Preface

This guide provides information about how to install and configure Cisco Enterprise Network Function Virtualization Infrastructure Software (Cisco Enterprise NFVIS) on a supported Cisco hardware device. The guide also provides details on virtual machine deployments, configuration of software features, and life cycle management using Representation State Transfer (REST) application programming interface (API).

Audience

This guide is intended for network administrators and operators who are familiar with basic Linux installation and configuration requirements.

- To find warranty information for a specific product or product family, access Cisco Warranty Finder.

Cisco Bug Search Tool

Cisco Bug Search Tool (BST) is a web-based tool that acts as a gateway to the Cisco bug tracking system that maintains a comprehensive list of defects and vulnerabilities in Cisco products and software. BST provides you with detailed defect information about your products and software.
CHAPTER 1

About Cisco Enterprise NFVIS

Cisco Enterprise Network Function Virtualization Infrastructure Software (Cisco Enterprise NFVIS) is a Linux-based infrastructure software designed to help service providers and enterprises to design, deploy and manage network services. Cisco Enterprise NFVIS helps dynamically deploy virtualized network functions, such as a virtual router, firewall, and WAN acceleration, on a supported Cisco device. You do not always require a physical device for every network function. Automated provisioning and centralized management also eliminates costly truck rolls.

Cisco Enterprise NFVIS provides a Linux-based virtualization layer to the Cisco Enterprise Network Function Virtualization (ENFV) solution.

Cisco ENFV Solution Overview

The Cisco ENFV solution helps convert your critical network functions into a software which can deploy network services across dispersed locations in minutes. It provides a fully integrated platform that can run on top of a diverse network of both virtual and physical devices with the following primary components:

- Cisco Enterprise NFVIS
- VNFs
- Unified Computing System (UCS) and Enterprise Network Compute System (ENCS) hardware platforms
- Digital Network Architecture Center (DNAC)

For more details on the Cisco ENFV solution, see the Cisco Enterprise Network Functions Virtualization Solution Overview.

- Benefits of Cisco Enterprise NFVIS, on page 1
- Supported Hardware Platforms, on page 2
- Key Tasks You can Perform Using Cisco Enterprise NFVIS, on page 3

Benefits of Cisco Enterprise NFVIS

- Cost effective solution to consolidate multiple physical network appliances into a single server running multiple virtual network functions.
- Flexibility in deploying services quickly and in a timely manner.
- Cloud based VM life cycle management and provisioning.
• In-box life cycle management software to deploy and chain VMs dynamically on the platform.
• Programmable APIs.

Supported Hardware Platforms

Depending on your requirement, you can install Cisco Enterprise NFVIS on the following Cisco hardware platforms:

• Cisco 5100 Series Enterprise Network Compute System (Cisco ENCS)
• Cisco 5400 Series Enterprise Network Compute System (Cisco ENCS)
• Cisco UCS C220 M4 Rack Server
• Cisco Cloud Services Platform 2100 (CSP 2100)
• Cisco ISR4331 with UCS-E140S-M2/K9
• Cisco ISR4351 with UCS-E160D-M2/K9
• Cisco ISR4451-X with UCS-E180D-M2/K9
• Cisco UCS-E160S-M3/K9 Server
• Cisco UCS-E180D-M3/K9
• Cisco UCS-E1120D-M3/K9

Cisco ENCS
The Cisco 5100 and 5400 Series Enterprise Network Compute System combines routing, switching, storage, processing, and a host of other computing and networking activities into a compact one Rack Unit (RU) box. This high-performance unit achieves this goal by providing the infrastructure to deploy virtualized network functions and acting as a server that addresses processing, workload, and storage challenges.

Cisco UCS C220 M4 Rack Server
The Cisco UCS C220 M4 Rack Server is a high-density, general-purpose enterprise infrastructure and application server that delivers world class performance for a wide range of enterprise workloads, including virtualization, collaboration, and bare-metal applications.

Cisco CSP 2100
Cisco Cloud Services Platform 2100 (Cisco CSP 2100) is a software and hardware platform for data center network functions virtualization. This open kernel virtual machine (KVM) platform, with Red Hat Enterprise Linux (RHEL) 7.3 as the base operating system, is designed to host networking virtual services. Cisco CSP 2100 enables network, security, and load balancer teams to quickly deploy any Cisco or third-party network virtual service.

Note
Return Material Authorization (RMA) capability for CSP 2100 is not supported when in use with NFVIS.
Cisco UCS E-Series Server Modules

The Cisco UCS E-Series Servers (E-Series Servers) are the next generation of Cisco UCS Express servers. E-Series Servers are a family of size, weight, and power efficient blade servers that are housed within the Generation 2 Cisco Integrated Services Routers (ISR G2), Cisco 4400, and Cisco 4300 Series Integrated Services Routers. These servers provide a general-purpose compute platform for branch office applications deployed either as bare metal on operating systems, such as Microsoft Windows or Linux; or as virtual machines on hypervisors.

Supported VMs

Currently, the following Cisco supplied VMs and third party VMs are supported:

- Cisco ISRv
- Cisco Adaptive Security Virtual Appliance (ASAv)
- Cisco Virtual Wide Area Application Services (vWAAS)
- Linux Server VM
- Windows Server 2012 VM

Key Tasks You can Perform Using Cisco Enterprise NFVIS

- Perform VM image registration and deployment
- Create new networks and bridges, and assign ports to bridges
- Create custom flavors—a flavor is the customized profile of the VM image
- Perform service chaining of VMs
- Perform VM operations
- Verify system information including CPU, port, memory, and disk statistics

The APIs for performing these tasks are explained in the API Reference for Cisco Enterprise NFVIS.

Note

From a Cisco Enterprise NFVIS command-line interface, you can connect to another server and VMs remotely using the SSH client.
CHAPTER 2

Installing Cisco Enterprise NFVIS Using the KVM Console

• Installation Prerequisites, on page 5
• Image Signing and Verification, on page 6
• Entering BIOS Setup, on page 7
• Installing Cisco Enterprise NFVIS on the Cisco UCS C220 M4 Rack Server or Cisco CSP 2100, on page 7
• Installing Cisco Enterprise NFVIS on Cisco UCS E-Series Servers, on page 8
• Installing Cisco Enterprise NFVIS on a Cisco ENCS 5100 and 5400, on page 12

Installation Prerequisites

Ensure that the following prerequisites are met:

• The IP address is configured for Cisco Integrated Management Controller (CIMC) as well as a login account with administrative privileges.

• The login account is set up with administrative privileges.

• The installation media for Cisco Enterprise NFVIS has an ISO image.

• The IP address of the system (required for remote access) is available.

• Hyper-threading is enabled in BIOS. By default, hyper-threading is enabled in BIOS on the UCS-C, UCS-E and ENCS platforms.

Note
The installation steps are slightly different for Cisco UCS and Cisco ENCS platforms. See the following sections for details:

Installing Cisco Enterprise NFVIS on the Cisco UCS C220 M4 Rack Server or Cisco CSP 2100, on page 7
Installing Cisco Enterprise NFVIS on Cisco UCS E-Series Servers, on page 8
Installing Cisco Enterprise NFVIS on a Cisco ENCS 5100 and 5400, on page 12
Assumptions

- The user is familiar with the supported hardware device, CIMC, Cisco Network Plug and Play, and Cisco Application Policy Infrastructure Controller Enterprise Module (APIC-EM).
- The initial setup of the hardware device is complete, and the device is ready for loading Cisco Enterprise NFVIS.
- The user is familiar with general Linux installation.

For more details on the supported hardware devices, see respective documentation available on Cisco.com.

Image Signing and Verification

Cisco Enterprise NFVIS supports RPM signing and signature verification for all RPM packages in the ISO and upgrade images. You can also verify the integrity of the Cisco Enterprise NFVIS ISO and upgrade images.

RPM Signing

All RPM packages in the Cisco Enterprise NFVIS ISO and upgrade images are signed to ensure cryptographic integrity and authenticity. This guarantees that the RPM packages have not been tampered with and the RPM packages are from Cisco Enterprise NFVIS. The private key, used for signing the RPM packages, is created and securely maintained by Cisco.

RPM Signature Verification

Cisco Enterprise NFVIS verifies all RPM packages during installation or upgrade. The following table describes the Cisco Enterprise NFVIS behavior when the signature verification fails during installation or upgrade.

<table>
<thead>
<tr>
<th>Scenario</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco Enterprise NFVIS 3.7.1 installation</td>
<td>If the signature verification fails while installing Cisco Enterprise NFVIS, the installation is aborted.</td>
</tr>
<tr>
<td>Cisco Enterprise NFVIS upgrade from 3.6.x to Release 3.7.1</td>
<td>The RPM signatures are verified when the upgrade is being performed. If the signature verification fails, an error is logged but the upgrade is completed.</td>
</tr>
<tr>
<td>Cisco Enterprise NFVIS upgrade from Release 3.7.1 to later releases</td>
<td>The RPM signatures are verified when the upgrade image is registered. If the signature verification fails, the upgrade is aborted.</td>
</tr>
</tbody>
</table>

Image Integrity Verification Using sha256sum

RPM signing and signature verification can be done only for the RPM packages available in the Cisco NFVIS ISO and upgrade images. To ensure the integrity of all additional non-RPM files available in the Cisco NFVIS ISO image, a hash of the Cisco NFVIS ISO image is published along with the image. Similarly, a hash of the Cisco NFVIS upgrade image is published along with the image. To verify that the hash of Cisco NFVIS ISO image or upgrade image matches the hash published by Cisco, run the following command and compare the hash with the published hash:
Entering BIOS Setup

This section applies only to ENCS 5400 and UCS-E series routers.

When you enter the BIOS setup for the first time, ensure that you secure the BIOS by setting up an admin-level and a user-level password. You have to set up the admin password when you access the BIOS menu for the first time. The user password (which only gives access to a small subset of BIOS options) must be set inside the BIOS setup menu.

To set up the admin password, press F2 when the system boots up. You will be prompted to set the password. To set up the user password, after you log in, go to the ‘Security’ tab and set the password.

Installing Cisco Enterprise NFVIS on the Cisco UCS C220 M4 Rack Server or Cisco CSP 2100

This section provides information about a series of tasks you need to perform to install Cisco Enterprise NFVIS on a Cisco UCS C220 M4 Rack Server or Cisco CSP 2100.

Logging Into the CIMC GUI

Before you begin

- Make sure that you have configured the IP address to access CIMC.
- If not installed, install Adobe Flash Player 10 or later on your local system.

For details on how to configure an IP address for CIMC, see the Set up CIMC for UCS C-Series Server guide on cisco.com.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>In your web browser, enter the IP address that you configured to access CIMC during initial setup.</td>
</tr>
<tr>
<td>2</td>
<td>If a security dialog box displays, do the following:</td>
</tr>
<tr>
<td></td>
<td>a) <strong>Optional</strong>: Select the check box to accept all content from Cisco.</td>
</tr>
<tr>
<td></td>
<td>b) Click <strong>Yes</strong> to accept the certificate and continue.</td>
</tr>
<tr>
<td>3</td>
<td>In the log in window, enter your username and password.</td>
</tr>
<tr>
<td></td>
<td>When logging in for the first time to an unconfigured system, use <strong>admin</strong> as the username and <strong>password</strong> as the password.</td>
</tr>
<tr>
<td>4</td>
<td>Click <strong>Log In</strong>.</td>
</tr>
<tr>
<td></td>
<td>The <strong>Change Password</strong> dialog box only appears the first time you log into CIMC.</td>
</tr>
</tbody>
</table>
Activating a Virtual Device

You will have to launch the KVM Console to activate virtual devices.

Before you begin

Ensure that you have the Java 1.6.0_14 or a higher version installed on your local system.

Step 1
Download the Cisco Enterprise NFVIS image from a prescribed location to your local system.

Step 2
From CIMC, select the Server tab, and click Launch KVM Console.

Note: A JNLP file will be downloaded to your system. You must open the file immediately after it is downloaded to avoid the session timeout.

Step 3
Open the renamed .jnlp file. When it prompts you to download Cisco Virtual KVM Console, click Yes. Ignore all security warnings and continue with the launch.

The KVM Console is displayed.

Step 4
From the Virtual Media menu on the KVM Console, select Activate Virtual Devices.

If prompted with an unencrypted virtual media session message, select Accept this session, and click Apply. The virtual devices are activated now.

Mapping the Cisco Enterprise NFVIS Image

Step 1
From the Virtual Media menu on the KVM Console, select Map CD/DVD....

Step 2
Browse for the installation file (ISO) on your local system, and select it.

Step 3
Click Map Device.

The ISO image file is now mapped to the CD/DVD.

Installing Cisco Enterprise NFVIS on Cisco UCS E-Series Servers

Before you begin

- Configure the UCS E interface on the Cisco ISR router.
- Configure the Gigabit Ethernet interface on the Cisco ISR router.
• Ensure that you have the IP address configured for CIMC access as well as a login account with administrative privileges.

• Ensure that the Cisco UCS E server has one of the following supported firmware versions or above:
  • BIOS UCSED.2.5.0.3 or later for UCS-E160D-M2/K9 and UCS-E180D-M2/K9
  • BIOS UCSES.1.5.0.5 or later for UCS-E140S-M2/K9

For more details on how to perform the basic configuration on the Cisco ISR routers, see the following guides:

• Sample Configuration on the Cisco ISR Router to Bring Up a Cisco UCS E Server, on page 10

• Getting Started Guide for Cisco UCS E-Series Servers, Release 1.0(2) Installed in the Cisco ISR 4451-X

For details on how to configure an IP address for CIMC, see the Getting Started Guide for Cisco UCS E-Series Servers, Release 1.0 on cisco.com.

---

Step 1
Log into CIMC.
For details, see Logging Into the CIMC GUI, on page 7

Step 2
From the Server tab, click Launch KVM Console.
The KVM Console opens in a separate window.

Step 3
From the KVM console, click the Virtual Media tab.

Step 4
In the Virtual Media tab, map the virtual media using either of the following methods:
a) Select the Mapped checkbox for the CD/DVD drive containing the operating system.
b) Click Add Image, browse, and select the Cisco Enterprise NFVIS ISO image, click Open to mount the image, and then select the Mapped checkbox for the mounted image.

You must keep the Virtual Media tab open during the installation process. Closing the tab unmaps all virtual media.

Step 5
From the Server tab, select BIOS.

Step 6
From the BIOS Actions area, select Configure Boot Order.
The Configure Boot Order dialog box appears.

Step 7
From the Device Types area, select CD/DVD Linux Virtual CD/DVD, and then click Add.

Step 8
Select HDD PCI RAID Adapter, and then click Add.

Step 9
Set the boot order sequence using the Up and Down options. The CD/DVD Linux Virtual CD/DVD boot order option must be the first choice.

Step 10
Click Apply to complete the boot order setup.

Step 11
Reboot the server by selecting the Power Off Server option from the Server Summary page in CIMC.

Step 12
After the server is down, select the Power On Server option in CIMC.
When the server reboots, the KVM console will automatically install Cisco Enterprise NFVIS from the virtual CD/DVD drive. The entire installation might take 30 minutes to one hour to complete.

Step 13
After the installation is complete, the system is automatically rebooted from the hard drive. Log into the system when the command prompt changes from "localhost" to "nfvis" after the reboot.
Wait for some time for the system to automatically change the command prompt. If it does not change automatically, press Enter to manually change the command prompt from "localhost" to "nfvis". Use admin as the login name and Admin123# as the default password.
Note  The system prompts you to change the default password at the first login attempt. You must set a strong password as per the on-screen instructions to proceed with the application. You cannot run API commands or proceed with any tasks unless you change the default password at the first login. API will return 401 unauthorized error if the default password is not reset.

Step 14  You can verify the installation using the System API or by viewing the system information from the Cisco Enterprise NFV portal.

What to do next
You can verify the default configuration, and set up initial IP configuration to launch the Cisco Enterprise NFV portal. For details, see Setting Up System Configuration.

Sample Configuration on the Cisco ISR Router to Bring Up a Cisco UCS E Server

The following sample configuration shows the basic configuration performed on the Cisco ISR 4451 router with DHCP enabled.

Installing Cisco Enterprise NFVIS on a Cisco ENCS 5100 and 5400

Software or hardware RAID controller setup is not supported with Cisco ENCS in Cisco Enterprise NFVIS Release 3.5.1.

Before you begin

- Make sure that you have configured the IP address to access CIMC.
- If not installed, install Adobe Flash Player 10 or later on your local machine.

For details on how to configure an IP address for CIMC, see the Set up CIMC for UCS C-Series Server and Getting Started Guide for Cisco UCS E-Series Servers and the Cisco UCS E-Series Network Compute Engine on cisco.com.

Step 1
In your web browser, enter the IP address that you configured to access CIMC during initial setup.

Step 2
If a security dialog box displays, do the following:
  a) Optional: Select the check box to accept all content from Cisco.
  b) Click Yes to accept the certificate and continue.

Step 3
In the Log in window, enter your username and password.
When logging in for the first time to an unconfigured system, use admin as the username and password as the password.

Step 4
Click Log In.
The Change Password dialog box only appears the first time you log into CIMC.
Installing Cisco Enterprise NFVIS on a Cisco ENCS 5104

Step 1  Create bootable usb with NFVIS image.

Step 20  You can verify the installation using the System API or by viewing the system information from the Cisco Enterprise NFVIS portal.

Note  The system prompts you to change the default password at the first login. You must set a strong password as per the on-screen instructions to proceed with the application. You cannot run API commands or proceed with any tasks unless you change the default password at the first login. API will return 401 unauthorized error if the default password is not reset.
In this example, we used rufus utility in Windows environment. Rufus utility can be downloaded [https://rufus.akeo.ie/](https://rufus.akeo.ie/).

For this example, following parameters were used to burn bootable NFVIS USB device:

- Device: USB stick
- Partition scheme: MBR
- Filesystem: FAT32
- Cluster size: use default
- Volume label: use default
- Quick format: checked
- Create bootable: select "ISO Image" and click next icon then choose NFVIS image.
- Create extended label: checked

Press **Start** and wait for completion.

Eject USB thumb drive

---

**Step 2**  
Insert USB device in one of USB slot in ENCS5104.

**Step 3**  
Power on system.

**Step 4**  
During system boot up, press F6 key.

Press <DEL> or <F2> to enter setup, <F6> Boot Menu, <F12> Network Boot in 5 seconds or press any key to continue.

**Step 5**  
Once you press F6, you will see the following screenshot to select which device you want to boot from. Select your USB device.

In the following screenshot example, there is STEC USB being used. That display will vary depending on your usb device vendor. Use the arrow key to select that device.
Step 6  Wait until installation is completed. System will be rebooted once installation is done.

Step 7  Log into the system with username admin and Admin123# as a default password

Step 8  You will be prompted and asked to change password at the first login. You must set a strong password per the on-screen instruction to proceed.

Step 9  You can verify the installation status using the System API or command line interface per the NFVIS user guide.

What to do next

You can verify the default configuration, and set up initial IP configuration to launch the Cisco Enterprise NFV portal. For details, see Setting Up System Configuration.
Installing Cisco Enterprise NFVIS on a Cisco ENCS 5104
Setting Up System Configuration

- Default System Configuration on the Cisco ENCS, on page 17
- Default System Configuration on the Cisco UCS C220 M4 Server and Cisco CSP 2100, on page 19
- Default System Configuration on the Cisco UCS E-Series Servers, on page 20
- Setting Up Initial Configuration, on page 20
- User Roles and Authentication, on page 28
- Configuring the IP Receive ACL, on page 32
- Configuring Your Banner and Message of the Day, on page 33
- Setting the System Time Manually or With NTP, on page 34
- Enabling or Disabling the Portal Access, on page 35
- Configuring System Logs, on page 36
- Network File System Support, on page 37
- Secure Boot of host, on page 38
- CIMC Control, on page 39
- DPDK Support on NFVIS, on page 40
- Import and Export NFVIS VM, on page 44
- Backup and Restore NFVIS and VM Configurations, on page 45
- Dynamic SR-IOV, on page 47

Default System Configuration on the Cisco ENCS

The diagram below illustrates the default network configuration of Cisco Enterprise NFVIS with the Cisco ENCS.
- **LAN ports**—Eight physical Gigabit Ethernet ports for inbound and outbound traffic.
- **WAN port**—You can use one of the dual media Ethernet ports (wan-br and wan2-br) for DHCP connection.
- **Bridges**—They form a Layer 2 domain between virtual network interface controllers (vNICs) of VMs. A vNIC is used by a virtual machine to provide virtual network interfaces by defining a range of MAC addresses. The default management IP address (192.168.1.1) for the NFVIS host is configured on the management port. Multiple VMs can use the same LAN port for local connectivity.
• Network—It is a segment Layer 2 bridge domain where only the specific VLAN traffic is allowed.

• Reserved VLANs in the LAN network on the ENCS 5400 platform—The VLAN range 2350-2449 is reserved for internal use and should not be used on the external switch ports and for virtual machines in the LAN ports”. Note that this limitation doesn't apply to the WAN ports.

• Internal 192.168.10.00/24 and 192.168.50.0/24 networks—The IP subnet 192.168.10.0/24 and 192.168.50.0/24 are used for the ENCS-5400 internal networks. A user should not use this IP subnet on the NFVIS management network. In the future NFVIS releases, this internal subnet will be isolated so that users can use this for NFVIS management.

Note

The following networks and bridges are automatically configured. You can configure more as required.

- A LAN network (lan-net) and a LAN bridge (lan-br)
- A WAN network (wan-net) and a WAN bridge (wan-br)

wan2-net and wan2-br are the default configurations for ENCS 5400 and ENCS 5100.

The default networks and bridges cannot be deleted.

Default System Configuration on the Cisco UCS C220 M4 Server and Cisco CSP 2100

Configuring the networks in Cisco Enterprise NFVIS allows inbound and outbound traffic and VMs to be service chained. The following diagram illustrates the default network configuration:

Figure 3: Default Network Configuration with Cisco UCS C220 M4 and Cisco CSP 2100

The following networks and bridges are created by default, and cannot be deleted. You can configure more as required.

- A LAN network (lan-net) and a LAN bridge (lan-br)—The default static management IP address (192.168.1.1) for the NFVIS host is configured on the LAN bridge. All other ports for inbound and outbound traffic are associated with the LAN bridge. Any LAN port can be used to access the default static IP address. By default, the hostname is set to "nfvis".
• A WAN network (wan-net) and a WAN bridge (wan-br)—This is created with the "eth0" port, and is configured to enable the DHCP connection.

By default, the first port on the device is associated with the WAN bridge. All the other ports on the device are associated with the LAN bridge.

For more details about the initial setup, see the Installing the Server chapter in the Cisco UCS C220 M4 Server Installation and Service Guide or Cisco Cloud Services Platform 2100 Hardware Installation Guide.

Default System Configuration on the Cisco UCS E-Series Servers

Figure 4: Default Network Configuration with a Cisco UCS E-Series Server

The following networks and bridges are created by default, and cannot be deleted. You can configure more as required.

• A LAN network (lan-net) and a LAN bridge (lan-br)—The default static management IP address (192.168.1.1) for the NFVIS host is configured on the LAN bridge. All other ports for inbound and outbound traffic are associated with the LAN bridge. By default, the hostname is set to "nfvis".

• A WAN network (wan-net) and a WAN bridge (wan-br)—The physical WAN ports are on the Cisco ISR module. They are not externally available on the Cisco UCS E server. The WAN traffic comes from the ISR WAN ports, and goes through the backplane to the Cisco UCS-E server. The backplane has one internal WAN interface (GE0) to establish connection with the Cisco UCS-E server. By default, the "GE0" interface is enabled for the DHCP connection.

For more details on the initial setup, see the Getting Started Guide for Cisco UCS E-Series Servers and the Cisco UCS E-Series Network Compute Engine.

Setting Up Initial Configuration

For initial login, use admin as the default user name, and Admin123# as the default password. Immediately after the initial login, the system prompts you to change the default password. You must set a strong password as per the on-screen instructions to proceed with the application. All other operations are blocked until default password is changed. API will return 401 unauthorized error if the default password is not reset.
If wan-br and wan2-br has not obtained IP addresses through DHCP, the zero touch deployment is terminated. To manually apply the IP configurations answer 'y' and the system proceeds with dhclient on wan-br until the configurations are changed. For dhclient to continue to request IP address for PnP flow on both WAN interfaces answer 'n'.

You must follow the rules to create a strong password:

- Must contain at least one upper case and one lower case letter.
- Must contain at least one number and one special character (# - * ?).
- Must contain seven characters or greater. Length should be between 7 and 128 characters.

You can change the default password in three ways:

- Using the Cisco Enterprise NFVIS portal.
- Using the CLI—When you first log into Cisco Enterprise NFVIS through SSH, the system will prompt you to change the password.
- Using PnP (for details, see the Cisco Network Plug-n-Play Support, on page 49).
- Using console - After the initial login using the default password, you are prompted to change the default password.

NFVIS Version: 3.10.0-9

admin@localhost's password:

admin connected from ::1 using ssh on nfvis
nfvis# show version
To commit the target configuration to the active (running) configuration, use the `commit` command in any configuration mode in Cisco Enterprise NFVIS Release 3.5.1 and later. Changes made during a configuration session are inactive until the `commit` command is entered. By default, the commit operation is pseudo-atomic, meaning that all changes must succeed for the entire commit operation to succeed.

---

### Connecting to the System

#### Using IPv4

The three interfaces that connect the user to the system are the WAN and WAN2 interfaces and the management interface. By default, the WAN interface has the DHCP configuration and the management interface is configured with the static IP address 192.168.1.1. If the system has a DHCP server connected to the WAN interface, the WAN interface will receive the IP address from this server. You can use this IP address to connect to the system.

You can connect to the server locally (with an Ethernet cable) using the static management IP address; to connect to the box remotely using a static IP address, the default gateway needs to be configured.

You can connect to the system in the following three ways:

- Using the local portal—After the initial login, you are prompted to change the default password.
- Using the KVM console—After the initial login using the default password, you are prompted to change the default password.
- Using PnP—After the initial provisioning through PnP, the configuration file pushed by the PNP server must include the new password for the default user (admin).

#### Using IPv6

IPv6 can be configured in static, DHCP stateful and Stateless Autoconfiguration (SLAAC) mode. By default, DHCP IPv6 stateful is configured on the WAN interface. If DHCP stateful is not enabled on the network, the router advertisement (RA) flag decides which state the network stays in. If the RA shows Managed (M) flag, then the network stays in DHCP mode, even if there is no DHCP server in the network. If the RA shows Other (O) flag, then the network switches from DHCP server to SLAAC mode.

SLAAC provides ipv6 address and default gateway. Stateless dhcp is enabled in the SLAAC mode. If the server has dns and domain configured, then SLAAC also provides those values via stateless dhcp.

### Performing Static Configuration without DHCP

Starting from NFVIS 3.10.1 release, for ENCS 5400 and ENCS 5100, wan2-br obtains an IP address from DHCP. To configure default gateway, first use `no bridges bridge wan2-br dhcp` command.

If you want to disable DHCP and use static configuration, initial configuration is done by setting the WAN IP address and/or management IP address, and the default gateway. You can also configure a static IP on a created bridge.

To perform initial configuration on the system without using DHCP:

```bash
configure terminal
```
When an interface is configured with a static IP address, DHCP is automatically disabled on that interface.

Now you can either use the management IP or WAN IP to access the portal.

To configure static IPv6 on the WAN interface:

```
configure terminal
system settings mgmt ipv6 address 2001:DB8:1:1::72/64
bridges bridge wan-br ipv6 address 2001:DB8:1:1::75/64
system settings default-gw-ipv6 2001:DB8:1:1::76
commit
```

When an interface is configured with a static IPv6 address, DHCP IPv6 is automatically disabled on that interface. There are three options for IPv6 - static, DHCP and SLAAC, out of which only one can be enabled at a time.

### Configuring DHCP on the WAN or Management Interface

Starting from NFVIS 3.10.1, you can configure DHCP on any bridge. You can only have one DHCP bridge or management interface active at a time, and cannot have DHCP and default gateway configured at the same time.

You can configure DHCP either on the WAN interface or the management interface; you cannot configure DHCP on both the interfaces simultaneously.

To configure DHCP on any one of the interfaces (WAN or management), delete the default gateway.

To configure DHCP on the management interface:

```
configure terminal
no system settings default-gw
system settings mgmt dhcp
commit
exit
hostaction mgmt-dhcp-renew
```

To configure DHCP IPv6 on the management interface:

```
configure terminal
no system settings default-gw-ipv6
system settings mgmt dhcp-ipv6
commit
exit
hostaction mgmt-dhcp-renew
```
To configure DHCP on the WAN interface:

```
classify terminal
no system settings default-gw
system settings wan dhcp
commit
exit
hostaction wan-dhcp-renew
```

**Note**
Starting from NFVIS 3.10.1, you can configure DHCP IPv6 on any bridge. You can only have one DHCP IPv6 bridge or management interface active at a time, and cannot have DHCP IPv6 and default gateway IPv6 or SLAAC IPv6 configured at the same time.

To configure DHCP IPv6 on the WAN interface:

```
classify terminal
no system settings default-gw-ipv6
system settings wan dhcp-ipv6
commit
exit
hostaction wan-dhcp-renew
```

**Configuring SLAAC on the WAN or Management Interface**

**Note**
Starting from NFVIS 3.10.1, you can configure SLAAC IPv6 on any bridge. You can only have one SLAAC IPv6 bridge or management interface active at a time, and cannot have SLAAC IPv6 and default gateway IPv6 or DHCP IPv6 configured at the same time.

To configure SLAAC IPv6 on the WAN interface:

```
classify terminal
system settings wan slaac-ipv6
commit
```

To configure SLAAC IPv6 on the management interface:

```
classify terminal
system settings mgmt slaac-ipv6
commit
```

**Verifying Initial Configuration**

The `show system settings-native` command is used to verify initial configuration. Use `show bridge-settings` and `show bridge-settings bridge_name` commands to verify the configuration for any bridge on the system.

Extract from the output of the `show system settings-native` command when both WAN and management interfaces have a static configuration:

```
system settings-native mgmt ip-info interface lan-br
system settings-native mgmt ip-info ipv4_address 192.168.1.2
system settings-native mgmt ip-info netmask 255.255.255.0
```
Extract from the output of the `show system settings-native` command when the management interface has a DHCP configuration and the WAN interface has a static configuration:

```
system settings-native mgmt dhcp disabled
system settings-native mgmt ip-info interface MGMT
system settings-native mgmt ip-info ipv4_address 192.168.1.2
system settings-native mgmt ip-info netmask 255.255.255.0
!
!
!
```

Extract from the output of the `show system settings-native` command when the WAN interface has a DHCP configuration and the management interface has a static configuration:

```
system settings-native mgmt dhcp disabled
system settings-native mgmt ip-info interface lan-br
system settings-native mgmt ip-info ipv4_address 209.165.201.2
system settings-native mgmt ip-info netmask 255.255.255.0
!
!
!
```
### Configuring VLAN for NFVIS Management Traffic

A VLAN is a method of creating independent logical networks within a physical network. VLAN tagging is the practice of inserting a VLAN ID into a packet header in order to identify which VLAN the packet belongs to.

You can configure a VLAN tag on the WAN bridge (wan-br) interface to isolate Cisco Enterprise NFVIS management traffic from VM traffic. You can also configure VLAN on any bridge on the system (wan2-br for ENCS5400 or ENCS 5100, and user-br for all systems).

By default, Wan bridge and LAN bridge are in trunk mode and allows all VLANs. When you configure native VLAN, you must also configure all the allowed VLANs at the same time. The native VLAN becomes the only allowed VLAN if you do not configure all the VLANs. If you want a network that allows only one VLAN, then create another network on top of wan-net and lan-net and make it access network.

Cisco Enterprise Network Function Virtualization Infrastructure Software Configuration Guide, Release 3.8.x
You cannot have the same VLAN configured for the NFVIS management and VM traffic.

For more details on the VLAN configuration, see the Understanding and Configuring VLANs module in the Catalyst 4500 Series Switch Cisco IOS Software Configuration Guide.

To configure a VLAN:

```
configure terminal
bridges bridge wan-br vlan 120
commit
```

**Verifying VLAN Configuration**

Run the `show bridge-settings wan-br vlan` command to verify the VLAN configuration as shown below:

```
nfvis# show bridge-settings wan-br vlan
bridges bridge wan-br vlan 120
```

**VLAN APIs and Commands**

<table>
<thead>

**Configuring System Routes**

In addition to the default routes in the system, you can configure additional system routes. This configuration is specifically useful when certain destinations are not reachable through the default routes.

While you can create a route just by providing the destination and prefix length, a valid route requires that you specify either a device or a gateway or both.

To configure additional system routes:

```
configure terminal
system routes route 209.165.201.1 dev lan-br
commit
```

**Verifying the System Routes Configuration**

To verify the system routes configuration, use the `show system routes` command as shown below:
User Roles and Authentication

Role-based access enables the administrator to manage different levels of access to the system's compute, storage, database, and application services. It uses the access control concepts such as users, groups, and rules, which you can apply to individual API calls. You can also keep a log of all user activities.

Table 1: Supported User Roles and Privileges

<table>
<thead>
<tr>
<th>User Role</th>
<th>Privilege</th>
</tr>
</thead>
<tbody>
<tr>
<td>Administrators</td>
<td>Owns everything, can perform all tasks including changing of user roles, but cannot delete basic infrastructure. Admin's role cannot be changed; it is always &quot;administrators&quot;.</td>
</tr>
<tr>
<td>Operators</td>
<td>Start and stop a VM, and view all information</td>
</tr>
<tr>
<td>Auditors</td>
<td>Read-only permission</td>
</tr>
</tbody>
</table>

Rules for User Passwords

The user passwords must meet the following requirements:

- Must have at least seven characters length or the minimum required length configured by the admin user.
- Must not have more than 128 characters.
- Must contain a digit.
- Must contain one of the following special characters: hash (#), underscore (_), hyphen (-), asterisk (*), and question mark (?).
- Must contain an uppercase character and a lowercase character.
- Must not be same as last five passwords.
Creating Users and Assigning Roles

The administrator can create users and define user roles as required. You can assign a user to a particular user group. For example, the user "test1" can be added to the user group "administrators".

All user groups are created by the system. You cannot create or modify a user group.

To create a user:

```plaintext
configure terminal
rbac authentication users create-user name test1 password Test1_pass role administrators
commit
```

To delete a user:

```plaintext
configure terminal
rbac authentication users delete-user name test1
commit
```

To change the password, use the `rbac authentication users user change-password` command in global configuration mode. To change the user role, use the `rbac authentication users user change-role` command in global configuration mode.

User Management APIs and Commands

<table>
<thead>
<tr>
<th>User Management APIs</th>
<th>User Management Commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>• /api/operations/rbac/authentication/users</td>
<td>• rbac authentication users</td>
</tr>
<tr>

<tr>
<td>/oper/change-role</td>
<td>• rbac authentication users user change-role</td>
</tr>
<tr>
<td>• /api/config/rbac/authentication/users/user?deep</td>
<td></td>
</tr>
</tbody>
</table>

Configuring Minimum Length for Passwords

The admin user can configure the minimum length required for passwords of all users. The minimum length must be between 7 to 128 characters. By default, the minimum length required for passwords is set to 7 characters.

```plaintext
configure terminal
rbac authentication min-pwd-length 10
commit
```
Minimum Password Length APIs and Commands

<table>
<thead>
<tr>
<th>APIs</th>
<th>Commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>/api/config/rbac/authentication/</td>
<td>rbac authentication min-pwd-length</td>
</tr>
</tbody>
</table>

### Configuring Password Lifetime

The admin user can configure minimum and maximum lifetime values for passwords of all users and enforce a rule to check these values. The default minimum lifetime value is set to 1 day and the default maximum lifetime value is set to 60 days.

When a minimum lifetime value is configured, the user cannot change the password until the specified number of days have passed. Similarly, when a maximum lifetime value is configured, a user must change the password before the specified number of days pass. If a user does not change the password and the specified number of days have passed, a notification is sent to the user.

**Note**

The minimum and maximum lifetime values and the rule to check for these values are not applied to the admin user.

```bash
configure terminal
rbac authentication password-lifetime enforce true min-days 2 max-days 30
commit
```

### Password Lifetime APIs and Commands

<table>
<thead>
<tr>
<th>APIs</th>
<th>Commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>/api/config/rbac/authentication/password-lifetime/</td>
<td>rbac authentication password-lifetime</td>
</tr>
</tbody>
</table>

### Deactivating Inactive User Accounts

The admin user can configure the number of days after which an unused user account is marked as inactive and enforce a rule to check the configured inactivity period. When marked as inactive, the user cannot login to the system. To allow the user to login to the system, the admin user can activate the user account by using the `rbac authentication users user username activate` command.

**Note**

The inactivity period and the rule to check the inactivity period are not applied to the admin user.

```bash
configure terminal
rbac authentication account-inactivity enforce true inactivity-days 2
commit
```
Deactivate Inactive User Accounts APIs and Commands

<table>

Certification

Generate Sign-Request

```bash
nfvis(config)# system certificate signing-request ?
```
Possible completions:

- common-name
- country-code
- locality
- organization
- organization-unit-name
- state

The .csr file will be saved in /data/intdatastore/download/nfvis.csr

Use the scp command to download the file.

Install CA Sign Certificate

After CA sign in, the user needs to use the scp command to upload the file into nfvis.

```bash
nfvis(config)# system certificate install-cert path file://<full path of the file>
```

The path needs to start with "file://"

Switch Certificate

```bash
nfvis(config)# system certificate use-cert cert-type ca-signed
```

nginx process restarts after the switch.
The users cannot access the log files. The log files are added to all user actions and the user can download and view some of the logs from portal. A notification is generated when the log files reach 75% capacity.

## Secure Copy Command

The secure copy (scp) command allows only the admin user to secure copy a file from the Cisco NFVIS to an external system or from an external system to Cisco NFVIS. The **scp** command is:

```
scp source destination
```

### Note

For detailed information about how to use the **scp** command to copy to or from supported locations, see the **scp** section in Cisco Enterprise Network Function Virtualization Infrastructure Software Command Reference.

### Examples

The following example copies the sample.txt file from intdatastore to an external system.

```
nfvis# scp intdatastore:sample.txt user@203.0.113.2:/Users/user/Desktop/sample.txt
```

The following example copies the test.txt file from an external system to intdatastore.

```
nfvis# scp user@203.0.113.2:/Users/user/Desktop/test.txt intdatastore:test_file.txt
```

The following example copies the test.txt file from an external system to USB.

```
nfvis# scp user@203.0.113.2:/Users/user/Desktop/my_test.txt usb:usb1/test.txt
```

The following example copies the sample.txt file to an NFS location.

```
nfvis# scp user@203.0.113.2:/user/Desktop/sample.txt nfs:nfs_test/sample.txt
```

The following example copies the sample.txt file from an external system with IPv6 address.

```
nfvis# scp user@[2001:DB8:0:ABCD::1]:/user/Desktop/sample.txt intdatastore:sample.txt
```

The following example copies the nfvis_scp.log file to an external system.

```
nfvis# scp logs:nfvis_scp.log user@203.0.113.2:/Users/user/Desktop/copied_nfvis_scp.log
```

## Configuring the IP Receive ACL

To filter out unwanted traffic, you can configure ip-receive-acl to block or allow certain traffic based on the IP address and service ports.

To configure the source network for Access Control List (ACL) access to the management interface:

```
configure terminal
system setting ip-receive-acl 198.0.2.0/24
commit
```

### Verifying the Trusted IP Connection

Use the **show running-config system settings ip-receive-ac** command to display the configured source network for ACL access to the management interface.
Port 22222 and Management Interface ACL

Management interface ACL provides the Access Control List (ACL) to restrict the traffic through the management interface for setting up different ACL of subnet inside a big subnet. From 3.7.1 release, port 22222 is closed by default on an NFVIS system.

To open port 22222:

```
configure terminal
system settings ip-receive-acl 0.0.0.0/0 service scpd priority 2 action accept
commit
```

Priority can be set to any number, as long as there is no other ACL that drops packets from same IP with lower priority number.

Use `no system settings ip-receive-acl` to close port 22222. When an entry is deleted from `ip-receive-acl`, all configurations to that source are deleted since the source IP address is the key. To delete one service, configure other services again.

From 3.8.1 release, only an admin user can use the scp command on this port to upload or download only from restricted folders like `/data/intdatastore/`.

Use the `show running-config system settings ip-receive-acl` command to verify the interface configuration:

```
nfvis# show running-config system settings ip-receive-acl
system settings ip-receive-acl 10.156.0.0/16
service [ ssh https scpd ]
action accept
priority 100
```

Configuring Your Banner and Message of the Day

Cisco Enterprise NFVIS supports two types of banners: system-defined and user-defined banners. You cannot edit or delete the system-defined banner, which provides copyright information about the application. Banners are displayed on the login page of the portal.
You can post messages using the Message of the Day option. The message is displayed on the portal's homepage when you log into the portal.

To configure your banner and message:

```
configure terminal
banner-motd banner "This is a banner" motd "This is the message of the day"
commit
```

**Note**
Currently, you can create banners and messages in English only. You can view the system-defined banner using the `show banner-motd` command. This command does not display the user-defined banner or message.

**Banner and Message APIs and Commands**

<table>

**Setting the System Time Manually or With NTP**

You can configure the Cisco Enterprise NFVIS system time manually or synchronise with an external time server using Network Time Protocol (NTP).

To set the system time manually:

```
configure terminal
system set-manual-time 2017-01-01T00:00:00
commit
```

**Note**
NTP is automatically disabled when the time clock is set manually.

To set the system time using NTP IPv4:

```
configure terminal
system time ntp preferred_server 209.165.201.20 backup_server 1.ntp.esl.cisco.com
commit
```

To set the system time using NTP IPv6:

```
configure terminal
commit
```
Verifying the System Time Configuration

To verify all system time configuration details, use the `show system time` command in privileged EXEC mode as shown below:

```
nfvis# show system time
system time current-time 2017-01-01T17:35:39+00:00
system time current-timezone "UTC (UTC, +0000)"
```

<table>
<thead>
<tr>
<th>REMOTE</th>
<th>REFID</th>
<th>ST</th>
<th>T</th>
<th>WHEN</th>
<th>POLL</th>
<th>REACH</th>
<th>DELAY</th>
</tr>
</thead>
<tbody>
<tr>
<td>OFFSET</td>
<td>JITTER</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>*calo-timeserver .GPS. 1 u 4 64 1 69.423</td>
<td>2749736 0.000</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>* sys.peer and synced, o pps.peer, # selected, + candidate,</td>
<td>- outlyer, . excess, x falseticker, space reject</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

If the NTP server is invalid, it will not be displayed in the table. Also, when an NTP server is queried, if a response is not received before the timeout, the NTP server will also not be displayed in the table.

System Time APIs and Commands

<table>
<thead>

</tr>
</tbody>
</table>

Enabling or Disabling the Portal Access

The Cisco Enterprise NFVIS portal access is enabled by default. You can disable the access if required.

To disable the portal access:

```
configure terminal
system portal access disabled
commit
```

You can enable the portal access using the `enable` keyword with the `system portal access` command.

Note
Verifying the Portal Access

Use the `show system portal status` command to verify the portal access status as shown below:

```
nfvis# show system portal status
system portal status "access disabled"
```

### Portal Access APIs and Commands

<table>
<thead>
<tr>
<th>Portal Access APIs</th>

</tr>
</thead>
<tbody>
<tr>
<td>• /api/config/system/portal</td>
<td>• system portal access</td>
</tr>
<tr>
<td>• /api/operational/system/portal/status</td>
<td>• show system portal status</td>
</tr>
</tbody>
</table>

---

## Configuring System Logs

You can view system logs for troubleshooting purpose. There are two log types and five log levels. The two log types are configuration and operational.

The INFO and WARNING log levels are set by default respectively for the configuration and operational log types. You can change them as required. However, the change to the log level is not persisted across a reboot. After a reboot, the default log levels are used.

The following table explains the log levels:

<table>
<thead>
<tr>
<th>Log Level</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEBUG</td>
<td>Information, typically of interest only when diagnosing problems.</td>
</tr>
<tr>
<td>INFO</td>
<td>Confirmation that things are working as expected.</td>
</tr>
<tr>
<td>WARNING</td>
<td>An indication that something unexpected happened, or indicative of some problem in the near future (for example, ‘disk space low’). The software application is still working as expected.</td>
</tr>
<tr>
<td>ERROR</td>
<td>Due to a serious problem, the software application is not able to perform some function.</td>
</tr>
<tr>
<td>CRITICAL</td>
<td>A serious error, indicating that the program itself may not be able to continue running.</td>
</tr>
</tbody>
</table>

You can configure system logs using the `system set-log` command in global configuration or privileged EXEC mode:

```
system set-log level error logtype configuration
```

### Verifying the System Log Configuration

To verify the system log configuration, use the `show system logging-level` command as shown below:
System Log APIs and Commands

<table>
<thead>
<tr>
<th>System Log APIs</th>
<th>System Log Commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>• /api/operations/system/set-log</td>
<td>• system set-log logtype</td>
</tr>
<tr>
<td>• /api/operational/system/logging-level</td>
<td>[all/configuration/operational] level</td>
</tr>
<tr>
<td></td>
<td>[critical/debug/error/info/warning]</td>
</tr>
<tr>
<td></td>
<td>• show system logging-level</td>
</tr>
</tbody>
</table>

Network File System Support

The Network File System (NFS) is an application where the user can view, store and update the files on a remote device. NFS allows the user to mount all or a part of a file system on a server. NFS uses Remote Procedure Calls (RPC) to route requests between the users and servers.

**NFS Mount and Unmount**

To mount NFS:

```bash
configure terminal
system storage nfs_storage
nfs
100
10.29.173.131
/export/vm/amol
commit
```

To unmount NFS use `no system storage nfs_storage` command.

**Image Registration on NFS**

Images in tar.gz, ISO and qcow2 format, remote images and images on mounted NFS can be registered on NFS.

To register tar.gz images on NFS:

```bash
configure terminal
vm_lifecycle images image myas10 src file:///data/mount/nfs_storage/repository/asav961.tar.gz properties property placement value nfs_storage
commit
```

Similar configuration can be used for the various images formats.

To unregister an image from NFS use `no vm_lifecycle images` command.
Deploy VM on NFS

To deploy a VM on NFS, under deployment vm group use `placement type zone_host host nfs_storage` command.

Secure Boot of host

**Note**

This feature is supported only on ENCS 5400. Upgrade BIOS to version 2.6 for this feature. The secure boot feature is only available for release 3.9.1 fresh install.

The secure boot feature prevents malicious software applications and unauthorized operating systems from loading into the system during the system start up process. If secure boot feature is enabled, only the authorized software applications boots up from the device. Each device has keys that allow software with the correct signature to boot up on the device.

This feature ensures that the software applications that boot up on the device are certified by Cisco. The NFVIS 3.9.1 image is signed with Cisco key. If secure boot is enabled the signature is verified during the device boot up. If the verification fails, the image does not boot up.

Secure boot is disabled by default and to enable it you must change firmware configurations from CIMC. Secure boot needs to boot from a separate UEFI partition.

To enable secure boot:

1. Get into CIMC and use **show bios detail** command to view the BIOS version.

   ```
   ENCS# scope bios
   ENCS/bios # show detail
   BIOS:
   BIOS Version: " ENCS54_2.6 (Build Date: 07/12/2018)"
   Boot Order: EFI
   FW Update/Recovery Status: Done, OK
   Active BIOS on next reboot: main
   UEFI Secure Boot: disabled
   ENCS/bios #
   ```
   
2. enable secure boot.

   ```
   ENCS/bios # set secure-boot enable
   Setting Value : enable
   Commit Pending.
   ENCS/bios *# commit
   ENCS/bios # show detail
   BIOS:
   BIOS Version: "ENCS54_2.6 (Build Date: 07/12/2018)"
   Boot Order: EFI
   FW Update/Recovery Status: None, OK
   Active BIOS on next reboot: main
   UEFI Secure Boot: enabled
   ENCS/bios #
   ```

Legacy boot, UEFI boot and UEFI secure boot are the three boot modes. Secure boot can only be used on a disk that has UEFI partition.
You can configure boot order from CIMC command or portal or from BIOS setup menu. With CIMC you can only configure legacy boot order. BootOrderRules are by default set to Strict and so boot order follows the CIMC configuration. Since CIMC cannot be used to configure UEFI boot order, the BootOrderRules setting must be changed to Loose when secure boot is enabled.

If BootOrderRules is set to Loose, the boot order will follow the BIOS setup menu. When an operating system is installed in secure boot mode, the new UEFI boot option for the OS automatically appears at the top of the BIOS menu boot order list, to boot the installed operating system.

To set BootOrderRule to Loose:

```
ENCS/bios # scope advanced
ENCS/bios/advanced # set BootOrderRules Loose
ENCS/bios/advanced # commit
Changes to BIOS set-up parameters will require a reboot.
Do you want to reboot the system?[y|N]y
```

### CIMC Control

On ENCS 5400, NFVIS administrators have authoritative control of the device. This includes capability to change the IP address used to reach the CIMC and modifying the CIMC and BIOS passwords.

### CIMC Access using NFVIS

CIMC access using NFVIS is supported only on ENCS 5400.

When CIMC access is enabled on NFVIS, there is a potential risk of unauthorized ISRv to gain access to the host CIMC and switch management console. You must have authorization from CID or Consent token to gain root access.

```
To access CIMC using NFVIS WAN or management interface IP address, use the `system settings cimc-access enable` command. Once you configure CIMC access on NFVIS, the stand alone CIMC access using CIMC IP address is disabled and you will be able to access CIMC using NFVIS management interface IP address. The configurations remain on the device even after the device reboot.

When the CIMC access is configured, it enables a few ports to access services like SSH, SNMP, HTTP and HTTPS into the CIMC.

The following port numbers are being used for forwarding services to CIMC:

- 20226 for SNMP
- 20227 for SSH
- 20228 for HTTP
- 20229 for HTTPS

If you are unable to access CIMC using NFVIS, check the show log nfvis_config.log file. Use `system settings cimc-access disable` to disable this feature.
BIOS-CIMC Update

Starting from 3.8.1 release, for ENCS 5400 router, if existing BIOS/CIMC version is lower than the bundled image in 3.8.1 NFVIS package, it is updated automatically during the NFVIS upgrade or installation. Also the CPU microcode is upgraded. The upgrade time takes longer than the previous releases and the upgrade will be done automatically, and you cannot stop the process once it is initiated.

For ENCS 5100 router, BIOS will be upgraded automatically to a new version but you need to boot up the server manually after the upgrade.

NFVIS Password Recovery

1. Load the NFVIS 3.9.1 image, using the CIMC KVM console.
2. Select Troubleshooting from the Boot Selection menu.
3. Select Rescue a NFVIS Password.
4. Select Continue.
5. Press Return to get a shell.
6. Run the `chroot /mnt/sysimage` command.
7. Run the `./nfvis_password_reset` command to reset the password to admin.
8. Confirm the change in password and enter Exit twice.
   Remove the CD-ROM and reboot NFVIS.
9. Login to NFVIS with the default credentials admin/Admin123#.
   After login to NFVIS, enter a new password at prompt.
10. Connect to NFVIS with the new password.

Note

You can update and recover NFVIS 3.8.1 and older passwords using NFVIS 3.9.1.

DPDK Support on NFVIS

The Data Plane Development Kit (DPDK) is a set of data plane libraries and network interface controller drivers for fast packet processing.

DPDK Support for NFVIS 3.10.x

DPDK support is enabled only on ENCS 5400 from NFVIS 3.10.1 release. To enable DPDK use `system settings dpdk enable` command. Once DPDK is enabled it cannot be disabled. You can use `factory-default-reset all-except-images-connectivity` to disable DPDK.

To enable DPDK support:
configure terminal
system settings dpdk enable
commit

DPDK can be enabled if:

- No VMs are deployed.
- There are no other bridges created other than the default bridge which is wan-br, wan2-br or lan-br.
- The default bridges are not modified.

DPDK mode is enabled on a bridge, if the bridge is created as part of a network or bridge api without any NIC ports. NIC ports can also be added later to the bridge, if no VMs are deployed on the network associated to the bridge. If a NIC port is added to the bridge, the bridge will switch to non-dpdk mode. Once a bridge enters non-dpdk mode, it will not switch back to DPDK mode again. NFVIS supports DPDK for the interface with virtio driver only.

---

**Note**

NFVIS 3.10.x release does not support `tcpdump packetcapture` command on DPDK enabled bridge.

If DPDK is enabled, all VMs deployed will have DPDK and HugePage support. The default hugepage size is 2MB. After DPDK is enabled the system reserves 512 hugepages for Openvswitch operations. Hugepages for VM are allocated dynamically. If the system is not able to allocate HugePages for a newly deployed VM, the VM will boot up in error state. Memory Fragmentation is the main reason why HugePage allocation fails. In this case a reboot can help solve the issue.

---

**Note**

DPDK support is only enabled on the bridges without NIC ports.

For a system without Hyper-threading one additional core is reserved by the system and for a system with Hyper-threading two additional logical cores are reserved by the system.

NFVIS does not support changing Hyper-thread option such as disabling after DPDK is enabled with Hyper-thread. The system can be unstable if you change Hyper-thread setting after DPDK is enabled.

---

**DPDK VM Migration for NFVIS 3.11.x**

**Enhancements to DPDK Support in NFVIS 3.12.x**

**Service Bridge DPDK Support for New Platforms**

Starting from NFVIS 3.12.1 DPDK support is added for service bridges on UCS-C M5, UCS-E M3 and CSP 5000 series. Only the service bridge is supported and the default wan bridge and lan bridge do not support DPDK feature. DPDK is supported on service bridge with or without any pnic. The configuration for service bridge without any pnic is the same as ENCS platform on NFVIS 3.11.1 release, all service bridges will become dpdk-capable after DPDK is enabled. NFVIS system does not require reboot after DPDK is enabled.

DPDK and SR-IOV cannot co-exist on the pnic used for DPDK-capable bridge. The configuration for service bridge with pnic is as followed:
1. (Optional) If pnic ethX-Y is still attached to lan-br, remove it from lan-br.

   ```
   configure terminal
   bridges bridge lan-br
   no port ethX-Y
   commit
   ```

2. Remove SR-IOV networks associated with ethX-Y (usually ethX-Y-SRIOV-*).

   ```
   configure terminal
   no networks network ethX-Y-SRIOV-1
   no networks network ethX-Y-SRIOV-2
   ...
   commit
   ```

3. Disable ethX-Y SRIOV configuration.

   ```
   configure terminal
   pnic ethX-Y
   no sriov
   nnumvf 0
   commit
   ```

4. Create service bridge with port ethX-Y.

   ```
   configure terminal
   bridges bridge service-br port ethX-Y
   networks network service-net bridge service-br
   commit
   ```

5. Enable system-wide DPDK setting.

   ```
   configure terminal
   system settings dpdk enable
   commit
   ```

**Note**

- You can also enable DPDK before creating service bridge with port ethX-Y.

- Except ENCS 5400 platform, all default bridges (lan-br, wan-br, wan-br2) does not enter DPDK-mode after DPDK is enabled system-wide.

- If you do not remove SR-IOV configuration from pnic ethX-Y, and ethX-Y is a port of service bridge, this service bridge cannot enter DPDK-mode after DPDK is enabled system-wide. If you have to use pnic ethX-Y in DPDK bridge, after removing SR-IOV configuration from ethX-Y, delete old bridge and create new bridge and attach ethX-Y to the new bridge.

---

**Migration for VMs with PNIC associated to DPDK bridge**

If DPDK is enabled, all VMs deployed will have DPDK and HugePage support. The default hugepage size is 2MB. After DPDK is enabled, the system will reserve additional 512–2048 contiguous hugepages for DPDK operations. Though hugepages for VM are allocated dynamically, it will cause memory fragmentation and the main reason DPDK enabling process will fail. In this case, a system reboot might help to solve the issue.
If system can find enough hugepages for DPDK process, not only service bridges will enter DPDK-mode, all VMs’ vnic attached to those bridges will be migrated from virtio to dpdk type (dpdkvhostuserclient):

```
nfvis# support ovs vsctl show | begin service-br
  Bridge service-br
    Port "vnic2"
      Interface "vnic2"
        type: dpdkvhostuserclient
          options: {vhost-server-path="/run/vhostfd/vnic2"}
    Port service-br
      Interface service-br
        type: internal

nfvis# support virsh dumpxml ROUTER | begin interface | until serial
  <interface type='network'>
    <mac address='52:54:00:ae:14:57'/>
    <source network='wan-net'/>
    <target dev='vnic1'/>
    <model type='virtio'/>
    <address type='pci' domain='0x0000' bus='0x00' slot='0x04' function='0x0'/>
  </interface>
  <interface type='vhostuser'>
    <mac address='52:54:00:3d:ee:1a'/>
    <source type='unix' path="/run/vhostfd/vnic2" mode='server'/>
    <target dev='vnic2'/>
    <model type='virtio'/>
    <address type='pci' domain='0x0000' bus='0x00' slot='0x05' function='0x0'/>
  </interface>
```

**DPDK and Factory Reset**

The three commonly-used factory reset configurations disable DPDK.

<table>
<thead>
<tr>
<th>Factory-default-reset configuration</th>
<th>DPDK enabled</th>
<th>Networks kept</th>
<th>Deployment deleted</th>
<th>Registered image deleted</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>all-except-images</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>all-except-images -connectivity</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Frequently Seen Failures**

- Error when DPDK is enabled.
  - When enabling DPDK, lack of system memory results in an error. Ensure that you have 4 GB contiguous HugePages to enable DPDK. You can also reboot the system.
  - DPDK requires one physical core from each socket. A multi-sockets system (like UCS-C or CSP) can encounter deployments that occupy all cores on one socket and DPDK can fail to enable. Power-off some VM (resource-locking VMs likes ISRv/ASAv/vWAAS) and enable VM after DPDK is enabled successfully.
  - If the system is not able to allocate HugePages for a newly deployed VM, the VM will boot up in error state.
Import and Export NFVIS VM

Starting from NFVIS 3.10.1 release, you can backup or export (vmExportAction) and restore or import (vmImportAction) VMs. To backup or restore the whole NFVIS system, refer Backup and Restore NFVIS and VM Configurations.

VM Export and Import Limitations

• The imported VM cannot change datastore.
• The original registered image must exist.
• The OVS network name must be identical to the one used by original deployment.
• NFVIS does not check the disk space before exporting or importing a VM.
• The VM has larger disk footprint compared to original deployment after exporting or importing.

To export a VM ensure that:

• VM is in powered off state.
• Backup file is saved in any NFVIS datastores or USB.
• Provide a backup name for NFVIS to append .vmbkp extension to the backup name.

You can only create and save a VM backup to datastores. The backup file has .bkup extension. To verify the backup:

```text
nfvis# show system file-list disk local | display xpath | include backup
/system/file-list/disk/local[si-no='84']/name tiny_backup.vmbkp
```

```text
 nfvis# show system file-list disk local 84
 SI NO NAME PATH SIZE TYPE DATE MODIFIED
 84 tiny_backup.vmbkp /mnt/extdatastore1 17M VM Backup Package 2019-01-31 19:31:32
```

To import a VM ensure that:

• The Backup file is placed under NFVIS datastores or USB.
• The registered image used by the original deployed VM is in the same datastore, with same properties.
• The Original deployed VM does not exist on the system.
• OVS network used by the original deployment should exist.
• Restored VM is created with the same datastore with same deployment properties.
• The full path name to backup file is used (for example, /mnt/extdatastore1/backup.vmbkp, not extdatastore1:backup)

```text
nfvis# vmImportAction importPath /mnt/extdatastore1/tiny_backup.vmbkp
System message at 2019-01-31 19:53:32...
```
Commit performed by admin via ssh using maapi.

The following examples show export failures:

- Original deployment is not deleted
  
  nfvis# vmImportAction importPath /mnt/extdatastore1/tiny_backup.vmbkp
  Error: Exception from action callback: Deployment Configuration : 'SystemAdminTenantIdtiny' already exists, can not be imported/restored due to conflict!

- 2. OVS network used by original deployment is deleted.
  
  nfvis# vmImportAction importPath /mnt/extdatastore1/tiny_backup.vmbkp
  Error: Exception from action callback: Restoration Request rejected, see logs for root cause

Backup and Restore NFVIS and VM Configurations

Starting from NFVIS 3.10.1 release, you can backup and restore NFVIS configurations and VMs. You can also restore a backup from one NFVIS device to another if they are running on the same version of NFVIS and have the same platform.

To backup or restore a single VM, use vmImportAction and vmBackupAction APIs.

To backup and save NFVIS and all VM configurations use configuration-only option. To backup and save VM disks, NFVIS and VM configurations use configuration-and-vms option.

You can only create a backup to datastore or uploads directory. The backup file has .bkup extension.

The following examples shows the backup options:

nfvis# hostaction backup configuration-and-vms file-path intdatastore:sample.bkup

nfvis# hostaction backup configuration-only file-path extdatastore2:sample-dir/sample.bkup

The following example shows the backup stored on a USB:

nfvis# hostaction backup configuration-only file-path usb:usb1/sample.bkup

Use hostaction backup force-stop command to stop the running backup.

To restore a previous backup on same NFVIS setup or on a new NFVIS setup use except-connectivity option which preserves connectivity of the NFVIS and restores everything else from backup.

nfvis# hostaction restore file-path intdatastore:sample.bkup

The following example shows how to restore a backup on a different NFVIS device:
**Backup, Restore and Factory-Default-Reset**

To restore the system after factory-default-reset using backup or restore, check:

- **Backup file location:**
  - The system backup bundle is saved under `/datastore/uploads/` by default.
  - Factory-default-reset cleans up all files under `/datastore/uploads/`, but leave files under `/datastore/` intact.
  - To restore the system from backup bundle after factory-default-reset, if the backup bundle is saved on any other location, the minimum requirement is to have a connection to the NFVIS to upload the backup bundle.

- **VM restoration if system backup contains VM backups:**
  - VM restoration requires the original image or template registered in NFVIS.
  - Factory-default-reset all clean ups all registered images and uploaded files. You need to configure minimum setup, like host connection and upload registered images to the same datastore.

To save backup bundle from factory-default-reset:

- **Save the backup bundle in remote locations.** Then restore the connectivity and upload the backup bundle after reset.

- **Save backup bundle in local `/datastore/` and not in `/datastore/uploads/`:

  ```
  # Backup & Restore on the same NFVIS box without NFS & USB
  # [[ BACKUP ]]
  # before executing factory-default-reset
  nfvis# nfvis# hostaction backup configuration-only file-path extdatastore1:configBackup-01.bkup
  nfvis# system file-copy source /mnt/extdatastore1/uploads/configBackup-01.bkup destination /mnt/extdatastore2/
  # after factory-default-reset all-except-images or all-except-images-connnectivity, file /mnt/extdatastore1/uploads/configBackup-01.bkup will be deleted
  # but /mnt/extdatastore2/configBackup-01.bkup won't.
  # [[RESTORE]]
  # after NFVIS rebooted and login to console, copy file to uploads/ directory
  nfvis# system file-copy source /mnt/extdatastore2/configBackup-01.bkup destination /mnt/extdatastore2/uploads/
  nfvis# hostaction restore file-path extdatastore2:configBackup-01.bkup
  ```

For VM restoration:

- Use all-except-images and all-except-images-connnectivity to keep registered images intact.
• Save the configurations of existing image registrations before running factory-default-reset all. Save the customized flavors or profiles if you have them which can be used as reference after factory-default-reset all.

**Dynamic SR-IOV**

Dynamic SR-IOV allows you to enable or disable SR-IOV on a Physical Network Interface Controller (PNIC). You can disable SR-IOV on any PNIC to 0 and enable SR-IOV by setting a value between 1 to maximum virtual functions (maxvfs) supported on PNICs. You can also create and delete SR-IOV networks based on the number of virtual functions (numvfs) set on that PNIC while enabling SR-IOV. Existing fresh installation behavior has not changed. Each PNIC has default number of VFs created and Default SRIOV networks are created. User can use CLI, API or GUI to Enable/Disable SR-IOV on a PNIC or to Create/Delete SR-IOV networks.

**Restrictions or Limitations**

• The supported platforms are CSP-2100, CSP-5000, UCS-C220-M5X and UCS-E-M3.
• Dynamic SR-IOV is not supported on certain PNICs:
  • PNIC with driver i40e
  • PNIC that does not support SRIOV
• Only switch mode VEB is supported for NFVIS 3.12.1 release.
• Resizing the number of virtual functions is not supported. SR-IOV should be disabled and then enabled with desired number of virtual functions.

**Disable SR-IOV on a PNIC**

All SR-IOV networks for a PNIC must be deleted. PNIC should not be attached to a bridge.

```
configure terminal
no pnic eth0-1 sriov
commit
```

**Enable SR-IOV on a PNIC**

To enable SR-IOV on a PNIC, it has to support SR-IOV, numvfs field should be less than maximum supported VFs (maxvfs) on a PNIC and PNIC should not be attached to a bridge.

```
configure terminal
pnic eth0-1 sriov numvfs 20
commit
```

To display SR-IOV state of all PNICs use `show pnic sriov` command. To display SR-IOV state of individual PNIC use `show pnic eth0-1 sriov` command.
**Creation of SR-IOV Networks**

To create SR-IOV networks, PNIC must have SRIOV enabled and configured with numvfs. The SRIOV network name must have the following format: `<pnic_name>~SRIOV-<num>` with `<pnic_name>` as a valid PNIC name and `<num>` must be greater than 0 and less than numvfs.

To create SR-IOV network in trunk mode:

```plaintext
configure terminal
networks network eth0-1-SRIOV-1 sriov true
commit
```

To create SR-IOV network in access mode:

```plaintext
configure terminal
networks network eth0-1-SRIOV-1 sriov true trunk false vlan 30
commit
```

**Delete SR-IOV Networks**

To delete SR-IOV networks VM should not be attached to the network.

```plaintext
configure terminal
no networks network eth0-1-SRIOV-1
commit
```

To verify the system networks use `show system networks` command.
Cisco Network Plug-n-Play Support

Starting from 3.10.1 release, NFVIS is integrated with PnP 1.8.

The Cisco Network Plug and Play (Cisco Network PnP) solution provides a simple, secure, unified, and integrated offering for enterprise network customers to ease new branch or campus device rollouts, or for provisioning updates to an existing network. The solution provides a unified approach to provision enterprise networks comprising Cisco routers, switches, and wireless devices with a near zero touch deployment experience. This solution uses Cisco Application Policy Infrastructure Controller Enterprise Module (APIC-EM) to centrally manage remote device deployments.

Currently, you can use the Cisco Network Plug and Play client to:
- Auto discover the server
- Provide device information to the server
- Bulk provisioning of user credentials

**Bulk Provisioning of User Credentials**

You can change the default username and password of the devices using the Cisco Network PnP client. The Cisco Network PnP server sends the configuration file to Cisco Network PnP clients residing on multiple devices in the network, and the new configuration is automatically applied to all the devices.

**Note**

For bulk provisioning of user credentials, ensure that you have the necessary configuration file uploaded to the Cisco APIC-EM. The following are the supported configuration formats:

**Sample Format 1**

```xml
<config xmlns="http://tail-f.com/ns/config/1.0">
  <rbac xmlns="http://www.cisco.com/nfv/rbac">
    <authentication>
      <users>
        <user>
          <name>admin</name>
          <password>Cisco123#</password>
        </user>
      </users>
    </authentication>
  </rbac>
</config>
```
Sample Format 2

If you use format 2, the system will internally convert this format into format 1.

```
<aaa xmlns="http://tail-f.com/ns/aaa/1.1">
  <authentication>
    <users>
      <user>
        <name>admin</name>
        <password>User123#</password>
      </user>
    </users>
  </authentication>
</aaa>
```

For more details on the Cisco Network PnP solution and how to upload a configuration file, see the Configuration Guide for Cisco Network Plug and Play on Cisco APIC-EM.

- PnP Discovery Methods, on page 50
- Configuring PnP Discovery Methods, on page 51
- PnP Action, on page 54

**PnP Discovery Methods**

When a device is powered on for the first time, the Cisco Network PnP agent discovery process, which is embedded in the device, wakes up in the absence of the startup configuration file, and discovers the IP address of the Cisco Network PnP server located in the Cisco APIC-EM. The Cisco Network PnP agent uses the following discovery methods:

- Static IP address—The IP address of the Cisco Network PnP server is specified using the `set pnp static ip-address` command.

- DHCP with option 43—The Cisco PnP agent automatically discovers the IP address of the Cisco Network PnP server specified in the DHCP option 43 string. For more details on how to configure DHCP for APIC-EM controller auto-discovery, see the Solution Guide for Cisco Network Plug and Play.

- Domain Name System (DNS) lookup—If DHCP discovery fails to get the IP address of the APIC-EM controller, for example, because option 43 is not configured, the Cisco Plug and Play Agent falls back on a DNS lookup method. Based on the network domain name returned by the DHCP server, it constructs a fully qualified domain name (FQDN) for the APIC-EM controller, using the preset hostname "pnpserver".
For more details on how to configure DNS for APIC-EM controller auto-discovery, see the Solution Guide for Cisco Network Plug and Play.

Note: DNS lookup method is not supported in 3.10.1 release.

Cloud Redirection—This method uses the Cisco Cloud Device Redirect tool available in the Cisco Software Central. The Cisco Plug and Play Agent falls back on the Cloud Redirection method if DNS lookup is not successful.

## Configuring PnP Discovery Methods

To enable static mode for PnP discovery using IPv4:

```bash
configure terminal
pnp automatic dhcp disable
pnp automatic dns disable
pnp automatic cco disable
pnp static ip-address 192.0.2.8 port 80
commit
```

To enable static mode for PnP discovery using IPv6:

```bash
configure terminal
pnp automatic dhcp-ipv6 disable
pnp automatic dns-ipv6 disable
pnp automatic cco-ipv6 disable
pnp static ipv6-address 192.0.2.8 port 80
commit
```

Either IPv4 or IPv6 can be enabled at a time.

To enable static mode for PnP discovery using FQDN:

```bash
configure terminal
pnp static ip-address apic-em-fqdn.cisco.com port 80 transport http
commit
```

In FQDN support for PnP, domain names can be specified as an input. FQDN that is configured with IPv6 on a DNS server is not supported.

To enable automatic mode for PnP discovery using IPv4:
By default, the automatic discovery mode for DHCP, DNS, and CCO is enabled. You can enable or disable the options as required. For example, you can enable all options or keep one enabled, and the rest disabled.

```bash
configure terminal
pnp automatic dhcp enable
pnp automatic dns enable
pnp automatic cco enable
pnp automatic timeout 100
commit
```

To enable automatic mode for PnP discovery using IPv6:

```bash
configure terminal
pnp automatic dhcp-ipv6 enable
pnp automatic dns-ipv6 enable
pnp automatic cco-ipv6 enable
pnp automatic timeout 30
commit
```

You cannot disable both static and automatic PnP discovery modes at the same time. You must restart PnP action every time you make changes to the PnP discovery configuration. You can do this using the `pnp action` command restart.

**Verifying the PnP Status**

Use the `show pnp` command in privileged EXEC mode to verify the configuration of PnP discovery methods. The following sample output shows that the static discovery mode is enabled, and the automatic discovery mode is disabled.

```bash
nfvis# show pnp
pnp status response "PnP Agent is running\n"
**pnp status ip-address 192.0.2.8**
pnp status port 80
pnp status transport ""
pnp status created_by user
pnp status dhcp_opt43 0
pnp status dns_discovery 0
pnp status cco_discovery 0
pnp status timeout 100
nfvis#
```

**FQDN**

```bash
nfvis# show pnp
pnp status response "PnP Agent is running\ns server-connection\n status: Success\n time: 19:59:38 Feb 27\nbackoff\n status: Success\n time: 19:59:38 Feb 27"
pnp status ip-address apic-em-fqdn.cisco.com
pnp status ip6-address ""
pnp status port 443
pnp status transport https
pnp status cafile /etc/pnp/certs/trustpoint/pnplabel
pnp status created_by user
pnp status dhcp_opt43 0
pnp status dns_discovery 0
```
Cisco Network Plug-n-Play Support

Configuring PnP Discovery Methods

The following sample output shows that the static discovery mode is disabled, and the automatic discovery mode is enabled for DHCP, DNS, and CCO:

**DHCP:**
```
nfvis# show pnp
pnp status response "PnP Agent is running\ncni-exec\n status: Success\ntime: 18:30:57
Apr 21\nserver-connection\n status: Success\ntime: 15:40:41 Apr
22\ncertificate-install\n status: Success\ntime: 18:31:03 Apr 21\ndevice-auth\n status: Success\ntime: 18:31:08 Apr 21\nbackoff\n status: Success\ntime: 15:40:41 Apr
22"
pnp status ip-address 192.0.2.8
pnp status port 443
pnp status transport https
pnp status cafile /etc/pnp/certs/trustpoint/pnplabel
pnp status created_by dhcp_discovery
pnp status dhcp_opt43 0
pnp status dns_discovery 0
pnp status cco_discovery 0
pnp status timeout 60
```

**DNS:**
```
nfvis# show pnp
pnp status response "PnP Agent is running\ncni-exec\n status: Success\ntime: 17:18:42
Apr 22\nserver-connection\n status: Success\ntime: 17:20:00 Apr
22\ncertificate-install\n status: Success\ntime: 17:18:47 Apr 22\ndevice-auth\n status: Success\ntime: 17:18:53 Apr 22\nbackoff\n status: Success\ntime: 17:20:00 Apr
22"
pnp status ip-address 192.0.2.8
pnp status port 443
pnp status transport https
pnp status cafile /etc/pnp/certs/trustpoint/pnplabel
pnp status created_by dns_discovery
pnp status dhcp_opt43 0
pnp status dns_discovery 0
pnp status cco_discovery 0
pnp status timeout 60
```

**CCO:**
```
nfvis# show pnp
pnp status response "PnP Agent is running\ncni-exec\n status: Success\ntime: 17:18:42
Apr 22\nserver-connection\n status: Success\ntime: 17:20:00 Apr
22\ncertificate-install\n status: Success\ntime: 17:18:47 Apr 22\ndevice-auth\n status: Success\ntime: 17:18:53 Apr 22\nbackoff\n status: Success\ntime: 17:20:00 Apr
22"
pnp status ip-address 192.0.2.8
pnp status port 443
pnp status transport https
pnp status cafile /etc/pnp/certs/trustpoint/pnplabel
pnp status created_by cco_discovery
pnp status dhcp_opt43 0
pnp status dns_discovery 0
pnp status cco_discovery 0
pnp status timeout 60
```
PnP Action

You can start, stop, and restart any PnP action using the PnP action command or API.

PnP Action API and Command

<table>

CHAPTER 5

VM Life Cycle Management

VM life cycle management refers to the entire process of registering, deploying, updating, monitoring VMs, and getting them service chained as per your requirements. You can perform these tasks and more using a set of REST APIs or NETCONF commands or the Cisco Enterprise NFVIS portal.

VM Packaging Format

All VM images are available in the .tar.gz/qcow2/vmdk/img/iso format. All Cisco supplied VMs are available in the prescribed format. Vendors are responsible for packaging all third party VMs in the prescribed format.

- Workflow of VM Life Cycle Management, on page 55
- Uploading VM Images to an NFVIS Server, on page 57
- VM Bootstrap Configuration Options with a VMDeployment, on page 58
- OpenStack Configuration Drive Support for Third Party VMs, on page 59
- Performing Resource Verification, on page 60
- Configuring Management IP Address, on page 61
- VM States, on page 61

Workflow of VM Life Cycle Management

The following diagram depicts the basic workflow of the VM life cycle management using REST APIs:
1. **Register a VM Image**—To register a VM image, you must first copy or download the relevant VM image to the NFVIS server, or host the image on an http or https server. Once you have downloaded the file, you can register the image using the registration API. The registration API allows you to specify the file path to the location (on the http/https server) where the tar.gz file is hosted. Registering the image is a one-time activity. Once an image is registered on the http or https server, and is in active state, you can perform multiple VM deployments using the registered image.

2. **Customizing the Setup**—After registering a VM image, you can optionally create a custom profile or flavor for the VM image if the profiles defined in the image file do not match your requirement. The flavor creation option lets you provide specific profiling details for a VM image, such as the virtual CPU on which the VM will run, and the amount of virtual memory the VM will consume.

   Depending on the topology requirement, you can create additional networks and bridges to attach the VM to during deployment.

3. **Deploy a VM**—A VM can be deployed using the deployment API. The deployment API allows you to provide values to the parameters that are passed to the system during deployment. Depending on the VM you are deploying, some parameters are mandatory and others optional.

4. **Manage and Monitor a VM**—You can monitor a VM using APIs and commands that enable you to get the VM status and debug logs. Using VM management APIs, you can start, stop, or reboot a VM, and view statistics for a VM such as CPU usage.

   A VM can also be managed by changing or updating its profile. You can change a VM’s profile to one of the existing profiles in the image file; alternatively, you can create a new custom profile for the VM.

   The vNICs on a VM can also be added or updated.
Before performing the VM life cycle management tasks, you will have to upload the VM images to the NFVIS server or http/s server.

For details on APIs, see the VM Lifecycle Management APIs chapter in the API Reference for Cisco Enterprise Network Function Virtualization Infrastructure Software.

### Uploading VM Images to an NFVIS Server

You can upload VM images to an NFVIS server in the following ways. The files are copied to the default location (/data/intdatastore/uploads) on the host server.

- Copy the images from your local system to the NFVIS server—Use the **Image Upload** option from the Cisco Enterprise NFVIS portal.
- Copy the images using the USB drive—Ensure that you have plugged the USB drive that contains the required images into the server before mounting the USB drive.
- Copy using the **scp** command (scp username@external_server:/path/image.tar.gz intdatastore:image.tar.gz).

From 3.8.1 release, NFVIS supports deleting images while the download is in progress. NFVIS also supports resuming image download after a power outage or lost connectivity.

To copy an image using the USB device:

```bash
configure terminal
system usb-mount mount ACTIVE
system file-copy usb file name usb1/package/isrv-universalk9.16.03.01.tar.gz
commit
```

Use the **show system file-list disk usb** command in privileged EXEC mode to view a list of files available with the mounted USB drive. To save space, you can delete all unwanted text and TAR files from the default location using the **system file-delete** command in global configuration mode.

### Verifying the Image Copied from the USB Drive

After copying the file from the USB drive to the host server, you can verify the file using the **show system file-list disk local** command:

```bash
nfvis# show system file-list disk local
```

<table>
<thead>
<tr>
<th>SI NO</th>
<th>NAME</th>
<th>PATH</th>
<th>SIZE</th>
<th>TYPE</th>
<th>DATE MODIFIED</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>lastlog-20170314.gz</td>
<td>/data/intdatastore/logs/2017-03/14/10-00</td>

<td>167K</td>
<td>Other</td>
<td>2017-03-14 21:55:42</td>
</tr>
</tbody>
</table>
VM Bootstrap Configuration Options with a VM Deployment

You can include the bootstrap configuration (day zero configuration) of a VM in the VM deployment payload in the following three ways:

- **Bundle bootstrap configuration files into the VM package**—In this method, the bootstrap configuration variables can be tokenized. Token names must be in bold text. For each tokenized variable, key-value pairs must be provided during deployment in the deployment payload.

- **Bootstrap configuration as part of the deployment payload**—The entire bootstrap configuration is copied to the payload without tokens.

- **Bootstrap configuration file in the NFVIS server**—In this method, the configuration file is copied or downloaded to the NFVIS server, and referenced from the deployment payload with the filename including full path.

<table>
<thead>
<tr>
<th>APIs</th>
<th>Commands</th>
</tr>
</thead>
</table>
| • /api/operations/system/file-copy/usb/file  
• /api/config/system/usb-mount | • system file-copy usb file name  
• system usb-mount mount ACTIVE  
• system file-delete  
• show system file-list disk usb  
• show system file-list disk local |
For examples on how to use bootstrap configuration options in the deployment payload, see the API Reference for Cisco Enterprise Network Function Virtualization Infrastructure Software.

OpenStack Configuration Drive Support for Third Party VMs

To enable staging of bootstrap configuration files at the time of a third party VM deployment as per OpenStack standards, the following cloud init format is supported:

```
openstack/content
openstack/content/0000
openstack/content/0001
openstack/latest/meta_data.json
```

In the above sample, the "0000" and "0001" files are the actual bootstrap files from the deployment payload. A third party VM can use the init file to fetch its configuration files.

The following metadata file is used to provide the file path on the configuration drive and reference to the actual bootstrap configuration files.

```
{
  "files": [
    {
      "content_path": "/content/0000",
      "path": "/config/day-0.txt"
    },
    {
      "content_path": "/content/0001",
      "path": "/sample/path/iosxe_config.txt"
    }
  ]
}
```

With this implementation, two copies of the same bootstrap configuration file will be present on the virtual CD-ROM package. The first version at the root (iosxe_config.txt) and the second inside the "openstack/content" folder.

The admin will also have to specify the bootstrap configuration file in the image properties file before packaging the VM.

Example for the Bootstrap Configuration File in the Image Properties File

```
--optimize=OPTIMIZE [REQUIRED] optimized VM: --optimize=true/false;
--root_file_disk_bus=ROOT_FILE_DISK_BUS root disk file type:
--root_file_disk_bus=virtio/ide; default is virtio
--virtual_interface_model=VIRTUAL_INTERFACE_MODEL
--virtual_interface_model=rtl8139; default is none
--thick_disk_provisioning=THICK_DISK_PROVISIONING
--thick_disk_provisioning=true; default is false
--bootstrap_cloud_init_bus_type=BOOTSTRAP CLOUD INIT BUS TYPE
--bootstrap_cloud_init_bus_type=virtio; default is ide
--bootstrap_cloud_init_drive_type=BOOTSTRAP CLOUD INIT DRIVE TYPE
--bootstrap_cloud_init_drive_type=disk; default is cdrom
--bootstrap=BOOTSTRAP bootstrap file/s for VM (two parameters required in the format of dst:src; dst filename including path has to match exactly to what the VM expects; upto 20 bootstrap files are accepted.)
examples:
--bootstrap ovf-env.xml:file1,ios-xe.txt:file2 for ISRv; both files get mounted at the
```
Performing Resource Verification

Given below are the APIs and commands to perform different types of resource verification:

<table>
<thead>
<tr>
<th>Task</th>
<th>API</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>To display CPU information for each CPU or the user specified CPU, and the VMs pinned to the CPU</td>
<td>• api/operational/resources/cpu-info/cpus &lt;cpu-info/cpus/cpu &lt;cpu-id&gt;</td>
<td>show resources cpu-info cpus</td>
</tr>
<tr>
<td></td>
<td>• /api/operational/resources/cpu-info/vnfs &lt;vnfs/vnfs/vnf &lt;deployment_name&gt;.&lt;vm_group_name&gt;</td>
<td>show resources cpu-info vnfs</td>
</tr>
<tr>
<td></td>
<td>• /api/operational/resources/cpu-info/allocation</td>
<td>show resources cpu-info allocation</td>
</tr>
</tbody>
</table>

To display information on the VMs running in all the physical CPUs or a specific physical CPU in the system

To get information on the number of CPUs allocated to VMs and the CPUs that are already used by the VMs

To display information on all CPUs, VMs pinned to the CPUs, and VMs allocated to the CPUs, use the **show resources cpu-info** command.

**CPU Over-Subscription**

Cisco Enterprise NFVIS does not allow CPU over-subscription for low-latency network appliance VMs (for example, Cisco ISRv and Cisco ASAv). However, the CPU over-subscription is allowed for non low-latency VMs (for example, Linux Server VM and Windows Server VM).
Configuring Management IP Address

The following commands need to be executed in a sequence to first delete an exiting subnet and then add a new subnet in the network. For these commands to work, ensure there is no managed VNF’s in the system before you change management network address.

To delete an existing subnet use `no vm_lifecycle networks network int-mgmt-net subnet int-mgmt-net-subnet` command.

To create a new subnet:

```bash
configure terminal
vm_lifecycle networks network int-mgmt-net subnet int-mgmt-net-subnet address 105.20.0.0
gateway 105.20.0.1 netmask 255.255.255.0 dhcp false
commit
```

VM States

</tr>
</tbody>
</table>
VM Deployment Scenarios

This chapter provides details on the following deployment scenarios using REST APIs. As an example, the Cisco ENCS is used to illustrate these scenarios.

- Single VM deployment
- Service chaining with two VMs
- Service chaining of multiple VMs with Windows or Linux servers

The following VM images are used to explain the deployment scenarios:

- Cisco Integrated Services Router (ISRv) — isrv-03.16.02
- Cisco Adaptive Security Virtual Appliance (ASAv) — asav951-201
- Linux server — ubuntu-14.04.3-server-amd64-disk1

- Registering VM Images, on page 63
- Service Chaining of VMs, on page 67

Registering VM Images

You must register all VM images before deploying them.

Note

Register all the VM images required for the VM deployment depending on the topology. A VM image registration is done only once per VM image. You can perform multiple VM deployments using the registered VM image.

To register a Cisco ISRv image:

1. Set up the http/https server to host the VM image, or upload the image to the NFVIS server using the local portal or the `scp` command.
2. Register the Cisco ISRv image using the following API method:

```
curl -k -v -u admin:admin -H Accept:application/vnd.yang.data+xml -H Content-Type:application/vnd.yang.data+xml -X
```
3. Verify the image status using the following API method:

```bash
```

4. Now, repeat Steps 1 to 3 to register the Cisco ASAv and Linux server images. Ensure that you provide the exact image name and source file location when running the API commands.

---

**Note**

You can run API commands from any console/server that can reach Cisco Enterprise NFVIS.

---

**Single VM Deployment**

In this example, a Cisco ISRv image with three network interfaces is deployed. The following diagram illustrates the deployment topology:

*Figure 6: Single VM Deployment*

---

**Steps for Deploying a VM**

To deploy a Cisco ISRv image:

1. Verify that all networks required for your deployment are configured.

```bash
curl -k -v -u admin:admin -H 'Content-Type:application/vnd.yang.data+xml' -X GET https://<NFVIS_IP>/api/config/networks?deep
```
2. Before deploying the VM, you can perform a resource check to ensure that you have sufficient resources for the deployment.

```
curl -k -u admin:admin -X GET
https://<NFVIS_IP>/api/operational/resources/precheck/vnf/newvnf,isrv-small,true
?deep
```

3. Deploy the Cisco ISRv VM.

```
curl -k -u admin:admin -H Accept:application/vnd.yang.data+xml -H
Content-Type:application/vnd.yang.data+xml -X
POST https://<NFVIS_IP>/api/config/vm_lifecycle/tenants/tenant/admin/deployments --data

        </metric_collector>
      </kpi>
    </kpi_data>
  </vm_group>
</deployment>
```
If two VM’s are connected to the same physical interface, one over SRIOV and another over virtio net from a bridge connected to the packet filter, you cannot ping between the two VM’s between these interfaces. Use SRIOV or virtio net on both the VM’s to connect to the packet filter over a bridge.

4. Verify the deployment status.

```bash
```

**Note** To enable NIM support on a Cisco ISRv running on Cisco ENCS, you must use the following variable in the ISRv deployment payload.

```xml
<variable>
  <name>ngio</name>
  <val>enable</val>
</variable>
```
Service Chaining of VMs

Service chaining here refers to a set of network services in the form of VMs using an intermediate network. Cisco Enterprise NFVIS supports service chaining of two or more VMs eliminating the need of dedicated hardware devices for different types of network services.

To service chain traffic between two or more VMs, you will have to create the following:

- Bridge—For example, you can create a new bridge called sc-br.
- Network—For example, you can create a new network called sc-net.
- Launch VM1 and VM2 with an interface from each VM to the service chain network (sc-net).

For more details on how to configure service chaining using APIs, see the following topics:

- Service Chaining with two VM Images, on page 67
- Service Chaining of Multiple VMs with Windows or Linux Servers, on page 68

Service Chaining with two VM Images

In this example, a Cisco ISRv VM and a Cisco ASAv VM are service chained. For that, you will have to deploy both VMs.

Figure 7: Service Chaining with two VM Images

Steps for Service Chaining with Two VM Images

1. Create a new bridge for service chaining.

   ```bash
curl -k -v -u admin:admin -H content-type:application/vnd.yang.data+xml -X POST https://<NFVIS_IP>/api/config/bridges --data '<bridge><name>sc-br</name></bridge>'
   ```

2. Create a new network for service chaining, and attach the bridge to the network.

   ```bash
curl -k -v -u admin:admin -H content-type:application/vnd.yang.data+xml -X POST https://<NFVIS_IP>/api/config/networks --data
   ```
3. Verify that all bridges and networks are configured.
4. Deploy the Cisco ISRv VM, and verify the deployment status.
5. Deploy the cisco ASAv VM, and verify the deployment status.

See Steps for Deploying a VM, on page 64 for API command details for Steps 3 to 5.

Service Chaining of Multiple VMs with Windows or Linux Servers

In this example, multiple VMs will be service chained. Cisco ISRv and Cisco ASAv VMs can be deployed as explained in Service Chaining with two VM Images, on page 67.

This section covers Linux server deployment (Windows 2012 server can also be deployed using the same steps.)

Figure 8: Service Chaining of Multiple VMs with Windows or Linux Servers

Steps for Service Chaining of Multiple VMs with Windows or Linux Servers

1. Create networks and bridges as required.
   
   See Steps 1 and 2 in Steps for Service Chaining with Two VM Images, on page 67 for details on creating networks and bridges.

2. Deploy Cisco ISRv and Cisco ASAv, and verify their deployment status.
3. Deploy the Linux server VM.
4. Verify the server deployment status.

   See the Steps for Deploying a VM, on page 64 for API command details for Steps 2 to 4.
 SPAN Session or Port Mirroring

- About SPAN Sessions, on page 69
- Configuring SPAN Sessions, on page 69
- Configuration Examples for SPAN Session Scenarios, on page 71

About SPAN Sessions

The Switched Port Analyzer (SPAN) or Port Mirroring feature helps you analyze network traffic passing through interfaces or VLANs by using SPAN sessions. The SPAN sessions send a copy (mirror) of the traffic to another interface or VLAN on the switch that has been connected to a network analyzer or monitoring device. SPAN does not affect the switching of network traffic on the source interfaces.

Note

You must dedicate a destination port for SPAN use. Except for traffic that is required for the SPAN session, destination ports do not receive or forward traffic. When the SPAN is configured on the system, there might be some performance hit.

SPAN Session Interfaces

The interface can be:

- Physical interface
- LAN SRIOV
- VM's vNIC (virtio net)

In the case of virtio net or SRIOV VF, you have to specify the VM group name and NIC ID of the VM interface. If the VM vNIC is virtio net type, then the SPAN session is applied on the OVS bridge. If VM vNIC is SRIOV VF, then the mirror is applied to the hardware bridge. The interface name is specified for a physical interface, for example, GE0-0 or eth0.

Configuring SPAN Sessions

The SPAN session configuration has the following four parameters:
• Session number—Each SPAN session is identified with a unique number.

• Bridge name—The SPAN session is applied to a bridge. For VLAN mirroring, the bridge must be specified. The bridge name is optional if the source or destination interface is configured for the session.

• Source configuration—The source of the mirror traffic can be one of the following:
  • Packets entering (Rx), or exiting (Tx), or both. You can specify multiple interfaces of any type.
  • You can also specify all interfaces on the OVS bridge.
  • All packets entering a VLAN. You can also specify a list of VLANs.

• Destination configuration—The destination for the mirrored traffic can be one of the following:
  • The mirrored traffic can be sent to interfaces of any type.
  • The mirrored traffic can be sent to a specific VLAN. In this case, the original VLAN tag is stripped in the mirrored traffic in favor of the destination VLAN. This loss of original VLAN information might make the mirrored traffic hard to interpret.

To configure a SPAN session:

```
configure terminal
monitor session 2
bridge wan-br
source interface GE0-0
destination vm-vnic Linux2 0
commit
```

Verifying the SPAN Session Configuration

Use the `show system monitor session` command to verify the SPAN session configuration.

```
nfvis# show system monitor session
system monitor session 2
  bridge "wan-br"
  destination_vlan ""
  destination_interface vnic0
  source_vlans ""
  source_rx_interfaces "GE0-0"
  source_tx_interfaces "GE0-0"
  source_all false
  statistics "tx_bytes=142660, tx_packets=1380"
```

Use the `show running-config monitor session` command to verify the interface configuration for a SPAN session:

```
nfvis# show running-config monitor session
monitor session 2
  destination vm-vnic Linux2 0
  source vm-vnic Linux1 0 both
  source interface GE0-0 both
```
SPAN Session APIs and Commands

<table>
<thead>
<tr>
<th>APIs</th>
<th>Commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>• /api/config/monitor</td>

</tr>
<tr>
<td></td>
<td>• show monitor session status</td>
</tr>
<tr>
<td></td>
<td>• show running-config monitor session</td>
</tr>
</tbody>
</table>

Configuration Examples for SPAN Session Scenarios

Example: SPAN Session Traffic on a Physical Interface

The following example shows how to configure all traffic coming in or going out on GE0-0 (physical interface) and VM Linux1 (vnic0). And traffic is mirrored to the VM Linux2 (vnic1). With this configuration, any traffic arriving on vnet1 will be dropped.

An existing SPAN session will be in FAIL state after the system reboot. In this case, you need to recreate (delete and create) the SPAN session after the system bootup.

VM deployment interfaces:
- SPAN source: GE0-0 (traffic in both directions)
- SPAN source: Linux1/vnic0, and wan-net (traffic in both directions)
- SPAN destination: Linux2/vnic0, and wan-net

```
nfvis# show running-config monitor session
monitor session 20
  destination vm-vnic Linux2 0
  source vm-vnic Linux1 0 both
    source interface GE0-0 both

nfvis#
nfvis# show system monitor session
system monitor session 20
  bridge wan-br
  destination_vlan ""
  destination_interface vnic11
  source_vlans
  source_rx_interfaces "vnic10, GE0-0"
```
Example: SPAN Session Traffic on a LAN SRIOV

The following example shows how to configure all traffic coming in or going out on an SRIOV interface (VF0). It is also mirrored to VF1.

Note

This scenario is applicable only to the Cisco ENCS.

VM deployment for VF-VF scenario:

CentOS_SRIOV, C3, and C5 are CentOS VMs with SRIOV support.

- CentOS_SRIOV: vnic0: wan-net/vnic1: LAN-SRIOV-1 (192.168.1.36)
- C3: vnic0: LAN-SRIOV3 (192.168.1.3)
- C5: vnic0: LAN-SRIOV5 (192.168.1.5)

SPAN destination and source:

- SPAN destination: CentOS_SRIOV (vnic0: wan-net/vnic1: LAN-SRIOV-1)
- SPAN source: C3 (vnic0: LAN-SRIOV-3); traffic in both directions (rx, tx)
- Ping target: C5 (vnic0: LAN-SRIOV-5)
Example: SPAN Session Traffic on a VLAN

The following example shows how to configure the SPAN session for all traffic entering in VLAN 10 and 11. It is also mirrored to VLAN 20.

```
nfvis# show running-config monitor session
monitor session 11
    bridge lan-br
    destination vlan 20
    source vlan [ 10 11 ]

nfvis# show system monitor session
system monitor session 11
    bridge lan-br
    destination_vlan 20
    destination_interface ""
    source_vlans "10, 11"
    source_rx_interfaces ""
    source_tx_interfaces ""
    source_all true
    statistics "tx_bytes=0, tx_packets=0"

nfvis# show monitor session 11
NUMBER STATUS
------------------------
11 CREATE_SUCCESS
```
Example: SPAN Session Traffic on a VLAN
CHAPTER 8

Configuring Packet Capture

The Packet Capture feature helps you capture all packets being transmitted and received over physical and virtual network interface controllers (physical port and vNIC) for analysis. These packets are inspected to diagnose and solve network problems. Packets are stored in the/data/intdatastore/pktcaptures folder on the host server.

Benefits

- You can customize the configuration to capture specific packets such as Internet Control Message Protocol (ICMP), TCP, UDP, and Address Resolution Protocol (ARP).
- You can specify a time period over which packets are captured. The default is 60 seconds.

To configure packet capture on a physical port:

```
configure terminal
tcpdump port eth0
```

Output: pcap-location /data/intdatastore/pktcaptures/tcpdump_eth0.pcap

To configure packet capture on a vNIC:

```
configure terminal
tcpdump vnic tenant-name admin deployment-name 1489084431 vm-name ROUTER vnic-id 0 time 30
```

Output: pcap-location /data/intdatastore/pktcaptures/1489084431_ROUTER_vnic0.pcap

Types of Errors

<table>
<thead>
<tr>
<th>Error</th>
<th>Scenario</th>
</tr>
</thead>
<tbody>
<tr>
<td>Port/vnic not found</td>

VM Image Packaging

VM Image Packaging is a tool for converting qcow2 and img images into a tar.gz format with additional properties and profiles. VM image packaging can be done in two ways:

- **VM Image Packaging Utility:** This is an enhanced packaging process that allows the VM owner to run the `nfvpt.py` utility as a command with a combination of parameters to package the VM.

- **Standard Image Packaging:** This is a manual process in which a raw disk image (qcow2, img) is packaged along with the image properties file and bootstrap files (if needed) into a TAR archive file.

**Contents**

The VM image packaging utility contains the following:

- **nfvpt.py**—It is a python based packaging tool that bundles the VM raw disk image/s along with VM specific properties.

- **image_properties_template.xml**—This is the template file for the VM image properties file, and has the parameters with default values. If the user provides new values to these parameters while creating the VM package, the default values get replaced with the user-defined values.

- **nfvis_vm_packaging_utility_examples.txt**—This file contains examples on how to use the image packaging utility to package a VM image.

A VM image package is a TAR archive file with the root disk image and other descriptor files. This packaging method simplifies the process of a VM image registration and deployment. The attributes specified for the image enable resource requirement specification, creation of VM profiles, and a host of other properties for the VM.

The Cisco Enterprise NFVIS VM image packaging tool, nfvpt.py, helps VM owners package their VMs. The tool takes one or more qcow2 images (raw disk file) as the input file along with VM specific properties, bootstrap configuration files (if any), and generates a compressed TAR file.
Usage

To get the list of parameters that can be included in the command, and to get an explanation of each of the parameters, run the **help** command for the tool.

```
nfvpt.py --help
```
VM Image Packaging

Usage

Required:
- `--package_filename PACKAGE_FILENAME`
  [REQUIRED] file name for the target VNF package name
  default is root disk image name with extension .tar.gz
- `--root_disk_image ROOT_DISK_IMAGE`
  [REQUIRED] List of root disk images to be bundled
  example: --root_disk_image isrv.qcow2;
  --root_disk_image isrv1.qcow2,isrv2.qcow2
- `--prop_template PROP_TEMPLATE`
  image properties template file name including path
  default path is the current dir of the tool and name
  is image_properties_template.xml if the user doesn't
  input this option example: --prop_template
  /usr/bin/image_properties_template.xml
- `--vnf_type VNF_TYPE`
  [REQUIRED] VNF type, e.g. ROUTER, FIREWALL, vWAAS,
  vWLC, and OTHER
- `--vnf_name NAME`
  [REQUIRED] Name of the VNF image
- `--vnf_version VNF_VERSION`
  [REQUIRED] VNF version, e.g. --vnf_version 1.0 or
  --vnf_version 0.9
- `--app_vendor APP_VENDOR`
  Application Vendor e.g. Cisco, Juniper etc
- `--monitored {true,false}`
  [REQUIRED] Monitored VNF: --monitored=true/false;
- `--optimize {true,false}`
  [REQUIRED] optimized VM: --optimize=true/false;

HA options:
- `--ha_capable`
- `--ha_vnic HA_VNIC VM HA vnic`
- `--ha_vnic_count HA_VNIC_COUNT`
  Number of ha_vnics

Resources:
Resources: min and max - vCPU, memory and disk
- `--min_vcpu VCPU_MIN`
  min #vCPU : min number of vCPU supported by VM
  example:--min_vcpu 2
- `--max_vcpu VCPU_MAX`
  max #vCPU : max number if vCPU required for VM
  example:--max_vcpu 4
- `--min_mem MEMORY_MB_MIN`
  min mem : min mem in MB required for VM
  example:--min_mem 1024
- `--max_mem MEMORY_MB_MAX`
  max mem : max mem in MB required for VM
  example:--max_mem 4196
- `--min_disk ROOT_DISK_GB_MIN`
  min disk : min disk in GB required for VM
  example:--min_disk 8
- `--max_disk ROOT_DISK_GB_MAX`
  max disk : max disk in GB required for VM
  example:--max_disk 8
- `--vnic_max VNIC_MAX`
  max number of Vnics allowed for VM example:--vnic_max
  8
- `--vnic_names VNIC_NAMES`
  list of vnic number to name mapping in format
  number:name example --vnic_names
  1:GigabitEthernet2,2:GigabitEthernet4

Profile Options:
- `--profile PROFILE`
  enter the profile name, profile description, no of
  vCPU required, min memory required in MB, min disk
space required in MB, example: --profile profile1,"This is profile 1",2,2048,4096 --profile profile2,"This is profile 2",4,4096,4096
--default_profile DEFAULT_PROFILE
default profile

Driver Support Options:
--sriov {true,false} Enable/Disable SRIOV support: --sriov=true/false; default is false
--sriov_list SRIOV_DRIVER_LIST
list of SRIOV drivers example: --sriov_list igb,igbvf,i40evf
--pcie {true,false} Not supported
--pcie_list PCIE_DRIVER_LIST
Not supported

Privilege/Priority Options:
--privileged {true,false} Not supported

Custom Properties:
--custom CUSTOM custom properties format: --custom ["propattr_"<attr>:<value>,key:<value>]
(keyattr_<attr>:<value>,type:<value>,valN<<value>,[valNattr_<attr>:<value>]) Allows specification of custom properties: 0 or more propattr_<attr>:<value> pairs - 'propattr' is a keyword and used to specify property attributes key:<value> pairs 0 or more keyattr_<attr>:value pairs - 'keyattr' is a keyword and is used to specify key attributes type:<value> pair - type of value valN<<value> pair - val1:value,val2:value etc 0 or more valNattr_<attr>:<value> pairs - 'valN'attr is an attribute for valN See usage_examples.txt

The table lists the parameters that can be passed to the nfvpt.py command.

<table>
<thead>
<tr>
<th>Parameter</th>

</tr>
</tbody>
</table>

**NFVIS Specific Enhancements**

*Note*

Use pack_dir option if the *.tar.gz* already exists and you want to modify the bootstrap configuration file or *image_properties.xml* manually.

The following parameters are added as part of the NFVIS specific enhancements:
--pack_dir <DIR> PACK

package all files in directory

Resources:

--vnic_names VNIC_NAMES

list of vnic number to name mapping in format
number:name example --vnic_names
1:GigabitEthernet2,2:GigabitEthernet4

Usage

Follow the steps to change a single line in day-0 configuration file or add a single option in image_properties.xml:

1. Get the working VM packaging image - isrv*.tar.gz.
2. Extract the contents - tar -xvf isrv*.tar.gz.
3. Modify the file contents as required.
4. nfvpt.py --pack_dir current-working-dir-with-files -i isrv.qcow2 -o isrv.tar.gz

VM Packaging Utility Usage Examples

Given below are the contents of the file nfvis_vm_packaging_utility_examples.txt:

Example 1: Usage for TinyLinux

nfvpt.py -o TinyLinux -i TinyLinux.qcow2 -n TinyLinux -t linux -r 1.0 --monitored false
--min_vcpu 1 --max_vcpu 2 --min_mem 1024 --max_mem 1024 --min_disk 1 --max_disk 2
--vnic_max 1 --optimize false

Example 2: Usage for ASAv

The bootstrap filename has to be day0-config. This cannot be modified as ASAv looks for the exact filename.

nfvpt.py -o asav961-201 -i asav961-201.qcow2 -n ASAv -t firewall -r 961-201 --monitored true --bootstrap day0-config:filename1
--min_vcpu 1 --max_vcpu 4 --min_mem 1024 --max_mem 8192 --min_disk 8 --max_disk 16 --vnic_max 8 --optimize true
--profile ASAv5,"ASAv5 profile",1,1024,8192 --profile ASAv10,"ASAv10 profile",1,4096,8192
--profile ASAv30,"ASAv30 profile",4,8192,16384
--default_profile ASAv5

Example 3: Usage for ISRv
The bootstrap filename has to be `ovf-env.xml`. This cannot be modified as ISRv looks for the exact filename.

```
nfvpt.py -o isrv.16.03.01 -i isrv-universalk9.16.03.01.qcow2 -n ISRV.16.03.01 -t ROUTER -r 16.03.01 --bootstrap ovf-env.xml:file1,ios-xe.txt:file2 --min_vcpu 2 --max_vcpu 8 --min_mem 4096 --max_mem 8192 --min_disk 8 --max_disk 8 --vnic_max 8 --optimize true --profile ISRv-small,"ISRv small profile",2,4096,8192 --profile ISRv-medium,"ISRv medium profile",4,4096,8192 --default_profile ISRv-small --srivov_list igb,igbvf,i40evf --custom tech_package,ax
```

**Example 4:** Usage for a third party VM with config drive (ISO) mounted at specific path on the VM:

```
nfvpt.py -o test.1.0 -i test-1.0.qcow2 -n TEST -t OTHER -r 1.0 --monitor true --privileged true --bootstrap /:bootstrap.xml,/license/lic.txt:license.txt --min_vcpu 2 --max_vcpu 8 --min_mem 4096 --max_mem 8192 --min_disk 8 --max_disk 8 --vnic_max 8 --optimize true --profile small,"small profile",2,4096,8192 --profile medium,"medium profile",4,4096,8192 --default_profile small
```

In this case, `test.1.0.pkg : bootstrap.xml` gets mounted as `bootstrap.xml` at the root, and the `license.txt` gets mounted as `/license/lic.txt`.

**Example 5:** Usage for Palo Alto Firewall

```
nfvpt.py -o PA_L3_HA -i PA-VM-KVM-8.0.5.qcow2 --json d.json -t firewall -n "PA FIREWALL" -r 8.0.5 --app_vendor PA --monitor true --ha_package
```

**Example 6:** Usage for Asav

```
nfvpt.py -i foo.qcow2 -o asav.tar.gz --json pa1.json --app_vendor cisco -t firewall -r 10 --optimize true -n asav --monitor true --ha_package --ha_capable
```

**Example 7:** Usage for csr

```
nfvpt.py --ha_package --pack_dir /data/intdatastore -i csr1000v-universalk9.16.09.01.qcow2 -o csr1000v-universalk9.16.09.01-ha.tar.gz
```

**Standard VM Image Packaging**

The standard VM packaging is based on the Open Virtualization Format (OVF) packaging standard, in which a single file is distributed in open virtualization appliance (OVA) format. The VM image is shared using a TAR archive file with the root disk image and descriptor files.

---

**Note**

Cisco Enterprise NFVIS supports VM packaging in `.tar.gz` (compressed form of OVA) format. Ensure that all supported third party VM images are available in the supported format.
Generating a VM Package

Package files are provided for Cisco ISRv, Cisco ASAv, and tiny Linux and Windows server 2000. Vendors are responsible for packaging all third party VMs in the supported format.

1. Create a VM qcow2 image.

2. Create an `image_properties.xml` file with the VM properties. Ensure that you add all mandatory fields. Include the profiles supported for the VM in this file, and select one default profile. If you do not want to monitor the VM bootup, make the bootup time as -1.

3. Create `bootstrap-config` or `day0-config`, if any bootstrap configuration is required for the VM. If the bootstrap configuration requires inputs from the user, use the tokens in the xml or text file. These tokens are populated during the VM deployment with the provided data.

4. Create a `package.mf` file, which lists all the files to be bundled into the `.tar.gz` file along with checksums.

5. Generate the packaging file using "`tar -cvzf ova_file_name list_of_files_to_be_bundled`".

    For example, `tar -cvzf isrv.tar.gz isr rv-universalk9.03.16.02.S.155-3.S1a-ext-serial.qcow2 image_properties.xml isr_ovf_env.xml package.mf`.

Appendix

VM Image Package Files

The table lists the contents of the VM package that are generated using the packaging tool:

<table>
<thead>
<tr>
<th>File</th>
<th>Description</th>
<th>Mandatory/Optional</th>
</tr>
</thead>
<tbody>

Package Manifest File

The package manifest XML file provides a list of the files in the package with their names and their expected checksum. SHA1 algorithm (sha1sum) is used to calculate the checksum. This is a mandatory file to be bundled in the VM package. The manifest file must be named as package.mf.

Table 3: Package Manifest File Details

</tr>
<tr>
<td>Expected checksum</td>
<td>The calculated SHA1 checksum to be validated.</td>
<td>&lt;sha1_checksum&gt;</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>

Bootstrap Configuration File

The bootstrap configuration file is an XML or a text file, and contains properties specific to a VM and the environment. Properties can have tokens, which can be populated during deployment time from the deployment payload.
VM Image Properties File

This XML file provides information about the resources supported or required for the VM operation. All mandatory parameters have to be defined. It also supports custom attributes. This is a mandatory file to be bundled in the VM package. The VM package supports up to 10 disks to be bundled into the package.

Upgrading Cisco Enterprise NFVIS

The Cisco Enterprise NFVIS upgrade image is available as a .nfvispkg file. Currently, downgrade is not supported. All RPM packages in the Cisco Enterprise NFVIS upgrade image are signed to ensure cryptographic integrity and authenticity. In addition, all RPM packages are verified during Cisco Enterprise NFVIS upgrade. For more information about the Image Signing and Verification feature, see Image Signing and Verification, on page 6.

Ensure that you copy the image to the Cisco Enterprise NFVIS server before starting the upgrade process. Always specify the exact path of the image when registering the image. Use the scp command to copy the upgrade image from a remote server to your Cisco Enterprise NFVIS server. When using the scp command, you must copy the image to the "/data/intdatastore/uploads" folder on the Cisco Enterprise NFVIS server. The following is an example on how to use the scp command to copy the upgrade image:

```
scp -P 22222 nfvis-351.nfvispkg admin@192.0.2.9:/data/intdatastore/uploads/nfvis-351.nfvispkg
```

Alternatively, you can upload the image to the Cisco Enterprise NFVIS server using the System Upgrade option from the Cisco Enterprise NFVIS portal.

---

**Note**

When the NFVIS upgrade is in progress, ensure that the system is not powered off. If the system is powered off during the NFVIS upgrade process, the system can become inoperable and you need to reinstall the system.

The upgrade process comprises two tasks:

- Registering the image using the `system upgrade image-name` command.
- Upgrading the image using the `system upgrade apply-image` command.

**Registering an Image**

To register an image:

```
configure terminal
system upgrade image-name nfvis-351.nfvispkg location /data/intdatastore/uploads
commit
```
You must verify the image registration status before upgrading the image using the `system upgrade apply-image` command. The package status must be valid for the registered image.

### Verifying the Image Registration

Use the `show system upgrade reg-info` command in the privileged EXEC mode to verify the image registration.

```
nfvis# show system upgrade reg-info
PACKAGE NAME LOCATION VERSION STATUS UPLOAD DATE
--------------------------------------------------------------------------------------------------------------------
nfvis-351.nfvispkg /data/upgrade/register/nfvis-351.nfvispkg 3.6.1-722 Valid 2017-04-25T10:29:58.052347-00:00
```

### Upgrading the Registered Image

To upgrade the registered image:

```
configure terminal
system upgrade apply-image nfvis-351.nfvispkg scheduled-time 5
commit
```

### Verifying the Upgrade Status

Use the `show system upgrade apply-image` command in the privileged EXEC mode

```
nfvis# show system upgrade apply-image
UPGRADE NAME STATUS FROM UPGRADE TO
---------------------------------------------------------------------------------------------
nfvis-351.nfvispkg SUCCESS 3.5.0 3.5.1
```

The only upgrade supported when BIOS secured boot (UEFI mode) is enabled on ENCS 5400 platform is:

NFVIS 3.8.1 + BIOS 2.5(legacy) --> NFVIS 3.9.1 + BIOS 2.6(legacy)

The following upgrade requires re-installation:

NFVIS 3.8.1 + BIOS 2.5(legacy) --> NFVIS 3.9.1 + BIOS 2.6(UEFI)
NFVIS 3.9.1 + BIOS 2.6(legacy) --> NFVIS 3.9.1 + BIOS 2.6(UEFI)

CHAPTER 11

Configuring vBranch High Availability

The vbranch high availability (HA) solution is a box-to-box HA. It is similar to the traditional branch, which uses physical boxes for routing and other services. This solution uses the Hot Standby Router Protocol (HSRP), a default gateway redundancy (or a first hop redundancy), which allows the network to recover from the failure of the device acting as the default gateway for the LAN side end points (devices). The routing protocols are configured to converge the traffic on the WAN side, when there are failures. So, this solution uses HSRP to provide redundancy for the branch connectivity on the LAN side. The Enhanced Interior Gateway Routing Protocol (EIGRP), Open Shortest Path First (OSPF) routing protocols, and Embedded Event manager (EEM) scripts are configured to converge on the WAN side. The following section explains the redundancy solutions for the branch, with each ENCS having separate active WAN link.

You can use this recommended HA design as is, or modify as per the field requirement.

- Prerequisites for vBranch HA, on page 99
- vBranch HA Design and Topology, on page 100
- Enable Virtual NIC Failure Detection with Track Feature, on page 101
- Isolating LAN and Transit Link Traffic for vBranch HA, on page 103
- Packet Flow for vBranch HA, on page 104
- Configuration Examples for vBranch HA, on page 105
- Cisco ENCS Failure Points, on page 108

Prerequisites for vBranch HA

- Cisco ISRv must run HSRP on the LAN facing interface.

- The WAN links are active on both Cisco ENCS1 and Cisco ENCS2. Each of the ENCS WAN link is connected to the WAN network (most cases with two SPs), with two ENCSs in an active-active mode.

- The LAN facing links of both Cisco ENCS devices are connected to an external switch (as an uplink), and all the devices on the LAN segment are also connected to the external switch. There should be no LAN device connecting directly to the Cisco ENCS internal switch.

- A transit link, which is L3 routed, is configured between the Cisco ENCS devices. Since the LAN HSRP makes only one device active, the transit link is used to forward traffic. This link is used to forward traffic from the standby ENCS WAN to LAN or LAN to WAN. This link can be back-to-back connected on the ENCS internal switch ports.
vBranch HA Design and Topology

Physical Devices Connection
Each Cisco ENCS has a WAN traffic connected to the Gigabit Ethernet interface, GE0-0, in this dual-WAN topology.

There are two Cisco ENCS devices namely ENCS1 and ENCS2. There is an external switch connecting one of the LAN ports from each Cisco ENCS. There is a back-to-back connection between ENCS1 and ENCS2 connecting one of the LAN ports from each Cisco ENCS. The WAN port from each Cisco ENCS is connected to the service provider’s network.

ISRv1 on ENCS1 and ISRv2 on ENCS2 are responsible for handling packets from LAN to WAN and WAN to LAN. If the WAN connection goes down or if the ISRv1 becomes unavailable, fast converging routing protocols, such as EIGRP and OSPF, can respond within seconds so that ISRv2 is prepared to transfer packets.

VM and Service Chain Network Connection
The Cisco ISRv should be created with an additional vNIC mapped to the transit link between two Cisco ENCS devices, apart from the regular WAN and LAN or service net links. The Cisco ISRv on both ENCS should have identical resource configurations (vNICs, vCPU, memory, etc.) and feature configurations.

Each Cisco ENCS is running an instance of service VNFs (for example, Cisco ASAv and Cisco WAAS), and should have the identical service chain VNFs configured on both Cisco ENCS devices. Service VNFs...
should also have same features configured on both Cisco ENCS devices. The traffic goes through the service VNFs on the active Cisco ENCS only, even though both Cisco ENCS devices are actively forwarding on the WAN link. On a failover, the traffic will go over the service VNFs on the newly active ENCS (ENCS2).

This HA solution requires a transit link configured between two Cisco ENCS devices. One of the LAN ports from each of the Cisco ENCS can be connected back to back. This transit link port should be extended to the Cisco ISRv.

Enable Virtual NIC Failure Detection with Track Feature

You can enable the Track feature to detect virtual NIC failure in the following two scenarios:

- When the underlying physical link fails, the HSRP or routing protocols cannot detect the failure—This is because the line protocol does not go down when the underlying physical link fails if the Cisco ISRv is using a virtual NIC.

- With EEM scripts unconfigured, when the underlying physical link fails, the virtual NIC line protocol does not go down. In this case the routing protocol does not withdraw the routes.

Configuration Example for the Track Feature with Scenario 1 (HSRP)

In the virtual environment, you can enable higher protocols like HSRP to take action when the link failure happens. One way to achieve this is by configuring the Track feature on some object (ICMP ping) in Cisco IOS XE.

In Cisco ISRv, if the LAN interface where HSRP is running is a virtual NIC, then you can configure the track object to ping some device on the LAN segment, and monitor the connection failures. So, when the track object is down due to some connection failure, you can configure an action as to shut down the HSRP group, so that the peer will take over the active role making the default Gateway IP active. Without this track object, both Cisco ENCS devices will become active getting into a split-brain scenario.

The following example shows how to configure the track object on the active ISRv1, and monitor the connection failures by pinging the device IP in the network.

Note

The Cisco ISRv should have AX license to configure the IP SLA.

```
track 1 ip sla 1 reachability
ip sla 1
  icmp-echo 192.0.2.1 source-ip 198.51.100.1
  frequency 5
ip sla schedule 1 life forever start-time now
!
track 5 ip sla 5 reachability
ip sla 5
  icmp-echo 192.0.2.2 source-ip 198.51.100.2
  frequency 5
ip sla schedule 5 life forever start-time now
!
```

The following output shows that the Track 1 reachability is failed, and Track 5 is up.

```
device1# show track
```
Track 1
  IP SLA 1 reachability
  **Reachability is Down**
  11 changes, last change 00:01:22
  Latest operation return code: Timeout
  Tracked by:
  HSRP GigabitEthernet3 25

Track 5
  IP SLA 5 reachability
  **Reachability is Up**
  4 changes, last change 00:02:32
  Latest operation return code: OK
  Latest RTT (milliseconds) 1
  Tracked by:
  HSRP GigabitEthernet3 25

ISRv1#

The following example shows how to configure the Track object to monitor the line protocol state of the interface:

```
track 2 interface GigabitEthernet2 line-protocol
```

The following output shows that the line protocol state is down:

```
device# show track
Track 2
  Interface GigabitEthernet2 line-protocol
  **Line protocol is Down** ((hw down))
  8 changes, last change 00:01:25
  Tracked by:
    HSRP GigabitEthernet3 25
```

**Configuration Example for the Track Feature with Scenario 2 (EEM Scripts)**

With EEM scripts unconfigured, when an underlying link fails, the virtual NIC line protocol does not go down. This causes the problem as the routing protocol will not withdraw the routes. You can configure a Track object (can use the same object defined for HSRP above) to detect the failure. When the failure happens, the active Cisco ISRv has to withdraw the routes or network, so that the WAN link does not receive any traffic. One way to withdraw the routes is configure the EEM script, and delete the network from EIGRP.

The following example shows how to configure the EEM scripts, and remove the network from EIGRP:

```
track 5 ip sla 5 reachability
! ip sla 5
  icmp-echo 192.0.2.1 source-ip 192.0.2.18
  frequency 5
  ip sla schedule 5 life forever start-time now
! event manager applet noshut_int
  event track 5 state up
  action 1.1 cli command "enable"
  action 1.2 cli command "config t"
  action 1.3 cli command "router eigrp 10"
  action 1.4 cli command "network 192.0.2.1 0.0.0.255"
  action 1.5 cli command "end"
  event manager applet shut_int
  event track 5 state down
  action 1.1 cli command "enable"
  action 1.2 cli command "config t"
  action 1.3 cli command "router eigrp 10"
```
action 1.4 cli command "no network 192.0.2.1 0.0.0.255"
action 1.5 cli command "end"

In the virtual environment HSRP, make sure to use standby use-bia.

The following configuration example shows how to use the Track object (Track 5) to shut down HSRP group in ISRv1, when reachability is down for Track 5:

```
interface GigabitEthernet4
   description Service-NET-Virtio
   ip address 192.0.2.1 255.255.255.0
   standby use-bia
   standby 25 ip 192.0.2.22
   standby 25 timers 1 5
   standby 25 priority 105
   standby 25 preempt
   standby 25 track 5 shutdown
```

**Isolating LAN and Transit Link Traffic for vBranch HA**

LAN traffic and transit link traffic shall be isolated by configuring different VLANs for each traffic since both links are connected to the same ENCS internal switch. If you do not isolate these traffic, both LAN traffic and transit link will flow through the same internal switch on the Cisco ENCS.

The following Cisco ENCS switch configuration example shows how to isolate traffic. In this example, the Cisco ISRv is configured to send HSRP traffic as an untag and transit traffic in VLAN 46. So, to isolate HSRP traffic and transit traffic on the internal switch, the Gigabit Ethernet interface 1/0 is connected to a LAN network and Gigabit Ethernet interface 1/1 is configured as the transit link. The Gigabit Ethernet interface 1/1 allows the VLAN 46 to pass the transit traffic. It should also have non-default (other than 1) native VLAN (for example, VLAN 2), because the Cisco ENCS internal switch uplink (internal) has the native VLAN 1 configured.

Enable MSTP on all switches before isolating traffic.

```
switch
   interface gigabitEthernet1/0
      negotiation auto
      no shutdown
      switchport access vlan 1
      switchport mode access
      switchport trunk native vlan 1
      switchport trunk allowed vlan 1-2349,2450-4093
   
   switch
      interface gigabitEthernet1/1
      negotiation auto
      no shutdown
      spanning-tree mst 1 cost 200000000
      spanning-tree mst 2 cost 200000000
      switchport access vlan 46
      switchport mode trunk
      switchport trunk native vlan 2
      switchport trunk allowed vlan 1-2349,2450-4093
   ```
spanning-tree enable
spanning-tree mode mst
spanning-tree mst configuration
name region1
revision 1
instance 1 vlan 1
instance 2 vlan 46
!

Use the show switch vlan detailed command to verify the configuration as shown below:

device# show switch vlan detailed

Packet Flow for vBranch HA

This section explains high-level packet flow in failure and non-failure cases.

Non-Failure Case

In the non-failure case, both active and standby Cisco ENCS devices are up and running.

- LAN to WAN through the standby ENCS1 WAN link
  - The device in the LAN segment is configured with the default gateway as the HSRP virtual IP address, and since ENCS1 is an active HSRP, LAN traffic first comes to the active ENCS1.
  - LAN traffic goes through the service chain VM (Cisco ASAv), and then hits the Cisco ISRv. In this case, the destination IP is routable through the ENCS1 WAN interface. The Cisco ISRv sends traffic over the WAN link.
• LAN to WAN through the standby ENCS2 WAN link—In this case, the LAN to WAN traffic uses the transit link between the active and standby devices.
  • Devices in the LAN segment are configured with the default gateway as the HSRP virtual IP address, and since ENCS1 is an active HSRP, the LAN traffic first comes to the active ENCS1.
  • The LAN traffic goes through the service chain VMs (Cisco ASAv), and then hits the active Cisco ISRv. In this case, the destination IP is routable through the ENCS2 WAN interface. The traffic is sent to the Cisco ISRv on ENCS2 over the transit link, and then sent out over the WAN link to the destination.

• WAN to LAN through the active ENCS1
  • The WAN traffic hits the Cisco ISRv on ENCS1, then it goes through the service chain VMs, and sent to the LAN device.

• WAN to LAN through the standby ENCS2 WAN link—In this case, the WAN to LAN traffic uses the transit link between the active and standby devices.
  • The WAN traffic comes to the Cisco ISRv on ENCS2. The PBR/PFR configuration forces the traffic to use the transit link instead of the directly connected LAN port. So, the traffic is sent to the Cisco ISRv on ENCS1 over the transit link.
  • Then, the traffic on ENCS1 goes through the service chain VMs, and sent to the LAN device.

**Failure Case**

In the failure case, the active device goes down, and the standby device becomes active.

The virtual IP (default gateway) address becomes active on ENCS2. The transit link will not be used. The traffic now goes through the service chain VMs on ENCS2, and gets forwarded directly between WAN and LAN interfaces. The PBR/PFR configuration should monitor the HSRP state, and use the LAN port instead of the transit link to forward LAN traffic.

**Configuration Examples for vBranch HA**

This sample configuration is for Cisco ENCS HA with a dual-WAN scenario. The Cisco ISRv is configured with vNICs connected to the wan-net, service-net, and transit link. HSRP is configured on the service-net interface. Each Cisco ENCS is provisioned with the Cisco ASAv (service-net) and Cisco vWAAS (service-net).

---

**Note**

You can use this design as is, or modify as per the field requirement.

**Example: Active Cisco ENCS Configuration with ISRv1**

```
interface GigabitEthernet1
  vrf forwarding Mgmt-intf
  ip address 192.0.2.1 255.255.255.0
  negotiation auto
```

---
Example: Active Cisco ENCS Configuration with ISRv1

```
interface GigabitEthernet2
  description WAN-GE0-0-SRIOV-1
  ip address 192.0.2.2 255.255.255.0

### Failure Points

**WAN Net2 failure (WAN SRIOV VF connected to ISRv2 is down)**
- Link down

**Transit link between ENCS1 and ENCS2 fails**
- Link down

### Sequence of Events

1. ISRv2 on ENCS2 detects the WAN connection failure. This failure is detected when the interface goes down due to VF going down or the track object going down.
2. WAN-IP2 becomes unreachable, and all the routes converge towards WAN-IP1 on ENCS1. WAN-IP1 is the only IP for branch connectivity.
3. All the WAN to LAN and LAN to WAN traffic will now flow through ENCS1.

1. ISRv2 on ENCS2 detects the link going down due to VF going down or connection failure. The connection failure is detected by the track object. Then, ENCS2 WAN-IP2 link with EEM script is shut down.
2. WAN-IP2 becomes unreachable, and all the routes converge towards WAN-IP1 on ENCS1. WAN-IP1 is the only IP for branch connectivity.
3. All the WAN to LAN and LAN to WAN traffic will now flow through ENCS1.
CHAPTER 12

Cisco ENCS Single WAN IP Deployment Scenarios

• Single WAN IP Deployment, on page 113
• Preconfiguring the Cisco ENCS for a Single WAN IP Deployment, on page 114
• Single WAN IP Deployment with Gigabit Ethernet Interface 0/0, on page 115
• Single WAN IP Deployment with the 4G Interface, on page 116

Single WAN IP Deployment

A single WAN IP deployment can be considered when the Cisco ENCS is preconfigured at the corporate main office with the service provider's WAN IP address, and shipped to the branch office for quick deployment. At the branch office, you do not have to perform any installation or configuration task. You just have to boot the system with the preconfigured setup. The single WAN IP deployment scenario could vary as per customer requirements. The following are two sample single WAN IP deployment scenarios with the Cisco ISRv:

Ensure that you preconfigure the Cisco ENCS at the main office before shipping the device to the branch office. You cannot connect to the remote branch office from your main office in a single WAN IP deployment scenario.

• Single WAN IP Deployment with Gigabit Ethernet Interface
• Single WAN IP Deployment with the 4G Interface
Preconfiguring the Cisco ENCS for a Single WAN IP Deployment

To preconfigure the Cisco ENCS:

1. Install Cisco Enterprise NFVIS on the Cisco ENCS via CIMC. For details, see Installing Cisco Enterprise NFVIS on a Cisco ENCS 5100 and 5400, on page 12.

2. Connect your local system (laptop) to the local management interface of the host server.

4. Upload the Cisco ISRv image using the portal, and register the VM.

5. From the portal, remove the default Gigabit Ethernet 0/0 or GE0-0 WAN interface.

6. Deploy Cisco ISRv with Gigabit Ethernet 2 for SRIOV-1 and Gigabit Ethernet 3 for the wan-net.

7. Open the Cisco ISRv VNC.

8. From the VNC console, configure ISRv Gigabit Ethernet 2 and Gigabit Ethernet 3 interfaces with appropriate IP addresses. Then, perform a "no shut" of the interfaces.

9. Set the WAN static IP address to be on the same subnet as ISRv Gigabit Ethernet 2 IP address, and use ISRv Gigabit Ethernet 2 interface IP address as the default gateway.

10. Ping with the Cisco ISRv IP address to ensure connectivity.

11. Configure Dynamic Multipoint VPN on the Cisco ISRv, and ensure the main server can access the portal.

## Single WAN IP Deployment with Gigabit Ethernet Interface 0/0

In this scenario, two Gigabit Ethernet interfaces are configured on the Cisco ISRv: Gigabit Ethernet2 as the outbound interface and Gigabit Ethernet3 as the internal interface. The outbound interface IP address is provided by the service provider. The internal interface is the WAN interface that serves as the default gateway for Cisco Enterprise NFVIS.

Single WAN IP Deployment with the 4G Interface

In this scenario, a 4G interface (NIM card) is configured as the outbound interface and Gigabit Ethernet3 as the internal interface. The outbound interface IP address is provided by the service provider. The internal interface is the WAN interface that serves as the default gateway for Cisco Enterprise NFVIS.

Resetting to Factory Default

You can reset the host server to factory default with the following three options:

- Reset all—Deletes VMs and volumes, files including logs, images, and certificates. Erases all configuration. Connectivity will be lost, and the admin password will be changed to factory default password..

- Reset all (except images)—Deletes VMs and volumes, files including logs, images, and certificates. Erases all configuration except images. Connectivity will be lost, and the admin password will be changed to factory default password..

- Reset all (except images and connectivity)—Deletes VMs and volumes, files including logs and certificates. Erases all configuration except images, network, and connectivity.

Note
This option must be used only for troubleshooting purpose. We recommend you contact Cisco Technical Support before choosing this option. This option will reboot the system. Do not perform any operations for at least twenty minutes until the system is rebooted successfully.

To reset to factory default:

```
configure terminal
factory-default-reset all
```

Note
Click Yes when you are prompted with the factory default warning message.

Event Notifications

Cisco Enterprise NFVIS generates event notifications for key events. A NETCONF client can subscribe to these notifications for monitoring the progress of configuration activation and the status change of the system and VMs.

There are two types of event notifications: nfvisEvent and vmlcEvent (VM life cycle event)

To receive event notifications automatically, you can run the NETCONF client, and subscribe to these notifications using the following NETCONF operations:

- `--create-subscription=nfvisEvent`
- `--create-subscription=vmlcEvent`

You can view NFVIS and VM life cycle event notifications using the `show notification stream nfvisEvent` and `show notification stream vmlcEvent` commands respectively.

- nfvisEvent, on page 122
- vmlcEvent, on page 133

Syslog Support

Cisco enterprise NFVIS can send syslog messages to syslog servers configured by the user. Syslogs are sent for Network Configuration Protocol (NETCONF) notifications from NFVIS.

Syslog Message Format

Syslog messages have the following format:

<Timestamp> hostname %SYS-<Severity>-<Event>: <Message>

Sample Syslog messages:

2017 Jun 16 11:20:22 nfvis %SYS-6-AAA_TYPE_CREATE: AAA authentication type tacacs created successfully AAA authentication set to use tacacs server
2017 Jun 16 11:20:23 nfvis %SYS-6-RBAC_USER_CREATE: Created rbac user successfully: admin
2017 Jun 16 15:36:12 nfvis %SYS-6-CREATE_FLAVOR: Profile created: ISRv-small
2017 Jun 16 15:36:12 nfvis %SYS-6-CREATE_FLAVOR: Profile created: ISRv-medium
2017 Jun 16 15:36:13 nfvis %SYS-6-CREATE_IMAGE: Image created: ISRv_IMAGE_Test
2017 Jun 19 10:57:27 nfvis %SYS-6-NETWORK_CREATE: Network testnet created successfully
2017 Jun 21 13:55:57 nfvis %SYS-6-VM_ALIVE: VM is active: ROUTER

Configuring Syslog Servers

To configure a remote Syslog server:

```
configure terminal
system settings logging host 172.24.22.186
port 3500
transport tcp
commit
```

Note

A maximum of 4 remote syslog servers can be configured. The remote syslog server can be specified using its IP address or DNS name. The default protocol for sending syslog is UDP with a default port of 514. For TCP, the default port is 601.

To configure syslog severity:
configure terminal
system settings logging severity error

Note
The severity levels are:

- debug
- informational
- alert
- notice
- warning
- error
- critical
- emergency

By default, the logging severity of syslog is informational which means all syslogs at informational severity and higher will be logged.

To configure syslog facility:

configure terminal
system settings logging facility local5

Note
The logging facility can be changed to a facility from local0 to local7

By default, NFVIS sends syslog with the facility of local7

CHAPTER 16

SNMP Support on NFVIS

- Introduction about SNMP, on page 153
- SNMP Operations, on page 153
- SNMP Versions, on page 155
- SNMP MIB Support, on page 156
- Configuring SNMP Support, on page 158

Introduction about SNMP

Simple Network Management Protocol (SNMP) is an application-layer protocol that provides a message format for communication between SNMP managers and agents. SNMP provides a standardized framework and a common language used for the monitoring and management of devices in a network.

The SNMP framework has three parts:

- SNMP manager - The SNMP manager is used to control and monitor the activities of network hosts using SNMP.
- SNMP agent - The SNMP agent is the software component within the managed device that maintains the data for the device and reports these data, as needed, to managing systems.
- MIB - The Management Information Base (MIB) is a virtual information storage area for network management information, which consists of collections of managed objects.

A manager can send the agent requests to get and set MIB values. The agent can respond to these requests. Independent of this interaction, the agent can send unsolicited notifications (traps or informs) to the manager to notify the manager of network conditions.

SNMP Operations

SNMP applications perform the following operations to retrieve data, modify SNMP object variables, and send notifications:

- SNMP Get - The SNMP GET operation is performed by a Network Management Server (NMS) to retrieve SNMP object variables.
- SNMP Set - The SNMP SET operation is performed by a Network Management Server (NMS) to modify the value of an object variable.
SNMP Notifications - A key feature of SNMP is its capability to generate unsolicited notifications from an SNMP agent.

SNMP Get

The SNMP GET operation is performed by a Network Management Server (NMS) to retrieve SNMP object variables. There are three types of GET operations:

- **GET**: Retrieves the exact object instance from the SNMP agent.
- **GETNEXT**: Retrieves the next object variable, which is a lexicographical successor to the specified variable.
- **GETBULK**: Retrieves a large amount of object variable data, without the need for repeated GETNEXT operations.

The command for SNMP GET is:

```
snmpget -v2c -c [community-name] [NFVIS-box-ip] [tag-name, example ifSpeed].[index value]
```

SNMP Walk

SNMP walk is an SNMP application that uses SNMP GETNEXT requests to query a network entity for a tree of information.

An object identifier (OID) may be given on the command line. This OID specifies which portion of the object identifier space will be searched using GETNEXT requests. All variables in the subtree below the given OID are queried and their values presented to the user.

The command for SNMP walk with SNMP v2 is:

```
snmpwalk -v2c -c [community-name] [nfvis-box-ip]
```

```
SNMPv2-MIB::sysDescr.0 = STRING: Cisco NFVIS
SNMPv2-MIB::sysObjectID.0 = OID: SNMPv2-SMI::enterprises.9.12.3.1.3.1291
DISMAN-EVENT-MIB::sysUpTimeInstance = Timeticks: (43545580) 5 days, 0:57:35.80
SNMPv2-MIB::sysContact.0 = STRING:
SNMPv2-MIB::sysName.0 = STRING:
SNMPv2-MIB::sysLocation.0 = STRING:
SNMPv2-MIB::sysServices.0 = INTEGER: 70
SNMPv2-MIB::sysORLastChange.0 = Timeticks: (0) 0:00:00.00
IF-MIB::ifIndex.1 = INTEGER: 1
IF-MIB::ifIndex.2 = INTEGER: 2
IF-MIB::ifIndex.3 = INTEGER: 3
IF-MIB::ifIndex.4 = INTEGER: 4
IF-MIB::ifIndex.5 = INTEGER: 5
IF-MIB::ifIndex.6 = INTEGER: 6
IF-MIB::ifIndex.7 = INTEGER: 7
IF-MIB::ifIndex.8 = INTEGER: 8
IF-MIB::ifIndex.9 = INTEGER: 9
IF-MIB::ifIndex.10 = INTEGER: 10
IF-MIB::ifIndex.11 = INTEGER: 11
IF-MIB::ifDescr.1 = STRING: GE0-0
IF-MIB::ifDescr.2 = STRING: GE0-1
IF-MIB::ifDescr.3 = STRING: MGMT
IF-MIB::ifDescr.4 = STRING: gigabitEthernet1/0
IF-MIB::ifDescr.5 = STRING: gigabitEthernet1/1
IF-MIB::ifDescr.6 = STRING: gigabitEthernet1/2
```
The following is a sample configuration of SNMP walk with SNMP v3:

```
nsmwalk -v 3 -u user3 -a sha -A changePassphrase -x aes -X changePassphrase -l authPriv -n snmp 172.16.1.101 system
```

SNMP Notifications

A key feature of SNMP is the ability to generate notifications from an SNMP agent. These notifications do not require that requests be sent from the SNMP manager. Unsolicited (asynchronous) notifications can be generated as traps or inform requests. Traps are messages alerting the SNMP manager to a condition on the network. Inform requests (informs) are traps that include a request for confirmation of receipt from the SNMP manager. Notifications can indicate improper user authentication, restarts, the closing of a connection, loss of connection to a neighbor router, or other significant events.

Starting from Release 3.8.1 NFVIS has SNMP Trap support for switch interfaces. If a trap server is setup in the NFVIS snmp configuration, it will send trap messages for both NFVIS and switch interfaces. Both the interfaces are triggered by the link state up or down by unplugging a cable or setting admin_state up or down when a cable is connected.

SNMP Versions

Cisco enterprise NFVIS supports the following versions of SNMP:
• SNMP v1—The Simple Network Management Protocol: A Full Internet Standard, defined in RFC 1157. (RFC 1157 replaces the earlier versions that were published as RFC 1067 and RFC 1098.) Security is based on community strings.

• SNMP v2c—The community-string based Administrative Framework for SNMP v2. SNMP v2c (the "c" stands for "community") is an Experimental Internet Protocol defined in RFC 1901, RFC 1905, and RFC 1906. SNMP v2c is an update of the protocol operations and data types of SNMP v2p (SNMP v2 Classic), and uses the community-based security model of SNMP v1.

• SNMP v3—Version 3 of SNMP. SNMP v3 is an interoperable standards-based protocol defined in RFCs 3413 to 3415. SNMP v3 provides secure access to devices by authenticating and encrypting packets over the network.

The security features provided in SNMP v3 are as follows:
  • Message integrity—Ensuring that a packet has not been tampered with in transit.
  • Authentication—Determining that the message is from a valid source.
  • Encryption—Scrambling the contents of a packet to prevent it from being learned by an unauthorized source.

Both SNMP v1 and SNMP v2c use a community-based form of security. The community of managers able to access the agent MIB is defined by an IP address Access Control List and password.

SNMP v3 is a security model in which an authentication strategy is set up for a user and the group in which the user resides. A security level is the permitted level of security within a security model. A combination of a security model and a security level determines which security mechanism is employed when handling an SNMP packet.

Authentication of the community with the user configuration is implemented even though SNMP v1 and v2 traditionally do not require a user configuration to be set. For both SNMP v1 and v2 on NFVIS, the user must be set with the same name and version as the corresponding community name. The user group must also match an existing group with the same SNMP version for snmpwalk commands to work.

SNMP MIB Support

The following MIB’s are supported for SNMP on NFVIS:

IF-MIB:
  • ifDescr
  • ifType
  • ifPhysAddress
  • ifSpeed
  • ifOperStatus
  • ifAdminStatus
  • ifMtu
  • ifName
• ifHighSpeed
• ifPromiscuousMode
• ifConnectorPresent
• ifInErrors
• ifInDiscards
• ifInOctets
• ifOutErrors
• ifOutDiscards
• ifOutOctets
• ifOutUcastPkts
• ifHCInOctets
• ifHCInUcastPkts
• ifHCOutOctets
• ifHCOutUcastPkts
• ifInBroadcastPkts
• ifOutBroadcastPkts
• ifInMulticastPkts
• ifOutMulticastPkts
• ifHCInBroadcastPkts
• ifHCOutBroadcastPkts
• ifHCInMulticastPkts
• ifHCOutMulticastPkts

Entity MIB:
• entPhysicalIndex
• entPhysicalDescr
• entPhysicalVendorType
• entPhysicalContainedIn
• entPhysicalClass
• entPhysicalParentRelPos
• entPhysicalName
• entPhysicalHardwareRev
• entPhysicalFirmwareRev
Configuring SNMP Support

Though SNMP v1 and v2c is using community-based string, the following is still required:

- Same community and user name.
- Same SNMP version for user and group.
To configure SNMP v2 support:

```
configure terminal
snmp community public community-access readOnly
snmp group testgroup snmp 2 noAuthNoPriv read read-access write write-access notify notify-access
snmp user public user-group testgroup user-version 2
snmp host host2 host-ip-address 2.2.2.2 host-port 162 host-user-name public host-version 2
hostsecurity-level noAuthNoPriv
snmp enable traps linkUp
```

To configure SNMP v3 support:

```
configure terminal
snmp group testgroup3 snmp 3 authPriv notify test write test read test
snmp user user3 user-version 3 user-group testgroup3 auth-protocol sha priv-protocol aes passphrase changePassphrase
! configure snmp host to enable snmp v3 trap
snmp host host3 host-ip-address 3.3.3.3 host-version 3 host-user-name user3
host-security-level authPriv host-port 162
! Change to different security level
!
! SNMP host configuration is supported for NFVIS 3.6.1 release. Host trap server configuration will be officially supported for NFVIS 3.7.1 release.
!
Note SNMP v3 context snmp is added automatically when configured from the web portal. To use a different context value or empty context string, use NFVIS CLI or API for configuration.

Note NFVIS SNMP v3 only supports single passphrase for both auth-protocol and priv-protocol.

Note NFVIS 3.11.1 release enhances the special character support for passphrase. Now the following characters are supported: @#$!&*
NFVIS 3.12.1 release supports the following special characters: - _ #@%*$&! and whitespace. Backslash (\) is not supported.

Verify the configuration for SNMP support

Use the `show snmp agent` command to verify the snmp agent description and ID.

```
nfvis# show snmp agent

snmp agent sysDescr "Cisco NFVIS 
snmp agent sysOID 1.3.6.1.4.1.9.12.3.1.3.1291
```

Use the `show snmp traps` command to verify the state of snmp traps.

```
nfvis# show snmp traps

TRAP TRAP
NAME STATE
---------------------
linkDown disabled
linkUp enabled
```

Use the `show snmp stats` command to verify the snmp stats.

```
nfvis# show snmp stats

snmp stats sysUpTime 57351917
snmp stats sysServices 70
snmp stats sysORLastChange 0
snmp stats snmpInPkts 104
snmp stats snmpInBadVersions 0
snmp stats snmpInBadCommunityNames 0
snmp stats snmpInBadCommunityUses 0
snmp stats snmpInASNParseErrs 0
snmp stats snmpSilentDrops 0
snmp stats snmpProxyDrops 0
```

Use the `show running-config snmp` command to verify the interface configuration for snmp.

```
nfvis# show running-config snmp

snmp agent enabled true
snmp agent engineID 00:00:00:09:12:23:34:45:56:67:78
snmp enable traps linkUp
snmp community pub_comm
  community-access readOnly
snmp community tachen
  community-access readOnly
snmp group tachen snmp 2 noAuthNoPriv
  read test
  write test
  notify test
```
! snmp group testgroup snmp 2 noAuthNoPriv
read  read-access
write write-access
notify notify-access
!
snmp user public
user-version 2
user-group 2
auth-protocol md5
priv-protocol des
!
snmp user tachen
user-version 2
user-group tachen
!
snmp host host2
host-port 162
host-ip-address 2.2.2.2
host-version 2
host-security-level noAuthNoPriv
host-user-name public
!

Upper limit for SNMP configurations:

• Communities: 10
• Groups: 10
• Users: 10
• Hosts: 4

Configuring SNMP Support
CHAPTER 17

TACACS and RADIUS Support on NFVIS

- About RADIUS, on page 163
- RADIUS Operation, on page 163
- Configuring a TACACS+ Server, on page 164
- Configuring RADIUS, on page 165
- Specifying TACACS and RADIUS Authentication, on page 166

About RADIUS

Remote Authentication Dial-In User Service (RADIUS) is a distributed client-server system that secures networks against unauthorized access. In the Cisco implementation, RADIUS clients run on Cisco routers and send authentication requests to a central RADIUS server that contains all user authentication and network service access information.

RADIUS is a fully open protocol, distributed in source code format, that can be modified to work with any security system currently available on the market.

Cisco supports RADIUS under its AAA security paradigm. RADIUS has been implemented in a variety of network environments that require high levels of security while maintaining network access for remote users.

RADIUS Operation

When a user attempts to log in and authenticate to an access server using RADIUS, the following steps occur:

1. The user is prompted to enter the username and password.
2. The username and encrypted password are sent over the network to the RADIUS server.
3. The user receives one of the following responses from the RADIUS server:
   a. ACCEPT—The user is authenticated.
   b. CHALLENGE—A challenge is issued by the RADIUS server. The challenge collects additional data from the user.
   c. CHANGE PASSWORD—A request is issued by the RADIUS server, asking the user to select a new password.
d. REJECT—The user is not authenticated and is prompted to reenter the username and password, or access is denied.

The ACCEPT or REJECT response is bundled with additional data that is used for EXEC or network authorization. You must first complete RADIUS authentication before using RADIUS authorization. The additional data included with the ACCEPT or REJECT packets consists of the following:

- Services that the user can access, including connections such as Telnet, rlogin, or local-area transport (LAT), and services such as PPP, Serial Line Protocol (SLIP), or EXEC services.
- Connection parameters, including the host or client IP address, access list, and user timeouts.

**Configuring a TACACS+ Server**

TACACS+ is a security application that provides centralized validation of users attempting to gain access to a router or network access server. TACACS+ services are maintained in a database on a TACACS+ daemon running, typically, on a UNIX or Windows NT workstation. You must configure a TACACS+ server before the configured TACACS+ features on your network access server are available.

On the TACACS+ server, ensure you configure Cisco attribute-value (AV) pair privilege level (priv-lvl) for Cisco Enterprise NFVIS service for the minimum privilege level of administrators and operators.

For more details on TACACS+ configuration, see the Configuring TACACS module in TACACS+ Configuration Guide, Cisco IOS XE Release 3S.

---

**Note**

In NFVIS 3.11.1 or earlier release, users with no privilege level or users with a privilege level that is less than the operator's privilege level are considered as auditors with read-only permission.

After NFVIS 3.12.1 release, users with privilege level zero won't be able to login to NFVIS anymore.

To configure TACACS+:

```plaintext
configure terminal
tacacs-server host 209.165.201.20 shared-secret test1
key 0
admin-priv 14
oper-priv 9
commit
```

In this configuration, privilege level 14 is assigned to the administrator role, and privilege level 9 is assigned to the operator role. This means a user with privilege level 14 or higher will have all admin privileges when the user logs into the system, and a user with privilege level 9 or higher will have all privileges of an operator at the time of login.

Starting from NFVIS 3.9.2 release, TACACS+ secret encryption is supported. You can only configure either secret key or encrypted secret key at a given time. Encrypted secret key can contain special characters but secret key cannot. For NFVIS 3.12.1 release, the following pattern is supported for encrypted-shared-key: `[-a-zA-Z0-9/\<\>%\*\$\#\{\}\]+`.

To configure encrypted TACACS+ key:

```plaintext
configure terminal
```

```plaintext
```
Verifying the TACACS+ configuration

Use the `show running-config tacacs-server` command to verify the configuration if encrypted TACACS+ key is configured:

```
nfvis# show running-config tacacs-server
```
```
tacacs-server host 209.165.201.20
    encrypted-shared-secret $8$mRTnL9TKZCFi1BUP7Mwbm3JViO4Z7QvJ
    admin-priv 15
    oper-priv 11
```

TACACS+ APIs and Commands

<table>
<thead>
<tr>
<th>TACACS+ APIs</th>
<th>TACACS+ Commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>• /api/config/security_servers/tacacs-server</td>
<td>• tacacs-server host</td>
</tr>
<tr>
<td>• /api/config/security_servers/tacacs-server?deep</td>
<td>• key</td>
</tr>
<tr>
<td>• /api/config/security_servers/tacacs-server</td>
<td>• admin-priv</td>
</tr>
<tr>
<td>/host/&lt;ip-address/domain-name&gt;</td>
<td>• oper-priv</td>
</tr>
</tbody>
</table>

Configuring RADIUS

To configure RADIUS support:

```
radius-server host 103.1.4.3
    key 0
    shared-secret cisco123
    admin-priv 2
    oper-priv 1
    commit
```

Starting from NFVIS 3.9.2 release, TACACS+ secret encryption is supported. You can only configure either secret key or encrypted secret key at a given time. To configure encrypted RADIUS key:

```
radius-server host 103.1.4.3
    key 0
    encrypted-shared-secret cisco123
    admin-priv 2
    oper-priv 1
    commit
```
Verifying the RADIUS configuration

Use the `show running-config radius-server` command to verify the interface configuration for a RADIUS session:

```
nfvis# show running-config radius-server
radius-server host 103.1.4.3
    key 0
    shared-secret cisco123
    admin-priv 2
    oper-priv 1
```

### RADIUS Support APIs and Commands

<table>
<thead>
<tr>
<th>APIs</th>
<th>Commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>• /api/config/security_servers/radius-server</td>
<td>• host</td>
</tr>
</tbody>
</table>

**Specifying TACACS and RADIUS Authentication**

NFVIS supports both TACACS+ and RADIUS but only one authentication method can be enable at a time. After you have identified the TACACS+ and RADIUS server and defined an associated TACACS+ and RADIUS authentication key, you must define method lists for TACACS+ and RADIUS authentication. Because TACACS+ and RADIUS authentication is operated through AAA, you need to issue the `aaa authentication` command, specifying TACACS+ or RADIUS as the authentication method.

```
nfvis(config)# aaa authentication ?
Possible completions:
    radius   Use RADIUS for AAA
    tacacs   Use TACACS+ for AAA
    users    List of local users
```

- Only when TACACS+ or RADIUS is enabled, it can be used for authentication.
- When TACACS+ or RADIUS is not accessible, local authentication is used. Local authentication is disabled if the connection between TACACS+ or RADIUS and NFVIS is restored.
- If same username exists on both local and TACACS+ or RADIUS, then TACACS+ or RADIUS user is chosen for authentication.
- It is recommended to configure Syslog Support, on page 151 so that it is easier to debug if TACACS+ or RADIUS does not work as expected.

All login attempts will be logged in syslogs in the local `/var/log/nfvis_syslog.log` file and in remote syslog servers. It is important to configure a remote syslog server when configuring TACACS+/RADIUS in order to be able to view logs regarding login attempts when TACACS+/RADIUS is configured.
ENCS Switch Configuration

Access to the ENCS switch is restricted through Consent Token. Consent Token is a security feature that is used to authenticate the network administrator of an organization to access system shell with mutual consent from the network administrator and Cisco Technical Assistance Centre (Cisco TAC).

From the switch console, there is access to debug mode and an advanced debug mode. Credentials of the local user are synchronized to access debug mode. Advanced debug uses unique credentials for each device that allows for additional debugging options for Cisco engineering. To enter either debug mode permission must be granted through Consent Token.

- ENCS Switch Commands, on page 167
- ENCS Switch APIs, on page 167
- ENCS Switch Portal Configuration, on page 167

ENCS Switch Commands

See, Cisco Enterprise Network Compute System Switch Command Reference for switch commands.

ENCS Switch APIs

See, API Reference for Cisco Enterprise Network Function Virtualization Infrastructure Software for switch related APIs.

ENCS Switch Portal Configuration

Switch Settings

The Switch option from the Cisco Enterprise NFVIS portal allows you to configure STP/RSTP, VLAN on specified ranges, RADIUS based authentication, and port channel load balancing for various switch ports. This section describes how to configure settings on the ENCS switch portal.
You can view the Switch Interface operational data and the statistics parameters in the following table:

### Table 5: Switch Settings Interface

<table>
<thead>
<tr>

</tbody>
</table>

**Configuring Spanning Tree**

Spanning Tree Protocol (STP) is a Layer 2 protocol that runs on bridges and switches. The main purpose of STP is to ensure that you do not create loops when you have redundant paths in your network.

The Spanning Tree option is enabled by default. You can click on edit and make the necessary settings or disable Spanning Tree if required.
The configuration of spanning tree has the following parameters when it is enabled:

**Table 6: Spanning Tree Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>Spanning Tree</td>
<td>Specifies the state of the Spanning Tree.</td>
<td>Enable or Disable</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The default value is Enable.</td>
</tr>
<tr>
<td>Mode</td>
<td>Specifies the mode of the Spanning Tree.</td>
<td>stp or rstp</td>
</tr>
<tr>
<td>Forward Time</td>
<td>Specifies the Spanning Tree forward time in seconds.</td>
<td>Range: 4-30 seconds</td>
</tr>
<tr>
<td>Hello Time</td>
<td>Specifies the Hello time in seconds.</td>
<td>Range: 1 to 10 seconds</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Range</td>
</tr>
<tr>
<td>--------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>------------------------</td>
</tr>
<tr>
<td>Max Age</td>
<td>Specifies the spanning-tree bridge maximum age in seconds.</td>
<td>6 to 40 seconds</td>
</tr>
<tr>
<td>Loopback Guard</td>
<td>Specifies the loopback guard status.</td>
<td>Enable or Disable</td>
</tr>
<tr>
<td>Path Cost Method</td>
<td>Specifies the speed of the interface.</td>
<td></td>
</tr>
<tr>
<td>Priority</td>
<td>Specifies the port priority.</td>
<td>0 to 61440 in steps of 4096</td>
</tr>
<tr>
<td>BPDU Filtering</td>
<td>Specifies that BPDU packets are filtered when the spanning tree is disabled on an interface.</td>
<td></td>
</tr>
<tr>
<td>BPDU Flooding</td>
<td>Specifies that BPDU packets are flooded unconditionally when the spanning tree is disabled on an interface.</td>
<td></td>
</tr>
</tbody>
</table>

**Configuring Dot1x**

This chapter describes how to configure dot1x port-based authentication on the Cisco Enterprise NFVIS portal. dot1x prevents unauthorized devices (clients) from gaining access to the network. It is a standard for media-level (Layer 2) access control, offering the capability to permit or deny network connectivity based on the identity of the end user or device. The dot1x is disabled by default. You can click on edit to enable dot1x.
The configuration of dot1x has the following parameters:

**Table 7: Dot1x Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>Authentication</td>
<td>Specifies the authentication type for the port.</td>
<td>radius or none</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The default value is radius.</td>
</tr>
<tr>
<td>Guest VLAN Timeout(s)</td>
<td>Specifies the time delay in seconds between enabling Dot1X (or port up) and adding the port to the guest VLAN.</td>
<td>Range: 30 to 180 seconds</td>
</tr>
<tr>
<td>System Auth control</td>
<td>Specifies the authentication control.</td>
<td>Enable or Disable</td>
</tr>
</tbody>
</table>

**Configuring LACP**

The Link Aggregation Control Protocol (LACP) enables you to bundle several physical ports together to form a single logical channel. LACP enables you to form a single Layer 2 link automatically from two or more Ethernet links. This protocol ensures that both ends of the Ethernet link are functional and are part of the aggregation group.
LACP uses the following parameters to control aggregation:

**Table 8: LACP Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Priority</td>
<td>Specifies the port priority.</td>
<td>Range: 1 to 65535</td>
</tr>
<tr>
<td>Port-channel load balance</td>
<td>Specifies the load balance of the port channel.</td>
<td>Mac Based or IP Based</td>
</tr>
</tbody>
</table>

**Configuring VLAN**

You can use virtual LANs (VLANs) to divide the network into separate logical areas. VLANs can also be considered as broadcast domains. Any switch port can belong to a VLAN, and unicast, broadcast, and multicast packets are forwarded and flooded only to end stations in that VLAN. Each VLAN is considered a logical network, and packets destined for stations that do not belong to the VLAN must be forwarded through a router.

You can configure VLANs in the range `<1-2349>|<2450-4093>` for a specified switch port.
Configuring General Settings

You can configure general settings using the following parameters for each switch interface:

- Interface—Name of the interface
- Description—Set the description per interface
- Speed—10/100/1000 MBPS
- Dot1x Auth—802.1x, mac or both
- PoE Method—auto, never or four-pair
- PoE Limit—0-60000mW
- Admin Status—enable or disable
You can make the advanced settings using the following parameters for each switch interface:

- **Mode**—access, dot1q-tunnel, private-vlan, or trunk
- **Access Vlan**—Specifies the number of VLANs.
- **Allowed Vlan**—All or VLAN IDs
- **Native Vlan**—Specifies the VLAN ID. You can enter a value from one of the following ranges:
  - 1 to 2349
  - 2450 to 4093
- **Dot1q Tunnel Vlan**—Specifies the Layer 2 tunnel port.
• Community—Specifies the community number. Range: 1 to 29
• Protected Port—Yes or No

---

**Note**

The VLAN configuration takes effect only if the global VLANs are also configured with the same values in Configuring VLAN, on page 173.

---

## Configuring Spanning Tree per Interface

You can configure spanning tree for each switch interface using the following parameters:
- Spanning Tree—Enable or Disable
- Cost—Specifies the cost. Range: 1 to 200000000
- Priority—Specifies the port priority. Range: 0 to 240, default value is 128
- Link Type—point-to-point or shared
- BPDU Guard—Enable or Disable
- Root Guard—Enable or Disable
- Port Fast—auto or enable
- BPDU Filtering—specifies that BPDU packets are filtered when the spanning tree is disabled
- BPDU Flooding—specifies that BPDU packets are flooded when the spanning tree is disabled
Secondary IP

The Cisco Enterprise NFVIS supports multiple IP addresses per interface. A Secondary IP feature can be configured on the WAN interface, as an additional IP to reach the software. Set the external routes for Secondary IP to reach the NFVIS. Routers configured with secondary addresses can route between the different subnets attached to the same physical interface.

To access secondary IP through ISRv, the WAN physical port is removed from wan-br similar to single IP.

To configure Secondary IP:

Configure Secondary IP
nfvis(config)# system settings wan secondary ip address 1.1.2.3 255.255.255.0

Source Interface

This feature is used to set the source interface for packets with source IP address, generated by NFVIS using the default route.

Prerequisites for configuring Source Interface

- IP must be one of the configured IP addresses in system settings.
- The source-interface IP address can be one of the following:
  - mgmt
  - WAN
  - WAN Secondary IP
  - WAN2 IP or IP configured on any bridge
- Source-interface configuration must be applied if the WAN IP is static.
- For DHCP, Source-interface IP is accepted but cannot be applied. The configuration takes effect once you switch from DHCP to static.
To configure Source Interface:

Configure source-interface ip
nfvis(config)# system settings source-interface 1.1.2.3

The Secondary IP and Source Interface related errors are logged in show log
/var/log/nfvis_config.log file.

Ports and Port Channels

This chapter contains the following sections.

• Configuring Port Channels, on page 181
• Configuring LLDP, on page 184
• Configuring Admin Status of a Port, on page 184
• Tracking Changes for a Port, on page 185
• Speed, Duplex and Autonegotiation, on page 185

Configuring Port Channels

Information About Port Channels

Port channels provide a mechanism for combining individual links into a group to create a single logical link that provides the aggregate bandwidth of up to eight physical links. Port channels provide increased bandwidth and redundancy and balance the traffic load between the members port. If a member port within a port channel fails, traffic previously carried over the failed port switches to the remaining member ports.

Port channels can be configured using static mode (no protocol) or the Link Access Control Protocol (LACP). Any configuration changes that you apply to the port channel are applied to each member port of the port channel. A port channel must have at least two ports. A port channel can be added to a bridge. A bond is created when a port channel has more than two members and the port channel is added to a bridge.

A port can be a member of only one port channel. All the ports in a port channel must be compatible; they must use the same speed and operate in full-duplex mode.

Port Channels Bond Mode

A port channel can be configured for the following bond modes:

• active-backup: In this mode, one of the ports in the aggregated link is active and all others ports are in the standby mode.

• balance-slb: In this mode, load balancing of traffic is done based on the source MAC address and VLAN.

• balance-tcp: In this mode, 5-tuple (source and destination IP, source and destination port, protocol) is used to balance traffic across the ports in an aggregated link.
Port Channels LACP Mode

A port channel can be configured for the following LACP modes:

- **off**: Indicates that no mode is applicable.
- **active**: Indicates that the port initiates transmission of LACP packets.
- **passive**: Indicates that the port only responds to the LACP packets that it receives but does not initiate the LACP negotiation.

Creating a Port Channel

To create a port channel:

```bash
configure terminal
pnic pc type port_channel lACP_type active bond_mode balance-tcp trunks 10, 20
commit
```

### Port Channel Creation APIs and Commands

<table>
<thead>
<tr>
<th>APIs</th>
<th>Commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>/api/config/pnics</td>
<td>pnic name type port_channel</td>
</tr>
<tr>
<td>/api/operational/pnics</td>
<td>show pnic</td>
</tr>
</tbody>
</table>

Adding a Port to a Port Channel

A port channel must have at least two ports. A bond is created when a port channel has more than two members and the port channel is added to a bridge. You can add a port to a new port channel or a port channel that already contains ports.

To add a port to a port channel:

```bash
configure terminal
pnic eth1 member_of pc
commit
```

### Adding a Port to a Port Channel APIs and Commands

<table>
<thead>
<tr>
<th>APIs</th>
<th>Commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>/api/config/pnics/pnic/name/member_of</td>
<td>pnic name member_of portchannel_name</td>
</tr>
</tbody>
</table>

Adding a Port Channel to a Bridge

You can add a port channel to a new bridge or an existing bridge. When a port channel is added to a bridge, a bond is added for the port channel.

To add a port channel to a bridge:
configure terminal
bridges bridge test-br port pc
commit

Adding a Port Channel to a Bridge APIs and Commands

<table>
<thead>
<tr>
<th>APIs</th>
<th>Commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>/api/config/bridges/bridge/bridgename</td>
<td>bridges bridge name port portchannel_name</td>
</tr>
</tbody>
</table>

Deleting a Port Channel

Before deleting a port channel, you must remove all members assigned to the port channel. If the port channel is configured on the bridge, you must remove the port channel from the bridge.

To delete a port channel:

configure terminal
no pnic pc
commit

Port Channel Deletion APIs and Commands

<table>
<thead>
<tr>
<th>APIs</th>
<th>Commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>/api/config/pnics/pnic/portchannel_name</td>
<td>no pnic portchannel_name</td>
</tr>
<tr>
<td>/api/operational/pnics</td>
<td>show pnic</td>
</tr>
</tbody>
</table>

Removing a Port from a Port Channel

To remove a port from a port channel:

configure terminal
no pnic eth1 member_of pc
commit

Removing a Port from a Port Channel APIs and Commands

<table>
<thead>
<tr>
<th>APIs</th>
<th>Commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>/api/config/pnics/pnic/name/member_of</td>
<td>no pnic name member_of portchannel_name</td>
</tr>
</tbody>
</table>

Removing a Port Channel from a Bridge

To remove a port channel from a bridge:

configure terminal
no bridges bridge test-br port pc
commit

<th>Commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>/api/config/bridges/bridge/bridgename</td>
<td>no bridges bridge bridgename port portname</td>
</tr>
</tbody>
</table>

Configuring LLDP

To enable LLDP on a port:

```
configure terminal
pnic eth0 lldp enabled
commit
```

To disable LLDP on a port:

```
configure terminal
pnic eth0 lldp disabled
commit
```

**LLDP Configuration APIs and Commands**

<table>
<thead>
<tr>
<th>APIs</th>
<th>Commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>/api/config/pnics/pnic/portname/lldp</td>
<td>pnic name lldp</td>
</tr>
<tr>
<td>/api/operational/lldp</td>
<td>show lldp</td>
</tr>
<tr>
<td>/api/operational/lldp?deep</td>
<td></td>
</tr>
</tbody>
</table>

Configuring Admin Status of a Port

To bring a port up administratively:

```
configure terminal
pnic eth5 adminstatus up
commit
```

To bring a port down administratively:

```
configure terminal
pnic eth5 adminstatus down
commit
```

**Admin Status Configuration APIs and Commands**

<table>
<thead>
<tr>
<th>APIs</th>
<th>Commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>/api/config/pnics/pnic/portname/adminstatus</td>
<td>pnic name adminstatus</td>
</tr>
</tbody>
</table>
Tracking Changes for a Port

**Note**
This feature is supported only on ENCS 5400.

The configured VNICS tracks the state of the ports based on the PNICS notifications. To verify the state of the port, use `show interface` or `ethtool` commands. You can also use commands specific to the VM, that displays the interface link state.

To configure track state on GE0-0 & GE0-1:

```plaintext
configure terminal
pnic GE0-0 track-state ROUTER 1
end
```

To configure track state on switch port:

```plaintext
configure terminal
switch interface gigabitEthernet 1/0 track-state ROUTER 2
end
```

**Speed, Duplex and Autonegotiation**

To enable autonegotiation on a port:

```plaintext
configure terminal
pnic GE0-0 speed auto duplex auto
commit
```

To configure speed and duplex with non auto values:

```plaintext
configure terminal
pnic GE0-0 speed 100 duplex full
commit
```

Speed can be set to 10, 100, 1G, 10G, 10G_PF, 10G_SR, 10G_VF and auto. Duplex values can be set at full, half and auto.

Use `show pnic GE0-0 operational-speed`, `show pnic GE0-0 operational-duplex` and `show pnic GE0-0 autoneg` to verify the configurations.

**Note**
The speed and duplex configurations are dependent on the peer configuration. If the peer is set at a certain speed and duplex, NFVIS port is set to match that speed. Not all ports on ENCS 5000 series hardware devices support Automatic medium-dependent interface crossover (auto-MDIX) feature. Based on the port connected to the ENCS device, the cable type used to connect to the peer and the speed or duplex settings on the peer, you can try straight through and cross over cable.
Speed, Duplex and Autonegotiation
MSTP for ENCS 5400 8-Port Switch

Multiple Spanning Trees Protocol (MSTP) is introduced to the 8-port switch on ENCS 5400. MSTP enables multiple VLANs to be mapped to the same spanning tree instance, which reduces the number of spanning-tree instances needed to support a large number of VLANs.

ENCS 5400 switch supports 15 instances. Each spanning tree instance is identified by an instance ID from 1 to 15.

To enable MST:

```
configure terminal
switch
  spanning-tree mode mst
  commit
```

To configure VLAN-to-instance mapping:

```
configure terminal
switch
  spanning-tree mst configuration
  instance 1 vlan 15
  name mst_test
  revision 2
  commit
```

To configure the switch priority:

```
configure terminal
switch
  spanning-tree mst 1 priority 0
  commit
```

To configure the path cost per interface's mst instance:

```
configure terminal
switch
  interface gigabitEthernet 1/1
    spanning-tree mst 1 port-priority 96
    spanning-tree mst 1 cost 2
    commit
```

To configure the maximum hop count for all MST instances:

```
class terminal
```
switch
    spanning-tree mst max-hops 10
commit

Use the `show switch spanning-tree mstp configuration global` command to verify the MSTP configuration.

nfvis# show switch spanning-tree mstp configuration global
spanning-tree mstp configuration global name transit-net
spanning-tree mstp configuration global revision 2
spanning-tree mstp configuration global max-hops 20

Use the `show switch spanning-tree mstp configuration instance-list` command to verify the MSTP instance configuration.

nfvis# show switch spanning-tree mstp configuration instance-list
INSTANCE  VLANS MAPPED           STATE
--------------------------------------------------------
 0  1,2350-2353,2363   enabled
 1    15               enabled

To display the global information for MSTP instance 2 use `show switch spanning-tree mstp summary instance-global-info` command.

To display interface information for MSTP instance 2 use `show switch spanning-tree mstp summary instance-interface-info 2` command.
