# Secure Copy

The Secure Copy (SCP) feature provides a secure and authenticated method for copying device configurations or device image files. SCP relies on Secure Shell (SSH), an application and protocol that provide a secure replacement for the Berkeley r-tools suite (Berkeley university's own set of networking applications). This document provides the procedure to configure a Cisco device for SCP server-side functionality.

# **Finding Feature Information**

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to https://cfnng.cisco.com/. An account on Cisco.com is not required.

# **Prerequisites for Secure Copy**

- Before enabling Secure Copy (SCP), you must correctly configure Secure Shell (SSH), authentication, and authorization on the device.
- Because SCP relies on SSH for its secure transport, the device must have a Rivest, Shamir, and Adelman (RSA) key pair.

# **Information About Secure Copy**

### **How Secure Copy Works**

The behavior of Secure Copy (SCP) is similar to that of remote copy (RCP), which comes from the Berkeley r-tools suite (Berkeley university's own set of networking applications), except that SCP relies on Secure Shell (SSH) for security. In addition, SCP requires that authentication, authorization, and accounting (AAA) authorization be configured so that the device can determine whether the user has the correct privilege level.

SCP allows a user only with a privilege level of 15 to copy any file that exists in the Cisco IOS File System (IFS) to and from a device by using the **copy** command. An authorized administrator may also perform this action from a workstation.

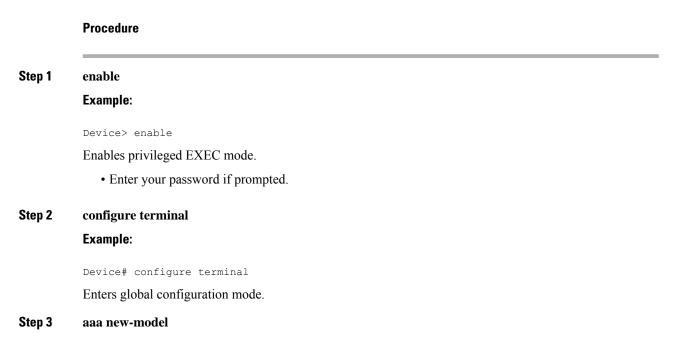

**Note** Enable the SCP option while using the pscp.exe file with the Cisco software.

The Cisco router running on IOS XE considers 1024 bytes \* 32 blocks (32768 bytes) per TCP window size. A bad length error message is displayed for packets that flow in beyond this parameter.

# How to Configure Secure Copy

### **Configuring Secure Copy**

To configure a Cisco device for Secure Copy (SCP) server-side functionality, perform the following steps.

#### **Example:**

Device(config) # aaa new-model

Sets AAA authentication at login.

#### Step 4 aaa authentication login {default | list-name} method1 [ method2... ]

#### Example:

Device(config)# aaa authentication login default group tacacs+ Enables the AAA access control system.

Device(config)# username superuser privilege 2 password 0 superpassword

Establishes a username-based authentication system.

**Note** You may omit this step if a network-based authentication mechanism, such as TACACS+ or RADIUS, has been configured.

#### **Step 6** ip scp server enable

#### Example:

Device(config) # ip scp server enable Enables SCP server-side functionality.

#### Step 7 exit

#### Example:

Device(config) # exit

Exits global configuration mode and returns to privileged EXEC mode.

#### **Step 8** show running-config

#### **Example:**

Device# show running-config

(Optional) Displays the SCP server-side functionality.

### Step 9 debug ip scp

#### Example:

Device# debug ip scp

(Optional) Troubleshoots SCP authentication problems.

# **Configuration Examples for Secure Copy**

### **Example: Secure Copy Configuration Using Local Authentication**

The following example shows how to configure the server-side functionality of Secure Copy (SCP). This example uses a locally defined username and password.

```
! AAA authentication and authorization must be configured properly in order for SCP to work.
aaa new-model
aaa authentication login default local
aaa authorization exec default local
username user1 privilege 15 password 0 lab
! SSH must be configured and functioning properly.
ip scp server enable
```

### Example SCP Server-Side Configuration Using Network-Based Authentication

The following example shows how to configure the server-side functionality of SCP using a network-based authentication mechanism:

```
! AAA authentication and authorization must be configured properly for SCP to work.
aaa new-model
aaa authentication login default group tacacs+
aaa authorization exec default group tacacs+
! SSH must be configured and functioning properly.
ip ssh time-out 120
ip ssh authentication-retries 3
ip scp server enable
```

#### **Technical Assistance**

Description	Link
The Cisco Support and Documentation website provides online resources to download documentation, software, and tools. Use these resources to install and configure the software and to troubleshoot and resolve technical issues with Cisco products and technologies. Access to most tools on the Cisco Support and Documentation website requires a Cisco.com user ID and password.	

# Glossary

**AAA**—authentication, authorization, and accounting. A framework of security services that provide the method for identifying users (authentication), for remote access control (authorization), and for collecting and sending security server information used for billing, auditing, and reporting (accounting).

**RCP**—remote copy. Relies on Remote Shell (Berkeley r-tools suite) for security; RCP copies files such as device images and startup configurations to and from devices.

**SCP**—secure copy. Relies on SSH for security; SCP support allows secure and authenticated copying of anything that exists in the Cisco IOS File System (IFS). SCP is derived from RCP.

**SSH**—Secure Shell. An application and protocol that provide a secure replacement for the Berkeley r-tools suite. The protocol secures the sessions using standard cryptographic mechanisms, and the application can be used similar to the Berkeley rexec and rsh tools. SSH Version 1 is implemented in the Cisco software.

Glossary

I

# **Secure Shell Version 2 Support**

The Secure Shell Version 2 Support feature allows you to configure Secure Shell (SSH) Version 2. (SSH Version 1 support was implemented in an earlier Cisco software release.) SSH runs on top of a reliable transport layer and provides strong authentication and encryption capabilities. The only reliable transport that is defined for SSH is TCP. SSH provides a means to securely access and securely execute commands on another computer over a network. The Secure Copy Protocol (SCP) feature that is provided with SSH allows for the secure transfer of files.

# Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to https://cfnng.cisco.com/. An account on Cisco.com is not required.

# **Prerequisites for Secure Shell Version 2 Support**

- Before configuring SSH, ensure that the required image is loaded on your device. The SSH server requires you to have a k9 (Triple Data Encryption Standard [3DES]) software image depending on your release.
- You have to use a SSH remote device that supports SSH Version 2 and connect to a Cisco device.
- SCP relies on authentication, authorization, and accounting (AAA) to function correctly. Therefore, AAA
  must be configured on the device to enable the secure copy protocol on the SSH Server.

Note

The SSH Version 2 server and the SSH Version 2 client are supported on your Cisco software, depending on your release. (The SSH client runs both the SSH Version 1 protocol and the SSH Version 2 protocol. The SSH client is supported in k9 images depending on your release.)

For more information about downloading a software image, refer to the *Configuration Fundamentals Configuration Guide*.

# **Restrictions for Secure Shell Version 2 Support**

- Secure Shell (SSH) servers and SSH clients are supported in Triple Data Encryption Standard (3DES) software images.
- Execution Shell, remote command execution, and Secure Copy Protocol (SCP) are the only applications supported.
- Rivest, Shamir, and Adleman (RSA) key generation is an SSH server-side requirement. Devices that act as SSH clients need not generate RSA keys.
- The RSA key pair size must be greater than or equal to 768 bits.
- The following features are not supported:
  - Port forwarding
  - Compression

# Information About Secure Shell Version 2 Support

## **Secure Shell Version 2**

The Secure Shell Version 2 Support feature allows you to configure SSH Version 2.

The configuration for the SSH Version 2 server is similar to the configuration for SSH Version 1. The **ip ssh version** command defines the SSH version to be configured. If you do not configure this command, SSH by default runs in compatibility mode; that is, both SSH Version 1 and SSH Version 2 connections are honored.

Note

SSH Version 1 is a protocol that has never been defined in a standard. If you do not want your device to fall back to the undefined protocol (Version 1), you should use the **ip ssh version** command and specify Version 2.

The **ip** ssh rsa keypair-name command enables an SSH connection using the Rivest, Shamir, and Adleman (RSA) keys that you have configured. Previously, SSH was linked to the first RSA keys that were generated (that is, SSH was enabled when the first RSA key pair was generated). This behavior still exists, but by using the **ip** ssh rsa keypair-name command, you can overcome this behavior. If you configure the **ip** ssh rsa keypair-name command with a key pair name, SSH is enabled if the key pair exists or SSH will be enabled

if the key pair is generated later. If you use this command to enable SSH, you are not forced to configure a hostname and a domain name, which was required in SSH Version 1 of the Cisco software.

The login banner is supported in SSH Version 2, but it is not supported in Secure Shell Version 1.

## **Secure Shell Version 2 Enhancements**

The SSH Version 2 Enhancements feature includes a number of additional capabilities such as supporting Virtual Routing and Forwarding (VRF)-Aware SSH, SSH debug enhancements, and Diffie-Hellman (DH) group exchange support.

Note The VRF-Aware SSH feature is supported depending on your release.

The Cisco SSH implementation has traditionally used 768-bit modulus, but with an increasing need for higher key sizes to accommodate DH Group 14 (2048 bits) and Group 16 (4096 bits) cryptographic applications, a message exchange between the client and the server to establish the favored DH group becomes necessary. The **ip ssh dh min size** command configures the modulus size on the SSH server. In addition to this, the **ssh** command was extended to add VRF awareness to the SSH client-side functionality through which the VRF instance name in the client is provided with the IP address to look up the correct routing table and establish a connection.

Debugging was enhanced by modifying SSH debug commands. The **debug ip ssh** command was extended to simplify the debugging process. Before the simplification of the debugging process, this command printed all debug messages related to SSH regardless of what was specifically required. The behavior still exists, but if you configure the **debug ip ssh** command with a keyword, messages are limited to information specified by the keyword.

### Secure Shell Version 2 Enhancements for RSA Keys

Cisco SSH Version 2 supports keyboard-interactive and password-based authentication methods. The SSH Version 2 Enhancements for RSA Keys feature also supports RSA-based public key authentication for the client and the server.

User authentication—RSA-based user authentication uses a private/public key pair associated with each user for authentication. The user must generate a private/public key pair on the client and configure a public key on the Cisco SSH server to complete the authentication.

An SSH user trying to establish credentials provides an encrypted signature using the private key. The signature and the user's public key are sent to the SSH server for authentication. The SSH server computes a hash over the public key provided by the user. The hash is used to determine if the server has a matching entry. If a match is found, an RSA-based message verification is performed using the public key. Hence, the user is authenticated or denied access based on the encrypted signature.

Server authentication—While establishing an SSH session, the Cisco SSH client authenticates the SSH server by using the server host keys available during the key exchange phase. SSH server keys are used to identify the SSH server. These keys are created at the time of enabling SSH and must be configured on the client.

For server authentication, the Cisco SSH client must assign a host key for each server. When the client tries to establish an SSH session with a server, the client receives the signature of the server as part of the key exchange message. If the strict host key checking flag is enabled on the client, the client checks if it has the host key entry corresponding to the server. If a match is found, the client tries to validate the signature by using the server host key. If the server is successfully authenticated, the session establishment continues; otherwise, it is terminated and displays a "Server Authentication Failed" message.

**Note** Storing public keys on a server uses memory; therefore, the number of public keys configurable on an SSH server is restricted to ten users, with a maximum of two public keys per user.

Note

RSA-based user authentication is supported by the Cisco server, but Cisco clients cannot propose public key as an authentication method. If the Cisco server receives a request from an open SSH client for RSA-based authentication, the server accepts the authentication request.

Note

For server authentication, configure the RSA public key of the server manually and configure the **ip ssh stricthostkeycheck** command on the Cisco SSH client.

### **SNMP Trap Generation**

Depending on your release, Simple Network Management Protocol (SNMP) traps are generated automatically when an SSH session terminates if the traps have been enabled and SNMP debugging has been enabled. For information about enabling SNMP traps, see the "Configuring SNMP Support" module in the *SNMP Configuration Guide*.

**Note** When you configure the **snmp-server host** command, the IP address must be the address of the PC that has the SSH (telnet) client and that has IP connectivity to the SSH server. For an example of an SNMP trap generation configuration, see the *Example: Setting an SNMP Trap* section.

You must also enable SNMP debugging using the **debug snmp packet** command to display the traps. The trap information includes information such as the number of bytes sent and the protocol that was used for the SSH session. For an example of SNMP debugging, see the *Example: Setting an SNMP Trap* section.

### SSH Keyboard Interactive Authentication

The SSH Keyboard Interactive Authentication feature, also known as Generic Message Authentication for SSH, is a method that can be used to implement different types of authentication mechanisms. Basically, any currently supported authentication method that requires only user input can be performed with this feature. The feature is automatically enabled.

The following methods are supported:

Password

- SecurID and hardware tokens printing a number or a string in response to a challenge sent by the server
- Pluggable Authentication Module (PAM)
- S/KEY (and other One-Time-Pads)

For examples of various scenarios in which the SSH Keyboard Interactive Authentication feature has been automatically enabled, see the "Examples: SSH Keyboard Interactive Authentication, on page 26" section.

# How to Configure Secure Shell Version 2 Support

### Configuring a Device for SSH Version 2 Using a Hostname and Domain Name

• enable

Enables privileged EXEC mode.

• Enter your password if prompted.

Device> enable

configure terminal

Enters global configuration mode.

Device# configure terminal

• hostname name

Configures a hostname for your device.

Device(config) # hostname cisco520

• ip domain-name name

Configures a domain name for your device.

cisco520(config)# ip domain-name example.com

• crypto key generate rsa

Enables the SSH server for local and remote authentication. cisco520(config)# crypto key generate rsa

• ip ssh [time-out seconds | authentication-retries integer]

(Optional) Configures SSH control variables on your device.

```
cisco520(config) # ip ssh time-out 120
```

• ip ssh version [2]

(Optional) Specifies the version of SSH to be run on your device. cisco520(config) # ip ssh version 2

• exit

Exits global configuration mode and enters privileged EXEC mode.

I

• Use **no hostname** command to return to the default host.

cisco520(config)# exit

# **Configuring a Device for SSH Version 2 Using RSA Key Pairs**

enable	
Examp	le:
Device	> enable
Enable	s privileged EXEC mode.
• Ei	nter your password if prompted.
config	ure terminal
Examp	le:
Device	# configure terminal
Enters	global configuration mode.
ip ssh	rsa keypair-name keypair-name
Example:	
Device	e(config)# ip ssh rsa keypair-name sshkeys
Specifies the RSA key pair to be used for SSH.	
Note	A Cisco device can have many RSA key pairs.
crypto	key generate rsa usage-keys label key-label modulus modulus-size
Examp	le:
Device	config)# crypto key generate rsa usage-keys label sshkeys modulus 768
Enable	s the SSH server for local and remote authentication on the device.
• Fo	or SSH Version 2, the modulus size must be at least 768 bits.
Note	To delete the RSA key pair, use the <b>crypto key zeroize rsa</b> command. When you delet key pair, you automatically disable the SSH server.
ip ssh	[time-out seconds   authentication-retries integer]
Examp	

Configures SSH control variables on your device.

Step 6 ip ssh version 2
Example:
Device(config) # ip ssh version 2
Specifies the version of SSH to be run on the device.
Step 7 exit
Example:
Device(config) # exit

Procedure

Exits global configuration mode and enters privileged EXEC mode.

# **Configuring the Cisco SSH Server to Perform RSA-Based User Authentication**

Step 1	enable
	Example:
	Device> enable
	Enables privileged EXEC mode.
	• Enter your password if prompted.
Step 2	configure terminal
	Example:
	Device# configure terminal
	Enters global configuration mode.
Step 3	hostname name
	Example:
	Device(config) # hostname host1
	Specifies the hostname.
Step 4	ip domain-name name
	Example:
	<pre>host1(config)# ip domain-name name1</pre>
	Defines a default domain name that the Cisco software uses to complete unqualified hostnames.

#### Step 5 crypto key generate rsa

#### Example:

host1(config)# crypto key generate rsa

Generates RSA key pairs.

#### Step 6 ip ssh pubkey-chain

#### Example:

host1(config) # ip ssh pubkey-chain

Configures SSH-RSA keys for user and server authentication on the SSH server and enters public-key configuration mode.

• The user authentication is successful if the RSA public key stored on the server is verified with the public or the private key pair stored on the client.

#### Step 7 username username

#### Example:

host1(conf-ssh-pubkey)# username user1

Configures the SSH username and enters public-key user configuration mode.

#### Step 8 key-string

#### Example:

host1(conf-ssh-pubkey-user)# key-string

Specifies the RSA public key of the remote peer and enters public-key data configuration mode.

Note You can obtain the public key value from an open SSH client; that is, from the .ssh/id\_rsa.pub file.

Step 9 key-hash key-type key-name

#### Example:

host1(conf-ssh-pubkey-data)# key-hash ssh-rsa key1

(Optional) Specifies the SSH key type and version.

- The key type must be ssh-rsa for the configuration of private public key pairs.
- This step is optional only if the **key-string** command is configured.
- You must configure either the key-string command or the key-hash command.
- **Note** You can use a hashing software to compute the hash of the public key string, or you can also copy the hash value from another Cisco device. Entering the public key data using the **key-string** command is the preferred way to enter the public key data for the first time.

#### Step 10 end

Example:

host1(conf-ssh-pubkey-data)# end

Exits public-key data configuration mode and returns to privileged EXEC mode.

• Use no hostname command to return to the default host.

# Configuring the Cisco IOS SSH Client to Perform RSA-Based Server Authentication

### Procedure Step 1 enable Example: Device> enable Enables privileged EXEC mode. • Enter your password if prompted. Step 2 configure terminal **Example:** Device# configure terminal Enters global configuration mode. Step 3 hostname name Example: Device(config) # hostname host1 Specifies the hostname. Step 4 ip domain-name name Example: host1(config) # ip domain-name name1 Defines a default domain name that the Cisco software uses to complete unqualified hostnames. Step 5 crypto key generate rsa Example: host1(config) # crypto key generate rsa Generates RSA key pairs.

### Step 6 ip ssh pubkey-chain Example: host1(config)# ip ssh pubkey-chain Configures SSH-RSA keys for user and server authentication on the SSH server and enters public-key configuration mode. Step 7 server server-name Example: host1(conf-ssh-pubkey)# server server1 Enables the SSH server for public-key authentication on the device and enters public-key server configuration mode. Step 8 key-string Example: host1(conf-ssh-pubkey-server)# key-string Specifies the RSA public-key of the remote peer and enters public key data configuration mode. Note You can obtain the public key value from an open SSH client; that is, from the .ssh/id rsa.pub file. Step 9 exit Example: host1(conf-ssh-pubkey-data)# exit Exits public-key data configuration mode and enters public-key server configuration mode. Step 10 key-hash key-type key-name Example: host1(conf-ssh-pubkey-server)# key-hash ssh-rsa key1 (Optional) Specifies the SSH key type and version. • The key type must be ssh-rsa for the configuration of private/public key pairs. • This step is optional only if the **key-string** command is configured. • You must configure either the key-string command or the key-hash command. Note You can use a hashing software to compute the hash of the public key string, or you can copy the hash value from another Cisco device. Entering the public key data using the key-string command is the preferred way to enter the public key data for the first time. Step 11 end Example: host1(conf-ssh-pubkey-server)# end

Exits public-key server configuration mode and returns to privileged EXEC mode.

Step 12 configure terminal Example:

host1# configure terminal

Enters global configuration mode.

Step 13ip ssh stricthostkeycheck

Example:

host1(config) # ip ssh stricthostkeycheck

Ensures that server authentication takes place.

- The connection is terminated in case of a failure.
- Use no hostname command to return to the default host.

# **Starting an Encrypted Session with a Remote Device**

**Note** The device with which you want to connect must support a Secure Shell (SSH) server that has an encryption algorithm that is supported in Cisco software. Also, you need not enable your device. SSH can be run in disabled mode.

#### Procedure

ssh [-v {1 | 2} | -c {aes128-ctr | aes192-ctr | aes256-ctr | aes128-cbc | 3des | aes192-cbc | aes256-cbc} | -l
user-id | -l user-id:vrf-name number ip-address ip-address | -l user-id:rotary number ip-address | -m
{hmac-md5-128 | hmac-md5-96 | hmac-sha1-160 | hmac-sha1-96} | -o numberofpasswordprompts n |
-p port-num] {ip-addr | hostname} [command | -vrf]

#### **Example:**

Device# ssh -v 2 -c aes256-ctr -m hmac-shal-96 -l user2 10.76.82.24

Starts an encrypted session with a remote networking device.

### **Troubleshooting Tips**

The **ip** ssh version command can be used for troubleshooting your SSH configuration. By changing versions, you can determine the SSH version that has a problem.

# **Enabling Secure Copy Protocol on the SSH Server**

Note	The following task configures the server-side functionality for SCP. This task shows a typical configuration that allows the device to securely copy files from a remote workstation.		
	Procedure		
Step 1	enable		
	Example:		
	Device> enable		
	Enables privileged EXEC mode.		
	• Enter your password if prompted.		
Step 2	configure terminal		
	Example:		
	Device# configure terminal		
	Enters global configuration mode.		
Step 3	aaa new-model		
	Example:		
	Device(config)# aaa new-model		
	Enables the AAA access control model.		
Step 4	aaa authentication login default local		
	Example:		
	Device(config)# aaa authentication login default local		
	Sets AAA authentication at login to use the local username database for authentication.		
Step 5	aaa authorization exec defaultlocal		
	Example:		
	Device(config)# aaa authorization exec default local		
	Sets the parameters that restrict user access to a network, runs the authorization to determine if the user ID is allowed to run an EXEC shell, and specifies that the system must use the local database for authorization.		
Step 6	usernamename privilege privilege-level password password		
	Example:		

	Device(	config)# username samplename privilege 15 password password1		
		nes a username-based authentication system, and specifies the username, privilege level, and an pted password.		
	Note	The minimum value for the <i>privilege-level</i> argument is 15. A privilege level of less than 15 results in the connection closing.		
Step 7	ip ssh time-outseconds			
	Example:			
	Device(	config)# ip ssh time-out 120		
	Sets the	time interval (in seconds) that the device waits for the SSH client to respond.		
Step 8	ip ssh authentication-retries integer			
	Example:			
	Device(	config)# ip ssh authentication-retries 3		
	Sets the number of authentication attempts after which the interface is reset.			
Step 9	ip scpserverenable			
	Example:			
	Device(	config)# ip scp server enable		
	Enables	the device to securely copy files from a remote workstation.		
Step 10	exit			
	Example			
	Device(	config)# exit		
	Exits glo	obal configuration mode and returns to privileged EXEC mode.		
Step 11	debug ip scp			
	Example:			
	Device#	debug ip scp		
	(Optiona	al) Provides diagnostic information about SCP authentication problems.		

## **Troubleshooting Tips**

To troubleshoot SCP authentication problems, use the **debug ip scp**command.

# Verifying the Status of the Secure Shell Connection

#### Procedure

Step 1	enable	
	Example:	
	Device> enable	
	Enables privileged EXEC mode.	
	• Enter your password if prompted.	
Step 2	show ssh	
	Example:	
	Device# show ssh	
	Displays the status of SSH server connections.	
Step 3	exit	
	Example:	
	Device# exit	
	Exits privileged EXEC mode and returns to user EXEC mode.	

#### **Examples**

The following sample output from the **show ssh** command displays status of various SSH Version 1 and Version 2 connections for Version 1 and Version 2 connections:

Device# show ssh Connection Version Encryption State Username 0 1.5 3DES Session started lab Connection Version Mode Encryption Hmac State Username 1 2.0 IN aes128-cbc hmac-md5 Session started lab 1 2.0 OUT aes128-cbc hmac-md5 Session started lab

The following sample output from the **show ssh** command displays status of various SSH Version 1 and Version 2 connections for a Version 2 connection with no Version 1 connection:

Device# show ssh Connection Version Mode Encryption Hmac State Username 1 2.0 IN aes128-cbc hmac-md5 Session started lab 1 2.0 OUT aes128-cbc hmac-md5 Session started lab %No SSHv1 server connections running.

The following sample output from the **show ssh** command displays status of various SSH Version 1 and Version 2 connections for a Version 1 connection with no Version 2 connection:

Device# show ssh Connection Version Encryption State Username 0 1.5 3DES Session started lab %No SSHv2 server connections running.

# **Verifying the Secure Shell Status**

#### Procedure

enable
Example:
Device> enable
Enables privileged EXEC mode.
• Enter your password if prompted.
show ip ssh
Example:
Device# show ip ssh
Displays the version and configuration data for SSH.
exit
Example:
Device# exit
Exits privileged EXEC mode and returns to user EXEC mode.

#### Examples

The following sample output from the **show ip ssh** command displays the version of SSH that is enabled, the authentication timeout values, and the number of authentication retries for Version 1 and Version 2 connections:

Device# **show ip ssh** SSH Enabled - version 1.99 Authentication timeout: 120 secs; Authentication retries: 3

\_\_\_\_\_

The following sample output from the **show ip ssh** command displays the version of SSH that is enabled, the authentication timeout values, and the number of authentication retries for a Version 2 connection with no Version 1 connection:

\_\_\_\_\_

```
Device# show ip ssh
SSH Enabled - version 2.0
Authentication timeout: 120 secs; Authentication retries: 3
```

The following sample output from the **show ip ssh** command displays the version of SSH that is enabled, the authentication timeout values, and the number of authentication retries for a Version 1 connection with no Version 2 connection:

```
Device# show ip ssh

3d06h: %SYS-5-CONFIG_I: Configured from console by console

SSH Enabled - version 1.5

Authentication timeout: 120 secs; Authentication retries: 3
```

# **Monitoring and Maintaining Secure Shell Version 2**

#### Procedure

Step 1	enable		
	Example:		
	Device> enable		
	Enables privileged EXEC mode.		
	• Enter your password if prompted.		
Step 2	debug ip ssh		
	Example:		
	Device# debug ip ssh		
	Enables debugging of SSH.		
Step 3	debug snmp packet		
	Example:		

Device# debug snmp packet

Enables debugging of every SNMP packet sent or received by the device.

#### Example

The following sample output from the **debug ip ssh** command shows the connection is an SSH Version 2 connection:

```
Device# debug ip ssh
```

```
00:33:55: SSH1: starting SSH control process

```

# **Configuration Examples for Secure Shell Version 2 Support**

### Example: Configuring Secure Shell Version 2

Device# configure terminal Device(config)# ip ssh version 2

### Example: Configuring Secure Shell Versions 1 and 2

Device# configure terminal Device(config)# no ip ssh version

### Example: Starting an Encrypted Session with a Remote Device

Device# ssh -v 2 -c aes256-cbc -m hmac-shal-160 -l shaship 10.76.82.24

### Example: Configuring Server-Side SCP

The following example shows how to configure the server-side functionality for SCP. This example also configures AAA authentication and authorization on the device. This example uses a locally defined username and password.

```
Device# configure terminal
Device(config)# aaa new-model
Device(config)# aaa authentication login default local
Device(config)# username samplename privilege 15 password password1
Device(config)# ip ssh time-out 120
Device(config)# ip ssh authentication-retries 3
Device(config)# ip scp server enable
```

### Example: Setting an SNMP Trap

The following example shows that an SNMP trap is set. The trap notification is generated automatically when the SSH session terminates. In the example, a.b.c.d is the IP address of the SSH client. For an example of SNMP trap debug output, see the "Example: SNMP Debugging, on page 28" section.

```
snmp-server
snmp-server host a.b.c.d public tty
```

### **Examples: SSH Keyboard Interactive Authentication**

#### Example: Enabling Client-Side Debugs

The following example shows that the client-side debugs are turned on, and the maximum number of prompts is six (three for the SSH keyboard interactive authentication method and three for the password authentication method).

```
Password:
Password:
Password:
Password:
Password:
Password: cisco123
Last login: Tue Dec 6 13:15:21 2005 from 10.76.248.213
user1@courier:~> exit
logout
[Connection to 10.76.248.200 closed by foreign host]
Device1# debug ip ssh client
SSH Client debugging is on
Device1# ssh -1 lab 10.1.1.3
Password:
*Nov 17 12:50:53.199: SSH0: sent protocol version id SSH-1.99-Cisco-1.25
*Nov 17 12:50:53.199: SSH CLIENTO: protocol version id is - SSH-1.99-Cisco-1.25
*Nov 17 12:50:53.199: SSH CLIENTO: sent protocol version id SSH-1.99-Cisco-1.25
*Nov 17 12:50:53.199: SSH CLIENTO: protocol version exchange successful
*Nov 17 12:50:53.203: SSH0: protocol version id is - SSH-1.99-Cisco-1.25
```

\*Nov 17 12:50:53.335: SSH CLIENT0: key exchange successful and encryption on \*Nov 17 12:50:53.335: SSH2 CLIENT 0: using method keyboard-interactive Password: Password: \*Nov 17 12:51:01.887: SSH2 CLIENT 0: using method password authentication Password: Password: lab Device2> \*Nov 17 12:51:11.407: SSH2 CLIENT 0: SSH2\_MSG\_USERAUTH\_SUCCESS message received \*Nov 17 12:51:11.407: SSH2 CLIENT 0: user authenticated \*Nov 17 12:51:11.407: SSH2 CLIENT 0: pty-req request sent \*Nov 17 12:51:11.411: SSH2 CLIENT 0: shell request sent \*Nov 17 12:51:11.411: SSH2 CLIENT0: user authenticated

#### Example: Enabling ChPass with a Blank Password Change

In the following example, the ChPass feature is enabled, and a blank password change is accomplished using the SSH Keyboard Interactive Authentication method. A TACACS+ access control server (ACS) is used as the back-end AAA server.

```
Devicel# ssh -1 cisco 10.1.1.3

Password:

Old Password: cisco

New Password: cisco123

Re-enter New password: cisco123

Device2> exit

[Connection to 10.1.1.3 closed by foreign host]
```

#### Example: Enabling ChPass and Changing the Password on First Login

In the following example, the ChPass feature is enabled and TACACS+ ACS is used as the back-end server. The password is changed on the first login using the SSH keyboard interactive authentication method.

```
Device1# ssh -1 cisco 10.1.1.3
Password: cisco
Your password has expired.
Enter a new one now.
New Password: cisco123
Re-enter New password: cisco123
Device2> exit
[Connection to 10.1.1.3 closed by foreign host]
Device1# ssh -1 cisco 10.1.1.3
Password:ciscol
Your password has expired.
Enter a new one now.
New Password: cisco
Re-enter New password: ciscol2
The New and Re-entered passwords have to be the same.
Try again.
New Password: cisco
```

```
Re-enter New password: cisco
Device2>
```

#### Example: Enabling ChPass and Expiring the Password After Three Logins

In the following example, the ChPass feature is enabled and TACACS+ ACS is used as the back-end AAA server. The password expires after three logins using the SSH keyboard interactive authentication method.

```
Device# ssh -1 cisco. 10.1.1.3
Password: cisco
Device2> exit
[Connection to 10.1.1.3 closed by foreign host]
Device1# ssh -1 cisco 10.1.1.3
Password: cisco
Device2> exit
Device1# ssh -1 cisco 10.1.1.3
Password: cisco
Device2> exit
[Connection to 10.1.1.3 closed by foreign host]
Device1# ssh -1 cisco 10.1.1.3
Password: cisco
Your password has expired.
Enter a new one now.
New Password: cisco123
Re-enter New password: ciscol23
```

Device2>

### Example: SNMP Debugging

The following is sample output from the **debug snmp packet** command. The output provides SNMP trap information for an SSH session.

```
Device1# debug snmp packet
SNMP packet debugging is on
Device1# ssh -1 lab 10.0.0.2
Password:
Device2# exit
[Connection to 10.0.0.2 closed by foreign host]
Device1#
*Jul 18 10:18:42.619: SNMP: Queuing packet to 10.0.0.2

Device1#
```

### Examples: SSH Debugging Enhancements

The following is sample output from the **debug ip ssh detail** command. The output provides debugging information about the SSH protocol and channel requests.

```
Device# debug ip ssh detail
```

```
00:04:22: SSH0: starting SSH control process
00:04:22: SSH0: sent protocol version id SSH-1.99-Cisco-1.25
00:04:22: SSH0: protocol version id is - SSH-1.99-Cisco-1.25
00:04:22: SSH2 0: SSH2 MSG KEXINIT sent
00:04:22: SSH2 0: SSH2_MSG_KEXINIT received
00:04:22: SSH2:kex: client->server enc:aes128-cbc mac:hmac-shal
00:04:22: SSH2:kex: server->client enc:aes128-cbc mac:hmac-sha1

# Where to Go Next

You have to use a SSH remote device that supports SSH Version 2, and you have to connect to a Cisco device.
