> <li>• <b>level</b>—Specifies the threshold levels for broadcast, multicast, or unicast traffic.</li> <li>• <i>rising_threshold</i>—Upper threshold level.</li> <li>• <i>falling_threshold</i>—Lower threshold level.</li> <li>• <b>bps</b>—Specifies the suppression level in bits per second.</li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>• <b>pps</b>—Specifies the suppression level in packets per second.</li> </ul>
<b>Step 5</b>	<b>storm-control action {shutdown   trap}</b>  <b>Example:</b> Router# <b>storm control action trap</b>	Specifies the action to take when a storm occurs on a port <ul style="list-style-type: none"> <li>• <b>shutdown</b>—Disables the port during a storm. The <b>shutdown</b> action sets the port to shut state during a storm. The port remains in shutdown state until recovered by giving a <b>no shutdown</b> command when the storm goes below the configured lower threshold .</li> <li>• <b>trap</b>—Sends an SNMP trap. The <b>trap</b> action generates an SNMP trap when a storm is detected . The default is to restrict the particular ingress traffic and not to send out traps.</li> </ul>
<b>Step 6</b>	<b>exit</b>  <b>Example:</b> Router# <b>exit</b>	Exits interface configuration mode and returns the router to global configuration mode.

### Configuration Example

```

interface GigabitEthernet0/0/1
no ip address
negotiation auto
storm-control broadcast level bps 50k 40k
storm-control multicast level pps 100 90
storm-control unicast level 1.00 0.50
service instance 1 ethernet
encapsulation dot1q 2
rewrite ingress tag pop 1 symmetric
bridge-domain 1
!
```

## Verifying Storm Control

- Use the **show storm-control** command to verify the Broadcast and Multicast Suppression feature configuration.

```
Router# show storm-control Gi0/15/1
```

Interface	Type	Filter State	Upper	Lower	Current
Gi0/0/0	Bcast	Forwarding	0 pps	0 pps	0 pps
Gi0/0/0	Ucast	Forwarding	80.00%	20.00%	0.00%
Gi0/0/1	Bcast	Blocking	50k bps	40k bps	0 bps
Gi0/0/1	Mcast	Blocking	100 pps	90 pps	0 pps
Gi0/0/1	Ucast	Blocking	1.00%	0.50%	0.00%

- Use the **show storm-control GigabitEthernet** command to verify the Broadcast and Multicast Suppression feature configuration at the interface.

```
Router # show storm control GigabitEthernet 0/0/1
```

Interface	Type	Filter State	Upper	Lower	Current
Gi0/0/1	Bcast	Blocking	50k bps	40k bps	0 bps
Gi0/0/1	Mcast	Blocking	100 pps	90 pps	0 pps
Gi0/0/1	Ucast	Blocking	1.00%	0.50%	0.00%

- Use the **show run interface** command to verify the action trap configured on the port.

```
Router# show run interface GigabitEthernet 0/4/2
```

```
Building configuration...
Current configuration : 300 bytes
!
interface GigabitEthernet0/4/2
 no ip address
 negotiation auto
 storm-control broadcast level 9.00 7.00
 storm-control action trap
 service instance trunk 1 ethernet
 encapsulation dot1q 1-200
 rewrite ingress tag pop 1 symmetric
 bridge-domain from-encapsulation
!
end
```

- The following example shows the **action trap** being sent when a storm is hit.

```
Router# show storm-control G 0/4/2
```

Interface	Type	Filter State	Upper	Lower	Current
Gi0/4/2	Bcast	Blocking	9.00%	7.00%	11.00%

May 29 14:46:28.008 IST: %STORM\_CONTROL-3-TRAP: A packet storm was detected on Gi0/4/2.

```
Sending SNMP trap
```

- The following example shows the **action shutdown** configured.

```
Router# show run interface Gi0/4/2
```

```
Building configuration...
Current configuration : 300 bytes
!
interface GigabitEthernet0/4/2
 no ip address
 negotiation auto
 storm-control broadcast level 9.00 7.00
 storm-control action shutdown
 service instance trunk 1 ethernet
 encapsulation dot1q 1-200
 rewrite ingress tag pop 1 symmetric
 bridge-domain from-encapsulation
!
end
```
