

Configure Segment Routing Path Computation Element

The Segment Routing Path Computation Element (SR-PCE) provides stateful PCE functionality by extending the existing IOS-XR PCEP functionality with additional capabilities. SR-PCE is supported on the MPLS data plane and IPv4 control plane.

Note

The Cisco IOS XRv 9000 is the recommended platform to act as the SR-PCE. Refer to the Cisco IOS XRv 9000 Router Installation and Configuration Guide for more information.

- About SR-PCE, on page 1
- Configure SR-PCE, on page 2
- PCE-Initiated SR Policies, on page 5

About SR-PCE

The path computation element protocol (PCEP) describes a set of procedures by which a path computation client (PCC) can report and delegate control of head-end label switched paths (LSPs) sourced from the PCC to a PCE peer. The PCE can request the PCC to update and modify parameters of LSPs it controls. The stateful model also enables a PCC to allow the PCE to initiate computations allowing the PCE to perform network-wide orchestration.

Note

For more information on PCE, PCC, and PCEP, refer to the Path Computation Element section in the MPLS Configuration Guide for Cisco NCS 6000 Series Routers.

SR-PCE learns topology information by way of IGP (OSPF or IS-IS) or through BGP Link-State (BGP-LS). SR-PCE is capable of computing paths using the following methods:

- TE metric—SR-PCE uses the TE metric in its path calculations to optimize cumulative TE metric.
- IGP metric—SR-PCE uses the IGP metric in its path calculations to optimize reachability.
- LSP Disjointness—SR-PCE uses the path computation algorithms to compute a pair of disjoint LSPs. The disjoint paths can originate from the same head-end or different head-ends. Disjoint level refers to

the type of resources that should not be shared by the two computed paths. SR-PCE supports the following disjoint path computations:

- Link Specifies that links are not shared on the computed paths.
- Node Specifies that nodes are not shared on the computed paths.
- SRLG Specifies that links with the same SRLG value are not shared on the computed paths.
- SRLG-node Specifies that SRLG and nodes are not shared on the computed paths.

When the first request is received with a given disjoint-group ID, the first LSP is computed, encoding the shortest path from the first source to the first destination. When the second LSP request is received with the same disjoint-group ID, information received in both requests is used to compute two disjoint paths: one path from the first source to the first destination, and another path from the second source to the second destination. Both paths are computed at the same time.

Configure SR-PCE

This task explains how to configure SR-PCE.

Before you begin

The Cisco IOS XRv 9000 is the recommended platform to act as the SR-PCE.

SUMMARY STEPS

- 1. configure
- 2. pce
- 3. address ipv4 address
- 4. state-sync ipv4 address
- 5. tcp-buffer size size
- **6.** password {clear | encrypted} password
- 7. segment-routing {strict-sid-only | te-latency}
- 8. timers
- 9. keepalive time
- 10. minimum-peer-keepalive time
- 11. reoptimization time
- **12**. exit

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure	Enters XR Config mode.
	Example:	
	RP/0/RP0/CPU0:router# configure	

	Command or Action	Purpose
Step 2	pce	Enables PCE and enters PCE configuration mode.
	Example:	
	RP/0/RP0/CPU0:router(config)# pce	
Step 3	address ipv4 address	Configures a PCE IPv4 address.
	Example:	
	RP/0/RP0/CPU0:router(config-pce)# address ipv4 192.168.0.1	
Step 4	state-sync ipv4 address	Configures the remote peer for state synchronization.
	Example:	
	RP/0/RP0/CPU0:router(config-pce)# state-sync ipv4 192.168.0.3	
Step 5	tcp-buffer size size	Configures the transmit and receive TCP buffer size for
	Example:	each PCEP session, in bytes. The default buffer size is 256000. The valid range is from 204800 to 1024000.
	<pre>RP/0/RP0/CPU0:router(config-pce) # tcp-buffer size 1024000</pre>	_
Step 6	password {clear encrypted} password	Enables TCP MD5 authentication for all PCEP peers. Any
	Example:	TCP segment coming from the PCC that does not contain a MAC matching the configured password will be rejected.
	RP/0/RP0/CPU0:router(config-pce)# password encrypted pwd1	Specify if the password is encrypted or clear text.
Step 7	segment-routing {strict-sid-only te-latency}	Configures the segment routing algorithm to use strict SID
	Example:	or TE latency.
	<pre>RP/0/RP0/CPU0:router(config-pce)# segment-routing strict-sid-only</pre>	Note This setting is global and applies to all LSPs that request a path from this controller.
Step 8	timers	Enters timer configuration mode.
	Example:	
	RP/0/RP0/CPU0:router(config-pce)# timers	
Step 9	keepalive time	Configures the timer value for locally generated keep-alive
	Example:	messages. The default time is 30 seconds.

	Command or Action	Purpose
	<pre>RP/0/RP0/CPU0:router(config-pce-timers) # keepalive 60</pre>	
Step 10	minimum-peer-keepalive time Example: RP/0/RP0/CPU0:router(config-pce-timers)# minimum-peer-keepalive 30	Configures the minimum acceptable keep-alive timer that the remote peer may propose in the PCEP OPEN message during session establishment. The default time is 20 seconds.
Step 11	<pre>reoptimization time Example: RP/0/RP0/CPU0:router(config-pce-timers)# reoptimization 600</pre>	Configures the re-optimization timer. The default timer is 1800 seconds.
Step 12	<pre>exit Example: RP/0/RP0/CPU0:router(config-pce-timers)# exit</pre>	Exits timer configuration mode and returns to PCE configuration mode.

Configure the Disjoint Policy (Optional)

This task explains how to configure the SR-PCE to compute disjointness for a pair of LSPs signaled by PCCs that do not include the PCEP association group-ID object in their PCEP request. This can be beneficial for deployments where PCCs do not support this PCEP object or when the network operator prefers to manage the LSP disjoint configuration centrally.

SUMMARY STEPS

- 1. disjoint-path
- **2. group-id** *value* **type** {**link** | **node** | **srlg** | **srlg-node**} [**sub-id** *value*]
- 3. strict
- **4.** lsp {1 | 2} pcc ipv4 address lsp-name lsp_name [shortest-path]

DETAILED STEPS

	Command or Action	Purpose
Step 1	disjoint-path	Enters disjoint configuration mode.
	Example:	
	RP/0/RP0/CPU0:router(config-pce)# disjoint-path	

	Command or Action	Purpose
Step 2	<pre>group-id value type {link node srlg srlg-node} [sub-id value] Example: RP/0/RP0/CPU0:router(config-pce-disjoint)# group-id 1 type node sub-id 1</pre>	Configures the disjoint group ID and defines the preferred level of disjointness (the type of resources that should not be shared by the two paths):
		• link—Specifies that links are not shared on the
Step 3	strict Example:	without any disjointness constraint, will be computed (Optional) Prevents the automatic fallback behavior of the preferred level of disjointness. If a pair of paths that mee the requested disjointness level cannot be found, the disjoint calculation terminates and no new path is provided. The existing path is not modified.
	RP/0/RP0/CPU0:router(config-pce-disjoint)# strict	
Step 4	<pre>lsp {1 2} pcc ipv4 address lsp-name lsp_name [shortest-path] Example: RP/0/RP0/CPU0:router(config-pce-disjoint) # lsp 1 pcc ipv4 192.168.0.1 lsp-name rtrA_tl shortest-path RP/0/RP0/CPU0:router(config-pce-disjoint) # lsp 2</pre>	Adds LSPs to the disjoint group. The shortest-path keyword forces one of the disjoint paths to follow the shortest path from the source to the destination. This option can only be applied to the the first LSP specified.

PCE-Initiated SR Policies

An SR-TE policy can be configured on the path computation element (PCE) to reduce link congestion or to minimize the number of network touch points.

Note

The PCE-initiated SR-TE policies are entered in PCE configuration mode. For more information on configuring SR-TE policies, see the SR-TE Policy Overview.

To minimize the number of network touch points, an application, such as a Network Services Orchestrator (NSO), can request the PCE to create an SR-TE policy. PCE deploys the SR-TE policy using PCC-PCE communication protocol (PCEP).

- **1.** PCE sends a PCInitiate message to the PCC.
- 2. If the PCInitiate message is valid, the PCC sends a PCRpt message; otherwise, it sends PCErr message.
- 3. If the PCInitiate message is accepted, the PCE updates the SR-TE policy by sending PCUpd message.

You can achieve high-availability by configuring multiple PCEs with SR-TE policies. If the head-end (PCC) loses connectivity with one PCE, another PCE can assume control of the SR-TE policy.

Configuration Example: PCE-Initiated SR Policy with Explicit SID List

To configure a PCE-initiated SR-TE policy, you must complete the following configurations:

- 1. Enter PCE configuration mode.
- **2.** Create the segment list.

Note

When configuring an explicit path using IP addresses of intermediate links, the SR-TE process selects either the protected or the unprotected Adj-SID of the link, depending on the order in which the Adj-SIDs were received.

3. Create the policy.

```
/* Enter PCE configuration mode and create the SR-TE segment lists */
Router# configure
Router(config) # pce
/* Create the SR-TE segment lists */
Router(config-pce) # segment-routing
Router(config-pce-sr) # traffic-eng
Router(config-pce-sr-te)# segment-list name addr2a
Router(config-pce-sr-te-sl)# index 10 address ipv4 1.1.1.2
Router(config-pce-sr-te-sl) # index 20 address ipv4 10.2.3.2
Router(config-pce-sr-te-sl) # index 30 address ipv4 1.1.1.4
Router(config-pce-sr-te-sl) # exit
/* Create the SR-TE policy */
Router(config-pce-sr-te) # peer ipv4 1.1.1.1
Router(config-pce-sr-te) # policy P1
Router(config-pce-sr-te-policy)# color 2 end-point ipv4 2.2.2.2
Router(config-pce-sr-te-policy)# candidate-paths
Router(config-pce-sr-te-policy-path) # preference 50
Router(config-pce-sr-te-policy-path-preference)# explicit segment-list addr2a
Router(config-pce-sr-te-pp-info) # commit
Router(config-pce-sr-te-pp-info)# end
```

Router(config)#

Running Config

```
pce
segment-routing
traffic-eng
segment-list name addr2a
  index 1 address ipv4 14.14.14.4
!
  peer ipv4 1.1.1.1
  policy P1
    color 2 end-point ipv4 2.2.2.2
    candidate-paths
    preference 50
       explicit segment-list addr2a
    !
    !
```
