

## IPsec Pairwise Keys

**Table 1: Feature History**

| Feature Name                                   | Release Information                           | Description                                                                                                                                       |
|------------------------------------------------|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| Secure Communication Using Pairwise IPsec Keys | Cisco IOS XE Catalyst SD-WAN Release 16.12.1b | This feature allows you to create and install private pairwise IPsec session keys for secure communication between an IPsec device and its peers. |

The IPsec pairwise keys feature implements controller-based key exchange protocol between a device and controller.

Controller-based key exchange protocol is used to create a Gateway-to-Gateway VPN (RFC7018) in either a full-mesh topology or dynamic full-mesh topology.

The network devices set up a protected control-plane connection to the controller. The controller distributes policies to network devices. The network devices, in turn, communicate with each other through a secure data plane.

A pair of IPsec session keys (one encryption key and one decryption key) are configured for each pair of local and remote transport locations (TLOC).

- [Supported Platforms, on page 1](#)
- [Pairwise Keys, on page 2](#)
- [IPsec Security Association Rekey, on page 2](#)
- [Configure IPsec Pairwise Keys, on page 2](#)

## Supported Platforms

The following platforms are supported for IPsec Pairwise Keys feature:

- Cisco IOS XE Catalyst SD-WAN devices
- Cisco vEdge devices

## Pairwise Keys

Key exchange method combined with authentication policies facilitate pairwise key creation between two network devices. You use a controller to distribute keying material and policies between network devices. The devices generate private pairwise keys with each other.

IPsec devices share public keys from the Diffie-Hellman (DH) algorithm with the controllers. The controllers relay the DH public keys to authorized peers of the IPsec device as defined by the centralized policy.

Network devices create and install private pairwise IPsec session keys to secure communication with their peers.

## IPsec Security Association Rekey

Every rekeying IPsec device generates a new Diffie-Hellman (DH) pair and new IPsec security association pairs for each peer with which it is communicating. The new security association pairs are generated as a combination of the new DH private key and the DH public key of each peer. The IPsec device distributes the new DH public value to the controller, which forwards it to its authorized peers. Each peer continues to transmit to the existing security association, and subsequently, to new security associations.

During a simultaneous rekey, up to four pairs of IPsec Security Associations (SAs) can be temporarily created. These four pairs converge on a single rekey of a device.

An IPsec device can initiate a rekey due to reasons such as the local time or a volume-based policy, or the counter result of a cipher counter mode initialization vector nearing completion.

When you configure a rekey on a local inbound security association, it triggers a peer outbound and inbound security association rekey. The local outbound security association rekey is initiated after the IPsec device receives the first packet with the new Security Parameter Index (SPI) from a peer.

**Note**

- A pairwise-key device can form IPsec sessions with both pairwise and nonpairwise devices.
- The rekeying process requires higher control plane CPU usage, resulting in lower session scaling.

## Configure IPsec Pairwise Keys

### Configure IPsec Pairwise Keys Using Cisco Catalyst SD-WAN Manager

1. From the Cisco SD-WAN Manager menu, choose **Configuration** > **Templates**.
2. Click **Feature Templates** and then click **Add Template**.

**Note**

In Cisco vManage Release 20.7.1 and earlier releases, **Feature Templates** is called **Feature**.

3. From the **Device Model** drop-down menu, choose the type of device for which you are creating the template.
4. From **Basic Information**, click **Cisco Security** feature template.
5. From **Basic Configuration**, click **On** or **Off** from the **IPsec pairwise-keying** field.
6. Alternatively, enter the pairwise key specific to the device in the **Enter Key** field.
7. Click **Save**.

## Configure Pairwise Keys and Enable Rekeying on the CLI

A pair of IPsec session keys is configured for each pair of local and remote transport locations.

The keys use AES-GCM-256 (AES\_256\_CBC for multicast) cipher to perform encryption. By default, a key is valid for 3600 seconds.

### Configure Pairwise Keys

Use the following command to configure pairwise keys:

```
Device(config)# security ipsec pairwise-keying
```

**Note** You must reboot the Cisco IOS XE Catalyst SD-WAN device for the private-key configuration to take effect.

### Configure Rekeying for IPsec Pairwise Keys

Use the following command to configure rekeying for pairwise keys:

```
Device(config)# security ipsec pwk-sym-rekey
```

## Verify IPsec Pairwise Keys on a Cisco IOS XE Catalyst SD-WAN Device

Use the following command to verify the outbound connections for pairwise keys:

```
Device# show sdwan ipsec pwk outbound-connections
```

| SS          | E-KEY       | AH           | REMOTE |          |            |              | SA          | PKEY  | NONCE | PKEY |

Use the following command to display IPsec pairwise keys information on a Cisco IOS XE Catalyst SD-WAN device:

Device# **show sdwan security-info**

```
security-info authentication-type "AH_SHA1_HMAC SHA1_HMAC"  
security-info rekey 86400  
security-info replay-window 512  
security-info encryption-supported "AES_GCM_256 (and AES_256_CBC for multicast)"  
security-info fips-mode Enabled  
security-info pairwise-keying Enabled
```

### Debug Commands on Cisco IOS XE Catalyst SD-WAN Devices

Use the following **debug** commands for debugging issues related to IPsec pairwise keys:

```
debug plat soft sdwan ftm pwk [dump | log]  
debug plat soft sdwan ttm pwk [dump | log]  
debug plat soft sdwan vdaemon pwk [dump | log]
```
