

Configuring Fabric QoS Policies and Classes

This module provides the conceptual and configuration information for fabric QoS.

Feature History for Configuring Fabric Quality of Service Policies and Classes on Cisco IOS XR Software

Release	Modification
Release 5.0.0	This feature was introduced.
Release 6.6.1	Support for assured forwarding (AF) priority was introduced.

Prerequisites for Configuring Fabric Quality of Service Policies and Classes

This prerequisite is required for configuring modular fabric QoS on your network:

- You must be in a user group associated with a task group that includes the proper task IDs. The command reference guides include the task IDs required for each command. If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Information About Configuring Fabric Quality of Service Policies and Classes

Overview

The fabric queue selection mechanism is known as fabric QoS. There are four queues per destination port: (high priority) HP1, HP2, assured-forwarding (AF) and best effort (BE).

Note By default, internal control traffic is placed in the high-priority queue.

You can configure a fabric QoS policy that defines classification criteria for selecting high-priority or low-priority queue. This is applied to the secure domain router (SDR) (this may be the whole router if no individual service domain routers are configured) and affects all fabricq ASICs in the logical router.

Of the four levels of priority—HP1, HP2, AF, and BE—AF is unused. From Release 6.6.1 onwards, support for AF is enabled. The enhancement allows for AF and BE traffic to be supported, even while prioritizing traffic for BE. This provides better quality of service whenever there is a fabric congestion.

A maximum of four classes can be specified within the policy. A class known as *class-default* is automatically created and equates to the BE queues. The name of this class cannot be altered. Any name may be applied to the classes that equate to the priority and AF ports or queues.

Note The **class-map** for fabric QoS checks that all the IPv4, IPv6 and MPLS matches the conditions configured for all the incoming packets. The match also supports Class of Service (CoS).

Fabric QoS policy class maps are restricted to matching a subset of these classification options:

- precedence
- dscp
- qos-group
- discard-class
- mpls experimental topmost

Note To match on **qos-group** or **discard-class**, an ingress QoS policy must be applied, setting the required values for **qos-group** or **discard-class**. Both of these variables have local significance only and are not recognized outside of the router.

The fabricq queue selection mechanism is known as Fabric QoS. To provide class of service to the traffic under fabric congestion scenarios, configure Fabric QoS. The platform-independent user interface allows you to configure an MQC policy on the switch fabric queues. This policy is global for all line cards on the router.

Ingress Policy and Fabric QoS Policy Interaction

If the ingress QoS policy remarks certain traffic with values that the fabric QoS policy class-maps are to match on, then the remarked traffic is matched and placed in the appropriate port or queues. This provides the ability for the ingress QoS policy and the fabric QoS policy to complement each other, rather than potentially conflicting.

It is important to remember that if an ingress QoS policy is applied to an interface and the fabric QoS policy has been applied to the router, then the ingress MSC RX PSE is required to perform two classification cycles.

How to Configure Fabric Quality of Service Policies and Classes

Creating a Traffic Class

See the “Creating a Traffic Class” section in the “Configuring Modular Quality of Service Packet Classification on Cisco IOS XR Software” module.

Creating a Fabric QoS Service Policy

SUMMARY STEPS

1. **configure**
2. **class-map** *class-map-name*
3. **match precedence***class-map-precedence value*
4. **policy-map** *policy-name*
5. **class** *class-name*
6. **priority** [*level priority-level*]
7. **exit**
8. **exit**
9. **switch-fabric service-policy** *policy_name*
10. Use the **commit** or **end** command.

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure Example: RP/0/RP0/CPU0:router# configure	Enters XR Config mode.
Step 2	class-map <i>class-map-name</i> Example: RP/0/RP0/CPU0:router(config)# class-map class201	Creates a class map to be used for matching packets to the class whose name you specify and enters the class map configuration mode. If you specify match-any, one of the match criteria must be met for traffic entering the traffic class to be classified as part of the traffic class. This is the default.

	Command or Action	Purpose
Step 3	<p>match precedence <i>class-map precedence value</i></p> <p>Example:</p> <pre>RP/0/RP0/CPU0:router(config-cmap)# match precedence ipv4 5</pre>	Specifies a precedence value that is used as the match criteria against which packets are checked to determine if they belong to the class specified by the class map.
Step 4	<p>policy-map <i>policy-name</i></p> <p>Example:</p> <pre>RP/0/RP0/CPU0:router(config-cmap)# policy-map policy1</pre>	Creates or modifies a policy map that can be attached to one or more interfaces to specify a service policy and enters the policy map configuration mode.
Step 5	<p>class <i>class-name</i></p> <p>Example:</p> <pre>RP//CPU0:router(config-pmap)# class class1</pre>	Specifies the name of the class whose policy you want to create or change.
Step 6	<p>priority [<i>level priority-level</i>]</p> <p>Example:</p> <pre>RP/0/RP0/CPU0:router(config-pmap-c)# priority level 1</pre>	Specifies priority to a class of traffic belonging to a policy map.
Step 7	<p>exit</p> <p>Example:</p> <pre>RP/0/RP0/CPU0:router(config-pmap-c)# exit</pre>	Returns the router to policy map configuration mode.
Step 8	<p>exit</p> <p>Example:</p> <pre>RP/0/RP0/CPU0:router(config-pmap)# exit</pre>	Returns the router to XR Config mode.
Step 9	<p>switch-fabric service-policy <i>policy_name</i></p> <p>Example:</p> <pre>RP/0/RP0/CPU0:router(config-pmap-c)# switch-fabric service-policy policy1</pre>	Configures a service policy for the switch fabric.
Step 10	Use the commit or end command.	<p>commit —Saves the configuration changes and remains within the configuration session.</p> <p>end —Prompts user to take one of these actions:</p> <ul style="list-style-type: none"> • Yes — Saves configuration changes and exits the configuration session. • No —Exits the configuration session without committing the configuration changes.

	Command or Action	Purpose
		<ul style="list-style-type: none"> • Cancel —Remains in the configuration session, without committing the configuration changes.

Configuration Examples for Configuring Fabric Quality of Service Policies and Classes

Configuring Fabric Quality of Service Policies and Classes: Example

This configuration is an example of how the packets are matched:

```
class-map match-all High
match not mpls experimental topmost 0
match not precedence routine
end-class-map
```

The match is based on the outermost protocol with these results:

- **IP packets:**

- IP packets with ToS0 (Type of Service) is False, because `match not mpls experimental topmost 0` is True and `match not precedence routine` is False. So both the options are False.
- IP packets with ToS1 to ToS7 is True, because `match not mpls experimental topmost 0` is True and `match not precedence routine` is True. So both the options are True.

- **MPLS packets:**

- MPLS packets with EXP0 (Experimental bits) is False, because `match not mpls experimental topmost 0` is False and `match not precedence routine` is True. So both the options are False.
- MPLS packets with EXP1 to EXP7 is True, because `match not mpls experimental topmost 0` is True and `match not precedence routine` is True. So both the options are True.

This configuration is an example of a possible fabric QoS policy:

```
class-map match-any llq
match mpls experimental topmost 5
match precedence critical
!
class-map match-any business
match mpls experimental topmost 3
match precedence flash
!
policy-map fabric_qos
class llq
priority
!
```

To apply the policy, use the **switch-fabric service-policy** command with the *policy-name* argument.

This example shows an ingress QoS policy working in conjunction with a fabric QoS policy. The fabric QoS policy is shown first, followed by the ingress QoS policy:

```

class-map match-any llq
  match qos-group 5
  !
class-map match-any business&games
  match qos-group 3
  !
policy-map fabric_qos
  class llq
    priority
  !
  !
class-map match-any voip
  match mpls experimental topmost 5
  match precedence critical
  match dscp cs5
  !
class-map match-any business
  match mpls experimental topmost 4
  match dscp cs4
  match precedence flash-override
  !
class-map match-any broadband-games
  match mpls experimental topmost 3
  match dscp cs3
  march precedence flash
  !

policy-map input-qos
  class voip
    priority level 1
    police rate percent 20
    conform-action set qos-group 5
  class business
    set qos-group 3
  class broadband-games
    set qos-group 3

```
