New and Changed QoS Features

New and Changed QoS Features

Table 1: QoS Features Added or Modified in IOS XR Release 7.0.x

Feature	Description	Changed in Release	Where Documented
Inter-SDR Collapsed Forwarding	The inter-SDR (secure domain routers) collapsed forwarding means that the cross-SDR interconnect (CSI) interface is used for forwarding packets. With the Ingress QoS Classify/Remark request on CSI interface feature, you can now remark the packet headers based on the policy maps attached to the CSI interface.	Release 7.0.1	Inter-SDR Collapsed Forwarding
