PPP Commands

This module provides command line interface (CLI) commands for configuring Point-to-Point Protocol (PPP) on the Cisco NCS 6000 Series Router.

To use commands of this module, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using any command, contact your AAA administrator for assistance.

PPP is a standard protocol used to send data over synchronous serial links. PPP also provides a Link Control Protocol (LCP) for negotiating properties of the link. LCP uses echo requests and responses to monitor the continuing availability of the link.

PPP provides the following Network Control Protocols (NCPs) for negotiating properties of data protocols that will run on the link:

- Cisco Discovery Protocol Control Protocol (CDPCP) to negotiate CDP properties
- IP Control Protocol (IPCP) to negotiate IP properties
- IP Version 6 Control Protocol (IPv6CP) to negotiate IPv6 properties
- Multiprotocol Label Switching Control Protocol (MPLSCP) to negotiate MPLS properties
- Open System Interconnection Control Protocol (OSICP) to negotiate OSI properties

- clear ppp sso state, on page 3
- clear ppp statistics, on page 4
- encapsulation ppp, on page 5
- group, on page 6
- peer ipv4 address, on page 7
- ppp authentication (BNG), on page 8
- ppp chap password, on page 11
- ppp chap refuse, on page 13
- ppp ipcp dns, on page 15
- ppp ipcp neighbor-route disable, on page 16
- ppp ipcp peer-address default, on page 17
- ppp max-bad-auth (BNG), on page 18
- ppp max-configure (BNG), on page 19
- ppp max-failure (BNG), on page 21
- ppp max-terminate, on page 23
- ppp ms-chap hostname, on page 24
- ppp ms-chap password, on page 25
• ppp ms-chap refuse, on page 26
• ppp multilink multiclass, on page 27
• ppp multilink multiclass local, on page 28
• ppp multilink multiclass remote apply, on page 29
• ppp pap refuse, on page 30
• ppp pap sent-username password, on page 32
• ppp timeout authentication, on page 34
• ppp timeout retry, on page 36
• security ttl, on page 37
• show ppp interfaces (BNG), on page 38
• show ppp sso alerts, on page 43
• show ppp sso state, on page 44
• show ppp sso summary, on page 46
• ssrp group, on page 48
• ssrp location, on page 49
• ssrp profile, on page 50
clear ppp sso state

To clear the replicated Inter-Chassis Stateful Switchover (ICSSO) states for the specified standby interface or for all interfaces on the specified node, use the `clear ppp sso state` command in XR EXEC mode.

```plaintext
clear ppp sso state {interface interface-path-id|all} location node-id
```

**Syntax Description**
- `interface interface-path-id`: Physical interface or virtual interface.
  - **Note**: Use the `show interfaces` command to see a list of all interfaces currently configured on the router.
  - Note: For more information about the syntax for the router, use the question mark (?) online help function.
- `all location node-id`: Specifies the full qualified path of a specific node in the format `rack/slot/module`.

**Command Default**
No default behavior or values

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.0.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
This command sets the PPP sessions in the Standby-Up state to the Standby-Down state. All replicated data received from the peer is purged, and SSRP Request messages are re-sent to the peer.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>ppp</td>
<td>execute</td>
</tr>
</tbody>
</table>

**Examples**
The following example shows how to clear the replicated ICSSO states for the specified standby interface:

```
RP/0/RP0/CPU0:router# clear ppp sso state interface 0/1/0/1
```

The following example shows how to clear the replicated Inter-Chassis Stateful Switchover (ICSSO) states for all interfaces on the specified node:

```
RP/0/RP0/CPU0:router# clear ppp sso state all location 1/0/1
```
clear ppp statistics

To clear all Point-to-Point Protocol (PPP) statistics for a PPP interface, use the `clear ppp statistics` command in XR EXEC mode.

```
clear ppp statistics interface interface-path-id
```

**Syntax Description**

<table>
<thead>
<tr>
<th>interface interface-path-id</th>
<th>Physical interface or virtual interface.</th>
</tr>
</thead>
</table>

**Note**

Use the `show interfaces` command to see a list of all interfaces currently configured on the router.

For more information about the syntax for the router, use the question mark (?) online help function.

**Command Default**

No default behavior or values

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 5.0.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

```
Task ID       Operations ID
ppp           execute
```

**Examples**

The following example shows how to clear PPP statistics for a PPP interface:

```
RP/0/RP0/CPU0:router# clear ppp statistics interface 0/1/0/1
```
encapsulation ppp

To enable encapsulation for communication with routers or bridges using the Point-to-Point Protocol (PPP), use the `encapsulation ppp` command in interface configuration mode. To disable PPP encapsulation, use the `no` form of this command.

```
encapsulation ppp
```

**Syntax Description**

This command has no keywords or arguments.

**Command Default**

PPP encapsulation is disabled.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.0.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `encapsulation ppp` command to enable PPP encapsulation on an interface.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ppp</td>
<td>read, write</td>
</tr>
<tr>
<td>interface</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to set up PPP encapsulation on interface POS 0/1/0/1:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# interface POS 0/1/0/1
RP/0/RP0/CPU0:router(config-if)# encapsulation ppp
```

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router# interface serial 0/0/1/2/4:3
RP/0/RP0/CPU0:router# encapsulation ppp
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show ppp interfaces (BNG), on page 38</td>
<td>Displays PPP state information for an interface.</td>
</tr>
</tbody>
</table>
To create a Session State Redundancy Protocol (SSRP) group and associate it with a profile, use the `group` command in XR Config mode. To remove this group, use the no form of this command.

```
group group-id profile profile_name [default]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>group-id</code></td>
<td>SSRP group identifier. The range is 1 to 65535.</td>
</tr>
<tr>
<td><code>profile</code></td>
<td>Profile to associate with this group.</td>
</tr>
<tr>
<td><code>default</code></td>
<td>Associates the group to the default profile.</td>
</tr>
</tbody>
</table>

**Command Default**

No default behavior or values

**Command Modes**

XR Config mode

**Command History**

Release 5.0.0  This command was introduced.

**Usage Guidelines**

Any interfaces on this card can be configured to use this group. The group number must be unique across the router.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ppp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to create an SSRP group:

```
RP/0/RP0/CPU0:router# config
RP/0/RP0/CPU0:router(config)# ssrp location 0/1/cpu0
RP/0/RP0/CPU0:router(config-ssrp-node)# group 1 profile default
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ssrp location, on page 49</td>
<td>specify the node on which to create a SSRP group and enter the SSRP node configuration mode.</td>
</tr>
</tbody>
</table>
peer ipv4 address

To configure the IPv4 address for a Session State Redundancy Protocol (SSRP) peer, use the `peer ipv4 address` command in SSRP configuration mode. To remove the address, use the no form of this command.

**Syntax Description**

```plaintext
peer ipv4 address  ip-address
```

- **ip-address**: IP address of the peer interface whose states will be replicated by SSRP.

**Command Default**

No default behavior or values

**Command Modes**

SSRP configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.0.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ppp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to configure the IPv4 address for a Session State Redundancy Protocol (SSRP) peer:

```
RP/0/RP0/CPU0:router# config
RP/0/RP0/CPU0:router(config)# ssrp profile Profile_1
RP/0/RP0/CPU0:router(config-ssrp)# peer ipv4 address 10.10.10.10
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ssrp profile, on page 50</code></td>
<td>Configures a SSRP profile and enters the SSRP configuration mode.</td>
</tr>
</tbody>
</table>
ppp authentication (BNG)

To enable Challenge Handshake Authentication Protocol (CHAP), MS-CHAP, or Password Authentication Protocol (PAP), and to specify the order in which CHAP, MS-CHAP, and PAP authentication is selected on the interface, use the **ppp authentication** command in an appropriate configuration mode. To disable PPP authentication, use the **no** form of this command.

```
ppp authentication protocol [protocol [protocol]] {list-name|default}
```

**Syntax Description**

- **protocol** (Name of the authentication protocol used for PPP authentication. See Table 1: PPP Authentication Protocols for Negotiation, on page 9 for the appropriate keyword. You may select one, two, or all three protocols, in any order.
- **list-name** (Optional) Used with authentication, authorization, and accounting (AAA). Name of a list of methods of authentication to use. If no list name is specified, the system uses the default. The list is created with the **aaa authentication ppp** command.
- **default** (Optional) Specifies the name of the list of methods created with the **aaa authentication ppp** command.

**Command Default**

PPP authentication is not enabled.

**Command Modes**

Interface configuration

Dynamic template configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.0.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you enable CHAP or PAP authentication (or both), the local router requires the remote device to prove its identity before allowing data traffic to flow. PAP authentication requires the remote device to send a name and a password, which is checked against a matching entry in the local username database or in the remote security server database. CHAP authentication sends a challenge message to the remote device. The remote device encrypts the challenge value with a shared secret and returns the encrypted value and its name to the local router in a response message. The local router attempts to match the remote device’s name with an associated secret stored in the local username or remote security server database; it uses the stored secret to encrypt the original challenge and verify that the encrypted values match.

You can enable CHAP, MS-CHAP, or PAP in any order. If you enable all three methods, the first method specified is requested during link negotiation. If the peer suggests using the second method, or refuses the first method, the second method is tried. Some remote devices support only one method. Base the order in which you specify methods on the remote device’s ability to correctly negotiate the appropriate method, and on the level of data line security you require. PAP usernames and passwords are sent as clear text strings, which can be intercepted and reused.

To enter the dynamic template configuration mode, run **dynamic-template** command in the XR Config mode.
If you use a `list-name` value that was not configured with the `aaa authentication ppp` command, then authentication does not complete successfully and the line does not come up.

Note

Table 1: PPP Authentication Protocols for Negotiation, on page 9 lists the protocols used to negotiate PPP authentication.

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>chap</td>
<td>Enables CHAP on an interface.</td>
</tr>
<tr>
<td>ms-chap</td>
<td>Enables Microsoft’s version of CHAP (MS-CHAP) on an interface.</td>
</tr>
<tr>
<td>pap</td>
<td>Enables PAP on an interface.</td>
</tr>
</tbody>
</table>

Enabling or disabling PPP authentication does not affect the ability of the local router to authenticate itself to the remote device.

MS-CHAP is the Microsoft version of CHAP. Like the standard version of CHAP, MS-CHAP is used for PPP authentication. In this case, authentication occurs between a personal computer using Microsoft Windows NT or Microsoft Windows 95 and a Cisco router or access server acting as a network access server.

Enabling or disabling PPP authentication does not affect the local router authenticating itself to the remote device.

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ppp</td>
<td>read, write</td>
</tr>
<tr>
<td>aaa</td>
<td>read, write</td>
</tr>
</tbody>
</table>

Examples

In this example, CHAP is enabled on POS 0/4/0/1 and uses the authentication list MIS-access:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# interface POS 0/4/0/1
RP/0/RP0/CPU0:router(config-if)# encapsulation ppp
RP/0/RP0/CPU0:router(config-if)# ppp authentication chap MIS-access
```

This is an example of configuring the `ppp authentication` command:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# dynamic-template type ppp pl
RP/0/RP0/CPU0:router(config-dynamic-template-type)# ppp authentication chap ms-chap pap
```
### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>aaa authentication ppp</code></td>
<td>Specifies one or more AAA authentication methods for use on serial interfaces running PPP.</td>
</tr>
<tr>
<td><code>encapsulation</code></td>
<td>Sets the encapsulation method used by the interface.</td>
</tr>
<tr>
<td><code>username</code></td>
<td>Configures a new user with a username, establishes a password, and grants permissions for the user.</td>
</tr>
</tbody>
</table>
**ppp chap password**

To enable a router calling a collection of routers to configure a common Challenge Handshake Authentication Protocol (CHAP) secret password, use the `ppp chap password` command in interface configuration mode. To disable the password, use the `no` form of this command.

```
ppp chap password [clear|encrypted] password
```

**Syntax Description**

- `clear` (Optional) Specifies the cleartext encryption parameter for the password.
- `encrypted` (Optional) Indicates that the password is already encrypted.
- `password` Cleartext or already-encrypted password.

**Command Default**
The password is disabled.

**Command Modes**
Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.0.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The `ppp chap password` command is sent in CHAP responses and is used by the peer to authenticate the local router. This does not affect local authentication of the peer. This command is useful for routers that do not support this command (such as routers running older Cisco IOS XR images).

The CHAP secret password is used by the routers in response to challenges from an unknown peer.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>PPP</td>
<td>read, write</td>
</tr>
<tr>
<td>AAA</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

In this example, a password (xxxx) is entered as a cleartext password:

```
RP/0/RP0/CPU0:router(config-if)# ppp chap password xxxx
```

When the password is displayed (as shown in the following example, using the `show running-config` command), the password xxxx appears as 030752180500:

```
RP/0/RP0/CPU0:router(config)# show running-config interface POS 1/0/1/0
interface POS0/1/4/2
```
description Connected to P1 POS 0/1/4/3
ipv4 address 10.12.32.2 255.255.255.0
encapsulation ppp
ppp authentication chap pap
ppp chap password encrypted 030752180500

On subsequent logins, entering any of the three following commands would have the same effect of making xxxx the password for remote CHAP authentication:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# interface POS 1/0/1/0
RP/0/RP0/CPU0:router(config-if)# ppp chap password xxxx
RP/0/RP0/CPU0:router(config-if)# ppp chap password clear xxxx
RP/0/RP0/CPU0:router(config-if)# ppp chap password encrypted 1514190900
```

### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>aaa authentication ppp</td>
<td>Specifies one or more authentication, authorization, and accounting (AAA) methods for use on serial interfaces running PPP.</td>
</tr>
<tr>
<td>ppp authentication (BNG), on page 8</td>
<td>Enables CHAP, MS-CHAP, or PAP, and specifies the order in which CHAP, MS-CHAP, and PAP authentication is selected on the interface.</td>
</tr>
<tr>
<td>ppp chap refuse, on page 13</td>
<td>Refuses CHAP authentication from peers requesting it.</td>
</tr>
<tr>
<td>ppp max-bad-auth (BNG), on page 18</td>
<td>Configures a PPP interface not to reset itself immediately after an authentication failure but instead to allow a specified number of authentication retries.</td>
</tr>
<tr>
<td>show running-config</td>
<td>Displays the contents of the currently running configuration file or the configuration for a specific interface, or map class information.</td>
</tr>
</tbody>
</table>
ppp chap refuse

To refuse Challenge Handshake Authentication Protocol (CHAP) authentication from peers requesting it, use the `ppp chap refuse` command in interface configuration mode. To allow CHAP authentication, use the `no` form of this command.

```
ppp chap refuse
```

**Syntax Description**
This command has no keywords or arguments.

**Command Default**
CHAP authentication is disabled.

**Command Modes**
Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.0.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The `ppp chap refuse` command specifies that CHAP authentication is disabled for all calls, meaning that all attempts by the peer to force the user to authenticate using CHAP are refused.

If outbound Password Authentication Protocol (PAP) has been configured (using the `ppp authentication` command), PAP is suggested as the authentication method in the refusal packet.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ppp</td>
<td>read, write</td>
</tr>
<tr>
<td>aaa</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**
The following example shows how to specify POS interface 0/3/0/1 and disable CHAP authentication from occurring if a peer calls in requesting CHAP authentication. The method of encapsulation on the interface is PPP.

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# interface POS 0/3/0/1
RP/0/RP0/CPU0:router(config-if)# encapsulation ppp
RP/0/RP0/CPU0:router(config-if)# ppp chap refuse
```

**Related Commands**

</tbody>
</table>
ppp ipcp dns

To configure the primary and secondary Domain Name System (DNS) IP addresses for the Internet Protocol Control Protocol (IPCP), use the **ppp ipcp dns** command in interface configuration mode. To remove the addresses, use the no form of this command.

```
ppp ipcp dns  primary-ip-address  [sec-ip-address]
```

**Syntax Description**

- **primary-ip-address**: Primary DNS IP address, in the format A.B.C.D.
- **sec-ip-address**: Secondary DNS IP address, in the format W.X.Y.Z.

**Command Default**

No default behavior or values

**Command Modes**

Interface configuration

**Command History**

Release 5.0.0

This command was introduced.

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ppp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to configure the primary and secondary DNS IP addresses for Internet Protocol Control Protocol (IPCP):

```
RP/0/RP0/CPU0:router# config
RP/0/RP0/CPU0:router(config)# interface serial 0/1/0/1
RP/0/RP0/CPU0:router(config-if)# ppp ipcp dns 10.10.10.10 10.10.10.11
```
ppp ipcp neighbor-route disable

To disable installation of a route to the peer address negotiated by Internet Protocol Control Protocol (IPCP), use the **ppp ipcp neighbor-route disable** command in interface configuration mode. To re-enable installation of a route to the peer address negotiated by IPCP, use the no form of this command.

**Syntax Description**

This command has no keywords or arguments.

**Command Default**

No default behavior or values

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ppp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to disable installation of a route to the peer address negotiated by IPCP:

```
RP/0/RP0/CPU0:router# config
RP/0/RP0/CPU0:router(config)# interface serial 0/1/0/1
RP/0/RP0/CPU0:router(config-if)# ppp ipcp neighbor-route disable
```
ppp ipcp peer-address default

To specify the default IPv4 address that is assigned to the peer by the Internet Protocol Control Protocol (IPCP), use the **ppp ipcp peer-address default** command in interface configuration mode. To remove the address, use the no form of this command.

```
ppp ipcp peer-address default  ip-address
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>

<table>
<thead>
<tr>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>The following example shows how to specify the default IPv4 address that is assigned to the peer by IPCP.</td>
</tr>
</tbody>
</table>

```
RP/0/RP0/CPU0:router# config
RP/0/RP0/CPU0:router(config)# interface serial 0/1/0/1
RP/0/RP0/CPU0:router(config-if)# ppp ipcp peer-address default 10.10.10.10
```
ppp max-bad-auth (BNG)

To configure a PPP interface not to reset itself immediately after an authentication failure but instead to allow a specified number of authentication retries, use the `ppp max-bad-auth` command in the appropriate configuration mode. To reset to the default of immediate reset, use the `no` form of this command.

```
ppp max-bad-auth retries
```

**Syntax Description**

- `retries` Number of retries after which the interface is to reset itself. Range is from 0 to 10. Default is 0 retries.

**Command Default**

- `retries`: 0

**Command Modes**

- Interface configuration
- Dynamic template configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.0.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `ppp max-bad-auth` command applies to any interface on which PPP encapsulation is enabled.

To enter the dynamic template configuration mode, run `dynamic-template` command in the XR Config mode.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ppp</td>
<td>read, write</td>
</tr>
<tr>
<td>aaa</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

In this example, POS interface 0/3/0/1 is set to allow two additional retries after an initial authentication failure (for a total of three failed authentication attempts):

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# interface POS 0/3/0/1
RP/0/RP0/CPU0:router(config-if)# encapsulation ppp
RP/0/RP0/CPU0:router(config-if)# ppp authentication chap
RP/0/RP0/CPU0:router(config-if)# ppp max-bad-auth 3
```

This example shows how to allow two additional retries after an initial authentication failure in the dynamic template configuration mode:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# dynamic-template type ppp p1
RP/0/RP0/CPU0:router(config-dynamic-template-type)# ppp max-configure 5
```
**ppp max-configure (BNG)**

To specify the maximum number of configure requests to attempt (without response) before stopping the requests, use the `ppp max-configure` command in an appropriate configuration mode. To disable the maximum number of configure requests and return to the default, use the `no` form of this command.

```
ppp max-configure retries
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>retries</td>
<td>Maximum number of retries. Range is 4 through 20. Default is 10.</td>
</tr>
</tbody>
</table>

**Command Default**

- `retries`: 10

**Command Modes**

- Interface configuration
- Dynamic template configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.0.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `ppp max-configure` command to specify how many times an attempt is made to establish a Link Control Protocol (LCP) session between two peers for a particular interface. If a configure request message receives a reply before the maximum number of configure requests are sent, further configure requests are abandoned.

To enter the dynamic template configuration mode, run `dynamic-template` command in the XR Config mode.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ppp</td>
<td>read, write</td>
</tr>
<tr>
<td>aaa</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

This example shows a limit of four configure requests:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# interface POS 0/3/0/1
RP/0/RP0/CPU0:router(config-if)# encapsulation ppp
RP/0/RP0/CPU0:router(config-if)# ppp max-configure 4
```

This example shows how a limit of four configure requests is specified in the dynamic template configuration mode:

```
RP/0/RP0/CPU0:router# configure
```
### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ppp max-failure (BNG), on page 21</td>
<td>Configures the maximum number of consecutive CONFNAKs to permit before terminating a negotiation.</td>
</tr>
</tbody>
</table>
**ppp max-failure (BNG)**

To configure the maximum number of consecutive Configure Negative Acknowledgments (CONFNAKs) to permit before terminating a negotiation, use the `ppp max-failure` command in an appropriate configuration mode. To disable the maximum number of CONFNAKs and return to the default, use the `no` form of this command.

```plaintext
ppp max-failure retries
```

**Syntax Description**

- `retries`: Maximum number of CONFNAKs to permit before terminating a negotiation. Range is from 2 to 10. Default is 5.

**Command Default**

`retries`: 5

**Command Modes**

- Interface configuration
- Dynamic template configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.0.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To enter the dynamic template configuration mode, run `dynamic-template` command in the mode.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ppp</td>
<td>read, write</td>
</tr>
<tr>
<td>aaa</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The `ppp max-failure` command specifies that no more than three CONFNAKs are permitted before terminating the negotiation:

```plaintext
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# interface POS 0/3/0/1
RP/0/RP0/CPU0:router(config-if)# encapsulation ppp
RP/0/RP0/CPU0:router(config-if)# ppp max-failure 3
```

This example shows how no more than three CONFNAKs are permitted before terminating the negotiation in the dynamic template configuration mode:
The image contains a page from a document discussing the `ppp max-failure` command. The context includes a router configuration example and an explanation of the command's usage. Below is the extracted textual content in a structured format:

```plaintext
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# dynamic-template type ppp p1
RP/0/RP0/CPU0:router(config-dynamic-template-type)# ppp max-failure 4
```

The related commands table is as follows:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="#ppp-max-failure-bng">PPP Commands</a></td>
<td>Specifies the maximum number of configure requests to attempt (without response) before stopping the requests.</td>
</tr>
<tr>
<td><strong>ppp max-failure (BNG), on page 19</strong></td>
<td></td>
</tr>
</tbody>
</table>
```
**ppp max-terminate**

To configure the maximum number of terminate requests (TermReqs) to send without reply before closing down the Link Control Protocol (LCP) or Network Control Protocol (NCP), use the `ppp max-terminate` command in interface configuration mode. To disable the maximum number of TermReqs and return to the default, use the `no` form of this command.

```
ppp max-terminate number
```

**Syntax Description**

- `number`: Maximum number of TermReqs to send without reply before closing down the LCP or NCP. Range is from 2 to 10. Default is 2.

**Command Default**

- `number`: 2

**Command Modes**

- Interface configuration

**Command History**

- **Release**: 5.0.0
  - This command was introduced.

**Usage Guidelines**

- No specific guidelines impact the use of this command.

**Task ID**

- **Task ID**: read, write

**Examples**

In the following example, a maximum of five TermReqs are specified to be sent before terminating and closing LCP or NCP:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# interface POS 0/3/0/1
RP/0/RP0/CPU0:router(config-if)# encapsulation ppp
RP/0/RP0/CPU0:router(config-if)# ppp max-terminate 5
```

</tbody>
</table>
**ppp ms-chap hostname**

To configure the hostname for MS-CHAP authentication on an interface, use the `ppp ms-chap hostname` command in interface configuration mode. To remove the hostname, use the `no` form of this command.

```
ppp ms-chap hostname hostname
```

**Syntax Description**

- `hostname` Specifies the hostname for MS-CHAP authentication.

**Command Default**

No default behavior or values

**Command Modes**

Interface configuration

**Command History**

- **Release** 5.0.0
  - This command was introduced.

**Usage Guidelines**

No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ppp</td>
<td>read, write</td>
</tr>
<tr>
<td>aaa</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to configure the hostname for MS-CHAP authentication on an interface:

```
RP/0/RP0/CPU0:router(config-if)# ppp ms-chap hostname Host_1
```
**ppp ms-chap password**

To configure a common Microsoft Challenge Handshake Authentication (MS-CHAP) secret password, use the `ppp ms-chap password` command in interface configuration mode. To disable the password, use the `no` form of this command.

```
ppp ms-chap password [{clear|encrypted}] password
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear</td>
<td>(Optional) Specifies the cleartext encryption parameter for the password.</td>
</tr>
<tr>
<td>encrypted</td>
<td>(Optional) Indicates that the password is already encrypted.</td>
</tr>
<tr>
<td>password</td>
<td>Cleartext or already-encrypted password.</td>
</tr>
</tbody>
</table>

**Command Default**

The password is disabled.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.0.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `ppp ms-chap password` command is sent in CHAP responses and is used by the peer to authenticate the local router. This does not affect local authentication of the peer. The `ppp ms-chap password` command is useful for routers that do not support this command (such as routers running older software images). The MS-CHAP secret password is used by the routers in response to challenges from an unknown peer.

**Task ID**

<table>
<thead>
<tr>
<th>Task</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ppp</td>
<td>read,</td>
</tr>
<tr>
<td></td>
<td>write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to enter a password (xxxx) as a cleartext password:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# interface POS 0/3/0/1
RP/0/RP0/CPU0:router(config-if)# encapsulation ppp
RP/0/RP0/CPU0:router(config-if)# ppp ms-chap password clear xxxx
```
**ppp ms-chap refuse**

To refuse Microsoft Challenge Handshake Authentication Protocol (MS-CHAP) authentication from peers requesting it, use the `ppp ms-chap refuse` command in interface configuration mode. To allow MS-CHAP authentication, use the `no` form of this command.

**Syntax Description**
This command has no keywords or arguments.

**Command Default**
MS-CHAP authentication is disabled.

**Command Modes**
Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 5.0.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The `ppp ms-chap refuse` command specifies that MS-CHAP authentication is disabled for all calls, meaning that all attempts by the peer to force the user to authenticate using MS-CHAP are refused.

If outbound Password Authentication Protocol (PAP) has been configured (using the `ppp authentication` command), PAP is suggested as the authentication method in the refusal packet.

**Examples**
This example shows how to specify POS interface 0/3/0/1 and disable MS-CHAP authentication from occurring if a peer calls in requesting MS-CHAP authentication. The method of encapsulation on the interface is PPP.

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# interface POS 0/3/0/1
RP/0/RP0/CPU0:router(config-if)# encapsulation ppp
RP/0/RP0/CPU0:router(config-if)# ppp ms-chap refuse
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ppp authentication (BNG), on page 8</code></td>
<td>Enables CHAP, MS-CHAP, or PAP, and specifies the order in which CHAP, MS-CHAP, and PAP authentication is selected on the interface.</td>
</tr>
</tbody>
</table>
**ppp multilink multiclass**

To enable multiclass multilink PPP, use the **ppp multilink multiclass** command in interface configuration mode. To disable multiclass multilink PPP, use the no form of this command.

**Syntax Description**
This command has no keywords or arguments.

**Command Default**
No default behavior or values

**Command Modes**
Interface configuration

**Command History**
Release 5.0.0 This command was introduced.

**Usage Guidelines**
No specific guidelines impact the use of this command.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ppp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**
The following example shows how to enable multiclass multilink PPP:

```
RP/0/RP0/CPU0:router# config
RP/0/RP0/CPU0:router(config)# interface Multilink 0/1/0/0/1
RP/0/RP0/CPU0:router(config-if)# ppp multilink multiclass
```
**ppp multilink multiclass local**

To configure the initial number and maximum number of Multiclass Multilink PPP (MCMP) receive classes in a Conf-Request sent from a local host to its peer, use the `ppp multilink multiclass local` command in interface configuration mode. To remove these settings, use the no form of this command.

```
ppp multilink multiclass local initial init-number maximum max-number
```

<table>
<thead>
<tr>
<th><strong>Syntax Description</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><code>initial init-number</code></td>
<td>Specifies the initial number of receive classes in the Conf-Request. The range is 1 to 16.</td>
</tr>
<tr>
<td><code>maximum max-number</code></td>
<td>Specifies the maximum number of receive classes in the Conf-Request. The range is 1 to 16.</td>
</tr>
</tbody>
</table>

**Command Default**

When MCMP is enabled, the default `initial` value is 2 and the default `maximum` value is 4.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.0.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The maximum number of receive classes configures the number of transmission classes on the local host.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ppp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to configure the initial number and maximum number of Multiclass Multilink PPP (MCMP) receive classes in a Conf-Request sent from a local host to its peer:

```
RP/0/RP0/CPU0:router# config
RP/0/RP0/CPU0:router(config)# interface Multilink 0/1/0/0/1
RP/0/RP0/CPU0:router(config-if)# ppp multilink multiclass local initial 1 maximum 16
```
ppp multilink multiclass remote apply

To configure the minimum number of Multiclass Multilink PPP (MCMP) receive classes that a local host will accept from its peer in a Conf-Request, use the `ppp multilink multiclass` command in interface configuration mode. To remove this setting, use the no form of this command.

```
ppp multilink multiclass remote apply  min-number
```

**Syntax Description**

`min-number` Specifies the minimum number of receive classes in the Conf-Request. The range is 1 to 16.

**Command Default**

The default is 2 if MCMP is enabled.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.0.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is used to coerce the peer to accept a minimum number of MCMP classes. If the peer does not accept the minimum number of MCMP classes specified by this command, the local router will not bring up the PPP link.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ppp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to use the `ppp multilink multicast remove apply` command.

```
RP/0/RP0/CPU0:router# config
RP/0/RP0/CPU0:router(config)# interface Multilink 0/1/0/0/1
RP/0/RP0/CPU0:router(config-if)# ppp multilink multiclass remote apply 16
```

**ppp pap refuse**

To refuse Password Authentication Protocol (PAP) authentication from peers requesting it, use the **ppp pap refuse** command in interface configuration mode. To allow PAP authentication, use the **no** form of this command.

**ppp pap refuse**

**Syntax Description**

This command has no keywords or arguments.

**Command Default**

PAP authentication is disabled.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 5.0.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The **ppp pap refuse** command specifies that PAP authentication is disabled for all calls, meaning that all attempts by the peer to force the user to authenticate using PAP are refused.

If outbound Challenge Handshake Authentication Protocol (CHAP) has been configured (using the **ppp authentication** command), CHAP is suggested as the authentication method in the refusal packet.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ppp</td>
<td>read, write</td>
</tr>
<tr>
<td>aaa</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to specify POS 0/3/0/1 using PPP encapsulation on the interface. This example shows PAP authentication being specified as disabled if a peer calls in requesting PAP authentication.

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# interface POS 0/3/0/1
RP/0/RP0/CPU0:router(config-if)# encapsulation ppp
RP/0/RP0/CPU0:router(config-if)# ppp pap refuse
```

**Related Commands**

<table>
<thead>
<tr>

### PPP Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ppp authentication (BNG), on page 8</strong></td>
<td>Enables CHAP, MS-CHAP, or PAP, and specifies the order in which CHAP, MS-CHAP, and PAP authentication is selected on the interface.</td>
</tr>
<tr>
<td><strong>ppp max-bad-auth (BNG), on page 18</strong></td>
<td>Configures a PPP interface not to reset itself immediately after an authentication failure but instead to allow a specified number of authentication retries.</td>
</tr>
<tr>
<td><strong>ppp pap sent-username password, on page 32</strong></td>
<td>Enables remote PAP support for an interface, and includes the sent-username and password commands in the PAP authentication request packet to the peer.</td>
</tr>
</tbody>
</table>
**ppp pap sent-username password**

To enable remote Password Authentication Protocol (PAP) support for an interface, and to use the values specified for username and password in the PAP authentication request, use the `ppp pap sent-username password` command in interface configuration mode. To disable remote PAP support, use the `no` form of this command.

```
ppp pap sent-username username password [{clear|encrypted}] password
```

**Syntax Description**

- `username`  Username sent in the PAP authentication request.
- `clear`  (Optional) Specifies the cleartext encryption parameter for the password.
- `encrypted`  (Optional) Indicates that the password is already encrypted.
- `password`  Cleartext or already-encrypted password.

**Command Default**

Remote PAP support is disabled.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.0.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `ppp pap sent-username password` command to enable remote PAP support (for example, to respond to the peer’s request to authenticate with PAP) and to specify the parameters to be used when sending the PAP authentication request.

You must configure the `ppp pap sent-username password` command for each interface.

**Examples**

In the following example, a password is entered as a cleartext password, xxxx:

```
RP/0/RP0/CPU0:router(config-if)# ppp pap sent-username xxxx password notified
```

When the password is displayed (as shown in the following example, using the `show running-config` command), the password notified appears as 05080F1C2243:
RP/0/RP0/CPU0:router(config-if)# show running-config

interface POS0/1/0/0
description Connected to P1 POS 0/1/4/2
ipv4 address 10.12.32.2 255.255.255.0
encapsulation ppp
ppp pap sent-username P2 password encrypted 05080F1C2243

On subsequent logins, entering any of the three following commands would have the same effect of making xxxx the password for remote PAP authentication:

RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# interface POS 0/1/0/0
RP/0/RP0/CPU0:router(config-if)# ppp pap sent-username xxxx password notified
RP/0/RP0/CPU0:router(config-if)# ppp pap sent-username xxxx password clear notified
RP/0/RP0/CPU0:router(config-if)# ppp pap sent-username xxxx encrypted 1514190900

Related Commands

<td>Sets PPP authentication timeout parameters.</td>
</tr>
<tr>
<td>show running-config</td>
<td>Displays the contents of the currently running configuration file or the configuration for a specific interface, or map class information.</td>
</tr>
</tbody>
</table>
**ppp timeout authentication**

To set PPP authentication timeout parameters, use the `ppp timeout authentication` command in interface configuration mode. To reset the default value, use the `no` form of this command.

```
ppp timeout authentication seconds
```

**Syntax Description**

- `seconds` Maximum time, in seconds, to wait for a response to an authentication packet. Range is from 3 to 30 seconds. Default is 10 seconds.

**Command Default**

- `seconds`: 10

**Command Modes**

- Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.0.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The default authentication time is 10 seconds, which should allow time for a remote router to authenticate and authorize the connection and provide a response. However, it is also possible that it will take much less time than 10 seconds. In such cases, use the `ppp timeout authentication` command to lower the timeout period to improve connection times in the event that an authentication response is lost.

**Note**

- The timeout affects connection times only if packets are lost.

**Note**

- Although lowering the authentication timeout is beneficial if packets are lost, sending authentication requests faster than the peer can handle them results in churn and a slower connection time.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ppp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

In the following example, PPP timeout authentication is set to 20 seconds:

```
RP/0/RP0/CPU0:router(config-if)# ppp timeout authentication 20
```
### PPP Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>

</thead>
<tbody>
<tr>
<td><strong>aaa authentication ppp</strong></td>
<td>Specifies one or more authentication, authorization, and accounting (AAA) methods for use on serial interfaces running PPP.</td>
</tr>
<tr>
<td><strong>ppp authentication (BNG), on page 8</strong></td>
<td>Enables CHAP, MS-CHAP, or PAP, and specifies the order in which CHAP, MS-CHAP, and PAP authentication is selected on the interface.</td>
</tr>
</tbody>
</table>
ppp timeout retry

To set PPP timeout retry parameters, use the `ppp timeout retry` command in interface configuration mode. To reset the time value, use the `no` form of this command.

```
ppp timeout retry seconds
```

**Syntax Description**

- `seconds`: Maximum time, in seconds, to wait for a response during PPP negotiation. Range is from 1 to 10 seconds. Default is 3 seconds.

**Command Default**

```
seconds: 3
```

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.0.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `ppp timeout retry` command is useful for setting a maximum amount of time PPP should wait for a response to any control packet it sends.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ppp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows the retry timer being set to 8 seconds:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# interface POS 0/3/0/1
RP/0/RP0/CPU0:router(config-if)# encapsulation ppp
RP/0/RP0/CPU0:router(config-if)# ppp timeout retry 8
```
security ttl

To specify that the time-to-live (TTL) value in the IP header of the packet is used to validate that a packet is from the expected source, use the `security ttl` command in SSRP configuration mode. To remove the TTL requirement, use the no form of this command.

```
security ttl max-hops number
```

**Syntax Description**

- `max-hops number`  Maximum number of hops between the peer routers.

**Command Default**

The `max-hops` default is 255.

**Command Modes**

SSRP configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.0.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If `max-hops` is not specified, the TTL value must be 255 for a packet to be accepted.

**Task ID**

- Task ID: ppp
  - Operations: read, write

**Examples**

The following example shows how to specify that the time-to-live (TTL) value in the IP header of a packet is used to validate that the packet is from the expected source:

```
RP/0/RP0/CPU0:router# config
RP/0/RP0/CPU0:router(config)# ssrp profile Profile_1
RP/0/RP0/CPU0:router(config-ssrp)# peer ipv4 address 10.10.10.10
RP/0/RP0/CPU0:router(config-ssrp)# security ttl max-hops number 50
```
show ppp interfaces (BNG)

To display PPP state information for an interface, use the `show ppp interfaces` command in XR EXEC mode.

```
show ppp interfaces {brief|detail} \{all|type interface-path-id|location node-id\}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>brief</td>
<td>(Optional) Displays brief output for all interfaces on the router, for a specific POS interface instance, or for all interfaces on a specific node.</td>
</tr>
<tr>
<td>detail</td>
<td>(Optional) Displays detailed output for all interfaces on the router, for a specific interface instance, or for all interfaces on a specific node.</td>
</tr>
<tr>
<td>all</td>
<td>(Optional) Displays detailed PPP information for all nodes.</td>
</tr>
<tr>
<td>location node-id</td>
<td>(Optional) Displays detailed PPP information for the designated node. The <code>node-id</code> argument is entered in the rack/slot/module notation.</td>
</tr>
<tr>
<td>all</td>
<td>(Optional) Displays detailed PPP information for the designated node. The <code>node-id</code> argument is entered in the rack/slot/module notation.</td>
</tr>
</tbody>
</table>

**Command Default**

No default behavior or values

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.0.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

There are seven possible PPP states applicable for either the Link Control Protocol (LCP) or the Network Control Protocol (NCP).

The command output displays a summary of the interface as it is in the PPP Interface Descriptor Block (IDB). The output includes the following information (where applicable):

- Interface state
- Line protocol state
- Link Control Protocol (LCP) state
- Network Control Protocol (NCP) state
• Multilink PPP state
• Multilink PPP configuration
• Keepalive configuration
• Authentication configuration
• Negotiated MRUs
• Negotiated IP addresses

This command can display information for a single interface, all interfaces on a specified node, or all interfaces on the router.

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations Task ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>ppp</td>
<td>read</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to display PPP state information for a POS interface:

```
RP/0/RP0/CPU0:router# show ppp interface POS 0/2/0/3
POS0/2/0/3 is up, line protocol is up
  LCP: Open
  Keepalives enabled (10 sec)
  Local MRU: 4470 bytes
  Peer MRU: 4470 bytes
  Authentication
    Of Us: CHAP (Completed as 'test-user')
    Of Peer: PAP (Completed as 'peer-user')
  CDP: Listen
  IPCP: Open
    Local IPv4 address: 55.0.0.1
    Peer IPv4 address: 55.0.0.2
    Peer DNS Primary: 55.0.0.254
    Peer DNS Secondary: 155.0.0.254
  IPv6: Open
    Local IPv6 address: fe80::3531:35ff:fe55:5747/128
    Peer IPv6 address: fe80::3531:35ff:fe55:4213/128
  MPLS: Stopped
```

This example shows how to display PPP state information for a POS interface that is running as a Layer 2 attachment circuit:

```
RP/0/0/CPU0:# show ppp interface POS0/2/0/2
POS0/2/0/2 is up, line protocol is up
  LCP: Open
    Running as L2 AC
```

This example shows how to display PPP state information for a multilink interface:

```
RP/0/RP0/CPU0:router:# show ppp interface Multilink 0/3/0/0/100
Multilink0/3/0/0/100 is up, line protocol is down
  LCP: Open
    SSO-State: Standby-Up
    Keepalives disabled
  IPCP: Open
```
SSO-State: Standby-Up
Local IPv4 address: 100.0.0.1
Peer IPv4 address: 100.0.0.2
IPV6CP: Open
Local IPv6 address: fe80::3531:35ff:fe55:4600/128
Peer IPv6 address: fe80::3531:35ff:fe55:3215/128
Multilink
Local MRRU: 1500 bytes
Peer MRRU: 1500 bytes
Local Endpoint Discriminator: 1234567812345678
Peer Endpoint Discriminator: 1111222233334444
MCMP classes: Local 4, Remote 2
Member links: 2 active, 6 inactive (min-active 2)
- Serial0/3/1/3/1 ACTIVE
- Serial0/3/1/3/2 ACTIVE
- Serial0/3/1/3/3 INACTIVE : LCP not negotiated
- Serial0/3/1/3/4 INACTIVE : Mismatching peer endpoint

This example shows how to display PPP state information for a serial interface:

RP/0/RP0/CPU0:router# show ppp interface Serial 0/3/1/3/1

Serial0/3/1/3/1 is down, line protocol is down
LCP: Open
SSO-State: Standby-Up
Keepalives enabled (10 sec)
Local MRU: 1500 bytes
Peer MRU: 1500 bytes
Local Bundle MRU: 1500 bytes
Peer Bundle MRU: 1500 bytes
Local Endpoint Discriminator: 1234567812345678
Peer Endpoint Discriminator: 1111222233334444
Local MCMP Classes: Not negotiated
Remote MCMP Classes: Not negotiated
Authentication
Of Us: CHAP (Completed as 'test-user')
Of Peer: PAP (Completed as 'peer-user')
Multilink
Multilink group id: 100
Member status: ACTIVE

Table 2: show ppp interfaces Field Descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ack-Rcvd</td>
<td>Configuration acknowledgment was received; waiting for peer to send configuration request.</td>
</tr>
<tr>
<td>Ack-Sent</td>
<td>Configuration acknowledgment was sent; waiting for peer to respond to configuration request.</td>
</tr>
<tr>
<td>Authentication</td>
<td>Type of user authentication configured on the local equipment and on the peer equipment. Possible PPP authentication protocols are Challenge Handshake Authentication Protocol (CHAP), MS-CHAP, and Password Authentication Protocol (PAP).</td>
</tr>
<tr>
<td>Closed</td>
<td>Lower layer is up, but this layer is not required.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Closing</td>
<td>Shutting down due to local change.</td>
</tr>
<tr>
<td>Initial</td>
<td>Connection is idle.</td>
</tr>
<tr>
<td>IPCP</td>
<td>IP Control Protocol (IPCP) state. The seven possible states that may be displayed are as follows:</td>
</tr>
<tr>
<td></td>
<td>• Initial—Lower layer is unavailable (Down), and no Open has occurred. The Restart timer is not running in the Initial state.</td>
</tr>
<tr>
<td></td>
<td>• Starting—An administrative Open has been initiated, but the lower layer is still unavailable (Down). The Restart timer is not running in the Starting state. When the lower layer becomes available (Up), a Configure-Request is sent.</td>
</tr>
<tr>
<td></td>
<td>• Closed—IPCP is not currently trying to negotiate.</td>
</tr>
<tr>
<td></td>
<td>• Stopped—A Terminate-Request has been sent and the Restart timer is running, but a Terminate-Ack has not yet been received.</td>
</tr>
<tr>
<td></td>
<td>• Closing—A Terminate-Request has been sent and the Restart timer is running, but a Terminate-Ack has not yet been received. Upon reception of a Terminate-Ack, the Closed state is entered. Upon the expiration of the Restart timer, a new Terminate-Request is transmitted, and the Restart timer is restarted. After the Restart timer has expired Max-Terminate times, the Closed state is entered.</td>
</tr>
<tr>
<td></td>
<td>• Stopping—A Terminate-Request has been sent and the Restart timer is running, but a IPCP-Ack has not yet been received. Req-Sent.</td>
</tr>
<tr>
<td></td>
<td>• ACKsent—IPCP has received a request and has replied to it.</td>
</tr>
<tr>
<td></td>
<td>• ACKrcvd—IPCP has received a reply to a request it sent.</td>
</tr>
<tr>
<td></td>
<td>• Open—IPCP is functioning properly.</td>
</tr>
<tr>
<td>Keepalive</td>
<td>Keepalive setting and interval in seconds for echo request packets.</td>
</tr>
<tr>
<td>LCP</td>
<td>Indicates the current state of LCP. The state of the LCP will report the following states:</td>
</tr>
<tr>

</tbody>
</table>
**show ppp sso alerts**

To display all Inter-Chassis Stateful Switchover (ICSSO) alerts that have occurred, use the `show ppp sso alerts` command in XR EXEC mode.

```
show ppp sso alerts location node-id
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>location</td>
<td>Specifies the full qualified path of a specific node in the format <code>rack/slot/module</code>.</td>
</tr>
</tbody>
</table>

**Command Default**

No default behavior or values

**Command History**

Release 5.0.0 This command was introduced.

**Usage Guidelines**

This command displays the following information for alerts that have prevented a standby session from being brought to the Standby-Up state using replicated data.

- The interfaces on which the alerts have occurred
- The layer in which the error has occurred
- A short description of the error

**Note**

Only one error is reported for each layer for each interface. The error displayed is the most recent error that has occurred.

**Task ID**

<table>
<thead>
<tr>
<th>Task</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ppp</td>
<td>read</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to display all ICSSO alerts that have occurred:

```
RP/0/RP0/CPU0:router# show ppp sso errors location 0/3/cpu0

<table>
<thead>
<tr>
<th>Intf</th>
<th>Layer</th>
<th>SSO</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>with error</td>
<td>Error</td>
</tr>
<tr>
<td>Mu0/3/0/0/100</td>
<td>IPCP</td>
<td>Unsupported IPCP option 0x07</td>
</tr>
<tr>
<td>Se0/3/1/3/1:0</td>
<td>LCP</td>
<td>Unacceptable value for LCP MRU option</td>
</tr>
<tr>
<td>Se0/3/1/3/2:0</td>
<td>of-us-auth</td>
<td>Incorrect Authentication protocol, CHAP</td>
</tr>
<tr>
<td>Se0/3/1/3/3:0</td>
<td>of-peer-auth</td>
<td>Invalid CHAP Authentication options</td>
</tr>
<tr>
<td>Se0/3/1/3/4:0</td>
<td>LCP</td>
<td>Inconsistent LCP MRRU options</td>
</tr>
</tbody>
</table>
```
show ppp sso state

To display the Inter-Chassis Stateful Switchover (ICSSO) states of a Point-to-Point Protocol (PPP) session running under a particular Multi-Router Automatic Protection Switching (MR-APS) group, use the `show ppp sso state` command in XR EXEC mode.

```plaintext
show ppp sso state group group-id location node-id
```

**Syntax Description**

- `group group-id` Specifies the redundancy group number. The range is 1 to 32.
- `location node-id` Specifies the full qualified path of a specific node in the format rack/slot/module.

**Command Default**

If `group` is not specified, states are displayed for all redundancy groups.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.0.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command shows the states of these session layers:

- LCP
- of-us authentication
- of-peer authentication
- IPCP

**Note**

When an interface is in Standby mode, it is ready to forward traffic immediately after a switchover, if all the session layers, including IPCP, are in the S-Negd state.

**Examples**

The following example shows how to display the ICSSO states for PPP running under a redundancy group:

```plaintext
RP/0/RP0/CPU0:router# show ppp sso state location 0/3/cpu0
```

- **Not-Ready**: The session is not yet ready to run as Active or Standby
- **S-UnNegd**: In Standby mode, no replication state received yet
- **A-Down**: In Active mode, lower layer not yet up
- **Deact'ing**: Session was Active, now going Standby
- **A-UnNegd**: In Active mode, not fully negotiated yet
- **S-Negd**: In Standby mode, replication state received and pre-programmed
Act'ing: Session was Standby and pre-programmed, now going Active
A-Negd: In Active mode, fully negotiated and up
-: This layer not running

<table>
<thead>
<tr>
<th>SSO-Group 1</th>
<th>of-us</th>
<th>of-peer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sess-ID</td>
<td>Ifname</td>
<td></td>
</tr>
<tr>
<td>-------------</td>
<td>-------</td>
<td>---------</td>
</tr>
<tr>
<td>1</td>
<td></td>
<td></td>
</tr>
<tr>
<td>2</td>
<td></td>
<td></td>
</tr>
<tr>
<td>3</td>
<td></td>
<td></td>
</tr>
<tr>
<td>4</td>
<td></td>
<td></td>
</tr>
<tr>
<td>5</td>
<td></td>
<td></td>
</tr>
<tr>
<td>6</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

show ppp sso state
show ppp sso summary

To display the number of sessions in each Inter-Chassis Stateful Switchover (ICSSO) state for each session layer, use the `show ppp sso summary` command in XR EXEC mode.

```
show ppp sso summary location node-id
```

**Syntax Description**

| location node-id | Specifies the full qualified path of a specific node in the format rack/slot/module. |

**Command Default**

No default behavior or values

**Command Modes**

XR EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.0.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command displays information for these session layers:

- LCP
- of-us
- of-peer authentication
- IPCP

**Note**

Only sessions with Session State Redundancy Protocol (SSRP) configured are displayed.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ppp</td>
<td>read</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to display the number of sessions in each ICSSO state for each session layer.

```
RP/0/RP0/CPU0:router# show ppp sso summary location 0/3/cpu0
```

Not-Ready : The session is not yet ready to run as Active or Standby
Stby-UnNegd: In Standby mode, no replication state received yet
Act-Down : In Active mode, lower layer not yet up
Deactivating: Session was Active, now going Standby
Act-UnNegd : In Active mode, not fully negotiated yet
Stby-Negd : In Standby mode, replication state received and pre-programmed
Activating : Session was Standby and pre-programmed, now going Active
Act-Negd  : In Active mode, fully negotiated and up
- : This layer not running

</tbody>
</table>
ssrp group

To attach an Session State Redundancy Protocol (SSRP) group on an interface, use the `ssrp group` command in interface configuration mode. To remove the SSRP group from the interface, use the `no` form of this command.

```
ssrp group group-number id id-number ppp
```

**Syntax Description**
- `group-number` SSRP group number. The range is 1 to 65535.
- `id id-number` SSRP identifier number. The range is 1 to 4294967295.
- `ppp` Specifies point-to-point protocol.

**Command Default**
No default behavior or values

**Command Modes**
Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.0.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The group must be configured first on a specific location (linecard) and then assigned to the interface. The redundancy ID must be unique within the group. This command specifies a list the protocols that the group can replicate. Currently only PPP is supported.

**Examples**
The following example shows how to

```
RP/0/RP0/CPU0:router#  config
RP/0/RP0/CPU0:router(config)# interface Multilink 0/1/0/0/1
RP/0/RP0/CPU0:router(config-if)# ssrp group 1 id 1 ppp
```
ssrp location

To specify the node on which to create a Session State Redundancy Protocol (SSRP) group and enter the SSRP node configuration mode, use the `ssrp location` command in XR Config mode.

`ssrp location node_id`

**Syntax Description**

`node_id` Specifies the full qualified path of a specific node in the format `rack/slot/module`.

**Command Default**

No default behavior or values

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.0.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The location specifies the card on which an SSRP group is created.

**Task ID**

<table>
<thead>
<tr>
<th>Task ID</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>ppp</td>
<td>read, write</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to create an SSRP group on a specified node for use by any interface on the card:

```
RP/0/RP0/CPU0:router# config
RP/0/RP0/CPU0:router(config)# ssrp location 0/1/cpu0
RP/0/RP0/CPU0:router(config-ssrp-node)#
```
To configure a Session State Redundancy Protocol (SSRP) profile and enter the SSRP configuration mode, use the `ssrp profile` command in XR Config mode. To remove the profile, use the `no` form of this command.

```
ssrp profile  profile-name
```

**Syntax Description**
- `profile-name` Name of this SSRP profile.

**Command Default**
No default behavior or values

**Command Modes**
XR Config mode

**Command History**
- **Release 5.0.0**
  - This command was introduced.

**Usage Guidelines**
A Session State Redundancy Protocol (SSRP) profile allows the same SSRP configuration to be shared across multiple groups. The same profile can be attached to multiple groups across the router. The group must be configured before the interface that uses the group can be configured. The group number is used in the TCP port number so, the group number must be unique across the router.

**Task ID**
- **Task ID**
  - **ppp**
    - read,
      - write

**Examples**
This example shows how to configure an SSRP profile:

```
RP/0/RP0/CPU0:router# config
RP/0/RP0/CPU0:router(config)# ssrp profile Profile_1
RP/0/RP0/CPU0:router(config-ssrp)#
```
