Note

To achieve simplification and consistency, the Cisco SD-WAN solution has been rebranded as Cisco Catalyst SD-WAN. In addition, from Cisco IOS XE SD-WAN Release 17.12.1a and Cisco Catalyst SD-WAN Release 20.12.1, the following component changes are applicable: Cisco vManage to Cisco Catalyst SD-WAN Manager, Cisco vAnalytics to Cisco Catalyst SD-WAN Analytics, Cisco vBond to Cisco Catalyst SD-WAN Validator, Cisco vSmart to Cisco Catalyst SD-WAN Controller, and Cisco Controllers to Cisco Catalyst SD-WAN Control Components. See the latest Release Notes for a comprehensive list of all the component brand name changes. While we transition to the new names, some inconsistencies might be present in the documentation set because of a phased approach to the user interface updates of the software product.

What's New in Cisco IOS XE (SD-WAN) and Cisco Catalyst SD-WAN Releases

Cisco is constantly enhancing the Cisco Catalyst SD-WAN solution with every release and we try and keep the content in line with the latest enhancements. The following links includes release-wise new and modified features that are documented in the Configuration, Command Reference, and Hardware Installation guides. For information on additional features and fixes that were committed to the Cisco Catalyst SD-WAN solution, see the *Resolved and Open Bugs* section in the Release Notes.

CLI Configuration Commands

Use the CLI configuration commands to modify and then activate a device's configuration parameters.

To enter configuration mode, type the **config** command in operational mode. All changes to the device's configuration are made to a copy of the active configuration, called a candidate configuration. These changes do not take effect until you issue a successful **commit** or **commit confirm** command.

- CLI Operational Commands, on page 5
- CLI Overview, on page 5

CLI Operational Commands

Use the CLI operational commands to view system status, monitor and troubleshoot a Cisco vEdge device and network connectivity, initiate configuration mode, and control the CLI environment. When you first enter the CLI, you are in operational mode.

CLI Overview

The CLI on the Cisco vEdge devices is one of the ways you can configure and monitor these devices. The CLI provides various commands for configuring and monitoring the software, hardware, and network connectivity of the vSmart controllers and the vEdge routers. The CLI provides the following features:

- Displaying help about CLI commands
- Completing partial commands
- Editing the command line with keyboard sequences
- Configuring CLI session settings
- Filtering command output
- Adding comments to device configurations
- Activating and deactivating parts of a configuration
- Displaying CLI messages

The Cisco SD-WAN CLI design is based on the YANG data modeling language, defined in RFC 6020.

CLI Modes

The CLI has two modes:

- Operational mode, for monitoring the state of the Cisco vEdge device. When you log in to the CLI, you are in operational mode. In this mode, you view device status, monitor and troubleshoot the device and network connectivity, enter into configuration mode, and control the CLI session parameters.
- Configuration mode, for changing the operational parameters of the Cisco vEdge device. You enter configuration mode by issuing the configure command in operational mode. This mode has a number of submodes for manipulating different parts of the configuration. For example, the mode interface-eth1 allows you to configure parameters for Ethernet interface 1. All changes to the device's configuration are done to a copy of the active configuration, called a candidate configuration. Configuration changes take effect only when you enter a commit or commit confirmed command and that command is successful.

Start the CLI

Before you begin, make sure the vSmart controller and the vEdge router hardware is set up and the Cisco SD-WAN software is installed. You must have a direct console connection to the device or network using SSH. If your device is not set up, follow the installation instructions provided to you with the vSmart controller or the vEdge router before proceeding.

The login prompt for a Cisco vEdge device shows the software version and then prompts for a username and password.

When you log into a vSmart controller or a vEdge router, you are prompted to enter your user name and password. Once you enter your password, you are automatically placed at the CLI prompt.

For security reasons, each time you log out of the device, the CLI session ends and you are required to log in again to access the CLI.

CLI Prompts

The prompt indicates the mode the CLI is in:

- host-name#: The host name followed by a hash mark indicates that the CLI is in operational mode. An operational mode prompt is similar to vsmart#.
- host-name(config)#: When the CLI is in configuration mode, the string config is added to the prompt. For example, a configuration mode prompt is similar to vsmart(config)#. If you are configuring a lower hierarchy in the commands, the prompt also indicates that level. For example, if you are configuring Ethernet interface 1 for a VPN, in the hierarchy vpn > interface, the configuration mode prompt is vsmart(config-interface-eth1)#. The CLI prompt shows only the parent hierarchy, not the full path to the command, so that the CLI prompt never gets too long.

To change the operational mode prompt, use the **prompt1** operational command:

```
vsmart# prompt1 eve@vsmart#
eve@vsmart#
```

To change the configuration mode prompt, use the **prompt2** operational command:

```
vsmart# prompt2 eve@vsmart(config)#
eve@vsmart(config)#
```

Configure CLI Session Settings

The following are the default CLI session settings for a Linux terminal:

vsmart# show cli autowizard false complete-on-space false history 100 idle-timeout 1800 ignore-leading-space true output-file terminal paginate true prompt1 \h\M# prompt2 \h(\m)# 30 screen-length screen-width service prompt config true show-defaults false terminal xterm-256color disable timestamp

To change the session values, use the command names listed in the output above. For more information on the commands, see Operational Commands .

Command Hierarchies

CLI commands are organized in a hierarchy that groups commands that perform related or similar functions. For example, in operational mode, commands that display information about OMP are collected under the **show omp** command hierarchy. In configuration mode, commands that configure OMP properties are collected under the **omp** command hierarchy.

Display Help about CLI Commands

To list the available CLI commands, along with a short description of the command, type a ? (question mark).

If you type ? at the prompt, the CLI displays a list of available commands. In operational mode, you see:

```
vsmart# ?
Possible completions:
 autowizard
                      Automatically query for mandatory elements
  clear
                      Clear parameter
  clock
                      System clock
  commit
                      Confirm a pending commit
  complete-on-space
                      Enable/disable completion on space
  config
                      Manipulate software configuration information
  debua
                      Debugging commands
  exit
                      Exit the management session
  file
                      Perform file operations
  help
                      Provide help information
                      Configure history size
  history
  idle-timeout
                      Configure idle timeout
  job
                      Job operations
  leaf-prompting
                      Automatically query for leaf values
```

logout Logout a user

monitor Monitor a file

no Negate a command or set its defaults

nslookup Look up a DNS name

paginate Paginate output from CLI commands

ping Ping a host

poweroff Shut down the system

prompt1 Set operational mode prompt

prompt2 Set configure mode prompt

quit Exit the management session

repoot Reboot the system request Perform an action

screen-length Configure screen length

screen-width Set CLI screen width

show Show information about the system

tcpdump on a network interface

timestamp Enable/disable the display of timestamp

tools Tools commands

traceroute Trace connectivity to a host

vdig Asynchronous FQDN resolution

vping Send L2, L3, L7 probes to remote host

vshell System shell

If you type tools and ? at the prompt, the CLI displays a list of available commands for tools. In operational mode, you see:

vm9# tools ?

Possible completions:

consent-token Access restricted functionality using Consent Token

core-state Show Core state

cpu-util Show CPU Utilization

flood-ping Flood-ping a host ike-debug IKE debug tools

internal (TESTBED) Internal commands

ip-route Display route table

```
iperf Network bandwidth measurement tool
netstat Display network status
nping Network packet generation tool
ss Display network statistics
stun-client STUN client protocol tool
support Support commands
vtysh Integrated shell for Quagga routing software suite
```

Note

To access vtysh commands, see Quagga docs on the Quagga Routing website.

If you type ? at the prompt after entering configuration mode, you see:

```
vsmart(config)# ?
Possible completions:
  apply-policy Apply network policy
 banner
                Set banners
                OMP information
 omp
 policy
                Configure policy
                Configure security
  security
 snmp
                Configure SNMP
                Configure System
  system
                VPN Instance
  vpn
               Abort configuration session
 abort
                Remove all configuration changes
 clear
  commit
                Commit current set of changes
  describe
               Display transparent command information
 do
                Run an operational-mode command
  end
                Terminate configuration session
                Exit from current mode
  exit.
  help
                Provide help information
 load
                Load configuration from an ASCII file
                Negate a command or set its defaults
 no
                Display current mode path
 pwd
 revert
                Copy configuration from running
 rollback
                Roll back database to last committed version
  save
                Save configuration to an ASCII file
 show
                Show a parameter
                Exit to top level and optionally run command
  top
  validate
                Validate current configuration
```

If you type? after a command name, the CLI shows all possible completions for that command. For example:

```
vsmart# show interface vpn 0 ?
Possible completions:
  eth0 eth1 | <>
```

If you type **help** before a command name, it will you give you more information about the command. For example:

```
vsmart# help show cli
Help for command: show cli
Display cli settings
```

The **show parser dump** command also displays information about available commands and their syntax.

Enter User-Defined Strings

For many configuration commands, you define a string that identifies an instance of a configurable object. For example, when you create user accounts, you configure a user-defined string for the username:

```
vEdge(config-system) # aaa user eve
```

In this command, the strings "aaa" and "user" are Cisco SD-WAN software keywords, and the string "eve" is a user-defined string.

User-defined strings can include all uppercase and lowercase letters, all digits, spaces, and all special characters except for angle brackets (< and >).

To include a space or an exclamation point (!) in a user-defined string, either type a backslash (\) before the space or enclose the entire string in quotation marks (" "). For example:

```
vEdge(config) # banner login "Remember to log out when you are done!"
vEdge(config-banner) # show full-configuration
banner
login "Remember to log out when you are done!"
!
vEdge(config-banner) #

vEdge(config-system) # organization-name My\ Company
vEdge(config-system) # show configuration
system
organization-name "My Company"
!
vEdge(config-system) #
```

Complete Partial Commands and Strings

The CLI provides command completion. It recognizes commands and options based on the first few letters you type so that you do not always have to remember or type the full command or option name.

To display a list of all possible command or option completions, type the partial command followed immediately by a question mark. For example:

To complete a command or option that you have partially typed, press the tab key after you have typed a partially completed command name. If the partially typed letters begin a string that uniquely identifies a command, the complete command name is displayed. Otherwise, a list of possible completions is displayed.

Command completion also works with other strings, such as filenames, directory names, interface names, and usernames.

To enable command completion when you press the space bar, enable it for the duration of the terminal session:

```
vEdge# complete-on-space true
```

When this is enabled, you can press the tab key or the space bar to complete a partially typed command name or variable string.

Command completion is disabled within quoted strings. So if an argument contains spaces and you quote them with a backslash (for example, **prefix-list my\ list**) or with quotation marks (for example, **prefix-list "my list"**), you cannot use command completion. Space completion does not work with filenames.

Edit the Command Line with Keyboard Sequences

You can use keyboard sequences in the CLI to move around and edit text on the command line itself. You can also use keyboard sequences to scroll through a list of recently executed commands. The following table lists some of the CLI keyboard sequences.

Table 1:

Category	Action	Keyboard Sequence
Move the cursor	Move the cursor back one character.	Ctrl-B or Left Arrow
	Move the cursor back one word.	Esc-B or Alt-B
	Move the cursor forward one character.	Ctrl-F or Right Arrow
	Move the cursor forward one word.	Esc-F or Alt-F
	Move the cursor to the beginning of the command line.	Ctrl-A or Home
	Move the cursor to the end of the command line.	Ctrl-E or End
Delete characters	Delete the character before the cursor.	Ctrl-H, Delete, or Backspace
	Delete the character following the cursor.	Ctrl-D
	Delete all characters from the cursor to the end of the line.	Ctrl-K
	Delete the whole line.	Ctrl-U or Ctrl-X
	Delete the word before the cursor.	Ctrl-W, Esc-Backspace, or Alt-Backspace
	Delete the word after the cursor.	Esc-D or Alt-D
Insert recently deleted text	Insert the most recently deleted text at the cursor.	Ctrl-Y
Display previous command lines	Scroll backward through the list of recently executed commands.	Ctrl-P or Up Arrow
	Scroll forward through the list of recently executed commands.	Ctrl-N or Down Arrow
	Search the command history in reverse order.	Ctrl-R
	Show list.	
Capitalization	Capitalize the word at the cursor; that is, make the first character uppercase and the rest of the word lowercase.	Esc-C

Category	Action	Keyboard Sequence
	Change the word at the cursor to all lowercase.	Esc-l
Special cases	Cancel a command; that is, clear a line.	Ctrl-C
	Quote insert character; that is, do not treat the next keystroke as an edit command.	Ctrl-V/Esc-Q
	Redraw the screen.	Ctrl-l
	Transpose characters.	Ctrl-T
	Enter multiline values when prompted for a value in the CLI (not available when editing a CLI command).	Esc-M
	Exit configuration mode.	Ctrl-Z

Filter Command Output

You can filter the output from a command by adding the pipe (|) symbol at the end of the command, followed by one of the filtering commands listed in the following table. You can chain together a series of filters on a single command line.

Table 2:

Filter	Description
append filename	Append output text to a file.
begin regular-expression	Begin with the line that matches a regular expression.
best-effort	Display data even if the data provider is unavailable, or continue loading from a file even if failures are occurring.
count	Count the number of lines in the output.
csv	Display the outfield fields in a comma-separated format.
display	Display the output as XML.
exclude regular-expression	Exclude lines that match a regular expression.
include regular-expression	Include lines that match a regular expression.
linnum	Enumerate lines in the output.
match-all	All selected filters must match.
match-any	At least one selected filter must match.
more	Paginate the output.
nomore	Suppress pagination of the output.

Filter	Description
notab	Display each output field on a separate line instead of in a table.
repeat seconds	Execute the command repeatedly, every specified number of seconds.
save filename	Save the output to a file.
select	For tabular output, select the columns to display.
tab	Enforce the table output of fields.
until regular-expression	End the display with the line that matches a regular expression.

Use Regular Expressions

The regular expressions available for use in filtering commands are a subset of those used in the UNIX **egrep** command and in the AWK programming language. The following table lists some common operators.

Table 3:

Operator	Action
	Match any character.
^	Match the beginning of a string.
\$	Match the end of a string.
[abc]	Character class, which matches any of the characters abc Character ranges are specified by a pair of characters separated by a
[^abc]	Negated character class, which matches any character except abc.
r1 r2	Alternation. It matches either r1 or r2.
r1r2	Concatenation. It matches r1 and then r2.
r+	Match one or more rs.
r*	Match zero or more <i>r</i> s.
r?	Match zero or one <i>r</i> s.
(r)	Grouping. It matches r .

Understand CLI Messages

The CLI displays messages at various times, such as when you enter and exit configuration mode, commit a configuration, and type a command or value that is not valid.

When you type an invalid command or value, a CLI message indicates the nature of the error:

```
vsmart# show c
Possible completions:
   certificate    Display installed certificate properties
```

```
cli Display cli settings
clock System clock
configuration Display configuration history
control Display Control Information
```

When you commit a configuration, the CLI first validates the configuration. If there is a problem, the CLI indicates the nature of the problem:

```
Entering configuration mode terminal
vsmart(config) # no vpn 0
vsmart(config) # commit
Aborted: 'vpn' : Cannot delete vpn 0
vsmart(config>) #
```

Count the Number of Lines in Command Output

To count the number of lines in the output from a command, use the **count** filtering command. For example:

```
vsmart# show interface | count
Count: 17 lines
```

Display Line Numbers in Command Output

To display line numbers in the output, use the **linnum** command filter. For example:

Search for a String in Command Output

To have the command output include only lines matching a regular expression, use the **include** command filter. For example:

```
vsmart# show cli | include screen
screen-length 30
screen-width 80
```

To have the command output include only the lines not containing a regular expression, use the **exclude** filtering command. For example:

To display the output starting at the first match of a regular expression, use the **begin** command filter. For example:

```
vsmart# show cli | begin show
show-defaults false
terminal linux
timestamp disable
```

To end the command output when a line matches a regular expression, use the **until** command filter. For example:

```
vsmart# show cli | until history
autowizard false
complete-on-space true
history 100
```

Save Command Output to a File

To save command output to a file, use the **save** filename or **append** filename command filter. For example:

```
vsmart# show running-config omp | save filename
```

To save the configuration except for any passwords, add the **exclude password** command filter:

```
vsmart# show running-config system | exclude password | save filename
```

Configure a Device from the CLI

To configure a vSmart controller or vEdge router directly from the device, enter configuration mode:

```
vsmart# confid
```

Then type either the full configuration command or type one command at a time to move down through the command hierarchy. Here is an example of typing a full configuration command:

```
vsmart(config)# vpn 1 interface ge0/1 ip address 1.1.1.1/16
```

Here is an example of moving down the command hierarchy by typing one command at a time:

```
vsmart(config) # vpn1
vsmart(config-vpn-1) # interface eth1
vsmart(config-interface-eth1) # ip address 1.1.1.1/16
vsmart(config-interface-eth1) #
```

To move to another portion of the hierarchy, simply type the name of the top-level command. For example:

```
vsmart(config-interface-eth1) # policy
vsmart(config-policy) #
```

To look at the configuration changes:

```
vsmart(config-policy)# top show configuration
vpn 1
  interface eth1
  ip address 1.1.1.1/16
  shutdown
!
!
```

To commit the changes:

```
vsmart(config-policy) # commit
Commit complete.
```

Add Comments in a Configuration

All characters following an exclamation point (!) character up to the next newline in a configuration are ignored. This allows you to include comments in a file containing CLI commands and then paste the file into

the CLI. To enter the ! character as an argument or to include it in a password, prefix it with a backslash (\) or place it inside quotation marks (" ").

Delete Commands from a Configuration

Use the **no** command to delete commands from a configuration. For example:

```
vsmart(config)# do show running-config
vpn 1
interface eth1
 ip address 1.1.1.1/16
 auto-negotiation
 shudown
 no proxy-arp
vsmart(config) # no vpn 1 interface eth1 ip address
vsmart(config) # commit
commit complete.
vsmart(config)# do show running-config

Configuration Commands

Note

For a list of Cisco IOS XE SD-WAN commands qualified for use in Cisco vManage CLI templates, see List of Commands Qualified in Cisco IOS XE Release 17.x. For information about specific commands, see the appropriate chapter in Cisco IOS XE SD-WAN Qualified Command Reference Guide.

- Overview of Configuration Commands, on page 25
- aaa, on page 26
- aaa netconf-accounting, on page 29

Overview of Configuration Commands

The configuration command reference pages describe the CLI commands that you use to configure the functional network properties of vSmart controllers, vEdge devices, and vBond orchestrators. To configure a Cisco vEdge device, enter configuration mode by issuing the **config** command from operational mode in the CLI. You know that you are in configuration mode because the CLI prompt changes to include the string (**config**).

In the CLI, configuration commands are organized into functional hierarchies. The top-level configuration hierarchies are:

- apply-policy—Apply control policy and data policy.
- banner—Set login messages for the device.
- bridge—Configure Layer 2 bridging for a rvEdge route.
- omp—Configure properties for the Viptela Overlay Management Protocol.
- policy—Configure control policy and data policy.
- security—Configure IPsec parameters.
- snmp—Configure SNMP parameters.
- system—Configure basic system parameters.

• vpn—Configure the properties of a VPN, including the interfaces that participate in the VPN and the routing protocols that are enabled in the VPN.

To manage a configuration session, use the Configuration Session Management Commands.

aaa

To configure role-based access to a device using authentication, authorization, and accounting use the system aaa command in privileged EXEC mode.

vManage Feature Template

Configuration > Templates > AAA

Note

You can only configure the password-policy commands using the device CLI template on Cisco SD-WAN Manager.

Command Hierarchy

```
system
 aaa
    [no] accounting
   admin-auth-order
   auth-fallback
   auth-order (local | radius | tacacs)
   logs
      [no] audit-disable
      [no] netconf-disable
   password-policy min-password-length length
    password-policy num-lower-case-characters number-of-lower-case-characters
   password-policy num-numeric-characters number-of-numeric-characters
   password-policy num-special-characters number-of-special-characters
   password-policy num-upper-case-characters number-of-upper-case-characters
   radius-servers tag
   user username
     group group-name
     password password
    task name
      config
       default action {accept | deny}
       accept "xpath"
       deny "xpath
      oper-exec
        default action {accept | deny}
       accept "command"
       deny "command
   usergroup group-name
     task {interface | policy | routing | security | system | authorization task} {read |
 write }
```

Syntax Description

password-policy min-password-length length	The minimum allowed length of a password. You can specify between 8 to 32 characters.
password-policy num-lower-case-characters number-of-lower-case-characters	The minimum number of lower case characters. You can specify between 1 to 128 characters.
password-policy num-numeric-characters number-of-numeric-characters	The minimum number of numeric characters. You can specify between 1 to 128 characters.
password-policy num-special-characters number-of-special-characters	The minimum number of special characters. You can specify between 1 to 128 characters.
password-policy num-upper-case-characters number-of-upper-case-characters	The minimum number of upper case characters. You can specify between 1 to 128 characters.
task "name"	The name of an authorization task.
accept "xpath"	The XPath string for a configuration command that the authorization feature allows a user to execute.
deny "xpath"	The XPath string for a configuration command that the authorization feature does not allow a user to execute.
accept "command"	An operational command that the authorization feature allows a user to execute.
deny "command"	An operational command that the authorization feature does not allow a user to execute.
task authorization_task	The name of a configured authorization task.

Command History

Release	Modification
Cisco SD-WAN Release 14.1	Command introduced.
Cisco SD-WAN Release 20.4.1	password-policy commands introduced.
Cisco SD-WAN Release 20.5.1	accounting command introduced. task commands introduced. authorization_task argument introduced.

The following example shows to set up a user, their password, and group using the system aaa command:

```
Device# config
Entering configuration mode terminal
Device(config)# system aaa
Device(config-aaa)# user eve
Device(config-user-eve)# password 123456
Device(config-user-eve)# group operator
Device(config-user-eve)# exit
vEdge(config-aaa)# commit and-quit
Commit complete.
```

The following example shows how to enable accounting using the system aaa command:

```
Device# config
Entering configuration mode terminal
Device(config)# system aaa
Device(config-aaa)# accounting
Device(config-aaa)# exit
vEdge(config-aaa)# commit and-quit
Commit complete.
```

The following example shows how to configure and authorization task using the system aaa command and how to associate the task with a user group:

```
Device# config
Entering configuration mode terminal
Device (config) # system aaa
Device(config-aaa)# task task1
Device (config-task-task1) # config default-action deny
Device (config-config) # accept "/vpn/"
Device (config-accept-/vpn/) # exit
Device(config-config)# exit
Device(config-task-task1)# oper-exec default-action accept
Device(config-oper-exec) # deny "show system"
Device (config-deny-show system) # deny "request admin-tech"
Device(config-deny-request admin-tech) # exit
Device(config-oper-exec)# exit
Device(config-task-task1)# exit
Device(config-aaa) # usergroup group1
Device(config-usergroup-group1)# task task1 read write
Device (config-usergroup-group1) # commit
Commit complete.
```

The following example shows how to verify your AAA configuration:

```
vEdge# show running-config system aaa
system
aaa
auth-order local radius
task task1
oper-exec
default-action accept
deny "show system"
!
deny "request admin-tech"
!
config
default-action accept
accept /vpn/
!
```

```
usergroup basic
  task system read write
  task interface read
 usergroup group1
  task task1 read write
 usergroup netadmin
 usergroup operator
  task system read
  task interface read
  task policy read
  task routing read
  task security read
 user admin
  password $1$zvOh58pk$QLX7/RS/F0c6ar94.x12k.
 user eve
  password $1$aLEJ6jve$aBpPQpkl3h.SvA2dt4/6E/
  group operator
!
```

Operational Commands

```
show aaa usergroup
show users
request aaa unlock-user
Related Topics
```

aaa netconf-accounting

To enable authentication, authorization, and accounting (AAA) accounting of netconf services for billing or security purposes when you use TACACS+, use the **aaa netconf-accounting** command in global configuration mode or template configuration mode. To disable AAA accounting, use the **no** form of this command.

aaa netconf-accounting

aaa netconf-accounting { system | exec | network | connection connection-name }

Syntax Description

system	Performs accounting for all system-level events not associated with users, such as reloads.	
	Note	When system accounting is used and the accounting server is unreachable at system startup time, the system will not be accessible for approximately two minutes.

exec	Runs accounting for the EXEC shell session. This keyword might return user profile information such as what is generated by the autocommand command.
network	Runs accounting for all network-related service requests.
connection	Provides information about all outbound connections made from the network access server, such as Telnet, local-area transport (LAT), TN3270, packet assembler and disassembler (PAD), and rlogin.

Command Default

AAA accounting is disabled.

Command Modes

Global configuration (config)

Command History

Release	Modification
Cisco Catalyst SD-WAN Manager Release 20.15.1	Command is introduced.

Usage Guidelines

The **system aaa netconf-accounting** configuration depends on **system aaa accounting**. Only when **system aaa netconf-accounting** is configured, the netconf-accounting also can be configured.

When **system aaa accounting** is deleted, **system aaa netconf-accounting** is also deleted. However, when you delete **system aaa netconf-accounting**, there is no effect on **system aaa accounting**.

Example

The following example shows how to configure netconf accounting:

```
Device (config)# system
Device (config)# aaa netconf-accounting aaalist1
Device (config)#
```

access-list

Configure or apply an IPv6 access list (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface Bridge

Configuration ► Templates ► VPN Interface Cellular (for vEdge cellular wireless routers only)

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface GRE

Configuration ► Templates ► VPN Interface PPP

Configuration ► Templates ► VPN Interface PPP Ethernet

Command Hierarchy

Create an Access List

```
policy ipv6
 access-list acl-name
   default-action action
   sequence number
      match
       class class-name
       destination-port number
       next-header protocol
        packet-length number
        plp (high | low)
        source-port number
        tcp flag
        traffic-class value
      action
        drop
        count counter-name
        log
        accept
         class class-name
         mirror mirror-name
         policer policer-name
          set traffic-class value
```

Apply an Access List

```
vpn vpn-id
  interface interface-name
  ipv6 access-list acl-name (in | out)
```

Syntax Description

acl-name	Access List Name:
	Name of the access list to configure or to apply to the interface. acl-name can be up to 32 characters long.
(in out	Direction in which to Apply Access List:
	Direction in which to apply the access list. Applying it in the inbound direction (in) affects packets being received on the interface. Applying it in the outbound direction (out) affects packets being transmitted on the interface.

Command History

Release	Modification
16.3	Command introduced.

Example

Apply an IPv6 access list to data traffic being recieved on an interface in VPN 1:

```
vpn 1
  interface ge0/4
  ip address fd00:1234:/16
```

```
no shutdown
access-list acl-filter in
```

Operational Commands

show policy access-list-associations show policy access-list-counters show policy access-list-names

Related Topics

access-list, on page 32

access-list

Configure or apply an IPv4 access list (on vEdge routers only).

Command Hierarchy

Create an Access List

```
policy
  access-list acl-name
   default-action action
   sequence number
     match
        class class-name
        destination-data-prefix-list list-name
        destination-ip prefix/length
        destination-port number
       dscp number
       packet-length number
       plp (high | low)
       protocol number
        source-data-prefix-list list-name
        source-ip prefix-length
       source-port number
        tcp flag
      action
       drop
          count counter-name
          log
        accept
          class class-name
          count counter-name
          log
          mirror mirror-name
          policer policer-name
          set dscp value
          set next-hop ipv4-address
```

Apply an Access List

```
vpn vpn-id
  interface interface-name
  access-list acl-name (in | out)
```

Syntax Description

acl-name	Access List Name:	
	Name of the access list to configure or to apply to the interface.	
(in out)	Direction in which to Apply Access List: Direction in which to apply the access list. Applying it in the inbound direction (in) affects packets being received on the interface. Applying it in the outbound direction (out) affects packets being transmitted on the interface.	

Command History

Release	Modification
14.1	Command introduced.

Example

Apply an access list to an interface in VPN 1:

```
vpn 1
  interface ge0/4
   ip address 10.20.24.15/24
  no shutdown
  access-list acl1 in
```

Operational Commands

show policy access-list-associations show policy access-list-counters show policy access-list-names

Related Topics

access-list, on page 30

accounting-interval

How often an 802.1X interfaces sends interim accounting updates to the RADIUS accounting server during an 802.1X session (on vEdge routers only). By default, no interim accounting updates are sent; they are sent only when the 802.1X session ends.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface Ethernet

Command Hierarchy

```
vpn 0
  interface interface-name
  dot1x
     accounting-interval seconds
```

Syntax Description

	seconds	Accounting Update Interval:	
		How often to send 802.1X interim accounting updates to the RADIUS server.	
		Range:	
		0 through 7200 seconds	
		Default:	
		0 (no interim accounting updates are sent)	
- 1			

Command History

Release	Modification
16.3	Command introduced.

Example

Send 802.1X interim accounting updates once per hour:

```
vpn 0
  interface ge0/7
  dot1x
    accounting-interval 3600
```

Operational Commands

clear dot1x client show dot1x clients show dot1x interfaces show dot1x radius show system statistics

Related Topics

```
acct-req-attr, on page 35
nas-identifier, on page 346
nas-ip-address, on page 347
radius, on page 413
radius-servers, on page 417
```

acct-req-attr

Configure RADIUS accounting attribute–value (AV) pairs to send to the RADIUS accounting server during an 802.1X session (on vEdge routers only). These AV pairs are defined in RFC 2865, RADIUS, and RFC 2866, RADIUS Accounting, and they are placed in the Attributes field of the RADIUS Accounting Request packet.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface Ethernet

Command Hierarchy

```
vpn 0
  interface interface-name
  dot1x
   acct-req-attr attribute-number (integer integer | octet octet | string string)
```

Syntax Description

attribute-number	Accounting Attribute Number:
	RADIUS accounting attribute number.
	Range:
	1 through 64
(integerinteger octetoctet	Attribute Value:
tring)	Value of the attribute. Specify the value as an integer, octet, or string, depending on the accounting attribute itself.

Command History

Release	Modification
16.3	Command introduced.

Example

Set the Acct-Authentic attribute to RADIUS:

```
vpn 0
  interface ge0/0
  dot1x
   acct-req-attr 45 integer 1
```

Operational Commands

clear dot1x client

```
show dot1x clients
show dot1x interfaces
show dot1x radius
show system statistics
```

Related Topics

nas-ip-address, on page 347
radius, on page 413
radius-servers, on page 417
```

action

Configure the actions to take when the match portion of an IPv4 policy is met (on vEdge routers, Cisco IOS XE Catalyst SD-WAN devices, and vSmart controllers).

vManage Feature Template

For vEdge routers, Cisco IOS XE Catalyst SD-WAN devices, and vSmart controllers:

Configuration ► Policies

Configuration ► Security (for zone-based firewall policy)

Command Hierarchy

For Application-Aware Routing

```
policy
  app-route-policy policy-name
  vpn-list list-name
   default-action sla-class sla-class-name
   sequence number
   action
      backup-sla-preferred-color colors
      count counter-name
   log
   sla-class sla-class-name [strict] [preferred-color colors]
```

For Centralized Control Policy

Configure on vSmart controllers only.

```
policy
control-policy policy-name
default-action action
sequence number
   action
   reject
   accept
   export-to (vpn vpn-id | vpn-list vpn-list)
   set
      omp-tag number
      preference value
   service service-name (tloc ip-address | tloc-list list-name) [vpn vpn-id]
```

```
tloc ip-address color color [encap encapsulation]
tloc-action action
tloc-list list-name
```

For Centralized Data Policy

Configure on Cisco IOS XE Catalyst SD-WAN devices and vSmart controllers only.

```
policy
  data-policy policy-name
    vpn-list list-name
      default-action action
      sequence number
        action
          cflowd (not available for deep packet inspection)
          count counter-name
          drop
          1οα
          tcp-optimization
          accept
            nat [pool number] [use-vpn 0] (in Releases 16.2 and earlier, not available for
 deep packet inspection)
            redirect-dns (host | ip-address)
            set
              dscp number
              forwarding-class class
              local-tloc color color [encap encapsulation]
              local-tloc-list color color [encap encapsulation] [restrict]
              next-hop ip-address
              policer policer-name
              service service-name local [restrict] [vpn vpn-id]
              service service-name (tloc ip-address | tloc-list list-name) [vpn vpn-id]
              tloc ip-address color color [encap encapsulation]
              tloc-list list-name
              vpn vpn-id
  vpn-membership policy-name
    default-action (accept | reject)
      sequence number
        action (accept | reject)
```

For Cflowd Traffic Flow Monitoring

```
policy
  data-policy policy-name
  vpn-list list-name
    default-action
      (accept | drop)
    sequence number
    action
      accept
      cflowd
```

For Localized Control Policy

Configure on vEdge routers and Cisco IOS XE Catalyst SD-WAN devices only.

```
policy
  route-policy policy-name
  default-action action
  sequence number
   action
    reject
   accept
   set
   aggregator as-number ip-address
```

```
as-path (exclude | prepend) as-numbers atomic-aggregate community value local-preference number metric number metric-type (type1 | type2) next-hop ip-address omp-tag number origin (egp | igp | incomplete) originator ip-address ospf-tag number weight number
```

For Localized Data Policy

Configure on vEdge routers and Cisco IOS XE Catalyst SD-WAN devices only.

```
access-list acl-name
default-action action
sequence number
action
drop
count counter-name
log
accept
class class-name
count counter-name
log
mirror mirror-name
policer policer-name
set dscp value
set next-hop ipv4-address
```

For Zone-Based Firewall Policy

Configure on vEdge routers and Cisco IOS XE Catalyst SD-WAN devices only.

```
policy
zone-based-policy policy-name
  default-action action
  sequence number
   action
      drop
      inspect
      log
      pass
```

Syntax Description

S

default-action sla-class	Default Action for Application-Aware Routing:
sla-class-name	Default CI A to apply if a data made their a suclus

Default SLA to apply if a data packet being evaluated by the policy matches none of the match conditions. If you configure no default action, all data packets are accepted and no SLA is applied to them.

policy control-policy policy-name default-action (accept reject) policy route-policy policy-name default-action (accept reject) policy data-policy policy-name default-action (accept drop) policy vpn-membership policy-name default-action (accept drop) policy access-list acl-name default-action (accept drop)	Default Action for Control Policy and Data Policy: Default action to take if an item being evaluated by a policy matches none of the match conditions. If you configure no policy (specifically, if you configure no match–action sequences within a policy), the default action, by default, is to accept all items. If you configure a policy with one or more match–action sequences, the default action, by default, is to either reject or drop the item, depending on the policy type.
default-action (drop inspect pass)	Default Action for Zone-Base Firewall Policy: Default action to take if a data traffic flow matches none of the match conditions. drop discards the data traffic. inspect inspects the packet's header to determine its source address and port. The address and port are used by the NAT device to allow traffic to be returned from the destination to the sender. pass allows the packet to pass to the destination zone without inspecting the packet's header at all. With this action, the NAT device blocks return traffic that is addressed to the sender.

Syntax Description

For Application-Aware Routing

count counter-name	Count of Matching Items
	Count the packets or bytes that match the application-aware routing policy, saving the information to the specified filename.
log	Log Packets:
	Place a sampled set of packets that match the SLA class rule into the vsyslog and messages system logging (syslog) files.

sla-class sla-class-name [strict] sla-class sla-class-name [strict] preferred-color colorsbackup-sla-preferred-color colors Tunnel To Send Data Traffic:

Direct data packets that match the parameters in the **match** portion of the **policy app-route-policy** configuration to a tunnel interface that meets the SLA characteristics in the SLA class *sla-class-name*. Configure the SLA class with the **policy sla-class** command.

- sla-class sla-class-name—When you specify an SLA class with no additional parameters, data traffic that matches the SLA is forwarded as long as one tunnel interface is available. The software first tries to send the traffic through a tunnel that matches the SLA. If a single tunnel matches the SLA, data traffic is sent through that tunnel. If two or more tunnels match, traffic is distributed among them. If no tunnel matches the SLA, data traffic is sent through one of the available tunnels.
- sla-class sla-class-name preferred-color color—To set a specific tunnel to use when data traffic matches an SLA class, include the preferred-color option, specifying the color of the preferred tunnel. If more than one tunnel matches the SLA, traffic is sent to the preferred tunnel. If a tunnel of the preferred color is not available, traffic is sent through any tunnel that matches the SLA class. If no tunnel matches the SLA, data traffic is sent through any available tunnel. In this sense, color preference is considered to be a loose matching, not a strict matching, because data traffic is always forwarded, whether a tunnel of the preferred color is available or not.
- **sla-class** *sla-class-name* **preferred-color** *colors*—To set multiple tunnels to use when data traffic matches an SLA class, include the **preferred-color** option, specifying two or more tunnel colors. Traffic is load-balanced across all tunnels. If no tunnel matches the SLA, data traffic is sent through any available tunnel. In this sense, color preference is considered to be a loose matching, not a strict matching, because data traffic is always forwarded, whether a tunnel of the preferred color is available or not. When no tunnel matches the SLA, you can choose how to handle the data traffic:
- strict—Drop the data traffic.
- backup-sla-preferred-color—Direct the data traffic to a specific tunnel. Data traffic is sent out the configured tunnel if that tunnel interface is available; if that tunnel is unavailable, traffic is sent out another available tunnel. You can specify one or more tunnel colors. As with the preferred-color option, the backup SLA preferred color is loose matching.

In a single **action** configuration, you cannot include both the **strict** and **backup-sla-preferred-color** options. In these options, *color* can be one of **3g**, **biz-internet**, **blue**, **bronze**, **custom1**, **custom2**, **custom3**, **default**, **gold**, **green**, **lte**, **metro-ethernet**, **mpls**, **private1** through **private6**, **public-internet**, **red**, and **silver**.

Syntax Description

For Centralized Control Policy

(accept reject)	Accept or Reject:
	By default, all items that match the parameters in the match portion of the policy control-policy configuration are rejected. Include reject to explicitly reject matching items. Include accept to accept matching items and to perform any specified actions.
set omp-tag number	OMP Tag:
	Set the tag string that is included in accepted OMP routes.
set preference number	Preference Value:
	Set the preference value that is included in accepted OMP routes.
	Range:
	1 through 256
export-to(vpnvpn-id vpn-listvpn-list)	Send to VPN:
	Direct matching routes to the specified VPN or VPN list. You can configure this option only with match route match conditions.
service service-name (tloc	Service:
ip-address tloc-list list-name) [vpn vpn-id]	Direct matching routes to the named service. <i>service-name</i> can be FW , IDS , IDP , netsvc1 , netsvc2 , netsvc3 , and netsvc4 . The IP address of one TLOC or list of TLOCs identifies the TLOCs to which the traffic should be directed to reach the service. If the list contains multiple TLOCs, the traffic is load-balanced among them. The VPN identifier is where the service is located. Configure the services themselves on the vEdge routers that are collocated with the service devices, using the vpn service configuration command.

action

set tloc-action action	

TLOC Action:

Direct matching routes or TLOCs using the mechanism specified by *action*, and enable end-to-end tracking of whether the ultimate destination is reachable. Setting a TLOC action is useful when traffic is first directed, via policy, to an intermediate destination, which then forwards the traffic to its ultimate destination. For example, for traffic from vEdge-A destined for vEdge-D, a policy might direct traffic from vEdge-A first to vEdge-B (the intermediate destination), and vEdge-B then sends it to the final destination, vEdge-D.*action* can be one of the following:

- ecmp—Equally direct matching control traffic between the intermediate destination and the ultimate destination. In our example, traffic would be sent to vEdge-B (which would then send it to vEdge-D) and directly to vEdge-D. With this action, if the intermediate destination is down, all traffic reaches the ultimate destination.
- **primary**—First direct matching traffic to the intermediate destination. If that router is not reachable, then direct it to the final destination. In our example, traffic would first be sent to vEdge-B. If this router is down, it is sent directly to vEdge-D. With this action, if the intermediate destination is down, all traffic reaches the final destination.
- backup—First direct matching traffic to the final destination. If that router is not reachable, then direct it to the intermediate destination. In our example, traffic would first be sent directly to vEdge-D. If the vEdge-A is not able to reach vEdge-D, traffic is sent to vEdge-B, which might have an operational path to reach vEdge-D. With this action, if the source is unable to reach the final destination directly, it is possible for all traffic to reach the final destination via the intermediate destination.
- **strict**—Direct matching traffic only to the intermediate destination. In our example, traffic is sent only to vEdge-B, regardless of whether it is reachable. With this action, if the intermediate destination is down, no traffic reaches the final destination. If you do not configure a **set tloc-action** action in a centralized control policy, **strict** is the default behavior.

Note

- set tloc-action is only supported end-to-end if the transport color is the same from a site to the intermediate hop and from the intermediate hop to the final destination. If the transport that is used to get from a site to the intermediate hop is a different color than the transport that is used to get from the intermediate hop to the final destination, then set tloc-action will fail.
- If the action is accept set tloc-action, configure the service TE on the intermediate destination.

	Setting the TLOC action option enables the vSmart controller to perform end-to-end tracking of the path to the ultimate destination router. In our example, matching traffic goes from vEdge-A to vEdge-B and then, in a single hop, goes to vEdge-D. If the tunnel between vEdge-B and vEdge-D goes down, the vSmart controller relays this information to vEdge-A, and vEdge-A removes its route to vEdge-D from its local route table. End-to-end tracking works here only because traffic goes from vEdge-B to vEdge-D in a single hop, via a single tunnel. If the traffic from vEdge-A went first to vEdge-B, then to vEdge-C, and finally to vEdge-D, the vSmart controller is unable to perform end-to-end tracking and is thus unable to keep vEdge-A informed about whether full path between it and vEdge-D is up.
set tloc-list list-name	TLOC List: Direct matching routes or TLOCs to the TLOC or TLOCs in the named TLOC list . If the list contains multiple TLOCs, the traffic is load-balanced amont them. Changing an OMP route's TLOC is one way to use policy to effect traffic engineering, which directs packets to specific vEdge routers. The color configured in the TLOC list provides a means to separate streams of traffic.

Syntax Description

For Centralized Data Policy

(accept drop)	Accept or Drop:
	By default, all packets that match the parameters in the match portion of the policy data-policy configuration are dropped. Include drop to explicitly reject matching packets. Include accept to accept matching packets and to perform any specified actions.
count counter-name	Count Packets:
	Count the packets that match the match criteria, saving the information to the specified filename.
log	Log Packets:
	Place a sampled set of packets that match the match conditions into the vsyslog and messages system logging (syslog) files.
nat use-vpn 0	NAT Functionality:
	Direct matching traffic to the NAT functionality so that it can be directed directly to the Internet or other external destination. In Releases 16.2 and earlier, you cannot use NAT with deep packet inspection.

nat fallback	This command attempts to route traffic through an alternate route, typically through a data center route, in the following conditions:
	• The nat use-vpn 0 command is routing traffic through a NAT direct internet access (DIA) interface.
	The NAT DIA interface is not available or is inactive.
	Without this command, when the nat use-vpn 0 command is used and the NAT DIA interface is not available or is inactive, the traffic is dropped.
	Use nat use-vpn 0 and nat fallback with the match command to operate when specific criteria are met.
	Example:
	from-vsmart data-policy service-side-nat-policy direction from-service vpn-list vpn-1 sequence 91 match source-data-prefix-list RFC1918 action accept nat use-vpn 0 nat fallback exit
next-hop ip-address	Next-Hop Address:
	Set the next-hop address in accepted packets.
tcp-optimization	Optimize TCP Traffic:
	Fine-tune TCP to decrease round-trip latency and improve throughout for TCP traffic.
policer policer-name	Policer:
	Policy the packets using the specified policer.
service service-name	Service:
(tloc ip-address tloc-list list-name) [vpn vpn-id]	Direct matching packets to the named service. <i>service-name</i> can be FW , IDS , IDP , netsvc1 , netsvc2 , netsvc3 , and netsvc4 . The TLOC address or list of TLOCs identifies the TLOCs to which the traffic should be directed to reach the service. In the case of multiple TLOCs, the traffic is load-balanced among them. The VPN identifier is where the service is located. Configure the services themselves on the vEdge routers that are collocated with the service devices, using the vpn service configuration command.
service	Service via GRE Tunnel:
service-namelocal [restrict] [vpn vpn-id]	Direct matching packets to the named service that is reachable via a GRE tunnel whose source is in the transport VPN (VPN 0). If the GRE tunnel used to reach the service is down, packet routing falls back to using standard routing. To drop packets when a GRE tunnel to the service is unreachable, include the restrict option. In the service VPN, you must also advertise the service using the service command. You configure the GRE interface or interfaces in the transport VPN (VPN 0).

redirect-dns	Split DNS Server:
(ip-address host)	For a policy that enables split DNS (that is, when the match condition specifies dns-app-list and dns), specify how to direct matching packets. For DNS queries (dns request), specify the IP address of the DNS server to use to resolve the DNS query. For DNS responses (dns response), specify host so that the response from the DNS server is properly forwarded to the requesting service VPN.
set tloc-list list-name	TLOC from a List of TLOCs:
	Direct matching packets to one of the TLOCs is the list defined with a policy lists tloc-list list. When the list contains multiple TLOCs that are available and that satisfy the match conditions, the TLOC with the lowest preference value is used. If two or more of TLOCs have the lowest preference value, traffic is sent among them in an ECMP fashion.
set local-tloc color color	TLOC Identified by Color:
[encap encapsulation] [set local-tloc-list color color [encapencapsulation] [restrict]	Direct matching packets to a TLOC identified by its color and, optionally, its encapsulation. color can be 3g, biz-internet, blue, bronze, custom1, custom2, custom3, default, gold, green lte, metro-ethernet, mpls, private1 through private6, public-internet, red, and silver.
[restrict]	By default, <i>encapsulation</i> is ipsec . It can also be gre . By default, if the TLOC is not available, traffic is forwarded using an alternate TLOC. To drop traffic if the TLOC is unavailable, include the restrict option.
set tloc ip-address color	TLOC Identified IP Address and Color:
color [encap ecapsulation]	Direct matching packets to a TLOC identified by its IP address and color, and optionally, by its encapsulation. color can be 3g, biz-internet, blue, bronze, custom1, custom2, custom3, default, gold, green lte, metro-ethernet, mpls, private1 through private6, public-internet, red, and silver.
	By default, encapsulation is ipsec. It can also be gre.
set vpn vpn-id	VPN:
	Set the VPN Identifier that is included in accepted packets.

For Cflowd Traffic Flow Monitoring

(accept reject)	Accept or Reject:	
	By default, all items that match the parameters in the match portion of the policy data-policy configuration are rejected. Include reject to explicitly reject matching items. Include accept to accept matching items and to perform any specified actions.	
cflowd	Enable Packet Collection:	
	Collect packets for traffic monitoring.	

For Localized Control Policy

(accept reject)	Accept or Reject:
	By default, all items that match the parameters in the match portion of the policy control-policy configuration are rejected. Include reject to explicitly reject matching items. Include accept to accept matching items and to perform any specified actions.
set aggregator as-number	Aggregator:
ip-address	Set the AS number in which a route aggregator is located and the IP address of the route aggregator. <i>as-number</i> can be a value from 1 through 65535.
set as-path (exclude prepend)	AS Path:
as-numbers	Exclude or append one or more AS numbers at the beginning of the AS path. Each <i>as-number</i> can be a value from 1 through 65535. If you specify more than one AS number, include the numbers in quotation marks.
set atomic-attribute	Atomic Aggregate:
	Set the BGP atomic aggregate attribute.
set community value	Community:
	Set the BGP community value. It can be <i>aa:nn</i> , internal , local-as , no-advertise , and no-export . In <i>aa:nn</i> , <i>aa</i> is the AS community number and <i>nn</i> is a two-byte number.
set local-preference number	Local Preference:
	Set the BGP local preference value. <i>number</i> can be a value from 0 through 4294967295.
set metric number	Metric:
	Set the metric. <i>number</i> can be a value from 0 through 4294967295.
set metric-type type	Metric Type:
	Set the metric type. type can be type1 or type2.
set next-hop ip-address	Next-Hop Address:
	Set the next-hop address.
set omp-tag number	OMP Tag Value:
	Set the OMP tag value. <i>number</i> can be a value from 0 through 4294967295.
set origin origin	Origin Code:
	Set the BGP origin code. <i>origin</i> can be egp , igp (default), and incomplete .
set originator ip-address	Originator:
	Set the IP address from which the route was learned.
	1

set ospf-tag number	OSPF Tag Value:
	Set the OSPF tag value. <i>number</i> can be a value from 0 through 4294967295.
set weight number	Weight:
	Set the BGP weight. <i>number</i> can be a value from 0 through 4294967295.

For Localized Data Policy

(accept drop)	Accept or Drop:
	By default, all packets that match the parameters in the match portion of the policy access-list configuration are dropped. Include drop to explicitly reject matching packets. Include accept to accept matching packets and to perform any specified actions.
count counter-name	Count Packets
	Count the packets that match the match criteria, saving the information to the specified filename. If you configure a counter and additional actions, such as policing, the data packets are counted before the other actions are performed, regardless of the order in which you enter the commands in the configuration.
class class-name	Class
	Assign the packets to the specified QoS class name.
set dscp value	DSCP;
	For QoS, set or overwrite the DSCP value in the packet. <i>value</i> can be a number from 0 through 63.
log	Log Packet Headers:
	Log the packet headers into the vsyslog and messages system logging (syslog) files.
mirror mirror-name	Mirroring:
	Mirror the packets to the specified mirror.
set next-hop	Next-Hop Address:
ipv4-address	Set the next-hop address. The address must be an IPv4 address.
policer policer-name	Policing:
	Police the packets using the specified policer.

Syntax Description

For Zone-Based Firewall Policy

drop	Drop:
	Discard the data traffic.
inspect	Inspect:
	Inspect the packet's header to determine its source address and port. The address and port are used by the NAT device to allow traffic to be returned from the destination to the sender.
log	Log Packet Headers:
	Log the packet headers into the vsyslog and messages system logging (syslog) files.
pass	Pass Through:
	Allow the packet to pass through to the destination zone without inspecting the packet's header at all. With this action, the NAT device blocks return traffic that is addressed to the sender.

Release	Modification
14.1	Command introduced.
14.2	Added application-aware routing policy.
14.3	Added Cflowd traffic monitoring.
15.2	Added setting GRE encapsulation and preferred color for an SLA class.
15.4	Added match condition for localized control policy.
16.1	Added log option to application-aware policy action.
16.3	Added backup-sla-preferred-color option for application-aware routing.
17.1	Added load-balancing among multiple colors for application-aware routing.
17.2	Added redirect-dns option for centralized data policy.
18.2	Added zone-based firewall policy.
Cisco IOS XE Catalyst SD-WAN Release 17.2.1r	Added support to Cisco IOS XE Catalyst SD-WAN devices for selecting one or more local TLOCs for an action.
Cisco IOS XE Release 17.4.1 Cisco SD-WAN Release 20.4.1	Added support for Cisco IOS XE Catalyst SD-WAN devices for redirecting application traffic to a Secure Internet Gateway (SIG).

Example

Create a centralized control policy that changes the TLOC for accepted packets:

```
policy
  control-policy change-tloc
  sequence 10
   action accept
    set tloc 1.1.1.2
```

Related Topics

```
apply-policy, on page 74
lists, on page 286
match, on page 318
policy, on page 384
policy ipv6, on page 390
```

action

Configure the actions to take when the match portion of an IPv6 policy is met (on vEdge routers only).

Command Hierarchy

Localized Data Policy for IPv6

Configure on vEdge routers only.

```
policy ipv6
access-list acl-name
default-action action
sequence number
action
drop
count counter-name
log
accept
class class-name
count counter-name
log
mirror mirror-name
policer policer-name
set
traffic-class value
```

Syntax Description

(accept drop)	Accept or Drop:	
	By default, all packets that match the parameters in the match portion of the policy access-list configuration are dropped. Include drop to explicitly reject matching packets. Include accept to accept matching packets and to perform any specified actions.	
countcounter-name	Count Packets:	
	Count the packets that match the match criteria, saving the information to the specified filename. If you configure a counter and additional actions, such as policing, the data packets are counted before the other actions are performed, regardless of the order in which you enter the commands in the configuration.	

classclass-name	Class:
	Assign the packets to the specified QoS class name.
log	Log Packet Headers:
	Log the packet headers into system logging (syslog) files.
mirrormirror-name	Mirroring:
	Mirror the packets to the specified mirror.
policerpolicer-name	Policing:
	Police the packets using the specified policer.
set	Traffic Class:
traffic-classvalue	For QoS, set or overwrite the traffic class value in the packet. <i>value</i> can be a number from 0 through 63.

Release	Modification
14.1	Command introduced.
16.3	Command modified for IPv6.

Example

Configure an IPv6 ACL that changes the traffic class on TCP port 80 data traffic, and apply the ACL to an interface in VPN 0:

```
vEdge# show running-config policy ipv6 access-list
ipv6 access-list traffic-class-48-to-46
sequence 10
 match
  destination-port 80
  traffic-class
 action accept
  count port_80
  log
  set
   traffic-class 46
  !
 !
default-action accept
!
vEdge# show running-config vpn 0 interface ge0/7 ipv6
vpn 0
interface ge0/7
 ipv6 access-list traffic-class-48-to-46 in
!
```

Operational Commands

show running-config

Related Topics

policy, on page 384

address-family

Configure global and per-neighbor BGP address family information (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► BGP

Command Hierarchy

```
vpn vpn-id
  router
    bgp local-as-number
      address-family ipv4_unicast
        aggregate-address prefix/length [as-set] [summary-only]
       maximum-paths paths number
       network prefix/length
       redistribute (connected | nat | natpool-outside | omp | ospf | static) [route-policy
policy-name]
vpn vpn-id
  router
    bgp local-as-number
      neighbor ip-address
        \verb| address-family ipv4_unicast| \\
          maximum-prefixes number [threshold] [restart minutes | warning-only]
          route-policy policy-name (in | out)
```

Syntax Description

ipv4_unicast	Address Family:
	Currently, Cisco SD-WAN software supports only the BGP IPv4 unicast address family.
aggregate-address prefix /	Aggregate Prefixes:
length [as-set][summary-only]	For all BGP sessions, aggregate the specified prefixes. To generate set path information, include the as-set option. To filter out more specific routes from BGP updates, include the summary-only option.
maximum-paths paths	IBGP and EBGP Multipath Load Sharing:
number	For all BGP sessions, enable multipath load sharing, and configure the maximum number of parallel paths that can be installed into a route table.
	Range:
	0 to 32

network prefix / length	Networks To Advertise:
	Networks to be advertised by BGP. Identify the networks by their prefix and length.
maximum-prefixes number	Prefixes Received from a Neighbor:
[threshold] [restart minutes warning-only]	Configure how to handle prefixes received from the BGP neighbor:
9 71	<i>number</i> is the maximum number of prefixes that can be received from the neighbor.
	Range:
	1 through 4294967295
	Default:
	0 (there is no limit to the number of prefixes received)
	Treshold is the percentage of the maximum number of prefixes at which to either generate a warning message or restart the BGP peering session.
	Range:
	1 through 100 percent
	Default:
	0 (no warning message is generated)
	restart <i>minutes</i> is how long to wait after the maximum number of prefixes has been exceeded before restarting the BGP peering session with the neighbor.
	Range:
	0 through 65535 minutes (approximately 1092 hours, or 45 days)
	Default:
	None
	warning-only displays a warning message only when the maximum prefix limit is exceeded.
	Policy to Apply to Received Prefixes:
out)	Apply the specified policy, <i>policy-name</i> , to prefixes received from the neighbor. You can apply the policy inbound (in) as the prefixes are received from the neighbor or outbound (out) as they are send to the neighbor.
redistribute (connected nat	Redistribute Routes into BGP:
natpool-outside omp ospf static) [route-policy policy-name]	For all BGP sessions, redistribute routes learned from other protocols into BGP. Optionally, apply a route policy to the redistributed routes.

Release	Modification	
14.1	Command introduced.	
16.3	Added redistribute natpool-outside option.	

Example

Redistribute OMP routes into BGP:

```
vpn 1
  router
  bgp 123
   address-family ipv4-unicast
  redistribute omp
  !
  !
 !
!
```

Have BGP advertise the network 1.2.0.0/16:

```
vEdge(config-address-family-ipv4-unicast) # network 61.0.1.0/24
vEdge(config-address-family-ipv4-unicast) # network 10.20.25.0/24
vEdge(config-address-family-ipv4-unicast) # show full-configuration
vpn 1
router
bgp 1
address-family ipv4-unicast
network 61.0.1.0/24
network 10.20.24.0/24
!
!
!
vEdge(config-address-family-ipv4-unicast) # commit and-quit
Commit complete.
vEdge# show bgp routes
```

				LOCAL			AS	PATH	
VPN	PREFIX	NEXTHOP	METRIC	PREF	WEIGHT	ORIGIN	PATH	STATUS	
1	10.20.25.0/24	0.0.0.0	0	-	32768	igp	Local	valid,best	
1	61.0.1.0/24	0.0.0.0	0	_	32768	igp	Local	valid,best	

Operational Commands

clear bgp neighbor

show bgp neighbor

show bgp routes

address-pool

Configure the pool of addresses in the service-site network for which the vEdge router interface acts as DHCP server (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► DHCP Server

Command Hierarchy

```
vpn vpn-id
  interface geslot/port
  dhcp-server
   address-pool prefix/length
```

Syntax Description

prefix/length	Address Pool:	
	IPv4 prefix range of the DHCP address pool.	

Command History

Release	Modification
14.3	Command introduced.

Example

Configure the interface to be the DHCP server for the addresses covered by the IP prefix 10.0.100.0/24:

```
vEdge# config
Entering configuration mode terminal
vEdge(config)# vpn 1 interface ge0/4
vEdge(config-interface-ge0/4)# dhcp-server address-pool 10.0.100.0/24
vEdge(config-dhcp-server)# show full-configuration
vpn 1
  interface ge0/4
  dhcp-server
   address-pool 10.0.100.0/24
  !
  !
  !
}
```

Operational Commands

show dhep interface

show dhep server

admin-auth-order

Have the "admin" user use the authentication order configured in the **auth-order** command, when verifying access to an overlay network device through an SSH session or a console connection.

If you do not configure the admin-auth-order command, the "admin" user is always authenticated locally.

In Releases 17.1 and earlier, when you log in as "admin" from a console port, you are authenticated locally. No other authentication methods can be used.

vManage Feature Template

For all Cisco vEdge devices:

Configuration ► Templates ► AAA

Command Hierarchy

```
system
  aaa
  admin-auth-order
```

Command History

Rele	ase	Modification
16.2		Command introduced.
17.2		Modified for supporting authentication order process for console connections.

Operational Commands

show aaa usergroup

show users

Example

Set the authentication order for the "admin":

```
Viptela# config
Entering configuration mode terminal
Viptela(config)# system aaa admin-auth-order
Viptela(config)# commit and-quit
Commit complete.
Viptela# show running-config system aaa
system
aaa
admin-auth-order
!
```

Command History

Command introduced in Viptela Software Release 16.2.In Release 17.2, support authentication order process for console connections.

Related Topics

```

admin-state

Enable or disable the DHCP server functionality on the interface (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► DHCP Server

Command Hierarchy

```
vpn vpn-id
  interface geslot/port
  dhcp-server
   admin-state (down | up)
```

Syntax Description

down	Disable DHCP Server Functionality:		
	By default, DHCP server functionality is disabled on a vEdge router interface.		
enable	Enable DHCP Server Functionality:		
	Allow the vEdge router to act as a DHCP server for the local site networks accessible through this interface.		

Command History

Release	Modification
14.3	Command introduced.

Example

Enable DHCP server functionality on an interface:

```
vEdge# config
Entering configuration mode terminal
vEdge(config)# vpn 1 interface ge0/4
vEdge(config-interface-ge0/4)# dhcp-server address-pool 10.0.100.0/24
vEdge(config-interface-ge0/4)# dhcp-server admin-state up
vEdge(config-dhcp-server)# show full-configuration
vpn 1
  interface ge0/4
```

```
dhcp-server
  admin-state up
  address-pool 10.0.100.0/24
!
!
!
```

Operational Commands

show dhep interface show dhep server

admin-tech-on-failure

When a Cisco vEdge device reboots, collect system status information in a compressed tar file, to aid in troubleshooting and diagnostics. This tar file, which is saved in the user's home directory, contains the output of various commands and the contents of various files on the local device, including syslog files, files for each process (daemon) running on the device, core files, and configuration rollback files. For aid in troubleshooting, send the tar file to Cisco customer support.

vManage Feature Template

For all Cisco vEdge devices:

Configuration ► Templates ► System

Command Hierarchy

```
system
admin-tech-on-failure
```

This comand has no keywords or arguments.

Command History

Release	Modification
17.1	Command introduced.

Example

Configure the device to collect system status information in an admin-tech file when the device reboots:

```
vEdge# show running-config system
system
admin-tech-on-failure
```

Operational Commands

request admin-tech

Related Topics

request admin-tech, on page 661 show crash, on page 805

advertise

To advertise additional paths for a BGP peer policy template based on selection, use the **advertise** command in address family configuration configuration mode at the specific VPN or VRF level.

Route advertisements that you configure with the **advertise** command apply to all VPNs configured on the router. The advertise command can be issued for either a VPN or all VPNs on a device.

advertise isis command is added to support IS-IS route redistribution in OMP. OMP is updated to advertise both Level 1 and Level 2 IS-IS routes for Software Defined Access (SDA). This command is supported for both the IPv4 and IPv6 address families.

```
advertise [aggregate prefix [aggregate-only]][bgp ][connected][ospf type ][static]
[route-map map-tag]

no advertise [bgp ][connected][ospf type ][static][route-map map-tag]
```

Syntax Description

aggregate prefix	Aggregate Routes:
[aggregate-only]	Aggregate routes from the specified prefix before advertising them into OMP. By default, the aggregated prefixes and all individual prefixes are advertised. To advertise only the aggregated prefix, include the aggregate-only option.
bgp	BGP Routes:
	Advertise all BGP routes learned by the Cisco vEdge device or Cisco IOS XE SD-WAN device to OMP.
connected	Connected Routes:
	Advertise all connected routes on the Cisco vEdge device or Cisco IOS XE SD-WAN device to OMP. Connected routes are advertised by default. To disable advertisement, use the no advertise connected command.
network prefix	Network Routes:
	Advertise a specific route learned by the Cisco vEdge device or Cisco IOS XE SD-WAN device to OMP. This route must be in the device route table for the VPN. Use this option to advertise a specific route instead of advertising all routes for a protocol.
ospf type	OSPF Routes:
	Advertise all OSPF routes learned by the local Cisco vEdge device or Cisco IOS XE SD-WAN device to OMP. For the global OMP configuration, <i>type</i> can be external , to advertise routes learned from external ASs. For the VPN-specific OMP configuration, <i>type</i> can be external , to advertise routes learned from the local AS. For the global OMP configuration, OSPF external routes are advertised by default.

static	Static Routes: Advertise all static routes configured on the Cisco vEdge device or Cisco IOS XE SD-WAN device to OMP. Static routes are advertised by default. To disable advertisement, use the no advertise static command.
isis	IS-IS Routes Advertise both Level 1 and Level 2 IS-IS routes for Software Defined Access (SDA) for both the IPv4 and IPv6 address families.
route-map	(Optional) Specifies the route map that should be interrogated to filter the importation of routes from this source routing protocol to the current routing protocol. If not specified, all routes are redistributed. If this keyword is specified, but no route map tags are listed, no routes will be imported.

Command Default

This command has no default behavior.

Command Modes

Router configuration (config-router)

Address family configuration (config-af)

Command History

Release	Modification
14.1	Command introduced.
Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	Added route-map.

Example

The following example shows the ISIS route distribution in OMP:

age-time

Configure when MAC table entries age out (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► Bridge

Command Hierarchy

bridge bridge-id
 age-time seconds

```
seconds MAC Table Entry Aging Time:

How long an entry is in the MAC table before it ages out.

Default:
300 seconds (5 minutes)

Range:
10 through 4096 seconds
```

Command History

Release	Modification
15.3	Command introduced.

Example

Change the age out time for bridge 1 to 6 minutes.

```
vEdge# show running-config bridge
bridge 1
   age-time 360
   vlan 1
   interface ge0/2
    no native-vlan
    no shutdown
!
   interface ge0/5
    no native-vlan
    no shutdown
!
   interface ge0/6
    no native-vlan
   no shutdown
!
!
!
```

Operational Commands

show bridge interface show bridge mac show bridge table

alarms

To enter the alarms configuration mode and set alarm parameters, use the **alarms** command in system configuration mode.

alarms

This command has no arguments or keywords.

Command Default

None

Command Modes

System configuration (config-system)

Command History

Release	Modification
Cisco SD-WAN Release 20.7.1	This command is introduced.

Examples

The following example shows how you can enter the alarm configuration mode:

config

system

alarms

Related Commands

Command	Description
cpu-usage	Configures CPU-usage watermarks and polling interval.
memory-usage	Configures memory-usage watermarks and polling interval.
disk-usage	Configures disk-usage watermarks and polling interval.
disk-speed	Configures watermarks for the disk read and write speeds for disk partitions on a Cisco vManage server.
show alarms	Displays alarms history and watermarks for CPU, memory, and disk usage, and the disk read and write speeds.

allow-local-exit

Configure Cloud OnRamp for SaaS (formerly called CloudExpress service) to use an interface with Direct Internet Access (DIA) as an exit to the Internet (on vEdge routers only). To ensure that Cloud OnRamp for SaaS is set up properly, configure it in vManage NMS, not using the CLI.

Command Hierarchy

vpn vpn-id
 cloudexpress
 allow-local-exit

Command History

Release	Modification
16.3	Command introduced.

Example

Allow local exit for Cloud OnRamp for SaaS in VPN 100:

```
vEdge# show running-config vpn 100 cloudexpress
vpn 100
  cloudexpress
  allow-local-exit
!
```

Operational Commands

clear cloudexpress computations show cloudexpress applications

show cloudexpress gateway-exits

show cloudexpress local-exits

show omp cloudexpress

show running-config vpn cloudexpress

allow-same-site-tunnels

Allow tunnels to be formed between vEdge routers in the same site (on Cisco vEdge routers only).

Note

No BFD sessions are established between two collocated Cisco vEdge routers. However, with the command "allow-same-site-tunnels", we can form tunnels between Cisco vEdge Routers at the same site.

vManage Feature Template

For Cisco vEdge routers only:

Configuration ► Templates ► System

Command Hierarchy

```
system allow-same-site-tunnels
```

Command History

Release	Modification
15.4	Command introduced.

Example

In this example, vEdge2 has two circuits, one to the Internet and the second to an MPLS network. vEdge1 is also located at the same site, but has no circuits. This configuration binds two subinterfaces from vEdge1 to the two circuit interfaces on vEdge2 so that vEdge1 can establish TLOCs on the overlay network.

```
vEdge1# show running-config system
allow-same-site-tunnels
vEdge1# show running-config vpn 0
interface ge0/2.101
 ip address 101.1.19.15/24
 mt.u 1496
  tunnel-interface
   color lte
 no shutdown
interface ge0/2.102
 ip address 102.1.19.15/24
 mtu 1496
  tunnel-interface
   color mpls
 no shutdown
vEdge2# show running-config system
allow-same-site-tunnels
vEdge2# show running-config vpn 0
interface ge0/0
  ip address 172.16.255.2
  tunnel-interface
    color lte
 no shutdown
interface ge0/3
  ip address 172.16.255.16
  tunnel-interface
   color mpls
  !
 no shutdown
interface ge0/2.101
 ip address 101.1.19.16/24
 mtu 1496
 tloc-extension ge0/0
 no shutdown
interface ge0/2.102
 ip address 102.1.19.16/24
 mtu 1496
 tloc-extension ge0/3
 no shutdown
```

Related Topics

tloc-extension, on page 501

allow-service

Configure the services that are allowed to run over the WAN connection in VPN 0, which is the VPN that is reserved for control plane traffic. For other VPNs, use of these services is not restricted.

On a vEdge router, services that you configure on a tunnel interface act as implicit access lists (ACLs). If you explicitly configure ACLs on a tunnel interface, with the **policy access-list** command, the handling of packets matching both implicit and explict ACLs depends on the exact configuration. For more information, see the Configuring Localized Data Policy article for your software release.

vManage Feature Template

For all Cisco vEdge devices:

Configuration ► Templates ► VPN Interface Cellular (for vEdge cellular wireless routers only)

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface PPP

Command Hierarchy

```
vpn 0
  interface interface-name
    tunnel-interface
      [no] allow-service service-name
```

interface-name | Interface Type:

Name of a physical interface. The services that you configure in **allow-service** commands apply only to physical interfaces, such as **ge** and **eth** interfaces. They do not apply to non-physical interfaces, such as loopback interfaces.

service-name

Type of Service:

Type of service to allow or disallow on the WAN tunnel connection.

On vEdge routers, *service-name* can be all or one of more of bgp, dhcp, dns, https, icmp, netconf, ntp, ospf, sshd, and stun. By default, DHCP (for DHCPv4 and DHCPv6), DNS, HTTPS, and ICMP are enabled on a vEdge router tunnel interface. On vSmart controllers, service-name can be all or one or more of dhcp, dns, icmp, netconf, ntp, sshd, and stun. By default, DHCP (for DHCPv4 and DHCPv6), DNS, and ICMP are enabled on a vSmart controller tunnel interface. On vManage NMSs, service-name can be all or one or more of dhcp, dns, https, icmp, netconf, ntp, sshd, and stun. By default, DHCP (for DHCPv4 and DHCPv6), DNS, ICMP, and HTTPS are enabled on a vManage NMS tunnel interface. You cannot disallow the following services: DHCP, DNS, NTP, and STUN. If you allow the NTP service on the WAN connection in VPN 0, you must configure the address of an NTP server with the **system ntp** command. The **allow-service stun** command pertains to allowing or disallowing a Cisco vEdge device to generate requests to a generic STUN server so that the device can determine whether it is behind a NAT and, if so, what kind of NAT it is and what the device's public IP address and public port number are. On a vEdge router that is behind a NAT, you can also have tunnel interface to discover its public IP address and port number from the vBond controller, by configuring the vbond-as-stun-server command on the tunnel interface.

To configure more than one service, include multiple allow-service commands.

Configuring **allow-service all** overrides any commands that allow or disallow individual services.

Caution When **allow-service all** overrides the commands allowing or restricting individual services, the implicit ACLs created by the configuration of the services are disabled. Disabling the implicit ACLs could open the control-plane to attacks. Before you configure **allow-service all**, consider whether you should configure explicit ACLs or a ZBFW.

Command History

Release	Modification
14.1	Command introduced.
15.4	BGP, OSPF services and support for netconf added on vEdge routers.
16.3	Added support for DHCPv6.
18.1.1	Added support for https service on vEdge routers.

Example

Display the services that are enabled by default on the WAN connection:

```
vEdge# show running-config vpn 0 interface ge0/2 tunnel-interface | details
vpn 0
interface ge0/2
tunnel-interface
encapsulation ipsec weight 1
color lte
```

```
max-controllers
control-connections
                 default
carrier
hello-interval
                 1000
hello-tolerance 12
no allow-service all
no allow-service bgp
allow-service dhcp
allow-service dns
allow-service https
allow-service icmp
no allow-service sshd
no allow-service ntp
no allow-service ospf
no allow-service stun
```

Operational Commands

```
show ntp associations
show ntp peer
show running-config vpn 0
```

Related Topics

```

api-key

To configure the API key for Umbrella registration, on Cisco IOS XE Catalyst SD-WAN devices, use the **api-key** command in config-profile mode.

```
api-key api-key
```

Syntax Description

All Key (nexadecimal).	api-key	API key (hexadecimal).
------------------------	---------	------------------------

Command Mode

config-profile

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.2.1r	This command was introduced.

Examples

Use **parameter-map type umbrella global** to enter config-profile mode, then use **orgid**, **api-key**, and **secret** to configure Umbrella registration.

In config-profile mode, you can use **show full-configuration** to display Umbrella registration details.

Example

This example configures Umbrella registration details.

```
Device(config) # parameter-map type umbrella global
Device(config-profile) # orgid 1234567
Device(config-profile) # api-key aaa12345aaa12345aaa12345
Device(config-profile) # secret 0 bbb12345bbb12345bbb12345bbb12345
```

app-probe-class

To define a forwarding class and DSCP marking per color that a particular class of applications is forwarded to, use the **app-probe-class** command in global configuration mode.

app-probe-class app-probe-class-name

no app-probe-class app-probe-class-name

Syntax Description

app-probe-class	Specifies the app-probe-class of SLA class applications that is forwarded to devices.
app-probe-class-name	Specifies the app-probe-class name.

Command Default

There are no default values.

Command Modes

Global configuration (config)

Command History

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	This command was introduced.

In the following example, you can create real-time-video app-probe-class with DSCP measurements:

```
Device (config) # app-probe-class real-time-video
Device (config) # forwarding-class videofc
Device (config) # color mpls dscp 34
```

```
Device(config)# color biz-internet dscp 40
Device(config)# color lte dscp 0
```

app-route-policy

Configure or apply a policy for application-aware routing (on vSmart controllers only).

vManage Feature Template

For vSmart controllers:

Configuration ► Policies ► Centralized Policy

Command Hierarchy

Create a Policy for Application-Aware Routing

```
policy
  app-route-policy policy-name
   vpn-list list-name
      default-action sla-class sla-class-name
      sequence number
          app-list list-name
          destination-data-prefix-list list-name
          destination-ip prefix/length
          destination-port number
          dns (request | response)
          dns-app-list list-name
          dscp number
          plp (high | low)
          protocol number
          source-data-prefix-list list-name
          source-ip prefix/length
          source-port address
        action
          backup-sla-preferred-color colors
          count counter-name
          sla-class sla-class-name [strict] [preferred-color colors]
```

Apply a Policy for Application-Aware Routing

```
apply-policy
  site-list list-name app-route-policy policy-name
```

Syntax Description

policy-name

Application-Aware Routing Policy Name:

Name of the application-aware routing policy to configure or to apply to a list of sites in the overlay network. *policy-name* can be up to 32 characters long.

Release	Modification
14.2	Command introduced.

Example

Configure and apply a simple data policy for application-aware routing

```
vSmart# show running-config policy
policy
sla-class test sla class
 latency 50
app-route-policy test_app_route_policy
 vpn-list vpn_1_list
  sequence 1
   match
    protocol 6
   action sla-class test_sla_class strict
   !
  sequence 2
   match
    protocol 17
   action sla-class test_sla_class
  sequence 3
   match
    protocol 1
   action sla-class test_sla_class strict
   !
 vpn-list vpn_1_list
  vpn 1
 site-list site_500
  site-id 500
 site-list site 600
  site-id 600
 !
apply-policy
site-list site 500
 app-route-policy test app route policy
```

Operational Commands

show app-route stats

Related Topics

sla-class, on page 462

app-visibility

Enable application visibility so that a vEdge router can monitor and track the applications running on the LAN (on vEdge routers only).

vManage Feature Template

For vEdge routers:

Configuration ► Policies ► Localized Policy

Command Hierarchy

```
policy
   app-visibility
```

Command History

Release	Modification
15.2	Command introduced.

Example

Enable application-visibility on a vEdge router:

```
vEdge# show running-config policy
policy
app-visibility
!

Operational Commands

clear app dpi all clear app dpi apps clear app dpi flows show app dpi applications show app dpi flows show app dpi supported-applications

applications

Configure applications for which to enable Cloud OnRamp for SaaS (formerly called CloudExpress service) (on vEdge routers only). To ensure that Cloud OnRamp for SaaS is set up properly, configure it in vManage NMS, not using the CLI.

Command Hierarchy

```
vpn vpn-id
  cloudexpress
  applications applications
```

Syntax Decription

applications	Interface Node Type:
	List of applications.
	Values:
	amazon_aws, box_net, concur, dropbox, google_apps, gotomeeting, intuit, office365, oracle, salesforce, sugar_crm, zendesk, zoho_crm
	Default:
	none

Command History

Release	Modification
16.3	Command introduced.

Example

Configure a list of applications for which to enable Cloud OnRamp for SaaS:

```
vEdge# show running-config vpn 100 cloudexpress
vpn 100
  cloudexpress
  applications salesforce office365 amazon_aws oracle box_net dropbox intuit concur zendesk
  gotomeeting google_apps
  !
!
```

Operational Commands

clear cloudexpress computations

show cloudexpress applications

show cloudexpress gateway-exits

show cloudexpress local-exits show omp cloudexpress show running-config vpn cloudexpress

apply-policy

Have a policy take effect by applying it to sites within the overlay network (on vSmart controllers only).

Command Hierarchy

For Application-Aware Routing Policy

```
apply-policy
  site-list list-name
  app-route-policy policy-name
```

For Centralized Control Policy

```
apply-policy
  site-list list-name
  control-policy policy-name (in | out)
```

For Centralized Data Policy

```
apply-policy
  site-list list-name
    data-policy policy-name (all | from-service | from-tunnel)
    cflowd-template template-name
apply-policy
  site-list list-name vpn-membership policy-name
```

Syntax Description

cflowd-template template-name	Cflowd Template: For a centralized data policy that applies to cflowd flow collection, associate a flow collection template with the data policy.
	Policy Name: app-route-policy policy-name control-policy policy-name (in out)data-policy policy-name (all from-service from-tunnel)vpn-membership policy-name Name of the policy to apply to the specified sites. policy-name must match that which you specified in the control-policy, data-policy, or vpn-membership configuration command. For centralized control policy, specify the direction in which to apply the policy. The in option applies the policy to packets before they are placed in the vSmart controller's RIB, so the specified actions affect the OMP routes stored in the RIB. The out option applies the policy to packets after they are exported from the RIB. For centralized data policy, specify the direction in which to apply the policy. The all option (which is the default) applies to all data traffic passing through the vEdge router: the policy evaluates all data traffic going from the local site (that is, from the service side of the router) into the tunnel interface, and it evaluates all traffic entering to the local site through the tunnel interface. To apply the data policy only to policy exiting from the local site, use the from-service option. To apply the policy only to incoming traffic, use the from-tunnel option. You can apply different data policies in each of the two traffic directions.

site-list	Site List:
list-name	List of sites to which to apply the policy. <i>list-name</i> must match a list name that you configured in the policy lists site-list portion of the configuration. For the same type of policy, when you apply policies with apply-policy commands, the site IDs across all the site lists must be unique. That is, the site lists must not contain overlapping site IDs. An example of overlapping site IDs are those in the two site lists site-list 1 site-id 1-100 and site-list 2 site-id 70-130 . Here, sites 70 through 100 are in both lists. If you were to apply these two site lists to two different control-policy policies, for example, the attempt to commit the configuration on the vSmart controller would fail. You can, however, apply one of these sites lists to a control-policy policy and the other to a data-policy policy. The restriction regarding overlapping site IDs applies to the following types of policies:
	• Application-aware routing policy (app-route-policy)
	• Centralized control policy (control-policy)
	• Centralized data policy (data-policy)
	• Centralized data policy used for cflowd flow monitoring (a data-policy that includes a cflowd action and an apply-policy that includes a cflowd-template command)

Release	Modification	
14.1	Command introduced.	
14.2	Added app-route-policy.	
14.3	Added cflowd-template.	
15.2	Added all, from-service, and from-tunnel options	
15.4	Added restrictions so that you cannot apply the same type of policy.	
16.3	Added support for overlapping sites in different site lists.	

Operational Commands

show running-config apply-policy

Example 1

Apply a centralized control policy to the sites defined in the list west:

```
apply-policy
  site-list west control-policy change-tloc out
```

On a vSmart controller, configure site lists to use for control and data policies that contain overlapping site identifiers, and apply the policies to these site lists:

```
policy
  lists
    # site lists for control-policy
    site-list us-control-list
```

```
site-id 1-200
    site-list emea-control-site-list
     site-id 201-300
    site-list apac-control-site-list
     site-id 301-400
    # site lists for data-policy
    site-list platinum-site-list
     site-id 50-70
    site-list titanium-site-list
      site-id 70-130
    site-list rhodium-site-list
     site-id 131-301
  control-policy us-control-policy
  control-policy emea-control-policy
  control-policy apac-control-policy
  data-policy platinum-data-policy
  data-policy titanium-data-policy
  data-policy rhodium-data-policy
apply-policy
  # Apply control policies. Among the control policies, there is no overlap of site IDs.
  site-list us-control-site-list
   control-policy us-control-policy in
                                               # policy is applied to sites 1-200
                                               # sites overlap with data-policy
platinum-data-policy
  site-list emea-control-site-list
   control-policy emea-control-policy in
                                               # policy is applied to sites 201-300
                                               # sites overlap with data-policy
rhodium-data-policy
  site-list apac-control-site-list
   control-policy apac-control-site-list in # policy is applied to sites 301-400
                                               # sites overlap with data-policy
rhodium-data-policy
  # Apply data policies. Among the data policies, there is no overlay of site IDs.
  site-list platinum-site-list
   data-policy platinum-data-policy all
                                               # policy is applied to sites 50-70
                                               # sites overlap with control-policy
us-control-policy
  site-list titanium-site-list
    data-policy titanium-data-policy all
                                               # policy is applied to sites 70-130
                                               # sites overlap with control-policy
us-control-policy
  site-list rhodium-site-list
   data-policy rhodium-data-policy all
                                               # policy is applied to sites 131-301
                                               # sites overlap with control-policy
us-control-policy,
                                            # emea-control-policy, and apac-control-policy
```

Command introduced in Cisco SD-WAN Software Release 14.1.app-route-policy option added in Release 14.2.cflowd-template option added in Release 14.3.all, from-service, and from-tunnel options for centralized data policy added in Release 15.2.In Release 15.4, added restrictions so that you cannot apply the same type of policy (for example, data-policy or control-policy) to site lists that contain overlapping site IDs.In Release 16.3, add support for overlapping sites in different site lists.

archive

Periodically archive a copy of the full running configuration to an archival file. What is archived is the configuration that is viewable by the user "admin".

vManage Feature Template

For all Cisco vEdge devices:

Configuration ► Templates ► Archive

Command Hierarchy

```
system
  archive
  interval minutes
  path file-path
  ssh-id-file filename
  vpn vpn-id
```

Syntax Description

interval minutes	Archival Time Interval:	
	How often to archive the full running configuration. In addition, the running configuration is archived each time you issue the commit command on a Cisco vEdge device.	
	Range:	
	5 minutes through 525600 minutes (about one year)	
	Default:	
	10080 minutes (7 days)	

path file-path /	Location of Archival File:
filename	Path to the directory in which to store the archival file and the base name of the file. <i>file-path</i> can be one of the following:
	• ftp: file-path—Path to a file on an FTP server.
	• scp: user @ host: file-path
	• / file-path / filename—Path to a file on the local Cisco vEdge device.
	A separate file is created for each archiving operation. To distinguish the files, a timestamp is appended to the filename. The timestamp has the format <i>yyyy-mm-dd_hh-mm-ss</i> .
ssh-id-file filename	SSH Key File
	Name of the SSH private key file on the local Cisco vEdge device. This file is used to SCP into a remote file server. The Cisco SD-WAN software automatically generates a public and a private key and places the public key in the SSH key file archive_id_rsa.pub, which is located in /home/admin directory on the Cisco vEdge device. If you do not include the ssh-id-file option in the configuration, the software uses the automatically generated private key. You can also manually generate and upload an SSH private key file.
vpn vpn-id	VPN:
	VPN in which the archival file server is located or through which the server can be reached. On vEdge routers, <i>vpn-id</i> can be a value from 0 through 65530. On vSmart controllers, <i>vpn-id</i> can be either 0 or 512.

Release	Modification
14.2	Command introduced.

Example

Archive the running configuration on a vEdge router every two weeks:

```
system
archive
interval 20160
path scp://eve@eves-computer:/usr/archives
ssh-id-file /ssh-key-file
vpn 1
```

Operational Commands

show running-config system

Related Topics

```
load, on page 1077 save, on page 1082
```

area

Configure an OSPF area within a VPN on a vEdge router.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► OSPF

Command Hierarchy

```
vpn vpn-id
router
   ospf
     area number
       interface interface-name
         authentication
           authentication-key key
           message-digest key
           type (message-digest | simple)
         cost number
         dead-interval seconds
         hello-interval seconds
       network (broadcast | point-to-point)
         passive-interface
         priority number
         retransmit-interval seconds
        ! end area interface
       nssa
         no-summary
         translate (always | candidate | never)
       range prefix/length
          cost number
          no-advertise
        stub
         no-summary
```

Syntax Description

number	Area Number:	
	Number of the OSPF area.	
	Range:	
	The area is a 32-bit number.	

Command History

Release	Modification
14.1	Command introduced.

The remaining commands are explained separately.

Example

In VPN 1 on a vEdge router, configure OSPF area 0. The interface **ge0/0** participates in the local OSPF network.

```
vEdge# show running-config vpn 1 router ospf
vpn 1
router
 ospf
  redistribute static
  redistribute omp
  area 0
   interface ge0/0
   exit
  exit
  !
 1
vEdge# show interface vpn 1
                           ADMIN
                                   OPER
                                          ENCAP PORT
                                                                                 SPEED
                     RX
                             TX

                            STATUS STATUS TYPE TYPE
                                                          MTU
                                                               HWADDR
                                                                                  MBPS
  DUPLEX UPTIME
                    PACKETS PACKETS
    ge0/0
               10.2.2.11/24 Up
                                    ďΩ
                                           null
                                                  service 1500 00:0c:29:ab:b7:58 10
           0:01:36:54 725
    full
```

Operational Commands

show ospf interface

show ospf neighbor detail

arp

Configure an ARP table entry for an interface in a VPN (on vEdge routers only).

Address Resolution Protocol (ARP) resolves network layer IP address to a link layer physical address, such as an Ethernet MAC address. By default, ARP is enabled on vEdge routers, and they maintain an ARP cache that maps IP addresses to MAC addresses for devices in their local network. To learn a device's MAC address, vEdge routers broadcast ARP messages to that device's IP address, requesting the MAC address.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface Bridge

Configuration ► Templates ► VPN Interface Cellular (for vEdge cellular wireless routers only)

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface PPP Ethernet

Command Hierarchy

```
vpn vpn-id
  interface interface-name
  arp
  ip ip-address mac mac-address
```

Add a Permanent ARP Table Entry: Configure a permanent (static) ARP table entry. Enter the IP address for the ARP entry in dotted decimal notation or as a fully qualified host name. Enter the MAC address in colon-separated hexadecimal notation.
Disable ARP: Remove a static ARP mapping address.

Command History

Release	Modification
14.1	Command introduced.

Example

Configure a permanent MAC address for the ARP table:

```
vpn 0
interface ge0/0
    arp ip 10.10.0.0 mac 00:10:FA:B5:AE:15
```

Operational Commands

clear arp

show arp

arp-timeout

Configure how long it takes for a dynamically learned ARP entry to time out (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface Bridge

Configuration ► Templates ► VPN Interface Cellular (for vEdge cellular wireless routers only)

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface PPP Ethernet

Command Hierarchy

```
vpn vpn-id
  interface interface-name
    arp-timeout seconds
```

seconds	Timeout Time
	Time before a dynamically learned ARP entry times out.
	Range:
	0 through 2678400 seconds (744 hours)
	Default:
	1200 seconds (20 minutes)

Command History

Release	Modification
14.1	Command introduced.

Example

Set the ARP timeout value to 40 minutes:

```
vEdge(config-interface-ge0/4)# arp-timeout 2400
```

Operational Commands

clear arp

show arp

auth-fail-vlan

Configure an authentication-fail VLAN on an interface running IEEE 802.1X, to provide network access when RADIUS authentication or the RADIUS server fails (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface Ethernet

Command Hierarchy

```
vpn 0
  interface interface-name
  dot1x
     auth-fail-vlan vlan-id
```

```
vlan-id VLAN Identifier:

Identifier of the VLAN to be the restricted VLAN.

Range:

1 through 4094
```

Command History

Release	Modification
16.3	Command introduced.

Example

Configure VLAN 30 as the critical VLAN:

```
bridge 30
name Critical_VLAN
vlan 30
interface ge0/5
no native-vlan
no shutdown
!
!
interface ge0/5
dot1x
auth-fail-vlan 30
!
no shutdown
!
```

Operational Commands

```
clear dot1x client
show dot1x clients
show dot1x interfaces
show dot1x radius
show system statistics
```

Related Topics

```
auth-reject-vlan, on page 88
bridge, on page 117
default-vlan, on page 179
guest-vlan, on page 223
radius, on page 413
```

auth-fallback

Configure authentication to fall back to a secondary or tertiary authentication mechanism when the higher-priority authentication method fails to authenticate a user. By default, authentication fallback is disabled.

The fallback process applies to both SSH sessions and console connections to an overlay network device.

Enable authentication fallback if you want the next authentication method to attempt to authenticate the user even when the user is rejected by the first or second method.

Cisco vManage Feature Template

For all Cisco vEdge devices:

Configuration ► Templates ► AAA

Command Hierarchy

```
system
  aaa
  auth-fallback
```

Command History

Release	Modification
15.2.8	Command introduced.
17.2	Added support for authentication order process for console connections.

Example

Display the AAA configuration. If authentication fallback is enabled, the **auth-fallback** command is shown in the configuration:

The following examples illustrate the default authentication behavior and the behavior when authentication fallback is enabled:

- If the authentication order is configured as radius local:
 - With the default authentication, local authentication is used only when all RADIUS servers are unreachable. If an authentication attempt via a RADIUS server fails, the user is not allowed to log in even if they have provided the correct credentials for local authentication.
 - With authentication fallback enabled, local authentication is used when all RADIUS servers are unreachable or when a RADIUS server denies access to a user.
- If the authentication order is configured as local radius:
 - With the default authentication, RADIUS authentication is tried when a username and matching password are not present in the running configuration on the local device.
 - With authentication fallback enabled, RADIUS authentication is tried when a username and matching
 password are not present in the running configuration on the local device. In this case, the behavior
 of two authentication methods is identical.

- If the authentication order is configured as radius tacacs local:
 - With the default authentication, TACACS+ is tried only when all RADIUS servers are unreachable, and local authentication is tried only when all TACACS+ servers are unreachable. If an authentication attempt via a RADIUS server fails, the user is not allowed to log in even if they have provided the correct credentials for the TACACS+ server. Similarly, if a TACACS+ server denies access, the user cannot log via local authentication.
 - With authentication fallback enabled, TACACS+ authentication is used when all RADIUS servers are unreachable or when a RADIUS server denies access a user. Local authentication is used next, when all TACACS+ servers are unreachable or when a TACACS+ server denies access to a user.
- When admin-auth-order is enabled and auth-fallback is disabled—Local authentication is used only when all TACACS+ servers are unreachable. If TACACS+ server denies access, a user cannot log in using local authentication.
- When admin-auth-order and auth-fallback are enabled—Local authentication is used when all TACACS+ servers are unreachable or when a TACACS+ server denies access to a user.

```
vEdge# show running-config system aaa
system
aaa
auth-order local radius
auth-fallback
!
```

Operational Commands

show running config

Related Topics

```

auth-order, on page 86
radius, on page 413
tacacs, on page 482
usergroup, on page 535
```

auth-order

Configure the order in which the Cisco SD-WAN software tries different authentication methods when authenticating devices that are attempting to connect to an 802.1X WAN (on vEdge routers only).

The default authentication order is radius, then mab.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface Ethernet

Command Hierarchy

```
vpn vpn-id
  interface interface-name
  dot1x
    auth-order (mab | radius)
```

Syntax Description

mab	MAC Authentication Bypass:	
	Use MAC authentication bypass for authentication, which provides authentication for non-802.1X–compliant devices.	
radius	RADIUS Authentication:	
	Use RADIUS servers for authentication.	

Example

Configure the router to use MAB authentication before RADIUS authentication:

```
vpn 0
  interface ge0/0
  dot1x
    auth-order mab radius
```

Operational Commands

clear dot1x client show dot1x clients show dot1x interfaces show dot1x radius show system statistics

Related Topics

```
mac-authentication-bypass, on page 314 radius, on page 413 radius-servers, on page 417
```

auth-order

Configure the order is which the software tries different authentication methods when verifying user access to an overlay network device through an SSH session or a console port. When verifying a user's login credentials, the software starts with the method listed first. Then, if the login credentials do not match, it tries the next authentication method.

To configure the authentication for the "admin" user, use the admin-auth-order command.

The default authentication order is **local**, then **radius**, and then **tacacs**. With the default authentication order, the authentication process occurs in the following sequence:

• The authentication process first checks whether a username and matching password are present in the running configuration on the local device.

- If local authentication fails, and if you have not configured authentication fallback (with the **auth-fallback** command), the authentication process stops. However, if you have configured authentication fallback, the authentication process next checks the RADIUS server. For this method to work, you must configure one or more RADIUS servers with the system radius servercommand. If a RADIUS server is reachable, the user is authenticated or denied access based on that server's RADIUS database. If a RADIUS server is unreachable and if you have configured multiple RADIUS servers, the authentication process checks each server sequentially, stopping when it is able to reach one of them. The user is then authenticated or denied access based on that server's RADIUS database.
- If the RADIUS server is unreachable (or all the servers are unreachable), the authentication process checks the TACACS+ server. For this method to work, you must configure one or more TACACS+ servers with the **system tacacs server** command. If a TACACS+ server is reachable, the user is authenticated or denied access based on that server's TACACS+ database. If a TACACS+ server is unreachable and if you have configured multiple TACACS+ servers, the authentication process checks each server sequentially, stopping when it is able to reach one of them. The user is then authenticated or denied access based on that server's TACACS+ database.
- If the TACACS+ server is unreachable (or all TACACS+ servers are unreachable), user access to the local Cisco vEdge device is denied.

You can configure one, two, or three authentication methods in the preferred order, starting with the one to be tried first. If you configure only one authentication method, it must be **local**.

In Releases 17.1 and earlier, when you log in as "admin" from a console port, you are authenticated locally. No other authentication methods can be used.

vManage Feature Template

For all Cisco vEdge devices:

Configuration ► Templates ► AAA

Command Hierarchy

```
system
  aaa
  auth-order (local | radius | tacacs)
```

Syntax Description

	Default Authentication Order:
	The default authentication order is local , then radius , and then tacacs .
local	Locally Configured Username and Password:
	Verify users based on the username and password configured on the local overlay network device. If you specify only one authentication method, it must be local .
radius	RADIUS Authentication:
	Verify users based on usernames and passwords configured on a RADIUS server. RADIUS authentication is performed only if a RADIUS server is configured with the system radius server command.

tacacs	TACACS+ Authentication:
	Verify users based on usernames and passwords configured on a RADIUS server. RADIUS authentication is performed only if a RADIUS server is configured with the system tacacs server command.

Command History

Release	Modification
14.1	Command introduced.
17.2	Added authentication order process for console connections.

Example

Set the authentication order to be RADIUS first, followed by local authentication:

```
vEdge# config
Entering configuration mode terminal
vEdge(config)# system aaa radius local
vEdge(config-aaa)# commit and-quit
Commit complete.
vEdge# show running-config system aaa
system
aaa
auth-order local radius
!
!
```

Operational Commands

show aaa usergroup

show users

radius, on page 413
tacacs, on page 482
usergroup, on page 535
```

auth-reject-vlan

Configure an authentication-reject VLAN to place IEEE 802.1X-enabled clients into if authentication is rejected by the RADIUS server (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface Ethernet

Command Hierarchy

```
vpn vpn-id
  interface interface-name
  dot1x
    auth-reject-vlan vlan-id
```

Syntax Description

```
vlan-id VLAN Identifier:

Identifier of VLAN into which to place 802.1x-enabled clients if authentication for the clients is rejected by the RADIUS servers.

Range:

1 through 4094
```

Command History

Release	Modification
16.3	Command introduced.

Example

Configure a restricted VLAN:

```
bridge 40

name Restricted_VLAN
vlan 40
interface ge0/5
no native-vlan
no shutdown
!
!
vpn 0
interface ge0/5
dot1x
auth-reject-vlan 40
!
no shutdown
!
```

Operational Commands

clear dot1x client show dot1x clients show dot1x interfaces show dot1x radius show system statistics

Related Topics

auth-fail-vlan, on page 82

```
bridge, on page 117
default-vlan, on page 179
guest-vlan, on page 223
```

auth-req-attr

Configure RADIUS authentication attribute–value (AV) pairs to send to the RADIUS server during an 802.1X session (on vEdge routers only). These AV pairs are defined in RFC 2865, RADIUS, and they are placed in the Attributes field of the RADIUS Accounting Request packet.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface Ethernet

Command Hierarchy

```
vpn 0
  interface interface-name
  dot1x
    auth-req-attr attribute-number (integer integer | octet octet | string string)
```

Syntax Description

attribute-number	Authentication Attribute Number:
	RADIUS authentication attribute number.
	Range:
	1 through 64
(integer integer octet octet string string)	Attribute Value: (integer integer octet octet string string) Value of the attribute. Specify the value as an integer, octet, or string, depending on the authentication attribute itself.

Command History

Release	Modification
16.3	Command introduced.

Example

Set the Service-Type authentication attribute to service type 2, which is a Framed service:

```
vEdge# show running-config vpn 0 dot1x
vpn 0
  name "Transport VPN"
  interface ge0/5
  dot1x
```

```
auth-req-attr 6 integer 2
    ...
!
```

Operational Commands

clear dot1x client show dot1x clients show dot1x interfaces show dot1x radius show system statistics

```

authentication

vpn router ospf area interface authentication—Configure authentication for OSPF protocol exchanges (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► OSPF

Command Hierarchy

```
vpn vpn-id
  router
  ospf
    area number
    interface interface-name
      authentication
      authentication-key key
      message-digest message-digest-key key-id md5 encrypted-key
      type (message-digest | simple)
```

Syntax Description

key	Authentication Key:	
	Specify the authentication key (password). Plain text authentication is used when devices within an area cannot support the more secure MD5 authentication. It can be 1 to 32 characters.	

authentication type message-digest message-digest-key key-id md5 encrypted-key	MD5 Authentication: Use MD5 authentication for OSPF protocol exchanges on an interface, and specify the key ID and the encrypted key (password) to use to verify received packets. MD5 authentication includes an MD5 checksum in each transmitted packet. <i>key-id</i> can be from 1 to 255 characters. If you specify the <i>encrypted-key</i> in clear text and the text contains special characters, enclose the key in quotation marks (" ").
authentication type simple	Simple Authentication: Use simple, or plain text, authentication for all OSPF protocol exchanges on an interface.

Command History

Release	Modification
14.1	Command introduced.

Example

Configure MD5 authentication for OSPF:

```
vEdge(config) # vpn 1 router ospf area 3
vEdge(config-area-3) # interface ge0/1
vEdge(ospf-if-ge0/1) # authentication message-digest message-digest-key 6 md5 "$4$P3T3Z2sCirxa5+cCLEFXKw==<""""""</pre>
```

Operational Commands

show ospf interface

authentication-type

vpn interface ike authentication-type—Configure the type of authentication to use during IKE key exchange (on vEdge routers only). IKE supports preshared key (PSK) authentication only.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► Security

Command Hierarchy

```
vpn vpn-id
  interface ipsecnumber
   ike
    authentication-type pre-shared-key
    local-id id
    pre-shared-secret password
    remote-id id
```

local-id id	IKE Session Identifier:	
remote-idid	String to associate the IKE session with the preshared password. Configure this identifier if the remote IKE connection peer requires a local ID or remote ID from its peer. <i>id</i> can be an IP address or any text string from 1 through 63 characters long.	
	Default:	
	Tunnel's source IP address (for local-id); tunnel's destination IP address (for remote-id)	
pre-shared-secret	Preshared Password:	
password	Password to use with the preshared key. <i>password</i> can be an ASCII or a hexadecimal string from 1 through 127 characters long.	
	Note From Cisco SD-WAN 19.2.x release onwards, the pre-shared key needs to be at least 16 bytes in length. The IPsec tunnel establishment fails if the key size is less than 16 characters when the router is upgraded to version 19.2.	

Command History

Release	Modification
17.2	Command introduced.

Example

Configure the preshared-key password:

```
\label{eq:vedge} $$ vEdge (config) $\# vpn 1 interface ipsec1 ike $$ vEdge (config-ike) $\# authentication-type pre-shared-key pre-shared-secret $C$123456 $$
```

Operational Commands

clear ipsec ike sessions

show ipsec ike inbound-connections

show ipsec ike outbound-connections

show ipsec ike sessions

show running-config

Related Topics

mode, on page 340

authentication-type

security ipsec authentication-type—Configure the type of authentication to use on IPsec tunnel connections between vEdge routers (on vEdge routers only).

Note

This command is deprecated in Cisco SD-WAN Release 20.6.1 and later. Use the command **integrity-type** instead.

Command Hierarchy

security
 ipsec
 authentication-type type

type | Authentication Type:

Type of authentication to use on IPsec tunnel connections. You can configure multiple authentication types. Configure each type with a separate security ipsec authentication-type command. The order in which these commands appear in the configuration does not matter. Each pair of vEdge routers advertise their configured authentications in their TLOC properties, and then the two routers negotiate the authentication to use on the IPsec tunnel connection between them. They use the strongest authentication type configured on each router. For example, if vEdge-1 advertises AH-HMAC-SHA1, ESP HMAC-SHA1, and none and vEdge-2 advertises ESP HMAC-SHA1 and none, the two routers negotiate to use ESP HMAC-SHA1 as the integrity method between them.

type can be one of the following options, which are listed in order from most strong to least strong:

- ah-sha1-hmac enables AH-SHA1 HMAC and ESP HMAC-SHA1. With the authentication type, ESP encrypts the inner header, packet payload, ESP trailer, and MPLS label (if applicable), and AH authenticates these fields, as well as the non-mutable fields in the outer header. AH creates an HMAC-SHA1 hash and places it in the last field of the data packet.
- ah-no-id enables a modified version of AH-SHA1 HMAC and ESP HMAC-SHA1 that ignores the ID field in the packet's outer IP header. This option accommodates some non-Cisco-vEdge devices, including the Apple AirPort Express NAT, that have a bug that causes the ID field in the IP header, a non-mutable field, to be modified. Configure the **ah-no-id** option in the list of authentication types to have the Cisco SD-WAN AH software ignore the ID field in the IP header so that the Cisco SD-WAN software can work in conjunction with these devices.
- sha1-hmac enables ESP HMAC-SHA1. With this authentication type, ESP encrypts the inner header, packet payload, ESP trailer, and MPLS label (if applicable). ESP then creates an HMAC-SHA1 hash and places it in the last field of the data packet.
- none maps to no authentication. With this authentication type, ESP encrypts the inner header, packet payload, ESP trailer, and MPLS label (if applicable), but no HMAC-SHA1 hash is calculated. You can choose this option in situations where data plane authentication and integrity are not a concern.

For information about which data packet fields are affected by these authentication types, see the "Data Plane Integrity" section in the Data Plane Security Overview article for your software release.

For Releases 16.2 and later, the encryption algorithm on IPsec tunnel connections is either AES-256-GCM or AES-256-CBC. For unicast traffic, if the remote side supports AES-256-GCM, that encryption algorithm is used. Otherwise, AES-256-CBC is used. For multicast traffic, the encryption algorithm is AES-256-CBC. For Releases 16.1 and earlier, the encryption algorithm on IPsec tunnel connections is AES-256-CBC. You cannot modify the encryption algorithm choice made by the software.

When you change the IPsec authentication, the AES key for the data path is changed.

Default: ah-sha1-hmac and sha1-hmac

Command History

Release	Modification
14.2	Command introduced.
Cisco SD-WAN Release 20.6.1	This command was deprecated. Starting from Cisco SD-WAN Release 20.6.1, use the command integrity-type instead.

Example

Have the vEdge router negotiate the IPsec tunnel authentication type among AH-SHA1, ESP SHA1-HMAC, and none:

```
vEdge# config
Entering configuration mode terminal
vm6(config)# security ipsec authentication-type shal-hmac
vm6(config-ipsec)# authentication-type ah-shal-hmac
vm6(config-ipsec)# authentication-type none
```

auto-cost reference-bandwidth

vpn router ospf auto-cost reference-bandwidth—Control how OSPF calculates the default metric for an interface (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► OSPF

Command Hierarchy

```
vpn vpn-id
  router
   ospf
    auto-cost reference-bandwidth mbps
```

Syntax Description

```
mbps Reference Bandwidth:
Interface speed.
Range:
1 through 4294967
Mbps
Default:
100 Mbps
```

Command History

Release	Modification
14.1	Command introduced.

Example

Set the reference bandwidth to 10 Mbps:

```
vEdge(config) # vpn 1 router ospf
vEdge(config-ospf) # auto-cost reference-bandwidth 10
vEdge(config-ospf) # show config
vpn 1
router
  ospf
  auto-cost reference-bandwidth 10
!
!
```

Operational Commands

show ospf process

auto-sig-tunnel-probing

To allow cloudexpress probes in all the active auto SIG tunnels, use the **auto-sig-tunnel-probing** command in config-cloudexpress mode. To disable auto-sig-tunnel-probing, use the **no** form of this command.

auto-sig-tunnel-probing

no auto-sig-tunnel-probing

Command Default

Enabled

Command Modes

config-cloudexpress

Command History

Release	Modification
Cisco SD-WAN Release 20.6.1	This command was introduced.

Usage Guidelines

Use **auto-sig-tunnel-probing** to enable the CXP probes in all the active auto SIG tunnels configured in the node to select the best possible SIG tunnel for accessing the SaaS applications.

Example

In this example, you allow cloudexpress probes in all the auto SIG tunnels.

```
Device(config) # vpn 2
Device(config-vpn-2) cloudexpress
Device(config-cloudexpress) # applications amazon_aws concur
Device(config-cloudexpress) # auto-sig-tunnel-probing
Device(config-cloudexpress) # node-type gateway
```

auto-rp

vpn router pim auto-rp— Enable and disable auto-RP for PIM (on vEdge routers only). By default, auto-RP is disabled.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► PIM

Command Hierarchy

```
vpn vpn-id
  router
  pim
  auto-rp
```

Command History

Release	Modification
14.2	Command introduced.

Operational Commands

show multicast replicator

show multicast rpf

show multicast topology

show multicast tunnel

show pim interface

show pim neighbor

autonegotiate

vpn interface autonegotiate—Configure whether an interface runs in autonegotiation mode (on vEdge routers only).

On all vEdge router models, all interfaces support 1-Gigabit Ethernet SFPs. These SFPs can either be copper or fiber. For fiber SFPs, the supported speeds are 1 Gbps full duplex and 100 Mbps full duplex. For copper SFPs, the supported speeds are 10/100/1000 Mbps and half/full duplex. To use a fixed speed and duplex configuration for interfaces that do not support autonegotiation, you must disable autonegotiation and then use the **speed** and **duplex** commands to set the appropriate interface link characteristics.

Integrated routing and bridging (IRB) interfaces do not support autonegotiation. In Releases 17.1 and later, the **autonegotiate** command is not available for these interfaces.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface Bridge

Configuration ► Templates ► VPN Interface Cellular (for vEdge cellular wireless routers only)

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface PPP Ethernet

vManage Feature Template

For all Cisco SD-WAN devices:

Configuration ► Templates ► VPN Interface Bridge

Command Hierarchy

```
vpn vpn-id
  interface geport/slot
  [no] autonegotiate
```

Command History

Release	Modification
15.3	Command introduced.
17.1	Disable this command for IRB interfaces.

Example

Set the interface speed to 10 Mbps:

```
vpn 0
 interface ge0/0
 no autonegotiate
 speed 10
```

Operational Commands

show interface

Related Topics

duplex, on page 198 speed, on page 465

bandwidth-downstream

vpn interface bandwidth-downstream—Generate notifications when the bandwidth of traffic received on a physical interface in the WAN transport VPN (VPN 0) exceeds a specific limit (on vEdge routers and vManage NMSs only). Specifically, notifications are generated when traffic exceeds 85 percent of the bandwidth you configure with this command. Notifications generated include Netconf notifications, which are sent to the vManage NMS, SNMP traps, and syslog messages. Notifications are sent when either the transmitted or received bandwidth exceeds 85 percent of the bandwidth configured for that type of traffic.

By default, no bandwidth notifications of any kind are generated, so if you are interested in monitoring bandwidth usage, you must do so manually.

Note

Starting from Cisco SD-WAN Release 20.6, the device sends the port speed information for bandwidth, when bandwidth is not configured.

You can configure this command on all interface types except for GRE and loopback interfaces.

vManage Feature Template

For vEdge routers and vManage NMSs only:

Configuration ► Templates ► VPN Interface Bridge

Command Hierarchy

```
vpn 0
  interface interface-name
  bandwidth-downstream kbps
```

Syntax Description

```
kbps Interface Received Bandwidth:
```

Maximum received on a physical interface to allow before generating a notification. When the transmission rate exceeds 85 percent of this rate, an SNMP trap is generated.

Range:

1 through 2147483647 $(2^{32}/2) - 1$ kbps

Example

Have the vEdge router generate a notification when the received or transmitted traffic on an interface exceeds 85 percent of a 50-Mbps circuit:

```
vEdge# show running-config vpn 0 interface ge0/2
vnn 0
interface ge0/2

banner login

banner login—Configure banner text to be displayed before the login prompt on a Cisco vEdge device.

vManage Feature Template

For all Cisco vEdge devices:

Configuration ► Templates ► Banner

Command Hierarchy

```
banner
  login "text"
```

Syntax Description

text	Login Banner Text:
	Text string for the login banner. The string can be from 1 to 2048 characters long. If the string contains spaces, enclose it in quotation marks. To insert a line break, type \n.
	For Cisco IOS XE SD-WAN Release 16.12.1r, to insert a line break, type \x0a.
	From Cisco IOS XE Catalyst SD-WAN Release 17.3.1a onwards, to insert a line break, type \n and delimiters like double-quotes ("") are not required in the banner string.

Command History

Release	Modification
14.1	Command introduced.

Release	Modification
15.1.1	Changed maximum banner length to 2048 characters.
Cisco IOS XE SD-WAN 16.12.1r	Changed the value for inserting a line break for the banner string.
Cisco IOS XE Catalyst SD-WAN Release 17.3.1a	Changed the value for inserting a line break to \n for the banner string.

Example

Set a login banner:

```
vSmart(config) # banner login "vSmart Controller in Data Center 1\n AUTHORIZED USERS ONLY"
vSmart(config-banner) # commit and-quit
Commit complete.
vSmart# exit
MacBook-Pro:~ me$ ssh 10.0.5.19
vSmart Controller in Data Center 1

Release	Modification
14.1	Command introduced.
15.1.1	Chnaged maximum banner length to 2048 characters.
Cisco IOS XE SD-WAN 16.12.1r	Changed the value for inserting a line break for the banner string.
Cisco IOS XE Catalyst SD-WAN Release 17.3.1a	Changed the value for inserting a line break to \n for the banner string.

Example

Set a post-login banner:

```
vSmart(config) # banner motd "Welcome to vSmart Controller 1"
vSmart(config-banner) # commit and-quit
Commit complete.
vSmart# exit
MacBook-Pro:~ me$ ssh 10.0.5.19
login: admin
password:
Welcome to vSmart Controller 1
admin connected from 10.0.1.1 using on vSmart
```

Operational Commands

show running-config

banner login, on page 103

best-path

vpn router bgp best-path—Configure how the active BGP path is selected (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► BGP

Command Hierarchy

```
vpn id
  router
  bgp local-as-number
  best-path
    as-path multipath-relax
  compare-router-id
  med (always-compare | deterministic | missing-as-worst)
```

Syntax Description

as-path multipath-relax	Select Routes with BGP Multipath:
	By default, when you are using BGP multipath, the BGP best path process selects from routes in the same AS to load-balance across multiple paths. If you configure the as-path multipath-relax option, the BGP best path process selects from routes in different ASs.
med (always-compare	Use the MED to Select the Active BGP Path:
deterministic missing-as-worst)	Compare the specified multi-exit discriminator (MED) parameter to determine the active path. The MED parameter can be one of:
	always-compare : Always compare MEDs regardless of whether the peer ASs of the compared routes are the same.
	deterministic : Compare MEDs from all routes received from the same AS regardless of when the route was received.
	missing-as-worst : If a path is missing a MED attribute, consider it to be the worst path.

compare-router-id	Use the Router ID to Select the Active BGP Path:
	Compare the router IDs among BGP paths to determine the active path. The system prefers the router with the lowest router ID. If the received route contains an ORIGINATOR_ID attribute (through iBGP reflection), the system uses that router ID; if the attribute is not present, the system uses the router ID of the peer that route was received from.

Command History

Release	Modification
14.1	Command introduced.

Example

Compare the router IDs among different BGP paths to determine which path will be the active one:

```
vEdge(config-best-path) # show config
vpn 1
  router
bgp 666
   best-path
    compare-router-id
  !
  !
  !
  !
  !
  !
  !
```

Operational Commands

show bgp routes

bfd app-route

bfd app-route—Configure Bidirectional Forwarding Protocol timers used by application-aware routing (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► BFD

Command Hierarchy

```
bfd app-route
  multiplier number
  poll-interval milliseconds
```

Syntax Description

multiplier number	Multiplier for the Polling Interval:
	Value to multiply the poll interval by to set how often application-aware routing acts on the data plane tunnel statistics to figure out the loss and latency and to calculate new tunnels if the loss and latency times do not meet configured SLAs.
	Range: 1 through 6
	Default: 6
poll-interval	Polling Interval:
milliseconds	How often BFD polls all data plane tunnels on a vEdge router to collect packet latency, loss, and other statistics to be used by application-aware routing.
	Range:
	1 through 4,294,967,295 (2 ³² – 1) milliseconds
	Default:
	600,000 milliseconds (10 minutes)

Command History

Release	Modification
14.2	Command introduced.

Example

Change the polling interval and multiplier to use for application-aware routing:

```
vEdge(config) # bfd app-route poll-interval 900000 vEdge(config) # bfd app-route multiplier 4
```

Operational Commands

show app-route stats

show bfd summary

Related Topics

bfd color, on page 108

bfd color

bfd color—Configure the Bidirectional Forwarding Protocol timers used on transport tunnels (on vEdge routers only).

Note

BFD is always enabled on vEdge routers. There is no **shutdown** configuration command to disable it.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► BFD

Command Hierarchy

```
bfd color color
  hello-interval milliseconds
  multiplier number
  pmtu-discovery
```

hello-interval	Hello Packet Interval:
milliseconds	For the transport tunnel, how often BFD sends Hello packets. BFD uses these packets to detect the liveness of the tunnel connection and to detect faults on the tunnel.
	Range:
	100 through 300000 milliseconds (5 minutes)
	Default:
	1000 milliseconds (1 second)
color color	Identifier for the Transport Tunnel:
	Transport tunnel for data traffic moving between vEdge routers. The color identifies a specific WAN transport provider.
	Values:
	3g, biz-internet, blue, bronze, custom1, custom2, custom3, default, gold, green, lte, metro-ethernet, mpls, private1 through private6, public-internet, red, silver
	Default:
	default
multiplier	Multiplier for the Hello Packet Interval:
number	How many Hello packet intervals BFD waits before declaring that a tunnel has failed. BFD declares that the tunnel has failed when, during all these intervals, BFD has received no Hello packets on the tunnel. This interval is a multiplier of the Hello packet interval time. For example, with the default Hello packet interval of 1000 milliseconds (1 second) and the default multiplier of 7, if BFD has not received a Hello packet after 7 seconds, it considers that the tunnel has failed and implements its redundancy plan.
	Range:
	1 through 60
	Default:
	7 (for hardware vEdge routers), 20 (for vEdge Cloud software routers)

pmtu-discovery	Path MTU Discovery:
	Control BFD path MTU discovery on the transport tunnel. By default, BFD PMTU discovery is enabled, and it is recommended that you do not modify this behavior. With PMTU discovery enabled, the path MTU for the tunnel connection is checked periodically, about once per minute, and it is updated dynamically. With PMTU discovery enabled, 16 bytes might be required by PMTU discovery, so the effective tunnel MTU might be as low as 1452 bytes. From an encapsulation point of view, the default IP MTU for GRE is 1468 bytes, and for IPsec it is 1442 bytes because of the larger overhead. Enabling PMTU discovery adds to the overhead of the BFD packets that are sent between the vEdge routers, but does not add any overhead to normal data traffic. If PMTU discovery is disabled, the expected tunnel MTU is 1472 bytes (tunnel MTU of 1500 bytes less 4 bytes for the GRE header, 20 bytes for the outer IP header, and 4 bytes for the MPLS header). However, the effective tunnel MTU might be 1468 bytes, because the software might sometimes erroneously add 4 bytes to the header.
	Note If interface IP MTU is 1500 byte, then Tunnel MTU is 1442 (1500 default interface MTU - 58 bytes for tunnel overhead). When the BFD session is established, Tunnel MTU is set to 1441. Once the BFD is up, Tunnel MTU is lowered by 1 byte. Whereas, when BFD is in down state, Tunnel MTU is 1442.
	Default: Enabled

Command History

Release	Modification
14.1	Command introduced.
15.1 15.1.1	Added pmtu-discovery option, renamed interval option to hello-interval, and changed Hello interval units from seconds to milliseconds.
15.2	Changed default multiplier from 3 to 7.
15.3.2	Added colors private3, private4, private5, and private6.
16.1	Enabled path MTU discovery by default.
16.2	Added default multiplier for vEdge Cloud routers.
20.5	Changed maximum hello interval from 60 seconds to 5 minutes.
	Added the sla-damp-multiplier keyword for Cisco vEdge devices.

Example

Change the BFD Hello packet interval for the **lte** tunnel connection to 2 minutes:

```
vEdge# show running-config bfd
bfd color lte
hello-interval 2000
```

Operational Commands

show bfd sessions show control connections show app-route stats

Note

Note that the default BFD configuration is not displayed when you issue the **show running-config** command. This is because BFD is always enabled on vEdge routers, and there is no **shutdown** configuration command to disable it. However, if you configure additional BFD properties, they are displayed by the **show running-config** command.

bfd app-route color

bfd app-route color—Configure the Bidirectional Forwarding Protocol timers used on transport tunnels (on vEdge routers only).

Note

BFD is always enabled on vEdge routers. There is no **shutdown** configuration command to disable it.

Cisco vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► BFD

Command Hierarchy

bfd app-route color <color>

color color	Specifies an identifier for the transport tunnel for data traffic moving between vEdge routers. The color identifies a specific WAN transport provider.
	The following are the color values:
	3g, biz-internet, blue, bronze, custom1, custom2, custom3, default, gold, green, lte, metro-ethernet, mpls, private1 through private6, public-internet, red, silver
	Default:
	default

Command History

Release	Modification
20.5.1	This command is introduced.

Example

```
vvEdge (config) # bfd app-route color public-internet
```

Operational Commands

request sla-dampening-reset color

bgp

vpn router bgp— Configure BGP within a VPN on a vEdge router.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► BGP

Command Hierarchy

```
vpn vpn-id
  router
  bgp local-as-number
  address-family ipv4-unicast
    aggregate-address prefix/length [as-set] [summary-only]
    maximum-paths paths number
    network prefix/length
    redistribute (connected | nat | natpool-outside | omp | ospf | static) [route-policy
policy-name]
  best-path
    as-path multipath-relax
    compare-router-id
    med (always-compare | deterministic | missing-as-worst)
    distance
    external number
```

```
internal number
  local number
neighbor ip-address
  address-family ipv4-unicast
   maximum-prefixes number [threshold] [restart minutes | warning-only]
    route-policy policy-name (in | out)
  capability-negotiate
  description text
  ebgp-multihop ttl

  password md5-digest-string
  remote-as remote-as-number
  send-community
  send-ext-community
  [no] shutdown
 timers
   advertisement-interval number
    connect-retry seconds
   holdtime seconds
   keepalive seconds
  update-source ip-address
! end neighbor configuration
propagate-aspath
router-id ip-address
[no] shutdown
timers
 holdtime seconds
```

local-as-number	Local AS Number:
	AS number of the local BGP site. You can specify the AS number in 2-byte asdot notation (1 through 65535) or in 4-byte asdot notation (1.0 through 65535.65535).

Command History

Release	Modification
14.1	Command introduced.

Example

Configure BGP in VPN 1:

```
vpn 1
  router
  bgp 123
   address-family ipv4_unicast
  redistribute omp
  neighbor 10.0.19.17
   no shutdown
  remote-as 456
```

Operational Commands

clear bgp neighbor

show bgp neighbor show bgp routes show bgp summary show omp routes detail

bind

vpn 0 interface tunnel-interface bind—Bind a physical WAN interface to a loopback interface.

vManage Feature Template

Configuration ► Templates ► VPN Interface Cellular

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface PPP

Command Hierarchy

```
vpn 0
  interface interface-name
  tunnel-interface
  bind interface-name
```

Syntax Description

interface-name	Interface Name
	Physical WAN interface to bind to a loopback interface. <i>interface-name</i> has the format ge <i>slot/port</i> . Both the loopback and physical WAN interfaces must be in VPN 0.

Command History

Release	Modification
14.2	Command introduced.
Cisco SD-WAN Release 19.2	Added support for Cisco XE SD-WAN routers.
Cisco IOS XE SD-WAN Release 16.12.1	

Examples

Example 1

(for Cisco vEdge routers)

Bind the physical interface **ge0/0** to the interface **loopback2**:

```
vpn 0
interface ge0/0
ip address 10.1.15.15/24
no shutdown
!
interface loopback2
ip address 172.16.15.15/24
tunnel-interface
color metro-ethernet
carrier carrier1
bind ge0/0
!
no shutdown
```

Example 2

(for Cisco IOS XE Catalyst SD-WAN devices)

```
Device#show sdwan running-config
interface Loopback1
 tunnel-interface
   encapsulation ipsec
   color red
   bind GigabitEthernet1
   no allow-service bgp
   allow-service dhcp
   allow-service dns
   allow-service icmp
   no allow-service sshd
   no allow-service netconf
   no allow-service ntp
   no allow-service ospf
   no allow-service stun
   allow-service https
  no allow-service snmp
  exit
exit
```

Operational Commands

show control connections

block-icmp-error

vpn interface nat block-icmp-error—Prevent a vEdge router that is acting as a NAT device from receiving inbound ICMP error messages (on vEdge routers only). By default, such a vEdge router blocks these error messages. Blocking error messages is useful in the face of a DDoS attack.

NAT uses ICMP to relay error messages across a NAT, so if you want to receive these messages, disable the blocking of ICMP error messages.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface Cellular (for vEdge cellular wireless routers only)

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface NAT Pool

Configuration ► Templates ► VPN Interface PPP

Command Hierarchy

```
vpn vpn-id
  interface interface-name
  nat
    block-icmp-error
```

Syntax Description

None

Command History

Release	Modification
14.2	Command introduced.

Example

Configure a vEdge router acting as a NAT so that it does not block inbound ICMP error messages, to allow the router to receive NAT ICMP relay error messages:

```
vEdge# config
vEdge(config)# vpn 1 interface ge0/4 nat
vEdge(config-nat)# no block-icmp-error
vEdge(config-nat)# show full-configuration
vpn 1
  interface ge0/4
  nat
     no block-icmp-error
  !
!
```

Operational Commands

show ip nat filter

show ip nat interface

show ip nat interface-statistics

block-non-source-ip

vpn interface block-non-source-ip—Do not allow an interface to forward traffic if the source IP address of the traffic does not match the inteface's IP prefix range (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

```
Configuration ► Templates ► VPN Interface Bridge

Configuration ► Templates ► VPN Interface Cellular (for vEdge cellular wireless routers only)

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface PPP
```

Command Hierarchy

```
vpn vpn-id
  interface interface-name
  block-non-source-ip
```

Command History

Release	Modification
17.1.1	Command introduced.

Syntax Description

None

Example

Have the router block traffic being sent out the transport interface (in VPN 0) and out one service-side interface (in VPN 1) when the traffic's source IP address does not match the IP address configured on the interface:

```
vpn 0
  interface ge0/0
   block-non-source-ip
   ...
vpn 1
  interface ge1/0
   block-non-source-ip
   ...
```

Operational Commands

show interface

show ip routes

bridge

bridge—Create a bridging domain (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► Bridge

Command Hierarchy

```
bridge bridge-id
age-time seconds
interface interface-name
description "text description"
native-vlan
[no] shutdown
static-mac-address mac-address
max-macs number
name text
vlan vlan-id
```

Syntax Description

name	Bridging Domain Description:	
text	Text description of the bridging domain. If <i>text</i> contains spaces, enclose it in quotation marks.	
bridge-id	Bridging Domain Identifier:	
	Number that identifies the bridging domain.	
	Range:	
	1 through 63	

Example

Configure three bridge domains on a vEdge router:

```
vEdge# show running-config bridge
bridge 1
vlan 1
interface ge0/2
 no native-vlan
 no shutdown
interface ge0/5
 no native-vlan
 no shutdown
interface ge0/6
 no native-vlan
 no shutdown
bridge 2
vlan 2
interface ge0/2
 no native-vlan
 no shutdown
interface ge0/5
 no native-vlan
 no shutdown
interface ge0/6
 no native-vlan
 no shutdown
```

bridge 50

2

140

0

```
interface ge0/2
 native-vlan
 no shutdown
 interface ge0/5
 native-vlan
 no shutdown
 interface ge0/6
 native-vlan
 no shutdown
vEdge# show bridge interface

capability-negotiate

50

vpn router bgp capability-negotiate—Allow the BGP session to learn about the BGP extensions that are supported by the neighbor (on vEdge routers only).

This feature is disabled by default. If you have enabled it, use the **no capability-negotiate** configuration command to disable it.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► BGP

Command Hierarchy

```
vpn vpn-id
  router
  bgp local-as-number
   neighbor ip-address
       capability-negotiate
```

Syntax Description

None

Command History

Release	Modification
14.1	Command introduced.

Example

Enable BGP capability negotiation:

```
vEdge# show running-config vpn 1 router bgp neighbor 1.10.10.10
vpn 1
router
bgp 666
neighbor 1.10.10.10
no shutdown
remote-as 777
capability-negotiate
!
!
!
!
!
```

Operational Commands

show bgp neighbor

carrier

vpn 0 interface tunnel-interface carrier—Associate a carrier name or private network identifier with a tunnel interface (on vEdge routers, vManage NMSs, and vSmart controllers only).

vManage Feature Template

For vEdge routers, vManage NMSs, and vSmart controllers only:

Configuration ► Templates ► VPN Interface Cellular (for vEdge cellular wireless routers only)

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface PPP

Command Hierarchy

```
vpn 0
  interface interface-name
   tunnel-interface
    carrier carrier-name
```

Table 4: Syntax Description

vcarrier-name	Private Network Identifier:	
	Carrier name to associate with a tunnel interface.	
	Values:	
	carrier1, carrier2, carrier3, carrier4, carrier5, carrier6, carrier7, carrier8, default	
	Default:	
	default	

Command History

Release	Modification
14.2	Command introduced.

Example

Associate a carrier name with a tunnel connection:

```
vpn 0
interface ge0/0
ip address 10.1.15.15/24
no shutdown
!
interface loopback2
ip address 172.16.15.15/24
tunnel-interface
  color metro-ethernet
  carrier carrier1
  bind ge0/0
!
no shutdown
```

Operational Commands

show control connections

cellular

cellular—Configure a cellular module on a vEdge router (on vEdge routers only).

The firmware installed in the router's cellular modules is specific to each service provider and determines which profile properties you can configure. You can modify the attributes for a profile only if allowed by the service provider.

To associate a cellular profile with a cellular interface, use the interface cellular profile configuration command.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► Cellular Profile

Command Hierarchy

```
cellular cellularnumber
profile number
apn name
auth auth-method
ip-addr ip-address
name profile-name
pdn-type type
primary-dns ip-address
secondary-dns ip-address
user-name user-name
user-pass password
```

Syntax Description

cellular	Cellular Interface Name:
number	Name of the cellular interface. It must be cellular0 .

Command History

Release	Modification
16.1	Command introduced.

Example

Configure a cellular interface with a profile, and the profile with an APN.

```
vEdge# show running-config cellular
cellular cellular0
profile 1
   apn reg_ims
'
```

Operational Commands

clear cellular errors

clear cellular session statistics

show cellular modem

show cellular network

```
show cellular profiles
show cellular radio
show cellular sessions
show cellular status
show interface
```

profile, on page 407

cflowd-template

policy cflowd-template—Create a template that defines the location of cflowd collectors, how often sets of sampled flows should be sent to the collectors, and how often the cflowd template should be sent to the collectors (on vSmart controllers only). You can configure a maximum of four cflowd collectors per vEdge router. To have a template take effect, apply it with the appropriate data policy.

You must configure at least one cflowd-template, but it need not contain any parameters. With no parameters, the data flow cache on vEdge nodes is managed using default settings, and no flow export occurs.

vManage Feature Template

For vSmart controllers:

Configuration ► Policies ► Centralized Policy

Command Hierarchy

```
policy
  cflowd-template template-name
    collector vpn vpn-id address ip-address port port-number transport transport-type
        source-interface interface-name
    flow-active-timeout seconds
    flow-inactive-timeout seconds
    flow-sampling-interval number
    template-refresh seconds
apply-policy
site-list list-name
    data-policy policy-name
    cflowd-template template-name
```

Syntax Description

template-name	Template Name:
	Name of the template.

Command History

Release	Modification
14.3	Command introduced.

Example

Configure a cflowd flow collection template, and apply it to a group of sites in the overlay network:

```
vSmart# show running-config policy
cflowd-template test-cflowd-template
collector vpn 1 address 172.16.255.14 port 11233
flow-active-timeout 60
flow-inactive-timeout 90
flow-sampling-interval 64
template-refresh 120
!
vSmart# show running-config apply-policy
apply-policy
site-list site-list-for-cflowd
data-policy policy-for-cflowd
cflowd-template test-cflowd-template
!
!
```

Operational Commands

```
clear app cflowd flow-all (on vEdge routers only)
clear app cflowd flows (on vEdge routers only)
clear app cflowd statistics (on vEdge routers only)
show running-config policy (on vSmart controllers only)
show app cflowd collector (on vEdge routers only)
show app cflowd flow-count (on vEdge routers only)
show app cflowd flows (on vEdge outers only)
show app cflowd statistics (on vEdge routers only)
show app cflowd template (on vEdge routers only)
show policy from-vsmart (on vEdge routers only)
```

channel

wlan channel—Specify the radio channel (on vEdge cellular wireless routers only).

vManage Feature Template

For vEdge cellular wireless routers only:

Configuration ► Templates ► WiFi Radio

Command Hierarchy

```
wlan radio-band
  channel (auto | auto-no-dfs) (channel)
```

Syntax Description

(auto auto-no-dfs)	Automatic Channel Selection:	
	Have the router automatically select the best channel to use from among all channels or from among all channels except for those with dynamic frequency selection (DFS) capabilities. Airport radar uses frequencies that overlap DFS channels. If you are using a 5-GHz radio band, and if your installation is near an airport, it is recommended that you configure auto-no-dfs , to remove DFS channels from the list of available channels.	
	Default:	
	auto	
channel	Channel for 2.4-GHz WLANs:	
	Use a 2.4-GHz radio band. This band supports IEEE 802.11b, 802.11g, and 802.11n clients.	
	Range:	
	1 through 13, depending on the country configuration.	
channel	Channel for 5-GHz WLANs:	
	Use a 5-GHz radio band. This band supports IEEE 802.11a, 802.11n, and 802.11ac clients. You can configure channels for standard or for DFS capabilities. <i>Channels available for 5-GHz, including DFS:</i> 36, 40, 44, 48, 52, 56, 60, 64, 100, 104, 108, 112, 116, 120, 124, 128, 132, 136, 140, 144, 149, 153, 157, 161, and 165, depending on the country configuration	

Command History

Release	Modification
16.3	Command introduced.

Example

Configure a 5-GHz channel:

```
vEdge# show running-config wlan
wlan 5GHz
channel 36
interface vap0
 ssid tb31_pm6_5ghz_vap0
 no shutdown
interface vap1
 ssid tb31 pm6 5ghz vap1
 data-security wpa/wpa2-enterprise
 radius-servers tag1
 no shutdown
 interface vap2
                tb31_pm6_5ghz_vap2
 ssid
 data-security wpa/wpa2-personal
 mgmt-security optional
```

Operational Commands

clear wlan radius-stats

show wlan clients

show wlan interfaces

show wlan radios

show wlan radius

channel-bandwidth

wlan channel-bandwidth—Specify the IEEE 802.11n and 802.11ac channel bandwidth (on vEdge cellular wireless routers only).

vManage Feature Template

For vEdge cellular wireless routers only:

Configuration ► Templates ► WiFi Radio

Command Hierarchy

```
wlan radio-band
  channel-bandwidth megahertz
```

Syntax Description

Channel Bandwidth	
Bandwidth available on the WLAN channel.	
Values:	
20, 40, 80 MHz	
Default:	
20 MHz (for 2.4 GHz); 80 MHz (for 5 GHz)	

Example

Explicitly configure the default channel bandwidth for a 5-GHz radio band:

```
vEdge# show running-config wlan
wlan 5GHz
  channel 36
  channel-bandwidth 80
  interface vap0
   ssid   tb31_pm6_5ghz_vap0
  no shutdown

cipher-suite

vpn interface ipsec ike cipher-suite—Configure the type of authentication and encryption to use during IKE key exchange (on vEdge routers only).

vpn interface ipsec cipher-suite—Configure the authentication and encryption to use on an IPsec tunnel that is being used for IKE key exchange (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface IPsec

Command Hierarchy

```
vpn vpn-id
  interface ipsecnumber
   ike
      cipher-suite suite
  ipsec
      cipher-suite suite
```

Syntax Description

suite Authentication and Encryption Type for IKE Key Exchange:

Type of authentication and integrity checking to use during IKE key exchange. It can be one of the following:

- aes128-cbc-sha1—Use the AES-128 advanced encryption standard CBC encryption with the HMAC-SHA1 keyed-hash message authentication code algorithm for integrity.
- aes128-cbc-sha2—Use the AES-128 advanced encryption standard CBC encryption with the HMAC-SHA256 keyed-hash message authentication code algorithm for integrity.
- aes256-cbc-sha1—Use the AES-256 advanced encryption standard CBC encryption with the HMAC-SHA1 keyed-hash message authentication code algorithm for integrity. This is the default.
- aes256-cbc-sha2—Use the AES-256 advanced encryption standard CBC encryption with the HMAC-SHA256 keyed-hash message authentication code algorithm for integrity.

suite | Encryption Type for IPsec Tunnel:

Type of encryption to use on an IPsec tunnel that is being used for IKE key exchange. It can be one of the following:

- aes256-cbc-sha1—Calculate message encryption using the AES-256 cipher in CBC (cipher block chaining) mode and using HMAC-SHA1-96 keyed-hash message authentication.
- aes256-gcm—Calculate message encryption using the AES-256 algorithm in GCM (Galois/counter mode). This is the default.
- null-sha1—Do not encrypt the IPsec tunnel that is being used for IKE key exchange traffic.

Command History

Release	Modification
17.2	Command introduced.
18.2	Added support for SHA2-based ciphers for IKE.

Example

Change the IKE key exchange to use AES-128 encryption and HMAC-SHA1:

```
vEdge(config) # vpn 1 interface ipsec1 ike
vEdge(config-ike) # cipher-suite aes128-sha1
```

Change the IPsec tunnel encryption to AES-256 in CBC mode:

```
vEdge(config) # vpn 1 interface ipsec1 ipsec
vEdge(config-ipsec) # cipher-suite aes256-cbc-sha1
```

Operational Commands

clear ipsec ike sessions

show ipsec ike inbound-connections

show ipsec ike outbound-connections show ipsec ike sessions

class-map

policy class-map—Map forwarding classes to output queues (on vEdge routers only). When you are configuring QoS policy, you refer to the forwarding class mappings when you configure a QoS scheduler.

Class mappings can apply to unicast and multicast traffic.

vManage Feature Template

For vEdge routers:

Configuration ► Policies ► Localized Policy

Command Hierarchy

```
policy
  class-map
    class class-name queue number
```

Syntax Description

class
class-name
queue number

Class Mapping to Output Queue:

Map a class name to an interface queue number. The class name can be a text string from 1 to 32 characters long. On hardware vEdge routers and Cloud vEdge virtualized routers, each interface has eight queues, numbered from 0 through 7. Queues 1 through 7 are available for data traffic, and the default scheduling method for these seven queues is weighted round-robin (WRR). Queue 0 is reserved, and is used for both control traffic and low-latency queuing (LLQ). For LLQ, any class that is mapped to queue 0 must also be configured to use LLQ; 100 percent of control traffic is transmitted. In Releases 17.2 and earlier, on Cloud vEdge virtualized routers, each interface has four queues, numbered from 0 through 3. Queue 0 is reserved for control traffic, and queues 1, 2, and 3 are available for data traffic. The scheduling method for all four queues is WRR. LLQ is not supported.

Command History

Release	Modification
14.1	Command introduced.
14.2	Changed the LLQ queue from queue 1 to queue 0. The software supports only one queue for LLQ, and it must be queue 0.
17.2.2	Added support for multicast traffic and for vEdge Cloud routers. vEdge Cloud routers support eight queues, with queue 0 reserved for LLQ

Example

Map forwarding classes:

```
vEdge# show running-config policy class-map
policy
  class-map
   class be queue 2
  class af1 queue 3
   class af2 queue 4
   class af3 queue 5
!
```

qos-scheduler, on page 411
rewrite-rule, on page 433
```

clear-dont-fragment

vpn interface clear-dont-fragment—Clear the Don't Fragment (DF) bit in the IPv4 packet header for packets being transmitted out the interface (on vEdge routers only). When the DF bit is cleared, packets larger than that interface's MTU are fragmented before being sent.

Note

vpn interface clear-dont-fragment clears the DF bit when there is fragmentation needed and the DF bit is set. For packets not requiring fragmentation, the DF bit is not affected.

By default, the clearing of the DF bit is disabled.

vManage Feature Template

```
Configuration ► Templates ► VPN Interface Bridge
```

Configuration ► Templates ► VPN Interface Cellular (for vEdge cellular wireless routers only)

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface GRE

Configuration ► Templates ► VPN Interface PPP

Configuration ► Templates ► VPN Interface PPP Ethernet

Command Hierarchy

```
vpn vpn-id
  interface interface-name
  clear-dont-fragment
```

Syntax Description

None

Example

Clear the DF bit in IPv4 packets being sent out an interface:

```
vpn 0
  interface ge0/0
    clear-dont-fragment
```

Operational Commands

show interface detail

clock

Set the timezone to use on the local device.

vManage Feature Template

For all Cisco SD-WAN devices:

Configuration \triangleright Templates \triangleright System

Command Hierarchy

```
system clock timezone timezone
```

Syntax Description

timezone timezone	Set the timezone on the device. <i>timezone</i> is one of the timezones in the tz database (also called tzdata, the zoneinfo database, or the IANA timezone database). <i>timezone</i> has the format <i>area/location</i> . <i>area</i> is the name of a continent (Africa, America, Antarctica, Asia, Australia, or Europe), an ocean (Arctic, Atlantic, Indian, or Pacific), or Etc (such as Etc/UTC and Etc/GMT). <i>location</i> is the name of a specific location within the area, usually a city or small island. For more information, see the IANA Time Zone Database.
	Default: UTC

Examples

California time zone

California time:

vm6# show running-config system
system
clock timezone America/Los_Angeles

Command History

Release	Modification
14.1	Command introduced.
15.2	Support for the IANA timezone database added .

cloudexpress

vpn cloudexpress—Configure Cloud OnRamp for SaaS (formerly called CloudExpress service) in a VPN (on vEdge routers only).

Note

To ensure that CloudExpress service is set up properly, configure it in vManage NMS, not using the CLI.

Command Hierarchy

```
vpn vpn-id
  cloudexpress
   allow-local-exit
  applications application-names
```

```
local-interface-list interface-names
node-type type
```

Syntax Description

None

Command History

Release	Modification
16.3	Command introduced.

Example

Configure Cloud OnRamp for SaaS in VPN 100:

```
vEdge# show running-config vpn 100 cloudexpress
vpn 100
cloudexpress
node-type client
allow-local-exit
local-interface-list ge0/0 ge0/2
applications salesforce office365 amazon_aws oracle sap box_net dropbox jira intuit concur zendesk gotomeeting webex
google_apps
!
```

Operational Commands

clear cloudexpress computations

show cloudexpress applications

show cloudexpress gateway-exits

show cloudexpress local-exits

show omp cloudexpress

show running-config vpn cloudexpress

collector

policy cflowd-template collector—Configure the address of a cflowd collector (on vSmart controllers only). The Cisco SD-WAN software can export flows to a maximum of four collectors. Note that if one or more vManage NMSs are present in the overlay network, the collected flows are also sent to the NMSs. (The NMSs are not counted in the maximum number of collectors.) Configuring a cflowd collector is optional.

vManage Feature Template

For vSmart controllers:

Configuration ► Policies ► Centralized Policy

Command Hierarchy

```
policy
  cflowd-template template-name
```

collector vpn vpn-id address ip-address port port-number transport transport-type source-interface interface-name

Syntax Description

address ip-address port port number	Address and Port of the Collector: IP address of the collector and port number to use. The default collector port is 4739.
source-interface interface-name	Interface to Reach Collector: Interface to use to send flows to the collector. <i>interface-name</i> can be a Gigabit Ethernet or 10-Gigabit Ethernet interface (ge) or a loopback interface (loopback number).
transport transport-type	Transport Protocol Transport protocol used to reach the collector. <i>transport-type</i> can be transport_tcp or transport_udp .
vpn vpn-id	VPN: Number of the VPN in which the collector is located.

Command History

Release	Modification
14.3	Command introduced.
16.2.2	Added source-interface option.

Example

Configure a cflowd template:

```
vSmart# show running-config policy
cflowd-template test-cflowd-template
collector vpn 1 address 172.16.255.14 port 11233 transport transport_udp
flow-active-timeout 60
flow-inactive-timeout 90
template-refresh 120
!
```

Operational Commands

```
show running-config policy (on vSmart controllers only) show app cflowd collector (on vEdge routers only) show app cflowd template (on vEdge routers only)
```

color

vpn 0 interface tunnel-interface color—Identify an individual WAN transport tunnel (on vEdge routers only). In the Cisco SD-WAN software, the tunnel is identified by a color. The color is one of the TLOC parameters associated with the tunnel.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface Cellular (for vEdge cellular wireless routers only)

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface PPP

Command Hierarchy

```
vpn 0
  interface interface-name
   tunnel-interface
   color color [restrict]
```

Syntax Description

color color	Color:
	Identify an individual WAN transport tunnel by assigning it a color. The color is one of the TLOC parameters associated with the tunnel. (While the CLI on a vSmart controller allows you to configure a color, the color has no meaning because vSmart controllers have no TLOCs.) On a vEdge router, you can configure only one tunnel interface that has the color default . The colors metro-ethernet , mpls , and private1 through private6 are private colors. They use private addresses to connect to the remote side vEdge router in a private network. You can use these colors in a public network provided that there is no NAT device between the local and remote vEdge routers.
	Values:
	3g, biz-internet, blue, bronze, custom1, custom2, custom3, default, gold, green, lte, metro-ethernet, mpls, private1, private2, private3, private4, private5, private6, public-internet, red, and silver
	Default:
	default
color color	Restrict WAN Transport Tunnel:
restrict	Allow the local WAN transport tunnel to be created and a BFD session for the tunnel to established to the remote vEdge router only if a tunnel of the same color exists on the remote router. If, for a tunnel, you change the color only, the restrict option remains configured. To remove the restriction on a color, first issue the no color command and then configure the new color.

Command History

Release	Modification
14.1	Command introduced.
15.1	Added restrict option.
15.2	Added colors private3, private4, private5, and private6.
15.2	Supporeted application of restrict option to any color.

Example

On a vEdge router, configure two tunnel interfaces (two TLOCs). The tunnel on **ge0/1** connects to a public WAN, and the tunnel on **ge0/2** connects to a private MPLS network. BFD sessions on the tunnel on interface **ge0/2** are established only to other TLOCs on other vEdge routers whose color is also **mpls**. The **no control-connections** command disables attempts to establish control connections over the MPLS network.

```
vpn 0
 interface ge0/1
    ip address 172.16.31.3/24
   tunnel-interface
     encapsulation ipsec
     color biz-internet
     allow-service dhcp
     allow-service dns
     allow-service icmp
     no allow-service sshd
     no allow-service ntp
     no allow-service stun
     !
    no shutdown
  interface ge0/2
    ip address 10.10.23.3/24
    tunnel-interface
     encapsulation ipsec
     color mpls restrict
     no control-connections
     allow-service dhcp
     allow-service dns
     allow-service icmp
     no allow-service sshd
     no allow-service ntp
     no allow-service stun
   no shutdown
  1
!
```

Operational Commands

show control connections show omp tlocs

Related Topics

encapsulation, on page 205

community

snmp community—Define an SNMP community (on vEdge routers and vSmart controllers only).

vManage Feature Template

For vEdge routers and vSmart controllers only:

Configuration ► Templates ► SNMP

Command Hierarchy

```
snmp
  community name
   authorization read-only
  view string
```

Syntax Description

authorization read-only	Authorization Level: Set the access authorization level for SNMP Get, GetNext, and GetBulk requests. The MIBs supported by the Cisco SD-WAN software do not allow write operations, so you can configure only read-only authorization (which is the default authorization).
community name	Community String: Define the name an SNMP community, which authorizes SNMP clients based on the source IP address of incoming packets. The community name can be a maximum of 32 characters. If it includes spaces, enclose it in quotation marks (" "). The name can include angle brackets (< and >).
view string	Specify the MIB Objects an SNMP Manager Can Access: Configure the view, or MIB objects, that the SNMP manager can access for this community. You define the view name with the snmp view configuration command. The view name can be a maximum of 255 characters. If it includes spaces, enclose the name in quotation marks (" ").

Command History

Release	Modification
14.1	Command introduced.
16.3	Allowed angle brackets in the community string.

Example

Configure the **public** community to be read-only:

```
vEdge# config
Entering configuration mode terminal
vEdge(config)# snmp community public
vEdge(config-community-public)# authorization read-only
vEdge(config-community-public)# show config
snmp
   community public
   authorization read-only
!
!
vEdge(config-community-public)#
```

Operational Commands

show running-config snmp

compatible rfc1583

vpn router ospf compatible rfc1583—Calculate the cost of summary routes based on RFC 1583 rather than RFC 2328 (on vEdge routers only). By default, calculation is done per RFC 1583.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► OSPF

Command Hierarchy

```
vpn vpn-id
  router
   ospf
    compatible rfc1583
```

Syntax Description

no compatible	RFC 2328 Compliance:
rfc1583	Per RFC 1583, RFC 1583 compliance is enabled by default, and no configuration is necessary. To calculate the cost of OSPF summary routes based on RFC 2328, include the no compatible rfc1583 configuration command.

Command History

Release	Modification
14.1	Command introduced.

Example

Check that RFC 1583 compliance is the default:

```
vm1# show running-config vpn 1 router ospf area 0
vpn 1
router
 ospf
  area 0
   interface ge0/0
   exit
   exit
  !
vm1# show ospf process | include rfc1583
rfc1583-compatible
                       true
Enable RFC 2328 compliance:
vm1# config
Entering configuration mode terminal
vm1 (config) # vpn 1 router ospf
vml(config-ospf) # no compatible rfc1583
vml(config-ospf)# show config
vpn 1
router
 ospf
  no compatible rfc1583
\verb|vm1| \# \verb| show ospf process | include rfc1583|
rfc1583-compatible false
```

Operational Commands

show ospf process

connections-limit

vpn 0 interface tunnel-interface connections-limit—Configure the maximum number of HTTPS connections that can be established to a vManage application server (on vManage NMSs only).

Command Hierarchy

```
vpn 0
  interface interface-name
   tunnel-interface
   connections-limit number
```

Syntax Descriptions

```
number
Number of HTTPS Connections:

Set the maximum number of HTTPS connections to a vManage application server.

Range:

1 through 512

Default:

50
```

Command History

Release	Modification
16.1.1	Command introduced.

Example

Configure the maximum number of HTTPS connections that a vManage NMS server accepts to 25:

```
vManage# show running-config vpn 0
vpn 0
host my ip 10.0.1.1
interface eth0
 ip dhcp-client
 no shutdown
 interface eth1
  tunnel-interface
   connections-limit 25
   allow-service dhcp
   allow-service dns
  allow-service icmp
   no allow-service sshd
   no allow-service netconf
   no allow-service ntp
   no allow-service stun
   allow-service https
  shutdown
```

Operational Commands

show control connections

show omp tlocs and show omp tlocs detail (see display the configured preference and weight values)

Related Topics

allow-service, on page 65

console-baud-rate

system console-baud-rate—Change the baud rate of the console connection on a vEdge router (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► System

Command Hierarchy

system
 console-baud-rate rate

Syntax Description

rate	Baud Rate:
rate	Set the baud rate, in baud or bits per second (bps). Each signal carries only one bit, so the baud rate is equal to the bits-per-second rate.
	Values:
	1200, 2400, 4800, 9600, 19200, 38400, 57600, 115200
	Default:
	115200
1	

Command History

Release	Modification
14.2	Command introduced.

Example

Change the console baud rate to 57600:

```
system
console-baud-rate 57600
```

Operational Commands

show running-config system

contact

snmp contact—Configure the name of a network management contact person for this vEdge device.

vManage Feature Template

For all vEdge devices:

Configuration ► Templates ► SNMP

Command Hierarchy

```
snmp
contact string
```

Syntax Description

string | Name of Contact:

Name of the contact person in charge of managing the Cisco vEdge device. The string can be a maximum of 255 characters. If it contains spaces, enclose the string in quotation marks (" ").

Command History

Release	Modification
14.1	Command introduced.

Example

Configure the name and phone number of the contact person:

```
vEdge(config) # snmp contact "Eve Lynn, 408-702-1234"
```

Operational Commands

show running-config snmp

container

The support for vContainer Host is deferred. For more information, refer to deferral notice.

Related Topics

ip address-list, on page 263

control

security control—Configure the protocol to use on control plane connections to a vSmart controller (Cisco SD-WAN Manager and Cisco Catalyst SD-WAN Controllers only).

vManage Feature Template

For Cisco SD-WAN Manager and Cisco Catalyst SD-WAN Controllers only:

Configuration ► Templates ► Security

Synax Description

protocol (dtls tls)	Protocol for Control-Plane Connections:
	Protocol to use for control plane connections.
	Default:
	DTLS
tls-portport-number	TLS Port Number:
	For TLS tunnels only, port number to use for TLS control plane connections.
	Range:
	1025 through 65535
	Default:
	23456

Command History

Release	Modification
14.3	Command introduced.

Operational Commands

show control connections

control-connections

vpn 0 interface tunnel-interface control-connections—Attempt to establish a DTLS or TLS control connection for a TLOC (on vEdge routers only). This is the default behavior.

When a vEdge router has multiple tunnel interfaces and hence multiple TLOCs, the router establishes only a single control connection to the Cisco SD-WAN Manager. The router chooses a TLOC at random for this control connection, selecting one that is operational (that is, one whose administrative status is up). If the chosen TLOC becomes non-operational, the router chooses another one.

For control connection traffic without dropping any data, a minimum of 650-700 kbps bandwidth is recommended with default parameters configured for hello-interval (10) and hello-tolerance (12).

Note

The interface marked as "last-resort" or admin down is skipped when calculating the number of control connections and partial status is determined based on the other tlocs which are UP. Since the last resort is expected to be down, it is skipped while calculating the partial connection status. Same is the case with admin down interfaces when a particular interface is configured as shutdown.

For example, when LTE transport is configured as a last resort circuit, and if the Edge device has 3 tlocs in total including the one with LTE interface, then the device reports partial on 2(4) control connection status.

Starting in Release 15.4, this command is deprecated. Use the max-control-connections command instead.

Command Hierarchy

```
vpn 0
  interface interface-name
   tunnel-interface
   [no] control-connections
```

Table 5: Syntax Description

no	Do Not Establish a Control Connection for a TLOC:
control-connections	Do not attempt to establish a control connection for a TLOC. You can configure this
	option only on a vEdge router that has multiple TLOCs. One of the TLOCs must attempt
	to establish a DTLS or TLS control connection so that the router learns overlay network
	routing information from the Cisco Catalyst SD-WAN Controllers. This routing
	information is shared across all the TLOCs on the router.

Command History

Release	Modification
15.1	Command introduced.
15.3.3 15.4	Supported a vEdge router establishes only one control connection to Cisco SD-WAN Manager.
	This command is deprecated. Use the max-control-connections command instead.

Example

On a vEdge router, configure two tunnel interfaces (two TLOCs). The tunnel on ge0/1 connects to a public WAN, and the tunnel on ge0/2 connects to a private MPLS network. The router establishes a control connection over ge0/1. The **no control-connections** command on ge0/2 disables attempts to establish control connections over the MPLS network.

```
vpn 0
  interface ge0/1
    ip address 172.16.31.3/24
    tunnel-interface
      encapsulation ipsec
      color biz-internet
      allow-service dhcp
      allow-service dns
      allow-service icmp
      no allow-service sshd
      no allow-service ntp
      no allow-service stun
    no shutdown
  interface ge0/2
    ip address 10.10.23.3/24
    tunnel-interface
      encapsulation ipsec
      color mpls restrict
      no control-connections
```

```
allow-service dhcp
allow-service dns
allow-service icmp
no allow-service sshd
no allow-service ntp
no allow-service stun
!
no shutdown
!
```

Operational Commands

show control connections

control-direction

vpn interface dot1x control-direction—Configure how the 802.1x interface sends packets to and receive packets from unauthorized clients (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface Ethernet

Command Hierarchy

```
vpn vpn-id
  interface interface-name
  dot1x
     control-direction (in-and-out | in-only)
```

Syntax Description

in-and-out	Send and Receive Packets:	
	Set the 802.1x interface to send packets to and receive packets from unauthorized clients. Bidirectionality is the default behavior.	
in-only	Send Packets Only:	
	Set the 802.1x interface to send packets to unauthorized clients, but not to receive them.	

Command History

Release	Modification
16.3	Command introduced.

Example

Configure an 802.1x interface to send packets to but not receive packets from unauthorized clients:

```
vEdge# show running-config vpn 0 interface ge0/7
vpn 0
  interface ge0/7
  dot1x
     control-direction in-only
```

Operational Commands

clear dot1x client

show dot1x clients

show dot1x interfaces

show dot1x radius

show system statistics

control-policy

policy control-policy—Configure or apply a centralized control policy (on vSmart controllers only).

vManage Feature Template

For vSmart controllers:

Configuration ► Policies

Command Hierarchy

Create a Centralized Control Policy

Apply a Centralized Control Policy

Syntax Description

policy-name	Control Policy Name:	
	Name of the control policy to configure or to apply to a site list. <i>policy-name</i> can be up to 32 characters long.	

Command History

Release	Modification
14.2	Command introduced.

Example

On a vSmart controller, configure a control policy that changes the TLOC address of matching prefixes:

Operational Commands

show policy commands

control-session-pps

system control-session-pps—Police the flow of DTLS control session traffic.

Note

The system control-session-pps is a no operational command for Cisco IOS XE Catalyst SD-WAN devices.

vManage Feature Template

For all the Cisco vEdge devices:

Configuration ► Templates ► System

Command Hierarchy

```
system
  control-session-pps rate
```

Syntax Description

rate | Flow Rate

Set the maximum rate of DTLS control session traffic, in packets per second (pps).

Range:

1 through 65535 pps

Default:

300 pps

Command History

Release	Modification
14.2	Command introduced.

Example

Change the maximum control session traffic rate to 250 pps:

```
system
control-session-pps 250
```

Operational Commands

show running-config system

Related Topics

```
host-policer-pps, on page 234 icmp-error-pps, on page 235 policer, on page 381
```

controller-group-id

Configure the identifier of the controller group to which the vSmart controller belongs (on vSmart controllers only).

Command Hierarchy

```
system
controller-group-id number
```

Syntax Description

nu	mber	Controller Group Identifier:
		Numeric identifier of the controller group to which the vSmart controller belongs.
		Range: 0 through 100
		Default: 0

Command History

Release	Modification
16.1	Command introduced.

Examples

Configure a vSmart controller to be in controller group 1:

```
vSmart(config) # system controller-group-name 1
```

Operational Commands

show control connections show running-config system

Related Topics

controller-group-list, on page 154

exclude-controller-group-list, on page 209 max-control-connections, on page 330 max-omp-sessions, on page 335

controller-group-list

To list the controller groups to which a router belongs, use the **controller-group-list** command in system configuration mode. A router can form control connections only with the Cisco vSmart Controllers that are in the same controller group. To delete the control connections from the Cisco vSmart Controllers, use the no form of this command.

controller-group-list list-of-controller-groups

no controller-group-list list-of-controller-groups

Syntax Description

list-of-controller-groups	Specifies an identifier of one or more Cisco vSmart Controller groups to which a router belongs. You configure this identifier on the Cisco vSmart Controllers, using the system controller-group-id command.				
	The number of controller groups cannot exceed the maximum number of control connections configured on the router.				

Command History

Release	Modification
16.1	Command introduced.

The following example allows a router to establish control connections to the Cisco vSmart Controllers in groups 1 and 2:

vEdge(config)# system controller-group-list 1 2
vEdge(config)# commit and-quit
vEdge# show control connections

						PEER		PEER	
			CONTRO	LLER					
PEER	PEER	PEER	SITE	DOMAIN	PEER	PRIVATE	PEER	PUBLIC	
			GROUP						
TYPE	PROTOCOL	SYSTEM IP	ID	ID	PRIVATE IP	PORT	PUBLIC IP	PORT	LOCAL COLOR
	STATE	UPTIME	ID						
vsmart	t dtls	172.16.255.19	100	1	10.0.5.19	12446	10.0.5.19	12446	lte
	up	0:00:	01:56 1						
vsmart	t dtls	172.16.255.20	200	1	10.0.12.20	12446	10.0.12.20	12446	lte
	up	0:00:	17:34 2						

For information on Cisco IOS XE **controller-group-list** command, see controller-group-list in the Cisco IOS XE SD-WAN Qualified Command Reference.

Operational Commands

show control affinity config show control affinity status show control connections show control local-properties

Related Topics

controller-group-id, on page 153 exclude-controller-group-list, on page 209 max-control-connections, on page 330 max-omp-sessions, on page 335

controller-mode

To switch from autonomous mode to controller and from controller mode to autonomous mode use the controller-mode command in Privileged EXEC mode.

controller-mode { enable | disable }

Syntax Description

enable	Enables controller mode.
disable	Disables controller mode.

Command Default

The device exists in the day 0 configuration mode.

Command Modes

Privileged EXEC #

Command History

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.2.1r	This command was introduced.

Usage Guidelines

When you switch the device mode from autonomous to controller, the startup configuration and the information in NVRAM (certificates), are erased. This action is same as the **write erase**. If you switch back to autonomous mode, the IOS XE configuration is not restored because the startup configuration is empty. You have to manually restore configuration from the backup..

When you switch the device mode from controller to autonomous, all Yang-based configuration is preserved and can be reused if you switch back to controller mode. If you switch back to controller mode, the original configuration in controller mode is preserved.

If the mode change CLI is invoked from a Telnet terminal, the mode change operation is not permitted unless auto-boot variables are set in ROMmon.

Example

Use the **controller-modedisable** command the device to autonomous mode.

Device# controller-mode disable

Use the **controller-modeenable** command switches the device to Controller mode.

Device# controller-mode enable

controller-send-path-limit

To set the number of OMP routes that a Cisco Catalyst SD-WAN Controller can send to other Cisco Catalyst SD-WAN Controllers, use the **controller-send-path-limit** command in OMP configuration mode. To set the send path limit to default, use the **no** form of this command.

controller-send-path-limit routes no controller-send-path-limit

Syntax Description

routes Specifies the number of OMP routes that Cisco Catalyst SD-WAN Controllers can send to other Cisco Catalyst SD-WAN Controllers. Range: 4 to 128.

Command Default

None

Command Modes

OMP configuration (config-omp)

Command History

Release	Modification
Cisco SD-WAN Release 20.5.1	This command was introduced.

Usage Guidelines

We recommend setting the route limit to default for full network visibility across controllers. This ensures that all available routes are exchanged, subject to a maximum limit of 128.

Example

The following example shows how to set 100 as the limit for the number of routes Cisco Catalyst SD-WAN Controllers can send.

```
Device(config)# omp
Device(config-omp)# controller-send-path-limit 100
```

cost

Configure the cost of an OSPF interface (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► OSPF

Command Hierarchy

```
vpn vpn-id
  router
  ospf
    area number
    interface interface-name
    cost number
```

Syntax Description

number	Cost of the interface.
	Range: 1 through 65535

Command History

Release	Modification
14.1	Command introduced.

Example

Set the interface cost to be 20:

```
vEdge# show running-config vpn 1 router ospf area 0
vpn 1
router
  ospf
  area 0
    interface ge0/0
      cost 20
    exit
  exit
!
!
```

Operational Commands

show ospf interface

country

Configure the country in which the vEdge WLAN router is installed (on vEdge cellular wireless routers only). Setting the country is mandatory. This configuration ensures that the router complies to local regulatory requirements, enforcing country-specific allowable channels, allowed users, and maximum power levels for the various frequency levels.

vManage Feature Template

For vEdge cellular wireless routers only:

Configuration ► Templates ► WiFi Radio

Command Hierarchy

```
wlan radio-band country country
```

Syntax Description

country

Country in which the WLAN vEdge router is installed.

Values: Australia, Austria, Belgium, Brazil, Bulgaria, Canada, China, Costa Rica, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hong Kong, Hungary, Iceland, India, Indonesia, Ireland, Italy, Japan, Latvia, Liechtenstein, Lithuania, Luxembourg, Malaysia, Malta, Mexico, Netherlands, New Zealand, Norway, Pakistan, Panama, Philippines, Poland, Portugal, Puerto Rico, Romania, Saudi Arabia, Singapore, Slovakia, Slovenia, South Africa, South Korea, Spain, Sri Lanka, Sweden, Switzerland, Taiwan, Thailand, Turkey, United Kingdom, United States, Vietnam

Default: United States

Example

Set the country to Canada:

```
vEdge# show running-config wlan
wlan 5GHz
channel 36
country canada
interface vap0
 ssid tb31 pm6 5ghz vap0
 no shutdown
 interface vap1
                 tb31 pm6 5ghz vap1
 ssid
  data-security wpa/wpa2-enterprise
 radius-servers tag1
 no shutdown
 interface vap2
 ssid
                  tb31 pm6 5ghz vap2
 data-security wpa/wpa2-personal mgmt-security optional
 wpa-personal-key $4$BES+IEZB2vcQpeEoSR4ia9JqgDsPNoHukAb8fvxAg5I=
 no shutdown
 interface vap3
 ssid
                 tb31_pm6_5ghz_vap3
 data-security wpa2-enterprise
 mgmt-security optional
 radius-servers tag1
 no shutdown
```

cpu-usage

To configure the CPU-usage watermarks, use the **cpu-usage** command in the alarms configuration mode. To revert to the default watermark values, use the **no** form of this command.

cpu-usage [**high-watermark-percentage** *percentage*] [**medium-watermark-percentage** *percentage*] [**low-watermark-percentage** *percentage*] [**interval** *seconds*]

no cpu-usage

•		-	-	
1	/ntax	Desc	rın	tion

high-watermark-percentage	Specifies the high-usage watermark percentage.
	Range: 1 to 100 percent
	Default: 90 percent
medium-watermark-percentage	Specifies the medium-usage watermark percentage.
	Range: 1 to 100 percent
	Default: 75 percent
low-watermark-percentage	Specifies the low-usage watermark percentage.
	Range: 1 to 100 percent
	Default: 60 percent
intervalseconds	Specifies how frequently CPU usage should be checked and reported by the device to Cisco vManage.
	Range: 1 to 4294967295 seconds
	Default: 5 seconds

Command Default

The default usage watermarks and polling interval are:

• High-usage-watermark: 90 percent

• Medium-usage-watermark: 75 percent

• Low-usage-watermark: 60 percent

• Polling interval: 5 seconds

Command Modes

Alarms configuration (config-alarms)

Command History

Release	Modification
Cisco SD-WAN Release 20.7.1	This command is introduced.

Examples

The following example shows a sample configuration of the CPU-usage watermarks and the polling interval:

```
config
system
alarms
cpu-usage
high-watermark-percentage 80
medium-watermark-percentage 70
low-watermark-percentage 50
interval 10
```

Related Commands

-	Command	Description
	alarms	Enters the alarms configuration mode.

crypto pki trustpoint

To declare the trustpoint that a router should use, use the **crypto pki trustpoint** command in global configuration mode. To delete all identity information and certificates associated with the trustpoint, use the **no** form of this command.

crypto pki trustpoint name

no crypto pki trustpoint name

Syntax Description

name	Creates a name for the trustpoint. The name should be same for
	trustpoint and rsakeypair. (If you previously declared the
	trustpoint and want to update the characteristics, specify the name
	you previously created.)

Command Default

No default behavior or values.

Command Modes

Global Configuration mode

Command History

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.2.1r	This command was introduced.

Release	Modification
Cisco SD-WAN Release 20.1.1	This command was introduced.

Usage Guidelines

Declaring Trustpoints

Use the **crypto pki trustpoint** command to declare a trustpoint, which can be a root certificate authority (CA) or a subordinate CA. Issuing the **crypto pki trustpoint** command enables the ca-trustpoint configuration mode.

You can specify characteristics for the trustpoint using the following subcommands:

- (Mandatory) enrollment url: Specifies the enrollment url that can reach the CA server.
- (Mandatory) **subject-name cn**: Specifies the subject name configuration, which is sent as part of Certificate Signing Request (CSR).
- (Mandatory) **fingerprint**: Specifies the CA certificate fingerprint.
- (Mandatory) **rsakeypair label keysize**: Specifies the RSA key-pair to be used and the keysize. The keypair label should be same as the trustpoint label.
- (Mandatory) **auto-enroll renewal percentage [regenerate]**: By configuring auto-enrollment, the router can request a new certificate at some time before its own certificate (known as its identity or ID certificate) expires. The command states that IOS should perform certificate renewal at exactly the mentioned percentage of the current lifetime of the certificate. It is recommended that the value for renewal percentage should be greater than 50. The keyword, **regenerate** states that IOS should regenerate the RSA key-pair known as shadow key-pair during every certificate renewal operation. The keyword, **regenerate** is optional.
- (Mandatory) **revocation-check type**: To disable revocation checking when the PKI trustpoint policy is being used, configure **revocation-check none**. By default, **revocation-check** is enabled.
- (Optional) password: Specifies the password phrase that the CA server expects for successful certificate enrollment.

Example

The following example shows a root CA for automatic certificate renewal configuration:

```
crypto pki trustpoint Root-CA
   enrollment url http://172.16.1.1:80
  password 0 passw0rd $Passw0rd
  subject-name CN=spoke-1.cisco.com,OU=CVO
  fingerprint CC748544A0AB7832935D8CD0214A152E
  rsakeypair Root-CA 2048
  auto-enroll 80
  revocation-check crl
```

Related Commands

Command	Description
show crypto pki trustpoints status	Displays the certificate authentication and enrollment status.

crypto pki authenticate

To authenticate the certification authority (CA) by getting the certificate of the CA, use the **crypto pki authenticate** command in privileged EXEC mode.

crypto pki authenticate trustpoint name

Syntax Description

trustpoint name	The name of the trustpoint. The CA certificate with the trustpoint	
	should be in a privacy-enhanced mail (PEM)-formatted file.	

Command Default

No default behavior or values.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.2.1r	This command was introduced.
Cisco SD-WAN Release 20.1.1	This command was introduced.

Usage Guidelines

This command is required when you initially configure CA support on a router.

This command authenticates the CA to the router by obtaining the certificate of the CA that contains the public key of the CA. The CA certificate associates with a trustpoint and it is verified based on the fingerprint configured on the trustpoint.

This command is not saved on the router configuration.

If the CA does not respond by a timeout period after this command is issued, the terminal control is returned so that it remains available. If this scenario happens, you must reenter the command. The CA certificate expiration dates set for beyond the year 2049 are not recognized. If the validity period of the CA certificate is set to expire after the year 2049, the following error message is displayed when authentication with the CA server is attempted:

error retrieving certificate: incomplete chain

If you receive an error message similar to this, check the expiration date of your CA certificate. If the expiration date of your CA certificate is set after the year 2049, you must reduce the expiration date by a year or more.

Example

In the following example, the router requests the certificate of CA from a specified enrollment URL. The router compares the fingerprint of the retrieved CA certificate with the fingerprint configured by the CA administrator in the trustpoint configuration. If both the fingerprints match, the CA certificate is installed.

Router# crypto pki authenticate Root-CA

Certificate has the following attributes:

Fingerprint MD5: 755C9485 DDACCOBD B5ED93E6 4E8A7DEB
Fingerprint SHA1: 4D4380EA 07392044 6A5BF891 938AC610 COCOAA6D
Trustpoint Fingerprint: 4D4380EA 07392044 6A5BF891 938AC610 COCOAA6D
Certificate validated - fingerprints matched.

Trustpoint CA certificate accepted.

Router#

Related Commands

Command	Description
show crypto pki trustpoints status	Displays the certificate authentication and enrollment status.
crypto pki trustpoint	Declares the certificate authority that the router should use.

crypto pki enroll

To obtain the certificates of a router from the certificate authority (CA), use the **crypto pki enroll** command in privileged EXEC mode.

crypto pki enroll name

Syntax Description

n	name	The name of the CA. Use the same name as used when declaring
		the CA using the crypto pki trustpoint command.

Command Default

No default behavior or values.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.2.1r	This command was introduced.
Cisco SD-WAN Release 20.1.1	This command was introduced.

Usage Guidelines

This command requests certificates from the CA for SCEP configuration. This task is also known as enrolling with the CA. (Technically, enrolling and obtaining certificates are two separate events, but they both occur when this command is issued.)

The router needs a signed certificate from the CA for each RSA key pair of a router; if you previously generated general-purpose keys, this command obtains the certificate corresponding to the general-purpose RSA key pair.

You can remove existing certificates with the **no crypto pki trustpoint** command.

The **crypto pki enroll** command is not saved in the router configuration.

Note

If the router reboots after you issue the **crypto pki enroll** command but before you receive the certificates, ensure that you reissue the command.

Note

If you are using a Secure Shell (SSH) service, ensure to set up specific RSA key pairs (different private keys) for the trustpoint and the SSH service. (If the Public Key Infrastructure [PKI] and the SSH infrastructures share the same default RSA key pair, a temporary disruption of SSH service can occur. The RSA key pair can become invalid or can change because of the CA system, in which case you cannot log in using SSH. You receive the following error message: "key changed, possible security problem.")

Examples

In the following example, a router with a general-purpose RSA key pair requests a certificate from the CA.

```
Router# crypto pki enroll Root-CA
% Certificate request sent to Certificate Authority
% The certificate request fingerprint will be displayed.
% The 'show crypto pki certificates' command will also show the fingerprint.
Router#
```

When later, the router receives the certificate from the CA, it displays the following confirmation message:

```
Router# Fingerprint: 01234567 89ABCDEF FEDCBA98 75543210
%CRYPTO-6-CERTRET: Certificate received from Certificate Authority
Router #
```

If necessary, the router administrator can verify the displayed fingerprint with the CA administrator.

If there is a problem with the certificate request and the certificate is not granted, the following message appears on the console instead:

```
%CRYPTO-6-CERTREJ: Certificate enrollment request was rejected by Certificate Authority
```

Requesting certificates for a router with special-usage keys is the same as in the previous example, except that two certificates are returned by the CA. When the router receives the two certificates, the router displays the same confirmation message:

%CRYPTO-6-CERTRET: Certificate received from Certificate Authority

Related Commands

Command	Description
show crypto pki trustpoint	Displays the trustpoints that are configured on the router.

crypto pki import

To import a certificate manually via file system on a device such as bootflash, use the **crypto pki import** command in the privileged EXEC mode.

crypto pki import name certificate

Syntax Description

name certificate	Name of the certification authority (CA). This name is the same
	name used when the CA was declared with the crypto pki
	trustpoint command. The certificate file should be in PEM
	format.

Command Default

No default behavior or values.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.2.1r	This command was introduced.
Cisco SD-WAN Release 20.1.1	This command was introduced.

Usage Guidelines

For importing a certificate, ensure that a file is available in the bootflash device. The name of the file must be, <trustpoint-name>.crt and must be in PEM format. If you use usage keys (signature and encryption keys), ensure to enter the **crypto pki import** command twice.

Example

The following example shows how to import a certificate using the CA trustpoint, "Root-CA."

```
crypto pki trustpoint
```

```
Root-CA

crypto pki authenticate Root-CA

crypto pki enroll Root-CA

crypto pki import Root-CA certificate
```

Related Commands

Command	Description
show crypto pki trustpoint	Declares the CA that your router should use.
enrollment	Specifies the enrollment parameters of the CA.

custom-eflow

To define scope for eflow detection, use the **custom-eflow** command in policy elephant-flow configuration mode. To disable the configuration, use the **no** form of the command.

```
custom-eflow [ sequence sequence-num ]
no custom-eflow [ sequence sequence-num ]
```

Syntax Description

sequence	Specifies list of sequences.
sequence-num	Specify sequence value.
	Range: 1 to 255
	Default: 1

Command Default

If custom-eflow sequences are not configured, any flow which has more packet rate than elephant-flow-rate-threshold is considered as an elephant flow.

Command Modes

Policy elephant-flow configuration (policy-elephant-flow)

Command History

Release	Modification
Cisco SD-WAN Release 20.9.1	This command was introduced.

Usage Guidelines

A maximum of 8 custom-eflow sequences can be configured. If custom-eflow sequences are not configured, any flow which has more packet rate than elephant-flow-rate-threshold is considered as an elephant flow. However, even if a single custom-eflow sequence is configured, only flows matching atleast one of the custom-eflow sequences will be considered as elephant flows.

Examples

The following example shows how to configure custom-eflow sequences using the **custom-eflow** command:

```
vEdge2k(config) # policy
vEdge2k(config-policy) # elephant-flow
vEdge2k(policy-elephant-flow) # enable
vEdge2k(policy-elephant-flow) # custom-eflow
vEdge2k(policy-custom-eflow) # sequence 1
vEdge2k(config-sequence-1) #
```

das

Configure dynamic authorization service (DAS) parameters for use with IEEE 802.1X authentication so that the router can accept change of authentication (CoA) requests from a RADIUS server (on vEdge routers only).

When discussing DAS, the vEdge router (the NAS) is the server and the RADIUS server (or other authentication server) is the client.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface Ethernet

Command Hierarchy

```
vpn vpn-id
  interface interface-name
  dot1x
  das
```

client ip-address
port port-number
require-timestamp
secret-key password
time-window seconds
vpn vpn-id

Syntax Description

secret-key Password	Password:
	Password that the RADIUS or other authentication server uses to access the vEdge router 802.1X interface.
port port-number	Port Number:
	UDP port number for the vEdge router to use to listen for CoA requests from the RADIUS server. If you configure DAS on multiple 802.1Z interfaces on a vEdge router, you must configure each interface to use a different UDP port.
	Range: 1 through 65535
	Default: 3799
client ip-address	RADIUS Server IP Address:
	IP address of the RADIUS authentication server or other authentication server from which to accept CoA requests.
require-timestamp	Timestamps:
	Require the DAS client (which is the RADIUS or other authentication server) to include an event timestamp in all CoA messages.
	When timestamps are required both the vEdge router and the RADIUS server check that the timestamp in the CoA request is current and within a specific time window (the default time window is 5 minutes). If it is not, the CoA request is discarded. Also, when timestamps are required, a CoA received without a timestamp is discarded immediately.
	By default, timestamps are not required.
time-window seconds	Time Window:
	How long a CoA request is valid. The time window is applied to CoA requests only if you have configured require-timestamp . When you configure timestamps, both the vEdge router and the RADIUS server check that the timestamp in the CoA request is within the time window. If the timestamp is outside this window, the CoA request is discarded.
	Range: 0 through 1000 seconds
	Default: 300 seconds (5 minutes)
vpn vpn-id	VPN:
	VPN through which the RADIUS or other authentication server is reachable.

Command History

Release	Modification
16.3	Command introduced.

Example

Configure DAS with a network RADIUS servers to allow the vEdge router to accept CoA requests from that server. This configuration requires timestamps in the CoA requests and extends the valid CoA window to 10 minutes.

```
vEdge(config-das)# show full-configuration
vpn 0
interface ge0/2
dot1x
das
   time-window 600
   require-timestamp
   client 10.1.15.150
   secret-key $4$L3rwZmsIic8zj4BgLEFXKw==
!
!
!
!
```

radius, on page 413

data-policy

Configure or apply a centralized data policy based on data packet header fields (on vSmart controllers only).

Command Hierarchy

Create a Centralized Data Policy:

```
policy
  data-policy policy-name
   vpn-list list-name
    default-action action
    sequence number
    match
        app-list list-name
        destination-data-prefix-list list-name
```

```
destination-ip prefix/length
         destination-port number
        dns (request | response)
        dns-app-list list-name
        dscp number
        packet-length bytes
        plp (high | low)
        protocol number
         source-data-prefix-list list-name
         \verb"source-ip" prefix/length"
         source-port number
         tcp flag
       action
         cflowd (not available for deep packet inspection)
         count counter-name
        drop
         log
         tcp-optimization
         accept
          nat [pool number] [use-vpn 0] (in Releases 16.2 and earlier, not available for
deep packet inspection)
          redirect-dns (host | ip-address)
            dscp number
             forwarding-class class
            local-tloc color color [encap encapsulation]
            local-tloc-list color color [encap encapsulation] [restrict]
            next-hop ip-address
             policer policer-name
             service service-name local [restrict] [vpn vpn-id]
             service service-name [tloc ip-address | tloc-list list-name] [vpn vpn-id]
             tloc ip-address color color [encap encapsulation]
             tloc-list list-name
             vpn vpn-id
```

Apply a Centralized Data Policy:

```
apply-policy
  site-list list-name data-policy policy-name (all | from-service | from-tunnel)
  cflowd-template template-name
apply-policy
  site-list list-name vpn-membership policy-name
```

Syntax Description

policy-name	Data Policy Name:
	Name of the localized data policy to configure or to apply to a list of sites in the overlay network.
	Maximum characters: 32

Command History

Release	Modification
14.1	Command introduced.

Example

Configure and apply a simple data policy

```
vSmart# show running-config policy
policy
data-policy test-data-policy
 vpn-list test-vpn-list
  sequence 10
   match
    destination-ip 172.16.0.0/24
   action drop
    count test-counter
  default-action drop
 !
 !
 lists
 vpn-list test-vpn-list
  vpn 1
 site-list test-site-list
  site-id 500
  !
vSmart# show running-config apply-policy
apply-policy
site-list test-site-list
 data-policy test-data-policy
```

Verify the data policy

Immediately after we activate the configuration on the vSmar controller, it pushes the policy configuration to the vEdge routers in site 500. One of these routers is vEdge5, where we see that the policy has been received:

```
vEdge5# show omp data-policy
policy-from-vsmart
data-policy test-data-policy
 vpn-list test-vpn-list
   sequence 10
   match
    destination-ip 172.16.0.0/24
   action drop
    count test-counter
   !
   default-action drop
  !
 lists
 vpn-list test-vpn-list
  vpn 1
  1
```

!

Operational Commands

show policy data-policy-filter show policy from-vsmart show running-config policy

Related Topics

vpn-membership, on page 549

data-security

Configure the Wi-Fi protected access (WPA) and WPA2 data protection and network access control to use for an IEEE 802.11i wireless LAN (on vEdge cellular wireless routers only).

WPA authenticates individual users on the WLAN using a username and password. WPA uses the Temporal Key Integrity Protocol (TKIP), which is based on the RC4 cipher.

WPA2 implements the NIST FIPS 140-2—compliant AES encryption algorithm along with IEEE 802.1X-based authentication, to enhance user access security over WPA. WPA2 uses the Counter Mode Cipher Block Chaining Message Authentication Code Protocol (CCMP), which is based on the AES cipher.

Authentication is done either using preshared keys and through RADIUS authentication.

vManage Feature Template

For vEdge cellular wireless routers only:

Configuration ► Templates ► WiFi SSID

Command Hierarchy

wlan radio-band
 interface vap number
 data-security security

Syntax Description

security

Data Security Method:

Security method to apply to wireless LAN network data. It can be one of the following:

- none—No security is applied to the WLAN data. This is the default.
- wpa-enterprise—Also called WPA-802.1X mode. Enable WPA security in conjunction with a RADIUS authentication server. Configure the RADIUS server to use with the **radius-servers** command.
- wpa-personal—Also called WPA-PSK (preshared key) mode. Enable WPA security where
 each user enters a username and password to connect to the WLAN. Each wireless network
 device encrypts network traffic using a 256-bit key. Configure the password with the
 wpa-personal-key command.
- wpa/wpa2-enterprise—Enable both WPA and WPA2 security in conjunction with a RADIUS authentication server. Configure the RADIUS server to use with the **radius-servers** command.
- wpa/wpa2-personal—Enable both WPA and WPA2 security using only a username and password for authentication. Configure the password with the **wpa-personal-key** command.
- wpa2-enterprise—Enable WPA2 security in conjunction with a RADIUS authentication server. Configure the RADIUS server to use with the **radius-servers** command.
- wpa2-personal—Enable WPA2 security using only a username and password for authentication. Configure the password with the **wpa-personal-key** command.

Command History

Release	Modification
16.3	Command introduced.

Example

Configure data security on VAP interfaces 1, 2, and 3:

```
vEdge# show running-config wlan
wlan 5GHz
channel 36

dead-interval

Set the interval during which at least one OSPF hello packet must be received from a neighbor before declaring that neighbor to be down (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► OSPF

Command Hierarchy

```
vpn vpn-id
  router
   ospf
     area number
     interface interface-name
     dead-interval seconds
```

seconds | Dead Interval:

Time interval during which the vEdge router must receive an OSPF hello packet from its neighbor. If no packet is received, the vEdge router assumes that the neighbor is down.

The default dead interval of 40 seconds is four times the default hello interval of 10 seconds.

Range: 1 through 65535 seconds

Default: 40 seconds

Command History

Release	Modification
14.1	Command introduced.

Example

Set the OSPF dead interval to 30 seconds:

```
vEdge# show running-config vpn 1 router ospf area 0
vpn 1
router
ospf
  area 0
    interface ge0/0
      dead-interval 30
    exit
  exit
!
!
```

Operational Commands

show ospf interface

dead-peer-detection

Configure the parameters for detecting unreachable IKE peers through an IPsec tunnel (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface IPsec

Command Hierarchy

```
vpn vpn-id
interface ipsecnumber
dead-peer-detection interval seconds [retries number]
```

Syntax Description

interval seconds	Liveness Detection Interval: How often to send an IKE Hello packet to determine whether the IKE peer is alive and reachable. The IKE peer responds to the Hello packet by sending an acknowledgement (ACK) packet to the vEdge router. Range: 0 - 30 seconds Default: 10 seconds
retries number	Maximum Number of Retries: How many unacknowledged IKE Hello packets to send before declaring the IKE peer to be dead. Range: 0 - 255 Default: 3

Command History

Release	Modification
17.2	Command introduced.

Example

Change the liveness detection interval to 30 seconds and the number of retries to 10:

```
vEdge(config) # vpn 1 interface ipsec1
vEdge(config-interface-ipsec1) # dead-peer-detection 30 retries 10
```

Operational Commands

clear ipsec ike sessions show ipsec ike inbound-connections show ipsec ike outbound-connections show ipsec ike sessions

default-action

Configure the default action to take when the match portion of a policy is not met (on vEdge routers and vSmart controllers only).

vManage Feature Template

For vEdge routers and vSmart controllers:

```

For Zone-Based Firewalls

Configure on vEdge routers only.

```
policy
zone-based-policy policy-name
  default-action action
```

Syntax Description

default-action sla-class sla-class-name	Default Action for Application-Aware Routing:	
	Default SLA to apply if a data packet being evaluated by the policy matches none of the match conditions. If you configure no default action, all data packets are accepted and no SLA is applied to them.	

policy control-policy policy-name default-action (accept reject) policy route-policy policy-name default-action (accept reject) policy data-policy policy-name default-action (accept drop) policy vpn-membership policy-name	Default Action for Control Policy and Data Policy: Default action to take if an item being evaluated by a policy matches none of the match conditions. If you configure no policy (specifically, if you configure no match–action sequences within a policy), the default action, by default, is to accept all items. If you configure a policy with one or more match–action sequences, the default action, by default, is to either reject or drop the item, depending on the policy type.
default-action (accept drop)	Default Action for Zone-Base Firewall Policy
	Default action to take if a data traffic flow matches none of the match conditions. drop discards the data traffic.
	inspect inspects the packet's header to determine its source address and port. The address and port are used by the NAT device to allow traffic to be returned from the destination to the sender.
	pass allows the packet to pass to the destination zone without inspecting the packet's header at all. With this action, the NAT device blocks return traffic that is addressed to the sender.

Command History

Release	Modification
14.1	Command introduced.
14.2	Add application-aware routing.
18.2	Add zone-based firewall policy.

Example

Create a centralized control policy that changes the TLOC for accepted packets:

```
policy
  control-policy change-tloc
  default-action accept
  sequence 10
    action accept
  tloc 1.1.1.2
```

Operational Commands

show running-config policy

default-information originate

Generate a default external route into an OSPF routing domain (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► OSPF

Command Hierarchy

```
vpn vpn-id
  router
  ospf
  default-information
    originate (always | metric metric | metric-type type)
```

Syntax Description

originate metric-type type 1	Advertise Type 1 External Routes: Advertise the default route as an OSPF Type 1 external route.
originate metric-type type 2	Advertise Type 2 External Routes: Advertise the default route as an OSPF Type 2 external route.
originate always	Always Advertise the Default Route: Always advertise the default route in an OSPF routing domain.
originate metric metric	Assign a Metric to the Default Route Set the metric to use to generate the default route. Range: 0 through 16777214

Command History

Release	Modification
14.1	Command introduced.
17.1	Remove default value for originate metric

Example

Always advertise the default route:

```
vEdge(config-ospf)# default-information originate always
vEdge(config-ospf)# show configuration
vpn 1
  router
   ospf
```

```
default-information originate always
 !
 !
!
```

When default-information originate is configured on a vEdge router, the source route checking is not performed, and hence the DN-bit is not set. You can configure OMP to OSPF router redistribution for default route, if DN-bit is required:

```
policy
lists
 prefix-list DEFAULT ROUTE
   ip-prefix 0.0.0.0/0
route-policy OMP2OSPF
sequence 10
  match
   address DEFAULT ROUTE
   action accept
  default-action reject
!
vpn 1
router
 ospf
  default-information originate
   redistribute omp route-policy OMP2OSPF
```

Operational Commands

show ospf routes

default-vlan

Configure the VLAN for 802.1X–compliant clients that are successfully authenticated by the RADIUS server (on vEdge routers only).

If you do not configure a default VLAN on the vEdge router, successfully authenticated clients are placed into VLAN 0, which is the VLAN associated with an untagged bridge.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface Ethernet

Command Hierarchy

```
vpn vpn-id
  interface interface-name
  dot1x
    default-vlan vlan-id
```

Syntax Description

vlan-id VLAN Identifier:

Identifier of the VLAN for 802.1X-compliant clients that are successfully authenticated by the RADIUS server.

Command History

Release	Modification
16.3	Command introduced.

Example

Configure a default VLAN:

```
bridge 10
name Authorize_VLAN
vlan 10
interface ge0/5
 no native-vlan
 no shutdown
vpn 0
interface ge0/5
 dot1x
                    10
  default-vlan
 no shutdown
```

Operational Commands

clear dot1x client show dot1x clients show dot1x interfaces show dot1x radius

show system statistics

Related Topics

auth-fail-vlan, on page 82
auth-reject-vlan, on page 88
bridge, on page 117
guest-vlan, on page 223
radius, on page 413
```

description

Configure a text description for a parameter or property.

vManage Feature Template

For all Cisco vEdge devices:

Instances of the **description** command appear in multiple configuration templates.

Command Hierarchy

Instances of the **description** command appear throughout the configuration command hierarchy on Cisco vEdge devices.

Syntax Description

```
text | Text Description
```

Text description of the parameter or property.

The text can be a maximum of 128 characters. If it includes spaces, enclose the entire string in quotation marks (" ").

Command History

Release	Modification
14.1	Command introduced.

Example

Configure a text description for an interface:

```
vEdge(config-interface-ge0/4) # description "VPN 1 interface"
vEdge(config-interface-ge0/4) # show config
vpn 1
  interface ge0/4
   description "VPN 1 interface"
  !
```

Operational Commands

show interface description

show running-config vpn

Related Topics

name, on page 344

device-groups

Configure one or more groups to which the vEdge device belongs.

vManage Feature Template

For all vEdge devices:

Configuration ► Templates ► System

Command Hierarchy

```
system
device-groups [group-name]
```

Syntax Description

group-name	Group Names:
[group-names]	Name of one or more groups to which the device belongs. When specifying multiple group names, enclose the names in square brackets. When a group name contains spaces, enclose it in quotation marks (" ").

Command History

Release	Modification
14.2	Command introduced.

Example

Add a vEdge router to two groups: London and the United Kingdom:

```
vEdge(config) # system
vEdge(config-system) # device-groups London
vEdge(config-system) # device-groups [ "United Kingdom" ]
```

dhcp-helper

Allow an interface to act as a DHCP helper (on vEdge routers only). A DHCP helper interface forwards BOOTP (Broadcast) DHCP requests that it receives from the DHCP server specified by the configured IP helper address.

You can configure a DHCP helper only on service-side interfaces. These are interfaces in any VPN except VPN 0 (the WAN-side transport VPN) and VPN 512 (the out-of-band management VPN).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface Bridge

```
Configuration ► Templates ► VPN Interface Ethernet
```

Configuration ► Templates ► VPN Interface PPP Ethernet

Command Hierarchy

```
vpn id
  interface interface-name
  dhcp-helper ip-addresses
```

Syntax Description

ip-addresses	IP Address of DHCP Server
	IP addresses of one or more DHCP servers. You can configure up to eight IP addresses in a single dhcp-helper command. The addresses cannot be broadcast addresses.

Command History

Release	Modification	
14.1	Command introduced.	
14.3	Add support for four IP addresses on a single DHCP helper interface.	
17.2.2	Add support for eight IP addresses on a single DHCP helper interface.	

Example

Configure the IP address of a DHCP server to allow an interface to be a DHCP helper:

```
vEdge# config
Entering configuration mode terminal
vEdge(config)# vpn 1 interface ge0/4
vEdge(config-interface-ge0/4)# dhcp-helper 10.22.11.1
vEdge(config-interface-ge0/4)# commit and-quit
Commit complete.
vEdge# show running-config vpn 1 interface ge0/4
vpn 1
interface ge0/4
description "VPN 1 interface"
ip address 10.20.25.16/24
dhcp-helper 10.22.11.1
no shutdown
!
!
```

Configure multiple DHCP helpers:

```
vEdge(config-interface-ge0/4) # dhcp-helper 10.20.24.16 10.20.24.17 10.20.24.18 10.20.24.19
vEdge(config-interface-ge0/4) # show full-configuration
vpn 1
interface ge0/4
ip address 10.20.24.15/24
dhcp-helper 10.20.24.16 10.20.24.17 10.20.24.18 10.20.24.19
```

```
no shutdown!
```

Operational Commands

show running-config vpn interface

Related Topics

dhcp-server, on page 184

dhcp-server

Enable DHCP server functionality on a vEdge router so it can assign IP addresses to hosts in the service-side network (on vEdge routers only).

You can configure a DHCP helper only on service-side interfaces. These are interfaces in any VPN except VPN 0 (the WAN-side transport VPN) and VPN 512 (the out-of-band management VPN).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► DHCP Server

Command Hierarchy

```
vpn vpn-id
  interface geslot/port
    dhcp-server
      address-pool prefix/length
      admin-state (down | up)
      exclude ip-address
      lease-time seconds
      max-leases number
      offer-time seconds
      options
        default-gateway ip-address
        {\tt dns-servers}\ ip{\tt -address}
        domain-name domain-name
        interface-mtu mtu
        tftp-servers ip-address
      static-lease mac-address ip ip-address host-name hostname
```

Syntax Description

None

Command History

Release	Modification
14.3	Command introduced.

Example

Configure the interface to be the DHCP server for the addresses covered by the IP prefix 10.0.100.0/24:

```
vEdge# config
Entering configuration mode terminal
vEdge(config)# vpn 1 interface ge0/4
vEdge(config-interface-ge0/4)# dhcp-server address-pool 10.0.100.0/24
vEdge(config-dhcp-server)# show full-configuration
vpn 1
  interface ge0/4
  dhcp-server
   address-pool 10.0.100.0/24
  !
  !
  !
  !
```

Operational Commands

clear dhcp server-bindings show dhcp interface show dhcp server

Related Topics

dialer down-with-vlnterface

To track a Point-to-Point Protocol (PPP) session over a dialer interface on Cisco IOS XE Catalyst SD-WAN devices, use the **dialer down-with-vInterface** in the interface configuration mode. It specifies the status of the dialer interface that uses to connect to a specific destination subnetwork.

dialer down-with-vInterface

Command Default

The dialer interface is disabled.

Command Modes

Interface configuration

Command History

	Release	Modification
-	Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	This command was introduced.

Example

The following is a sample output from the show dialer command for an asynchronous interface:

```
Device# show interface dialer1

Dialer1 is down, line protocol is down (spoofing)

Hardware is Unknown
```

```
Internet address will be negotiated using IPCP
MTU 1500 bytes, BW 56 Kbit/sec, DLY 20000 usec,
    reliability 255/255, txload 1/255, rxload 1/255
Encapsulation PPP, LCP Closed, loopback not set
Keepalive set (10 sec)
DTR is pulsed for 1 seconds on reset
Last input never, output never, output hang never
Last clearing of "show interface" counters 00:50:36
Input queue: 0/75/0/0 (size/max/drops/flushes); Total output drops: 0
Queueing strategy: fifo
Output queue: 0/40 (size/max)
5 minute input rate 0 bits/sec, 0 packets/sec
5 minute output rate 0 bits/sec, 0 packets/sec
0 packets input, 0 bytes
538 packets output, 7524 bytes
```

direction

Configure the direction in which a NAT interface performs address translation (on vEdge routers only). For each NAT pool interface, you can configure only one direction.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface Cellular (for vEdge cellular wireless routers only)

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface NAT Pool

Configuration ► Templates ► VPN Interface PPP

Command Hierarchy

```
vpn vpn-id
  interface natpoolnumber
  nat
     direction (inside | outside)
```

Syntax Description

(inside | outside)

Direction To Perform Network Address Translation:

Direction in which to perform network address translation. It can be one of the following:

- inside—Translate the source IP address of packets that are coming from the service side of the vEdge router and that are destined to transport side of the router. This is the default
- outside —Translate the source IP address of packets that are coming to the vEdge router from the transport side of the vEdge router and that are destined to a service-side device.

Command History

Release	Modification
16.3	Command introduced.

Example

Configure a vEdge router to NAT a service-side and a remote IP address:

```
vEdge# show running-config vpn 1
interface natpool1
  ip address 10.15.1.4/30
  nat
    static source-ip 10.1.17.3 translate-ip 10.15.1.4 inside
    static source-ip 10.20.25.18 translate-ip 10.25.1.1 outside
    no overload
!
direction inside
  no shutdown
!
```

Operational Commands

```
show ip nat filter
show ip nat interface
show ip nat interface-statistics
```

Related Topics

encapsulation, on page 205

discard-rejected

Have OMP discard routes that have been rejected on the basis of policy (on vSmart controllers only). By default, rejected routes are not discarded.

vManage Feature Template

For vSmart controllers only:

Configuration ► Templates ► OMP

Command Hierarchy

```
omp
discard-rejected
```

Syntax Description

None

Command History

Release	Modification
15.4	Command introduced.

Example

Configure a vSmart controller to discard routes that have been rejected by a policy:

```
vSmart# show running-config omp
omp
no shutdown
discard-rejected
graceful-restart
timers
holdtime 15
exit
```

Operational Commands

show omp peers show omp routes show omp services show omp summary show omp tlocs

disk-speed

To configure watermarks for the disk read and write speeds for disk partitions on a Cisco vManage server, use the **disk-speed** command in the alarms configuration mode. To remove the configuration, use the **no** form of this command.

disk-speed disk-partition [read-high-watermark-kBps speed] [read-medium-watermark-kBps speed] [low-watermark-percentage percentage] [interval seconds]

no disk-speed disk-partition

Syntax Description

disk-partition	Specifies the disk partition for which the read and write speed watermarks should be applied. (Use '?' to view available disk partitions.)
high-watermark-percentage	Specifies the high-usage watermark percentage.
	Range: 1 to 100 percent
	Default: 90 percent

medium-watermark-percentage	Specifies the medium-usage watermark percentage. Range: 1 to 100 percent Default: 75 percent
low-watermark-percentage	Specifies the low-usage watermark percentage. Range: 1 to 100 percent Default: 60 percent
intervalseconds	Specifies how frequently disk usage should be checked and reported by the device to Cisco vManage. Range: 1 to 4294967295 seconds Default: 5 seconds

Command Default

By default, watermarks for disk read and write speeds are not configured.

Command Modes

Alarms configuration (config-alarms)

Command History

Release	Modification
Cisco SD-WAN Release 20.7.1	This command is introduced.

Examples

The following example shows a sample configuration of the disk read and write speed watermarks and the polling interval:

```
config
system
alarms
disk-speed /dev/nvmeln1
read-high-watermark-kBps 1000
read-medium-watermark-kBps 500
read-low-watermark-kBps 1000
write-high-watermark-kBps 1000
write-medium-watermark-kBps 500
write-low-watermark-kBps 1000
interval 100
```

Related Commands

Command	Description
alarms	Enters the alarms configuration mode.

disk-usage

To configure the disk-usage watermarks, use the **disk-usage** command in the alarms configuration mode. To revert to the default watermark values, use the **no** form of this command.

disk-usage file-system-path [high-watermark-percentage percentage] [medium-watermark-percentage percentage] [low-watermark-percentage percentage] [interval seconds]

no disk-usage file-system-path

•		_			
81	ntax	Heer	ru	ntın	ı
•	HILUA	2000		,,,,	ш

file-system-path	Specifies the file system path for which the disk usage watermarks should be applied. (Use '?' to view available file system paths.)
high-watermark-percentage	Specifies the high-usage watermark percentage.
	Range: 1 to 100 percent
	Default: 90 percent
medium-watermark-percentagepercentage	Specifies the medium-usage watermark percentage.
	Range: 1 to 100 percent
	Default: 75 percent
low-watermark-percentagepercentage	Specifies the low-usage watermark percentage.
	Range: 1 to 100 percent
	Default: 60 percent
intervalseconds	Specifies how frequently disk usage should be checked and reported by the device to Cisco vManage.
	Range: 1 to 4294967295 seconds
	Default: 5 seconds

Command Default

The default usage watermarks and polling interval are:

• High-usage-watermark: 90 percent

Medium-usage-watermark: 75 percent

• Low-usage-watermark: 60 percent

• Polling interval: 5 seconds

Command Modes

Alarms configuration (config-alarms)

Command History

Release	Modification
Cisco SD-WAN Release 20.7.1	This command is introduced.

Examples

The following example shows a sample configuration of the disk-usage watermarks and the polling interval:

config
system
alarms
disk-usage /tmp

high-watermark-percentage 80 medium-watermark-percentage 70 low-watermark-percentage 50 interval 10

Related Commands

_	Command	Description
	alarms	Enters the alarms configuration mode.

distance

Define the OSPF route administration distance based on route type (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► OSPF

Command Hierarchy

```
vpn vpn-id
  router
  ospf
    distance
    external number
    inter-area number
  intra-area number
```

Syntax Description

external number	Distance for External Routes:
	Set the OSPF distance for routes learned from other domains.
	Range: 0 through 255
	Default: 110
inter-area	Distance for Interarea Routes
number	Set the distance for routes coming from one area into another.
	Range: 0 through 255
	Default: 110
inter-area	Distance for Intra-Area Routes
number	Set the distance for routes within an area.
	Range: 0 through 255
	Default: 110

Command History

Release	Modification
14.1	Command introduced.

Example

Change the OSPF distance for routes learned from other domains:

```
vEdge# config
Entering configuration mode terminal
vEdge(config)# vpn 1 router ospf
vEdge(config-ospf)# distance external 50
vEdge(config-ospf)# show config
vpn 1
router
    ospf
    distance external 50
!
!
!
```

Operational Commands

show ospf routes

dns

Configure the address of a DNS server within a VPN.

vManage Feature Template

For all vEdge devices:

Configuration ► Templates ► VPN

Command Hierarchy

```
vpn vpn-id
  dns ip-address (primary | secondary)
```

Syntax Description

ip-address	Address of DNS Server: IPv4 or IPv6 address of a DNS server reachable from the vEdge device.
(primary secondary)	Primary or Secondary Server: Specify whether the DNS server is the primary server or a backup.
	Default: primary

Command History

Release	Modification
14.1	Command introduced.
16.3	Add support for IPv6 DNS server addresses.

Example

Configure a DNS server in VPN 3:

```
vEdge(config) # vpn 3 dns 1.2.3.4 primary
vEdge(config-vpn-3) # show configuration
vpn 3
dns 1.2.3.4 primary
```

Operational Commands

show running-config vpn

domain-id

Configure the identifier for the vEdge device overlay network domain (available on vSmart controllers and vEdge routers).

Command Hierarchy

```
system domain-id domain-id
```

Syntax Description

domain-id Domain Identifier A numeric identifier for the vEdge device overlay network domain. The domain identifier must be the same for all vEdge devices that reside in the same domain. Currently, the vEdge software supports only a single domain. Range: 1 through 4294967295 (a 32-bit integer) Default: 1 (value that is configured when the vSmart controller or vEdge router is first booted)

Command History

Release	Modification
14.1	Command introduced.
14.2	Domain ID default changed to 1.

Example

Configure the domain identifier to be 2:

```
vSmart# show running-config system
system
  system-ip 1.1.1.9
  domain-id 2
  site-id 50
  vbond 10.0.4.12
!
```

Operational Commands

show control local-properties

dot1x

Configure port-level 802.1X parameters on a router interface in VPN 0 (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface Ethernet

```
vpn 0
  interface interface-name
   dot.1x
      accounting-interval minutes
      acct-req-attr attribute-number (integer integer | octet octet | string string)
      auth-fail-vlan vlan-id
      auth-order (mab | radius)
      auth-reject-vlan vlan-id
      auth-req-attr attribute-number (integer integer | octet octet | string string)
      control-direction direction
      das
        client ip-address
       port port-number
        require-timestamp
       secret-key password
       time-window seconds
       vpn vpn-id
      default-vlan vlan-id
      guest-vlan vlan-id
      host-mode (multi-auth | multi-host | single-host)
      mac-authentication-bypass
       allow mac-addresses
       server
      nas-identifier string
      nas-ip-address ip-address
      radius-servers tag
      reauthentication minutes
      timeout
        inactivity minutes
      wake-on-lan
```

None

Command History

Release	Modification
16.3	Command introduced.

Example

Configure IEEE 802.1X on one router interface. In this example, the bridging domain numbers match the VLAN numbers, which is a recommended best practice. Also, the bridging domain name identifies the type of 802.1X VLAN.

```
system

!
```

Operational Commands

clear dot1x client

show dot1x clients

show dot1x interfaces

show dot1x radius show system statistics

Related Topics

radius, on page 413

duplex

Configure whether the interface runs in full-duplex or half-duplex mode.

On all vEdge router models, all interfaces support 1-Gigabit Ethernet SFPs. These SFPs can either be copper or fiber. For fiber SFPs, the supported speeds are 1 Gbps full duplex and 100 Mbps full duplex. For copper SFPs, the supported speeds are 10/100/1000 Mbps and half/full duplex. By default, the router autonegotiates the speed and duplex values for the interfaces.

To use a fixed speed and duplex configuration for interfaces that do not support autonegotiation, you must disable autonegotiation and then use the **speed** and **duplex** commands to set the appropriate interface link characteristics.

vManage Feature Template

For all vEdge devices:

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface PPP Ethernet

Command Hierarchy

```
vpn vpn-id
  interface geport/slot
  duplex (full | half)
```

Syntax Description

'	Duplex Mode:	
half)	Set the interface to run in full-duplex or half-duplex mode.	
	Default: full	

Command History

Release	Modification
14.1	Command introduced.
15.3	Support for autonegotiation added.

Example

Configure an interface to run in half-duplex mode:

```
vpn 0
interface ge0/0
no autonegotiate
duplex half
```

Operational Commands

show interface

Related Topics

```
autonegotiate, on page 98 speed, on page 465
```

ebgp-multihop

Attempt BGP connections to and accept BGP connections from external peers on networks that are not directly connected to this network (on vEdge routers only).

This feature is disabled by default. If you configure it, use the **no ebgp-multihop** command to return to the default.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► BGP

```
vpn vpn-id
  router
  bgp local-as-number
   neighbor ip-address
    ebgp-multihop [ttl]
```

```
til Time to Live for BGP Connections to External Peers:Set the time to live (TTL) for BGP connections to external peers.Range: 0 to 255Default: 1
```

Command History

Release	Modification
14.1	Command introduced.

Example

Enable EBGP multihop:

```
vEdge# show running-config vpn 1 router bgp neighbor 1.10.10.10
vpn 1
router
bgp 123
neighbor 1.10.10.10
no shutdown
remote-as 456
ebgp-multihop
!
!
!
!
!
```

Operation Commands

show bgp neighbor

ecmp-hash-key

Determine how equal-cost paths are chosen (on vEdge routers only). By default, a combination of the source IP address, destination IP address, protocol, and DSCP field is used as the ECMP hash key to determine which of the equal cost paths to choose.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN

```
vpn vpn-id
  ecmp-hash-key layer4
```

layer4 Use the Layer 4 Source and Destination Ports in the ECMP Hash Key:

Use a combination of the Layer 4 source port and Layer 4 destination port, in addition to the combination of the source IP address, destination IP address, protocol, and DSCP field, as the ECMP hash key. Note that this flag should be enabled only in networks where it can be guaranteed that there will never be IP fragmentation. Otherwise, enabling this could lead to out-of-order packets.

Command History

Release	Modification
14.1	Command introduced.

Example

Use the Layer 4 source and destination ports in the EMCP hash key:

```
vEdge(config-vpn-1)# ecmp-hash-key layer4
vEdge(config-vpn-1)# show config
vpn 1
ecmp-hash-key layer4
```

Operational Commands

show running-config vpn

ecmp-limit

Configure the maximum number of OMP paths that can be installed in the vEdge router's route table (on vEdge routers only). When a vEdge router has two or more WAN interfaces and hence two or more TLOCs, it has one static route for each of the WAN next hops. All routes are installed as ECMP routes only if the next hop for the route can be resolved.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► OMP

```
ecmp-limit number
```

number	Number of OMP Paths:	
	Maximum number of OMP paths that can be installed in a vEdge router's route table.	
	Range: 1 through 16	
	Default: 4	

Command History

Release	Modification
15.2	Command introduced.
15.3.3	Installing ECMP routes only if the next hop can be resolved added.

Operational Commands

show omp routes

eco-friendly-mode

Configure a vEdge Cloud router not to use its CPU minimally or not at all when the router is not processing any packets (available on vEdge Cloud routers). By default, eco-friendly mode is disabled.

Enabling eco-friendly mode is useful when you are upgrading multiple vEdge Cloud routers simultaneously, especially routers that have only one virtual CPU (vCPU). Enabling this mode allows the routers to download the software image files without timing out. (A software image download times out after 60 minutes).

Command Hierarchy

```
system
[no] eco-friendly-mode
```

Syntax Description

None

Command History

Release	Modification
17.2	Command introduced.

Example

Enable eco-friendly mode:

```
vEdge-Cloud# config
vEdge-Cloud(config)# system eco-friendly-mode
```

Operational Commands

show running-config system

eigrp

This topic describes the commands used to configure and monitor Enhanced Interior Gateway Routing Protocol (EIGRP) routing capabilities and features within a VPN on a Cisco IOS XE router. For full EIGRP configuration information and examples, refer to the Cisco IOS IP Routing: EIGRP Configuration Guide.

vManage Feature Template

Configuration ► Templates ► EIGRP

Command Hierarchy

```
vpn vpn-id
  router
     eigrp name
         address-family ipv4 vrf vrf-name
            autonomous-system autonomous-system-number
            af-interface intf-name
               authentication key-chain keychain-name
               authentication mode {hmac-sha-256 | md5}
              hello-interval seconds
              hold-time seconds
              passive-interface
               split-horizon
               summary-address [prefix | prefix-length]
               exit-af-interface
            eigrp router-id ipv4-address
           network [prefix | mask]
            shutdown
            topology {base | topology-name tid number}
               auto-summarv
               default-metric {k1 k2 k3 k4 k5}
               distribute-list {acl-num | acl-name | gateway address | prefix prefix-name
| route-map routemap-name}
              redistribute {bgp | connected | nat-route | omp | ospf | static} [route-map
 route-map-name] [metric k1 k2 k3 k4 k5]
               table-map route-map-name [filter]
```

Operational Commands

```
show eigrp address-family ipv4 vrf vrf-num neighbors [interface-name | peer-v4-address]
show eigrp address-family ipv4 vrf vrf-num accounting
show eigrp address-family ipv4 vrf vrf-num events [reverse] [starting-number] [errmsg]
show eigrp address-family ipv4 vrf vrf-num interfaces [interface-name | detail]
show eigrp address-family ipv4 vrf vrf-num timers
show eigrp address-family ipv4 vrf vrf-num topology [v4-prefix/prefixlength | active |

elephant-flow

To configure elephant-flow to throttle traffic flow, use **elephant-flow** command in policy configuration mode. To disable the elephant-flow configurations, use the **no** form of this command.

 $\begin{array}{c} \textbf{elephant-flow} \ [\textbf{custom-eflow}] \ [\textbf{enable}] \ [\textbf{max-queue-depth} \ depth \] \ [\textbf{queue-depth} \ depth \] \ [\textbf{rate-threshold} \ depth \] \\ \end{array}$

 $\begin{tabular}{ll} \textbf{no elephant-flow} & [\textbf{custom-eflow}] & [\textbf{enable}] & [\textbf{max-queue-depth} & depth] & [\textbf{queue-depth} & depth] & [\textbf{rate-threshold} & depth] & [\textbf{max-queue-depth} & depth] & [\textbf{max-queue-depth}$

Syntax Description

custome-eflow	Define scope for eflow direction.
enable	Enable elephant-flow configurations for Cisco vEdge2k.
max-queue-depth depth	Specify the maximum queue depth beyond which the packets of all flows starts dropping.
	Range: 1000 to 500000
	Default: 20000
queue-depth depth	Specify the queue depth beyond which the packets of elephant-flow starts dropping.
	Range: 1 to 100000
	Default: 200
rate-threshold threshold	Specify rate in Kilo Packets Per Second (KPPS) above which a flow is considered as elephant flow.
	Range: 10 to 500
	Default: 20

Command Default

Disabled.

Command Modes

Policy configuration (config-policy)

Command History

Release	Modification
Cisco SD-WAN Release 20.9.1	This command was introduced.

Examples

The following example shows how to configure elephant-flow configurations:

```
vEdge2k# config terminal
vEdge2k(config)# policy
vEdge2k(config-policy)# elephant-flow
vEdge2k(policy-elephant-flow)# enable
vEdge2k(policy-elephant-flow)# max-queue-depth 20000
vEdge2k(policy-elephant-flow)# rate-threshold 21
```

encapsulation

Set the encapsulation for a tunnel interface (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface Cellular (for vEdge cellular wireless routers only)

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface PPP

Command Hierarchy

```
vpn 0
  interface interface-name
    tunnel-interface
      encapsulation (gre | ipsec)
        preference number
        weight number
```

Syntax Description

(**gre** | **ipsec**) | Encapsulation:

Set the encapsulation to use on the tunnel interface. This encapsulation is one of the TLOC properties associated with the tunnel, along with the IP address and the color. The default IP MTU for GRE is 1468 bytes, and for IPsec it is 1442 bytes because of the larger overhead.

For a single tunnel, you can configure both IPsec and GRE encapsulations, by including two **encapsulation** commands. Cisco SD-WAN then creates two TLOCs for the tunnel interface. Both TLOCs have the same IP address and color, but one has IPsec encapsulation while the other has GRE encapsulation.

Default: None. When configuring a tunnel interface using the CLI, you must configure either an IPsec or a GRE interface.

Note When configuring a tunnel interface using a Cisco SD-WAN Manager template, Cisco SD-WAN Manager configures the default values for IPsec and GRE. For more information on configuring a tunnel interface, see the Create a Tunnel Interface section of the Systems and Interfaces Configuration Guide, Cisco SD-WAN Release 20.x.

preference | Preference:

number

Preference for directing traffic to the tunnel. A higher value is preferred. When a vEdge router has multiple tunnels (that is, multiple TLOCs), only the TLOC or TLOCs with the highest preference are chosen using inbound path selection. However, traffic is influenced in both the directions; inbound as well as outbound. If all TLOCs have the same preference and no policy is applied that affects traffic flow, traffic flows are evenly distributed among the tunnels, using ECMP. For example, when a preference of 100 on one TLOC and a preference of 50 on the other TLOC is set, the preference chosen is the TLOC with a preference of 100.

Note The criteria set in preferences work correctly when there are no other configurations that may alter the traffic flow. For example, if preferences are used with color restrict (color color restrict), there is a possibility of the reverse traffic going through a different tunnel than what is expected based on the configured preferences.

Range: 0 through 4294967295 $(2^{32} - 1)$

Default: 0

weight	Weight:
number	Weight to use to balance traffic across multiple tunnels (that is, across multiple TLOCs). A higher value sends more traffic to the tunnel. You typically set the weight based on the bandwidth of the TLOC. When a vEdge router has multiple TLOCs, all with the highest preference, traffic distribution is weighted according to the configured weight value. For example, if TLOC A has weight 10, and TLOC B has weight 1, and both TLOCs have the same preference value, then roughly 10 flows are sent out TLOC A for every 1 flow sent out TLOC B. Range: 1 through 255 Default: 1

Command History

Release	Modification
14.1	Command introduced.
15.1	<pre>preference and weight commands moved from under tunnel-interface to under encapsulation.</pre>
15.2	Add GRE encapsulation.

Example

Create a GRE tunnel and direct voice traffic to it:

```
interface ge1/1
   ip address 1.2.3.0/24
   tunnel-interface
     encapsulation gre
     color blue
     allow-service dhcp
     allow-service dns
     allow-service icmp
     no allow-service sshd
     no allow-service ntp
     no allow-service stun
   no shutdown
!
policy
 data-policy direct-voice-to-gre
   vpn-list voice-vpn-list
     sequence 10
       match
         dscp 8
        action accept
         set
           vpn 1
           tloc 1.2.3.4 color blue encap gre
          !
```

```
!
    default-action drop
!
!
lists
    vpn-list voice-vpn-list
        vpn 1-10
!
    site-list voice-site-list
        site-id 100-102
!
!
!
apply-policy site-list voice-site-list data-policy direct-voice-to-gre all
```

Operational Commands

show control connections

show omp tlocs

show omp tlocs detail (see display the configured preference and weight values)

Related Topics

```
bfd color, on page 108 color, on page 140
```

exclude

Exclude specific addresses from the pool of addresses for which the interface acts as DHCP server (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► DHCP Server

Command Hierarchy

```
vpn vpn-id
  interface genumber/subinterface
  dhcp-server
    exclude ip-address
```

Syntax Description

ip-address Address To Exclude:

IP address to exclude from the DHCP address pool.

To specify multiple individual addresses, list them in a single **exclude** command, separated by a space (for example, **exclude 1.1.1.1 2.2.2.2 3.3.3.3**). To specify a range of addresses, separate them with a hyphen (for example, **exclude 1.1.1.1-1.1.1.10**).

Command History

Release	Modification
14.3	Command introduced.
15.1	Support for command ranges added.

Example

Exclude 10.0.100.2 from the DHCP address pool 10.0.100.0/24:

```
vm5# config
Entering configuration mode terminal
vm5(config)# vpn 1 interface ge0/4
vm5(config-interface-ge0/4)# dhcp-server exclude 10.0.100.2
vm5(config-dhcp-server)# show full-configuration
vpn 1
interface ge0/4
dhcp-server
address-pool 10.0.100.0/24
exclude 10.0.100.2

!
!
!
```

Operational Commands

show dhep interface show dhep server

exclude-controller-group-list

Configure the vSmart controllers that the tunnel interface is not allowed to connect to (on vEdge routers only).

On a system-wide basis, you configure all the vSmart controllers that the router can connect to using the system controller-group-list command. Use the <code>exclude-controller-group-list</code> command to restrict the vSmart controllers that a particular tunnel interface can establish connections with. If a Cisco vEdge device is not able to establish required number of control connections from a TLOC which is minimum of max-control-connections from TLOC configuration and max-omp-sessions from system configuration, then the device will try to connect to Cisco vSmart Controller specified in <code>exclude-controller-group-list</code> command.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► System

```
vpn 0
interface interface-name
```

```
tunnel-interface
 exclude-controller-group-list number
```

number | vSmart Controller Groups To Exclude:

Identifiers of one or more vSmart controller groups that this tunnel is not allowed to establish control connections with. Separate multiple numbers with a space.

Range: 0 through 100

Command History

Release	Modification
16.1	Command introduced.

Example

Have the tunnel interface not use controller group list 2:

```
vpn 0
  interface ge0/2
    tunnel-interface
      exclude-controller-group-list 2
```

Operational Commands

show control affinity config show control affinity status show control connections show control local-properties

Related Topics

```
controller-group-id, on page 153
controller-group-list, on page 154
max-control-connections, on page 330
max-omp-sessions, on page 335
```

flow-active-timeout

For a cflowd template, how long to collect a set of flows for a flow on which traffic is actively flowing (on vSmart controllers only). At the end of this time period, the data set is exported to the collector.

vManage Feature Template

For vSmart controllers:

Configuration ► Policies ► Centralized Policy

Command Hierarchy

```
policy
  cflowd-template template-name
    flow-active-timeout seconds
```

Syntax Description

seconds | Collection Time:

How long to collect a set of sampled flows for a flow on which traffic is actively flowing. If you configure this time and later modify it, the changes take effect only on flows that are created after the configuration change has been propagated to the vEdge router. Because an existing flow continues indefinitely, to have configuration changes take effect, clear the flow with the clear app cflowd flows command.

Range: 30 through 3600 seconds Default: 600 seconds (10 minutes)

Command History

Release	Modification
14.3	Command introduced.
15.3	Default timeout value changed to 10 minutes.

Example

Configure a cflowd template:

```
vSmart# show running-config policy
cflowd-template test-cflowd-template
collector vpn 1 address 172.16.255.14 port 11233
 flow-active-timeout 600
 flow-inactive-timeout 90
 template-refresh 120
```

Operational Commands

```
clear app cflowd flows (on vEdge routers only)
clear app cflowd statistics (on vEdge routers only)
show policy from-vsmart (on vEdge routers only)
show running-config policy (on vSmart controllers only)
show app cflowd flows (on vEdge routers only)
show app cflowd template (on vEdge routers only)
```

Related Topics

flow-inactive-timeout, on page 213

flow-control

Configure flow control, which is a mechanism for temporarily stopping the transmission of data on the interface (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface PPP Ethernet

Command Hierarchy

```
vpn vpn-id
  interface geslot/port
  flow-control control
```

Syntax Description

```
    Control Direction:
    Configure flow control on an interface. control an be autoneg, both, egress, ingress, or none.
    Default: autoneg
```

Command History

Release	Modification
14.1	Command introduced.

Example

Configure bidirectional flow control on an interface:

```
vEdge(config-interface-ge0/0)# flow-control both
vEdge-interface-ge0/0)# show config
vpn 1
  interface ge0/0
   flow-control both
   no shutdown
!
!
```

Operational Commands

show running-config vpn interface

flow-inactive-timeout

For a cflowd template, how long to wait to send a set of sampled flows to a collector for a flow on which no traffic is flowing (on vSmart controllers only).

vManage Feature Template

For vSmart controllers:

Configuration ► Policies ► Centralized Policy

Command Hierarchy

```
policy
 cflowd-template template-name
    flow-inactive-timeout seconds
```

Syntax Description

seconds | Timeout Due to Inactivity:

How long to wait to send a set of sampled flows to a collector for a flow on which no traffic is flowing. If you configure this time and later modify it, the changes take effect only on flows that are created after the configuration change has been propagated to the vEdge router. Because an existing flow continues indefinitely, to have configuration changes take effect, clear the flow with the clear app cflowd flows command.

Range: 1 through 3600 seconds Default: 60 seconds (1 minute)

Command History

Release	Modification
14.3	Command introduced.
15.3	Default timeout value changed to 1 minute.

Example

Configure a cflowd template:

```
vSmart# show running-config policy
cflowd-template test-cflowd-template
collector vpn 1 address 172.16.255.14 port 11233
 flow-active-timeout 60
 flow-inactive-timeout 90
template-refresh 120
```

Operational Commands

clear app cflowd flows (on vEdge routers only)

clear app cflowd statistics (on vEdge routers only)

show policy from-vsmart (on vEdge routers only)

show running-config policy (on vSmart controllers only)

show app cflowd flows (on vEdge routers only)

show app cflowd template (on vEdge routers only)

Related Topics

flow-active-timeout, on page 210

flow-sampling-interval

For a cflowd template, how many packets to wait before creating a new flow (on vSmart controllers only).

vManage Feature Template

For vSmart controllers:

Configuration ► Policies ► Centralized Policy

Command Hierarchy

```
policy
  cflowd-template template-name
    flow-sampling-interval number
```

Syntax Description

number

Sampling Interval:

How many packets to wait before creating a new flow. Note that if a flow already exists, flow information continues to be recorded in that flow. While you can configure any integer value for the number of packets, the software rounds the value down to the nearest power of 2.

Range: 1 through 65536

Command History

Release	Modification
16.3	Command introduced.

Example

Start a new flow after 63 packets, when the 64th packet is received:

```
vSmart# show running-config policy
cflowd-template test-cflowd-template
collector vpn 1 address 172.16.255.14 port 11233
```

```
flow-active-timeout 60
flow-inactive-timeout 90
flow-sampling-interval 64
template-refresh 120
```

Operational Commands

```
clear app cflowd flows (on vEdge routers only)
clear app cflowd statistics (on vEdge routers only)
show policy from-vsmart (on vEdge routers only)
show running-config policy (on vSmart controllers only)
show app cflowd flows (on vEdge routers only)
show app cflowd template (on vEdge routers only)
```

flow-visibility

Enable cflowd visibility so that a vEdge router can perform traffic flow monitoring on traffic coming to the router from the LAN (on vEdge routers only).

vManage Feature Template

For vEdge routers:

Configuration ► Policies ► Localized Policy

Command Hierarchy

```
policy
  flow-visibility
```

Syntax Descriptionm

None

Command History

Release	Modification
15.3	Command introduced.

Operational Commands

clear app cflowd flows clear app cflowd statistics show app cflowd collector show app cflowd flow-count show app cflowd flows show app cflowd statistics show app cflowd template show policy from-vsmart

gps-location

Set the latitude and longitude of a vEdge device.

vManage Feature Template

For all vEdge devices:

Configuration ► Templates ► System

Command Hierarchy

```
system
gps-location latitude decimal-degrees
gps-location longitude decimal-degrees
```

Syntax Description

latitude decimal-degrees	Set the Latitude:
	Set the latitude of the device, specifying the coordinate in decimal degrees.
longitude decimal-degrees	Set the Longitude:
	Set the longitude of the device, specifying the coordinate in decimal degrees.

Command History

Release	Modification
14.1	Command introduced.

Example

Set the devices geographical coordinates:

```
vEdge(config-system) # gps-location latitude 37.368140
vEdge(config-system) # gps-location longitude -121.913658
vEdge(config-system) # show configuration
system
    gps-location latitude 37.368140
    gps-location longitude -121.913658
```

Operational Commands

show running-config system

Related Topics

location, on page 296 location, on page 295

graceful-restart

Control graceful restart for OMP (on vEdge routers and vSmart controllers only). By default, graceful restart for OMP is enabled on all vEdge routers and vSmart controllers.

vManage Feature Template

For vEdge routers and vSmart controllers only:

Configuration ► Templates ► OMP

Command Hierarchy

omp graceful-restart

Syntax Description

no omp graceful-restart	Disable Graceful Restart.	
omp timers graceful-restart-timer 0	By default, OMP graceful restart is enabled on vEdge routers and vSmart controllers. Use one of these two commands to disable it.	
	Note	Changing the Cisco SD-WAN Controller graceful-restart timers result in an OMP peer flap, independent of whether or not port-hop is enabled. We recommend that you change Cisco SD-WAN Controller graceful-restart timers with redundant Cisco SD-WAN Controller peering (where only a single Cisco SD-WAN Controller configuration is changed at a time) or during a maintenance period when a data plane disruption can be tolerated.

group

vpn 0 interface tunnel-interface group—Assign an identifier to an individual WAN transport tunnel.

The tunnel group is identified by a number in the range 1 to 4294967295 (default is 0). This identifier prevents the local router from forming tunnels to any other tunnel group. After a tunnel group is assigned, the local router can form tunnels to:

- Transports with matching group IDs, and
- · Transports with no group ID assigned

The group ID can be used with the color restrict option if needed. If using both options, tunnels can be formed only with transports that meet both criteria: color and group ID.

Note

If using group IDs, assign a group ID to all transports.

Simple Example

Scenario: A network contains three routers (A, B, and C).

Intention: Enable router A to form tunnels only with router B.

Method: To apply this restriction, assign routers A and B the same group ID (example: 100). Assign router C a different group ID (example: 200).

Result: Router A will form tunnels with router B, but not with router C.

Use Case

Group ID can be used as an alternative to restricting tunnel creation by color. It offers a good solution for sites with redundant connections to the same MPLS provider, where the head end uses two private colors (example: private1 and private2) to the same provider, but the remote sites only have one connection, and therefore only one color.

Instead of using the color restrict option, assign both private1 and private2 the same group ID at all sites. Now the remote site will form tunnels to both head end routers, but only with the matching group IDs.

Tunnels can be formed to all transports with matching group IDs, and transports with no group ID. Therefore, if using group IDs, assign a group ID to all transports. For example, use ID=100 for all public transports and ID=500 for all private transports on the same carrier. Regardless of color, tunnels are only attempted to matching transport IDs.

vManage Feature Template

For vEdge routers, vManage NMSs, and vSmart controllers only:

Configuration ► Templates ► VPN Interface Cellular (for vEdge cellular wireless routers only)

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface PPP

Command Hierarchy

```
vpn 0
  interface interface-name
  tunnel-interface
    group group-id
```

Command History

19.1	Command introduced.

Operational Commands

show control connections

show bfd sessions

show omp tlocs detail

Example

Associate a group ID with a tunnel connection:

```
vpn 0
interface ge0/0
ip address 10.1.15.15/24
no shutdown
!
interface loopback2
ip address 172.16.15.15/24
tunnel-interface
color metro-ethernet
group 100
bind ge0/0
!
no shutdown
```

group

Configure SNMPv3 groups.

vManage Feature Template

For all vEdge devices:

Configuration ► Templates ► SNMP

```
snmp
  group group-name authentication
  view string
```

authentication	Group Authentication:
	Authentication to use for members of the group. <i>authentication</i> can be one of the following:
	 auth-no-priv—Provide authentication using the HMAC-MD5 or HMAC-SHA algorithm.
	• <i>auth-priv</i> —Provide authentication using the HMAC-MD5 or HMAC-SHA algorithm, and provide CBC DES 56-bit encryption.
	• no-auth-no-priv—Provide authentication based on a username.
group	Group Name:
group-name	Name of the SNMPv3 group. <i>group-name</i> can be 1 to 32 alphanumeric characters. If the name includes spaces, enclose it in quotation marks (" ").
view string	SNMP View:
	Name of the view record to use for the group. It can be a 1 to 32 alphanumeric characters. If the name includes spaces, enclose it in quotation marks (" ").

group

Configure the Diffie-Hellman group number to be used in the IKE key exchange (on vEdge routers only). IKE key exchange is done in a Diffie-Hellman exchange.

```
vpn vpn-id
  interface ipsecnumber
   ike
     group number
```

number Group Number

Diffie-Hellman group number to use in key exchange. The number to use depends on the length of the Diffie-Hellman key. It can be one of the following values:

- 2—Use the 1024-bit more modular exponential (MODP) Diffie-Hellman group.
- 14—Use the 2048-bit MODP Diffie-Hellman group.
- 15—Use the 3072-bit MODP Diffie-Hellman group.
- 16—Use the 4096-bit MODP Diffie-Hellman group.

Default: 16

Command History

Release	Modification
17.2	Command introduced.

Example

Change the IKEv1 Diffie-Hellman group number to 15:

```
vEdge(config) # vpn 1 interface ipsec1 ike
vEdge(config-ike)# group 15
```

guard-interval

Specify the guard interval (on vEdge cellular wireless routers only). The guard interval allows reflections from the previous data transmission to settle before transmitting a new symbol.

vManage Feature Template

For vEdge cellular wireless routers only:

Configuration ► Templates ► WiFi Radio

Command Hierarchy

```
wlan radio-band
  guard-interval nanoseconds
```

Syntax Description

Set the guard interval: Set the guard interval. It can be one of the following values: 400—Short guard interval (SGI), which is 400 nanoseconds. The short guard interval can increase throughput, but it can also increase the error rate because of increased sensitivity to RF reflections. This is the default value for 5-GHz radio frequencies. 800—Normal guard interval, which is 800 nanoseconds. This is the default value for 2.4-GHz radio frequencies.

Command History

Release	Modification
16.3	Command introduced.

Example

Explicitly configure the short guard interval for a 5-GHz radio band:

```
vEdge# show running-config wlan
wlan 5GHz
channel 36
guard-interval 400
interface vap0
   ssid   tb31_pm6_5ghz_vap0
   no shutdown
!
```

Operational Commands

show interface

show wlan clients

show wlan interfaces

show wlan radios

show wlan radius

guest-vlan

Configure a guest VLAN to provide network access to limited services for non-802.1X-enabled clients (on vEdge routers only). These clients are placed in the guest VLAN only if MAC authentication bypass is not enabled.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface Ethernet

Command Hierarchy

```
vpn vpn-id
  interface interface-name
  dot1x
         quest-vlan vlan-id
```

Syntax Description

```
vlan-id VLAN Identifier:

Identifier of the VLAN into which to place non-802.1X—enabled clients.

Range: 1 through 4094
```

Command History

Release	Modification
16.3	Command introduced.

Example

Configure a guest VLAN:

```
bridge 20
name Guest_VLAN
vlan 20
interface ge0/5
no native-vlan
no shutdown
!
!
vpn 0
interface ge0/5
dot1x
guest-vlan 20
!
no shutdown
!
```

hello-interval

Configure the keepalive interval between Hello packets sent on a DTLS or TLS WAN transport connection.

vManage Feature Template

```
Configuration ► Templates ► VPN Interface Cellular (for cellular wireless routers only)
```

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface PPP

```
vpn 0
  interface interface-name
  tunnel-interface
  hello-interval milliseconds
```

milliseconds | Interval between Hello packets sent on a DTLS or TLS WAN tunnel connection. The combination of the hello interval and hello tolerance determines how long to wait before declaring a DTLS or TLS tunnel to be down.

> The hello tolerance interval must be at least two times the tunnel hello interval. The default hello interval is 1000 milliseconds (1 second). (Note that the hello interval is configured in milliseconds, and the hello tolerance is configured in seconds.)

With the default hello interval of 1 second and the default tolerance of 12 seconds, if no Hello packet is received within 11 seconds, the tunnel is declared down at 12 seconds. If the hello interval or the hello tolerance, or both, are different at the two ends of a DTLS or TLS tunnel, the tunnel chooses the interval and tolerance as follows:

- For a tunnel connection between two controller devices, the tunnel uses the lower hello interval and the higher tolerance interval for the connection between the two devices. (Controller devices are vBond controllers, vManage NMSs, and vSmart controllers.) This choice is made in case one of the controllers has a slower WAN connection. The hello interval and tolerance times are chosen separately for each pair of controller devices.
- For a tunnel connection between a router and any controller device, the tunnel uses the hello interval and tolerance times configured on the router. This choice is made to minimize the amount traffic sent over the tunnel, to allow for situations where the cost of a link is a function of the amount of traffic traversing the link. The hello interval and tolerance times are chosen separately for each tunnel between a router and a controller device.

Range: 100 through 600000 milliseconds (10 minutes)

Default: 1000 milliseconds (1 second)

If the tunnel interface is configured as a low-bandwidth link, the control connection might flap if you use a hello-interval of 100 milliseconds. For low-bandwidth link interfaces, use hello-interval of more than 100 milliseconds. For more information on low-bandwidth links, refer to the low-bandwidth-link command.

Command History

Release	Modification
15.2	Command introduced.
16.2	Maximum interval changed from 60 seconds to 10 minutes.
16.2.1	Add requirement that hello tolerance must be at least 2 times the hello interval.

Example

Decrease the amount of keepalive traffic sent between a router and Cisco SD-WAN controller devices:

vpn 0 interface ge0/0 tunnel-interface color lte

```
encapsulation ipsec
hello-interval 600000
hello-tolerance 600
```

hello-tolerance

Configure how long to wait for a Hello packet on a DTLS or TLS WAN transport connection before declaring that transport tunnel to be down.

vManage Feature Template

For al vEdge devices:

```
Configuration ► Templates ► VPN Interface Cellular (for vEdge cellular wireless routers only)
```

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface PPP

Command Hierarchy

```
vpn 0
  interface interface-name
  tunnel-interface
  hello-tolerance seconds
```

seconds

Hello Tolerance Interval:

How long to wait since the last Hello packet was sent on a DTLS or TLS WAN tunnel connection before declaring the tunnel to be down. The hello tolerance interval must be at least twice the hello interval, to ensure that at least one keepalive packet reaches and then returns from the remote side before timing out the peer. The default hello interval is 1000 milliseconds (1 second). (Note that the hello interval is configured in milliseconds, and the hello tolerance is configured in seconds.)

The combination of the hello interval and hello tolerance determines how long to wait before declaring a DTLS or TLS tunnel to be down. With the default hello interval of 1 second and the default tolerance of 12 seconds, if no Hello packet is received within 11 seconds, the tunnel is declared down at 12 seconds. If the hello interval or the hello tolerance, or both, are different at the two ends of a DTLS or TLS tunnel, the tunnel chooses the interval and tolerance as follows:

- For a tunnel connection between two controller devices, the tunnel uses the lower hello interval and the higher tolerance interval for the connection between the two devices. (Controller devices are vBond controllers, vManage NMSs, and vSmart controllers.) This choice is made in case one of the controllers has a slower WAN connection. The hello interval and tolerance times are chosen separately for each pair of controller devices.
- For a tunnel connection between a vEdge router and any controller device, the tunnel uses the hello interval and tolerance times configured on the router. This choice is made to minimize the amount traffic sent over the tunnel, to allow for situations where the cost of a link is a function of the amount of traffic traversing the link. The hello interval and tolerance times are chosen separately for each tunnel between a vEdge router and a controller device.

Range: 12 through 6000 seconds (10 minutes)

Default: 12 seconds

Command History

Release	Modification
15.2	Command introduced.
16.2	Maximum tolerance increased from 1 minute to 10 minutes.
16.2.1	Add requirement that hello tolerance must be at least 2 times the hello interval.

Example

Decrease the amount of keepalive traffic sent between a vEdge router and Cisco SD-WAN controller devices:

```
vEdge(config) # vpn 0 interface ge0/0 tunnel-interface color lte

hold-time

vpn 0 interface tunnel-interface hold-time—Set the delay before switching back to the primary tunnel interface from a circuit of last resort (only on vEdge routers with cellular modules). This delay is to ensure that the primary interface is once again fully operational and is not still flapping.

Command Hierarchy

```
vpn 0
  interface cellularnumber
  tunnel-interface
  hold-time milliseconds
```

Syntax Description

Delay Time milliseconds	Delay before switching over from using the last-resort circuit back to using the primary tunnel interface. This delay is to ensure that the primary interface is once again fully operational and is not still flapping.
	Range: 100 through 300000 milliseconds (0.1 through 300 seconds) Default: 7000 milliseconds (7 seconds)
	Default. 7000 minisceolids (7 secolids)

Command History

Release	Modification
16.2	Command introduced.

Example

Change the hold time for the circuit of last resort to 10 seconds:

```
vEdge# show running-config vpn 0 interface cellular0
vpn 0
interface cellular0
ip dhcp-client
tunnel-interface
hold-time 10000
encapsulation ipsec
color lte
last-resort-circuit
no allow-service bgp
allow-service dhcp
allow-service dns
```

```

clear-dont-fragment
mtu 1428
profile 1
no shutdown
!
```

show running-config vpn 0

host

Configure a static mapping between a hostname and an IPv4 or IPv6 address in the hostname cache.

vManage Feature Template

For all vEdge devices:

Configuration ► Templates ► VPN

Command Hierarchy

```
vpn vpn-id
  host string ip ip-address
```

Syntax Description

string	Hostname:	
	Name of the vEdge router within the VPN. The name can be a maximum of 128 characters.	
ip-address	IP Address:	
	IPv4 or IPv6 address to associate with the router. You can associate up to 8 total IP addresses with a hostname.	

Command History

Release	Modification
14.1	Command introduced.
16.3	Add support for IPv6 addresses.

Example

Configure a static hostname in VPN 1:

```
vEdge(config) # vpn 1 host my-hostname ip 1.2.3.4
vEdge(config-vpn-1) # show configuration
vpn 1
  host my-hostname ip 1.2.3.4
!
```

Configure one IPv4 and one IPv6 address for a host:

```
vEdge# show running-config vpn 0
vpn 0
host my-vEdge ip 10.0.12.26 2001::a00:cla
...
```

Operational Commands

show running-config vpn

host-mode

Set whether an 802.1X interface grants access to a single client or to multiple clients (on vEdge routers only). By default, only one authenticated client is allowed on an 802.1X port.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface Ethernet

Command Hierarchy

```
vpn vpn-id
  interface interface-name
  dot1x
    host-mode (multi-auth | multi-host | single-host)
```

Syntax Description

multi-	auth	Multiple Authenticated Clients:
		A single 802.1X interface grants access to multiple authenticated clients on data VLANs.
multi-	-host	Multiple Clients:
		A single 802.1X interface grants access to multiple clients. Only one of the attached clients must be authorized for the interface to grant access to all clients. If the interface becomes unauthorized, the vEdge router denies network access to all attached clients.

	,
single-host	ì

Single Client:

The 802.1X interface grants access only to the first authenticated client. All other clients attempting access are denied and dropped.

Command History

Release	Modification
16.3	Command introduced.

Example

Configure the 802.1X interface to grant access to multiple clients:

```
vpn 0
  interface ge0/0
  dot1x
    multi-host
```

host-name

Configure a name for the vEdge device. This name is prepended to the device's prompt in the shell.

vManage Feature Template

For all vEdge devices:

Configuration ► Templates ► System

Command Hierarchy

```
system
host-name string
```

string

Hostname:

Specify the name of the host. The text can be a maximum of 32 characters. If it includes spaces, enclose the entire string in quotation marks (" ").

Command History

Release	Modification
14.1	Command introduced.

Example

Configure the hostname on a vEdge device:

```
vEdge(config) # system host-name vsmart1
vEdge(config) # commit and-quit
Commit complete.
vsmart1#
```

Operational Commands

show running-config system

host-policer-pps

For a policer, configure the rate to deliver packets to the control plane (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► System

Command Hierarchy

```
system
 host-policer-pps rate
```

Syntax Description

nate | Packet Delivery Rate:

Maximum rate at which a policer delivers packets to the control plane, in packets per second (pps).

Range: 1000 through 25000 pps

Default: 20000 pps

Command History

Release	Modification
15.4	Command introduced.
16.3	Increase range from 20000 pps to 25000 pps, and change default from 5000 pps to 20000 pps.

Example

Change the maximum packet delivery message rate to 1000 pps:

```
system
host-policer-pps 1000
```

Operational Commands

show running-config system

allow-service, on page 65

idle-timeout

Set how long the CLI is inactive on a device before the user is logged out. If a user is connected to the device via an SSH connection, the SSH connection is closed after this time expires.

This command sets the CLI idle timeout on a systemwide basis, and it overrides the idle timeout you set from the CLI with the **idle-timeout** CLI operational command.

Command Syntax

```
system
idle-timeout minutes
```

Syntax Description

Number of minutes that the CLI is idle before the user is logged out of the CLI. A value of 0 (zero) sets the time to infinity, so the user is never logged out.

Range: 0 through 300 minutes (5 hours)

Default: CLI session does not time out

Command History

Release	Modification
17.2.2	Command introduced.

Example

Configure CLI sessions to time out after 5 hours:

```
vEdge(config) # system idle-timeout 300
```

show running-config system

Related Topics

idle-timeout, on page 646

igmp

Configure IGMP (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► IGMP

Command Hierarchy

```
vpn vpn-id
  router
  igmp
  interface interface-name
    join-group group-address
  [no] shutdown
```

Syntax Description

None

Command History

Release	Modification
14.3	Command introduced.

Example

Enable IGMP in VPN 1:

```
clear igmp interface
clear igmp protocol
clear igmp statistics
show igmp groups
show igmp interface
show igmp statistics
show igmp summary
```

ike

To configure the Internet Key Exchange (IKE) protocol parameters on edge devices, use the **ike** command in global configuration mode. Cisco SD-WAN supports only IKE version 2 as defined in RFC 7296.

Command Hierarchy

Command Syntax on vEdge Devices:

```
vpn vpn-id
  interface ipsecnumber
  ike
    authentication-type type
    local-id id
    pre-shared-secret password
    remote-id id
    cipher-suite suite
    group number
    mode mode
    rekey seconds
    version number
```

Command Syntax on Cisco IOS XE SD-WAN Devices:

```
crypto
  isakmp
  keepalive 60-86400 2-60 {on-demand | periodic}
  policy policy_num
      encryption {AES128-CBC-SHA1 | AES256-CBC-SHA1}
      hash {sha384 | sha256 | sha}
      authentication pre-share
      group {2 | 14 | 16 | 19 | 20 | 21}
      lifetime 60-86400
  profile ikev1_profile_name
      match identity address ip_address [mask]
      keyring keyring_name
```

version	IKE Version:
number	Specify the version of the IKE protocol to use. Cisco SD-WAN supports only IKE version 2 as defined in RFC 7296.
	Values: 1, 2
	Default: 1
	Note The IKEv1 is changed to IKEv2 protocol, if it is already in use on the older versions. We recommend to use IKEv2 to avoid packet loss.

Command History

Release	Modification
17.2	Command introduced.

Example

The following example shows the IKE configuration on vEdge devices:

The following example shows the IKE configuration on Cisco IOS XE SD-WAN devices:

```
crypto
  ikev2
    proposal proposal_name
        encryption {3des | aes-cbc-128 | aes-cbc-192 | aes-cbc-256 | des}
        integrity {sha256 | sha384 | sha512}
        group {2 | 14 | 15 | 16}
    keyring idev2_keyring_name
        peer peer_name
        address tunnel_dest_ip [mask]
        pre-shared-key key_string
    profile ikev2_profile_name
        match identity remote address ip_address
        authentication {remote | local} pre-share
        keyring local ikev2_keyring_name
        lifetime 120-86400
```

clear ipsec ike sessions show ipsec ike inbound-connections show ipsec ike outbound-connections show ipsec ike sessions

implicit-acl-logging

Log the headers of all packets that are dropped because they do not match a service configured with an **allow-service** command (on vEdge routers only). You can use these logs for security purposes, for example, to monitor the flows that are being directed to a WAN interface and to determine, in the case of a DDoS attack, which IP addresses to block.

When you enable implict ACL logging, by default, all dropped packets are logged. It is recommended that you limit the number of packets logged, by including the **log-frequency** command in the configuration. The default is to log every 512th packet.

vManage Feature Template

For vEdge routers:

Configuration ► Policies ► Localized Policy ► Add Policy ► Policy Overview ► Implicit ACL Logging field

Command Hierarchy

```
policy
  implicit-acl-logging
```

Syntax Description

None

Command History

Release	Modification
16.3	Command introduced.

Example

Log implicitly configured packets, logging every 512th packet:

```
vEdge# show running-config policy
policy
log-frequency 1000
implicit-acl-logging
...
!
```

```
clear app log flow-all
clear app log flows
show app log flow-count
show app log flows
```

Related Topics

```
allow-service, on page 65 log-frequency, on page 297
```

interface

Configure an interface within a VPN.

```

interface-name | Interface Name:

Name of the interface.

On vSmart controllers, interface-name can have one of the following formats: eth slot/port, **loopback** string, or **mgmt** number. If you specify the interface name in any other format, the CLI reports a failure when you issue the **validate** or **commit** command. No error is reported as you are typing the interface configuration command.

On vEdge routers, interface-name can have one of the following formats: ge slot/port, gre number, ipsec number, loopback string, mgmt number, natpool number, or ppp number. If you specify the interface name in any other format, the CLI reports a failure when you issue the validate or commit command. No error is reported as you are typing the interface configuration command.

For GRE interfaces, number can be 1 through 255.

For IPsec interfaces, number can be 1 through 255.

For loopback interfaces, string can be any alphanumeric value and can include underscores () and hyphens (–). The total interface name can be a maximum of 16 characters long (including the string "loopback").

For NAT pool interfaces, number can be 1 through 31.

For IEEE 802.1Q VLANs, interface-name can have the format **ge** slot/port.vlan-number, where vlan-number can be in the range 1 through 4094. To enable VLAN interfaces, activate the physical interface in VPN 0, and then enable the VLAN in the desired VPN. You can place the VLANs associated with a physical interface into multiple VPNs.

You can configure up to 512 interfaces on a vEdge device. This number includes physical interfaces, loopback interfaces, and subinterfaces.

A particular interface can be present only in one VPN.

Command History

Release	Modification
14.1	Command introduced.
15.3	Add support for natpool interface type.
15.3.3	Add support for ppp interfaces.
15.4.1	Add support for GRE interfaces.
17.1	Add support for IPsec interfaces.

Example

Configure a tunnel interface in VPN 0 on a vEdge router:

```
vEdge# show running-config vpn 0
vpn 0
```

```
interface ge0/0
ip address 10.1.15.15/24
tunnel-interface
color lte
allow-service dhcp
allow-service icmp
no allow-service sshd
no allow-service ntp
no allow-service stun
!
speed 100
no shutdown
shaping-rate 100000
!
```

Configure an interface in VPN 0 on a vEdge router with the PPPoE client:

```
vpn 0
  interface ge0/1
  pppoe-client ppp-interface ppp1
  no shutdown
!
!
```

Operational Commands

show interface

show interface arp-stats

show interface errors

show interface packet-sizes

show interface port-stats

show interface queue

show interface statistics

show tunnel gre-keepalives

show tunnel statistics gre

interface

Associate an interface with a bridging domain (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► Bridge

Command Hierarchy

```
bridge bridge-id
  interface interface-name
   description text
  native-vlan
  [no] shutdown
  static-mac-address mac-address
```

Syntax Description

[no] shutdown	Enable or Disable the Interface:
	By default, an interface in a bridge domain is disabled. To enable it, include the no shutdown command.
description text	Interface Description:
	Text description of the interface. If <i>text</i> contains spaces, enclose it in quotation marks.
interface-name	Interface Name:
	Name of the interface to associate with the bridging domain. Specify <i>interface-name</i> in the format ge <i>slot</i> / <i>port</i> .
native-vlan	Native VLAN:
	Treat untagged traffic as belonging to the VLAN in that particular bridge. Only one VLAN associated with an interface can be configured to run as native VLAN. Native VLAN is disabled by default.
static-mac-address	Static MAC Address
mac-address	Manually add static MAC address entries for an interface in a bridge domain.

Command History

Release	Modification
15.3	Command introduced.

Example

Configure three bridge domains on a vEdge router:

```
vEdge# show running-config bridge
bridge 1
  vlan 1
  interface ge0/2
  no native-vlan
  no shutdown
!
  interface ge0/5
  no native-vlan
  no shutdown
!
  interface ge0/6
```

```
no native-vlan
 no shutdown
bridge 2
vlan 2
interface ge0/2
 no native-vlan
 no shutdown
 !
interface ge0/5
 no native-vlan
 no shutdown
interface ge0/6
 no native-vlan
 no shutdown
bridge 50
interface ge0/2
 no native-vlan
 no shutdown
interface ge0/5
 no native-vlan
 no shutdown
interface ge0/6
 no native-vlan
 no shutdown
 !
vEdge# show bridge interface
```

show bridge table

interface

Configure the interfaces that participate in the IGMP domain, and configure the groups for the interface to join (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► IGMP

Command Hierarchy

```
vpn vpn-id
  router
  igmp
  interface interface-name
    join-group group-address
```

Syntax Description

i	nterface-name	Interface Name:
		Name of the interface to participate in the IGMP domain.

Command History

Release	Modification
14.3	Command introduced.

Example

Enable IGMP in VPN 1:

```
vm5(config-igmp)# show full-configuration
vpn 1
router
igmp
interface ge0/4
exit
interface ge0/5
  join-group 239.239.239.239
  exit
exit
exit
!
```

Operational Commands

clear igmp interface

clear igmp protocol clear igmp statistics show igmp groups show igmp interface show igmp statistics show igmp summary

interface

Configure virtual access points (VAPs) for SSIDs in a WLAN (on vEdge cellular wireless routers only).

On a vEdge100wm router, you can configure up to four service set identifiers (SSIDs) on the WLAN radio. Each SSID is referred to by a virtual access point (VAP) interface. To a client, each VAP interface appears as a different access point (AP) with its own SSID.

To reduce RF congestion, it is recommended that you do not configure more than two VAP interfaces on the router.

vManage Feature Template

For vEdge cellular wireless routers only:

Configuration ► Templates ► WiFi SSID

Command Hierarchy

```
wlan radio-band
interface vapnumber
data-security security
description text
max-clients number
mgmt-security security
radius-servers tag
[no] shutdown
ssid ssid
wpa-personal-key password
```

Syntax Description

[no] shutdown	Disable or Enable the VAP Interface:			
	Disable or enable the VAP interface.			
vap number	VAP Interface:			
	VAP instance.			
	Range: 0 through 3			
description	VAP Interface Description:			
text	Text description of the VAP interface. The text can be from 4 through 64 characters long.			

Command History

Release	Modification
16.3	Command introduced.

Example

Configure four VAP interfaces, for four SSIDs:

```
vEdge# show running-config wlan
wlan 5GHz
channel 36
 interface vap0
 ssid tb31_pm6_5ghz_vap0
 no shutdown
 interface vap1
                 tb31 pm6 5ghz vap1
 data-security wpa/wpa2-enterprise
 radius-servers tag1
 no shutdown
 interface vap2
 ssid
                  tb31 pm6 5ghz vap2
 data-security wpa/wpa2-personal mgmt-security optional
 wpa-personal-key $4$BES+IEZB2vcQpeEoSR4ia9JqgDsPNoHukAb8fvxAg5I=
 no shutdown
 interface vap3
                tb31_pm6_5ghz_vap3

 data-security wpa2-enterprise
 mgmt-security optional
 radius-servers tag1
 no shutdown
!
```

Operational Commands

clear wlan radius-stats

show interface

show wlan clients

show wlan interfaces

show wlan radios

show wlan radius

interface

Configure the properties of an interface in an OSPF area (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► OSPF

Command Hierarchy

```
vpn vpn-id
 router
   ospf
     area number
       interface interface-name
         authentication
           authentication-key key
           message-digest key
           type (message-digest | simple)
         cost number
         dead-interval seconds
         hello-interval seconds
         network (broadcast | point-to-point)
          passive-interface
         priority number
         retransmit-interval seconds
```

Syntax Description

interface-name	Interface Name:	
	Name of the interface, in the format ge <i>slot/port</i> or loopback <i>number</i> .	

Command History

Release	Modification
14.1	Command introduced.

Example

Configure interface ge0/0 to be in area 0:

```
vml# show running-config vpn 1 router ospf area 0
vpn 1
router
ospf
  area 0
    interface ge0/0
    exit
    exit
!
!
```

Operational Commands

show ospf interface

interface

Configure the interfaces that participate in the PIM domain, and configure PIM timers for the interfaces (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► PIM

Command Hierarchy

```
vpn vpn-id
  router
   pim
    interface interface-name
    hello-interval seconds
    join-prune-interval seconds
```

Syntax Description

interface-nam	Interface Name:
	Name of the interface, in the format ge <i>slot/port</i>

Command History

Release	Modification
14.2	Command introduced.

Example

Configure interface ge3/0 to participate in the PIM domain:

```
vEdge# show running-config vpn 1 router pim vpn 3
router
  pim
  interface ge3/0
  exit
  exit
 !
!
```

Operational Commands

show multicast replicator show multicast rpf show multicast topology show multicast tunnel show pim interface show pim neighbor show omp multicast-auto-discover show omp multicast-routes

interface gre

Configure a GRE tunnel interface in the transport VPN (on vEdge routers only).

GRE interfaces are logical interfaces, and you configure them just like any other physical interface. GRE interfaces come up as soon as they are configured, and they stay up as long as the physical tunnel interface is up.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface GRE

Command Hierarchy

```
vpn 0
interface grenumber
access-list acl-name
block-non-source-ip
clear-dont-fragment
description text
ip address prefix/length
keepalive seconds retries
mtu bytes
[no] nat-port-overload
policer policer-name
rewrite-rule rule-name
tcp-mss-adjust bytes
tunnel-destination ip-address
(tunnel-source ip-address | tunnel-source-interface interface-name)
```

Syntax Description

gre		Interface Name	
numbe	r	Name of the GRE interface. <i>number</i> can be a value from 1 through 255.	

Turning off port translation

Normally, traffic sent over IPSec/GRE tunnel to zScalar is translated using port is translation. In this scenario, each IPSec or GRE tunnel can carry only 64000 streams.

Use the **no nat-port-overload** command to turn off the port translation of traffic on GRE and IPsec tunnels. When port translation is turned off, each IPSec or GRE tunnel can carry only 64000 streams over a single IPSec/GRE tunnel.

Note

Port translation can be turned off when service-side traffic does not use overlapping IP addresses. We do not recommend turning off port translation when service-side traffic uses overlapping IP address.

Note

When the command is in use, the fragmentation reassembly and address reuse across VPNs is not supported.

Command History

Release	Modification
14.1	Command introduced.
15.4.1	Support for GRE interfaces added.
19.2.31	Support for nat-port-overload is added.

Example

Configure a GRE tunnel interface in VPN 0:

```
vEdge# show running-config vpn 0
vpn 0
interface gre1
ip address 172.16.111.11/24
keepalive 60 10
nat-port-overload
tunnel-source 172.16.255.11
tunnel-destination 10.1.2.27
no shutdown
!
```

Operational Commands

show interface

show tunnel statistics gre

interface ipsec

Configure an IKE-enabled IPsec tunnel that provides authentication and encryption to ensure secure packet transport (on vEdge routers only). You can create the IPsec tunnel in the transport VPN (VPN 0) and in any service VPN (VPN 1 through 65530, except for 512).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface IPsec

Command Hierarchy

```
vpn vpn-id
  interface ipsecnumber
   dead-peer-detection interval seconds retries number
   description text
      authentication-type type
       local-id id
       pre-shared-secret password
        remote-id id
      cipher-suite suite
     group number
     mode mode
     rekey seconds
      version number
    ip address ipv4-prefix/length
   ipsec
      cipher-suite suite
      perfect-forward-secrecy pfs-setting
      rekey seconds
      replay-window number
   mtu bytes
    [no] shutdown
    [no] nat-port-overload
    tcp-mss-adjust bytes
    tunnel-destination (dns-name | ipv4-address)
    (tunnel-source ip-address | tunnel-source-interface interface-name)
```

Syntax Descrption

description	Interface Description:
text	Text description of the ipsec interface. The text can be a maximum of 128 characters. If it includes spaces, enclose the entire string in quotation marks (" ").
ipsec number	Interface Name:
	Number of the ipsec interface.
	Range: 1 through 255

Command History

Release	Modification
17.2	Command introduced.
18.2	Add support for IPsec tunnels in VPN 0.
19.2.31	Support for nat-port-overload is added.

Turning off port translation

Normally, traffic sent over IPSec/GRE tunnel to zScalar is translated using port is translation. In this scenario, each IPSec or GRE tunnel can carry only 64000 streams.

Use the **no nat-port-overload** command to turn off the port translation of traffic on GRE and IPsec tunnels. When port translation is turned off, each IPSec or GRE tunnel can carry only 64000 streams over a single IPSec/GRE tunnel.

Note

Port translation can be turned off when service-side traffic does not use overlapping IP addresses. We do not recommend turning off port translation when service-side traffic uses overlapping IP address.

Note

When the command is in use, the fragmentation reassembly and address reuse across VPNs is not supported.

Example

Configure IKEv1 on a router:

```
vEdge# show running-config vpn 1 interface ipsec1
vpn 1
 interface ipsec1
 ip address 10.1.1.1/30
  tunnel-source 10.1.15.15

      address-pool prefix/length
      exclude ip-address
     lease-time seconds
     max-leases number
      offer-time minutes
      options
        default-gateway ip-address
       dns-servers ip-address
       domain-name domain-name
       interface-mtu mtu
        {\tt tftp-servers}\ ip{\tt -address}
      static-lease mac-address ip ip-address host-name hostname
    (ip address prefix/length | ip dhcp-client [dhcp-distance number])
   ip address-list prefix/length (on vSmart containers only)
   {\tt mac-address}
   mtu bytes
    [no] shutdown
    static-ingress-qos number
    tcp-mss-adjust bytes
   vrrp group-name
      priority number
      timer seconds
      track-omp
```

irb	Interface Name:
number	Name of the interface. <i>number</i> can from 1 through 63, and it must be the same number as the the identifier of the bridging domain that the IRB is connected to, as configured with the bridge command.

Command History

Release	Modification
15.3	Command introduced.

Example

Configure two IRB interfaces:

```
vEdge# show running-config vpn 1
vpn 1
interface ge0/4
 ip address 10.20.24.15/24
 no shutdown
interface irb1
 ip address 1.1.1.15/24
 no shutdown
 access-list IRB ICMP in
 access-list IRB ICMP out
interface irb50
 ip address 3.3.3.15/24
 no shutdown
vEdge# show running-config vpn 2
interface irb2
 ip address 2.2.2.15/24
 no shutdown
!
```

Operational Commands

Syntax Description

number	Interface Name:	
	Number of the PPP interface. <i>number</i> can be from 1 through 31.	

Command History

Release	Modification
15.3	Command introduced.
16.3	Add support for IPv6.

Example

Configure PPPoE:

```
vEdge# show running-config vpn 0 vpn 0
```

```
interface ge0/1
  pppoe-client ppp-interface ppp10
 no shutdown
interface ppp10
 ppp authentication chap
   hostname branch100@corp.bank.myisp.net
   password $4$OHHjdmsC6M8zj4BgLEFXKw==
  tunnel-interface
   encapsulation ipsec
   color gold
   no allow-service all
   no allow-service bgp
   allow-service dhcp
   allow-service dns
   allow-service icmp
   no allow-service ospf
   no allow-service sshd
   no allow-service ntp
   no allow-service stun
 mtu
          1492
 no shutdown
```

show interface show ppp interface show pppoe session

no integrity-type

integrity-type

To configure the type of integrity check performed on IPSec packets, use the **security ipsec integrity-type** command in IPsec configuration mode. To delete the authentication type, use the **no** form of this command.

```
integrity\text{-type} \quad \{ \ none \ \mid ip\text{-udp-esp} \ \mid ip\text{-udp-esp-no-id} \ \mid esp \ \}
```

Syntax Description

none	This option turns integrity checking off on IPSec packets. We don't recommend using this option
ip-udp-esp	Enables ESP encryption. In addition to the integrity checks on the Encapsulating Security Payload (ESP) header and payload, the checks also include the outer IP and UDP headers.
ip-udp-esp-no-id	This is similar to ip-udp-esp option, however, the ID field of the outer IP header is ignored. Configure this option in the list of integrity types to have the Cisco SD-WAN software ignore the ID field in the IP header so that the Cisco SD-WAN can work in conjunction with non-Cisco devices.
esp	Enables ESP encryption and integrity checking on ESP header.

Command Default

When an integrity-type is not specified, the default integrity-type is ip-udp-esp esp.

Command Modes

IPSec configuration (config-ipsec)

Command History

Release	Modif	ication
Cisco SD-WAN Release 20.6.1	This c	ommand was introduced.
	Note	From Cisco SD-WAN Release 20.6.1, this command replaces the authentication-type command.

Usage Guidelines

Configure each integrity type separately using the security ipsec integrity-type command.

Example

```
Device# configure
Device(config)# security
Device(config-security)# ipsec
Device(config-ipsec)# integrity-type esp
```

ip address

Configure an interface's IPv4 address as a static address (on vEdge routers and vSmart controllers only). To configure the interface to receive its IP address from a DHCP server, use the **ip dhcp-client** command.

vManage Feature Template

For vEdge routers and vSmart controllers only:

Configuration ► Templates ► VPN Interface Bridge

Configuration ► Templates ► VPN Interface Cellular (for vEdge cellular wireless routers only)

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface GRE

Configuration ► Templates ► VPN Interface IPsec

Configuration ► Templates ► VPN Interface NAT Pool

Configuration ► Templates ► VPN Interface PPP

Configuration ► Templates ► VPN Interface PPP Ethernet

Command Hierarchy

```
vpn vpn-id
  interface interface-name
  (ip address ipv4-prefix/length | ip dhcp-client [dhcp-distance number])
```

Syntax Description

ipv4-prefix/length	IP Address:
	IPv4 address of the interface. Specify the prefix in decimal four-part dotted notation. For loopback and NAT pool interfaces, the length must be /32. The address cannot be the same as the system IP address that is configured in VPN 0.

Command History

Release	Modification
14.1	Command introduced.

Example

Configure an interface's IP address:

```
vEdge# show running-config vpn 1 interface ge0/4
vpn 1
interface ge0/4
  description "VPN 1 interface"
  ip address 10.20.25.16/24
  no shutdown
!
```

Operational Commands

show interface

show ipv6 interface

Related Topics

```
ip dhep-client, on page 265
ipv6 address, on page 275
ipv6 dhep-client, on page 277
system-ip, on page 478
ip secondary-address, on page 272
```

ip address-list

Configure the IP addresses reachable by the interfaces on a container (on vContainer hosts only). You configure IP addresses in the WAN transport VPN (VPN 0) and in the management interface VPN (VPN 512) only.

Command Hierarchy

```
vpn vpn-id
  interface eth number
  ip address-list prefix/length
```

Syntax Description

interface eth number	Interface Name:
	Name of the interface on the container. The first interface is eth1 .
ip address-list	IP Address List:
prefix/length	Network address available on the interface.
vpn vpn-id	VPN Identifier:
	VPN for the interfaces. <i>vpn-id</i> can be either 0 (for the WAN transport VPN) or 512 (for the management VPN).

Command History

Release	Modification
16.2	Command introduced.

Example

Configure IP address lists, and configure containers for three vSmart controllers on a container host:

```
container
instance first_vsmart
 image 16.2.0
 no shutdown
 memory 512
 allow-address 35.197.204.176/32 0 all
 allow-address 35.232.118.121/32 0 all
 interface eth0
  host-ip-address 10.0.1.25
 !
instance second_vsmart
 image 16.2.\overline{0}
 no shutdown
 memory 512
 allow-address 35.197.204.176/32 0 all
 allow-address 35.232.118.121/32 0 all
 interface eth0
  host-ip-address 10.0.1.26
instance vm10
 image 16.2.0
 no shutdown
 memory 512
 allow-address 35.197.204.176/32 0 all
 allow-address 35.232.118.121/32 0 all
  interface eth0
  host-ip-address 10.0.1.30
  interface eth1
  host-ip-address 10.0.12.20
```

vContainer# show running-config container

interface eth2

```
host-ip-address 10.2.2.20
!
vpn 0
interface eth1
  ip address-list 10.0.1.25/24
  ip address-list 10.0.1.26/24
  ip address-list 10.0.1.27/24
  ip address-list 10.0.1.30/24
 ip static-route 0.0.0.0/0 10.0.1.1
 no shutdown
 interface eth2
  ip address-list 10.2.2.20/24
  ip address-list 10.2.2.25/24
  ip address-list 10.2.2.26/24
  ip address-list 10.2.2.27/24
  ip static-route 0.0.0.0/0 10.2.2.1
 no shutdown
 interface eth3
  ip address-list 10.0.12.20/24
 ip static-route 0.0.0.0/0 10.0.12.13
 no shutdown
vpn 512
 interface eth0
 ip dhcp-client
 no shutdown
```

ip dhcp-client

Configure an interface in the WAN transport VPN (VPN 0) to receive its IPv4 address from a DHCPv4 server. To configure the interface's IPv4 address as a static address, use the **ip address** command.

vManage Feature Template

For all vEdge devices:

Configuration ► Templates ► VPN Interface Cellular (for vEdge cellular wireless routers only)

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface PPP Ethernet

Command Hierarchy

```
vpn vpn-id
  interface interface-name
   (ip address ip-address/length | ip dhcp-client [dhcp-distance number])
```

Syntax Description

dhcp-distance	Administrative Distance:
number	Set the administrative distance of routes learned from a DHCP server.
	Range: 1 through 255
	Default: 1

Command History

Release	Modification
14.1	Command introduced.

Example

Configure an interface in VPN 0 to receive its IP address from a DHCP server:

```
vEdge# show running-config vpn 0 interface ge0/7
vpn 0
interface ge0/4
  ip dhcp-client
  no shutdown
!
!
```

Operational Commands

```
clear dhcp server-bindings
clear dhcp state
show dhcp interface
show interface
show ipv6 dhcp interface
show ipv6 interface
```

Related Topics

ipv6 dhcp-client, on page 277
```

ip gre-route

Configure a GRE-specific static route in a service VPN (a VPN other than VPN 0 or VPN 512) to direct traffic from the service VPN to a GRE tunnel (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN

Command Hierarchy

```
vpn vpn-id
  ip gre-route prefix/length vpn 0 interface gre number [gre number2]
```

Syntax Description

gre number [gre number2]	GRE Interface Name: Name of the GRE tunnel used to reach the service. If you configure two interfaces, the first is the primary GRE tunnel, and the second is the backup. All packets are sent only to the primary tunnel. If that tunnel fails, all packets are then sent to the secondary tunnel. If the primary tunnel comes back up, all traffic is moved back to the primary GRE tunnel
prefix/length	Prefix of GRE Static Route: IP address or prefix, in decimal four-part-dotted notation, and prefix length of the GRE-specific static route.

Command History

Release	Modification
15.4.3	Command introduced.

Example

Configure a GRE-specific static route so that traffic from the 58.0.1.0/24 network can reach the GRE interfaces in VPN 0:

```
vEdge# show running-config
vpn 0
  interface gre1
   ip address 10.0.111.11/24
  keepalive 60 10
   tunnel-source 10.0.5.11
   tunnel-destination 172.168.1.1
  no shutdown
!
interface gre2
  ip address 10.0.122.11/24
  tunnel-source 10.0.5.11
```

```
tunnel-destination 172.168.122.11
  no shutdown
!
!
vpn 1
  ip gre-route 58.0.1.0/24 vpn 0 interface gre1 gre2
```

ip ipsec-route

Configure an IPsec-specific static route in a service VPN (a VPN other than VPN 0 or VPN 512) to direct traffic from the service VPN to an IPsec tunnel (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN

Command Hierarchy

```
vpn vpn-id
ip ipsec-route prefix/length vpn 0 interface ipsecnumber [ipsecnumber2]
```

Syntax Description

ipsecnumber [ipsecnumber2]	IPsec Interface Name: Name of the IPsec tunnel interface. If you configure two interfaces, the first is the primary IPsec tunnel, and the second is the backup. All packets are sent only to the primary tunnel. If that tunnel fails, all packets are then sent to the secondary tunnel. If the primary tunnel comes back up, all traffic is moved back to the primary IPsec tunnel.
prefix/length	Prefix of IPsec Static Route: IP address or prefix, in decimal four-part-dotted notation, and prefix length of the IPsec-specific static route.

Command History

Release	Modification
18.2	Command introduced.

Example

Configure an IPsec-specific static route in VPN 100 to direct traffic from that VPN to an IPsec tunnel in VPN 0. In VPN 0, the primary IPsec tunnel is the interface *ipsec1* and the secondary IPsec tunnel is *ipsec2*.

```
vEdge# show running-config vpn 0

ip route

Configure an IPv4 static route in a VPN.

vManage Feature Template

For all vEdge devices:

Configuration ► Templates ► VPN

Command Hierarchy

```
vpn vpn-id
ip route prefix/length next-hop [administrative-distance]
```

Syntax Description

prefix/length	Address of Static Route:
	IP address or prefix, in decimal four-part-dotted notation, and prefix length of the static route.
administrative-distance	Administrative Distance of Route:
	Assign an administrative distance to the route. This value is used to determine the best route when multiple paths exist to the same destination.
	Range: 1 through 255
	Default: 1

next-hop	Next Hop towards the Destination:	
	IP address of the next hop to reach the static route. The n following	ext hop can be one of the
	• ip-address—IP address of the next-hop router.	
	• null0—Next hop is the null interface. All packets se dropped without sending any ICMP messages.	nt to this interface are
	• vpn 0—Direct packets to the transport VPN. If NAT interface, the packets can be forwarded to an Interned destination outside of the overlay network, effective router into a local Internet exit point. You must also dinterface in VPN 0.	t destination or other ly converting the vEdge
	Note Each tunnel establish control connection with control connection to be established, the control the tunnel interface. If there are multiple speratch (static/dynamically learnt) to reach the control match is chosen. Hence, same outgoing intercontrol connection will not be established via overcome this, its recommended to configure controller via each interface.	trol packet should go via cific routes ller, the path with longest face will be used. The a other interfaces. To

Command History

Release	Modification
14.1	Command introduced.

Example

Configure a static route to the prefix 0.0.0.0/0 via the next hop at 10.10.0.1:

```
vpn 0
  ip route 0.0.0.0/0 10.10.0.1
```

Operational Commands

show ip routes (for IPv4 routes) show ipv6 routes

Related Topics

```
ip gre-route, on page 267 ipv6 route, on page 278 nat, on page 348
```

ip secondary-address

Configure secondary IPv4 addresses for a service-side interface (on vEdge routers only).

You can configure secondary addresses only on interfaces whose primary address is configured with the **ip address** command. You cannot configure secondary addresses on interfaces that learn their primary address from DHCP (configured with the **ip dhcp-client** command).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface Bridge

Configuration ► Templates ► VPN Interface Ethernet

Command Hierarchy

```
vpn vpn-id
  interface interface-name
  ip secondary-address ipv4-address
```

Syntax Description

ipv4-address	IP Address:
	IPv4 address of the interface, in decimal four-part dotted notation. You can configure secondary IPv4 addresses for ge and irb interfaces in all VPNs except for VPN 0 and VPN 512. The address cannot be the same as the system IP address that is configured in VPN 0. You can configure up to four secondary IPv4 addresses per interface.

Command History

Release	Modification
17.1	Command introduced.

Example

Configure one secondary IPv4 address:

```
vEdge# show running-config vpn 1 interface ge0/4
vpn 1
interface ge0/4
  description "VPN 1 interface"
  ip address 10.20.25.16/24
  secondary-address 192.168.14.12/24
  no shutdown
!
```

Operational Commands

ping

show interface

show ipv6 interface

ip dhcp-client, on page 265
ipv6 address, on page 275
ipv6 dhcp-client, on page 277
system-ip, on page 478
```

ipsec

Configure the IPsec tunnel to use for IKE key exchange (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface IPsec

Command Hierarchy

```
vpn vpn-id
  interface ipsec number
  ipsec
     cipher-suite suite
    perfect-forward-secrecy pfs-setting
    rekey seconds
    replay-window number
```

Syntax Desription

None

Command History

Release	Modification
17.2	Command introduced.

Example

View the default configuration for the IPsec tunnel used for IKE key exchange:

```
vEdge# show running-config vpn 1 interface ipsec1 ipsec
vpn 1
  interface ipsec1
  ipsec
  rekey 14400
  replay-window 512
  cipher-suite aes256-cbc-sha1
```

clear ipsec ike sessions show ipsec ike inbound-connections show ipsec ike outbound-connections show ipsec ike sessions

Related Topics

ipsec

Configure parameters for IPsec tunnel connections (on vEdge routers only).

Command Hierarchy

```
security
ipsec
authentication-type type
rekey seconds
replay-window number
```

Syntax Description

None

Command History

Release	Modification
14.1	Command introduced.

Example

Shorten the IPsec rekeying interval:

```
vEdge# config
Entering configuration mode terminal
vm6(config)# security ipsec rekey ?
Possible completions:
  <600..172800 seconds>[3600]
vm6(config)# security ipsec rekey 600
```

Operational Commands

show security-info

Related Topics

request security ipsec-rekey, on page 705

iptables-enable

Enable the collection of iptable packet-filtering chains for all DTLS peers (on vSmart controllers and vManage NMSs only).

In Release 15.4, it is recommended that you do not enable iptables.

Command Hierarchy

```
system iptables-enable
```

Syntax Description

None

Command History

Release	Modification
15.4.3	Command introduced.
16.1	iptables-enable is enabled by default.

Example

Enable the use of iptables:

Enable the use of iptables:

vSmart(config)# system iptables-enable

Operational Commands

show system netfilter

ipv6 address

Configure a static IPv6 address on an interface. To configure the interface to receive its IP address from a DHCP server, use the **ipv6 dhcp-client** command.

You can configure IPv6 only on WAN transport interfaces, that is, only on interfaces in VPN 0 on vEdge routers and Cisco IOS XE SD-WAN devices.

If you configure both IPv4 and IPv6 static addresses on an interface, the IPv4 addresses take precedence and no IPv6 data plane tunnels are established.

vManage Feature Template

For all vEdge devices:

Configuration ► Templates ► VPN Interface Bridge

```
Configuration ► Templates ► VPN Interface Cellular

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface GRE

Configuration ► Templates ► VPN Interface PPP Ethernet
```

Command Hierarchy

```
vpn vpn-id
  interface interface-name
   (ipv6 address ipv6-prefix/length | ipv6 dhcp-client [dhcp-distance number]
[dhcp-rapid-commit])
```

Syntax Description

None

Command History

Release	Modification
16.3	Command introduced.

Example

Configure an IPv6 WAN transport interface:

```
vEdge(config) # vpn 0 interface ge0/3
vEdge(config-interface) # ipv6 address fd00:1234::/16
vEdge(config-interface) # no shutdown
vEdge(config-interface) # tunnel-interface
vEdge(config-tunnel-interface)# color green
vEdge(config-tunnel-interface)# encapsulation ipsec
vEdge(config-tunnel-interface) # commit and-quit
vEdge# show running-config vpn 0 interface ge0/3
vpn 0
interface ge0/3
 ipv6 address fd00:1234::/16
  tunnel-interface
   encapsulation ipsec
   color green
  no allow-service bgp
   allow-service dhcp
   allow-service dns
   allow-service icmp
   no allow-service sshd
   no allow-service netconf
   no allow-service ntp
   no allow-service ospf
  no allow-service stun
 no shutdown
```

show interface

show ipv6 interface

Related Topics

```
ip address, on page 262
ipv6 address, on page 275
ipv6 dhcp-client, on page 277
system-ip, on page 478
```

ipv6 dhcp-client

Configure an interface in the WAN transport VPN (VPN 0) to receive its IPv6 address from a DHCPv6 server. To configure the interface's IPv6 address as a static address, use the **ipv6 address** command.

You can configure IPv6 only on WAN transport interfaces, that is, only on interfaces in VPN 0.

vManage Feature Template

For all Cisco vEdge devices:

Configuration ► Templates ► VPN Interface Cellular (for vEdge cellular wireless routers only)

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface PPP Ethernet

Command Hierarchy

```
vpn vpn-id
  interface interface-name
   (ipv6 address ipv6-prefix/length | ipv6 dhcp-client [dhcp-distance number]
[dhcp-rapid-commit])
```

Syntax Description

dhcp-distance number	Administrative Distance:
	Set the administrative distance of routes learned from a DHCP server.
	Range: 1 through 255
	Default: 1
dhcp-rapid-commit	Rapid Commit:
	Enable the DHCPv6 rapid commit option to speed up the assignment of IP addresses. Rapid commit uses a two-message exchange to expedite address assignment.

Command History

Release	Modification
16.3	Command introduced.

Example

Configure an IPv6 WAN transport interface to use a dynamic IPv6 address, and enable the rapid commit option for DHCPv6:

```
vEdge(config) # vpn 0 interface ge0/3
vEdge(config-interface) # ip6 dhcp-client
vEdge(config-interface) # no shutdown
vEdge(config-interface) # tunnel-interface
vEdge(config-tunnel-interface)# color green
vEdge(config-tunnel-interface)# encapsulation ipsec
vEdge(config-tunnel-interface) # commit and-quit
vEdge# show running-config vpn 0 interface ge0/3
vpn 0
interface ge0/3
 ipv6 dhcp-client
  ipv6 dhcp-rapid-commit
  tunnel-interface
   encapsulation ipsec
  color green
   no allow-service bgp
  allow-service dhcp
   allow-service dns
   allow-service icmp
   no allow-service sshd
   no allow-service netconf
   no allow-service ntp
   no allow-service ospf
   no allow-service stun
 no shutdown
```

Operational Commands

clear dhcp state show ipv6 dhcp interface show ipv6 interface

Related Topics

ip address, on page 262 ipv6 address, on page 275

ipv6 route

Configure an IPv6 static route in a VPN (on vEdge routers only).

In Release 16.3, you can configure IPv6 only in VPN 0.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN

Command Hierarchy

```
vpn 0
  ipv6 route prefix/length next-hop [administrative-distance]
```

Syntax Description

prefix/length	Address of Static Route:
	IPv6 address of the static route, written as the prefix and prefix length.
administrative-distance	Administrative Distance of Route:
	Assign an administrative distance to the route. This value is used to determine the best route when multiple paths exist to the same destination. <i>Range:</i> 1 through 255Default: 0
next-hop	Next Hop towards the Destination:
	IPv6 address of the next hop to reach the static route. The next hop can be one of the following:
	• ipv6-address—IP address of the next-hop router.
	 null0—Next hop is the null interface. All packets sent to this interface are dropped without sending any ICMPv6 messages.

Command History

Release	Modification
16.3	Command introduced.

Example

Configure a static route to the prefix with a next hop of the null interface:

```
vpn 0
  ipv6 route 2001:1111:2222:3333::/64 null0
```

Operational Commands

show ip routes (for IPv4 routes) show ipv6 routes

Related Topics

ip route, on page 270

join-group

Configure an interface on the vEdge router to initiate a request to join a multicast group (on vEdge routers only). Configuring this command does not cause the vEdge router to behave like a host.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► IGMP

Command Hierarchy

```
vpn vpn-id
  router
  igmp
  interface interface-name
    join-group group-address
```

Syntax Description

group-address	Multicast Group To Join:
	Address of the multicast group to join.

Command History

Release	Modification
14.3	Command introduced.

Example

Enable IGMP in VPN 1:

```
vm5(config-igmp)# show full-configuration
vpn 1
router
  igmp
  interface ge0/4
  exit
  interface ge0/5
    join-group 239.239.239
    exit
  exit
  exit
  !
```

Operational Commands

clear igmp interface clear igmp protocol

```
clear igmp statistics
show igmp groups
show igmp interface
show igmp statistics
show igmp summary
```

join-prune-interval

Modify the PIM join/prune message interval for an interface (on vEdge routers only). The join/prune interval sets when PIM multicast traffic can join or be removed from a rendezvous point tree (RPT) or shortest-path tree (SPT).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► PIM

Command Hierarchy

```
vpn vpn-id
  router
   pim
    interface interface-name
    join-prune-interval seconds
```

Syntax Description

seconds Join/Prune Interval Time:

PIM join/prune message interval. vEdge routers send join/prune messages to their upstream RPF neighbor.

Range: 10 through 600 seconds

Default: 60 seconds

Command History

Release	Modification
14.2	Command introduced.

Example

Change the PIM join/prune message interval to 360 seconds:

```
vEdge# show running-config vpn 1 router pim vpn 3
router
  pim
  interface ge3/0
  join-prune-interval 360
```

```
exit
exit
!
```

show multicast replicator
show multicast rpf
show multicast topology
show multicast tunnel
show pim interface
show pim neighbor
show omp multicast-auto-discover
show omp multicast-routes

keepalive

Configure how often a GRE interface sends keepalive packets (on vEdge routers only). The sending of keepalive packets is enabled by default.

Because GRE tunnels are stateless, the sending of keepalive packets is the only way to determine whether the remote end of the tunnel is up. The keepalive packets are looped back to the sender. Receipt of these packets by the sender indicates that the remote end of the GRE tunnel is up.

In Releases 17.1 and later, GRE interfaces behind a NAT device send keepalive messages. If you configure an IP address for the GRE interface, it is that address that sends the keepalive messages.

If the vEdge router sits behind a NAT and you have configured GRE encapsulation, you must disable keepalives. To do this, include a **keepalive 0 0** command in the configuration. You cannot disable keepalives by issuing a **no keepalive** command. This command returns the keepalive to its default settings.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface GRE

Configuration ► Templates ► VPN Interface PPP Ethernet

Command Hierarchy

```
vpn vpn-id
  interface grenumber
  keepalive seconds retries
```

Syntax Description

seconds	Keepalive Time:
	How often the GRE interface sends keepalive packets on the GRE tunnel.
	Range: 0 through 65535 seconds
	Default: 10 seconds
retries	Keepalive Retries
	How many times the GRE interface tries to resend keepalive packets before declaring the remote end of the GRE tunnel to be down. With the default keepalive time of 10 seconds and the default retry of 3 times, if the router receives no looped-back keepalive packets from the remote end of the GRE tunnel, the tunnel would be declared to be down after 40 seconds.
	Range: 0 through 255
	Default: 3

Command History

Release	Modification
15.4.1	Command introduced.
17.1	Add support for GRE interfaces to send keepalive messages.

Example

Configure the keepalive time for a GRE tunnel:

```
vEdge(config-vpn-0)# interface gre1
vEdge(config-interface-gre1)# keepalive 60 10
vEdge(config-interface-gre1)# show full configuration
vpn 0
interface gre1
ip address 10.0.111.11/24
keepalive 60 10
tunnel-source 10.0.5.11
tunnel-destination 172.168.1.1
no shutdown
!
!
```

Operational Commands

show interface show tunnel gre-keepalive show tunnel statistics

Related Topics

tunnel-destination, on page 519 tunnel-source, on page 523

last-resort-circuit

Use the tunnel interface as the circuit of last resort (on vEdge routers). By default, this feature is disabled, and the tunnel interface is not considered to be the circuit of last resort.

There is a delay of 7 seconds before switching back to the primary tunnel interface from a circuit of last resort. This delay is to ensure that the primary interface is once again fully operational and is not still flapping.

When you configure a tunnel interface to be a last-resort circuit, the cellular modem becomes dormant and no traffic is sent over the circuit. However, the cellular modem is kept in online mode so that the modem radio can be monitored at all times and to allow for faster switchover in the case the tunnel interface needs to be used as the last resort.

To minimize the amount of extraneous data plane traffic on a cellular interface that is a circuit of last resort, increase the BFD Hello packet interval and disable PMTU discover.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface Ethernet

Command Hierarchy

```
vpn 0
  interface interface-name
   tunnel-interface
   [no] last-resort-circuit
```

Syntax Description

None

Command History

Release	Modification
16.2	Command introduced.

Example

Configure the **cellular0** interface to be the circuit of last resort for the vEdge router:

```
vEdge# show running-config vpn 0 interface cellular0
vpn 0
interface cellular0
ip dhcp-client
tunnel-interface
encapsulation ipsec
color lte
last-resort-circuit
no allow-service bgp
allow-service dhcp
allow-service icmp
no allow-service sshd
```

```
no allow-service netconf
no allow-service ntp
no allow-service ospf
no allow-service stun
!
clear-dont-fragment
mtu 1428
profile 1
no shutdown
!
!
vEdge# show running-config bfd
bfd color lte
hello-interval 300000
no pmtu-discovery
!
```

show control affinity config show control local-properties show interface

Related Topics

bfd color, on page 108

lease-time

Configure the time period for which a DHCP-assigned IP address is valid (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► DHCP Server

Command Hierarchy

```
vpn vpn-id
  interface geslot/port
  dhcp-server
  lease-time seconds
```

Syntax Description

```
seconds Lease Time:
How long DHCP-assigned addresses are valid.
Range: 60 through 4294967295 seconds
```

Command History

Release	Modification
14.3	Command introduced.

Example

Set the DHCP lease time to 2 hours:

```
vEdge# config
Entering configuration mode terminal
vEdge(config)# vpn 1 interface ge0/4
vEdge(config-interface-ge0/4)# dhcp-server address-pool 10.0.100.0/24
vEdge(config-dhcp-server)# exclude 10.0.100.2
vEdge(config-dhcp-server)# lease-time 7200
vEdge(config-dhcp-server)# show full-configuration
vpn 1
interface ge0/4
dhcp-server
address-pool 10.0.100.0/24
exclude 10.0.100.2
lease-time 7200
!
!
!
```

Operational Commands

show dhep interfaces show dhep server

lists

Create groupings of similar objects, such as IP prefixes, sites, TLOC addresses, and AS paths, for use when configuring policy match conditions or action operations and for when applying a policy (on vSmart controllers and vEdge routers only).

In the configuration, you can create multiple iterations of each type of list. For example, it is common to create multiple site lists and multiple VPN lists so that you can apply data policy to different sites and different customer VPNs across the network.

When you create multiple iterations of a type of list (for example, when you create multiple VPN lists), you can include the same values or overlapping values in more than one of these list. You can do this either on purpose, to meet the design needs of your network, or you can do this accidentally, which might occur when you use ranges to specify values. Here are two examples of lists that are configured with ranges and that contain overlapping values:

```
vpn-list list-1 vpn 1-10
vpn-list list-2 vpn 6-8
site-list list-1 site 1-10
site-list list-2 site 5-15
```

For all lists except for site lists, when you configure policies that contain lists with overlapping values, or when you apply the policies, you must ensure that the lists do not contain overlapping values. To do this, you must manually audit your configurations. Cisco SD-WAN performs no validation on the contents of lists, on the policies themselves, or on how the policies are applied to ensure that there are no overlapping values. If you configure or apply policies that contain lists with overlapping values to the same site, one policy is applied and the others are ignored. Which policy is applied is a function of the internal behavior of Cisco SD-WAN when it processes the configuration. This decision is not under user control, and so the outcome is not predictable.

For site lists, for each type of policy that is applied to site lists—app-route-policy, cflowd, control-policy, data-policy—you must ensure for that policy type that the lists do not contain any overlapping sites. Each site must be unique and used only once. However, across these four different policy types, the sites in the site lists can overlap. For example, if you apply a data-policy to sites 100-200, you can apply a control-policy to sites 120-130 or to sites 190-210, and you can apply an app-route-policy to sites 100-125. However, you cannot apply a second data-policy to sites 120-130. For a configuration example that illustrates this behavior, see apply-policy.

vManage Feature Template

For vEdge routers and vSmart controllers:

Configuration ► Policies

Command Hierarchy

For Application-Aware Routing Policy:

```
policy
  lists
  app-list list-name
     (app application-name | app-family application-family)
  data-prefix-list list-name
     ip-prefix prefix/length
  site-list list-name
     site-id site-id
  vpn-list list-name
     vpn vpn-id
```

For Centralized Control Policy:

```
policy
  lists
  color-list list-name
    color color
  prefix-list list-name
    ip-prefix prefix/length
  site-list list-name
    site-id site-id
  tloc-list list-name
    tloc address color color encap encapsulation [preference value]
  vpn-list list-name
    vpn vpn-id
```

For Centralized Data Policy

```
policy
  lists
  app-list list-name
      (app application-names | app-family application-family)
  data-prefix-list list-name
      ip-prefix prefix/length
```

```
site-list list-name
  site-id site-id
tloc-list list-name
  tloc ip-address color color encap encapsulation [preference value]
vpn-list list-name
  vpn vpn-id
```

For Localized Control Policy

```
policy
lists
   as-path-list list-name
   as-path path-list
community-list list-name
   community [aa:nn | internet | local-as | no-advertise | no-export]
ext-community-list list-name
   community [rt (aa:nn | ip-address) | soo (aa:nn | ip-address)]
prefix-list list-name
   ip-prefix prefix/length
```

For Localized Data Policy (ACLs)

```
policy
  lists
  data-prefix-list list-name
    ip-prefix prefix/length
```

Syntax Description

For Application-Aware Routing Policy:

app-list list-name	Application List:
(app application-name app-family application-family)	List of one or more applications or application families running on the subnets connected to the vEdge router. Each app-list can contain either applications or application families, but not both. To configure multiple applications or application families in a single list, include multiple app or app-family options, specifying one application or application family in each app or app-family option.
	application-name is the name of an application family. Cisco SD-WAN software supports about 2300 different applications. To list the supported applications, use the ? in the CLI.
	application-family is the name of an application family. It can be one of the following: antivirus, application-service, audio_video, authentication, behavioral, compression, database, encrypted, erp, file-server, file-transfer, forum, game, instant-messaging, mail, microsoft-office, middleware, network-management, network-service, peer-to-peer, printer, routing, security-service, standard, telephony, terminal, thin-client, tunneling, wap, web, and webmail.
data-prefix-list	Data Prefix List:
list-name	List of one or more IP prefixes. To configure multiple prefixes in a single list,
ip-prefix prefix/length	include multiple ip-prefix options, specifying one prefix in each option.
site-list list-name	Overlay Network Site List
site-id site-id	List of one or more identifiers of sites in Cisco SD-WAN overlay network. To configure multiple sites in a single list, include multiple site-id options, specifying one site number in each option. To configure a range of site IDs, separate the IDs with hyphens. In application-aware routing policy, you apply a centralized control policy (with the apply-policy command) by site list.

vpn-list list-name	VPN List:
vpn vpn-id	List of one or more identifiers of VPNs in Cisco SD-WAN overlay network. To configure multiple VPNs in a single list, include multiple vpn options, specifying one VPN number in each option. To configure a range of VPN IDs, separate the IDs with hyphens. In application-aware routing policy, you group policy sequences within VPN lists, with the policy vpn-list sequence command

For Centralized Control Policy:

color-list list-name	Color List:
color color	List of of one or more TLOC colors. To configure multiple colors in a single list, include multiple color options, specifying one <i>color</i> in each option. <i>color</i> can be one of $3g$, biz -internet, $blue$, $bronze$, $custom1$ through $custom3$, $default$, $gold$, $green$, lte , $metro$ -ethernet, $mpls$, $private1$ through $private6$, $public$ -internet, red , and $silver$.
prefix-list list-name	IP Prefix List:
ip-prefix prefix/length	List of one or more IP prefixes. To configure multiple prefixes in a single list, include multiple ip-prefix options, specifying one prefix in each option.
	Specify the IP prefixes as follows:
	• prefix/length—Exactly match a single prefix—length pair.
	• 0.0.0.0/0—Match any prefix—length pair.
	• 0.0.0.0/0 le <i>length</i> —Match any IP prefix whose length is less than or equal to length. For example, ip-prefix 0.0.0.0/0 le 16 matches all IP prefixes with lengths from /1 through /16.
	• 0.0.0.0/0 ge <i>length</i> —Match any IP prefix whose length is greater than or equal to <i>length</i> . For example, ip-prefix 0.0.0.0 ge 25 matches all IP prefixes with lengths from /25 through /32.
	• 0.0.0.0/0 ge length1 le length2, or 0.0.0.0 le length2 ge length1—Match any IP prefix whose length is greater than or equal to length1 and less than or equal to length2.
	For example, ip-prefix 0.0.0.0/0 ge 20 le 24 matches all /20, /21, /22, /23, and /24 prefixes. Also, ip-prefix 0.0.0.0/0 le 24 ge 20 matches the same prefixes. If <i>length1</i> and <i>length2</i> are the same, a single IP prefix length is matched. For example, ip-prefix 0.0.0.0/0 ge 24 le 24 matches only /24 prefixes.
	In centralized control policy, you reference a prefix list in a match route prefix-list match condition.

site-list list-name	Site List:
site-id site-id	List of one or more identifiers of sites in Cisco SD-WAN overlay network. To configure multiple sites in a single list, include multiple site-id options, specifying one site number in each option. To configure a range of site IDs, separate the IDs with hyphens. In centralized control policy, you can refer to a site list in match route site-list and match tloc site-list match conditions, and you apply a centralized control policy (with the apply-policy command) by site list.
tloc-list list-name	TLOC List:
tloc address color color encap encapsulation [preference value]	List of one or more address of transport locations (TLOCs) in Cisco SD-WAN overlay network. For each TLOC, specify its address, color, and encapsulation. address is the system IP address. color can be one of 3g, biz-internet, blue, bronze, custom1, custom2, custom3, default, gold, green, lte, metro-ethernet, mpls, private1 through private6, public-internet, red, and silver. encapsulation can be gre or ipsec.
	Optionally, set a preference value (from 0 to $2^{32} - 1$) to associate with the TLOC address. When you apply a TLOC list in an <i>action accept</i> condition, when multiple TLOCs are available and satisfy the match conditions, the TLOC with the lowest preference value is used. If two or more of TLOCs have the lowest preference value, traffic is sent among them in an ECMP fashion.
	To configure multiple TLOCs in a single list, include multiple tloc options, specifying one TLOC number in each option.
	In centralized control policy, you can refer to a TLOC list in match route tloc-list and match tloc tloc-list match conditions, and in <i>action accept</i> conditions.
vpn-list list-name	VPN List:
vpn vpn-id	List of one or more identifiers of VPNs in Cisco SD-WAN overlay network. To configure multiple VPNs in a single list, include multiple vpn options, specifying one VPN number in each option. To configure a range of VPN IDs, separate the IDs with hyphens. In centralized control policy, you can refer to a VPN list in match route vpn-list match condition and in the <i>action accept export-to vpn-list</i> policy action.

For Centralized Data Policy:

app-list list-name	Application List:
(app application-name app-family application-family)	List of one or more applications or application families running on the subnets connected to the vEdge router. Each app-list can contain either applications or application families, but not both. To configure multiple applications or application families in a single list, include multiple app or app-family options, specifying one application or application family in each app or app-family option.
	application-name is the name of an application family. Cisco SD-WAN software supports about 2300 different applications. To list the supported applications, use the ? in the CLI.
	application-family is the name of an application family. It can be one of the following: antivirus, application-service, audio_video, authentication, behavioral, compression, database, encrypted, erp, file-server, file-transfer, forum, game, instant-messaging, mail, microsoft-office, middleware, network-management, network-service, peer-to-peer, printer, routing, security-service, standard, telephony, terminal, thin-client, tunneling, wap, web, and webmail.
data-prefix-list	Data Prefix List:
list-name	List of one or more IP prefixes. To configure multiple prefixes in a single list,
ip-prefix prefix/length	include multiple ip-prefix options, specifying one prefix in each option.
site-list list-name	Site List:
site-id site-id	List of one or more identifiers of sites in Cisco SD-WAN overlay network. To configure multiple sites in a single list, include multiple site-id options, specifying one site number in each option. To configure a range of site IDs, separate the IDs with hyphens. In application-aware routing policy, you apply a centralized control policy (with the apply-policy command) by site list.
tloc-list list-name	TLOC List:
tloc address color color encap (gre ipsec) [preference value weight value]	List of one or more address of transport locations (TLOCs) in the overlay network. For each TLOC, specify its address, color, and encapsulation. <i>address</i> is the system IP address. <i>color</i> can be one of <i>3g</i> , <i>biz-internet</i> , <i>blue</i> , <i>bronze</i> , <i>custom1</i> , <i>custom2</i> , <i>custom3</i> , <i>default</i> , <i>gold</i> , <i>green</i> , <i>lte</i> , <i>metro-ethernet</i> , <i>mpls</i> , <i>private1</i> through <i>private6</i> , <i>public-internet</i> , <i>red</i> , and <i>silver</i> . encapsulation can be <i>gre</i> or <i>ipsec</i> .
	Optionally, set a preference value (from 0 to $2^{32} - 1$) to associate with the TLOC address. When you apply a TLOC list in an <i>action accept</i> condition, when multiple TLOCs are available and satisfy the match conditions, the TLOC with the lowest preference value is used. If two or more of TLOCs have the lowest preference value, traffic is sent among them in an ECMP fashion.
	To configure multiple TLOCs in a single list, include multiple tloc options, specifying one TLOC number in each option.
	In centralized data policy, you can refer to a TLOC list in match route tloc-list and match tloc tloc-list match conditions, and in <i>action accept</i> conditions.

vpn-list list-name	VPN List:
vpn vpn-id	List of one or more identifiers of VPNs in Cisco SD-WAN overlay network. To configure multiple VPNs in a single list, include multiple vpn options, specifying one VPN number in each option. To configure a range of VPN IDs, separate the IDs with hyphens. In centralized data policy, you can refer to a VPN list in a match vpn-list match condition in a VPN membership policy.
	For centralized data policy, you can include any VPNs except for VPN 0 and VPN 512. VPN 0 is reserved for control traffic, so never carries any data traffic, and VPN 512 is reserved for out-of-band network management, so also never carries any data traffic. Note that while the CLI allows you to include these two VPNs in a data policy configuration, the policy is not applied to these two VPNs.

For Localized Control Policy:

as-path path-list	AS Paths:
	List of one or more ASs that make up the AS path. You can write each AS as a single number or as a regular expression. To specify more than one AS in a single path, include the list in quotation marks (" "). To configure multiple AS paths in a single list, include multiple as-path options, specifying one AS path in each option.
community [aa:nn]	BGP Communities:
[internet] [local-as] [no-advertise]	List of one of more BGP communities. In community , you can specify:
[no-export]	• <i>aa:nn</i> : Autonomous system number and network number. Each number is a 2-byte value with a range from 1 to 65535.
	• internet : Routes in this community are advertised to the Internet community. This community comprises all BGP-speaking networking devices.
	• local-as: Routes in this community are not advertised outside the local AS.
	• no-advertise : Attach the NO_ADVERTISE community to routes. Routes in this community are not advertised to other BGP peers.
	 no-export: Attach the NO_EXPORT community to routes. Routes in this community are not advertised outside the local AS or outside a BGP confederation boundary.
	To configure multiple BGP communities in a single list, include multiple community options, specifying one community in each option.

community [**rt** (aa:nn | ip-address)] [**soo** (aa:nn | ip-address)]

BGP Extended Communities:

List of one or more BGP extended communities. In **community**, you can specify:

- **rt** (*aa:nn* | *ip-address*): Route target community, which is one or more routers that can receive a set of routes carried by BGP. Specify this as the autonomous system number and network number, where each number is a 2-byte value with a range from 1 to 65535, or as an IP address.
- soo (aa:nn | ip-address): Route origin community, which is one or more routers that can inject a set of routes into BGP. Specify this as the autonomous system number and network number, where each number is a 2-byte value with a range from 1 to 65535, or as an IP address.

To configure multiple extended BGP communities in a single list, include multiple community options, specifying one **community** in each option.

ip-prefix prefix/length

IP Prefix:

List of one or more IP prefixes and length. To configure multiple prefixes in a single list, include multiple **ip-prefix** options, specifying one prefix in each option.

Specify the IP prefixes as follows:

- prefix/length—Exactly match a single prefix-length pair.
- 0.0.0.0/0—Match any prefix—length pair.
- **0.0.0.0/0 le** *length*—Match any IP prefix whose length is less than or equal to length. For example, **ip-prefix 0.0.0/0 le 16** matches all IP prefixes with lengths from /1 through /16.
- **0.0.0.0/0 ge** *length*—Match any IP prefix whose length is greater than or equal to length. For example, **ip-prefix 0.0.0.0 ge 25** matches all IP prefixes with lengths from /25 through /32.
- 0.0.0.0/0 ge *length1* le *length2*, or 0.0.0.0 le *length2* ge *llength1*—Match any IP prefix whose length is greater than or equal to *length1* and less than or equal to *length2*.

For example, **ip-prefix 0.0.0.0/0 ge 20 le 24** matches all /20, /21, /22, /23, and /24 prefixes. Also, **ip-prefix 0.0.0.0/0 le 24 ge 20** matches the same prefixes. If length1 and length2 are the same, a single IP prefix length is matched. For example, **ip-prefix 0.0.0.0/0 ge 24 le 24** matches only /24 prefixes..

For Localized Data Policy (ACLs):

data-prefix-list list-name

IP Prefix:

ip-prefix prefix/length

List of one or more IP prefixes. You can specify both unicast and multicast prefixes. To configure multiple prefixes in a single list, include multiple **ip-prefix** options, specifying one prefix in each option.

Command History

Release	Modification
14.1	Command introduced.
16.3	Add support for overlapping sites in different site lists, and add support for IP multicast addresses.

Example

Configure a list of VPNs:

```
policy
  lists
    vpn-list west-coast
    vpn 20-30
    vpn 42
    vpn 45
```

Configure a list of prefixes:

```
policy
  lists
   prefix-list east
      ip-prefix 8.8.0.0/16
```

Operational Commands

show running-config policy lists

Related Topics

```
action, on page 36
apply-policy, on page 74
match, on page 318
policy, on page 384
sla-class, on page 462
```

local-interface-list

Configure Direct Internet Access (DIA) interfaces for Cloud OnRamp for SaaS (formerly called CloudExpress service) (on vEdge routers only).

Note

To ensure that Cloud OnRamp for SaaS is set up properly, configure it in vManage NMS, not using the CLI.

Command Hierarchy

```
vpn 0
  cloudexpress
   local-interface-list interfaces-names
```

Syntax Description

ir	terfaces	Interfaces:	
		List of interfaces names.	
		Default: If no local interface is configured, Cloud OnRamp for SaaS uses interfaces configured with NAT.	

Command History

Release	Modification
16.3	Command introduced.

Example

Configure Cloud OnRamp for SaaS to run on interfaces ge0/0 and ge0/2:

```
vEdge# show running-config vpn 100 cloudexpress
vpn 100
cloudexpress
local-interface-list ge0/0 ge0/2
!
```

Operational Commands

clear cloudexpress computations show cloudexpress applications show cloudexpress gateway-exits show cloudexpress local-exits show omp cloudexpress show running-config vpn cloudexpress

location

system location—Configure a text string that describes the location of a Cisco vEdge device.

vManage Feature Template

For all Cisco vEdge devices:

Configuration ► Templates ► System

Command Hierarchy

```
system
location "string"
```

Syntax Description

```
String Location description:

Text string that describes the location of the device. If the name contains spaces, enclose it in quotation marks.

Maximum characters: 128
```

Command History

Release	Modification
14.1	Command introduced.

Examples

Configuring router location

```
vEdge(config-system) # location "Main lab, row 18, rack 3"
vEdge(config-system) # commit and-quit
Commit complete.
vEdge# show running-config system
system
                 vEdge
host-name
                "Main lab, row 18, rack 3"
location
                172.16.255.15
system-ip
                 1
domain-id
site-id
organization-name "Cisco"
clock timezone America/Los Angeles
```

Operational Commands

show running-config system

Related Topics

```
gps-location, on page 216 location, on page 296
```

location

Configure the location of a Cisco vEdge device.

vManage Feature Template

For all Cisco vEdge devices:

Configuration ► Templates ► SNMP

Command Hierarchy

snmp location string

Syntax Description

string | Device Location:

Text string that describes the location of the device. If the name contains spaces, enclose it in quotation marks (" ").

Maximum characters: 255

Command History

Release	Modification
14.1	Command introduced.

Examples

Example

vEdge(config) # snmp location "Machine room 1, Aisle 3, Rack 7"

Operational Commands

show running-config snmp

Related Topics

gps-location, on page 216 location, on page 295

log-frequency

Configure how often packet flows are logged (on vEdge routers only). Packet flows are those that match an access list (ACL), a cflowd flow, or an application-aware routing (DPI) flow.

vManage Feature Template

For vEdge routers:

Configuration ► Policies ► Localized Policy ► Add Policy ► Policy Overview ► Log Frequency field

Command Hierarchy

policy log-frequency number

Syntax Description

number | Logging Frequency:

How often packet flows are logged.

Range: Any integer value. While you can configure any integer value for the frequency, the software rounds the value down to the nearest power of 2.

Default: 1000. With this default, the logging frequency is rounded down to 512. So, by default, every 512th packet is logged.

Syntax Description

string | Location description:

Text string that describes the location of the device. If the name contains spaces, enclose it in quotation marks.

Maximum characters: 128

Command History

Release	Modification
16.3	Command introduced.

Examples

Configure packet flow logging to log every 16 packets. Note that the configured logging frequency value of 20 is rounded down to 16, which is the nearest power of 2. With this configuration, every sixteenth packet is logged.

```
vEdge# show running-config policy log-frequency
policy
log-frequency 20
```

Operational Commands

clear app log flow-all clear app log flows show app log flow-count show app log flows

Related Topics

implicit-acl-logging, on page 241

log-translations

Log the creation and deletion of NAT flows (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface Cellular (for vEdge cellular wireless routers only)

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface NAT Pool

Configuration ► Templates ► VPN Interface PPP

Command Hierarchy

```
vpn vpn-id
  interface natpoolnumber
  nat
    log-translations
```

Command History

Release	Modification
18.3	Command introduced.

Examples

Example 1

Configure a vEdge router to perform dynamic NAT:

```
vEdge# show running-config vpn 1
interface natpool1
  ip address 10.15.1.4/30
  nat
  no shutdown
!
```

Example 2

Configure a vEdge router to perform static NAT, translating a service-side and a remote IP address:

```
vEdge# show running-config vpn 1
interface natpool1
  ip address 10.15.1.4/30
  nat
    static source-ip 10.1.17.3 translate-ip 10.15.1.4 inside
    static source-ip 10.20.25.18 translate-ip 10.25.1.1 outside
    direction inside
    no overload
    log-translations
!
  no shutdown
!
```

Operational Commands

```
show ip nat filter
show ip nat interface
show ip nat interface-statistics

logging disk

Log event notification system log (syslog) messages to a file on the local device's hard disk. Logging to the disk, at a priority level of "information," is enabled by default. Log files are placed in the directory /var/log on the local device. They are readable by the "admin" user.

vManage Feature Template

For all Cisco vEdge devices:

Configuration ► Templates ► Logging

Command Hierarchy

```
system
logging
disk
enable
file
rotate number
size megabytes
priority priority
```

•	_			
Syntax	Desc	rir	ıtı	on

omoble	
enable	

Enable and Disable Logging to Disk:

Allow syslog messages to be recorded in a file on the local hard disk. By default, logging to a local disk file is enabled.

To disable disk logging, use the **no system logging disk enable** configuration command.

Log files:

Syslog messages at or above the default or configured priority value are recorded in a number of files in the directory /var/log.

For Releases 15.4 and later, syslog messages are stored in the following files:

- auth.log—Login, logout, and superuser access events, and usage of authorization systems.
- · kern.log—Kernel messages.
- messages—Consolidated log file that contains syslog messages from all sources.
- vconfd—All configuration-related messages.
- vdebug—All debug messages for modules whose debugging is turned on and all syslog messages above the configured priority value are saved to the file /var/log/vdebug and, in Releases 16.3 and later, in /var/log/tmplog/vdebug. Debug logging supports various levels of logging based on the module. Different modules implement the logging levels differently. For example, the system manager (sysmgr) has two logging levels (on and off), while the chassis manager (chmgr) has four different logging levels (off, low, normal, and high). You cannot send debug messages to a remote host. To enable debugging, use the debug operational command.
- vsyslog—All syslog messages above the configured priority value are stored in the file /var/log/vsyslog. The default priority value is "informational", so by default, all "notice", "warning", "error", "critical", "alert", and "emergency" syslog messages are saved.

For Releases 15.3 and earlier, syslog messages are stored in the following files:

- auth.log—Login, logout, and superuser access events, and usage of authorization systems.
- confd/audit.log—Captured by the audit daemon. These messages generally pertain to systemwide operations, users, files, and directories.
- confd/confd.log—Configuration messages.
- confd/devel.log—Development message.
- confd/netconf.log—Netconf messages.
- confd/snmp.log—SNMP messages.
- daemon.log—System and application process messages.
- devel.log—Developer messages.
- kern.log—Kernel messages.

- messages—Common log messages.
- quagga/daemon.log—One log file for each routing process running on the device. Examples are bgpd.log and ospfd.log
- quagga/quagga-debug.log—Routing process debug syslog messages.
- tallylog—Attempted and failed login operations.
- user.log—All user-level logs.
- vdebug—All debug messages for modules whose debugging is turned on and all syslog messages above the configured priority value are saved to the file /var/log/vdebug. Debug logging supports various levels of logging based on the module. Different modules implement the logging levels differently. For example, the system manager (sysmgr) has two logging levels (on and off), while the chassis manager (chmgr) has four different logging levels (off, low, normal, and high). You cannot send debug messages to a remote host. To enable debugging, use the debug operational command.
- vsyslog—All syslog messages above the configured priority value are stored in the file /var/log/vsyslog. The default priority value is "informational", so by default, all "notice", "warning", "error", "critical", "alert", and "emergency" syslog messages are saved.
- wtmp—Login records.

SD-WAN software does not use the following standard LINUX files, which are present in /var/log, for logging: cron.log, debug, lpr.log, mail.log, and syslog. The files in the directory xml/ are not used for message logging.

priority priority

Message priority:

Severity of the syslog message to save. The severity indicates the seriousness of the event that generated the message. The default priority value is "informational", so, by default, all syslog messages are recorded.

The priority level can be one of the following (in order of decreasing severity):

- Emergency—System is unusable (corresponds to syslog severity 0).
- Alert— Action must be taken immediately (corresponds to syslog severity 1).
- Critical—A serious condition (corresponds to syslog severity 2).
- Error—An error condition that does not fully impair system usability (corresponds to syslog severity 3).
- Warning—A minor error condition (corresponds to syslog severity 4).
- Notice—A normal, but significant condition (corresponds to syslog severity 5).
- Informational—Routine condition (the default) (corresponds to syslog severity 6).

rotate number size megabytes	Log File Rotation:
	Syslog files are rotated on an hourly basis based on the file's size. When the file size exceeds the configured value, the file is rotated, and the syslogd process isnotified.
	The default file size is 10 MB. You can configure this to be from 1 to 20 MB.
	Syslog files are discarded after a certain number of files have been created. The default is 10. You can configure this to be from 1 to 10. Debug files are also rotated and discarded following a similar scheme. However, you cannot configure the file size (10MB), nor can you configure the number of rotations (10).

Release	Modification
14.1	Command introduced.
15.4	Files used to store syslog files changed.
16.3	Debug output is placed in the /var/log/tmplog/vdebug file, not the /var/log/vdebug file.

Usage Guidelines

show logging—Display the system logging parameters that are in effect on the vEdge router:

file list /var/log—List the files in the /var/log directory.

file show /var/log/vsyslog—Display the contents of the vsyslog syslog file. Here is sample output for Releases 15.3 and earlier:

```
vSmart# file show /var/log/vsyslog
Aug 5 17:00:04 vsmart vdaemon[937]: viptela_system_personality created/modified
Aug 5 17:00:04 vsmart vdaemon[937]: viptela_config_security:549 Rekey generation interval
3600 (Seconds)
Aug 5 17:00:04 vsmart SYSMGR[948]: %viptela-SYSMGR-6-200007: Confd Phase 2 UP
Aug 5 17:00:04 vsmart vdaemon[937]: Message Connection UP
```

For Releases 15.3 and earlier, each syslog message generated by SD-WAN has this format:

```
% date - source - module - level - MessageID: text-of-syslog-message
```

In the third line of the /var/log/vsyslog output shown above, the message source is a vSmart controller, the module is SYSMGR (the system manager), the level is 6 (informational), the message ID is 200007, and the message itself is "Confd Phase 2 UP".

In Releases 15.4 and later, each syslog message has the following format:

```
facility.source& date - source - module - MessageID: text-of-syslog-message
```

Here is an example of a syslog message (in the file, this message would be on a single line):

```
local7.info: Dec 29 16:50:56 vedge DHCP_CLIENT[324]:
%Viptela-vedge-DHCP_CLIENT-6-INFO-1300010:
Renewed address 10.0.99.14/24 for interface mgmt0
```

Examples

Change the syslog file size to 3 MB, save only three syslog files, and set the syslog priority to log only alert, and emergency conditions:

```
vEdge(config-system) # logging disk
vEdge(config-disk) # file size 3
vEdge(config-disk) # file rotate 3
vEdge(config-disk) # priority alert
vEdge(config-disk) # show configuration
system
logging
disk
file size 3
file rotate 3
priority alert
!
!
```

logging host

To log system messages to a remote host, use the **logging host** command in global configuration mode. To remove a specified logging host from the configuration, use the **no** form of this command.

logging host {hostname ipv4-address | ipv4-address | ipv6 ipv6-address} [vrf vrf-name] [transport [tcp [port port-no] | tls [port port-no | profile profile-name] | udp [port port-no]]}

no logging host {**hostname** *ipv4-address* | *ipv4-address* | **ipv6** *ipv6-address*}

Table 6: Syntax Description

ipv4-address	Specifies the IP address of the host that receives the system logging (syslog) messages.
hostname	Name of the IPv4 or IPv6 host that receives the syslog messages.
vrf vrf-name	(Optional) Specifies a VPN routing and forwarding instance (VRF) that connects to the syslog server host. Name of the VRF that connects to the syslog server host.
ipv6	Indicates that you use an IPv6 address for a host that receives the syslog messages.
ipv6-address	IPv6 address of the host that receives the syslog messages.
transport	(Optional) Method of transport of syslog messages, which is TLS, TCP, or UDP.
tls	(Optional) Specifies that TLS transport will be used to log messages.

tcp	(Optional) Specifies that TCP transport will be used to log messages.
udp	(Optional) Specifies that UDP transport will be used to log messages.
port port-no	(Optional) Integer that defines port. Range: 1-65535. If you do not specify a port number, the standard Cisco default port number is used. TLS: 6514. TCP: 601 UDP: 514
profile profile-name	(Optional) Name of the TLS profile.

Command Default

You cannot send system logging messages to any remote host.

Command Modes

Global configuration (config)

Command History

Release	Modification
Cisco IOS XE Release 17.2	This command was introduced on the Cisco IOS XE Catalyst SD-WAN device.

Usage Guidelines

Standard system logging is enabled by default. If logging is disabled on your system (using the **no logging on** command), ensure that you enter the **logging on** command to reenable logging before you can use the **logging host** command.

The **logging host** command identifies a remote host (usually a device serving as a syslog server) to receive logging messages. By issuing this command more than once, you can build a list of hosts that receive logging messages.

To specify the severity level for logging to all hosts or enforce the logging format as per RFC5424, use the **logging trap** command.

When the **no logging host** command is issued with or without the optional keywords, all logging to the specified host is disabled.

Examples

In the following example, **logging trap** command with logging format based on RFC5424 is logged to a host at 10.104.52.44:

```
Router(config)# logging trap syslog-format rfc5424
Router(config)# logging host 10.104.52.44 transport tls
```

In the following example, you can log messages to a host with an IP address of 172.16.150.63 connected through a **vpn1** VRF:

Router(config)# logging host 172.16.150.63 vrf vpn1

Related Commands

Command	Description
show crypto pki trustpoints status	Displays the truspoint that is configured in the Cisco IOS XE Catalyst SD-WAN device.
logging tls-profile profile-name [ciphersuite ciphersuite]	Logs system messages to syslog server through TLS profile.

logging tls-profile

To configure the TLS profile of a Cisco IOS XE Catalyst SD-WAN device, use the **logging tls-profile** command in global configuration mode. To remove a specified logging tls profile from the configuration, use the **no** form of this command.

logging tls-profile profile-name [ciphersuite ciphersuite]

no logging tls-profile

Table 7: Syntax Description

tls-profile profile-name	Indicates that you use TLS profile for Cisco IOS XE Catalyst SD-WAN device. String. Maximum: 32 characters.
ciphersuite ciphersuite	(Optional) Specifies the cipher suites that you can use for a connection with syslog server.

Command Default

None

Command Modes

Global configuration (config)

Command History

Release	Modification
Cisco IOS XE Release 17.2	This command was introduced on the Cisco IOS XE Catalyst SD-WAN device.

Example

In the following example, you can configure the TLS profile for profile1:

through a vpn1 VRF

Router(config)# logging tls-profile1

logging server

Log event notification syslog messages to a remote host. By default, syslog messages are also always logged to the local hard disk. To disable local logging, use the **no system logging disk enable** command.

vManage Feature Template

For all Cisco vEdge devices:

Configuration ► Templates ► Logging

Command Hierarchy

```
system
logging
server (dns-name | hostname | ip-address)
priority priority
source-interface interface-name
vpn vpn-id
```

Syntax Description

source-interface interface-name	Interface for System Log Messages to Use:
	Configure outgoing system log messages to use a specific interface. The interface name can be a physical interface or a subinterface (a VLAN-tagged interface). The interface must be located in the same VPN as the syslog server. Otherwise, the configuration is ignored. If you configure multiple syslog servers, the source interface must be the same for all of them.
priority priority	Message priority:
	Severity of the syslog message to save. The severity indicates the seriousness of the event that generated the message.
	priority can be one of the following:
	• emergency—System is unusable (corresponds to syslog severity 0).
	• alert— Action must be taken immediately (corresponds to syslog severity 1).
	• critical—A serious condition (corresponds to syslog severity 2).
	• error—An error condition that does not fully impair system usability (corresponds to syslog severity 3).
	• warn—A minor error condition (corresponds to syslog severity 4).
	• notice—A normal, but significant condition (corresponds to syslog severity 5).
	• information—Routine condition (the default) (corresponds to syslog severity 6).
name	Server name:
(dns-name host-name ip-address)	DNS name, hostname, or IP address of the system on which to store syslog messages. You can configure multiple syslog servers.

vpn vpn-id	VPN:
	VPN in which the syslog server is located or through which the syslog server can be reached.
	Range: 0 through 65530
	Default: VPN 0

Release	Modification
14.1	Command introduced.
15.2.7	Support for multiple syslog servers added.
15.4	source-interface command added.

Usage Guidelines

show logging —Display the system logging parameters that are in effect.

In Releases 15.3 and earlier, each syslog message generated by Cisco SD-WAN has this format:

```
%Viptela - module - level - MessageID: text-of-syslog-message
```

In Releases 15.4 and later, each syslog message has the following format:

```
facility.source date - source - module - MessageID: text-of-syslog-message
```

Examples

Configure two syslog servers, one that receives all emergency (severity 0) messages and a second that receives all messages at severity 4 (warn) and lower:

```
vEdge(config-logging)# show full-configuration
system
logging
disk
  enable
!
server log.cisco.com
  vpn    1
  priority emergency
  exit
server log2.cisco.com
  vpn    1
  priority warn
  exit
!
```

Related Topics

logging disk, on page 300

logs

Configure the logging of AAA and Netconf system logging (syslog) messages. By default, these messages are logged and placed in the auth.info and messages log files.

Each time a vManage NMS logs in to a vEdge router to retrieve statistics and status information and to push files to the router, the router generates AAA and Netconf log messages. These message can fill the log files. You might want to disable the logging of these messages to reduce the number of messages in these two log files.

vManage Feature Template

For all Cisco vEdge devices:

Configuration ► Templates ► AAA

Command Hierarchy

```
system
   aaa
   logs
    [no] audit-disable
   [no] netconf-disable
```

Syntax Description

visable the logging of AAA events. Default: These events are logged.
visable the logging of Netconf events. Default: These events are logged.
)

Command History

Release Modification	Modification
17.1	Command introduced.

Example

Disable the logging of AAA and Netconf events:

```
vEdge# show running-config system aaa
system
aaa
auth-order local radius
usergroup basic
  task system read write
  task interface read write
!
usergroup netadmin
!
usergroup operator
  task system read
```

```
task interface read
task policy read
task routing read
task security read
!
user admin
password $1$zvOh58pk$QLX7/RS/F0c6ar94.x12k.
!
logs
audit-disable
netconf-disable
!
!
```

Operational Commands

show users

low-bandwidth-link

Characterize the tunnel interface as a low-bandwidth link. This configuration command is relevant only for a router which has a low-bandwidth link, such as an LTE link.

The low bandwidth synchronizes all the BFD sessions and control session hello-interval on LTE WAN circuits to timeout at the same time. The periodic heartbeat messages are sent out at the same time to make optimal usage of LTE circuits radio waves or radio frequency energy to transmit and receive packets. The low bandwidth feature cannot reduce the number of hello packets to be transmitted (Tx) or received (Rx) for the sessions, but synchronizes the hello interval timeout for the sessions.

For example, if the BFD session and control connection hello-interval is 1 sec, and there is no user data traffic active on LTE circuits, then the sessions hello packets transmitted is spread across 1 sec window interval. Each session will timeout anywhere within that 1 sec interval and transmits the hello packet. This makes the LTE radio to be active almost all the time. With low bandwidth feature, all the session hello packets transmits at the same time, and leave the rest of the 1 sec interval idle, makes optimal usage of LTE modem radio energy.

Note

To prevent control-connection flapping when an interface is configured as a low-bandwidth link, use a hello-interval of greater than 100 milliseconds.

vManage Feature Template

```
Configuration ► Templates ► VPN Interface Cellular
Configuration ► Templates ► VPN Interface Ethernet
Configuration ► Templates ► VPN Interface PPP
```

Command Hierarchy

```
vpn 0
  interface interface-name
   tunnel-interface
   [no] low-bandwidth-link
```

Release	Modification
16.3	Command introduced.
Cisco IOS XE Release 17.2	Added support for Cisco IOS XE Catalyst SD-WAN devices.

Examples

Configure a tunnel interface for an LTE interface to be a low-bandwidth link:

```
vpn 0
interface ge0/0
ip address 10.1.15.15/24
tunnel-interface
color lte
low-bandwidth-interface
!
no shutdown
```

Operational Commands

show control local-properties | display xml | include low

mac-accounting

Generate accounting information for IP traffic (on vEdge routers only).

Command Hierarchy

```
vpn vpn-id
  interface genumber/subinterface
  mac-accounting (egress | ingress)
```

Syntax Description

(egress ingress)	Generate Accounting Information:
	 egress: Generate accounting information based on the destination (egress) MAC addresses.
	• ingress: Generate accounting information based on the source (ingress) MAC addresses.
no mac-accounting	Disable MAC accounting.

Release	Modification
14.1	Command introduced.

Examples

Generate accounting information about the IP traffic on this interface based on the source MAC addresses of the packets:

```
vpn 0
  interface ge0/0
  mac-accounting ingress
```

Operational Commands

show running-config vpn interface

mac-address

Configure a MAC address to associate with the interface in the VPN.

vManage Feature Template

For all Cisco vEdge devices:

Configuration ► Templates ► VPN Interface Bridge

Configuration ► Templates ► VPN Interface Cellular (for vEdge cellular wireless routers only)

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface PPP

Configuration ► Templates ► VPN Interface PPP Ethernet

Command Hierarchy

```
vpn vpn-id
  interface interface-name
  mac-address mac-address
```

Syntax Description

mac-address	MAC address. Separate the bytes in the address with colons. Note that you cannot change
	the default MAC address (00:00:00:00:00) of a loopback interface.

Command History

Release	Modification
14.1	Command introduced.

Example

Configure a MAC address on an interface:

```
vEdge(config-interface-ge0/4)# mac-address b8:e8:56:38:5e:89
```

Operational Commands

show interface vpn

mac-authentication-bypass

Enable authentication for non-802.1X–compliant clients (on vEdge routers only). These clients are authenticated based on their MAC address.

A non-802.1X-compliant client is one that does not respond to EAP identity requests from the vEdge router.

After the 802.1X interface detects a client, it waits to receive an Ethernet packet from the client. Then the router sends a RADIUS access/request frame to the authentication server that includes a username and password based on the MAC address. If authorization succeeds, the router grants the client access to the WAN or WLAN. If authorization fails, the router assigns the interface to the guest VLAN if one is configured.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface Ethernet

Command Hierarchy

```
vpn vpn-id
  interface interface-name
  dot1x
    mac-authentication-bypass
    allow mac-addresses
    server
```

Syntax Description

mac-authentication-bypass	Enable Authentication for Non-802.1X–Compliant Hosts:
	Turn on authentication for non-802.1X–compliant clients.
allow mac-address	Enable Authentication for Specific Devices:
	Turn on authentication for one or more devices based on their MAC address, as listed in <i>mac-addresses</i> , before performing an authentication check with the RADIUS server. You can configure up to eight MAC addresses for MAC authentication bypass.
server	Enable Authentication via a RADIUS Server:
	Authenticate non-802.1X–compliant clients using a RADIUS server. This option enables MAC authentication bypass on the RADIUS server.

Release	Modification
16.3	Command introduced.

Examples

Enable MAC authentication bypass:

```
vpn 0
  interface ge0/0
  dot1x
   mac-authentication-bypass
```

Operational Commands

clear dot1x client

show dot1x clients

show dot1x interfaces

show dot1x radius

show system statistics

match

To configure matching criteria for the custom-eflow sequence to be considered as elephant-flow, use the **match** command in sequence configuration mode. To disable the matching criteria, use the **no** form of the command.

match [client-ip IPv4-prefix/(IP/Length)] [server-ip IPv4-prefix/(IP/Length)] [protocol { TCP | UDP }] [
no match [client-ip IPv4-prefix/(IP/Length)] [server-ip IPv4-prefix/(IP/Length)] [protocol { TCP | UDP }]

Syntax Description

client-ip IPv4-prefix/ (IP/Length)	IP address of the required client subnet. Specify the IPv4-prefix (IP/Length) address.
server-ip IPv4-prefix/ (IP/Length)	IP address of the required server subnet. Specify the IPv4-prefix (IP/Length) address.
Protocol	Transport protocol type can be UDP or TCP.

Command Default

By default, protocol, client-ip, or server-ip matching criteria are not configured for the custom-eflow sequence.

Command Modes

Sequence number configuration (config-sequence-num)

Release	Modification
Cisco SD-WAN Release 20.9.1	This command was introduced.

Examples

The following example shows how to configure matching criteria using the **match** command:

```
vEdge2k(config-sequence-num) # match
vEdge2k(config-match) # protocol TCP
vEdge2k(config-match) # client-ip 10.2.3.0/24
vEdge2k(config-match) # server-ip 10.2.4.0/24
```

match

Define the properties that must be matched so that an IPv6 policy action can take effect (on vEdge routers only).

Command Hierarchy

For Localized Data Policy for IPv6

Configure on vEdge routers only.

```
policy ipv6
  access-list acl-name
  sequence number
  match
    class class-name
  destination-port number
  next-header protocol
  packet-length number
  plp (high | low)
  source-port number
  tcp flag
  traffic-class value
```

Syntax Description

For Localized Data Policy for IPv6

class class-name	Classification
	Match the specified class name. The name can be from 1 through 32 characters.
destination-port number	Destination Port:
	Match a destination port number. <i>number</i> can be 0 though 65535. Specify a single number, a list of numbers (with numbers separated by a space), or a range of numbers (with the two numbers separated with a hyphen [-]).
next-header protocol	Next Protocol:
	Match the next TCP or IP protocol in the IPv6 header. <i>protocol</i> is the number of an IPv6 protocol, and can be a value from 0 through 255.

packet-length number	Packet Length:
	Match packets of the specified length. The packet length is a combination of the lengths of the IPv6 header and the packet payload. <i>number</i> can be 0 though 65535. Specify a single length, a list of lengths (with numbers separated by a space), or a range of lengths (with the two numbers separated with a hyphen [-])
plp (high low)	Packet Loss Priority:
	Match a packet's loss priority (PLP). By default, packets have a PLP value of low . To set a packet's PLP value to high , apply a policer that includes the exceed remark option.
source-port number	Source Port:
	Match a source port. <i>number</i> can be 0 through 65535. Specify a single number, a list of numbers (with numbers separated by a space), or a range of numbers (with the two numbers separated with a hyphen [-]).
tcp flag	TCP Flag
	Match TCP flags. flag can be syn.
traffic-class number	Traffic Class:
	Match the specified traffic class value. <i>number</i> can be from 0 through 63.

Release	Modification
14.1	Command introduced.
16.3	Added support for IPv6 ACLs.

Examples

Configure an IPv6 ACL that changes the traffic class on TCP port 80 data traffic, and apply the ACL to an interface in VPN 0:

```
vEdge# show running-config policy ipv6 access-list
policy
  ipv6 access-list traffic-class-48-to-46
  sequence 10
  match
   destination-port 80
   traffic-class 48
!
  action accept
   count port_80
  log
   set
   traffic-class 46
!
!
!
default-action accept
```

```
!
! vEdge# show running-config vpn 0 interface ge0/7 ipv6 vpn 0
interface ge0/7
ipv6 access-list traffic-class-48-to-46 in
!
```

Operational Commands

show running-config policy

Syntax Description

For Application-Aware Routing Policy

app-id app-id-name	Application Identifier:
	Match the name of an application defined with a policy app-id command.
destination-data-prefix-list list-name	Destination Prefix or Port: Match a destination prefix or port. For prefixes, you can specify a single
destination-ip prefix/lengthdestination-port number	prefix or a list of prefixes. list-name is the name of a list defined with a policy lists prefix-list command. For the port, you can specify a single port number, a list of port numbers (with numbers separated by a space), or a range of port numbers (with the two numbers separated with a hyphen [-]).
dscp number	DSCP:
	Match the specified DSCP value.
plp (high low)	Packet Loss Priority:
	Match a packet's loss priority (PLP). By default, packets have a PLP value of low . To set a packet's PLP value to high , apply a policer that includes the exceed remark option.
protocol number	Protocol:
	Match the TCP or IP protocol number.
source-data-prefix-list	Source Prefix or Port:
list-name	Match a source prefix or port. For prefixes, you can specify a single prefix or a list of prefixes. list-name is the name of a list defined with a policy lists
source-ip prefix/length source-port number	prefix-list command. For the port, you can specify a single port number, a list of port numbers (with numbers separated by a space), or a range of port numbers (with the two numbers separated with a hyphen [-]).
dns-app-list list-name	Split DNS:
dns (request response)	Resolve DNS requests and process DNS responses on an application-by-application basis when the vEdge router is configured as an internet exit point. To match specific applications or application families, specify the name of a list you created with the lists app-list command. To process DNS requests for the applications (for outbound DNS queries), specify the dns request match condition. To process DNS responses from DNS servers, specify the dns response match condition.
traffic-to {access core service}	In a Hierarchical SD-WAN architecture, match border router traffic flowing to the access region that the border router is serving, the core region, or a service VPN.

For Centralized Control Policy

color color	Color:
color-list list-name	Match an individual color or a group of colors defined with a policy lists color-list list.
domain-id number	Domain:
	Match the domain identifier. Currently, the domain identifier can only be 1.
omp-tag number	OMP Tag:
	Match an OMP tag value in the route. number can be a value from 0 through 4294967295.
originator ip-address	Originating Address:
	Match the IP address of the device from which the route was learned.
origin protocol	Originating Protocol:
	Match the protocol from which the route was learned.
	protocol: One of: bgp-external, bgp-internal, connected, ospf-external1, ospf-external2, ospf-inter-area, ospf-intra-area, static
path-type {hierarchical-path direct-path	In a Hierarchical SD-WAN architecture, match a route by its path type, which can be one of the following:
transport-gateway-path}	• hierarchical-path: A route that includes hops from an access region to a border router, through region 0, to another border router, then to an edge router in a different access region.
	• <i>direct-path</i> : A direct path route from one edge router to another edge router.
	• <i>transport-gateway-path</i> : A route that is re-originated by a router that has transport gateway functionality enabled.
preference number	Preference:
	Match the preference value in the route.
prefix-list list-name	Prefix:
	Match one or more IP prefixes in a list defined with a policy lists prefix-list list.
region {region-id region-list} [role {border-router edge-router}]	In a Hierarchical SD-WAN architecture, match routes that are originated by device(s) in specific regions, and optionally devices with a specific role (edge router or border router).
site-id site-id	Site:
site-list list-name	Match an individual Cisco SD-WAN overlay network site identifier number or a group of site identifiers defined with a policy lists site-list list.

tloc-list list-name	TLOC from a List of TLOCs: Match one of the TLOCs in the list defined with a policy lists tloc-list list.
tloc address color color [encap encpasulation] tloc-list list-name	
tioc-iist tist-name	color can be 3g, biz-internet, blue, bronze, custom1, custom2, custom3, default, gold, green lte, metro-ethernet, mpls, private1 through private6, public-internet, red, and silver.
	Default: Encapsulation is ipsec. It can also be gre.
vpn vpn-id	VPN:
vpn-list list-name	Match an individual VPN identifier or the VPN identifiers in a list defined with a policy lists vpn-list command.

For Centralized Data Policy

destination-data-prefix-list	Destination Prefix or Port:
list-name destination-ip prefix/lengthdestination-port number	Match a destination prefix or port. For prefixes, you can specify a single prefix or a list of prefixes. list-name is the name of a list defined with a policy lists prefix-list command. For the port, you can specify a single port number, a list of port numbers (with numbers separated by a space), or a range of port numbers (with the two numbers separated with a hyphen [-]).
dscp number	DSCP: Match the specified DSCP value.
packet-length number	Packet Length Match packets of the specified length. number can be 0 though 65535. Specify a single length, a list of lengths (with numbers separated by a space), or a range of lengths (with the two numbers separated with a hyphen [-])
plp (high low)	Packet Loss Priority: Match a packet's loss priority (PLP). By default, packets have a PLP value of low. To set a packet's PLP value to high, apply a policer that includes the exceed remark option.
protocol number	Protocol: Match the TCP or IP protocol number.
source-data-prefix-list list-name source-ip prefix/length source-port number	Source Prefix or Port: Match a source prefix or port. For prefixes, you can specify a single prefix or a list of prefixes. list-name is the name of a list defined with a policy lists prefix-list command. For the port, you can specify a single port number, a list of port numbers (with numbers separated by a space), or a range of port numbers (with the two numbers separated with a hyphen [-]).

dns-app-list list-name	Split DNS:
dns (request response)	Resolve DNS requests and process DNS responses on an application-by-application basis when the vEdge router is configured as an internet exit point. To match specific applications or application families, specify the name of a list you created with the lists app-list command. To process DNS requests for the applications (for outbound DNS queries), specify the dns request match condition. To process DNS responses from DNS servers, specify the dns response match condition.
tep flag	TCP Flag: Match TCP flags. flag can be syn.
traffic-to {access core service}	In a Hierarchical SD-WAN architecture, match border router traffic flowing to the access region that the border router is serving, the core region, or a service VPN.

For Localized Control Policy

as-path list-name	BGP AS Path:
	AS path or paths in the route. list-name is the name of an AS path list defined with a policy lists as-path-list command.
community list-name	BGP Community:
	BGP community or communities in the route. list-name is the name of a BGP community list defined with a policy lists community-list command.
ext-community	BGP Extended Community:
list-name	BGP extended community or communities in the route. list-name is the name of a BGP extended community list defined with a policy lists ext-community-list command.
bgp origin	BGP Origin Code:
	BGP origin code. origin can be egp, igp, or complete.
	Default: egp
local-preference number	Local Preference:
	BGP local preference value.
	number can be a value from 0 through 4294967295.
next-hop list-name	Next Hop:
	Next hop in the route. list-name is the name of an IP prefix list defined with a policy lists prefix-list command.
omp-tag number	OMP Tag:
	OMP tag number for use by BGP or OSPF.
	number can be a value from 0 through 4294967295.

ospf-tag number	OSPF Tag:
	OSPF tag value.
	number can be a value from 0 through 4294967295.
peer ip-address	Peer Address:
	IP address of the peer.
address list-name	Prefix from which Route Was Learned:
	IP prefix or prefixes from which the route was learned. list-name is the name of an IP prefix list defined with a policy lists prefix-list command.
metric number	Route Metric:
	Metric in the route.
	number can be a value from 0 through 4294967295.

For Localized Data Policy

class class-name	Classification:
	Match the specified class name.
destination-data-prefix-list list-name destination-ip prefix/lengthdestination-port number	Destination Prefix or Port: Match a destination prefix or port. For prefixes, you can specify a single prefix or a list of prefixes. list-name is the name of a list defined with a policy lists prefix-list command. For the port, you can specify a single port number, a list of port numbers (with numbers separated by a space), or a range of port numbers (with the two numbers separated with a hyphen [-]).
dscp number	DSCP: Match the specified DSCP value.
packet-length number	Packet Length Match packets of the specified length. The packet length is a combination of the lengths of the IPv4 header and the packet payload. number can be 0 though 65535. Specify a single length, a list of lengths (with numbers separated by a space), or a range of lengths (with the two numbers separated with a hyphen [-]).
plp (high low)	Packet Loss Priority: Match a packet's loss priority (PLP). By default, packets have a PLP value of low. To set a packet's PLP value to high, apply a policer that includes the exceed remark option.
protocol number	Protocol: Match the TCP or IP protocol number.

source-data-prefix-list	Source Prefix or Port:
list-name	Match a source prefix or port. For prefixes, you can specify a single prefix
source-ip prefix/length	or a list of prefixes. list-name is the name of a list defined with a policy lists
source-port number	prefix-list command. For the port, you can specify a single port number, a list of port numbers (with numbers separated by a space), or a range of port numbers (with the two numbers separated with a hyphen [-]).
tcp flag	TCP Flag:
	Match TCP flags. flag can be syn.

For Zone-Based Firewall Policy

destination-data-prefix-list list-name destination-ip prefix/lengthdestination-port number	Destination Prefix or Port: Match a destination prefix or port. For prefixes, you can specify a single prefix or a list of prefixes. list-name is the name of a list defined with a policy lists prefix-list command. For the port, you can specify a single port number, a list of port numbers (with numbers separated by a space), or a range of port numbers (with the two numbers separated with a hyphen [-]).
protocol number	Protocol: Match the TCP or IP protocol number.
source-data-prefix-list list-name source-ip prefix/length source-port number	Source Prefix or Port: Match a source prefix or port. For prefixes, you can specify a single prefix or a list of prefixes. list-name is the name of a list defined with a policy lists prefix-list command. For the port, you can specify a single port number, a list of port numbers (with numbers separated by a space), or a range of port numbers (with the two numbers separated with a hyphen [-]).

Command History

Release	Modification
14.1	Command introduced.
15.4	Added omp-tag match condition for localized control policy, and rename tag to omp-tag.
16.1	Added packet-length match condition for centralization and localized data policy.
16.3	Added plp match condition for application-aware routing policy, centralized data policy, and localized data policy.
17.1	Added ospf-tag match condition for localized control policy.
18.2	Added zone-based firewall policy.

Release	Modification
Cisco IOS XE Release 17.4.1	Added support to display ICMP messages when a protocol value is 1 or 58 for a match condition.
Cisco SD-WAN Release 20.4.1	
Cisco IOS XE Catalyst SD-WAN Release 17.8.1a	Added path-type, region, role, and traffic-to match conditions.
Cisco SD-WAN Release 20.8.1	

Examples

Create an access list match condition that matches a destination IP address in a data packet:

```
vEdge(config-match) # show config
policy
access-list test-access-list
  sequence 10
  match
   destination-ip 172.16.0.0/16
  !
  !
  !
  !
  !
  !
```

Configure a route policy that matches a list of VPNs:

```
vSmart(config-match-route) # show config
policy
lists
  vpn-list my-vpn-list
  vpn 1
 !
!
control-policy my-control-policy
  sequence 10
  match route
   vpn-list my-vpn-list
  !
!
!
```

Match a destination prefix in VPN 1:

```
vSmart(config-policy) # show config
policy
  data-policy my-data-policy
  vpn-list my-vpn-list
  sequence 10
  match
    destination-ip 55.0.1.0/24
  !
  action drop
```

```
!
! default-action drop
!
! lists
  vpn-list my-vpn-list
  vpn 1
!
```

Create a route policy match condition that matches the prefix from which a route was learned:

```
vEdge(config-match) # show config
policy
lists
  prefix-list my-prefix-list
  ip-prefix 10.0.100.0/24
  ip-prefix 55.0.1.0/24
  ip-prefix 57.0.1.0/24
!
!
route-policy my-route-policy
  sequence 10
  match
   address my-prefix-list
!
!
!
!
```

Display ICMP messages when protocol value is 1 or 58 for a match condition:

```
vEdge(config-match)# show configpolicy
access-list acl_1
sequence 100
match
protocol 1
icmp-msg administratively-prohibited
!
action accept
count administratively-prohibited
!
!
```

Operational Commands

show running-config policy

Related Topics

```
action, on page 36
apply-policy, on page 74
lists, on page 286
match, on page 316
policy, on page 384
```

max-clients

Configure the maximum number of clients allowed to connect to the WLAN (on vEdge routers only).

Command Hierarchy

```
wlan radio-band
 interface vapnumber
   max-clients number
```

Syntax Description

number | Maximum Number of WLAN Clients:

Maximum number of clients allowed to connect to the WLAN. It is recommended that you do not configure more than 50 clients across all the VAPs.

Range: 1 through 50

Default: 25

Command History

Release	Modification
16.3	Command introduced.

Examples

Allow 30 clients to connect to the corporate network and 10 to the guest network:

```
vEdge# show running-config wlan
wlan 5GHz
 country "United States"
 interface vap0
 ssid
                 CorporateNetwork
 data-security wpa/wpa2-enterprise
 radius-server radius server1
 max-clients 30
 no shutdown
 interface vap1
                GuestNetwork
 data-security wpa/wpa2-personal
 wpa-personal-key GuestPassword
 max-clients
                 10
 no shutdown
!
```

Operational Commands

clear wlan radius-stats

show interface

show wlan clients

show wlan interfaces

show wlan radios

show wlan radius

max-control-connections

Configure the maximum number of Cisco Catalyst SD-WAN Controllers that the vEdge router is allowed to connect to (on vEdge routers only). When **max-control-connections** is configured (without affinity), vEdge routers establish control connection with Cisco Catalyst SD-WAN Controllers having higher System-IP.

Note

For control connection traffic without dropping any data, a minimum of 650-700 kbps bandwidth is recommended with default parameters configured for hello-interval (10) and hello-tolerance (12).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface Cellular (for vEdge cellular wireless routers only)

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface PPP

Command Hierarchy

```
vpn 0
  interface interface-name
  tunnel-interface
  max-control-connections number
```

Syntax Description

number | Maximum Number of Controllers

Set the maximum number of Cisco Catalyst SD-WAN Controllers that the vEdge router can connect to. These connections are DTLS or TLS control plane tunnels.

Range: 0 through 100

Default: Maximum number of OMP sessions configured with the **system max-omp-sessions** command.

Command History

Release	Modification
15.4	Command introduced. This command replaces the max-controllers command.

Release	Modification
16.1	Maximum number of controllers changed from 8 to 100, and default value changed from 2 to maximum number of configured OMP sessions.

Examples

Change the maximum number of vSmart controller connections to 4:

```
system max-control-connections 4
```

Operational Commands

show control affinity config show control affinity status show control connections show control local-properties

Related Topics

```
controller-group-id, on page 153
controller-group-list, on page 154
exclude-controller-group-list, on page 209
max-omp-sessions, on page 335
```

max-controllers

Configure the maximum number of vSmart controllers that the vEdge router is allowed to connect to (on vEdge routers only).

Starting in Release 15.4, this command is deprecated. Use the max-control-connections command instead.

Command Hierarchy

```
system
max-controllers number
```

Syntax Description

number	Maximum Number of Controllers	
	Set the maximum number of vSmart controllers that the vEdge router can connect to. These connections are DTLS or TLS control plane tunnels.	
	Range: 1 through 8	
	Default: 2	

Release	Modification
14.3	Command introduced.
15.4	This command is deprecated. Use the max-control-connections command instead.

Examples

Change the maximum number of vSmart controller connections to 4:

```
system
maximum-controllers 4
```

Operational Commands

show control connections

max-leases

Configure the maximum number of dynamic IP addresses that the DHCP server can offer (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► DHCP Server

Command Hierarchy

```
vpn vpn-id
  interface geslot/port
  dhcp-server
  max-leases number
```

Syntax Description

number	Number of Leases:
	Number of IP addresses that can be assigned on this interface.
	Range: 0 through 4294967295

Command History

Release	Modification
14.3	Command introduced.

Examples

Change the maximum number of leases to 500:

```
vEdge# config
Entering configuration mode terminal
vEdge(config)# vpn 1 interface ge0/4
vEdge(config-interface-ge0/4)# dhcp-server max-leases 500
vEdge(config-dhcp-server)# show full-configuration
vpn 1
  interface ge0/4
  dhcp-server
    max-leases 500
!
!
!
```

Operational Commands

show dhep interfaces

show dhep server

max-macs

Set the maximum number of MAC addresses that a bridging domain can learn (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► Bridge

Command Hierarchy

```
bridge bridge-id
  max-macs number
```

Syntax Description

```
number MAC Addresses:

Maximum number of MAC addresses that the bridging domain can learn.

Range: 0 through 4096

Default: 1024
```

Command History

Release	Modification
15.3	Command introduced.

Examples

Set the maximum number of MAC addresses that the bridging domain can learn to 512:

```
vEdge(config) # bridge 1
vEdge(config-bridge-1) # max-macs 512
```

Operational Commands

show bridge interface show bridge mac show bridge table

max-metric

Configure OSPF to advertise a maximum metric so that other routers do not prefer this vEdge router as an intermediate hop in their Shortest Path First (SPF) calculation (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► OSPF

Command Hierarchy

```
vpn vpn-id
  router
  ospf
  max-metric
   router-lsa (administrative | on-startup seconds)
```

Syntax Description

router-lsa administrative	Advertise Administratively:
	Force the maximum metric to take effect immediately, through operator intervention.
router-lsa on-startup	Advertise the Maximum metric When the Router Starts Up:
seconds	Advertise the maximum metric for the specified number of seconds after the router starts up.
	Range: 0, 5 through 86400 seconds
	Default: 0 seconds (the maximum metric is advertised immediately when the router starts up)

Command History

Release	Modification
14.1	Command introduced.

Examples

Have the maximum metric take effect immediately:

```
vEdge(config-ospf)# max-metric router-lsa administrative
vEdge(config-ospf)# show configuration
vpn 1
  router
   ospf
   max-metric router-lsa administrative
  !
!
```

Operational Commands

show ospf routes

max-omp-sessions

Configure the maximum number of OMP sessions that a vEdge router can establish to vSmart controllers (on vEdge routers only). A vEdge router establishes a single OMP session to each vSmart controller. Even when a vEdge router has multiple tunnel connections to the same vSmart controller, because all the tunnels have the same IP address, this group of tunnels is effectively a single OMP session. When **max-omp-sessions** is configured (without affinity), vEdge routers establish OMP peering with vSmarts controllers having higher System-IP.

In an overlay network with redundant vSmart controllers, configure the maximum number of OMP sessions to manage the scale of the overly network, by limiting the number of vSmart controllers that an individual vEdge router can establish control connections with.

This command provides system-wide control over the maximum number of control connections that a vEdge router can establish to vSmart controllers. To configure the number of control connections allowed on an individual tunnel interface, include the **max-control-connections** command when configuring the tunnel interface in VPN 0. The maximum number of OMP sessions configured on the router becomes the default value for the maximum number of control connections allowed on the router's tunnel interfaces.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► System

```
system
max-omp-sessions number
```

number	Maximum Numb	oer of OMP	Sessions:

Set the maximum number of OMP sessions that a vEdge router can establish to vSmart controllers. These connections are DTLS or TLS control plane tunnels.

Range: 0 through 100

Default: 2

Command History

Release	Modification
16.1	Command introduced.

Examples

Change the maximum number of vSmart controller connections to 4:

```
system max-omp-sessions 4
```

Operational Commands

show control affinity config show control affinity status show control connections show control local-properties

Related Topics

```
controller-group-id, on page 153
controller-group-list, on page 154
exclude-controller-group-list, on page 209
max-control-connections, on page 330
```

memory-usage

To configure the memory-usage watermarks, use the **memory-usage** command in the alarms configuration mode. To revert to the default watermark values, use the **no** form of this command.

memory-usage [high-watermark-percentage percentage] [medium-watermark-percentage percentage] [low-watermark-percentage percentage] [interval seconds]

no memory-usage

Syntax Description	high-watermark-percentagepercentage	Specifies the high-usage watermark percentage.
		Range: 1 to 100 percent
		Default: 90 percent
	medium-watermark-percentage	Specifies the medium-usage watermark percentage.
		Range: 1 to 100 percent
		Default: 75 percent
	low-watermark-percentagepercentage	Specifies the low-usage watermark percentage.
		Range: 1 to 100 percent
		Default: 60 percent
	intervalseconds	Specifies how frequently memory usage should be checked and reported by the device to Cisco vManage.
		Range: 1 to 4294967295 seconds
		Default: 5 seconds

Command Default

The default usage watermarks and polling interval are:

• High-usage-watermark: 90 percent

• Medium-usage-watermark: 75 percent

• Low-usage-watermark: 60 percent

• Polling interval: 5 seconds

Command Modes

Alarms configuration (config-alarms)

Command History

Release	Modification
Cisco SD-WAN Release 20.7.1	This command is introduced.

Examples

The following example shows a sample configuration of the memory-usage watermarks and the polling interval:

```
config
system
alarms
memory-usage
high-watermark-percentage 80
medium-watermark-percentage 70
low-watermark-percentage 50
interval 10
```

Related Commands

Command	Description
alarms	Enters the alarms configuration mode.

mgmt-security

Configure the encryption of management frames sent on the wireless LAN (on vEdge cellular wireless routers only). Management frame encryption is defined in the IEEE 802.11w standard, which defines protected management frames (PMFs).

You can configure the encryption of management frames only if you have configured a data security method value other than **none**.

vManage Feature Template

For vEdge cellular wireless routers only:

Configuration ► Templates ► WiFi SSID

Command Hierarchy

```
wlan radio-band
  interface vapnumber
  mgmt-security security
```

Syntax Description

security	Encryption of Management Frames
	Whether encryption of management frames is performed on wireless WANs.
	Values: none, optional, required
	Default: none

Command History

Release	Modification
16.3	Command introduced.

Examples

Configure management frame encryption for VAP 3:

```
vEdge# show running-config wlan
wlan 5GHz
channel 36
interface vap0
ssid tb31_pm6_5ghz_vap0
no shutdown
!
...
interface vap3
ssid tb31_pm6_5ghz_vap3
data-security wpa2-enterprise
mgmt-security optional
radius-servers tag1
no shutdown
```

```
. !
```

Operational Commands

clear wlan radius-stats

show interface

show wlan clients

show wlan interfaces

show wlan radios

show wlan radius

Related Topics

data-security, on page 171

mirror

Configure or apply a mirror to copy data packets to a specified destination for analysis (on vEdge routers only).

You can mirror only unicast traffic. You cannot mirror multicast traffic.

vManage Feature Template

For vEdge routers:

Configuration ► Policies ► Localized Policy

Command Hierarchy

Create a Localized Control Policy

```
policy
  mirror mirror-name
  remote-dest ip-address source ip-address
```

Apply a Localized Control Policy

```
policy
  access-list acl-name
  default-action action
    sequence number
    action accept
    mirror mirror-name
```

Syntax Description

mirror-name	Mirror Name:	
	Name of the mirror to configure or to apply in an access list.	
ip-address	Remote Destination:	
	Destination to which to mirror the packets.	

ip-address	Source:
	Source of the packets to mirror.

Command History

Release	Modification
14.1	Command introduced.

Examples

Configure and apply a mirror:

```
vEdge# show running-config policy
policy
mirror m1
remote-dest 10.2.2.11 source 10.20.23.16
!
access-list acl2
sequence 1
match
source-ip 10.20.24.17/32
destination-ip 10.20.25.18/32
!
action accept
mirror m1
!
!
default-action drop
!
```

Operational Commands

show running-config

mode

Configure the mode to use in IKEv1 Diffie-Hellman key exchanges (on vEdge routers only).

```
vpn vpn-id
  interface ipsecnumber
   ike
    mode mode
```

mode | Exchange Mode:

Mode to use for IKEv1 Diffie-Hellman key exchanges. It can be one of the following:

- aggressive: Use IKE aggressive mode to establish an IKE SA. In this mode, an SA is established with the exchange of only three negotiation packets.
- main: Use IKE main mode to establish an IKE SA. In this mode, a total of six negotiation packets are exchanged to establish the SA. This is the default.

Command History

Release	Modification
17.2	Command introduced.

Examples

Configure aggressive mode for IKEv1 key exchanges:

```
vEdge(config) # vpn 1 interface ipsec1 ike
vEdge(config-ike) # mode aggressive
```

Operational Commands

clear ipsec ike sessions show ipsec ike inbound-connections show ipsec ike outbound-connections show ipsec ike sessions

group, on page 220

mtu

Set the maximum MTU size of packets on the interface.

vManage Feature Template

For all Cisco vEdge devices:

Configuration ► Templates ► VPN Interface Bridge

Configuration ► Templates ► VPN Interface Cellular (for vEdge cellular wireless routers only)

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface GRE

Configuration ► Templates ► VPN Interface PPP

Configuration ► Templates ► VPN Interface PPP Ethernet

Command Hierarchy

```
vpn vpn-id
  interface interface-name
  mtu bytes
```

Syntax Description

bytes MTU Size:

MTU size, in bytes. For cellular interfaces, the maximum MTU is 1428 bytes. For IRB interfaces, the maximum MTU is 1500 bytes. For PPP interfaces, the maximum MTU is 1492 bytes.

Range: 576 through 2000 bytes

Default: 1500

Command History

Release	Modification
14.1	Command introduced.
16.3	Maximum MTU changed from 1804 bytes to 2000 bytes.

Example

Reduce the MTU size to support subinterfaces:

```
vpn 0
interface ge0/0
mtu 1496
```

Operational Commands

show interface

multicast-buffer-percent

Configure the amount of interface bandwidth that multicast traffic can use (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► System

Command Hierarchy

```
system
multicast-buffer-percent percentage
```

Syntax Description

ı use.

Command History

Release	Modification
16.1	Command introduced.

Examples

Change the interface bandwidth available for multicast traffic to 50 percent:

```
system
multicast-buffer-percent 50
```

Operational Commands

show running-config system

multicast-replicator

Configure a vEdge router to be a multicast replicator (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► Multicast

Command Hierarchy

```
vpn vpn-id
router
   multicast-replicator local [threshold number]
```

Syntax Description

local	Establishment of a Replicator:
	Configure the local router as a multicast replicator.

number

Replication Threshold:

Number of joins per group that the router can accept. For each join, the router can accept 256 outgoing tunnel interfaces (OILs).

Range: 0 through 1000

Default: 0. A value of 0 means that the router can accept any number of (*,G) and (S,G) joins.

Command History

Release	Modification
14.2	Command introduced.

Examples

Configure a vEdge router to be a multicast replicator:

```
vml# show running-config vpn 1 router
multicast-replicator local
!
```

Operational Commands

show multicast replicator

show multicast rfp

show multicast topology

show multicast tunnel

show omp multicast-auto-discover

show omp multicast-routes

show pim interface

show pim neighbor

show pim statistics

name

Provide a text description for the VPN (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN

Command Hierarchy

```
vpn vpn-id
  name string
```

Syntax Description

string | VPN Name:

Text name or description of the VPN. If it includes spaces, enclose the entire string in quotation marks (" ").

Maximum characters: 32

Command History

Release	Modification
14.1	Command introduced.

Examples

Configure a description for VPN 1:

```
vpn 1
  name "Customer A VPN"
```

Operational Commands

show running-config vpn

name

Provide a text name for the Cisco vEdge device.

vManage Feature Template

For all Cisco vEdge devices:

Configuration ► Templates ► SNMP

```
snmp
name string
```

string	Device Name:	
	Name of the Cisco vEdge device. If it contains spaces, enclose the string in quotation marks (" ").	
	Maximum characters: 255	

Command History

Release	Modification
14.1	Command introduced.

Examples

Configure the SNMP name of this Cisco vEdge device:

```
vEdge(config) # snmp name "Engineering vEdge Router"
```

Operational Commands

show running-config snmp

nas-identifier

Configure the NAS identifier of the local router, to send to the RADIUS server during an 802.1X session (on vEdge routers only).

vManage Feature Template

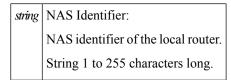

For vEdge routers only:

Configuration ► Templates ► VPN Interface Ethernet

Command Hierarchy

```
vpn 0
  interface interface-name
   dot1x
    nas-identifier string
```

Syntax Description

Command History

Release	Modification
16.3	Command introduced.

Examples

Configure a NAS identifier and IP address to send to the RADIUS server:

```
vEdge# show running-config vpn 0 dot1x
vpn 0
interface ge0/0
dot1x
   nas-identifier vedge@viptela.com
   nas-ip-address 1.2.3.4
!
```

Operational Commands

clear dot1x client

show dot1x clients

show dot1x interfaces

show dot1x radius

show system statistics

Related Topics

radius-servers, on page 417
```

nas-ip-address

Configure the NAS IP address of the local router, to send to the RADIUS server during an 802.1X session (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface Ethernet

```
vpn 0
  interface interface-name
```

```
dot1x
  nas-ip-address ip-address
```

```
ip-address IP Address:

NAS IP address to send to the RADIUS server.
```

Examples

Configure a NAS identifier and IP address to send to the RADIUS server:

```
vEdge# show running-config vpn 0 dot1x
vpn 0
interface ge0/0
dot1x
   nas-identifier vedge@viptela.com
   nas-ip-address 1.2.3.4
!
!
```

Release Information

Release	Modification
16.3	Command introduced.

Operational Commands

clear dot1x client show dot1x clients show dot1x interfaces show dot1x radius show system statistics

radius-servers, on page 417
```

nat

Configure a vEdge router to act as a NAT device (on vEdge routers only).

In the transport VPN (VPN 0), you can configure multiple NAT interfaces. In this configuration traffic is load-balanced, via ECMP, among the interfaces.

You can configure a NAT on a physical interface or on a **natpool** interface. You cannot configure NAT on a loopback interface. Note that for a **natpool** interface, you can configure only the interface's IP address, **shutdown** and **no shutdown** command, and the **nat** command and its subcommands. You cannot configure another other interface commands.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface Cellular (for vEdge cellular wireless routers only)

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface NAT Pool

Configuration ► Templates ► VPN Interface PPP

Command Hierarchy

```
vpn vpn-id
  interface [genumber/slot | natpoolnumber]
   nat
      block-icmp-error
      direction (inside | outside)
      log-translations
      natpool range-start ip-address1 range-end ip-address2
      [nol overload
      port-forward port-start port-number1 port-end port-number2 proto (tcp | udp)
private-ip-address ip-address private-vpn vpn-id
     refresh (bi-directional | outbound)
      respond-to-ping
     static source-ip ip-address1 translate-ip ip-address2 (inside | outside)
     static source-ip ip-address1 translate-ip ip-address2 source-vpn vpn-id protocol (tcp
 | udp) source-port number translate-port number
      tcp-timeout minutes
      udp-timeout minutes
```

Syntax Description

None

Examples

Configure a vEdge router to act as a NAT:

```
vEdge# config
vEdge(config)# vpn 1 interface ge0/4 nat
```

Command History

Release	Modification
14.2	Command introduced.
15.1	Multiple NAT interfaces can be configured.
16.3	Added support for 1:1 static NAT and dynamic NAT.

Operational Commands

show ip nat filter show ip nat interface show ip nat interface-statistics

Related Topics

```
encapsulation, on page 205 action, on page 50 ip gre-route, on page 267 ip route, on page 270
```

nat-refresh-interval

Configure the interval between NAT refresh packets sent on a DTLS or TLS WAN transport connection. This interval is how often a tunnel interface sends a refresh packet to maintain the UDP packet streams that traverse a NAT.

vManage Feature Template

For all Cisco vEdge devices:

Configuration ► Templates ► VPN Interface Cellular (for vEdge cellular wireless routers only)

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface PPP

Command Hierarchy

```
vpn 0
  interface interface-name
   tunnel-interface
   nat-refresh-interval seconds
```

Syntax Description

seconds	NAT Refresh Interval:
	Interval between NAT refresh packets sent on a DTLS or TLS WAN tunnel connection. These packets are sent to maintain the UDP packet streams that traverse a NAT between the device and the Internet or other public network. You might want to increase the interval on interfaces where you are charged for bandwidth, such as LTE interfaces.
	Range: 1 through 60 seconds
	Default: 5 seconds

Command History

Release	Modification
16.1.1	Command introduced.

Examples

Change the NAT refresh interval to 30 seconds:

```
vEdge# show running-config vpn 0 interface ge0/2 tunnel-interface
vpn 0
interface ge0/2
 tunnel-interface
  encapsulation ipsec
  color lte
  nat-refresh-interval 30
  no allow-service bgp
  allow-service dhcp
  allow-service dns
  allow-service icmp
  no allow-service sshd
  no allow-service netconf
  no allow-service ntp
  no allow-service ospf
  no allow-service stun
```

Operational Commands

show running-config

natpool

Configure a pool of addresses to use in NAT translation (on vEdge routers only).

You configure NAT port forwarding on interfaces in the WAN transport VPN (VPN 0).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface Cellular (for vEdge cellular wireless routers only)

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface NAT Pool

Configuration ► Templates ► VPN Interface PPP

```
vpn 0
  interface interface-name
  nat
   natpool range-start ip-address1 range-end ip-address2
```

range-start ip-address1	NAT Pool Address Range:
range-end ip-address2	Define the range of IP addresses to use for the NAT address pool. ip-address1 must be less than or equal to ip-address2. The pool can contain a maximum of 32 IP addresses. The addresses must be in the same subnet as the interface's IP address.

Command History

Release	Modification
18.3	Command introduced.

Operational Commands

show ip nat filter show ip nat interface show ip nat interface-statistics

neighbor

Configure a BGP neighbor (on vEdge routers only). For each neighbor, you must configure the remote AS number and enable the session by including the **no shutdown** command. All other configuration parameters are optional.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► BGP

```
vpn vpn-id
  router
   bgp local-as-number
      neighbor ip-address
        address-family ipv4-unicast
         maximum-prefixes number [threshold] [restart minutes | warning-only]
         route-policy policy-name (in | out)
        capability-negotiate
        description string
        ebgp-multihop ttl
        next-hop-self
        password md5-digest-string
        remote-as remote-as-number
        send-community
        send-ext-community
        [no] shutdown
        timers
         advertisement-interval number
         connect-retry seconds
```

```
holdtime seconds
keepalive seconds
update-source ip-address
```

ip-address	Neighbor Address:
	IP address of the BGP neighbor.

Command History

Release	Modification
14.1	Command introduced.

Examples

Configure a BGP neighbor:

Operational Commands

show bgp neighbor

network

Set the OSPF network type (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► OSPF

```
vpn vpn-id
  router
   ospf
    area number
    interface interface-name
    network (broadcast | point-to-point)
```

(broadcast	Network Type:
point-to-point)	Set the OSPF type of network to which the interface is connect. A broadcast network is a WAN or similar network. In a point-to-point network, the interface connects to a single remote OSPF router.
	Default: broadcast

Command History

Release	Modification
14.1	Command introduced.

Examples

Configure an interface as a point-to-point interface:

```
vml# show running-config vpn 1 router ospf area 0
vpn 1
router
ospf
  area 0
    interface ge0/1
      point-to-point
    exit
  exit
!
!
```

Operational Commands

show ospf interface

next-hop-self

Configure the router to be the next hop for routes advertised to the BGP neighbor (on vEdge routers only).

This feature is disabled by default. If you configure it, use the **no next-hop-self** command to return to the default.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► BGP

```
vpn vpn-id
  router
  bgp local-as-number
```

```
neighbor ip-address
next-hop-self
```

None

Examples

Configure the local vEdge router to be the next hop to its BGP neighbor:

```
vml# show running-config vpn 1 router bgp neighbor 1.10.10.10
vpn 1
router
bgp 123
neighbor 1.10.10.10
no shutdown
remote-as 456
next-hop-self
!
!
!
!
```

Command History

Release	Modification
14.1	Command introduced.

Operational Commands

show bgp routes

node-type

Configure a node type for Cloud OnRamp for SaaS (formerly called CloudExpress service) (on vEdge routers only).

Note

To ensure that Cloud OnRamp for SaaS is set up properly, configure it in vManage NMS, not using the CLI.

```
vpn vpn-id
  cloudexpress
   node-type type
```

```
type Interface Node Type:
Node type for Cloud OnRamp for SaaS on this interface.
Values: client, gateway
Default: client
```

Examples

Configure Cloud OnRamp for SaaS to act as a client in VPN 100:

```
vEdge# show running-config vpn 100 cloudexpress
vpn 100
cloudexpress
node-type client
!
```

Command History

Release	Modification
16.3	Command introduced.

Operational Commands

clear cloudexpress computations show cloudexpress applications show cloudexpress gateway-exits show cloudexpress local-exits show omp cloudexpress show running-config vpn cloudexpress

nssa

Configure an OSPF area to be an NSSA (a not-so-stubby area) (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► OSPF

```
vpn vpn-id
  router
  ospf
```

```
area number
  nssa
  no-summary
  translate (always | candidate | never)
```

translate (always candidate never)	LSA Translation: Allow vEdge routers that are ABRs (area border routers) to translate Type 7 LSAs to Type 5 LSAs. Type 7 LSAs carry external route information within an NSSA, and with the exception of the link-state type, they have the same syntax as Type 5 LSAs, which are OSPF external LSAs. Type 7 LSAs originate in and are advertised throughout an NSSA; NSSAs do not receive or originate Type 5 LSAs. Type 7 LSAs are advertised only within a single NSSA and are not flooded into the backbone area or into any other area by ABRs. The information that Type 7 LSAs contain can be propagated into other areas if the LSAs are translated into Type 5 LSAs, which can then be flooded to all Type 5-capable areas. Because NSSAs do not receive full routing information and must have a default route to route to AS-external destinations, an NSSA ABR can originate a default Type 7 LSA (IP address of 0.0.0.0/0) into the NSSA. The default route originated by an NSSA ABR is never translated into a Type 5 LSA. However, a default route originated by an NSSA internal AS boundary router (a router that is not also an ABR) may be translated into a Type 5 LSA. • always—The router always acts as the translator for Type 7 LSAs. That is, no other router, even if it is an ABR, can be the translator. If two ABRs are configured to always be the translator, only one of them actually ends up doing the translation. • candidate—The router offers translation services, but does not insist on being the translator.
	• never—Translate no Type 7 LSAs.
no-summary	Summary Routes: Do not inject OSPF summary routes into the NSSA.

Command History

Release	Modification
14.1	Command introduced.

Examples

Configure area 1 to be an NSSA:

```
vml# show running-config vpn 1 router ospf
vpn 1
router
  ospf
  redistribute static
  redistribute omp
  area 0
   interface ge0/0
   exit
```

```
exit
area 1
nssa
exit
!
!
```

Operational Commands

show ospf process

ntp

Configure Network Time Protocol (NTP) servers and MD5 authentication keys for the NTP servers.

Configuring NTP on a Cisco vEdge device or controller allows that device or controller to contact NTP servers to synchronize time. Other devices are allowed to ask a Cisco vEdge device for the time, but no devices are allowed to use the Cisco vEdge device as an NTP server.

vManage Feature Template

For all Cisco vEdge devices or Cisco SD-WAN Control Components:

Configuration ► Templates ► NTP

Command Hierarchy

```
system
ntp
  keys
  authentication key-id md5 md5-key
  trusted key-id
server (dns-server-address | ipv4-address)
  key key-id
  prefer
  source-interface interface-name
  version number
  vpn vpn-id
```

Syntax Description

source-interface	Interface for NTP To Use:
interface-name	Configure outgoing NTP packets to use a specific interface to reach the NTP server. The interface must be located in the same VPN as the NTP server. If it is not, the configuration is ignored. This option establishes the identify of outgoing packets, but has no effect on how the packets are routed to the NTP server. The actual interface used to reach the server is determined solely by a routing decision
	made in the software kernel.

server	Location of NTP Server:
(dns-server-address ipv4-address)	Configure the location of an NTP server, either by specifying its IPv4 address or the address of a DNS server that knows how to reach the NTP server. You can configure up to four NTP servers. The software uses the server at the highest stratum level.
authentication key-id md5 md5-key	Authentication: • Enable MD5 authentication for NTP servers. Each MD5 key is identified by a key-id, which can be a number from 1 through 65535. For md5-key, enter either a cleartext or an AES-encrypted key.
trusted key-id	To designate an authentication key as trustworthy, specify the key in the trusted command.
key key-id	To associate an authentication key with a server, specify the key in the key command. For the key to work, you must mark it as trusted.
version number	NTP Version: Version of the NTP protocol software. Range: 1 through 4 Default: 4
prefer	Prefer an NTP Server: If you configure multiple NTP servers, the software chooses the one with the highest stratum level. If more than one server is at the same stratum level, you can prefer that server by configuring it as prefer .
vpn vpn-id	VPN to Reach NTP Server: VPN to use to reach the NTP server, or VPN in which the NTP server is located. vpn-id can be from 0 through 65530. If you configure multiple NTP servers, they must all be located or reachable in the same VPN. Range: 0 through 65530 Default: VPN 0

Command History

Release	Modification
14.1	Command introduced.
15.4	Added support for up to four NTP servers, MD5 authentication, and configuring the source interface.

Examples

Configure three NTP servers, including one that uses an NTP server provided by the NTP Pool Project at the Network Time Foundation. The local NTP servers use MD5 authentication.

```

allow-service, on page 65

offer-time

Configure how long the IP address offered to a DHCP client is reserved for that client (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► DHCP Server

Command Hierarchy

```
vpn vpn-id
 interface geslot/port
   dhcp-server
     offer-time seconds
```

Syntax Description

seconds Duration of IP Address Offer:

How long the IP address offered to a DHCP client is reserved for that client. By default, an offered IP address is reserved indefinitely, until the DHCP server runs out of addresses. At that point, the address is offered to another client.

Range: 0 through 4294967295 seconds

Default: 600 seconds

Command History

Release	Modification
14.3	Command introduced.

Examples

Reserve offered IP address for 2 minutes:

```
vEdge# config
Entering configuration mode terminal
vEdge (config) # vpn 1 interface ge0/4
vEdge(config-interface-ge0/4)# dhcp-server offer-time 120
\verb|vEdge| (\verb|config-dhcp-server|) # | \textbf{show}| \textbf{full-configuration}|
vpn 1
 interface ge0/4
  dhcp-server
   offer-time
                 120
```

Operational Commands

show dhcp interfaces show dhcp server

omp

omp—Modify the OMP configuration (on vEdge routers and vSmart controllers only). By default, OMP is enabled on all vEdge routers and vSmart controllers.

vpn omp—Modify the OMP configuration in a particular VPN (on vEdge routers only). You can configure this command for any service-side VPN, that is, for any VPN except for VPN 0 and VPN 512.

vManage Feature Template

For vEdge routers and vSmart controllers only:

Configuration ► Templates ► OMP

Command Hierarchy

```
omp
  advertise (bgp | connected | ospf type | eigrp | static) (on vEdge routers only)
  discard-rejected (on vSmart controllers only)
  ecmp-limit number (on vEdge routers only)
  graceful-restart
  overlay-as as-number (on vEdge routers only)
  send-backup-paths (on vSmart controllers only)
  send-path-limit number
  [no] shutdown
  timers
   advertisement-interval seconds
   eor-timer seconds
   graceful-restart-timer seconds
  holdtime seconds
```

On vEdge routers only:

```
vpn vpn-id
  omp
  advertise (aggregate prefix [aggregate-only] | bgp | connected | network prefix | ospf
  type | eigrp | static)
```

Syntax Description

shutdown	Disable OMP:	ĺ
	Disable OMP. Doing so shuts down the Cisco SD-WAN overlay network.	
	Default: OMP is enabled on all vEdge routers and vSmart controllers.	

Command History

Release	Modification
14.1	Command introduced.

Release	Modification
16.3	Added vpn omp command.

Operational Commands

show omp peers

show omp routes

show omp services

show omp summary

show omp tlocs

on-demand enable

To enable dynamic on-demand tunnels on a spoke device, use the **on-demand enable** command in config-system mode. To disable dynamic on-demand tunnels, use the **no** form of this command.

on-demand enable

no on-demand enable

Command Default

Disabled

Command Modes

config-system

Command History

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.3.1a	This command was introduced.

Usage Guidelines

Use **on-demand enable** with **on-demand idle-timeout** to enable on-demand tunnels and configure the timeout in minutes. When there is no traffic in an on-demand tunnel, a timer begins. When the timeout interval is reached, the tunnel is removed and the on-demand link between the two devices is considered to by Inactive. Use **show system on-demand** to show the status of on-demand tunnels.

Example

In this example, the on-demand tunnel timeout is configured to 10 minutes.

```
Device(config-system) #on-demand enable
Device(config-system) #on-demand idle-timeout 10
```

on-demand idle-timeout

To configure the timeout interval for dynamic on-demand tunnels on a spoke device, use the **on-demand idle-timeout** command in config-system mode.

on-demand idle-timeout

Command Default

10 minutes

Command Modes

config-system

Command History

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.3.1a	This command was introduced.

Usage Guidelines

Use **on-demand idle-timeout** with **on-demand enable** to enable on-demand tunnels and configure the timeout in minutes. When there is no traffic in an on-demand tunnel, a timer begins. When the timeout interval is reached, the tunnel is removed and the on-demand link between the two devices is considered to be Inactive. Use **show system on-demand** to show the status of on-demand tunnels.

Example

In this example, the on-demand tunnel timeout is configured to 10 minutes.

```
Device(config-system) #on-demand enable
Device(config-system) #on-demand idle-timeout 10
```

options

vpn interface dhcp-server options—Configure the DHCP options to send to the client when the DHCP client request them (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► DHCP Server

Command Hierarchy

```
vpn vpn-id
  interface geslot/port
  dhcp-server
  options
  default-gateway ip-address
  dns-servers ip-address
  domain-name domain-name
  interface-mtu mtu
  tftp-servers ip-address
```

Syntax Description

default-gateway ip-address	Default Gateway:	
	IP address of a default gateway in the service-side network.	

dns-servers ip-address	DNS Servers: One or more of IP addresses for a DNS server in the service-side network. You can specify up to eight addresses.
domain-name domain-name	Domain Name: Domain name that the DHCP client uses to resolve hostnames.
interface-mtu mtu	Interface MTU: MTU size on the interface to the DHCP client. Range: 68 to 65535 bytes
tftp-servers ip-address	TFTP Servers: IP address of a TFTP server in the service-side network. You can specify one or two addresses.
option-code 43 ascii hex	Vendor specific information.
option-code 191 ascii	Vendor specific information.

Command History

Release	Modification
14.3	Command introduced.

Examples

Configure options to send when requested by a DHCP client:

```
vEdge# config
Entering configuration mode terminal
vEdge(config) # vpn 1 interface ge0/4
vm5(config-interface-ge0/4)# dhcp-server options
vEdge(config-options)# default-gateway 10.0.100.100
vEdge(config-options)# dns-servers 10.0.100.8
vEdge(config-options) # tftp-servers 10.0.100.76
vEdge(config-interface-ge0/4)# show full-configuration
vpn 1
 interface ge0/4
 dhcp-server
  options
   default-gateway 10.0.100.100
   dns-servers 10.0.100.8
   tftp-servers 10.0.100.76
!
```

Operational Commands

show dhcp interface show dhcp server

organization-name

system organization-name—Configure the name of your organization.

vManage Configuration

Administration ► Settings

Command Hierarchy

system organization-name name

Syntax Description

name | Organization Name:

Configure the name of your organization. The name is case-sensitive. It must be identical on all the devices in your overlay network, and it must match the name in the certificates for all Cisco SD-WAN network devices.

Command History

Release	Modification
14.1	Command introduced.

Examples

Configure an organization name:

vEdge(config) # system organization-name "Cisco"

Operational Commands

show control local-properties show orchestrator local-properties

request csr upload, on page 669

orgid

To configure the organization ID for Umbrella registration, on Cisco IOS XE Catalyst SD-WAN devices, use the **orgid** command in config-profile mode.

orgid organization-id

organization-id	Organization ID (decimal).
-----------------	----------------------------

Command Mode

config-profile

Command History

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.2.1r	This command was introduced.

Examples

Use **parameter-map type umbrella global** to enter config-profile mode, then use **orgid**, **api-key**, and **secret** to configure Umbrella registration.

In config-profile mode, use **show full-configuration** to display Umbrella registration details.

Example

This example configures Umbrella registration details.

```
Device(config)# parameter-map type umbrella global
Device(config-profile)# orgid 1234567
Device(config-profile)# api-key aaa12345aaa12345aaa12345aaa12345
Device(config-profile)# secret 0 bbb12345bbb12345bbb12345bbb12345
```

ospf

vpn router ospf—Configure OSPF within a VPN on a vEdge router.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► OSPF

```
vpn vpn-id
router
  ospf
  area number
    interface interface-name
    authentication
      authentication-key key
      message-digest key
      type (message-digest | simple)
    cost number
```

```

Monitoring Commands

show ospf database show ospf database-summary show ospf interface show ospf neighbor show ospf process show ospf routes

ospfv3 authentication

To specify the authentication type for an Open Shortest Path First version 3 (OSPFv3) instance, use the **ospfv3 authentication** command in interface configuration mode. To remove the authentication type for an interface, use the **no** form of this command.

ospfv3 authentication ipsec spi $\it spi-number~\{~md5~|~sha1~\}~\{~0~|~7~\}~\it key-string~no~ospfv3~authentication~ipsec$

yntax		

ipsec	Configures use of IP Security (IPsec) authentication.		
spi spi-number	Specifies the Security Policy Index (SPI) value. The <i>spi-number</i> value must be a number from 256 to 4294967295.		
md5	Enables message digest 5 (MD5) authentication.		
sha1	Enables Secure Hash Algorithm 1 (SHA-1) authentication.		
key-encryption-type	One of the following values can be entered:		
	• 0 The key is not encrypted.		
	• 7 The key is encrypted.		
key-string	Number used in the calculation of the message digest.		
	• When MD5 authentication is used, the key must be 32 hex digits (16 bytes) long.		
	• When SHA-1 authentication is used, the key must be 40 hex digits (20 bytes) long.		

Command Default

No authentication is specified.

Command Modes

Interface configuration (config-if)

Command History

Release	Modification
Cisco IOS XE Release 17.3.2	This command was introduced on Cisco IOS XE SD-WAN devices.

Usage Guidelines

Use the **ospfv3 authentication** command to specify the OSPFv3 authentication type on an interface. The **ospfv3 authentication** command cannot be configured per process. If the **ospfv3 authentication** command is used, it affects all OSPFv3 instances.

The **ospfv3 authentication** command applies to all instances of OSPFv3 configured for the interface using the **ospfv3 instance {ipv4 | ipv6} area** *area-id* command.

The following is an example of OSPFv3 IPsec authentication configuration with a MD5 key:

```
Device(config) # interface GigabitEthernet2
Device(config-if) # vrf forwarding 1
Device(config-if) # ip address 10.0.0.1 255.255.255.0
Device(config-if) # negotiation auto
Device(config-if) # ipv6 address 30:1:1::1/64
Device(config-if) # ospfv3 authentication ipsec spi 256 md5 FEEDACEEDEADBEEFFEEDACEEDEADBEEF

Device(config-if) # ospfv3 1 ipv6 area 0
Device(config-if) # ospfv3 1 ipv4 area 0
!
```

The following is an example of OSPFv3 IPsec authentication configuration with a SHA1 key:

```
Device(config)# interface GigabitEthernet4
Device(config)# vrf forwarding 1
Device(config-if)# ip address 10.0.0.0 255.255.255.0
Device(config-if)# negotiation auto
Device(config-if)# ipv6 address 40:1:1::1/64
Device(config-if)# ospfv3 authentication ipsec spi 300 sha1
FEEDACEEDEADBEEFFEEDACEEDEADBEEFFEEDACEE
Device(config-if)# ospfv3 1 ipv4 area 0
```

overlay-as

omp overlay-as—Configure a BGP AS number that OMP advertises to the router's BGP neighbors (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► OMP

Command Hierarchy

omp

overlay-as as-number

Syntax Description

as-number	AS Number:
	Local AS number to advertise to the router's BGP neighbors. You can specify the AS number in 2-byte ASDOT notation (1 through 65535) or in 4-byte ASDOT notation (1.0 through 65535.65535).

Command History

Release	Modification
17.1	Command introduced.

Operational Commands

show bgp routes

show omp routes

Related Topics

propagate-aspath, on page 408

overload

vpn interface nat overload— Control the mapping of addresses on a vEdge router that is acting as a NAT device (on vEdge routers only). By default, the **overload** function is enabled, which enables dynamic NAT.

Addresses are mapped one to one until the address pool is depleted. Then, in Release 16.3.0, the last address is used multiple times, and the port number is changed to a random value between 1024 and 65535. For Releases 16.3.2 and later, when the address pool is depleted, the first address in the pool is used multiple times. This reuse of the last address is called *overloading*. Overloading effectively implements dynamic NAT.

To enable static NAT, which maps a single source IP address to a single translated IP address, include the **no overload** command in the configuration. With this configuration, when the maximum number of available IP addresses is reached, you cannot configure any more mappings between source and translated addresses.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface Cellular (for vEdge cellular wireless routers only)

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface NAT Pool

Configuration ► Templates ► VPN Interface PPP

Command Hierarchy

```
vpn vpn-id
  interface natpoolnumber
  nat
    [no] overload
```

Syntax Description

None

Command History

Release	Modification
16.3	Command introduced.

Examples

Dynamic NAT

Configure a vEdge router to perform dynamic NAT:

```
vEdge# show running-config vpn 1
interface natpool1
  ip address 10.15.1.4/30
  nat
  no shutdown
'
```

Static NAT

Configure a vEdge router to perform static NAT, translating a service-side and a remote IP address:

```
vEdge# show running-config vpn 1
interface natpool1
  ip address 10.15.1.4/30
  nat
    static source-ip 10.1.17.3 translate-ip 10.15.1.4 inside
    static source-ip 10.20.25.18 translate-ip 10.25.1.1 outside
    direction inside
    no overload
!
no shutdown
!
```

Operational Commands

show ip nat filter

show ip nat interface

show ip nat interface-statistics

static, on page 469

parameter-map type umbrella global

To enter config-profile mode, to view or configure Umbrella registration details, on Cisco IOS XE Catalyst SD-WAN devices, use the **parameter-map type umbrella global** command in global configuration mode.

parameter-map type umbrella global

Syntax Description

This command has no arguments or keywords.

Command Mode

Global configuration (config)

Examples

Use the **parameter-map type umbrella global** command to enter config-profile mode, then use one of the following to display the current Umbrella registration details, or to configure Umbrella registration.

Example

This example displays the Umbrella registration details for a device.

```
Device(config)# parameter-map type umbrella global
Device(config-profile)# show full-configuration
parameter-map type umbrella global
local-domain umbrella_bypass
dnscrypt
orgid 1234567
api-key aaa12345aaa12345aaa12345
secret 0 bbb12345bbb12345bbb12345
```

Example

This example configures the Umbrella registration details.

```
Device(config)# parameter-map type umbrella global
Device(config-profile)# orgid 1234567
Device(config-profile)# api-key aaa12345aaa12345aaa12345
Device(config-profile)# secret 0 bbb12345bbb12345bbb12345bbb12345bbb12345
```

parent

To configure a server as an NTP parent, use the **parent enable** command in system configuration mode. To remove the NTP parent configuration, use the **no** form of this command.

```
\begin{tabular}{ll} \textbf{parent enable} & [\textbf{source-interface} & inteface-name \\ ] & [\textbf{stratum} & stratum-value \\ ] & [\textbf{vpn} & vpn-id \\ ] \\ \textbf{no parent enable} \\ \end{tabular}
```

Syntax Description	source-interface interface-name	Sets the interface that the NTP parent server uses to respond to NTP requests. The interface must be located in the same VPN as the NTP server. If it is not, the configuration is rejected.
	stratum stratum-value	Sets the stratum, which defines the distance of the router from a reference clock and defines the reliability and accuracy of the NTP source.
		Valid values are integers 1 through 15. If you do not enter a value, the system uses the router internal clock default stratum value, which is 7.
	vpn vpn-id	Sets the VPN for which this device acts as the NTP parent server. If you configure multiple NTP servers, they must all be located or reachable in the same VPN.
		Range: 0 through 65530
		Default: VPN 0

Command Default

NTP parent is not configured

Command Modes

ntp configuration (config-ntp)

Command History

Release	Modification
Cisco SD-WAN Release 20.4.1	This command was introduced.

Usage Guidelines

The following example shows how to configure a server as an NTP parent.

Example

The following example shows how to configure a track list for interfaces.

```
Device# config terminal
Device(config)# system
Device(config-system) ntp
Device(config-ntp)# parent
Device(config-parent)# enable
Device(config-parent)# source-interface loopback511
Device(config-parent)# stratum 6
Device(config-parent)# vpn 511
```

Table 8: Related Commands

Command	Description
peer	Configure an NTP parent to support NTP in symmetric active mode using.

passive-interface

vpn router ospf area interface passive-interface—Set the OSPF interface to be passive (on vEdge routers only). A passive interface advertises its address, but it does not actively run the OSPF protocol.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► OSPF

Command Hierarchy

```
vpn vpn-id
  router
   ospf
     area number
     interface interface-name
     passive-interface
```

Syntax Description

None

Command History

Release	Modification
14.1	Command introduced.

Examples

Configure a passive OSPF interface:

```
vEdge(config) # show config
vpn 1
router
  ospf
  area 0
    interface ge0/1
    passive-interface
    exit
  exit
!
```

Operational Commands

show ospf interface

password

vpn router bgp neighbor password—Configure message digest5 (MD5) authentication and an MD5 password on the TCP connection with the BGP peer (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► BGP

Command Hierarchy

```
vpn vpn-id
  router
  bgp local-as-number
   neighbor ip-address
    password md5-digest-string
```

Syntax Description

md5-digest-string	Password:
	Password to use to generate an MD5 message digest. It is case-sensitive and can be up to 25 characters long. It can contain any alphanumeric characters, including spaces. The first character cannot be a number.

Command History

Release	Modification
14.1	Command introduced.

Examples

Configure an MD5 password to a BGP neighbor:

```
vEdge# config
Entering configuration mode terminal
vEdge(config)# vpn 1 router bgp 1 neighbor 172.16.255.18
vEdge(config-neighbor-172.16.255.18)# password mypasswordhere
vEdge(config-neighbor-172.16.255.18)# show config
vpn 1
router
bgp 1
neighbor 172.16.255.18
no shutdown
password $4$NGrwc30Xn6BB6+gFXiRXKw==
!
!
!
```

Operational Commands

show bgp neighbor

peer

To configure a server to support NTP in symmetric active mode, use the **peer** command in system configuration mode. To remove the configuration, use the **no** form of this command.

peer ip-address [key key-id][vpn vpn-id][version version-number][source-interface interface-name
]
no peer ip-address

Syntax Description

peer ip-address	Configures a Cisco vEdge device to support NTP in symmetric active mode. Enter the IP address of the peer to use for NTP in this mode. When a server is defined with this keyword, NTP routers synchronize with this peer if they cannot reach the parent NTP router. If this keyword is not used, the Cisco vEdge device operates in symmetric passive mode and does not synchronize with the peer.
key key-id	Designates the ID of the MD5 authentication key for the peer.
vpn vpn-id	Designates the VPN to use to reach the peer, or VPN in which the peer is located. You can configure multiple NTP servers. Each NTP peer, NTP server, and NTP parent server must be located in the same VPN.
	Range: 0 through 65530
	Default: VPN 0
version version-number	Designates the version of the NTP protocol software.
	Range: 1 through 4
	Default: 4
source-interface interface-name	Configures the specific interface for the local NTP process to use to communicate with the peer. The interface must be located in the same VPN as the NTP server. If it is not, the configuration is ignored.

Command Default

Peer is not configured

Command Modes

ntp configuration (config-ntp)

Command History

Release	Modification
Cisco SD-WAN Release 20.4.1	This command was introduced.

Usage Guidelines

You can configure up to two devices to support NTP in symmetric active mode.

A device that is configured as an NTP peer should also be configured as an NTP parent.

The source interface must be in the VPN that is configured for the peer.

Example

The following example shows how to configure a server as an NTP peer.

```
Device# config terminal
Device(config)# system
Device(config-system) ntp
Device(config-ntp)# peer 172.16.10.1
Device(config-peer)# key 101
Device(config-peer)# vpn 511
Device(config-peer)# version 4
Device(config-peer)# source-interface ge0/1
```

Table 9: Related Commands

Command	Description
parent	Configures a Cisco vEdge device as an NTP parent.

perfect-forward-secrecy

vpn interface ipsec ipsec perfect-forward-secrecy—Configure the perfect forward secrecy (PFS) settings to use on an IPsec tunnel that is being used for IKE key exchange (on vEdge routers only). PFS ensures that past sessions are not affected if future keys are compromised

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface IPsec

Command Hierarchy

```
vpn vpn-id
  interface ipsecnumber
  ipsec
    perfect-forward-secrecy pfs-setting
```

Syntax Description

pfs-setting | PFS Setting for IPsec Tunnel:

Type of PFS to use on an IPsec tunnel that is being used for IKE key exchange. It can be one of the following:

- group-2—Use the 1024-bit Diffie-Hellman prime modulus group.
- group-14—Use the 2048-bit Diffie-Hellman prime modulus group.
- **group-15**—Use the 3072-bit Diffie-Hellman prime modulus group.
- **group-16**—Use the 4096-bit Diffie-Hellman prime modulus group.
- none—Disable PFS.

Default: group-16

Command History

Release	Modification
17.2.3	Command introduced.

Examples

Example 1

Have the IPsec tunnel use the 2048-bit modulus group:

```
vEdge(config) # vpn 1 interface ipsec1 ipsec
vEdge(config-ike) # perfect-forward-secrecy group-14
```

Example 2

For a Microsoft Azure end point that does not support PFS, disable PFS on an IPsec tunnel:

```
vEdge(config) # vpn 1 interface ipsec1 ipsec
vEdge(config-ipsec) # perfect-forward-secrecy none
```

Operational Commands

```
clear ipsec ike sessions
show ipsec ike inbound-connections
show ipsec ike outbound-connections
show ipsec ike sessions
```

pim

vpn router pim— Configure PIM (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► PIM

Command Hierarchy

```
vpn vpn-id
router
  pim
  auto-rp
  interface interface-name
  hello-interval seconds
  join-prune-interval seconds
  replicator-selection
  [no] shutdown
  spt-threshold kbps
```

Syntax Description

None

Command History

Release	Modification
14.2	Command introduced.

Operational Commands

show multicast replicator

show multicast rpf

show multicast topology

show multicast tunnel

show omp multicast-auto-discover

show omp multicast-routes

show pim interface show pim neighbor

pmtu

vpn interface pmtu—Enable path MTU (PMTU) discovery on the interface, using ICMP. When PMTU is enabled, the device automatically negotiates the largest MTU size that the interface supports in an attempt to minimize or eliminate packet fragmentation.

By default, PMTU discovery using ICMP is disabled.

On vEdge routers, the Cisco SD-WAN BFD software automatically performs PMTU discovery on each transport connection (that is, for each TLOC, or color). BFD PMTU discovery is enabled by default, and it is recommended that you use it and that you not configure ICMP PMTU discovery on router interfaces.

vManage Feature Template

Configuration ► Templates ► VPN Interface Cellular (for vEdge cellular wireless routers only)Configuration ► Templates ► VPN Interface EthernetConfiguration ► Templates ► VPN Interface PPP Ethernet

Command Hierarchy

```
vpn vpn-id
  interface interface-name
  pmtu
```

Syntax Description

None

Command History

Release	Modification
14.1	Command introduced.

Examples

Enable path MTU discovery on a vSmart interface:

```
vpn 0

Configuration ► Templates ► VPN Interface PPP Ethernet (for vEdge routers only)

Command Hierarchy

Configure a Policer

```
policy
  policer policer-name
   burst bytes
   exceed action
  rate bps
```

Apply a Policer in Centralized Data Policy

On vSmart controllers only.

```
policy
  data-policy policy-name
   vpn-list list-name
   sequence number
   action accept
   set policer policer-name
```

Apply a Policer via an Access List

On vEdge routers only.

```
policy
  access-list list-name
  sequence number
  action accept
    policer policer-name
```

Apply a Policer Directly to an Interface

On vEdge routers only.

```
vpn vpn-id
  interface interface-name
  policer policer-name (in | out)
```

Syntax Description

policer-name	Policer Name:
	Name of the policer. It can be a text string from 1 to 32 characters long. When you include a policer in the action portion of an access list or when you apply a policer directly to an interface, the name must match that which you specified when you created the policer with the policy policer configuration command.
burst bytes	Policer Parameters:
exceed action	Define the policing parameters:
rate bps	• burst is the maximum traffic burst size.
	bytes can be a value from 15000 to 10000000.
	• exceed is the action to take when the burst size or traffic rate is exceeded.
	action can be drop (the default) or remark. The drop action is equivalent to setting the packet loss priority (PLP) to low. The remark action sets the PLP to high. In centralized data policy, access lists, and application-aware routing policy, you can match the PLP with the match plp option.
	• rate is the maximum traffic rate, in bits per second.
	<i>bps</i> can be value from 0 through 264 – 1.
policy access-list	Apply a Policer Conditionally to an Interface, via an Access List:
access-list sequence number action accept policer policer-name	To apply a policer via an access list, first configure the name of the policer in the action portion of the access list. Then apply that access list to the interface, specifying the direction in which to apply it. Applying it in the inbound direction
vpn interface access-list list-name (in out)	(in) affects packets being received on the interface. Applying it in the outbound direction (out) affects packets being transmitted on the interface. Enabling a policer via an access lists applies the policing parameters conditionally, only to traffic transiting the interface in the specified direction that matches the parameters in the access list.

vpn interface policer	Apply a Policer Unconditionally to an Interface:
policer-name (in out)	Apply a policer directly to an interface, specifying the direction in which to apply it. Applying it in the inbound direction (in) affects packets being received on the interface. Applying it in the outbound direction (out) affects packets being transmitted on the interface. Applying a policer directly to an interface applies the policing parameters unconditionally, to all traffic transiting the interface in the specified direction.

Command History

Release	Modification
14.1	Command introduced.
16.3	Added support for multicast traffic.

Examples

Example 1

Create a policer, and apply it conditionally to outbound traffic on an interface in VPN 1:

```
policy
policer pl
 rate 1000000
burst 15000
 exceed drop
access-list acl1
 sequence 1
  match
                  2.2.0.0/16
   source-ip
   destination-ip 10.1.1.0/24 100.1.1.0/24
   destination-port 20 30
   protocol
                   6 17 23
  action accept
   policer pl
 default-action drop
vpn 1
interface ge0/4
 ip address 10.20.24.15/24
 no shutdown
 access-list acl1 out
!
```

Example 2

Apply the same policer unconditionally to outbound traffic on the same interface:

```
policy
policer p1
  rate  1000000
  burst  15000
  exceed drop
!
  vpn 1
  interface ge0/4
  ip address 10.20.24.15/24
  no shutdown
  policer p1
!
```

Release	Modification
16.3	Command introduced.

Examples

Configure an IPv6 ACL that changes the traffic class on TCP port 80 data traffic, and apply the ACL to an interface in VPN 0:

```
\texttt{vEdge\# show running-config policy ipv6 access-list}
policy
ipv6 access-list traffic-class-48-to-46
 sequence 10
 match
  destination-port 80
  traffic-class
 action accept
  count port 80
   log
  set
    traffic-class 46
   !
 default-action accept
 !
vEdge# show running-config vpn 0 interface ge0/7 ipv6
vpn 0
interface ge0/7
 ipv6 access-list traffic-class-48-to-46 in
!
```

Operational Commands

show running-config

Related Topics

policy, on page 384

port-forward

vpn interface nat port-forward—On a vEdge router operating as a NAT gateway, create port-forwarding rules to allow requests from an external network to reach devices on the internal network (on vEdge routers only). You can create up to 128 rules.

You configure NAT port forwarding on interfaces in the WAN transport VPN (VPN 0).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface Cellular (for vEdge cellular wireless routers only)

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface NAT Pool

Configuration ► Templates ► VPN Interface PPP

Command Hierarchy

```
vpn 0
  interface interface-name
  nat
    port-forward port-start port-number1 port-end port-number2
    proto (tcp | udp) private-ip-address ip-address private-vpn vpn-id
```

Syntax Description

port-start port-number1 port-end port-number2	Port or Range of Ports: Define the port or port range of interest. <i>port-number1</i> must be less than or equal to <i>port-number2</i> . To apply port forwarding to a single port, specify the same port number for the starting and ending numbers. When applying port forwarding to a range of ports, the range includes the two port numbers that you specify— <i>port-number1</i> and <i>port-number2</i> . Packets whose destination port matches the configured port or ports are forwarded to the internal device. Range: 0 through 65535
private-ip-address ip-address	Private Server: IP address of the internal device to which to direct traffic that matches the port-forwarding rule.

private-vpn vpn-id	Private VPN:
	Private VPN in which the internal device resides. This VPN is one of the VPN identifiers in the overlay network.
	Range: 0 through 65535
(tcp udp)	Protocol:
	Protocol to which to apply the port-forwarding rule. To match the same ports for both TCP and UDP traffic, configure two rules.

Command History

Release	Modification
15.1	Command introduced.

Examples

Configure a NAT port filter:

```
vEdge(config-nat)# show full-configuration
vpn 0
interface ge0/7
nat
  port-forward port-start 80 port-end 90 proto tcp
  private-vpn     1
   private-ip-address 10.10.1.2
  !
!
!
```

Operational Commands

show ip nat filter show ip nat interface show ip nat interface-statistics

port-hop

system port-hop, vpn 0 interface tunnel-interface—For a Cisco vEdge device that is behind a NAT device or for an individual tunnel interface (TLOC) on that Cisco vEdge device, rotate through a pool of preselected OMP port numbers, known as base ports, to establish DTLS connections with other Cisco vEdge devices when a connection attempt is unsuccessful (on vEdge routers, vManage NMSs, and vSmart controllers only). By default, port hopping is enabled on vEdge routers and on all tunnel interfaces on vEdge routers, and it is disabled on vManage NMSs and vSmart controllers.

There are five base ports: 12346, 12366, 12386, 12406, and 12426. These port numbers determine the ports used for connection attempts. The first connection attempt is made on port 12346. If the first connection does

not succeed after about 1 minute, port 12366 is tried. After about 2 minutes, port 12386 is tried; after about 5 minutes, port 12406; after about 6 minutes, port 12426 is tried. Then the cycle returns to port 12346.

If you have configured a port offset with the **port-offset** command, the five base ports are a function of the configured offset. For example, with a port offset of 2, the five base ports are 12348, 12368, 12388, 12408, and 12428. Cycling through these base ports happens in the same way as if you had not configured an offset.

vManage Feature Template

For vEdge routers, vManage NMSs, and vSmart controllers only:

Configuration ► Templates ► System

Configuration ► Templates ► VPN Interface Cellular (for vEdge cellular wireless routers only)

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface PPP

Command Hierarchy

```
system
  port-hop
vpn 0
  interface interface-name
  tunnel-interface
    port-hop
```

Syntax Description

no	Disable Port Hopping:
port-hop	Disable port hopping on the device, or if global port hopping is enabled, disable port hopping on an individual TLOC. If you disable port hopping on the device, by configuring no port-hop at the system level, port hopping on all tunnel interfaces is disable, and you cannot enable it on an individual tunnel interface. By default, port hopping is enabled on vEdge routers and on all tunnel interfaces on vEdge routers, and it is and disabled on vManage NMSs and vSmart controllers.

Examples

Enable port hopping:

```
system port-hop
```

Command History

Release	Modification
14.3	Command introduced.
15.1	Port hopping enabled by default.
15.3.8	Added support for BFD port hopping.

Release	Modification
16.2	Port hopping is disabled by default on vManage NMSs and vSmart controllers.

Operational Commands

request port-hop show control local-properties

Related Topics

port-scan

To enable port-scanning detection, enable the **port-scan** command in United Threat Defense (UTD) multitenancy threat configuration mode or UTD single-tenancy threat configuration mode. To disable port-scanning detection, use the **no** form of this command.

port-scan

no port-scan

Syntax Description

This command has no arguments or keywords.

Command Default

By default, port-scanning detection is disabled, so you have to enable port-scanning detection.

Command Modes

UTD multitenancy threat configuration mode (utd-mt-threat)

UTD single-tenancy threat configuration mode (utd-eng-std)

Command History

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	This command was introduced.
Cisco vManage Release 20.4.1	

Usage Guidelines

The **port-scan** command can detect, but not block possible port-scan attacks.

For more information on port-scanning detection, see the Configure Port-Scanning Detection Using a CLI Template section in the Security Configuration Guide, Cisco IOS XE Release 17.x.

For more information on specifying the alert level for port-scanning detection, see the sense level command.

Examples

The following example shows how to enable port-scanning detection:

```
Device(config) # utd engine standard multi-tenancy
Device(config-utd-mt-threat) # threat protection profile 101
Device(config-utd-mt-threat) # port-scan
Device(config-utd-mt-threat-port-scan) # sense level low
```

The following example shows how to disable port-scanning detection:

```
Device(config) # utd engine standard multi-tenancy
Device(config-utd-mt-threat) # threat-inspection profile 101
Device(config-utd-mt-threat) # no port-scan
```

The following example shows how to enable port-scanning detection in UTD single-tenancy threat configuration mode:

```
Device(config)# utd engine standard
Device(config-utd-eng-std)# threat-inspection
Device(config-utd-engstd-insp)# port-scan
Device(config-utd-threat-port-scan)# sense level low
```

The following example shows how to disable port-scanning detection in UTD single-tenancy threat configuration mode:

```
Device(config) # utd engine standard
Device(config-utd-eng-std) # threat-inspection
Device(config-utd-engstd-insp) # no port-scan
```

ppp

vpn 0 interface ppp—Configure the properties for a PPP virtual interface (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface PPP

Configuration ► Templates ► VPN Interface PPP Ethernet

Command Hierarchy

```
vpn 0
  interface pppnumber
  ppp
  ac-name name
  authentication
    chap hostname hostname password password
  pap sent-username username password password
```

Syntax Description

ac-name name	Access Concentrator Name: Name of the access concentrator used by PPPoE to route connections to the internet.
chap hostname hostname password password	Authentication Credentials for CHAP: Hostname and password provided by your Internet Service Provider (ISP). hostname can be up to 255 characters. You can configure both CHAP and PAP authentication on the same PPP interface. The software tries both methods and uses the first one that succeeds.
pap sent-username username password password	Authentication Credentials for PAP: Username and password provided by your Internet Service Provider (ISP). sent-username can be up to 255 characters. You can configure both CHAP and PAP authentication on the same PPP interface. The software tries both methods and uses the first one that succeeds.

Examples

Configure CHAP authentication on a PPP interface:

```
vEdge# show running-config vpn 0 interface ppp10
vpn 0
interface ppp10
ppp authentication chap
hostname branch100@corp.bank.myisp.net
password $4$OHHjdmsC7M8zj5BgLEFXKw==
ppp ac-name text
```

Command History

Release	Modification
15.3.3	Command introduced.
17.1	Added ability to configure both CHAP and PAP authentication on a PPP interface.

Operational Commands

clear pppoe statistics

show pppoe session

show pppoe statistics

show ppp interface

Related Topics

pppoe-client, on page 399

pppoe-client

vpn 0 interface pppoe-client—Enable the PPPoE client on the interface (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface PPP Ethernet

Command Hierarchy

```
vpn 0
  interface geslot/port
  pppoe-client
   ppp-interface pppnumber
```

Syntax Description

pppnumber	Interface Name:
	Name of the PPP interface.
	Possible values: from ppp1 through ppp31

Command History

Release	Modification
15.3.3	Command introduced.

Examples

Configure an interface to run the PPPoE client:

```
vEdge# show running-config vpn 0
vpn 0
  interface ge0/1
   pppoe-client ppp-interface ppp10
   no shutdown
```

Operational Commands

clear pppoe statistics

show interface detail

show ppp interface

show pppoe session

show pppoe statistics

priority

vpn router ospf area interface priority—Set the priority of the router to be elected as the designated router (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► OSPF

Command Hierarchy

```
vpn vpn-id
  router
   ospf
      area number
        interface interface-name
          priority number
```

Syntax Description

number | Designated Router Priority:

Set the priority of the router to be elected as the designated router (DR). The router with the highest priority becomes the DR. If the priorities are equal, the node with the highest router ID becomes the DR or the backup DR.

Range: 0 through 255

Default: 1

Command History

Release	Modification
14.1	Command introduced.

Examples

Set the router's DR priority to 127

```
vEdge# show running-config vpn 1 router ospf area 0
vpn 1
router
  ospf
  area 0
    interface ge0/0
      priority 127
    exit
  exit
!
!
```

Operational Commands

show ospf interface

probe

To configure specific SaaS applications for Cloud onRamp for SaaS, and the frequency for probing the paths to the cloud application servers, in Cisco IOS XE Catalyst SD-WAN devices, use the **probe** command in global configuration mode.

The **no** form of this command cancels probing for specific applications.

```
probe [latency frequency] [saas application-name]
no probe [saas application-name]
```

Syntax Description

latency frequency	Frequency at which Cloud onRamp for SaaS probes the paths to application servers for specified SaaS applications.
	Range: 0 to 65535 (seconds)
	Default: 30
	Note We recommend that you use the default value.

```
Specifies SaaS applications to probe, from a predefined list:
saas application-name
                          amazon_aws_apps
                          box_net_apps
                          concur apps
                          dropbox_apps
                          google apps
                          gotomeeting_apps
                          intuit_apps
                          office365_apps
                          oracle_apps
                          salesforce_apps
                          sugar_crm_apps
                          zendesk apps
                          zoho_crm_apps
                      Prerequisite: To use this option, probe-path configuration must be enabled either as
                      branch or gateway.
```

Command Mode

Global configuration (config)

Command History

Release	Modification
Cisco IOS XE Release 17.2	The command was introduced.

Examples

Example

```
Device(config)# probe latency 40
Device(config-probe)# top
Device(config)# probe saas office365_apps
Device(config-probe)# top
Device(config)# probe saas amazon_aws_apps
Device(config-probe)# top
Device(config)# show full probe
probe
latency 40
saas office365_apps
saas amazon_aws_apps
```

Example

This example cancels probling for office365_apps.

```
Device(config) # no probe saas office365_apps
```

probe-path branch

To enable Cloud onRamp for SaaS functionality in branch mode, for Cisco IOS XE Catalyst SD-WAN devices, use the **probe-path branch** command in global configuration mode.

The no form of this command disables Cloud onRamp for SaaS functionality in branch mode.

Syntax Description

color-all-dia	Enables Cloud onRamp for SaaS probing in branch mode on all transport locator (TLOC) interfaces that have been assigned a valid color. Use this option when all TLOC interfaces have direct internet access (DIA).
color-list list-of-tloc-colors	Enables Cloud onRamp for SaaS probing in branch mode on the interfaces that match the list of colors.

Command Mode

Global configuration (config)

Command History

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.2.1r	This command was introduced.

Examples

Example

After enabling Cloud on Ramp for SaaS for a branch, confirm that it is enabled with a **show** command.

```
Device(config)# show full probe-path
probe-path branch
```

Enable Cloud on Ramp for SaaS for a branch, for a list of colors.

```
Device(config) # probe-path branch color-list public-internet private1
Device(config) # show full probe-path
probe-path branch color-list public-internet private1
```

probe-path gateway

To enable Cloud onRamp for SaaS functionality in gateway mode use the **probe-path gateway** command in global configuration mode. To disable Cloud onRamp for SaaS functionality in gateway mode, use the **no** form of this command.

 $\begin{tabular}{ll} \textbf{probe-path gateway} & \{ \textbf{local-interface-list} & \textit{list-of-probe-interface-names} & | \textbf{color-all-dia} & | \textbf{color-list} & \textit{tloc-color-1} & [\ \dots \ tloc-color-n \] \ \} \\ \end{tabular}$

no probe-path gateway [**local-interface-list** *list-of-tloc-interface-names* | **color-all-dia** | **color-list** [. . . *tloc-color-n*]]

Syntax Description

local-interface-list list-of-probe-interface-names	List of probe interface names in service VPNs.
color-all-dia	Enables Cloud onRamp for SaaS to probe all transport locator (TLOC) interfaces that have been assigned a valid color, when the gateway site connects to the internet using VPN 0.
	Use this option when all TLOC interfaces have direct internet access (DIA).
color-list tloc-color-1 [tloc-color-n]	Enables Cloud onRamp for SaaS to probe only the DIA interfaces that match a specific list of TLOC colors, when the gateway site connects to the internet using VPN 0.

Command Mode

Global configuration (config)

Command History

Release	Modification
Cisco IOS XE Release 17.2	This command was introduced.
Cisco IOS XE Catalyst SD-WAN Release 17.6.1a	New keywords added: color-all-dia and color-list

Usage Guidelines

When using the **no** form of this command, you can include **local-interface-list** to specify interfaces, or omit this option to remove the gateway functionality.

Example

After enabling Cloud onRamp for SaaS for a gateway, with a list of interfaces, display the configuration.

Device(config)# show full probe-path
probe-path gateway local-interface-list GigabitEthernet5 GigabitEthernet1

profile

cellular profile—Configure a cellular profile (on vEdge routers only).

The firmware installed in the router's cellular module is specific to each service provider and determines which profile properties you can configure. You can modify the attributes for a profile only if allowed by the service provider.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► Cellular Profile

Command Hierarchy

```
cellular cellularnumber
profile profile-id
apn name
auth auth-method
ip-addr ip-address
name profile-name
pdn-type type
primary-dns ip-address
secondary-dns ip-address
user-name username
user-pass password
```

Syntax Description

	[
apn name	Access Point Name:
	Name of the gateway between the service provider network and the public Internet.
	It can be up to 32 characters long.
	it can be up to 32 characters long.
auth auth-method	Authentication Method:
	Authentication method used for the connection to the cellular network. Possible
	values are CHAP, None, PAP, or PAP/CHAP.
primary-dns ip-address	DNS Servers:
secondary-dns	IP addresses of the primary and secondary DNS servers in the service provider
1	network, in decimal four-part dotted notation.
ip-address	network, in decimal four-part dotted notation.
ip-addr ip-address	IP Address:
	Static IP address assigned to the cellular interface. This field is used when the
	service provider requires that a static IP address be pre-configured before attaching
	to the network
	to the network.
name profile-name	Name:
	Name used to identify the cellular profile. It can be up to 14 characters long.
	I.

pdn-type type	Packet Data Network Type:
	Type of packet data network (PDN) of the cellular network. Possible values are IPv4, IPv6 and IPv46.
profile profile-id	Profile Identifier:
	Identification number of the profile used for the cellular module.
	Range: 0 to 15
user-name username	Username:
	Username to use in making cellular connections for web services. It can be 1 to 32 characters long. It can contain any alphanumeric characters, including spaces. If the username contains spaces, enclose it in quotation marks (" ").
user-pass password	User Password:
	User password to use in making cellular connections for web services. The password is case sensitive. You can enter it in clear text or an AES-encrypted key.

Command History

Release	Modification
16.1	Command introduced.
16.3	Added support for profile 0; changed profile 16 to reserved, so you cannot modify it.

Examples

Configure a cellular interface with a profile, and the profile with an APN.

```
vEdge# show running-config cellular
cellular cellular0
profile 1
   apn reg_ims
```

Operational Commands

clear cellular errors

clear cellular session statistics

show cellular modem

show cellular network

show cellular profiles

show cellular radio

show cellular sessions

show cellular status

show interface

profile

vpn 0 interface cellular profile—Assign a cellular profile to a cellular interface (on vEdge routers only).

vManage Feature Template

For vEdge cellular wireless routers only:

Configuration ► Templates ► VPN Interface Cellular

Command Hierarchy

```
vpn 0
  interface cellularnumber
   profile profile-id
```

Syntax Description

profile	Profile:	
profile-id	Number that identifies the profile to use for the cellular interface. This profile is one you configure with the cellular profile command.	
	profile-id can be a value from 1 through 15.	

Command History

Release	Modification
16.1	Command introduced.

Examples

```
vEdge# show running-config vpn 0 interface cellular0
interface cellular0
 ip dhcp-client
  tunnel-interface
  encapsulation ipsec
  color lte
  no allow-service bgp
  allow-service dhcp
  allow-service dns
  allow-service icmp
  no allow-service sshd
  no allow-service netconf
  no allow-service ntp
  no allow-service ospf
  no allow-service stun
 mtu
          1428
 profile 3
  no shutdown
```

,

Operational Commands

clear cellular errors

clear cellular session statistics

show cellular modem

show cellular network

show cellular profiles

show cellular radio

show cellular sessions

propagate-aspath

vpn router bgp propagate-aspath—Carry the BGP AS path into OMP (on vEdge routers only). Configuring this option can help to avoid network loops.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► BGP

Command Hierarchy

```
vpn vpn-id
  router
  bgp local-as-number
    propagate-aspath
```

Syntax Description

None

Command History

Release	Modification
17.1	Command introduced.

Examples

Carry local BGP AS path information into OMP, and receive AS path information from OMP:

```
vpn 1
  router
  bgp 1
    propagate-aspath
```

Operational Commands

show bgp summary show omp routes detail

Related Topics

overlay-as, on page 370

propagate-community

To propagate the BGP communities between routing protocols during route redestribution, use the **propagate-community** command in the global configuration mode.

propagate-community

This command has no arguments or keywords.

Command Default

NA

Command Modes

Global Configuration

Command History

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.3.1a	This command was introduced on the Cisco IOS XE Catalyst SD-WAN devices.

Example

The following example shows the propagation of BGP on Cisco IOS XE Catalyst SD-WAN devices:

```
Device(config)# router bgp 123
Device(config)# address-family ipv4 vrf vrf1
Device(config-af)# propagate-community
Device(config-af)# redistribute omp
```

qos-map

qos-map—Configure a QoS map, or apply a QoS map on an interface (on vEdge routers only). QoS is applied to unicast or multicast packets being transmitted out the interface.

vManage Feature Template

For vEdge routers only:

Configuration ► Policies ► Localized Policy

Configuration ► Templates ► VPN Interface Cellular (for vEdge cellular wireless routers only)

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface GRE

Configuration ► Templates ► VPN Interface PPP Ethernet

Command Hierarchy

Create a QoS Map

```
policy
  qos-map map-name
  qos-scheduler class-name
```

Apply a QoS Map on an Interface

```
vpn vpn-id
  interface interface-name
   qos-map map-name
```

Syntax Description

тар-пате	QoS Map Name:
	Name of the QoS map. It can be a text string from 1 through 32 characters long. When you are configuring a QoS map, it can contain 64 QoS schedulers. The interface cannot be a VLAN interface (subinterface). When you apply a QoS map to an interface, the map name must match that which you specified when you created the QoS with the policy qos-map configuration command.
qos-scheduler class-name	QoS Scheduler: Name of a QoS scheduler configured with a policy qos-scheduler configuration command.

Examples

Create a QoS scheduler and QoS map, and apply it to an interface in VPN 1:

```
qos-map test-qos-map
!
```

Command History

Release	Modification
14.1	Command introduced.
16.3	Added support for multicast traffic.
17.1	Can no longer configure qos-map on a VLAN interface.

Operational Commands

show policy qos-map-info show policy qos-scheduler-info

Related Topics

```

qos-scheduler

policy qos-scheduler—Configure a QoS scheduler for a forwarding class (on vEdge routers only).

A scheduler can apply to unicast and multicast traffic.

vManage Feature Template

For vEdge routers:

Configuration ► Policies ► Localized Policy

```
policy
  qos-scheduler scheduler-name
   bandwidth-percent percentage
  buffer-percent percentage
  burst burst-rate
  class class-name
  drops (red-drop | tail-drop)
  scheduling (llq | wrr)
```

scheduler-name	Scheduler Name:
	Name of the QoS scheduler for a forwarding class. It can be a text string from 1 through 32 characters long.
bandwidth-percent	Bandwidth Percentage:
percentage	Percentage of the interface's bandwidth to allocate to the forwarding class. The sum of the bandwidth on all forwarding classes on an interface should not exceed 100 percent.
buffer-percent	Buffer Percentage:
percentage	Percentage of the interface's buffering capacity to allocate to the forwarding class. The sum of the buffering capacity of all forwarding classes on an interface should not exceed 100 percent.
burst burst-rate	Burst Rate:
	Number of bytes in a burst.
	Range: 5000 to 100000000
	Default: 15000
class class-name	Class:
	Name of the forwarding class. <i>class-name</i> can be a text string from 1 through 32 characters long. The common class names correspond to the per-hop behaviors AF (assured forwarding), BE (best effort), and EF (expedited forwarding).
drops (red-drop	Packet Drops:
tail-drop)	Method to use to drop packets that exceed the bandwidth or buffer percentage. Packets can be dropped either randomly (red-drop) or from the end of the queue (tail-drop). If you configure low-latency queuing (scheduling llq), you cannot configure the red-drop drop mechanism. If you attempt to configure both mechanisms, an error message is displayed when you try to validate the configuration, and the commit operation does not continue.
scheduling (llq wrr)	Queue Scheduling:
	Algorithm to use to schedule interface queues. It can be either low-latency queuing (llq) or weighted round-robin (wrr). If you use LLQ, you cannot configure RED packet drops.

Command History

Release	Modification
14.1	Command introduced.
16.2.3	Beginning with this release, if you attempt to configure LLQ and red drops, an error message is displayed when you try to validate the configuration, and the commit operation does not continue.

Release	Modification
16.3	Added support for multicast traffic.

Examples

Create a QoS scheduler and QoS map, and apply it to an interface in VPN 1:

Operational Commands

show policy qos-map-info show policy qos-scheduler-info

radius

system radius—Configure the properties of a RADIUS server to use for AAA authorization and authentication, and IEEE 802.1X LAN and IEEE 802.11i WLAN authentication.

vManage Feature Template

For all Cisco vEdge devices:

Configuration ► Templates ► AAA

Command Hierarchy

```
system
radius
retransmit number
server ip-address
    acct-port port-number
    auth-port port-number
priority number
secret-key password
source-interface interface-name
tag tag
    vpn vpn-id
timeout seconds
```

Command History

acct-port port-number	Accounting Port:
	UDP port to use to send 802.1X and 802.11i accounting information to the RADIUS server. The accounting information is sent in accounting attribute—value (AV) pairs, as defined in RFC 2866, RADIUS Accounting. By default, vEdge routers send accounting information on UDP port 1813. To disable accounting, set the accounting port number to 0. Range: 0 through 65535
	Default: 1813
server ip-address	Address of RADIUS Server:
	IP address of a RADIUS server host in the local network. You can configure up to eight servers. AAA authentication can be performed by up to eight servers. 802.1X and 802.11i authentication can be performed by a maximum of two servers.
secret-key password	Authentication Key:
	Key to use for authentication and encryption between the Cisco vEdge device and the RADIUS server. You can type the key as a text string from 1 to 128 characters long, and it is immediately encrypted, or you can type an AES 128-bit encrypted key. The key must match the AES encryption key used on the RADIUS server.
auth-port port-number	Destination Port for Authentication Requests:
	UDP destination port to use for authentication requests to the RADIUS server. If the server is not used for authentication, configure the port number to be 0. If you do not configure a port number, the default is RADIUS authentication port is 1812.
	Range: 1 through 65535
	Default: 1812
source-interface	Interface To Use To Reach Server:
interface-name	Interface on the local device to use to reach the RADIUS server. The source interface must be the same for all RADIUS servers.

Location Attempts:
How many times to search through the list of RADIUS servers while attempting to locate an operational server.
Range: 1 through 1000
Default: 3
Server Priority:
Set the priority of a RADIUS server, as a means of choosing or load balancing among multiple RADIUS servers for AAA authentication or between two servers for 802.1X or 802.11i authentication. A server with lower priority number is given priority over one with a higher number.
Range: 0 through 7
Default: 0
Server Tag Identifier:
Text string that identifies the RADIUS server.
Range: 4 through 16 characters
Time to Wait for Replies from Server:
Configure the interval, in seconds, that the Cisco vEdge device waits to receive a reply from the RADIUS server before retransmitting a request.
Range: 1 through 1000
Default: 5 seconds
VPN where Server Is Located:
VPN in which the RADIUS server is located or through which the server can be reached. If you configure multiple RADIUS servers, they must all be in the same VPN.
Range: 0 through 65530
Default: VPN 0

Release	Modification
14.1	Command introduced.
14.3	Added source-interface command.
15.3.8	Added secret-key command and deprecated key command.
16.1	Changed authentication key from 32 to 128 characters.
16.2.2	Added priority command.

Release	Modification
16.3	Added acct-port and tag commands, and added support for IEEE 802.1X LAN and IEEE 802.11i WLAN authentication.

Examples

Configure two RADIUS servers:

```
{\tt vEdge\#}~{\bf show}~{\bf running\text{-}config}~{\bf system}~{\bf radius}
system
  radius
    server 10.1.15.150
      tag freerad1
      source-interface ge0/0
      secret-key $4$L3rwZmsIic8zj4BgLEFXKw==
       priority
                        1
      exit
    server 10.20.24.150
     auth-port 2000
acct-port 2001
                       freerad2
      source-interface ge0/0
      secret-key $4$L3rwZmsIic8zj4BgLEFXKw==
priority 2
     priority
    exit
  !
```

Operational Commands

clear dot1x client

dot1x

show dot1x clients

show dot1x interfaces

show dot1x radius

show running-config system radius

show system statistics

radius-servers

system aaa radius-servers, vpn interface dot1x radius-servers, wlan interface radius-servers—Configure which RADIUS servers to use for AAA, IEEE 802.1X, and IEEE 802.11i authentication (for IEEE 802.1X and IEEE 802.11i on vEdge routers only).

vManage Feature Template

For all Cisco SD-WAN devices:

Configuration ► Templates ► AAA

For vEdge routers only:

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► WiFi SSID (for vEdge cellular wireless routers only)

Command Hierarchy

```
system
aaa
radius-servers tag

vpn 0
interface interface-name
dot1x
radius-servers tag

wlan radio-band
interface vapnumber
radius-servers tag
```

Syntax Description

tag	Tag Associated with a RADIUS Server:
	Tag of RADIUS server to use for AAA, IEEE 802.1X, or IEEE 802.11i authentication. The tag can be from 4 through 16 characters long. You can specify one or two tags. You configure the tags with the system radius server tag command. If you specify tags for two RADIUS servers, they must both be reachable in the same VPN. If you do not configure a priority value when you configure the RADIUS server with the system radius server priority command, the order in which you list the IP addresses is the order in which the RADIUS servers are tried. If you configure no RADIUS server tags, all RADIUS servers in the configuration are used for authentication.

Command History

Release	Modification
16.3	Command introduced.

Examples

Example 1

Configure two RADIUS servers to use for AAA authentication:

```
vEdge# show running-config system
system
aaa
 auth-order local radius tacacs
 radius-servers radius-1 radius-2
 usergroup basic
  task system read write
  task interface read write
 usergroup netadmin
 usergroup operator
  task system read
  task interface read
  task policy read
  task routing read
  task security read
 user admin
  password
$6$6fmWvCA6jHuEq/AK$y3gixVkyhtvXLWNTiv3Wy21i9/.6h56IQNWvI3YdjxH9qQmGVWVGQW391dlaqjRRDtUkuxeIy3/m9BqL/01ZG.
 !
. . .
radius
 server 1.2.3.4
  tag radius-1
  exit
 server 2.3.4.5
  tag radius-2
 exit
```

Example 2

Configure the RADIUS servers to use for 802.1X authentication:

```
system
radius
 server 10.1.15.150
                 freerad1
  tag
  source-interface ge0/0
  secret-key $4$L3rwZmsIic8zj4BgLEFXKw==
  priority
 exit
 server 10.20.24.150
  auth-port 2000
                 2001
  acct-port
  tag
                  freerad2
  source-interface ge0/4
  secret-key $4$L3rwZmsIic8zj4BgLEFXKw==
priority 2
  priority
 exit
```

range

vpn router ospf area range—Summarize OSPF routes at an area boundary so that only a single summary route is advertised to other areas by an ABR (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► OSPF

Command Hierarchy

```
vpn vpn-id
  router
  ospf
    area number
    range prefix/length
    cost number
    no-advertise
```

Syntax Description

prefix/length	Address Range:
	IP address and subnet mask of the IP addresses to be consolidated and advertised.
cost	Cost for the Summary Routes:
number	Metric for the Type 3 summary LSA. OSPF uses this metric during its SPF calculation to determine the shortest path to a destination.
	Range: 0 through 16777215
no-advertise	Do Not Advertise Type 3 Summary LSAs:
	Do not advertise the Type 3 Summary LSAs.

Command History

Release	Modification
14.1	Command introduced.

Operational Commands

show ospf process

reauthentication

vpn interface dot1x reauthentication—Enable periodic reauthentication of 802.1X clients (on vEdge routers only). By default, clients are authenticated only once, when they first request access to the LAN.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface Ethernet

Command Hierarchy

```
vpn vpn-id
  interface interface-name
  dot1x
    reauthentication minutes
```

Syntax Description

minutes Time between Reauthenticati	on Attempts:
-------------------------------------	--------------

Set the time between reauthentication attempts.

Range: 0 through 1440 minutes

Default: 0 (no reauthentication attempts are made after the initial LAN access request)

Command History

Release	Modification
16.3	Command introduced.

Examples

Require a client to reauthenticate once an hour:

```
vpn 0
  interface ge0/8
   dot1x
    requthentication 3600
```

Operational Commands

clear dot1x client

show dot1x clients

show dot1x interfaces

show dot1x radius

show system statistics

radius, on page 413

redistribute

To redistribute routes from one routing domain into another routing domain, use the **redistribute** command in the address family configuration mode.

redistribute protocol [metric {metric-value | transparent }] [match {internal | external 1 | external 2 }] [route-map map-tag] nssa-only

no redistribute protocol [**metric** { metric-value }] [**route-map** map-tag]

Syntax Description

protocol

Source protocol from which routes are being redistributed. It can be one of the following keywords: application, bgp, connected, eigrp, iso-igrpisis, mobile, ospf, rip, ospfv3, omp, static, nat, natpool-outside [nat-route].

The **static** [ip] keyword is used to redistribute IP static routes. The optional ip keyword is used when redistributing into the Intermediate System-to-Intermediate System (IS-IS) protocol.

metric metric-value (Optional) When redistributing from one OSPF process to another OSPF process on the same router, the metric will be carried through from one process to the other if no metric value is specified. When redistributing other processes to an OSPF process, the default metric is 20 when no metric value is specified. The default value is 0.

match {internal | external}

(Optional) Specifies the criteria by which OSPF routes are redistributed into other routing domains. It can be one of the following:

- internal—Routes that are internal to a specific autonomous system.
- external 1—Routes that are external to the autonomous system.
- nssa-external —Routes that are external to the autonomous system, but are imported into OSPF as Type 2 external routes.

The default is **internal**.

route-map

(Optional) Specifies the route map that should be interrogated to filter the routes from this source routing protocol to the current routing protocol. If not specified, all routes are redistributed. If this keyword is specified, but no route map tags are listed, no routes will be imported.

map-tag

(Optional) Identifier of a configured route map.

nssa-only

(Optional) Sets the nssa-only attribute for all routes redistributed into OSPF.

Command Default

Route redistribution is disabled.

Command Modes

Router configuration (config-router)

Address family configuration (config-af)

Command History

Release	Modification
14.1	This command was introduced.
14.2	Added nat option.
Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	Added route-map.

Usage Guidelines

A router receiving a link-state protocol with an internal metric will consider the cost of the route from itself to the redistributing router plus the advertised cost to reach the destination. An external metric only considers the advertised metric to reach the destination.

Examples

The following example shows how OSPF routes are redistributed into a BGP domain:

```
Device(config)# router bgp 109
Device(config-router)# redistribute ospf
```

The following example shows how to redistribute EIGRP routes into an OSPF domain:

```
Device(config)# router ospf 110
Device(config-router)# redistribute eigrp
```

The following example shows how to redistribute the specified EIGRP process routes into an OSPF domain. The EIGRP-derived metric will be remapped to 100 and RIP routes to 200.

```
Device(config) # router ospf 109
Device(config-router) # redistribute eigrp 108 metric 100 subnets
Device(config-router) # redistribute rip metric 200 subnets
```

The following example shows how EIGRP routes are redistributed into an EIGRP process in a named EIGRP configuration:

```
Device(config) # router eigrp virtual-name
Device(config-router) # address-family ipv4
Device(config-router-af) # topology base
Device(config-router-af-topology) # redistribute eigrp 6473 metric 1 1 1 1 1
```

The following example shows how EIGRP routes are redistributed into an EIGRP process in a named EIGRP configuration:

```
Device(config) # router eigrp virtual-name
Device(config-router) # address-family ipv4
Device(config-router-af) # redistribute bgp 100 metric 100 metric-type 1 subnets route-map
BGP-To_OSPF
```

Related Topics

route-policy, on page 439

redistribute leaked routes

To redistribute routes between the local service VPNs at the same edge site, use the **redistribute** command in the address-family configuration mode or router configuration mode. To stop the redistribution, use the **no** form of this command.

redistribute protocol [route-policy policy-name]

no redistribute protocol [**route-policy** policy-name]

Syntax Description

protocol

Source protocol from which routes are being redistributed. It can be one of the following keywords: **bgp**, **connected**, **omp**, **static**.

Due to the fact that leaked routes lose their original attributes and appear as **static**, the redistribution protocol will always be **static**.

route-policy (Optional) Specifies a route policy to apply to a BGP neighbor or to OSPF.

policy-name (Optional) Specifies the route policy name. Name of the route policy to configure or apply to a BGP neighbor or to OSPF. Range: 1 to 127 characters.

Command Default

Route redistribution is disabled.

Command Modes

Router configuration (config-router)

Address family configuration (config-af)

Command History

Release	Modification
Cisco SD-WAN Release 20.9.1	This command was introduced.

The following example shows how routes from service underlay A to service underlay B are redistributed via OSPF:

```
Device(config) # vpn 102
Device(config-vpn-102) # router ospf
Device(config-router) # redistribute static route-policy VPN101 TO VPN102
```

refresh

vpn interface nat refresh— Configure how NAT mappings are refreshed (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface Cellular (for vEdge cellular wireless routers only)

Configuration ► Templates ► VPN Interface Ethernet

```
Configuration ► Templates ► VPN Interface NAT Pool
```

Configuration ► Templates ► VPN Interface PPP

Command Hierarchy

```
vpn
  interface interface-name
   nat
    refresh (bi-directional | outbound)
```

Syntax Description

bi-directional	Refresh NAT Mappings for Inbound and Outbound Packets:
	On the interface, keep the NAT mappings for both outbound and inbound traffic active.
outbound	Refresh NAT Mappings for Outbound Packets Only:
	On the interface, keep the NAT mappings for outbound traffic active. This is the default behavior.

Command History

Release	Modification
14.2	Command introduced.

Examples

Refresh NAT mappings for outbound and inbound data traffic:

```
vm5# config
vm5 (config) # vpn 1 interface ge0/4 nat refresh bi-directional
vm5 (config-nat) # show full-configuration
vpn 1
  interface ge0/4
  nat
    bi-directional
  !
!
```

Operational Commands

show ip nat interface

show ip nat interface-statistics

rekey

security ipsec rekey—Modify the IPsec rekeying timer (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► Security

Command Hierarchy

```
security
  ipsec
    rekey seconds
```

Syntax Description

seconds | Rekeying Time:

How often a vEdge router changes the AES key used on its secure IPsec connection to other vEdge routers. If OMP graceful restart is enabled, the rekeying time must be at least twice the value of the OMP graceful restart timer. This value is equivalent to the security association (SA) lifetime.

Range: 10 through 1209600 seconds (14 days)

Default: 86400 seconds (24 hours)

Command History

Release	Modification
14.1	Command introduced.
15.3.5	Rekeying time default changed from 7200 seconds (2 hours) and maximum time increased from 2 days to 7 days.

Examples

Change the IPsec rekeying time to 1 week:

```
security
 ipsec
   rekey 604800
```

Operational Commands

show ipsec local-sa show security-info

Related Topics

```
graceful-restart, on page 217
request security ipsec-rekey, on page 705
show bfd sessions, on page 751
timers, on page 499
```

rekey

vpn interface ipsec ike rekey—Modify the IPsec rekeying timer to use during IKE key exchanges (on vEdge routers only).

vpn interface ipsec ipsec rekey—Modify the IPsec rekeying timer to use on an IPsec tunnel that is being used for IKE key exchange (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface IPsec

Command Hierarchy

```
vpn vpn-id
 interface ipsecnumber
   ike
     rekey seconds
    ipsec
      rekey seconds
```

Syntax Description

seconds | Rekeying Time:

How often IKE changes the AES key that is being used during IKE key exchanges.

Range: 30 through 1209600 seconds (up to 14 days)

Default: 3600 seconds (1 hour) (for **ipsec rekey**); 14400 seconds (4 hours) (for **ike rekey**)

Command History

Release	Modification
17.2	Command introduced.

Examples

Change the rekeying interval for IKE key exchanges to 7 days:

```
vEdge(config) # vpn 1 interface ipsec1 ike rekey-interval 604800
```

Operational Commands

clear ipsec ike sessions

request ipsec ike-rekey request ipsec ipsec-rekey

show ipsec ike inbound-connections

show ipsec ike outbound-connections

show ipsec ike sessions

remote-as

vpn router bgp neighbor remote-as—Configure AS number of the remote BGP peer (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► BGP

Command Hierarchy

```
vpn vpn-id
router
  bgp local-as-number
  neighbor ip-address
  remote-as remote-as-number
```

Syntax Description

remote-as	Remote AS Number:
as-number	AS number of the remote BGP peer.

Release Information

Release	Modification
14.1	Command introduced.

Examples

Set the remote AS number to 456:

```
vpn 1
router bgp 123
neighbor 18.72.0.3
remote-as 456
```

Operational Commands

show bgp neighbor

replay-window

vpn interface ipsec ipsec replay-window—Modify the size of the IPsec replay window on an IPsec tunnel that is being used for IKE key exchange (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface IPsec

Command Hierarchy

```
vpn vpn-id
  interface ipsecnumber
  ipsec
    replay-window number
```

Syntax Description

number	Replay Window Size:
	Size of the sliding replay window.
	Values: 64,128, 256, 512, 1024, 2048, 4096 packets
	Default: 512 packets

Command History

Release	Modification
17.2	Command introduced.

Examples

Change the size of the IPsec replay window to 1024 packets:

```
vEdge(config) # vpn 1 interface ipsec1 ipsec
vEdge(ipsec) # replay-window 1024
```

Operational Commands

```
show ipsec local-sa
show security-info
clear ipsec ike sessions
show ipsec ike inbound-connections
show ipsec ike outbound-connections
show ipsec ike sessions
```

Related Topics

ike, on page 239

replay-window

security ipsec replay-window—Modify the size of the IPsec replay window (on vEdge routers only).

Command Hierarchy

```
security
ipsec

```

Syntax Description

ze:
replay window.
6, 512, 1024, 2048, 4096 packets
ts

Release Information

Release	Modification
14.1	Command introduced.

Examples

Change the replay window size to 1024:

```
security
ipsec
replay-window 1024
```

Operational Commands

show ipsec local-sa show security-info

replicator-selection

vpn router pim replicator-selection— Allow vEdge routers to use different replicators for the same multicast group (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► PIM

```
vpn vpn-id
  router
  pim
    replicator-selection (random | sticky)
```

(random	How Replicator Is Chosen:
sticky)	Determine how the replicator for a multicast group is chosen:
	• random—Choose the replicatorat random.
	• sticky—Always use the same replicator. This is the default.

Command History

Release	Modification
14.3	Command introduced.

Operational Commands

show multicast replicator

show multicast rpf

show multicast topology

show multicast tunnel

show pim interface

show pim neighbor

respond-to-ping

vpn interface nat respond-to-ping—Have a vEdge router that is acting as a NAT device respond to ping requests to the NAT interface's IP address that are received from the public side of the connection (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface Cellular (for vEdge cellular wireless routers only)

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface NAT Pool

Configuration ► Templates ► VPN Interface PPP

```
vpn vpn-id
  interface interface-name
  nat
    respond-to-ping
```

None

Command History

Release	Modification
15.4	Command introduced.

Examples

Configure a vEdge router acting as a NAT so that it responds to ping requests from the WAN:

```
vEdge# config
vEdge(config)# vpn 1 interface ge0/4 nat respond-to-ping
vEdge(config-nat)# show full-configuration
vpn 1
  interface ge0/4
   nat
     respond-to-ping
!
!
```

Operational Commands

show ip nat filter

show ip nat interface

show ip nat interface-statistics

retransmit-interval

vpn router ospf area interface retransmit-interval—Set the interval at which the router retransmits OSPF link-state advertisements (LSAs) to its adjacencies (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► OSPF

```
vpn vpn-id
  router
   ospf
    area number
    interface interface-name
       retransmit-interval seconds
```

```
| seconds | Retransmit Interval:
| Time interval at which the OSPF retransmits LSAs to its neighbors.
| Range: 1 through 65535 seconds
| Default: 5 seconds
```

Command History

Release	Modification
14.1	Command introduced.

Examples

Set the LSA retransmission interval to 10 seconds:

```
vEdge# show running-config vpn 1 router ospf area 0
vpn 1
router
  ospf
  area 0
    interface ge0/0
     retransmit-interval 10
    exit
  exit
!
!
!
```

Operational Commands

show ospf interface

rewrite-rule

rewrite-rule—Configure a rewrite rule to overwrite the DSCP field of a packet's outer IP header, mark transit traffic with an 802.1p CoS value, and apply a rewrite rule on an interface (on vEdge routers only). A rewrite rule is applied to packets being transmitted out the interface.

You can apply rewrite rules to both unicast and multicast traffic.

vManage Feature Template

For vEdge routers only:

Configuration ► Policies ► Localized Policy

Configuration ► Templates ► VPN Interface Cellular (for vEdge cellular wireless routers only)

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface GRE

Configuration ► Templates ► VPN Interface PPP

Configuration ► Templates ► VPN Interface PPP Ethernet

Command Hierarchy

Create a Rewrite Rule

```
policy
  rewrite-rule rule-name
    class class-name loss-priority dscp dscp-value layer-2-cos number
```

Apply a Rewrite Rule on an Interface

```
vpn vpn-id
  interface interface-name
   rewrite-rule rule-name
```

Syntax Description

layer-2-cos	Class-of-Service Value:
number	Number of an 802.1p CoS value to use to mark transit traffic.
	Range: 0 through 7
dscp dscp-value	DSCP Value:
	Assign a DSCP value to transit traffic.
	Range: 0 through 63
class class-name	Forwarding Class Name:
	Name of the forwarding class.
loss-prioritye	Loss Priority:
	Packet loss priority (PLP) for the forwarding class.
	Values: high, low
rule-name	Rewrite Rule Name:
	Name of the QoS map. It can be a text string from 1 through 32 characters long. When you apply a rewrite rule to an interface, the name must match one that you specified when you created the rule with the policy rewrite-rule configuration command.

Note

Cisco IOS XE SD-WAN supports maximum of 64 entries only per rewrite rule.

Command History

Release	Modification	
14.1	Command introduced.	
16.3	Added support for multicast traffic.	

Release	Modification
18.3	Added support for Layer 2 class of service (CoS).

Examples

Create a rewrite rule, and apply it to an interface:

```
vEdge(config) # show config
rewrite-rule transport
class afl low dscp 3
class afl high dscp 4
class af2 low dscp 5
class af2 high dscp 6
class af3 low dscp 7
class af3 high dscp 8
class be low dscp 1
class be high dscp 2
vpn 0
interface ge0/0
 ip-address 10.1.15.15/24
 tunnel-interface
 no shutdown
 rewrite-rule transport
```

Operational Commands

show running-config policy show running-config vpn

route-consistency-check

system route-consistency-check—Check whether the IPv4 routes in the router's route and forwarding tables are consistent (on vEdge routers only). Performing route consistency checks is useful when you are troubleshooting routing and forwarding problems. However, the checking requires a large amount of device CPU, so it is recommended that you enable it only when you trouble shooting an issue and that you disable it at other times.

By default, route consistency checking is disabled.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► System

```
system
route-consistency-check
```

None

Command History

Release	Modification
17.1	Command introduced.

Examples

Enable route-consistency checking:

vEdge(config) # system route-consistency-check

Operational Commands

show ip fib

show ip routes

Related Topics

ip route, on page 270 ipv6 route, on page 278

route-export

To export routes from the transport VPN to service VPNs and vice-versa use the **route-export** command in VPN configuration mode.

route-export { bgp | connected | ospf | static } [route-policy policy-name]

Syntax Description

bgp	Leaks BGP routes into the selected VPN
connected	Leaks connected routes into the selected VPN
ospf	Leaks OSPF routes into the selected VPN
static	Leaks static routes into the selected VPN
route-policy policy-name	Filters the leaked routes based on the policy selected

Command History

Release	Modification
Cisco SD-WAN Release 20.3.1	Command introduced.

```
Device# config
Device(config)# vpn 1
Device(config-vpn-1)# route-export bgp route-policy policy-name
```

route-import

To configure route leaking between the transport VPN and service VPNs use the **route-import** command in SD-WAN configuration mode.

route-import	{ bgp	connected	ospf	static }	[route-policy	policy-name]
--------------	-------	-----------	------	----------	---------------	--------------

Syntax Description

bgp	Leaks BGP routes into the selected VPN
connected	Leaks connected routes into the selected VPN
ospf	Leaks OSPF routes into the selected VPN
static	Leaks static routes into the selected VPN
route-policy policy-name	Filters the leaked routes based on the policy selected

Command History

Release	Modification
Cisco SD-WAN Release 20.3.1	Command introduced.

```
Device# config
Device(config)# vpn 1
Device(config-vpn-1)# route-import bgp route-policy policy-name
```

route-import-service (for route leak)

To enable route leaking between the service VPNs, use the **route-import-service** command in VPN configuration mode. To disable the configurations, use the **no** form of this command.

route-import-service from vpn vpn-id { bgp | connected | ospf | static } route-policy policy-name no route-import-service from vpn vpn-id { bgp | connected | ospf | static } route-policy policy-name

Syntax Description

from	The source from which the routes are leaked.	
vpn vpn-id	Specify the VPN ID from which the routes are imported.	
bgp	Leaks BGP routes into the selected VPN.	
connected	Leaks connected routes into the selected VPN.	

ospf	Leaks OSPF routes into the selected VPN.
static	Leaks static routes into the selected VPN.
route-policy policy-name	Filters the leaked routes based on the policy selected.

Command Default

Access for the services shared from the source VPN is disabled.

Command Modes

VPN configuration (config-vpn-vpn-id)

Command History

Release	Modification
Cisco SD-WAN Release 20.9.1	This command was introduced.

Usage Guidelines

Route replication creates a link to a route in a routing information base (RIB) that is in a different VPN.

Examples

The following command shows how to enable route leaking on Cisco vEdge devices using the **route-import-service** command:

Device(config) # vpn 102

Device(config-vpn-102) # route-import-service from vpn 101 static route-policy VPN101_TO_VPN102

route-map

To define the conditions for redistributing routes from one routing protocol into another routing protocol, or to enable policy routing, use the **route-map** command in global configuration mode and the **match** and **set** commands in route-map configuration modes.

route-map name name [deny | description | match | ordering-seq sequence-number | permit | set]

no route-map name name

Syntax Description

name	Specifies the name of the route map.	
deny	(Optional) Blocks routes matching the route map from being forwarded or redistributed.	
description	(Optional) Describes the route-maps that are redistributed.	
match	Redistributes routes in the routing table that matches the specified tags.	
ordering-seq	(Optional) Orders the route maps based on the string provided.	
sequence-number	(Optional) Number that indicates the position a new route map will have in the list of route maps already configured with the same name.	
permit	(Optional) Permits only routes matching the route map to be forwarded or redistributed.	
set	(Optional) Sets routes to match the route map from being forwarded or redistributed.	

Command Default

Route-map is not enabled and conditions for redistributing routes from one routing protocol into another routing protocol are not configured.

Command Modes

Global configuration (config)

Command History

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	This command was added.

Usage Guidelines

The route maps are used when distributing the routes into the RIP, EIGRP or OSPF routing process. The route map defines which of the routes from a specified routing protocol that are allowed to be redistributed into a target routing process. Each **route-map** command has a list of **match** and **set** commands associated with it. The **match** and **set** route-map configuration commands define the conditions for redistributing routes from one routing protocol into another. The **match** commands specify the *match criteria*—the conditions under which redistribution is allowed for the current **route-map**command. The **set** commands specify the *set* actions—the particular redistribution actions to perform if the criteria enforced by the **match** commands are met.

When you are passing routes through a route map, a route map can have several parts. Any route that does not match at least one **match** clause relating to a **route-map** command will be ignored; that is, the route will not be advertised for outbound route maps and will not be accepted for inbound route maps. If you want to modify only some data, you must configure a second route map section with an explicit match specified.

Example

This example shows how to set the autonomous system path to match BGP autonomous system path access list 20:

```
Device(config) # router bgp 10
Device(config) # route-map bgp1
Device(config-route-map) # match as-path 20
```

The following example redistributes Routing Information Protocol (RIP) routes with a hop count equal to 1 into OSPF. These routes will be redistributed into OSPF as external link-state advertisements (LSAs) with a metric of 5, metric type of type 1, and a tag equal to 1.

```
Device(config) # router ospf 109
Device(config-router) # redistribute rip route-map rip-to-ospf
Device(config-router) # exit
Device(config) # route-map rip-to-ospf permit
Device(config-route-map) # match metric 1
Device(config-route-map) # set metric 5
Device(config-route-map) # set metric-type type1
Device(config-route-map) # set tag 1
```

route-policy

policy route-policy—Configure or apply a localized control policy (on vEdge routers only). For BGP, you apply the policy to an address family running on a specific BGP neighbor. For OSPF, you can apply the policy either to specific types of routes being redistributed into OSPF or to all inbound traffic.

vManage Feature Template

For vEdge routers only:

Configuration ► Policies ► Localized Policy

Configuration ► Templates ► OSPF

Command Hierarchy

Create a Localized Control Policy

```
route-policy policy-name
 default-action action
 sequence number
   match
     address list-name
     as-path list-name
     community list-name
     ext-community list-name
     local-preference number
     metric number
     next-hop list-name
     omp-tag number
     origin (egp | igp | incomplete)
     ospf-tag number
     peer address
   action
     reject
     accept
       set.
         aggregator number
         as-path (exclude | prepend) as-number
         atomic-aggregate
         community value
         local-preference number
         metric number
         metric-type (type1 | type2)
         next-hop ip-address
         omp-tag number
         origin (egp | igp | incomplete)
         originator ip-address
         ospf-tag number
         weight number
```

Apply a Localized Control Policy To BGP

```
vpn vpn-id
  router
  bgp local-as-number
  neighbor address
  address-family ipv4-upcast
      route-policy policy-name (in | out)
```

Apply a Localized Control Policy To OSPF

```
vpn vpn-id
  router
  ospf
    redistribute route-type route-policy policy-name
  route-policy policy-name in
```

Syntax Description

policy-name	Control Policy Name:
	Name of the localized control policy to configure or apply to a BGP neighbor or to OSPF. <i>policy-name</i> can be up to 32 characters long.
in, out Direction To Apply Policy:	
	Apply the policy to routes coming in to the router or being sent out of the router. For BGP, the policy can be applied to incoming or outgoing routes. For OSPF, the policy is apply to routes coming from OSPF neighbors. Use the OSPF redistribute command to apply policy to outgoing routes.

Command History

Release	Modification
14.1	Command introduced.
15.4	Added support for configuring route policy on all OSPF inbound routes (route-policy in).

Operational Commands

show ip routes detail show running-config

Related Topics

```
policy, on page 384 redistribute, on page 422
```

router

Configure the BGP, OSPF, and PIM routing protocol to run in a VPN (on vEdge routers only). You can configure BGP and OSPF routing protocols in all VPNs except for VPN 512, which is the management VPN. You can configure PIM in all VPNs except for VPN 0, which is the transport VPN reserved for the control plane, and VPN 512.

Command Hierarchy

```
vpn vpn-id
  router
  bgp ...
  igmp ...
  multicast-replicator local [threshold number]
  ospf ...
  pim ...
  ...
```

Command History

Release	Modification
14.1	Command introduced.
14.2	PIM and multicast added.
14.3	IGMP added.

Examples

Enable OSPF in VPN 1

```
Device# show running-config vpn 1 router ospf
vpn 1
router
ospf
timers spf 200 1000 10000
redistribute static
redistribute omp
area 0
interface ge0/4
exit
exit
!
```

The following example shows the OSPFv3 configuration

```
router ospfv3 1
!
address-family ipv4 unicast vrf vrf1
passive-interface int1
```

Operational Commands

show pim neighbor

router-id

Configure the OSPF router ID, which is the IP address associated with the router for OSPF adjacencies (on vEdge routers only).

Command Hierarchy

```
vpn vpn-id
  router
   ospf
    router-id ipv4-address
```

Syntax Description

pv4-address	OSPF Router ID:
	Configure the OSPF router ID as an IPv4 address, in decimal four-part dotted notation. The router ID can be used when electing the OSPF designated router (DR). if there is a tie in the router priority values, the node with the highest router ID becomes the DR or the backup DR. If you have configured a system IP address, that address is used for the OSPF router ID. If you configure a OSPF router ID that differs from the system IP address, the router ID takes precedence.

Command History

Release	Modification
14.1	Command introduced.

Examples

Configure the router ID for OSPF adjacencies in VPN 1

```
pn 1
  router
   ospf
   router-id 172.16.255.11
```

Operational Commands

show ospf process

Related Topics

```
priority, on page 400 system-ip, on page 478
```

router-id

Configure the BGP router ID, which is the IP address associated with the router for BGP sessions (on vEdge routers only).

vManage Feature Template

For all vEdge routers only:

Configuration ► Templates ► BGP

Command Hierarchy

```
vpn vpn-id
  router
  bgp local-as-number
    router-id ip-address
```

Syntax Description

router-id ip-address	BGP Router ID:]
	Configure the BGP router ID as an IPv4 address, in decimal four-part dotted notation. If you have configured a system IP address, that address is used for the BGP router ID. If you configure a BGP router ID that differs from the system IP address, the router ID takes precedence.).	

Command History

Release	Modification
14.1	Command introduced.

Examples

Configure the router ID for BGP sessions in VPN 1

```
vpn 1
  router
  bgp 123
    router-id 75.0.0.1
```

Operational Commands

show bgp summary

system-ip, on page 478

secret

To configure the secret key for Umbrella registration, on Cisco IOS XE Catalyst SD-WAN devices, use the **secret** command.

secret 0 secret

Syntax Description

secret	Secret key (hexadecimal).
--------	---------------------------

Command Mode

config-profile

Command History

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.2.1r	This command was introduced.

Examples

Use **parameter-map type umbrella global** to enter config-profile mode, then use **orgid**, **api-key**, and **secret** to configure Umbrella registration.

In config-profile mode, you can use **show full-configuration** to display Umbrella registration details.

Example

This example configures Umbrella registration details.

```
Device(config) # parameter-map type umbrella global
Device(config-profile) # orgid 1234567
Device(config-profile) # api-key aaa12345aaa12345aaa12345
Device(config-profile) # secret 0 bbb12345bbb12345bbb12345bbb12345
```

security

To configure security parameters on routers, Cisco vManage, and Cisco vSmart Controllers, use the use the **security** command in global configuration mode.

security

Syntax Description

None

Command Modes

Global configuration (config)

Command History

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.2.1v	Command qualified for use in Cisco SD-WAN Manager CLI templates.

Examples

The following example shows how to configure the security for a router.

```
Router(config)# security
```

send-community

Send the local router's BGP community attribute to the BGP neighbor (on vEdge routers only).

This feature is disabled by default. If you have configured it, use the **no send-community** command to return to the default.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► BGP

Command Hierarchy

```
vpn vpn-id
  router
  bgp local-as-number
   neighbor ip-address
   send-community
```

Command History

Release	Modification
14.1	Command introduced.

Examples

Configure the local vEdge router to send the BGP community attribute to its BGP neighbor

```
vEdge# show running-config vpn 1 router bgp neighbor 1.10.10.10
vpn 1
router
bgp 123
neighbor 1.10.10.10
no shutdown
remote-as 456
send-community
!
!
!
!
!
```

Operational Commands

show bgp neighbor

send-ext-community

Send the local router's BGP extended community attribute to the BGP neighbor (on vEdge routers only). This feature is disabled by default. If you enable it, use the **no send-ext-community** configuration command to disable it.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► BGP

Command Hierarchy

```
vpn vpn-id
  router
  bgp local-as-number
  neighbor ip-address
  send-ext-community
```

Command History

Release	Modification
14.1	Command introduced.

Examples

Configure the local vEdge router to send the BGP extended community attribute to its BGP neighbor

```
vm1# show running-config vpn 1 router bgp neighbor 1.10.10.10
vpn 1
router
bgp 123
   neighbor 1.10.10.10
    no shutdown
    remote-as 456
    send-ext-community
```

Operational Commands

show bgp neighbor

send-path-limit

Configure the maximum number of equal-cost routes that are advertised per prefix (on vSmart controllers and vEdge routers only).

Command Hierarchy

```
omp
  send-path-limit number
```

Syntax Description

send-path-limit Number of Routes:

number

Maximum number of equal-cost routes that a Cisco vEdge device advertises to a Cisco SD-WAN Controller or that a Cisco SD-WAN Controller redistributes to Cisco vEdge devices. More exactly, a route is a route-TLOC tuple. (Each TLOC consists of an IP address, color, and encap type.) Each Cisco vEdge device can have up to four WAN interfaces and hence can advertise up four route–TLOC tuples for each route.

Beginning with Cisco Catalyst SD-WAN Control Components Release 20.8.x, for a Cisco SD-WAN Controller operating within a Hierarchical SD-WAN architecture, the controller can provide up to 32 routes to edge devices. When an edge device installs the routes, it uses the OMP algorithm to select the best 16 routes, and forwards traffic on those routes.

Range: 1 to 16 routes in most Cisco Catalyst SD-WAN overlay networks. For a Cisco SD-WAN Controller operating within a Hierarchical SD-WAN architecture, the range is 1 to 32.

Default: 4

Command History

Release	Modification
14.2	Command introduced.
15.2	Maximum number of routes increased to 16.
Cisco SD-WAN Controller, Cisco Catalyst SD-WAN Control Components Release 20.8.x	Increased the route limit to 32 when used for a Cisco SD-WAN Controller operating within a Hierarchical SD-WAN architecture.

Operational Commands

show omp routes

sense level

To specify the alert level for port-scanning detection, use the **sense level** command in United Threat Defense (UTD) multitenancy threat configuration mode or UTD single-tenancy threat configuration mode.

sense level { low | medium | high }

no sense level

Syntax Description

low	Generates alerts only on error packets sent from the target host. Because of the nature of error responses, the low alert level should see very few false positives.
	When the sense level is low , the metadata is valid for a short span after which it is reset. Network Mapper (Nmap) has an option for running slow port scans that can take longer to execute. If the sense level is low , slower Nmap scans may not be detected.
medium	Tracks connection counts and generates filtered scan alerts. The medium alert level may generate false positives on active hosts (Network Address Translation [NATs], proxies, and Domain Name System [DNS] caches).
high	Tracks hosts on a network using a time window to evaluate port-scanning statistics for that host. A high setting can identify some of the slow scans because of continuous monitoring, but is sensitive to active hosts.
	Note When the sense level is set to high , false positives may be generated.

Command Default

If you do not configure the **sense level** command, or you use the **no** form of the command, sense level is configured as **low** by default.

Command Modes

UTD multitenancy threat configuration mode (utd-mt-threat)

UTD single-tenancy threat configuration mode (utd-eng-std)

Command History

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	This command was introduced.
Cisco vManage Release 20.4.1	

Usage Guidelines

Port-scanning detection must be enabled prior to specifying the alert level.

For more information on enabling port-scanning detection, see the port-scan command.

Examples

The following examples show how to set the different port-scanning alert levels in UTD multi-tenancy threat configuration mode:

```
Device(config)# utd engine standard multi-tenancy
Device(config-utd-mt-threat)# port-scan
Device(config-utd-threat-port-scan)# sense level low

Device(config)# utd engine standard multi-tenancy
Device(config-utd-mt-threat)# port-scan
Device(config-utd-threat-port-scan)# sense level medium

Device(config)# utd engine standard multi-tenancy
Device(config-utd-mt-threat)# port-scan
Device(config-utd-mt-threat)# sense level high
```

The following examples show how to set the different port-scanning alert levels in UTD single-tenancy threat configuration mode:

```
Device(config) # utd engine standard

Device(config-utd-eng-std) # threat-inspection

Device(config-utd-engstd-insp) # port-scan

Device(config-utd-threat-port-scan) # sense level low

Device(config) # utd engine standard

Device(config-utd-eng-std) # threat-inspection

Device(config-utd-engstd-insp) # port-scan

Device(config-utd-threat-port-scan) # sense level medium

Device(config) # utd engine standard

Device(config-utd-eng-std) # threat-inspection

Device(config-utd-engstd-insp) # port-scan

Device(config-utd-engstd-insp) # port-scan

Device(config-utd-threat-port-scan) # sense level high
```

The following is sample alert output:

```
2019/10/21-16:22:36.299733 UTC [**] [Hostname: 192.0.2.1] [**] [Instance_ID: 2] [**] Alert [**] [116:401:1] snort_decoder: WARNING: Nmap XMAS Attack Detected [**] [Classification: Attempted Information Leak] [Priority: 2] [VRF: 3] {TCP} 198.51.100.9:33108 -> 203.0.113:2008  
2019/10/07-18:04:15.926169 UTC [**] [Hostname: 192.0.2.5] [**] [Instance_ID: 1] [**] Alert [**] [116:423:2] snort_decoder: WARNING: TCP has no SYN, ACK, or RST [**] [Classification: Misc activity] [Priority: 3] [VRF: global] {TCP} 192.0.2.5:47519 -> 192.0.2.240:35533
```

service

Configure a service, such as a firewall or IDS, that is present on the local network in which the router is located. Configuring a service allows it to be used in a service chaining policy. You can configure services in all VPNs except for VPN 0, which is the transport VPN reserved for the control plane.

vManage Feature Template

Configuration ► Templates ► VPN

Command Hierarchy

For Cisco vEdge devices:

```
vpn vpn-id
  service service-name address ip-address
vpn vpn-id
  service service-name interface grenumber1 [grenumber2]
```

For Cisco IOS XE Catalyst SD-WAN devices:

sdwan

```
service service-name vrf vrf-id
[[no] track-enable]
ipv4 address ip-address [ip-address]...
```

Syntax Description

service-name	Type of Service
	Type of service available at the local site and in the VPN. Standard services are firewall, IDS, and IDP. Four custom services are available.
	Values:FW, IDP, IDS, netsvc1, netsvc2, netsvc3, netsvc4, TE
address ip-address	Location of Service
interfacegre number1 [gre number2]	IP address of the the service device, or GRE interface through which the service is reachable. You can specify up to four IP address. The service is advertised to the vSmart controller only if the address (or one of the addresses) can be resolved locally, at the local site, and not via routes learned through OMP. When configuring a GRE tunnel, specify the names of one or two GRE interfaces. If you configure two, the first interface is the primary GRE tunnel, and the second is the backup tunnel. All packets are sent only to the primary tunnel. If that tunnel fails, all packets are then sent to the secondary tunnel. If the primary tunnel comes back up, all traffic is moved back to the primary GRE tunnel.

[no] track-enable	(optional) Cisco Catalyst SD-WAN tests each service device periodically to check whether it is operational. Tracking saves the results of the periodic tests in a service log.
On a Cisco IOS XE Catalyst SD-WAN device, this can be viewed usin platform software sdwan tracker.	
	On a Cisco vEdge device, debug transport event level high enables tracking the debug logs and copies the logs to the debug file. You can view this file using the show log <i>filename</i> command.
	Tracking is enabled by default. Including no track-enable disables tracking. After disabling tracking, you can use track-enable to re-enable tracking.
ipv4 address ip-address	Specify one or more IPv4 addresses of the service device, separated by spaces. Minimum: 1 address per service Maximum: 4 addresses per service

Command History

Release	Modification
14.1	Command introduced.
14.2	Configured IP address of the service resolved locally.
15.4.1	Support for GRE interfaces added.
17.2.0	Support for traffic engineering (TE) service added.
Cisco IOS XE Catalyst SD-WAN Release 17.3.1a Cisco SD-WAN Release 20.3.1	Added support for Cisco IOS XE Catalyst SD-WAN devices. Added track-enable keyword to enable tracking the status of a devices that provide services used in a service chaining policy.

Usage Guidelines

Configuration using the service command makes a service device available to a device managed by Cisco Catalyst SD-WAN. A control policy is required to send traffic to the service device. For information about configuring control policies to direct traffic to service devices, see the Policies configuration guide.

The workflow is:

- 1. Configure a service device to provide a network service, such as a firewall. The service device can be a Cisco or non-Cisco device, and does not have to be managed by Cisco Catalyst SD-WAN.
- 2. On a device managed by Cisco Catalyst SD-WAN, configure access to the service device.
- **3.** On the device managed by Cisco Catalyst SD-WAN, apply a traffic policy that routes specific traffic to the service device.

Examples

Configure a firewall service that is available in VPN 1

```
vpn 1
  service FW address 10.0.2.11
```

Configuring Firewall Service Insertion for a Cisco vEdge Device

The following example configures a Cisco vEdge device to use a firewall service on a device in VPN 10. The device operating the firewall service has the address 10.0.2.1. In this example, tracking the service device status is enabled by default. The example shows the configuration, followed by the **show running-config vpn** output.

```
vEdge(config) # vpn 10
vEdge(config-vpn-1) # service FW address 10.0.2.1
vEdge (config-service-FW) #commit
vEdge# show running-config vpn 10
vpn 10
  service FW
     address 10.0.2.1
Use no track-enable to disable tracking.
vEdge(config) # vpn 10
vEdge(config-vpn-1) # service FW
vEdge (config-service-FW) # no track-enable
vEdge# show running-config vpn 10
vpn 10
  service FW
    no track-enable
     address 10.0.2.1
```

Configuring Firewall Service Insertion for a Cisco IOS XE Catalyst SD-WAN Device

The following example configures a Cisco IOS XE Catalyst SD-WAN device to use a firewall service on a device in VRF 10. The device operating the firewall service has two addresses: 10.0.2.1 and 10.0.2.2. Tracking is enabled by default. The example shows the configuration, followed by the **show sdwan running-config sdwan** output.

```
ISR4451(config) # sdwan
ISR4451(config-sdwan) # service firewall vrf 10
ISR4451(config-vrf-10) # ipv4 address 10.0.2.1 10.0.2.2
ISR4451(config-vrf-10) # commit

ISR4451# show sdwan running-config sdwan
sdwan
service firewall vrf 10
ipv4 address 10.0.2.1 10.0.2.2

Use no track-enable to disable tracking.

ISR4451# show sdwan running-config sdwan
sdwan

ISR4451# show sdwan running-config sdwan
sdwan
```

service firewall vrf 10 no track-enable ipv4 address 10.0.2.1 10.0.2.2

service-insertion appnav-controller-group appqoe

To configure a service controller inside a service controller group, use the **service-insertion appnay-controller-group appqoe** command in global configuration mode.

To remove the service controller configuration, use the **no** form of this command.

service-insertion appnav-controller-group appqoe group-name [appnav-controller ipv4-address [vrf vrf-id] | description | description | appnav-controller ipv4-address | vrf vrf-id]]

no service-insertion appnav-controller-group appqoe

Syntax Description

group-name	Specifies the name of the AppQoE service-controller-group that the service controller is being configured under
appnav-controller ipv4-address	Specifies the IPv4 address of the AppQoE service controller
vrf vrf-id	Specifies the ID of the VRF to which this configuration is being applied.
description description	Provides a description for the AppQoE controller.

Command Default

No service controller is configured.

Command Modes

Global configuration (config)

Command History

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	Command modified to enable applying the service-insertion configuration to a VRF.

Usage Guidelines

For the **service-insertion appnav-controller-group appqoe** configuration to take effect, you must create a VRF and configure interface VirtualPortGroup first.

Examples

The following example shows how to configure a service controller inside a controller group and connect service nodes to the controller:

config-transaction

```
vrf definition 200
interface VirtualPortGroup2
no shutdown
ip address 192.168.2.1 255.255.255.0
service-insertion appqoe
service-insertion appnav-controller-group appqoe ACG-APPQOE
appnav-controller 198.51.100.1 vrf 200
service-insertion service-node-group appqoe SNG-APPQOE
service-node 192.0.2.2
service-node 192.0.2.3
service-node 192.0.2.4
service-node 192.0.2.5
service-insertion service-context appqoe/1
appnav-controller-group ACG-APPQOE
service-node-group SNG-APPQOE
cluster-type service-controller
enable
vrf default
```

service-insertion service-node-group appqoe

To configure a supported device as an external AppQoE service node, use the **service-insertion service-node-group appqoe** command in global configuration mode.

To remove the service node configuration, see the **no** form of this command.

service-insertion service-node-group appqoe group-name [description description] [device-role service-node] [node-discovery enable] [service-node ipv4-address]

no service-insertion service-node-group appqoe

Syntax Description

group-name Specifies the name of the appqoe service-node-group that the service being configured under	
device-role service-node (Optional) Configures the supported device with the service-node role	
node-discovery enable (Optional) Enables discovery for the service node	
service-node ipv4-address	(Optional) Specifies the IPv4 address of the service node

Command Modes

Global configuration (config)

Command History

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	Command modified. Support was added for the keywords device-role service-node , which enables you to configure a device as an external service node.

Usage Guidelines

The parameters after **service-insertion service-node-group appqoe** group-name are optional and can be entered in any order.

Examples

The following example shows how to configure a service node in a service node group.

set ip next-hop verify-availability

To configure policy routing to verify the reachability of a single or multiple IPv4 or IPv6 next hops of a policy map before the router performs policy routing to the next hops, use the **set ipv4 next-hop verify-availability** or **set ipv6 next-hop verify-availability** commands respectively in the policy-map class mode.

To disable this feature, use the **no** form of this command

```
set [ ipv4 | ipv6 ] [ vrf vrf-name | global ] next-hop verify-availability [ ip-address ... [ ip-address ] ]
[ nhop-address sequence track object-number ]
no [ ipv4 | ipv6 ] [ vrf vrf-name | global ] next-hop verify-availability [ ip-address ... [ ip-address ] ]
[ nhop-address sequence track object-number ]
```

Syntax Description

vrf vrf-name	Specifies that the next hop reachability should be verified for a specific VRF.	
global	Specifies that the next hop reachability should be verified at a global level	
ip-addresses	Specifies a single or multiple next hops addresses to verify their reachability	
nhop-address	Specifies a single next hop address to verify its reachability	
sequence	Specifies the sequence to be inserted into the next-hop list. The range is from 1 to 65535.	
track	Sets the next hop depending on the state of a tracked object.	
object-number	Specifies tracked object number. The range is from 1 to 1000.	

Command Default

This command s disabled by default.

Command Modes

Policy-map class configuration (config-pmap-c)

Command History

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	This command was introduced.

Usage Guidelines

Use this command to enable policy routing to verify the reachability of a single or multiple IPv4 or IPv6 next hop addresses. This command can be configured globally or for a vrf. The options after **set [ipv4|ipv6] next-hop verify-availability** can be configured in any order.

An ellipsis (...) in the command syntax indicates that your command input can include multiple values for the ip-address argument

Example

The following example shows how to verify the availability of an IPv4 next hop address, and enable tracker for the address.

```
Device(config) # class-map match-any test100

Device(config-cmap) # match acess-group name test100

Device(config-cmap) # policy-map type epbr 1

Device(config-pmap) # class test300

Device(config-pmap-c) # set ipv4 vrf 300 next-hop verify-availability 10.10.0.2 10 track 2

The following example shows how to verify the availability of an IPv6 next hop address and enable tracker for the address.

Device(config) # class-map match-any test100_v6

Device(config-cmap) # match acess-group name test100_v6

Device(config-pmap) # class test300_v6

Device(config-pmap) # class test300_v6

Device(config-pmap-c) # set ipv6 vrf 300 next-hop verify-availability 2001:DB8::1 10 track
```

set platform software trace

To configure the binary trace level for one or all modules of a Cisco SD-WAN process on a specific hardware slot, issue the command **set platform software trace** in the Privileged EXEC mode.

set platform software trace process slot module level

Syntax Description

process Specify a Cisco SD-WAN process.

For the list of Cisco SD-WAN processes for which binary trace is supported see the table 'Supported Cisco SD-WAN Daemons' under 'Usage Guidelines'.

level Hardware slot from which process messages must be logged.

module Configure the trace level for one or all the modules of the process.

slot Select one of the following trace levels:

• debug: Debug messages

• emergency: Emergency possible message

• error: Error messages

• info: Informational messages

• noise: Maximum possible message

• notice: Notice messages

• verbose: Verbose debug messages

• warning: Warning messages

Command Default

Notice level

Command Modes

Privileged EXEC

Command History

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	Command support introduced for select Cisco SD-WAN processes. See the table 'Supported Cisco SD-WAN Daemons' under 'Usage Guidelines'.
Cisco IOS XE Catalyst SD-WAN Release 17.11.1a	New parameters are introduced for better binary configuration.

Usage Guidelines

Table 10: Supported Cisco SD-WAN Daemons

Cisco SD-WAN Daemons	Supported from Release
• fpmd	Cisco IOS XE Catalyst SD-WAN Release 17.4.1a
• ftm	
• ompd	
• vdaemon	
• cfgmgr	

Example

In the following example, the binary trace level for the 'config' module of the 'fpmd' process on the 'RP active' FRU is set to 'debug'.

Device# set platform software trace fpmd RP active config debug

shaping-rate

Configure the aggregate traffic rate on an interface to be less than line rate so that the interface transmits less traffic than it is capable of transmitting (on vEdge routers only). The interface cannot be a VLAN interface (subinterface).

Shaping rate below 2M is not supported on the following Cisco vEdge devices: Cisco vEdge100b, Cisco vEdge100m, Cisco vEdge 1000, and Cisco vEdge 2000.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface Cellular (for vEdge cellular wireless routers only)

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface GRE

Configuration ► Templates ► VPN Interface PPP Ethernet

Command Hierarchy

```
vpn vpn-id
  interface interface-name
  shaping-rate kbps
```

Syntax Description

kbps	Traffic Shaping Rate:		
	Rate at which to transmit traffic, in kilobits per second (kbps).		
	Range: 0 through the maximum interface speed		

Command History

Release	Modification
14.1	Command introduced.
17.1	Starting with this release, you can no longer configure shaping-rate on a VLAN interface

Examples

Limit the maximum amount of traffic that an interface can transmit

```
vEdge# show running-config vpn 0 interface ge0/0
vpn 0
interface ge0/0
ip address 10.1.15.15/24
tunnel-interface
color lte
```

```
allow-service dhcp
allow-service dns
allow-service icmp
no allow-service sshd
no allow-service ntp
no allow-service stun
!
no shutdown
shaping-rate 100000
!
```

Operational Commands

show running-config vpn

shutdown

Disable a parameter or property. The **no** form of the command enables a parameter or property.

vManage Feature Template

For all vEdge devices:

Instances of the shutdown and no shutdowncommand appear in multiple configuration templates.

Command Hierarchy

Instances of the **shutdown** and **no shutdown** command appear throughout the configuration command hierarchy on vEdge devices.

Command History

Release	Modification
14.1	Command introduced.

Examples

This example enables four interfaces and VPN 0 by including the no shutdown command in the configuration

```
vEdge# show running-config vpn 0
vpn 0
interface ge0/0
ip address 10.1.16.16/24
tunnel-interface
color lte
allow-service dhcp
allow-service icmp
no allow-service sshd
no allow-service stun
```

```
! no shutdown ! interface ge0/1 ip address 10.1.18.16/24 no shutdown ! interface ge0/2 shutdown ! interface ge0/3 ip address 10.0.21.16/24 no shutdown ! interface ge0/7 ip address 10.0.100.16/24 no shutdown ! interface ge0/7 ip address 10.0.100.16/24 no shutdown ! ip route 0.0.0.0/0 10.1.16.13
```

The IF OPER STATUS column in the show interface command output reports that **ge0/0**, **ge0/1**, **ge0/3**, and **ge0/7** are operational, as per our configuration, and **ge0/2** is down:

vEdge# show int	erface vpn 0

Operational Commands

The **show** commands for the various device functionalities indicate whether that functionality is operationally up (that is, enabled) or operationally down (that is, disabled).

site-id

Configure the identifier of the site in the Cisco SD-WAN overlay network, such as a branch, campus, or data center, in which the device resides (for vEdge routers, vManage NMSs, and vSmart controllers).

vManage Feature Template

For all vEdge device:

Configuration ► Templates ► System

Command Hierarchy

```
system
  site-id site-id
```

Syntax Description

```
site-id | Site Identifier:
```

Numeric identifier of the site in the Cisco SD-WAN overlay network. The site ID must be the same for all Cisco vEdge devices that reside in the same site.

Range: 1 through $4294967295 (2^{32} - 1)$

Command History

Release	Modification
14.1	Command introduced.

Examples

Configure the site ID to be 50

```
Cisco SD-WAN# show running-config system
system
system-ip 1.1.1.9
domain-id 1
site-id 50
vbond 10.0.4.12
```

Operational Commands

show control local-properties

sla-class

To configure a Service Level Agreements (SLA) class, use the **sla-class** command in global configuration mode. You can create groups of properties for a policy to use with application-aware routing. You can configure a maximum of six SLA classes for Cisco IOS XE Catalyst SD-WAN devices and four SLA classes for Cisco vEdge devices.

sla-class sla-class-name **jitter** jitter **latency** latency **loss** percentage **app-probe-class** app-probe-class-name

no sla-class sla-class-name

Syntax Description	jitter milliseconds	Specifies the jitter on the connection. Packets matching the policy for application-aware routing that have the specified jitter or a lower jitter value.			
		Range: 1 through 1000 milliseconds			
	latency milliseconds	Specifies the latency on the connection. Packets matching the policy for application-aware routing that have the specified latency or a lower latency value.			
		Range: 0 through 1000 milliseconds			
	loss percentage	Specifies the packet loss on the connection. Packets matching the policy for application-aware routing that have the specified packet loss or a lower packet loss value.			
		Range: 0 through 100 percent			
	app-probe-class app-probe-class-name	Specifies the app-probe-class configured on the SLA class.			

Command Default

There are no default values.

Command Modes

Global configuration (config)

Command History

Release	Modification
14.2	Command introduced.
16.2	jitter option added.
Cisco IOS XE Catalyst SD-WAN Release 17.2.1r	Support for upto eight SLA classes added. In previous releases, you can only configure upto four SLA classes. However, only four unique SLA classes can be defined in an App-Route policy or attached to a site.
Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	A app-probe-class keyword is added.

The following example shows the SLA configuration for a latency of 50 milliseconds and app-probe-class:

```
Device(config) # policy
Device(config) # sla-class 50ms-sla
Device(config) # latency 50
Device(config) # app-probe-class real-time-video
Device(config) # fallback-best-tunnel
Device(config) # criteria loss jitter
```

snmp

Configure the Simple Network Management Protocol. The Cisco SD-WAN software supports SNMPv2 and SNMPv3 simultaneously. By default, SNMP is disabled.

vManage Feature Template

For all vEdge devices:

Configuration ► Templates ► SNMP

Command Hierarchy

```
snmp
 community name
   authorization (read-only | read-write)
   view string
 contact string
 group group-name authentication
   view string
 location string
 name string
 [no] shutdown
 trap
   group group-name
     trap-type
       level severity
   target vpn vpn-id ip-address udp-port
     community-name community-name
     group-name group-name
     source-interface interface-name
 user username
   auth authentication
   auth-password password
   group group-name
   priv privacy
   priv-password password
 view string
   oid oid-subtree [exclude]
```

Command History

Release	Modification
14.1	Command introduced.
15.2	Support for SNMP traps added.
16.2	Support for SNMPv3 traps added.

Operational Commands

show running-config snmp

sp-organization-name

Configure the name of your service provider for a vBond orchestrator or vSmart controller that is part of a software multitenant architecture (on vBond orchestrators and vSmart controllers).

Command Hierarchy

```
system
 sp-organization-name name
```

Syntax Description

name | Service Provider Organization Name:

Configure the name of your service provider. The name is case-sensitive. It must be identical on all the devices in your overlay network, and it must match the name in the certificates for all vEdge network devices.

Command History

Release	Modification
17.1	Command introduced.

Examples

Configure an service provider organization name

```
vSmart(config) # system sp-organization-name "My Phone Company Inc"
```

Operational Commands

show control local-properties show orchestrator local-properties

Related Topics

request csr upload, on page 669

speed

Set the speed of the interface. Configure the interface speed, for use when the remote end of the connection does not support autonegotiation.

On all vEdge router models, all interfaces support 1-Gigabit Ethernet SFPs. These SFPs can either be copper or fiber. For fiber SFPs, the supported speed is 1 Gbps full duplex. For copper SFPs, the supported speeds are 10/100/1000 Mbps and half/full duplex. By default, the router autonegotiates the speed and duplex values for the interfaces.

To use a fixed speed and duplex configuration for interfaces that do not support autonegotiation, you must disable autonegotiation and then use the **speed** and **duplex** commands to set the appropriate interface link characteristics.

vManage Feature Template

For all vEdge devices:

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface PPP Ethernet

Command Hierarchy

```
vpn vpn-id
  interface interface-name
  speed speed
```

Syntax Description

```
| speed | Interface Speed: | Interface speed, in Mbps. | Values: 10, 100 | Default: Autonegotiate (10/100/1000 Mbps) on vEdge 1000 routers
```

Command History

Release	Modification	
14.1	Command introduced.	
15.3	Support for autonegotiation added	

Examples

Set the interface speed to 100 Mbps

```
vEdge# config
Entering configuration mode terminal
vEdge(config)# vpn 0 interface ge0/0
vEdge(config-interface-ge0/0)# no autonegotiate
vEdge(config-interface-ge0/0)# speed 100
```

Operational Commands

show interface

Related Topics

```
autonegotiate, on page 98 duplex, on page 198
```

spt-threshold

Configure when a PIM router should join the shortest-path source tree (SPT) (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► PIM

Command Hierarchy

```
vpn vpn-id
 router
   pim
      spt-threshold kbps
```

Syntax Description

kbps | Traffic Rate:

Traffic rate at which the router should join the shortest-path source tree. Until that rate occurs, traffic remains on the shared tree, and travels through the RP. By default, a vEdge router joins the SPT immediately after the first packet arrives from a new source.

Range: 0 to 100 kbps

Default: 0

Command History

Release	Modification
14.3	Command introduced.

Operational Commands

show multicastreplicator

show multicast rpf

show multicast topology

show multicast tunnel

show omp multicast-auto-discover

show omp multicast-routes

show pim interface

show pim neighbor

show pim rp-mapping

ssid

Configure the service set identifier (SSID) for a WLAN (on vEdge cellular wireless routers only). You can configure up to four SSIDs.

Each SSID is called a virtual access point (VAP) interface. To a client, each VAP interfaces appears as a different access point (AP) with its own SSID. To provide access to different networks, assign each VAP to a different VLAN.

vManage Feature Template

For vEdge cellular wireless routers only:

Configuration ► Templates ► WiFi SSID

Command Hierarchy

```
wlan radio-band
  interface vapnumber
  ssid ssid
```

Syntax Description

```
ssid WLAN SSID:
```

SSID for the WLAN.

Range: A string from 4 through 32 characters. The SSID for each virtual access point within a single radio frequency must be unique.

Command History

Release	Modification
16.3	Command introduced.

Examples

Configure four SSIDs

```
vEdge# show running-config wlan
wlan 5GHz
channel 36
interface vap0
  ssid    tb31_pm6_5ghz_vap0
  no shutdown
!
interface vap1
  ssid    tb31_pm6_5ghz_vap1
  data-security    wpa/wpa2-enterprise
  radius-servers tag1
  no shutdown
!
interface vap2
```

```
ssid tb31_pm6_5ghz_vap2
data-security wpa/wpa2-personal
mgmt-security optional
wpa-personal-key $4$BES+IEZB2vcQpeEoSR4ia9JqgDsPNoHukAb8fvxAg5I=
no shutdown
!
interface vap3
ssid tb31_pm6_5ghz_vap3
data-security wpa2-enterprise
mgmt-security optional
radius-servers tag1
no shutdown
!
!
```

Operational Commands

clear wlan radius-stats

show interface

show wlan clients

show wlan interfaces

show wlan radios

show wlan radius

static

Configure static NAT address mappings (on vEdge routers only).

In service VPNs (VPNs except VPN 0 and VPN 512, configure static NAT address mappings on a vEdge router that is acting as a NAT device. Across all NAT pools, a vEdge router can NAT a maximum of 254 source IP addresses. This is the number of addresses in a /24 prefix, less the .0 and .255 addresses. You cannot configure translation for .0 and .255 addresses.

In the transport VPN (VPN 0), configure static NAT address mappings to a pool of NAT addresses. You can configure as many static address mappings as there are IP address in the configured NAT pool. If you configure no static mappings, NAT address mapping is performed dynamically.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface Cellular (for vEdge cellular wireless routers only)

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface NAT Pool

Configuration ► Templates ► VPN Interface PPP

Command Hierarchy

In service VPNs:

```
vpn vpn-id
  interface natpool number
  nat
    static source-ip ip-address1 translate-ip ip-address2 (inside | outside)
```

In the transport VPN:

```
vpn 0
  interface ge slot | port
  nat
    static source-ip ip-address1 translate-ip ip-address2 source-vpn vpn-id protocol (tcp | udp) source-port number translate
```

Syntax Description

Table 11: In Service VPNs

	7
(inside outside)	Direction To Perform Network Address Translation:
	Direction in which to perform network address translation. It can be one of the following:
	inside: Translate the IP address of packets that are coming from the service side of the vEdge router and that are destined to transport side of the router. For translation of inside source IP addresses to occur, the translation direction, configured with the direction command, must be inside. direction inside is the default, so you can omit this command from the configuration.
	outside : Translate the IP address of packets that are coming to the vEdge router from the transport side of the vEdge router and that are destined to a service-side device. For translation of outside source IP addresses to occur, the translation direction, configured with the direction command, must be outside .
source-ip	Source IP Address:
ip-address1	Private source IP address to be NATed. This is the IP address of a device or branch router on the service side of the vEdge router.
translate-ip	Translate IP Address:
ip-address2	Public IP address to map the private source address to. This is the IP address that the vEdge router places in the source field of the packet's IP header when transmitting the packet over a transport network.

Table 12: In the Transport VPN

(tcp udp)	Protocol:
	Protocol being used to transmit the traffic flow.
source-ip ip-address1	Source IP Address:
	Private source IP address to be NATed. This is the IP address of a device or branch router on the service side of the vEdge router.
source-port number	Source Port Number:
	Number of the source port.
	Range: 1 through 65535

source-vpn vpn-id	Source VPN:
	Service VPN from which the traffic flow is being sent.
translate-ip	Translated IP Address:
ip-address2	Public IP address to map the private source address to. This IP address must be contained in the pool of NAT addresses that you configure with the natpool command.
translate-port number	Translated Port Number:
	Number to translate the port number to.
	Range: 1 through 65535

Command History

Release	Modification
16.3	Command introduced.
18.3	Support for static NAT address mappings in VPN 0 added.

Examples

Configure a vEdge router to NAT a service-side and a remote IP address

```
vEdge# show running-config vpn 1
interface natpool1
  ip address 10.15.1.4/30
  nat
    static source-ip 10.1.17.3 translate-ip 10.15.1.4 inside
    static source-ip 10.20.25.18 translate-ip 10.25.1.1 outside
    direction inside
    no overload
!
no shutdown
!
```

Operational Commands

```
show ip nat filter
show ip nat interface
show ip nat interface-statistics
```

Related Topics

static-ingress-qos

Allocate ingress traffic on an interface to a specific queue (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface Cellular (for vEdge cellular wireless routers only)

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface PPP Ethernet

Command Hierarchy

```
vpn vpn-id
  interface interface-name
  static-ingress-gos number
```

Syntax Description

number	Queue Number:
	Queue number to use for incoming traffic.
	Range: 0 through 7

Command History

Release	Modification
15.3	Command introduced.

Examples

Have incoming traffic on interface ge0/0 use queue 1

```
\verb|vEdge(config-interface-ge0/1)# | \textbf{static-ingress-qos 1}|\\
```

Operational Commands

show running-config vpn

static-lease

Assign a static IP address to a client device on the service-side network (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► DHCP Server

Command Hierarchy

```
vpn vpn-id
  interface ge number | subinterface
   dhcp-server
    static-lease mac-address ip ip-address host-name hostname
```

Syntax Description

host-name hostname	Hostname of Client: Hostname of client device.
mac-address	Network Client: MAC address of client to which static IP address is being assigned.
ip ip-address	Static IP Address: Static IP address to assign to the client.

Command History

Release	Modification
14.3	Command introduced.

Examples

Assign a static IP address to a device in the service-side network

```
vm5# config
Entering configuration mode terminal
vm5(config)# vpn 1 interface ge0/4
vm5(config-interface-ge0/4)# dhcp-server address-pool 10.0.100.0/24
vm5(config-dhcp-server)# static-lease b8:e8:56:38:5e:89 ip 10.0.100.23
vm5(config-dhcp-server)# show full-configuration
vpn 1
interface ge0/4
dhcp-server
address-pool 10.0.100.0/24
static-lease b8:e8:56:38:5e:89 ip 10.0.100.23
!
!
```

Operational Commands

show dhep interfaces show dhep server

stub

Configure an OSPF stub area (on vEdge routers only). A stub area is an area that OSPF does not flood AS external link-state advertisements (Type 5 LSAs).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► OSPF

Command Hierarchy

```
vpn vpn-id
  router
   ospf
    area number
    stub
    no-summary
```

Syntax Description

no-summary	Summary Routes:	
	Do not inject OSPF summary routes into the stub area.	

Command History

Release	Modification
14.1	Command introduced.

Examples

Configure area 2 as a stub area

```
vedge(config) # vpn 1 router ospf area 2 stub
```

Operational Commands

show ospf neighbor detail

system

Configure system-wide parameters.

vManage Feature Template

For all vEdge devices:

system-ip

Configure a system IP address for a vEdge device.

The system IP address is a persistent IP address that identifies the Cisco vEdge device. It is similar to a router ID on a regular router, which is the address used to identify the router from which packets originated. The system IP address is used internally as the device's loopback address in the transport VPN (VPN 0). (Note that this is not the same as a loopback address that you configure for an interface.)

On a vEdge router, the system IP address is used as the router ID for BGP or OSPF. If you configure a router ID for either of these protocols and it is different from the system IP address, the router ID takes precedence.

vManage Feature Template

For all vEdge devices:

Configuration ► Templates ► System

Command Hierarchy

```
system
system-ip ipv4-address
```

Syntax Description

ipv4-address	System IP Address:
	System IP address. Specify it as an IPv4 address in decimal four-part dotted notation. Specify just the address; the prefix length (/32) is implicit. The system IP address can be any IPv4 address except for 0.0.0.0/8, 127.0.0.0/8, and 224.0.0.0/4, and 240.0.0.0/4 and later. Each device in the overlay network must have a unique system IP address. You cannot use this same address for another interface in VPN 0.

Command History

Release	Modification
14.1	Command introduced.

Examples

Configure the system IP address and verify its configuration

Related Topics

ip address, on page 262 router-id, on page 444 router-id, on page 443

system-tunnel-mtu

Configure the MTU to use on the tunnels that send OMP control traffic between Cisco vEdge devices. These tunnels are internal tunnels used by the devices to exchange control traffic. This MTU value is not related to, and has no effect on, interface MTUs.

Generally, you never need to modify the system tunnel MTU. The only case when you might consider configuring this parameter is when you are adjusting the TCP MSS value.

vManage Feature Template

For all vEdge devices:

Configuration ► Templates ► System

Command Hierarchy

system
system-tunnel-mtu mtu

Syntax Description

mtu MTU:

MTU size to use on tunnels that carry OMP control traffic.

Range: 500 through 2000 bytes

Default: 1024 bytes

Command History

Release	Modification
14.1	Command introduced.

Examples

Explicitly configure the system tunnel MTU to the default value of 1000 bytes

vEdge(config-system) # system-tunnel-mtu 1000

Operational Commands

show running-config system

Related Topics

tcp-mss-adjust, on page 484

system patch-confirm

To configure a time limit to verify that a software patch was successful, use the **system patch-confirm** command in configuration mode.

system patch-confirm minutes

patch-confirm minutes	Time To Wait for Confirmation:
	If a software patch fails, this command specifies the amount of time the device waits for you to run request support software patch-confirm command. If you do not run this command, the device reverts to the previous software image.
	Range: 5 through 60 minutes

Command Default

No default.

Command Modes

configuration (config)

Release	Modification
17.4	This command was introduced.

Usage Guidelines

When this option is enabled, after you patch a device, you must run this command to confirm the patch. If you do not run this command, the device automatically reverts to the previous softwarer image. For example, after you patch the device using the request support software patch command, you must log in to the device after it reboots. Then you must run the request support software patch-confirm within the time limit that you specified.

If the control connections fail to come up when this option is enabled, the devices can still revert to the previous image. By default, this option is disabled.

Examples

The following example sets the time limit to 7 minutes:

Device(config) # system patch-confirm 7

table-map

To configure the policy for filtering and modifying the Open Shortest Path First version3 (OSPFv3) routes before installing them in to the Routing Information Base (RIB), use the **table-map** command in the router configuration mode. To disable this function, use the **no** form of this command.

table-map route-map-name [filter]

Syntax Description

route-map-name	Name of the table map. The <i>route-map-name</i> is 1 to 63 alphanumeric characters.
	For OSPFv3, the <i>route-map-name</i> argument specifies the name of a route map to be used for route attribute modification and filtering.
filter	(Optional) Filters routes based on the configuration of the specified route map. An OSPFv3 route is not installed in the RIB if it is denied in the route-map configuration.

Command Default

No route-map is configured as a table-map and all OSPFv3 routes are installed without modification or filtering.

Command Modes

Router configuration mode

Command History

Release	Modification
Cisco IOS XE Release 17.3.2	This command was introduced on Cisco IOS XE SD-WAN devices.

Usage Guidelines

A **table-map** can be used to modify and filter routes that are installed in the RIB. To filter routes that are explicitly or implicitly denied by the route-map, use the filter keyword. Before using this command, you must configure the required route-map in global configuration mode. A route-map can be used to modify the metric, tag, and omp-tag of OSPFv3 routes installed into the RIB.

The following example shows a route-map configuration for blocking the next hops that are learned through VRF:

```
Device(config) # router ospfv3 1
Device(config) # address-family ipv4 vrf vrf1
Device(config-af) # redistribute omp route-map match-omp-tag
Device(config-af) # table-map set-omp-tag
Device(config-af) # exit-address-family
```

tacacs

Configure the properties of a TACACS+ server that is used in conjunction with AAA to authorize and authenticate users who attempt to access Cisco vEdge devices.

vManage Feature Template

For all vEdge devices:

Configuration ► Templates ► AAA

Command Hierarchy

```
system
tacacs
authentication password-authentication
server ip-address
auth-port port-number
priority number
secret-key password
source-interface interface-name
vpn vpn-id
timeout seconds
```

Syntax Description

server ip-address	Address of TACACS+ Server:		
	Address of TACACS+ Server		
	IP address of a TACACS+ server host in the local network. You can configure up to 8 TACACS+ servers.		
secret-key password	Authentication Key:		
	secret-key <i>password</i> Key to use for authentication and encryption between the Cisco vEdge device and the TACACS+ server. You type the key as a text string from 1 to 32 characters long, and it is immediately encrypted, or you can type an AES 128-bit encrypted key. The key must match the encryption key used on the TACACS+ server.		

41 4	D C C D C A II C D
auth-port port-number	Destination Port for Authentication Requests:
	UDP destination port to use for authentication requests to the TACACS server. If the server is not used for authentication, configure the port number to be 0. If you do not configure a port number, the default is TACACS+ authentication port is 49.
source-interface	Interface To Use To Reach Server:
interface-name	Interface on the local device to use to reach the TACACS+ server.
authentication	Password Authentication:
authentication-type	Set the type of authentication to use for the server password. The default authentication type is PAP. You can change it to ASCII.
priority number	Server Priority:
	Set the priority of a TACACS+ server, as a means of choosing or load balancing among multiple TACACS+ servers. A server with lower priority number is given priority over one with a higher number.
	Range: 0 through 7
	Default: 0
timeout seconds	Time to Wait for Replies from Server:
	Configure the interval, in seconds, that the Cisco vEdge device waits to receive a reply from the TACACS+ server before retransmitting a request.
	Range: 1 through 1000
	Default: 5 seconds
vpn vpn-id	VPN where Server Is Located:
	VPN in which the TACACS+ server is located or through which the server can be reached. If you configure multiple TACACS+ servers, they must all be in the same VPN.
	Range: 0 through 65530
	Default: VPN 0

Command History

Release	Modification
14.2	Command introduced.
14.3	source-interface command added.
15.3.8	secret-key and deprecate key commands added.
16.2.2	authentication and priority commands added.

Examples

Configure TACACS+

```
vEdge(config) # system tacacs
vEdge(config-tacacs) # server 1.2.3.4 secret-key $4$aCGzJg5k6M8zj4BgLEFXKw==

tcp-mss-adjust

Configure the maximum segment size (MSS) of TCP SYN packets passing through a device. By default, the MSS is dynamically adjusted based on the interface or tunnel MTU such that TCP SYN packets are never fragmented. For data sent over an interface, the MSS is calculated by adding the interface maximum transmission unit (MTU), the IP header length, and the maximum TCP header length. For data sent over a tunnel, the MSS is the sum of the tunnel MTU, the IP header length, and the maximum TCP header length.

The resulting TCP MSS ADJUST will be always a value 84 bytes lower than the MTU, or less. The reason for this is that the MSS value is derived as:

```
MSS = MTU - (TCP \text{ header with maximum options}) - (IP \text{ header}) - (MPLS \text{ header}) MSS = MTU - (60) - (20) - (4)
```

vManage Feature Template

For all vEdge devices:

Configuration ► Templates ► VPN Interface Bridge

Configuration ► Templates ► VPN Interface Cellular (for vEdge cellular wireless routers only)

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface GRE

Configuration ► Templates ► VPN Interface PPP

Configuration ► Templates ► VPN Interface PPP Ethernet

Command Hierarchy

```
vpn vpn-id
  interface interface-name
  tcp-mss-adjust bytes
```

Syntax Description

bytes | Change the Packet Size:

TCP maximum segment size (MSS), which is the largest amount of data that the interface can receive in a single IP datagram, excluding the TCP and IP headers.

Range: 552 to 1960 bytes; for PPP interface, 552 to 1452 bytes

Default: None

Command History

Release	Modification
14.1	Command introduced.
15.3	TCP SYN MSS dynamically adjusted based on the interface or tunnel MTU.
16.3	Maximum TCP MSS changed from 1460 bytes to 1960 bytes.

Examples

Set the TCP MSS

```
vEdge# config
Entering configuration mode terminal
vEdge(config) # vpn 0 interface ge0/1
vEdge(config-interface-ge0/1)# tcp-mss-adjust 1400

system-tunnel-mtu, on page 479

tcp-optimization

Fine-tune TCP to decrease round-trip latency and improve throughput for TCP traffic (on vEdge routers only). You can configure TCP optimization in service-side VPNs only (VPNs other than VPN 0 and VPN 512).

Optimizing TCP traffic can be useful for improving the performance of SaaS applications, transcontinental links, and high-latency transport devices such as VSAT satellite communications systems.

By default, TCP optimization is disabled.

To configure TCP optimization for individual traffic flows rather than across a VPN, create a centralized data policy that includes the **tcp-opt** action.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN

Command Hierarchy

vpn vpn-id
tcp-optimization

Command History

Release	Modification
17.2	Command introduced.

Examples

Optimize TCP traffic in VPN 1

```
vEdge# show running-config vpn 1
vpn 1
tcp-optimization
```

Operational Commands

show app tcp-opt

Related Topics

tcp-optimization-enabled, on page 487

tcp-optimization-enabled

Enabled TCP optimization (on vEdge routers only).

On vEdge 1000 and vEdge 2000 routers, enabling TCP optimization carves out a separate CPU core to use for the optimization, because TCP optimization is CPU intensive.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► System

Command Hierarchy

```
system
tcp-optimization-enabled
```

Command History

Release	Modification
17.2	Command introduced.

Examples

Enable TCP optimization on a vEdge router

```
vEdge# show running-config system

tcp-syn-flood-limit

Configure the number of TCP SYN packets that the router can receive while establishing a TCP connection to use for a zone-based firewall before the router shuts down the connection (on vEdge routers only).

Command Hierarchy

```
policy
tcp-syn-flood-limit number
```

Syntax Description

```
    number
    Number of TCP SYN Packets:

    Number of TCP SYN packets to allow before terminating an attempt to establish a TCP connection.

    Range: 1 through 2147483647

    Default: 2000
```

Command History

Release	Modification
18.3	Command introduced.

Examples

For a zone-based firewall, change the number of TCP SYN packets that the router can receive from the default of 2000 to 2200

```
vEdge# show running-config policy
policy
  tcp-syn-flood-limit 2200
  zone A
   vpn 1
  zone B
   vpn 2
    vpn 3
   vpn 4

tcp-timeout

Configure when NAT translations over a TCP session time out (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface Cellular (for vEdge cellular wireless routers only)

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface NAT Pool

Configuration ► Templates ► VPN Interface PPP

Command Hierarchy

```
vpn vpn-id
  interface interface-name
  nat
    tcp-timeout minutes
```

Syntax Description

minutes Time:

Time after which NAT translations over TCP sessions time out.

Range: 1 through 65536 minutes

Default: 60 minutes (1 hour)

Command History

Release	Modification
14.2	Command introduced.

Examples

Change the NAT translation timeout value for TCP sessions to 2 hours

```
vEdge# config
vEdge(config) # vpn 1 interface ge0/4 nat tcp-timeout 120
vEdge(config-nat)# show full-configuration
vpn 1
 interface ge0/4
    tcp-timeout 120
```

Operational Commands

show ip nat filter show ip nat interface show ip nat interface-statistics

technology

Associate a radio access technology (RAT) with a cellular interface (on vEdge routers only).

vManage Feature Template

For vEdge cellular wireless routers only:

Configuration ► Templates ► VPN Interface Cellular

Command Hierarchy

```
vpn 0
  interface cellular number
    technology technology
```

Syntax Description

technology | Cellular Technology:

Define the RAT for a cellular interface on vEdge routers that support 4G LTE and CDMA-based 2G/3G networks (such as Sprint and Verizon networks). It can be one of the following:

auto: Automatically select the RAT. Use this value for a **cellular0** interface when you are using this interface for ZTP.

cdma: Use 2G/3G CDMA cellular technology.

Ite: Use 4G LTE cellular technology. This is the default.

Command History

Release	Modification
16.2.10 and 16.3.2	Command introduced.

Examples

Configure a cellular interface to automatically choose its radio access technology

```
vEdge# show running-config vpn 0 interface cellular0
 interface cellular0
 ip dhcp-client
  tunnel-interface
  encapsulation ipsec
   color lte
   no allow-service bgp
   allow-service dhcp
   allow-service dns
   allow-service icmp
   no allow-service sshd
   no allow-service netconf
   no allow-service ntp
   no allow-service ospf
   no allow-service stun
 mtu
           1428
  profile 0
 technology auto
 no shutdown
!
```

template-refresh

How often to send the cflowd template record fields to the collector (on vSmart controllers only).

vManage Feature Template

For vSmart controllers:

Configuration ► Policies ► Centralized Policy

Command Hierarchy

```
policy
  cflowd-template template-name
  template-refresh seconds
```

Syntax Description

seconds | Refresh Time:

How often to send the cflowd template record fields to the collector. If you configure this time and later modify it, the changes take effect only on flows that are created after the configuration change has been propagated to the vEdge router. Because an existing flow continues indefinitely, to have configuration changes take effect, clear the flow with the **clear app cflowd flows** command.

Range: 60 through 86400 seconds (1 minute through 1 day)

Default: 90 seconds

Command History

Release	Modification
14.3	Command introduced.

Examples

Configure a cflowd template

```
vSmart# show running-config policy
cflowd-template test-cflowd-template
collector vpn 1 address 172.16.255.14 port 11233
flow-active-timeout 60
flow-inactive-timeout 90
template-refresh 86400
```

Operational Commands

clear app cflowd flows (on vEdge routers only)

clear app cflowd statistics (on vEdge routers only)

```
show policy from-vsmart (on vEdge routers only)
show running-config policy (on vSmart controllers only)
show app cflowd collector (on vEdge routers only)
show app cflowd template (on vEdge routers only)
```

timeout inactivity

Set how long to wait before revoking the authentication of an client that is using 802.1X to access a network (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface Ethernet

Command Hierarchy

```
vpn vpn-id
  interface interface-name
  dot1x
    timeout
    inactivity minutes
```

Syntax Description

```
| Seconds | Client Inactivity Timeout:
| Time to wait before revoking the authentication of an inactive 802.1X client.
| Range: 0 through 1440 minutes (24 hours)
| Default: 60 minutes (1 hour)
```

Command History

Release	Modification
16.3	Command introduced.

Examples

Revoke a client's authentication after 2 hours

```
vpn 0
  interface ge0/7
  dot1x
     timeout
     activity 7200
```

clear dot1x client

tracker-dns-cache-timeout

To configure the the duration for which Cisco vEdge devices cache SIG endpoint IP addresses obtained through DNS query resolution of SIG endpoint FQDNs, use the **timer tracker-dns-cache-timeout** command on Cisco vManage in the system configuration mode. To remove the configuration and revert to default behavior, use the **no** form of the command.

timer tracker-dns-cache-timeout duration

Syntax Description	duration	Specifies the the duration (in minutes) for which WAN edge devices cache resolved SIG endpoint IP addresses.
		Range: 5 to 1440 minutes
		Default: 120 minutes

Command Default

120 minutes (2 hours)

Command Modes

System configuration (config-system)

Command History

Release	Modification
Cisco vManage Release 20.9.1	This command is introduced.

Examples

The following example shows a sample configuration which defines the cache timeout as 15 minutes:

```
config
system
timer tracker-dns-cache-timeout 15
```

timers

Configure OSPF timers (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► OSPF

Command Hierarchy

```
vpn vpn-id
  router
  ospf
    timers
    spf delay initial-hold-time maximum-hold-time
```

Syntax Description

spf delay	SPF Algorithm Timer:	
initial-hold-time maximum-hold-time	Configure the amount of time between when OSPF detects a topology and when it runs its SPF algorithm. This timer consists of three parts:	
	Delay: Delay from first change received until performing the SPF calculation. Range: 0 through 600000 milliseconds (60 seconds). Default: 200 milliseconds.	
	Initial hold time: Initial hold time between consecutive SPF calculations. Range: 0 through 600000 milliseconds (60 seconds). Default: 1000 milliseconds.	
	Maximum hold time: Longest time between consecutive SPF calculations. Range: 0 through 600000 milliseconds (60 seconds). Default: 10000 milliseconds.	

Command History

Release	Modification
14.1	Command introduced.

Examples

Set the OSPF SPF timers

```
\texttt{vEdge} \# \ \textbf{show running-config vpn} \ \textbf{1} \ \textbf{router ospf}
vpn 1
 router
 ospf
  timers spf 300 1200 15000
  redistribute static
  redistribute omp
   max-metric router-lsa administrative
   area 0
   interface ge0/0
   exit
   exit
vEdge# show ospf process | include time
                  1200
 spf-holdtime
 spf-max-holdtime
                        15000
 spf-last-exec-time
                       2607
```

Operational Commands

show ospf process

timers

Configure global and per-neighbor BGP timers (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► BGP

Command Hierarchy

```
vpn vpn-id
router
bgp local-as-number
timers
holdtime seconds
keepalive seconds
vpn vpn-id
router
bgp local-as-number
neighbor ip-address
timers
advertisement-interval seconds
connect-retry seconds
holdtime seconds
keepalive seconds
```

Syntax Description

advertisement-interval	Advertisement Interval:
seconds	For a BGP neighbor, set the minimum route advertisement interval (MRAI) between when BGP routing update packets are sent to that neighbor.
	Range: 0 through 600 seconds
	Default: 5 seconds for IBGP route advertisements; 30 seconds for EBGP route advertisements
connect-retry seconds	Connection Retry Time:
	For a BGP neighbor, set the amount of time between retries to establish a connection to a configured peer that has gone down.
	Range: 0 through 65535 seconds
	Default: 30 seconds
holdtime seconds	Hold Time:
	Set the interval after not receiving a keepalive message that the local BGP session considers its peer to be unavailable. The local router then terminates the BGP session to that peer.
	Provisioning the hold time for a specific neighbor overrides the global default or the hold time configured at the global level.
	Range: 0 through 65535 seconds
	Default: 180 seconds (three times the keepalive timer)

keepalive seconds	Keepalive Time:
	Frequency at which keepalive messages are advertised to a BGP peer. These messages indicate to the peer that the local router is still active and should be considered to be available.
	Provisioning the keepalive time for a specific neighbor overrides the global default or the keepalive configured at the global level.
	Range: 0 through 65535 seconds
	Default: 60 seconds (one-third the hold-time value)

Command History

Release	Modification
14.1	Command introduced.

Examples

Modify the connection retry time and the advertisement interval for a BGP neighbor

```
vEdge# show running-config vpn 1 router bgp neighbor 10.20.25.18
vpn 1
  router
bgp 1
  neighbor 10.20.25.18
    no shutdown
    remote-as 2
    timers
        connect-retry 60
    !
    password $4$L3rwZmsIiZB6wtBgLEFXKw==
    !
    !
    !
    !
    !
}
```

Operational Commands

show bgp neighbor detail

timers

Configure OMP timers on vEdge routers and vSmart controllers.

When you change an OMP timer on a device, the BFD sessions on that device go down and then come back up.

vManage Feature Template

For vEdge routers and vSmart controllers only:

Configuration ► Templates ► OMP

Command Hierarchy

omp
timers
advertisement-interval seconds
eor-timer seconds
graceful-restart-timer seconds
holdtime seconds

Syntax Description

eor-timer seconds	End-of-RIB Timer:
	How long to wait after an OMP session has gone down and then come back up to send an end-of-RIB (EOR) marker. After this marker is sent, any routes that were not refreshed after the OMP session came back up are considered to be stale and are deleted from the route table.
	Range: 1 through 3600 seconds (1 hour)
	Default: 300 seconds (5 minutes)
graceful-restart-timer	Graceful Restart Timer:
seconds	How often the OMP information cache is flushed and refreshed. To disable OMP graceful restart, use the no omp graceful-restart command.
	Note The graceful-restart-timer is peer driven. That is, WAN edge will wait for the timer configured on Cisco vSmart to expire before removing the stale routes from the OMP table and Cisco vSmart will wait for the timer configured on WAN Edge.
	Range: 1 through 604800 seconds (168 hours, or 7 days)
	Default: 43200 seconds (12 hours)
holdtime seconds	Holdtime Interval:
	How long to wait before closing the OMP connection to a peer. If the peer does not receive three consecutive keepalive messages within the specified hold time, the OMP connection to the peer is closed. (Note that the keepalive timer is one-third the hold time and is not configurable.) If the local device and the peer have different hold time intervals, the higher value is used. If you set the hold time to 0, the keepalive and hold timers on the local device and the peer are set to 0. The hold time must be at least two times the hello tolerance interval set on the WAN tunnel interface in VPN 0. To configure the hello tolerance interval, use the hello-tolerance command.
	Range: 0 through 65535 seconds
	Default: 60 seconds

advertisement-interval	Update Advertisement Interval:
seconds	Configure the amount of time between OMP Update packets.
	Range: 0 through 65535 seconds
	Default: 1 second

Command History

Release	Modification
14.1	Command introduced.
14.2	Removed keepalive option; changed default hold-time interval from 15 to 60 seconds; added graceful-restart-timer command.
15.3	Changed maximum graceful restart timer value to 12 hours.
15.3.5	Change default graceful restart timer value to 12 hours, and changed maximum graceful restart timer value to 7 days.
16.2	Added eor-timer command

Examples

Modify the default OMP timers

Operational Commands

tloc-extension

Bind this interface, which connects to another vEdge router at the same physical site, to the local router's WAN transport interface (on vEdge routers only). Note that you can configure the two routers themselves with different site identifiers.

You cannot configure TLOC extensions on cellular (LTE) interfaces.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface PPP

Configuration ► Templates ► VPN Interface PPP Ethernet

Command Hierarchy

```
vpn 0
  interface interface-name
  tloc-extension interface-name
```

Syntax Description

interface-name	Local Router's WAN Transport Interface:
	Physical interface on the local router that connects to the WAN transport circuit. The interface can be a Gigabit Ethernet interface (ge) or a PPP interface (ppp).

Command History

Release	Modification
15.4	Command introduced.

Examples

In this example, vEdge2 has two circuits, one to the Internet and the second to an MPLS network. vEdge1 is also located at the same site, but has no circuits. This configuration binds two subinterfaces from vEdge1 to the two circuit interfaces on vEdge2 so that vEdge1 can establish TLOCs on the overlay network.

```
vEdge1# show running-config vpn 0
interface ge0/2.101
 ip address 101.1.19.15/24
  mtu 1496
  tunnel-interface
   color red
 no shutdown
interface ge0/2.102
 ip address 102.1.19.15/24
 mtu 1496
 tunnel-interface
   color blue
 no shutdown
vEdge2# show running-config vpn 0
interface ge0/0
  ip address 172.16.255.2
  tunnel-interface
```

```
color red
 no shutdown
interface ge0/3
 ip address 172.16.255.16
  tunnel-interface
   color blue
 no shutdown

tloc-extension-gre-from

Configure an interface as an extended interface, to channel TLOC traffic from a source branch router to the local WAN interface (on IOS XE routers only).

vManage Feature Template

For Cisco IOS XE routers only:

Configuration ► Templates ► VPN Interface Ethernet

Command Hierarchy

```
sdwan
interface interface-name
  tloc-extension-gre-from extended-wan-interface-ip-address xconnect wan-interface-name
```

Syntax Description

wan-interface-name	Interface Name:
	Name of WAN interface that you are using for sending traffic over the extended TLOC.
extended-wan-interface-ip-address	IP Address of GRE Tunnel Destination:
	IP address of the destination of the GRE tunnel that is being used as the TLOC interface.
	GRE tunnel destination IP address of the TLOC interface. This is the interface in the branch router that you are using to extend the TLOC.

Command History

Release	Modification
16.9.1	Command introduced.

Examples

Bind two subinterfaces from Router 1 to two circuit interfaces on Router 2 so that Router 1 can establish TLOC connections in the overlay network. Router 2 has two circuits, one to the Internet and the second to an MPLS network. Router 1 is also located at the same site, but has no circuits and is on a different L3 network.

```
ISRK2# show sdwan running-config
sdwan
interface GigabitEthernet0/2.101
 encapsulation dot1q 101
  ip address 30.1.19.16/24
   mtu 1496

tloc-extension-gre-to

Configure a tunnel interface over which to run TLOC extensions (on IOS XE routers only). TLOC extensions allow you to extend a TLOC, over a GRE tunnel, to another router in the branch.

vManage Feature Template

For Cisco IOS XE routers only:

Configuration ► Templates ► VPN Interface Ethernet

Command Hierarchy

```
sdwan
  interface interface-name
   tunnel-interface
   tloc-extension-gre-to extended-interface-ip-address
```

Syntax Description

extended-interface-ip-address	IP Address of GRE Tunnel Destination:
	GRE tunnel destination IP address of the interface that you are extended to another router in the branch.

Command History

Release	Modification
16.9.1	Command introduced.

Examples

Create a GRE tunnel from Router 1 to Router 2 over an L3 network. Router 2 has two circuits, one to the Internet and the second to an MPLS network. Router 1 is located at the same site, but has no circuits and is on a different L3 network.

```
Device# show sdwan running-config

track

To configure interface or SIG container list tracking <as a single entity>, use the **track** command in vrrp configuration mode. To remove the tracking for this list, use the **no** form of this command.

track track-list-name [decrement priority]

Syntax Description

track-list-name

Interface or container list name

decrement	Decrement value for list priority
	1 5

Command Default

?

Command Modes

vrrp configuration (config-vrrp)

Command History

Release	Modification
Cisco SD-WAN Release 20.4.1	This command was introduced.

Usage Guidelines

None

Example

The following example shows how to configure a track list for interfaces.

```
Device# config terminal

Device (config)# system

Device (config-system)# track-list zs1 interface ge0/1 gre1 ipsec1

Device (config-system-tracker-list-zs1)# exit

Device (config-system)# exit

Device (config-vpn-1)# name vpn-name

Device (config-vpn-1)# interface ge0/2

Device (config-interface-ge0/2)# ip address 172.16.10.1/24

Device (config-interface-ge0/2)# no shutdown

Device (config-interface-ge0/2)# vrrp 100

Device (config-vrrp-100)# track zs1 decrement 10

Device (config-vrrp-100)# ipv4 172.16.10.100

Device (config-vrrp-100)# tloc-change-pref
```

The following example shows how to configure a track list for SIG container.

```
Device# config terminal

Device (config)# system

Device (config-system)# track-list sig-1 sig-container global

Device (config-system-tracker-list-SIG)# exit

Device (config-system)# exit

Device (config-ypn-1)# name vpn-name

Device (config-vpn-1)# interface ge0/2

Device (config-interface-ge0/2)# ip address 172.16.10.1/24

Device (config-interface-ge0/2)# vrrp 100

Device (config-vrrp-100)# track SIG decrement 10

Device (config-vrrp-track-zs1)# exit

Device (config-vrrp-100)# ipv4 172.16.10.100

Device (config-vrrp-100)# tloc-change-pref
```

Table 13: Related Commands

Command	Description
vrrp	Configures the VRRP to allow multiple routers to share a common virtual IP address for default gateway redundancy.
track	To configure object tracking on a VRRP object list
show vrrp	Displays information about the configured VRRP interfaces and groups.

track-default-gateway

For a static route, determine whether the next hop is reachable before adding that route to the device's route table. By default, this function is enabled.

With gateway tracking enabled, the software sends ARP messages every 10 seconds to the next hop of a static route. If the software receives an ARP response, it places the static route into the local route table. After 10 consecutive ARP responses are missed, the static route is removed from the route table. The software continues to periodically send ARP messages, and as soon as it once again receives an ARP response, the static route is added back to the route table.

Note

The internal threshold timeout value for receiving an ARP response is 1000 milliseconds. If an ARP response is not received by the internal threshold value, the tracker is marked as down.

vManage Feature Template

For all vEdge devices:

Configuration ► Templates ► System

Command Hierarchy

system

track-default-gateway

Command History

Release	Modification
15.3.5	Command introduced.
15.4	Number of retries changed from 3 to 10.

Examples

Have the device determine whether the next hop for a static route is reachable before placing the static route in the local route table:

```
system
track-default-gateway
```

show ip routes

Related Topics

ip route, on page 270

track-interface-tag

Configure a tag to apply to routes associated with a network that is connected to a non-operational interface (on vEdge routers only). Specifically, the tagging occurs only when a vEdge router has been unable to reset a port that has stopped transmitting packets but whose status remains Up. This error is reported by the "PCS issue detected" alarm.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► System

Command Hierarchy

```
system
  track-interface-tag number
```

Syntax Description

number	Tag:

Set the tag string to include in routes associated with a network that is connected to a non-operational interface.

Range: 1 through 4294967295

Command History

Release	Modification
15.3.8 and 15.4.3	Command introduced.

Examples

On a vEdge router, set a tag for tracking a non-operational interface, and on a vSmart controller create a policy to send data traffic on an alternate path around the interface

```
vEdge# show running-config system
system
  track-interface-tag 555
  ...
vSmart# show running-config policy
```

```
policy
control-policy pcs-policy
sequence 10
  match route
   omp-tag 555
!
  action accept
   set
    preference 5
!
!
default-action accept
!
!
```

show running-config system

Related Topics

track-interface-tag, on page 509

track-list

To configure object tracking on a VRRP object list, use the **track-list** command in system configuration mode. To remove the object tracking for this object list, use the **no** form of this command.

track-list list-name [interface interface-type-number [...interface-type-number] | sig-container global]
no track-list list-name

Syntax Description

interface interface-type-number	Sets a list of one or more interfaces that should be tracked for up/down events
sig-container global	Sets a list of SIG containers that should be tracked for up/down events

Command Default

No VRRP tracking is enabled

Command Modes

System configuration (config-system)

Command History

Release	Modification
Cisco SD-WAN Release 20.4.1	This command was introduced.

Usage Guidelines

None

Example

The following example shows how to configure a track list for interfaces.

```
Device# config terminal
Device(config)# system
Device(config-system)# track-list zsl interface ge0/1 grel ipsec1

Device(config-vpn-1)# name vpn-name
Device(config-vpn-1)# interface ge0/2

Device(config-interface-ge0/2)# ip address 172.16.10.1/24

Device(config-interface-ge0/2)# no shutdown
Device(config-interface-ge0/2)# vrrp 100

Device(config-vrrp-100)# track zsl decrement 10

Device(config-vrrp-100)# ipv4 172.16.10.100

Device(config-vrrp-100)# tloc-change-pref
```

The following example shows how to configure a track list for SIG container.

```
Device# config terminal
Device(config)# system
Device(config-system)# track-list SIG-1 sig-container global

Device(config)# vpn 1

Device(config-vpn-1)# name vpn-name
Device(config-vpn-1)# interface ge0/2

Device(config-interface-ge0/2)# ip address 172.16.10.1/24

Device(config-interface-ge0/2)# vrrp 100

Device(config-interface-ge0/2)# vrrp 100

Device(config-vrrp-100)# track zs1 decrement 10

Device(config-vrrp-100)# ipv4 172.16.10.100

Device(config-vrrp-100)# tloc-change-pref
```

Table 14: Related Commands

Command	Description
vrrp	Configures the VRRP to allow multiple routers to share a common virtual IP address for default gateway redundancy.
track	Tracks interface or container lists
show vrrp	Displays information about the configured VRRP interfaces and groups.

track-transport

Checks whether the routed path between the local device and a vBond orchestrator is up using ICMP probes at regular interval of 3s. By default, transport checking is enabled.

vManage Feature Template

For all vEdge devices:

Configuration ► Templates ► System

Command Hierarchy

```
system
[no] track-transport
```

Command History

Release	Modification
14.1	Command introduced.

Examples

Explicitly configure regular monitoring of the DTLS connection to the vBond orchestrator.

Operational Commands

show transport connection

tracker

Track the status of transport interfaces that connect to the internet.

Tracker uses HTTP. If you are using an endpoint that does not respond to HTTP, then the tracker will remain in a down state. You need the response to be 200 OK for an up state.

Tracking the interface status is useful when you enable NAT on a transport interface in VPN 0 to allow data traffic from the router to exit directly to the internet rather than having to first go to a router in a data center. In this situation, enabling NAT on the transport interface splits the TLOC between the local router and the data center into two, with one going to the remote router and the other going to the internet.

When you enable transport tunnel tracking, the software periodically probes the path to the internet to determine whether it is up. If the software detects that this path is down, it withdraws the route to the internet destination, and traffic destined to the internet is then routed through the data center router. When the software detects that the path to the internet is again functioning, the route to the internet is reinstalled.

The Enable Layer 7 Health Check feature helps in maintaining tunnel health by providing tunnels the ability to failover. Tracker module with **endpoint-api-url** is used for L7 Health check in the routers. The Direct Internet Access (DIA) traffic ingressing on SD-WAN service VPNs is tunnelled to the Secure Internet Gateways (SIG) for securing enterprise traffic. All LAN/WIFI enabled enterprise client's traffic, based on routing, is forwarded to the SIG.

vManage Feature Template

Configuration ► Templates ► System

Configuration ► Templates ► VPN Interface Cellular (for cellular wireless routers only)

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface NAT Pool

Configuration ► Templates ► VPN Interface PPP

Command Hierarchy

```
system
tracker tracker-name
endpoint-dns-name dns-name
endpoint-ip ip-address
endpoint-api-url api-url
interval seconds
multiplier number
threshold milliseconds

vpn 0
interface interface-name
tracker tracker-name
```

DNS Name of Interface End Point:
DNS name of the end point of the tunnel interface. This is the destination in the internet to which the router sends probes to determine the status of the transport interface. For each tracker, you must configure either one DNS name or one IP address or URL.
IP Address of Interface End Point:
IP address of the end point of the tunnel interface. This is the destination in the internet to which the router sends probes to determine the status of the transport interface. For each tracker, you must configure either one DNS name or one IP address or URL.
DNS API URL of tunnel interface Internet security endpoint. This is the destination in the internet to which the router sends probes to determine the status of the transport tunnel interface. For each tracker, you must configure either one DNS name or one IP address or URL.
Interval between Status Probes.
The frequency to determine the status of the transport interface.
Note The tracker takes additional time (0 - interval) to go down than the configured time (interval multiplies with the multiplier) as probe can happen after the network issue. For example, when the interval is 30 seconds, multiplier is 3, tracker goes down after [30*3 + (0-30)] seconds loss in the network.
Range: 10 through 600 seconds
Default: 60 seconds (1 minute)

multiplier number	Number of Retries
	Number of times to probes are resent before declaring that the transport interface is down.
	Range: 1 through 10
	Default: 3
threshold milliseconds	Time To Wait for Response
	The elapse time for the probe to return a response before declaring that the transport interface is down.
	Range: 100 through 1000 milliseconds
	Default: 300 milliseconds
tracker-name	Tracker Name
	Name of the tracker. tracker-name can be up to 128 lowercase letters. You can configure up to eight trackers. You can apply only one tracker to an interface.

Release	Modification
17.2.2	Command introduced.
19.3	Command modified. endpoint-api-url keyword is added.
Cisco IOS XE Catalyst SD-WAN Release 17.2.1r	Support added for Cisco IOS XE Catalyst SD-WAN devices.

Usage Guidelines

The **endpoint-api-url** keyword is supported on IPSec and GRE interfaces. However, **endpoint-ip** and **endpoint-dns** are not supported on IPSec/GRE interfaces.

The **endpoint-api-url** is used directly on tunnel interface. NAT is not required for tunnels in the Transport side.

Examples

Enable transport tracking on a NAT interface.

```
system
  tracker nat-tracker
  endpoint-ip 10.2.3.4
  vpn 0
  interface ge0/1
   nat
   tracker nat-tracker
```

Enable transport tracking on GRE interface.

```
system
  tracker gre-tracker
  endpoint-api-url http://gateway.zscalerbeta.net/vpntest
'
```

```
interface gre1
tracker gre-tracker
```

nat, on page 348

trap group

Configure SNMP trap groups.

For each trap generated by a vEdge device, the device also generates a notification message. Use the show notification stream command to display these messages.

For SNMPv3, the PDU type for notifications ie either SNMPv2c inform (InformRequest-PDU) or trap (Trapv2-PDU).

vManage Feature Template

For all vEdge devices:

Configuration ► Templates ► SNMP

Command Hierarchy

```
snmp
  trap
  group group-name
    trap-type
    level severity
```

group group-name	Group Name:
group name	Name of the trap group. It can be from 1 to 32 characters.
level severity	Severity Level:
	Severity level of the trap. Severity can be critical , major , or minor . You can specify one, two, or three severity levels for each trap type.

trap-type	Trap Type:
	Type of traps to include in the trap group. trap-group can be one of the following:
	all—All trap types.
	app-route—Traps generated by application-aware routing.
	bfd—Traps generated by BFD and BFD sessions.
	bridge—Traps generated by bridging sessions.
	control—Traps generated by DTLS and TLS sessions.
	dhcp—Traps generated by DHCP.
	hardware—Traps generated by Cisco vEdge hardware.
	omp—Traps generated by OMP.
	policy—Traps generated by control and data policy.
	routing—Traps generated by BGP, OSPF, and PIM.
	security—Trap generated by certificates, vSmart and vEdge serial number files, and IPSec.
	system—Traps generated by functions configured under the system
	vpn—Traps generated by VPN-specific functions, including interfaces and VRRP.
	wwan—Traps generated by WLAN interfaces.
I	

Release	Modification
15.2	Command introduced.

Examples

Configure trap groups and associate them with SNMP trap servers.

```
level minor major critical
!
!
trap group critical-traps
control
level critical
!
```

Operational Commands

show running-config snmp

Related Topics

```
show notification stream, on page 905 trap target, on page 517
```

trap target

Configure the target SNMP server to receive the SNMP traps generated by this device.

For each trap generated by a vEdge device, the device also generates a notification message. Use the **show notification stream viptela** command to display these messages.

vManage Feature Template

For all vEdge devices:

Configuration ► Templates ► SNMP

Command Hierarchy

```
snmp
  trap
  target vpn vpn-id ipv4-address udp-port
    community-name community-name
  group-name name
  source-interface interface-name
```

community-name community-name	Community Name: Name of an SNMP community configured with the community command.
group group-name	Group Name: Name of a trap group configured with the trap group command.
source-interface interface-name	Interface To Reach Target: Interface to use to send traps to the SNMP server that is receiving the trap information. This interface cannot be a subinterface.

vpn vpn-id ipv4-address	Trap Target:
udp-port	Location of the SNMP server to receive the trap information. You must specify the following:
	vpn <i>vpn-id</i> —Number of the VPN to use to reach to the SNMP server. It can be a value from 0 through 65530.
	ipv4-address—IPv4 address of the SNMP server.
	<i>udp-port</i> —UDP port number to connect to on the SNMP server. The number can be a value from 1 through 65535.

Release	Modification
15.2	Command introduced.
16.2	source-interface option added.

Examples

Configure trap groups and associate them with SNMP trap servers

```
v \texttt{Edge} \texttt{\#} \textbf{ show running-config snmp}

ike, on page 239
tunnel-source, on page 522
tunnel-source-interface, on page 524
```

tunnel-interface

Configure the interface to be a secure DTLS or TLS WAN transport connection (on vEdge routers, vManage NMSs, and vSmart controllers only). Configuring an interface to be a transport tunnel enables the flow of control and data traffic on the interface. On vEdge routers, it configures the interface's TLOC attributes, which are carried in the TLOC OMP routes that the vEdge router sends to the vSmart controllers in its domain. For the TLOC attributes on vEdge routers, you must configure, at a minimum, a color and an encapsulation type. These two attributes, along with the router's system IP address, are the 3-tuple that uniquely identify each TLOC.

Because tunnel interfaces connect to the WAN transport, they can be present only in VPN 0, so you can include the **tunnel-interface** command only when configuring VPN 0.

On vEdge routers, you can configure up to six tunnel interfaces (a combination of tunnel interfaces on both physical and loopback interfaces). On vSmart controllers, you can configure only one tunnel interface.

vManage Feature Template

For vEdge routers, vManage NMSs, and vSmart controllers only:

Configuration ► Templates ► VPN Interface Cellular (for vEdge cellular wireless routers only)

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface PPP

Command Hierarchy

```
vpn 0
  interface interface-name
   tunnel-interface
     allow-service service-name
     bind interface-name (on vEdge routers only)
     carrier carrier-name
     color color [restrict]
      encapsulation (gre | ipsec) (on vEdge routers only)
       preference number
       weight number
      exclude-controller-group-list number (on vEdge routers only)
      group group-id
     hello-interval milliseconds
      hello-tolerance seconds
     hold-time milliseconds (on vEdge routers only)
     last-resort-circuit (on vEdge routers only)
     low-bandwidth-link (on vEdge routers only)
     max-control-connections number (on vEdge routers only)
     nat-refresh-interval seconds
      port-hop
```

```
vbond-as-stun-server (on vEdge routers only)
vmanage-connection-preference number (on vEdge routers only)
```

Release	Modification
14.1	Command introduced.
19.1	Added group option.

Examples

Create a tunnel for LTE traffic

```
vEdge(config) # vpn 0 interface ge0/0 tunnel-interface color lte
vEdge(config-tunnel-interface) # preference 10
vEdge(config-tunnel-interface) # weight 10
```

Operational Commands

show control connections

show interface

show omp tlocs and show omp tlocs detail (to display configured preference and weight values)

tunnel-source

Configure the source IP address of an IPsec tunnel that is being used for IKE key exchange (on vEdge routers only). To configure the physical interface that is the source of an IPsec tunnel, use the **tunnel-source-interface** command.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface IPsec

Command Hierarchy

```
vpn vpn-id
  interface ipsec number
   (tunnel-source ipv4-address | tunnel-source-interface interface-name)
```

ipv4-address	Source Address:	
	Source IPv4 address of the IPsec tunnel. This is an address in VPN 0 on the local vEdge router.	

Release	Modification
17.2	Command introduced.

Examples

Configure the source IPv4 address of the IPsec tunnel used for IKE key exchange

```
vEdge(config) # vpn 1 interface ipsec1 tunnel-source 10.0.5.11
```

tunnel vrf multiplexing

To enable tunnel multiplexing, use the **tunnel vrf multiplexing** command in interface configuration mode. To remove the multiplexing, use the **no** form of this command.

tunnel vrf multiplexing no tunnel vrf multiplexing

Command Default

Tunnel multiplexing is enabled.

Command Modes

Interface configuration (config-if)

Command History

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.2.1r	Command qualified for use in Cisco vManage CLI templates.

Usage Guidelines

When configuring Secure Internet Gateway (SIG) tunnels, add this command to your tunnel configuration. The SIG tunnel is created in the VPN 0 (global) space. The SIG tunnel configuration is identical to other IPSEc tunnel configurations, excluding the inclusion of this command. This command enables VPN multiplexing and demultiplexing. This allows the hosts of multiple service VPNs to use the tunnel.

The following example shows how to set a Gigabit Ethernet interface as the tunnel source:

```
interface Tunnel10001
no shutdown
ip address 192.168.0.5 255.255.255.252
ip mtu 1500
tunnel source GigabitEthernet0/0/0
tunnel destination 10.1.1.1
tunnel mode ipsec ipv4
tunnel path-mtu-discovery
tunnel protection ipsec profile if-ipsec1-ipsec-profile
tunnel vrf multiplexing
```

udp-timeout

Configure when NAT translations over a UDP session time out (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface Cellular (for vEdge cellular wireless routers only)

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface NAT Pool

Configuration ► Templates ► VPN Interface PP

Command Hierarchy

```
vpn vpn-id
  interface interface-name
  nat
  udp-timeout minutes
```

Syntax Description

minutes	Time:
	Time after which NAT translations over UDP sessions time out.
	Range: 1 through 65536 minutes
	Default: 1 minute

Command History

Release	Modification
14.2	Command introduced.

Examples

Change the NAT translation timeout value for UDP sessions to 1 hour

```
vEdge# config
vEdge(config)# vpn 1 interface ge0/4 nat udp-timeout 60
vEdge(config-nat)# show full-configuration
vpn 1
  interface ge0/4
  nat
    udp-timeout 60
  !
  !
!
```

Operational Commands

show ip nat filter show ip nat interface show ip nat interface-statistics

update-source

Have BGP use a specific IP address or interface for the TCP connection to the neighbor(on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► BGP

Command Hierarchy

```
vpn vpn-id
  router
  bgp local-as-number
   neighbor ip-address
      update-source (ip-address | interface-name)
```

ip-address	IP Address:
	IP address to use for the TCP connection to the neighbor, in decimal four-part dotted notation.
interface-name	Interface Name:
	Interface name to use for the TCP connection to the neighbor.

Release	Modification
14.1	Command introduced.

Examples

Configure the IP address to use for the TCP connection to the BGP neighbor

```
vm6# show running-config vpn 1 router bgp 1 neighbor 10.20.25.18
vpn 1
router
bgp 1
neighbor 10.20.25.18
no shutdown
remote-as 2
!
password $4$L3rwZmsIiZB6wtBgLEFXKw==
update-source 75.0.0.1
!
!
!
!
```

Operational Commands

show bgp neighbor

upgrade-confirm

Configure the time limit for confirming that a software upgrade is successful. It is recommended that you configure this on all vEdge devices.

By default, software upgrade confirmation is not enabled. When you enable the confirmation, the device waits for the amount of time you configure. If the device does not come up within that time, the device reverts to the previous image.

When the upgrade-confirm is enabled, the devices can still revert to the previous image if the control-connections fail to come up.

After you issue the **request software install reboot** command to upgrade the software and then log in to the device after the reboot completes, enter the **request software upgrade-confirm** command within the configured time limit to confirm that the software upgrade is successful. If you do not, the system automatically reverts to the previous software image.

Command Hierarchy

```
system
upgrade-confirm minutes
```

Syntax Description

minutes	

Time To Wait for Confirmation:

How long to wait for a **request software upgrade-confirm** command to be issued before reverting to the previous software image if a software upgrade fails.

Range: 5 through 60 minutes

Default: None

Command History

Release	Modification
15.1	Command introduced.
15.2	Support for vBond orchestrator, vManage NMS, and vSmart controller added.

Examples

Set the upgrade confirmation time to 5 minutes. After a software upgrade, when the system reboots and restarts, if you do not issue a request software upgrade-confirm command within 5 minutes (either from the CLI or from the vManage NMS), the system automatically reverts to the software image that was running before the upgrade.

```
system
  upgrade-confirm
```

Operational Commands

request software activate

request software install

request software upgrade-confirm

Related Topics

request software activate, on page 706

usb-controller

Enable or disable the USB controller, which drives the external USB ports (on vEdge 1000 and vEdge 2000 series routers only). By default, the USB controller is disabled.

When you change the setting of this command in the configuration, the router reboots immediately, when you press the Enter key. You are prompted before the reboot occurs.

Enabling the USB controller allows you to copy configurations or files from or to a USB stick installed in the router

Note that for vEdge 100 and vEdge 5000 series routers, the USB controller is enabled by default.

vManage Feature Template

For vEdge 1000 and vEdge 2000 series routers only:

Configuration ► Templates ► System

Command Hierarchy

```
system
[no] usb-controller
```

Command History

Release	Modification
15.3.2	Command introduced.

Examples

Enable the USB controller on a vEdge route

```
vEdge(config) # system
vEdge(config-system) # usb-controller
The following warnings were generated:
    'system usb-controller': For this configuration to take effect, this command will cause an immediate device reboot
Proceed? [yes, no] yes
Starting cleanup

The system is going down for reboot NOW!
```

Operational Commands

show hardware environment

user

Configure an SNMPv3 user.

vManage Feature Template

For all vEdge devices:

Configuration ► Templates ► SNMP

Command Hierarchy

```
snmp
  user username
   auth authentication
  auth-password password
```

group group-name
priv privacy
priv-password password

Syntax Description

auth authentication	Authentication Type and Password:
auth-password password	Authentication mechanism to use for the user. <i>authentication</i> can be either message digest5 (md5) or SHA-2 message digest (sha). Enter the password either in cleartext or as an AES-encrypted key.
group group-name	Group Name: Name of an SNMPv3 group configured with the snmp group command. <i>group-name</i> can be 1 to 32 alphanumeric characters. If the name includes spaces, enclose it in quotation marks (" ").
priv privacy	Privacy Type and Password:
priv-password password	Privacy mechanism to use for the user. <i>privacy</i> can be the Advanced Encryption Standard cipher algorithm used in cipher feedback mode, with a 128-bit key (aes-cfb-128). In Releases 17.1 and earlier, <i>privacy</i> can also be the data encryption standard algorithm (des).
	Enter the password either in cleartext or as an AES-encrypted key.
user username	Username:
	Name of an SNMP user. It can be 1 to 32 alphanumeric characters. If the name includes spaces, enclose it in quotation marks (" ").

Command History

Release	Modification
16.2	Command introduced.
17.2	Support for DES privacy removed.

Operational Commands

show running-config snmp

group, on page 219

user

system aaa user: Configure a login account for each user who can access the local Cisco vEdge device, assigning the user a login name and a password and placing them into an authorization group.

Only a user who is logged in as the **admin** user has permission to create login accounts for users.

If an **admin** user changes the privileges of a user by changing their group, and if that user is currently logged in to the device, the user is logged out and must log back in again.

vManage Feature Template

For all vEdge devices:

Configuration ► Templates ► AAA

Command Hierarchy

```
system
aaa
user username
group group-name
password password
```

group	Authorization Group:
group-name	Name of an authorization group configured with the usergroup command. You must assign the user to one or more groups.
user-name	Username:
	Name for the user. In Releases 17.1 and later, <i>username</i> can be 1 to 128 characters long, and it must start with a letter. The name can contain only lowercase letters, the digits 0 through 9, hyphens (-), underscores (_), and periods (.). The name cannot contain any uppercase letters. In Releases 16.3 and earlier, <i>username</i> can be 1 to 32 characters long, and it must start with a letter. The name can contain only lowercase letters, the digits 0 through 9, and the hyphen (-) and underscore (_) characters. The name cannot contain any uppercase letters. The Cisco SD-WAN software provides one standard username, admin , which is a superuser who has read and write permissions to all commands and operations on the device.
	The following usernames are reserved, so you cannot configure them: backup, basic, bin, daemon, games, gnats, irc, list, lp, mail, man, news, nobody, proxy, quagga, root, sshd, sync, sys, uucp, and www-data. Also, names that start with viptela-reserved are reserved.
	If a remote server validates authentication and that user is not configured locally, the user is logged in to the vshell as the user "basic", with a home directory of /home/basic. If a remote server validates authentication and that user is configured locally, the user is logged in to the vshell under their local username (say, eve) with a home direction of /home/username (so, /home/eve).

password password

User Password:

Password for the user. *password* is an MD5 digest string, and it can contain any Unicode and ISO/IEC 10646 characters, including tabs, carriage returns, and linefeeds. To include an exclamation point (!) in a password, enclose the entire password in quotation marks (for example, "Pass01!"). For more information about allowed password characters, see Section 9.4 in RFC 7950, *The YANG 1.1 Data Modeling Language*.

Each username is required to have a password, and each user is allowed to change their own password.

After you type the password during the CLI configuration process, the string is immediately encrypted and a readable version of the password is never displayed. When you type the password in the vManage AAA feature template, a readable version is never displayed.

When a user is logging in to a vEdge device, they have five chances to enter the correct password. After the fifth incorrect attempt, the user is locked out of the device, and they must wait 15 minutes before attempting to log in again.

Command History

Release	Modification
14.1	Command introduced.
17.1	Increased maximum group name to 128 characters and support periods (.) in group name.

Examples

Configure a user whose role is to be a system operator

```
vEdge# config
Entering configuration mode terminal
vEdge(config)# system aaa
vedge-1(config-aaa)# user eve
vEdge(config-user-eve)# password 123456
vEdge(config-user-eve)# group operator
vEdge(config-aaa)# show configuration
system
aaa
user eve
password encrypted-password
group operator
!
```

radius, on page 413
tacacs, on page 482
usergroup, on page 535
```

usergroup

Configure groupings of users and assign authorization privileges to the group. Groups define what tasks the group members are authorized to perform on the vEdge device.

If an *admin* user changes the privileges of a user by changing their group, and if that user is currently logged in to the device, the user is logged out and must log back in again.

vManage Feature Template

For all vEdge devices:

Configuration ► Templates ► AAA

Command Hierarchy

```
system
   aaa
     usergroup group-name
     task (interface | policy | routing | security | system) (read | write)
```

Syntax Description

· J		
group-name	Group Name:	
	Name of an authentication group. In Releases 17.1 and later, <i>group-name</i> can be 1 to 128 characters long, and it must start with a letter. The name can contain only lowercase letters, the digits 0 through 9, hyphens (-), underscores (_), and periods (.). The name cannot contain any uppercase letters. In Releases 16.3 and earlier, <i>group-name</i> can be 1 to 32 characters long, and it must start with a letter. The name can contain only lowercase letters, the digits 0 through 9, and the hyphen (-) and underscore (_) characters. The name cannot contain any uppercase letters.	
	The vEdge software provides three standard user groups, <i>basic</i> , <i>netadmin</i> , and <i>operator</i> . The user <i>admin</i> is automatically placed in the group <i>netadmin</i> and is the only user in this group. All users learned from a RADIUS or TACACS+ server are placed in the group <i>basic</i> . All users in the basic group have the same permissions to perform tasks, as do all users in the <i>operator</i> group.	
	The following groups names are reserved, so you cannot configure them: adm, audio, backup, bin, cdrom, dialout, dip, disk, fax, floppy, games, gnats, input, irc, kmem, list, lp, mail, man, news, nogroup, plugdev, proxy, quagga, quaggavty, root, sasl, shadow, src, sshd, staff, sudo, sync, sys, tape, tty, uucp, users, utmp, video, voice, and www-data. Also, group names that start with the string viptela-reserved are reserved.	
	If a remote server validates authentication but does not specify a user group, the user is placed into the user group <i>basic</i> .	
	If a remote server validates authentication and specifies a user group (say, X), the user is placed into that user group only. However, if that user is also configured locally and belongs to a user group (say, Y), the user is placed into both the groups (X and Y).	
task (interface	Tasks Allowed:	
policy routing security system) (read write)	Privilege roles that the user group has. Each role allows the group to read or write specific portions of the device's configuration and to execute specific types of operational commands. For details, see the <i>Role-Based Access with AAA</i> article for your software release.	

Command History

Release	Modification
14.1	Command introduced.
15.3	Force a user to log out when their permissions are changed.
17.1	Increase maximum group name to 128 characters and support periods (.) in group name.

Examples

Display the default user groups and their privileges

```
vEdge# show running-config system aaa usergroup
system
aaa
  usergroup basic
  task system read write
  task interface read write
!
  usergroup netadmin
!
  usergroup operator
  task system read

vbond

Configure the IP address and other information related to the vBond orchestrator.

vManage Feature Template

For vEdge routers acting as vBond controllers only:

Configuration ► Templates ► System

Command Hierarchy

```
system
vbond (dns-name | ip-address) [local] [port number] [ztp-server]
```

In Releases 16.3 and later, the following command hierarchy is also available:

```
system
vbond [dns-name | host-name | ip-address] [local] [port number] [ztp-server]
```

vbond-only	Configure Device To Be only a vBond Orchestrator:
(Deprecated starting with Release 16.1)	Configure a hardware vEdge router or a software vEdge Cloud router to act only as a vBond orchestrator. Starting with Release 16.1, you must include this option to configure a vBond orchestrator. Starting with Release 16.1, a vBond orchestrator and a vEdge router cannot coexist in the same virtual machine or on the same hardware router, so do not configure any edge router functionality on a vBond orchestrator.
dns-name	DNS Name of the vBond Orchestrator:
	DNS name that points to one vBond orchestrator or to a number of vBond orchestrators. The addresses can resolve to vBond orchestrators configured with IPv4 addresses, with IPv6 addresses, or with both IPv4 and IPv6 adresses.
ip-address	IP Address of the vBond Orchestrator:
	IPv4 or IPv6 address of the vBond orchestrator, in decimal four-part dotted notation. You can configure one address, and it must be a public IP address.
local	Local vBond System:
	(On vBond orchestrator only. Designate the local vEdge router to be a vBond orchestrator in the vEdge overlay network domain.
	Starting in Release 16.3, if you configure the <i>local</i> option, you can omit the DNS name, hostname, or IP address of the vBond orchestrator as long as one of the interfaces in VPN 0 has a routable public IP address.
ztp-server	Local Zero-Touch-Provisioning Server:
	Designate the local vEdge router to be the zero-touch-provisioning (ZTP) server in the overlay network domain. Such a vBond orchestrator acts as an enterprise ZTP server, and provides the vEdge routers in your domain with the IP address of your enterprise vBond orchestrator and with the enterprise root CA chain. You must load two files onto your enterprise ZTP server: the vEdge authorized serial number file that you received from vEdge and your enterprise root CA chain, which must be signed by Symantec. You must also configure your enterprise DNS server with an A record that redirects the URL ztp.viptela.com to your enterprise ZTP server. The recommended URL for this enterprise server is ztp. your-company-name.com.
	A vEdge router acting as an enterprise ZTP server should be dedicated to that function. It cannot be used as a regular vBond orchestrator in the overlay network domain. Also, it is recommended that you not use it in an edge router capacity.
host-name	Multiple vBond Orchestrators:
	If you want to configure addresses of multiple vBond orchestrators, but are not using a DNS name resolution server, you can configure the hostname of an orchestrator. Then, in VPN 0, use the host command to configure the IP addresses of the vBond orchestrators. For example, if you configure system vbond vbond1 , you could configure vpn 0 host vbond1 10.0.12.26 2001::10.0.12.26 to configure two vBond orchestrator addresses, one an IPv4 address and the second an IPv6 address.

port number	Port Number to Connect to vBond Orchestrator:
	Port number to use to connect to the vBond orchestrator.
	If you omit this option, the local system first tries port 12346 on the vBond orchestrator. If this port is not available, the system then tries port 12366 and then port 12388, rotating through these three port numbers until one is available.
	If you do not want to rotate through these three port numbers, configure the port number to use to connect to the vBond orchestrator.
	Default: 12346
	Range: 1 through 65535
no system	Remove a vBond Orchestrator from the Configuration:
vbond	Remove the vBond configuration from the device. If you have configured an IP address for the vBond orchestrator, to change the address, you must delete the address and then configure the new address. Doing this causes all of the devices existing connections to the vEdge devices in the network to go down; they come back up after you commit the configuration with the new IP address. To avoid this problem, it is highly recommended that you always use a DNS name for your vBond orchestrators, and then make changes to the DNS devices instead of on the vEdge routers and vSmart controllers directly.

Release	Modification
14.1	Command introduced.
14.3	ztp-server option added.
16.1	vbond-only option deprecated.

Examples

Configure the DNS name of a vBond orchestrator on a vEdge router:

```
system
  vbond vbond.east.acme.com
!
```

Designate the local vEdge router to be a vBond orchestrator in its vEdge overlay network domain:

```
system
  vbond 10.0.4.12 local
```

Designate the local vEdge router to be an enterprise ZTP server:

```
system
  vbond 75.1.16.4 local ztp-server
!
```

Operational Commands

nslookup

show control connections

port-hop, on page 393

vbond-as-stun-server

Enable Session Traversal Utilities for NAT (STUN) to allow the tunnel interface to discover its public IP address and port number when the vEdge router is located behind a NAT (on vEdge routers only). When you configure this command, vEdge routers can exchange their public IP addresses and port numbers over private TLOCs.

With this configuration, the vEdge router uses the vBond orchestrator as a STUN server, so the router can determine its public IP address and public port number. (With this configuration, the router cannot learn the type of NAT that it is behind.) No overlay network control traffic is sent and no keys are exchanged over tunnel interface configured to the the vBond orchestrator as a STUN server. However, BFD does come up on the tunnel, and data traffic can be sent on it.

Because no control traffic is sent over a tunnel interface that is configured to use the vBond orchestrator as a STUN server, you must configure at least one other tunnel interface on the vEdge router so that it can exchange control traffic with the vSmart controller and the vManage NMS.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface Cellular (for vEdge cellular wireless routers only)

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface PPP

Command Hierarchy

```
vpn 0
  interface interface-name
  tunnel-interface
   vbond-as-stun-server
```

Command History

Release	Modification
16.3	Command introduced.

Examples

Configure two tunnel interfaces, one to use for the exchange of control traffic (ge0/2) and the other to allow the device to discover its public IP address and port number from the vBond orchestrator (ge0/1). Note that the no allow-service stun command, which is configured by default on tunnel interfaces, pertains to allowing or disallowing the vEdge router to generate requests to a generic

STUN server so that the device can determine whether it is behind a NAT and, if so, what kind of NAT it is and what the device's public IP address and public port number are.

```
vEdge \, (\texttt{config-interface-ge0/1}) \, \# \, \, \, \textbf{show full-configuration}

Related Topics

allow-service, on page 65

view

Define an SNMP MIB view.

vManage Feature Template

For all vEdge devices:

Configuration ► Templates ► SNMP

Command Hierarchy

```
snmp
  view string
  oid oid-subtree [exclude]
```

Syntax Description

exclude	Include or Exclude a Subtree of MIB Objects:
	If you omit the exclude option in the oid command, the subtree of MIB objects is included, or viewable, in the MIB view.
	If you specify the exclude option, the subtree of MIB objects is excluded and hence is not viewable in the MIB view. For example, you might want to exclude MIB objects which could potentially reveal information about configure SNMP credentials (such as snmpUsmMIB, snmpVacmMIB, and snmpCommunityMIB).
oid oid-subtree	Object Identifier:
	Object identifier of a subtree of MIB objects. Specify the OID in Abstract Syntax Notation One (ASN.1) notation, as a sequence of dotted integers that identify the node of an SNMP tree. Use the asterisk wildcard (*) in any position of the OID subtree to match any value at that position rather than matching a specific type or name.
view string	View Name:
	Name of the view record you are creating. It can be a maximum of 32 characters. If the name includes spaces, enclose it in quotation marks (" ").

Command History

Release	Modification
14.1	Command introduced.
16.2	Wildcard for configuring OID subtree added.

Examples

Create a view of the Internet portion of the SNMP MIB:

```
vEdge# show running-config snmp
snmp
no shutdown
view v2
oid 1.3.6.1
!
community private
view v2
authorization read-only
!
```

Create a view of the private portion of the Cisco SD-WAN MIB:

```
vEdge (config-snmp) # view viptela-private oid 1.3.6.1.4.1.41916
```

Configure a MIB view for system status:

```
vEdge(config) # show config
snmp
view status
oid 1.3.6.1.2.1.2.2.2.1.8
!
```

Operational Commands

show running-config snmp

vlan

Associate a VLAN tag (identifier) with the bridging domain (on vEdge routers only).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► Bridge

Command Hierarchy

```
bridge bridge-id
  vlan vlan-id
```

Syntax Description

```
vlan-id VLAN Tag:

VLAN identifier to associate with the bridging domain.

Range: 0 through 4095
```

Command History

Release	Modification
15.3	Command introduced.

Examples

Associate a VLAN ID with a bridging domain

```
vEdge(config) # bridge 1
vEdge(config-bridge-1) # vlan 27
```

Operational Commands

show bridge interface show bridge mac show bridge table

vmanage-connection-preference

Set the preference for using a tunnel interface to exchange control traffic with the vManage NMS (on vEdge routers only). Configuring this option is useful for LTE and other links on which you want to minimize traffic.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface Cellular (for vEdge cellular wireless routers only)

Configuration ► Templates ► VPN Interface Ethernet

Configuration ► Templates ► VPN Interface PPP

Command Hierarchy

```
vpn 0
  interface interface-name
  tunnel-interface
    vmanage-connection-preference number
```

Syntax Description

number Preference Value: Preference for using the tunnel interface to exchange control traffic with the vManage NMS. The tunnel with the higher value has a greater preference to be used for connections to the vManage NMS. To have a tunnel interface never connect to the vManage NMS, set the preference value to 0. At least one tunnel interface on the vEdge router must have a non-0 preference value.

Range: 0 through 8

Default: 5

Command History

Release	Modification
16.3	Command introduced.

Examples

Configure a tunnel interface for an LTE interface to be the TLOC that carries control traffic between the vEdge router and the vManage NMS

```
vpn 0
interface ge0/0
ip address 10.1.15.15/24
tunnel-interface
  color lte
  vmanage-connection-preference 8
!
  no shutdown
```

Operational Commands

show control local-properties | display xml | include vmanage-connection

Syntax Description

vpn-id VPN Identifier:

Numeric identifier of the VPN. VPN 0 is the transport VPN and is reserved for control plane traffic. VPN 512 is reserved for out-of-band management traffic.

Values: On vEdge routers: 0 through 65530 On Cisco SD-WAN controller devices: 0, 512

Command History

Release	Modification
14.1	Command introduced.

Examples

Configure VPN 0, which is the transport VPN used to reach the WAN. Here, the vEdge router connects to the WAN over interface ge0/1

```
vpn 0
interface ge0/1
   ip address 10.2.6.11/24
     color default
    preference 10
     weight 10
   no shutdown

```

Operational Commands

show bgp commands (on vEdge routers only)

show interface commands show multicast commands (on vEdge routers only) show ospf commands (on vEdge routers only) show pim commands (on vEdge routers only)

vpn-membership

Configure or apply a centralized data policy based on VPN membership (on vSmart controllers only).

vManage Feature Template

For vSmart controllers:

Configuration ► Policies ► Centralized Policy

Command Hierarchy

Create a Centralized Data Policy

```
policy
  vpn-membership policy-name
  default-action (accept | reject)
  sequence number
   match
     vpn vpn-id
     vpn-list list-name
  action (accept | reject)
```

Apply a Centralized Data Policy

```
apply-policy
   site-list list-name vpn-membership policy-name
```

Syntax Description

policy-name	VPN Membership Policy Name:
	Name of the VPN membership policy to configure or to apply to a list of sites in the overlay network. <i>policy-name</i> can be up to 32 characters long.

Command History

Release	Modification
14.1	Command introduced.

Examples

Create and apply a VPN membership policy for a group of VPNs

```
vSmart# show running-config
```

```
policy
 lists
  vpn-list east-vpns
   vpn 1-10
  site-list east-sites
   site-id 100-110
 vpn-membership vpn-policy
  sequence 1
  match vpn-list east-vpns
   action accept
  !
 default-action reject
!
apply-policy
site-list east-sites
 vpn-membership vpn-policy
!
```

vrrp

Configure the Virtual Router Redundancy Protocol (VRRP) to allow multiple routers to share a common virtual IP address for default gateway redundancy (on vEdge routers only).

Hosts are assigned a single default gateway (also called default router) IP address, either through DHCP or statically for the first-hop router. This situation creates a single point of failure in the network. VRRP provides default gateway (first-hop router) redundancy through configuration of a virtual IP address shared by multiple routers on a single LAN or subnet.

One router on the LAN or subnet becomes primary, thus assuming the role of the default gateway, and the other routers take the role of subordinate. When the primary router fails, one of the subordinates is elected as the new primary and assumes the role of default gateway.

You cannot configure VRRP on an interface that is in the transport VPN (VPN 0).

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface Ethernet

Command Hierarchy

```
vpn vpn-id
  interface geslot/port[.subinterface]
  vrrp group-number
   ipv4 ip-address
  priority number
  timer seconds
  (track-omp | track-prefix-list list-name)
```

Syntax Description

timer seconds	Advertisement Time:
	How often the VRRP primary sends VRRP advertisement messages. If subordinate routers miss three consecutive VRRP advertisements, they elect a new primary.
	For Cisco vEdge Devices
	Range: 1 through 3600 seconds
	Default: 1 second
	For Cisco XE SD-WAN Routers
	Range: 100 through 3600 milliseconds
	Default: 100 milliseconds
priority number	Priority To Be Elected Primary:
	Priority level of the router. The router with the highest priority is elected as primary. If two vEdge routers have the same priority, the one with the higher IP address is elected as primary.
	Range: 1 through 254
	Default: 100

(track-omp	Track Interface State:
track-prefix-list list-name list-name)	By default, VRRP uses of the state of the service (LAN) interface on which it is running to determine which vEdge router is the primary virtual router. When the interface for the primary goes down, a new VRRP primary virtual router is elected based on the VRRP priority value.
	Because VRRP runs on a LAN interface, if a vEdge router loses all its WAN control connections, the LAN interface still indicates that it is up even though the router is functionally unable to participate in VRRP. To take WAN side connectivity into account for VRRP, you can configure one of the following:
	track-omp : Track the Overlay Management Protocol (OMP) session running on the WAN connection when determining the VRRP primary virtual router. If all OMP sessions are lost on the primary VRRP router, VRRP elects a new default gateway from among all the gateways that have one or more active OMP sessions even if the gateway chosen has a lower VRRP priority than the current primary. With this option, VRRP failover occurs once the OMP state changes from up to down, which occurs when the OMP hold timer expires. (The default OMP hold timer interval is 60 seconds.) Until the hold timer expires and a new VRRP primary is elected, all overlay traffic is dropped. When the OMP session recovers, the local VRRP interface claims itself as primary even before it learns and installs OMP routes from the vSmart controllers. Until the routes are learned, traffic is also dropped.
	track-prefix-list : Tracks only the selected OMP remote prefixes on routing table (RIB).
	list-name is the name of a prefix list configured with the policy lists prefix-list command on the vEdge router. If all OMP sessions are lost, VRRP failover occurs as described for the track-omp option. OMP session lost does not immediately mean that failover occurs.
	Default: VRRP tracks only the interface on which it is configured.
vrrp	Virtual Router ID:
group-number	Virtual router ID, which is a numeric identifier of the virtual router. For each interface or subinterface, you can configure only a single VRRP group. On a router, you can configure a maximum of 512 groups.
	Range: 1 through 512
ip address	Virtual Router IP Address:
ip-address	IP address of the virtual router. The virtual IP address must be different from the configured interface IP addresses of both the local vEdge router and the peer running VRRP. For each interface or subinterface, you can configure only a single virtual IP address.

Release	Modification
14.1	Command introduced.
15.2	Tracking by prefix list added.
18.3	You can configure a maximum of 24 VRRP groups on a router.

Release	Modification
Cisco SD-WAN Release 20.3.1	Added support for up to 5 VRRP groups per interface, and up to 512 groups on a router. The VRRP group number range increased to: 1 to 512

Example: Configure VRRP in VPN 1, on the subinterface ge0/1.3 on vEdge Devices

```
vpn 1
  interface ge0/1.3
  ip address 10.2.3.11/24
  mtu 1490
  no shutdown
  vrrp 3
   priority 200
  timer 1
  ipv4 10.2.3.201
  track-prefix-list vrrp-prefix-list
!
```

Example: Configure VRRP on Cisco XE SD-WAN Routers

```
interface GigabitEthernet0/0/2
description to-LAN
no shutdown
arp timeout 1200
vrf forwarding 1
ip address 10.180.4.3 255.255.255.0
ip redirects
ip mtu 1500
           1500
negotiation auto
vrrp 1 address-family ipv4
 vrrpv2
 address 10.180.4.1
 priority 90
 timers advertise 1000
exit
exit
```

Example: Multiple VRRP Groups on One Interface

The following is an example of configuring 5 VRRP groups on 1 interface.

```
vpn 2
  interface ge0/4.2
  ip address 10.0.1.10/24
  ip secondary-address 10.0.2.10/24
  ip secondary-address 10.0.3.10/24
  ip secondary-address 10.0.4.10/24
  mtu 1496
  no shutdown
  vrrp 1
    priority 101
    ipv4 10.0.1.1
```

```
vrrp 2
  ipv4 10.0.1.2
!
 vrrp 3
  priority 101
  ipv4 10.0.2.1
!
 vrrp 4
  ipv4 10.0.3.1
!
 vrrp 5
  ipv4 10.0.4.1
!
!
!
!
!
```

Note

For Cisco IOS XE Catalyst SD-WAN devices, the VRRP timer range is 100 to 3600 milliseconds.

wake-on-lan

Allow a client to be powered up when the vEdge router receives an Ethernet magic packet frame (on vEdge routers only). This feature allows you to connect to clients that have been powered down.

vManage Feature Template

For vEdge routers only:

Configuration ► Templates ► VPN Interface Ethernet

Command Hierarchy

```
vpn vpn-id
  interface interface-name
  dot1x
    wake-on-lan
```

Command History

Release	Modification
16.3	Command introduced.

Examples

Configure wake on LAN on an 802.1X interface

```
vEdge# show running-config vpn 0 interface ge0/7 vpn 0 interface ge0/7
```

```
dot1x
  control-direction in-and-out
  wake-on-lan
```

clear dot1x client show dot1x clients show dot1x interfaces show dot1x radius show system statistics

Related Topics

```

wlan

Configure a wireless WAN (WLAN) (on vEdge cellular wireless routers only).

vManage Feature Template

For vEdge cellular wireless routers only:

Configuration ► Templates ► WiFi Radio

Configuration ► Templates ► WiFi SSID

Command Hierarchy

```
wlan radio-band
channel channel
channel-bandwidth megahertz
country country
guard-interval nanoseconds
interface vapnumber
data-security security
description text
max-clients number
mgmt-security security
radius-servers tag
[no] shutdown
ssid ssid
wpa-personal-key password
```

Syntax Description

radio-band

WLAN Frequency:

Select the radio band for the WLAN channel to use:

2.4GHz—Supports 13 channels that are spaced 5 MHz apart; channel 14 is not supported. This radio band supports IEEE 802.11b, 802.11g, and 802.11n clients.

5GHz—For this channel, allowable channels, allowed users, and maximum power level with the frequency ranges are country-specific. This radio band supports IEEE 802.11a, 802.11n, and 802.11ac clients.

The allowable channels and the maximum transmission power for these channels are country specific.

Command History

Release	Modification
16.3	Command introduced.

Examples

Configure a 5-GHz WLAN channel

```
vEdge# show running-config wlan
wlan 5GHz
 channel 36
interface vap0
 ssid tb31 pm6 5ghz vap0
 no shutdown
 interface vap1
 ssid tb31_pm6_5ghz_vap1
 data-security wpa/wpa2-enterprise
 radius-servers tag1
 no shutdown
 interface vap2
                tb31_pm6_5ghz_vap2
 ssid

wpa-personal-key

Configure the password to access a wireless LAN that uses wpa-personal or wpa2-personal security (on vEdge cellular wireless routers only).

vManage Feature Template

For vEdge cellular wireless routers only:

Configuration ► Templates ► WiFi SSID

Command Hierarchy

```
wlan radio-band
  interface vapnumber
  wpa-personal-key password
```

Syntax Description

password	Password:
	Password that users must enter to access the wireless LAN. The password is case sensitive. You can enter it in clear text or an AES-encrypted key.

Command History

Release	Modification
16.3	Command introduced.

Examples

Set a WPA password for a VAP interface (that is, for an SSID)

```
wpa-personal-key GuestPassword
max-clients 10
no shutdown
!
```

zone

Create a group of one or more VPNs in the overlay network that form a zone (on vEdge routers only).

Command Hierarchy

```
policy
  zone zone-name
  vpn vpn-id
```

Syntax Description

vpn	VPN:
vpn-id	Numeric identifier of the VPN.
	Range: 0 through 65530
zone-name	Zone Name:
	Name of the zone.

Command History

Release	Modification
18.2	Command introduced.

Examples

Configure and apply a zone-based firewall policy

```
vEdge# show running-config policy
policy
  zone A
   vpn 1
  zone B
   vpn 2
   vpn 3
   vpn 4
  zone-to-nozone-internet allow
  zone-pair zbfw-pair-1
   source-zone A
   destination-zone B
   zone-policy zbfw-policy-1
  zone-based-policy zbfw-policy-1
    sequence 1
      match
       protocol 6
      action inspect
    default-action drop
```

log
pass
```

Apply a Zone-Based Firewall Policy

```
policy
  zone zone-name
    vpn vpn-id
  zone-pair zone-pair-name
    destination-zone zone-name
    source-zone zone-name
    zone-policy zone-policy-name
```

Syntax Description

zone-policy-name	Zone Policy Name:
	Name of the zone-based firewall policy to configure or to apply to a zone pair in the overlay network. The zone name can be from 1 to 32 characters longs.

Command History

Release	Modification
18.2	Command introduced.

Examples

Configure and apply a zone-based firewall policy

```
vEdge# show running-config policy
policy
  zone A
   vpn 1
  zone B
   vpn 2
   vpn 3
   vpn 4
  zone-to-nozone-internet allow
  zone-pair zbfw-pair-1

zone-pair

Configure a zone pair to apply a zone-based firewall policy to traffic flows between a source zone and a destination zone (on vEdge routers only).

Command Hierarchy

```
policy
  zone-pair pair-name
  destination-zone zone-name
  source-zone zone-name
  zone-policy zone-policy-name
```

Syntax Description

destination-zone zone-name	Destination Zone:						
	Name of the destination zone. This is the zone to which traffic flows are destined, and that you configured with the policy zone command.						
source-zone zone-name	Source Zone:						
	Name of the source zone. This is the zone from which traffic flows are sent, and that you configured with the policy zone command.						
zone-policy zone-policy-name	Zone-Based Firewall Policy:						
	Name of the zone-based firewall policy to apply to the zone pair. This is a policy you configured with the policy zone-based-policy command.						

pair-name	Zone Pair Name:
	Name of the zone pairing.

Release	Modification
18.2	Command introduced.

Examples

Configure and apply a simple zone-based firewall policy

```
vEdge# show running-config policy
policy
  zone A
   vpn 1
  zone B
   vpn 2
   vpn 3
   vpn 4
  zone-to-nozone-internet allow
  zone-pair zbfw-pair-1
   source-zone A
   destination-zone B
   zone-policy zbfw-policy-1

zone-to-nozone-internet

For a zone-based firewall, control whether packets can reach destination zones that are accessible only over the public internet if none of the zones in the zone-based firewall policy include VPN 0 (on vEdge routers only). By default, if you do not include VPN 0 in any of the configured zones, packets can reach their destination zone over the public internet.

You can add this command to the configuration only after you have configured at least one zone. If you remove all zones from a configuration, the value of this command returns to the default of **allow**. If you want to block internet access, you must configure the **deny** option again.

Command Hierarchy

```
policy
  zone-to-nozone-internet (allow | deny)
```

Syntax Description

allow	Allow Traffic To Use the Public Internet:
	If you do not include VPN 0 in any of the configured zones, packets can travel over the public internet to reach their destination zone. This is the default.
deny	Do Not Allow Traffic To Use the Public Internet:
	If you do not include VPN 0 in any of the configured zones, packets cannot travel over the public internet to reach their destination zone.

Command History

Release	Modification
18.2	Command introduced.

Examples

Configure and apply a simple zone-based firewall

```
vEdge# show running-config policy
policy
  zone A
    vpn 1
!
  zone B
    vpn 2
    vpn 3
    vpn 4
!
  zone-to-nozone-internet allow
  zone-pair zbfw-pair-1
    source-zone A
    destination-zone B
    zone-policy zbfw-policy-1
!
```

```
zone-based-policy zbfw-policy-1
    sequence 1
    match
        protocol 6
    !
        action inspect
    !
        default-action drop
    !

Overview of Operational Commands

The operational command reference pages describe the CLI commands that you use to display the properties and operational status of vSmart controllers, vEdge routers, and vBond orchestrators in the overlay network. When you log in to the CLI on a Cisco vEdge device, you are in operational mode.

In the CLI, operational commands are organized alphabetically, and many commands are organized into functional hierarchies. The top-level operational commands and command hierarchies are:

• clear—Zero or erase information stored on the device or collected data.

- clock—Set the time.
- commit—Confirm a pending commit operation.
- complete-on-space—Enable the ability to type a space to have the CLI complete unambiguous commands.
- config—Enter configuration mode.
- exit—Configure basic system parameters.
- file—Configure the properties of a VPN, including the interfaces that participate in the VPN and the routing protocols that are enabled in the VPN.
- help—Display help information about CLI commands.
- history—Control the CLI command history cache.
- idle-timeout—Set how long a CLI session can be idle before the user is logged out.
- logout—Exit from the CLI session.
- no-Negate or cancel a command.
- nslookup—Perform a DNS name lookup.
- paginate—Set the number of lines of command output to display.
- ping—Ping a network device.
- poweroff—Power down the device.
- prompt1—Set the operational mode prompt.
- prompt2—Set the configuration mode prompt.
- pwd—Display the current path mode.
- quit—Exit from the CLI session.
- reboot—Reboot the device.
- request—Install various files onto the device.
- screen-length—Set the CLI screen length.
- screen-width—Set the CLI screen width.
- show—Display information about the status of the device or information stored on the device.
- tcpdump—Perform a TCP dump operation.
- timestamp—Enable timestamping.
- traceroute—Perform a traceroute operation.
- vshell—Exit to the shell on the device.

To filter operational command output, use the filters described in Command Filters for CLI Operational Commands.

clear app cflowd flow-all

Clear the cflowd flows in all VPNs (on vEdge routers only).

clear app cflowd flow-all

Command History

Release	Modification
14.3	Command introduced.

Examples

vEdge# show cflowd flows

show app cflowd flows, on page 728

clear app cflowd flows

Clear the cflowd flows in a specific VPN (on vEdge routers only).

clear app cflowd flows vpn vpn-id [flow-property]

Syntax Description

flow-property	Specific Flow To Clear:							
	Narrow down the exact flow to clear. <i>flow-property</i> can be one of:							
	dest-ip prefix/length							
	dest-port port-number(0 through 65535)							
	dscp dscp-value(0 through 255)							
	ip-proto protocol-number(0 through 255)							
	src-ip prefix/length							
	src-port port-number(0 through 65535)							
vpn vpn-id	VPN:							
	Specify the VPN in which to clear all cflowd flows.							

Command History

clear app dpi flows

Clear specific DPI flows in a particular VPN on the vEdge router (on vEdge routers only).

clear app dpi flows vpn *vpn-id* [**destination-prefix** *prefix/length*] [**destination-port** *number*] [**ip-protocol** *protocol*] [**source-prefix** *prefix/length*] [**src-port** *number*]

Syntax Description

destination-prefix prefix/length	IP Prefix:
source-prefix prefix/length	Destination or source IP prefix of the flow.
destination-port number	Port Number:
source-port number	Destination or source port number of the flow.
ip-protocol protocol	Protocol:
	Destination or source port number of the flow.
vpn vpn-id	VPN:
	VPN in which the flow participates.

Release	Modification
15.2	Command introduced.

clear arp

Refresh dynamically created IPv4 entries in the Address Resolution Protocol (ARP) cache (on vEdge routers and vSmart controllers only).

To clear IPv6 entries in the ARP cache, use the **clear ipv6 neighbor** command.

clear arp [interface interface-name] [ip-address] [vpn vpn-id]

Syntax Description

none	Refresh all dynamic ARP cache entries.
interface interface-name	Interface: Refresh the dynamic ARP cache entries associated with the specific interface.
ip-address	IP Address: Refresh the dynamic ARP cache entries for the specified IP address.
vpn vpn-id	VPN: Refresh the dynamic ARP cache entries for the specific VPN.

Command History

clear bgp neighbor

Reset the peering sessions with a specific BGP neighbor in a VPN (on vEdge routers only). **clear bgp neighbor** *ip-address* **vpn** *vpn-id* [**soft** (**in** | **out**)]

Syntax Description

ip-address vpn	Neighbor Address and VPN:					
vpn-id	Reset the connection to the specific BGP neighbor in the specified VPN.					

soft (in out)	Soft Reset:
	Perform a reset when the routing policy changes so that the new policy can take effect. With a soft reset, the route table is reconfigured and reactivated, but the BGP session itself is not reset. Use the in option to generate inbound route table updates from the BGP neighbor, and use the out option to have the local router send a new set of updated to the BGP neighbor.

clear cloudexpress computations

Clear the computations performed by Cloud OnRamp for SaaS (formerly called CloudExpress service) (on vEdge routers only). Cloud OnRamp for SaaS computations include application loss, latency, and best interface.

clear cloudexpress computations [application application]

Syntax Description

(none)	Clear all computations for all applications in all VPNs configured with Cloud OnRamp for SaaS.
application	Specific Application: Clear computations for a specific application configured for Cloud OnRamp for SaaS.
	Values: amazon_aws, box_net, concur, dropbox, google_apps, gotomeeting, intuit, jira, office365, oracle, salesforce, sap, sugar_crm, webex, zendesk, zoho_crm

Command History

Release	Modification
16.3	Command introduced.
17.1	Removed vpn command option.

Release Information Edit section

ACSRREJ - Challenge rejected by peer. NOVMCFG - No cfg in vmanage for device.

BDSGVEREL - Board ID Signature Verify Failure. NOZTPEN - No/Bad chassis-number entry in ZTP.

BIDNTPR - Board ID not Initialized. ORPTMO - Server's peer timed out.

BIDNTVRFD - Peer Board ID Cert not verified. RMGSPR - Remove Global saved peer.

CERTEXPRD - Certificate Expired RXTRDWN - Received Teardown.

CRTREISER - Challenge response rejected by peer. RDSIGFBD - Read Signature from Board ID failed.

CRTVERFL - Fail to verify Peer Certificate. SSLNFAIL - Failure to create new SSL context.

```
CTORGNMMIS - Certificate Org name mismatch.
DCONFAIL - DTLS connection failure.
DEVALC - Device memory Alloc failures.
DHSTMO - DTLS HandShake Timeout.
                                                                                      SERNTPRES - Serial Number not present.
                                                                                      SYSIPCHNG - System-IP changed.
                                                                                      SYSIFCHNG - System-IP changed.

TMRALC - Memory Failure.

TUNALC - Memory Failure.

TXCHTOBD - Failed to send challenge to BoardID.

UNMSGBDRG - Unknown Message type or Bad Register msg.

UNAUTHEL - Recd Hello from Unauthenticated peer.

VBDEST - vDaemon process terminated.
                - Disconnect vBond after register reply.
                - TLOC Disabled.
DISTLOC
DUPSER - Duplicate Serial Number.
DUPCLHELO - Recd a Dup Client Hello, Reset Gl Peer.
                                                                                       VECRTREV
                                                                                                     - vEdge Certification revoked.
HAFAIL
                - SSL Handshake failure.
HERAID - Socket Options failure.

LISFD - Listener Socket FD Error.

MGRTBLCKD - Migration blocked. Wait for local TMO.
                                                                                                     - vSmart Certificate revoked.
                                                                                       VB_TMO
MEMALCFL - Memory Allocation Failure.
NOACTVB - No Active vBond found to connect.
NOERR - No Error.
                                                                                                      - Peer vManage Timed out.

clear control port-index

To reset port-hop back to the base port on Cisco vEdge devices, use the **clear control port-index** command in privileged EXEC mode.

clear control port-index

Command Default This command has no default behavior.

Command Modes Privileged EXEC (#)

Command History	Release	Modification				
	Cisco SD-WAN Release 20.6.1	This command was introduced.				

Use the clear control port-index command to reach back to 12346 base port on all the WAN interfaces.

ExamplesThe following example shows how to clear the port-hopping bucket index:

Device# clear control port-index

clear crash

Delete the core files on the local device. Core files are saved in the /var/crash directory on the local device. **clear crash** *number*

Syntax Description

(none)	Clear all core and information files on the device.
number	Specific Core File: Clear the specific core file.
	$number$ is the index number listed in the ${\bf show}$ ${\bf crash}$ output.

Command History

Release	Modification
15.2	Command introduced.

Examples

```
vSmart# show crash
```

```
INDEX CORE TIME CORE FILENAME

O Tue Sep 2 17:13:43 2014 core.ompd.866.vsmart.1409703222

vSmart# clear crash
Are you sure you want to clear core and info files? [yes, NO]
vSmart# yes
vSmart# show crash
% No entries found.
```

clear dhcp server-bindings

Clear the bindings to DHCP servers (on vEdge routers only).

clear dhcp server-bindings vpn *vpn-id* **interface** *interface-name* [**client-mac** *mac-address*]

Syntax Description

interface interface-name	Interface to DHCP Server: Interface to use to reach the DHCP server.
--------------------------	--

client-mac client-mac	MAC Address of DHCP Server: Clear the entry for a single DHCP host based on the host's MAC address.
vpn vpn-id	VPN: Clear the DHCP bindings in a specific VPN.

Command History

Release	Modification		
14.3	Command introduced.		
15.1	client-mac option added.

```

clear dhcp state

Clear IPv4 DHCP state on the local device (on vEdge routers and vSmart controllers only). **clear dhcp state interface** *interface-name* [**vpn** *vpn-id*]

Syntax Description

interface interface-name	Clear the DHCP state of a specific interface.					
vpn vpn-id	Clear the DHCP state of an interface in the specified VPN.					

Command History

Release	Modification
14.3	Command introduced.

Examples

```
        vEdge# clear dhcp state interface ge0/0

        vEdge# show dhcp interface state init

        ACQUIRED LEASE TIME

        VPN IFNAME STATE IP
        TIME REMAINING GATEWAY

        0
        ge0/0 init 0.0.0.0/0 - - 0.0.0.0
```

clear dns cache

Clear the cache of DNS entries on the local device. Use this command to clear stale entries from the DNS cache.

The DNS cache is populated when the device establishes a connection with the vBond orchestrator. For a vEdge router, this connection is transient, and the DNS cache is cleared when its connection to the vBond orchestrator is closed. For a vSmart controller, the connection to a vBond orchestrator is permanent.

clear dns cache

Command History

Release	Modification
15.3	Command introduced.

Examples

In the example output below, the entries in the DNS cache are highlighted in bold. After the DNS cache is cleared, it takes about 30 seconds for the vSmart controller to reestablish its connection with the vBond orchestrator and to repopulate its DNS cache.

clear interface statistics

Zero interface statistics.

clear interface statistics [interface interface-name] [queue queue-number] [vpn vpn-id]

Syntax Description

(none)	Zero the statistics on all interfaces and all queues.
queue queue-number	Interface Queue: Zero the statistics on the specified queue.
interface interface-name	Specific Interface: Zero the statistics on the specified interface.
vpn vpn-id	VPN: Zero the interface statistics for interfaces in a specific VPN.

Command History

Release	Modification
14.1	Command introduced.

Examples

vEdge# show interface statistics

clear ip leak routes vpn

To clear leaked routes for a VPN, use the clear ip leak routes vpn command.

clear ip leak routes vpn vpn-id

Command History

Release	Modification
Cisco SD-WAN Release 20.3.1	Command introduced.

clear ip mfib record

Clear the statistics for a particular group, source, or VPN from the Multicast Forwarding Information Base (MFIB) (on vEdge routers only).

clear ip mfib record group *group-address* **source** *source-address* **vpn** *vpn-id* [**upstream-iif** *interface-name*] [**upstream-tunnel** *ip-address*]

Syntax Description

group group-address source source-address vpn vpn-id	Clear Statistics from the MFIB: Clear the statistics for a particular group, source, or VPN from the MFIB.
upstream-iif interface-name	Upstream Interface: Clear the MFIB statistics for the specified upstream interface.
upstream-tunnel ip-address	Upstream Tunnel: Clear the MFIB statistics for the specified tunnel to a remote system.

Command History

Release	Modification
14.2	Command introduced.

Examples

 $\label{eq:vedge} $\operatorname{vEdge\#}$ clear ip mfib record group 254.1.1.1 vpn 1 source 255.1.1.1 $$\operatorname{vEdge\#}$ $$

clear ip mfib stats, on page 604 show ip mfib summary, on page 863

clear ip mfib stats

Clear all statistics from the Multicast Forwarding Information Base (MFIB) (on vEdge routers only).

clear ip mfib stats

Examples

```
vEdge# clear ip mfib stats
vEdge#
```

Command History

Release	Modification
14.2	Command introduced.

Related Topics

clear ip mfib record, on page 603 show ip mfib stats, on page 862

clear ip nat filter

Clear the NAT translational filters (on vEdge routers only).

clear ip nat filter [parameter]

Syntax Description

paramet	Filter Parameter: Clear NAT translation filters associated with the specified parameter.
	parameter can be nat-ifname, nat-vpn-id, private-dest-address, private-dest-port, private-source-address, private-source-port, private-vpn-id, and proto. These parameters correspond to some of the column headers in the show ip nat filter command output.

Command History

Release	Modification
14.2	Command introduced.

clear ipv6 dhcp state interface interface-name [vpn vpn-id]

clear ipv6 dhcp state

Clear IPv6 DHCP state on the local device (on vEdge routers and vSmart controllers only).

Syntax Description

interface interface-name	Interface: Clear the DHCP state of a specific interface.
vpn vpn-id	VPN: Clear the DHCP state of an interface in the specified VPN.

Command History

Release	Modification
16.3	Command introduced.

clear dhcp state, on page 595 show dhcp interface, on page 808 show dhcp server, on page 809 show ipv6 dhcp interface, on page 879

clear ipv6 neighbor

Refresh dynamically created IPv6 entries in the Address Resolution Protocol (ARP) cache (on vEdge routers and vSmart controllers only).

To clear IPv4 entries in the ARP cache, use the **clear arp** command.

clear ipv6 neighbor [interface interface-name] [ip-address] [vpn vpn-id]

Syntax Description

(none)	Refresh all dynamic ARP cache entries.
interface interface-name	Interface: Refresh the dynamic ARP cache entries associated with the specific interface.
ip-address	IP Addresss: Refresh the dynamic ARP cache entries for the specified IP address.
vpn vpn-id	VPN: Refresh the dynamic ARP cache entries for the specific VPN.

Command History

Release	Modification
16.3	Command introduced.

Examples

```

clear omp routes

Recalculate the OMP routes and resend the routes to the IP route table (on vSmart controllers and vEdge routers only).

clear omp routes

Command History

Release	Modification
14.1	Command introduced.

Examples

```
vEdge# clear omp routes
vEdge#
```

Related Topics

```
clear omp all, on page 608
clear omp peer, on page 609
clear omp tlocs, on page 611
show omp routes, on page 916
```

clear omp tlocs

Recalculate the OMP TLOCs and resend the TLOCs to the route table (on vSmart controllers and vEdge routers only).

clear omp tlocs

Command History

Release	Modification
14.1	Command introduced.

Example

```
vEdge# clear omp tlocs vEdge#
```

Related Topics

clear omp all, on page 608 clear omp peer, on page 609 clear omp routes, on page 611 show omp tlocs, on page 926

clear orchestrator connections-history

Clear the history of connections and connection attempts made by the vBond orchestrator (on vBond orchestrators only).

clear orchestrator connections-history

Command History

Release	Modification
16.1	Command introduced.

trying

Examples

Show orchestrator connections-history

```
vEdge# show orenestrator connections—Index.y
Legend for Errors
BDSGVERFL - Board ID signature verify failure
BIDNTPR - Board ID not initialized
BIDNTVRFD - Peer board ID certificate not verified
CRTREJSER - Challenge response rejected by peer
- Pail to verify neer certificate
                                                                                ORPTMO - Remote client peer timeout
RMGSPR - Remove global saved peer
RXTRDWN - Received teardown
RDSIGFBD - Read signature from board ID failed
SSLNFAIL - Failure to create new SSL context
CRTVERFL
                - Fail to verify peer certificate
CRIVERFI - Fail to verify peer centificate COTORONNMIS - Certificate organization name mismatch DCONFAIL - DTLS connection failure DEVALC - Device memory allocation failures DHSTMO - DTLS handshake timeout
                                                                                 SERNTPRES - Serial number not present

clear ospf all

Reset OSPF in a VPN (on vEdge routers only).

clear ospf all vpn vpn-id

Syntax Description

vpn	VPN: Reset OSPF in the specified VPN.
vpn-id	

Command History

Release	Modification
14.1	Command introduced.

Examples

Related Topics

show ospf neighbor, on page 949

clear ospf database

Delete the entries in the OSPF link-state database learned from OSPF neighbors (on vEdge routers only). Use this command for troubleshooting OSPF or to reset the link-state database if you suspect that it has been corrupted.

clear ospf database vpn vpn-id

Syntax Description

vpn	VPN: Clear the OSPF link-state database of entries from the specified VPN.
vpn-id	

Command History

Release	Modification
14.2	Command introduced.

Examples

Edac#	chore	annf	database	*****

clear policer statistics

Clear the policer out-of-specification (OOS) packet statistics (on vEdge routers only). A policed packet is out of specification when the policer does not allow it to pass. Depending on the policer configuration, these packets are either dropped or they are remarked, which sets the packet loss priority (PLP) value on the egress interface to high.

clear policer statistics

Command History

Release	Modification
16.3	Command introduced.

Examples

Clear the policer OOS packet statistics

vEdge# show policer

NAME	INDEX	DIRECTION	RATE	BURST	OOS ACTION	OOS PKTS
ge0_0_11q ge0_3_11q	10 11	out out	2000000000000	15000 15000	drop drop	2499 3212
vEdge# clear policer statistics vEdge# show policer						
NAME	INDEX	DIRECTION	RATE	BURST	ACTION	PKTS
ge0_0_llq ge0_3_llq	10 11	out out	200000000000000000000000000000000000000	15000 15000	drop drop	0

Related Topics

clear policy

Reset all counters for IPv4 access lists or data policies (on vSmart controllers and vEdge routers only).

clear policy (access-list acl-name | app-route-policy policy-name | data-policy policy-name)

Syntax Description

access-list acl-name	Access List Counters: Zero the counters associated with the specified access list.
app-route-policy policy-name	Application-Aware Routing Policy Counter: Zero the counters associated with the specified application-aware routing policy.
data-policy policy-name	Data Policy Counters: Zero the counters associated with the specified data policy.

Command History

Release	Modification
14.1	Command introduced.

Related Topics

clear ipv6 policy, on page 608

clear policy zbfw filter-statistics

Clear the count of the packets that match a zone-based firewall's match criteria and the number of bytes that match the criteria (on vEdge routers only).

clear policy zbfw filter-statistics

Command History

Release	Modification
18.2	Command introduced.

Examples

Display statistics about packets that the router has processed with zone-based firewall policy

vEdge# show policy zbfw filter-staatistics

NAME	COUNTER	NAME		PACKETS	BYTES
ZONE-POLICY-1	counter	seq :	1	2	196

```
\begin{tabular}{ll} vEdge\# & \textbf{show policy zbfw filter-staatistics} \\ vEdge\# & \end{tabular}
```

Related Topics

show policy zbfw filter-statistics, on page 979

clear policy zbfw global-statistics

Zero the statistics about the packets processed by zone-based firewalls (on vEdge routers only).

clear policy zbfw global-statistics

Command History

Release	Modification
18.2	Command introduced.

Examples

Clear the statistics about packets that the router has processed with zone-based firewalls

```
vEdge# clear zbfw global-statistics
vEdge# show zbfw global-statistics

```

Related Topics

show tunnel statistics, on page 1036

clear wlan radius-stats

Clear the statistics about the sessions with RADIUS servers being used for WLAN authentication (on vEdge routers only).

clear wlan radius-stats [vap number]

Syntax Description

_	VAP Interface: Virtual access point instance.
number	Range: 0 through 3.

Command History

Release	Modification
17.1	Command introduced.

Related Topics

show interface, on page 829 show wlan clients, on page 1041 show wlan interfaces, on page 1042 show wlan radios, on page 1043 show wlan radius, on page 1045

clock

Set the time and date on the device. If you have configured NTP on the device, the NTP time overwrites the time and date that you set with the **clock** command.

clock set date ccyy-mm-dd

clock set time hh:mm:ss.sss

Syntax Description

ccyy-mm-da	Date: Set the date by specifying four-digit year, two-digit month, and two-digit day. The year can be from 2000 to 2060.
hh:mm:ss.sss	Time: Set the time by two-digit hour (using a 24-hour clock), two-digit minute, two-digit seconds, and an optional three-digit hundredths of seconds.

Note

You must set the time and date in a single command, but the order in which you specify them does not matter.

Command History

Release	Modification
14.1	Command introduced.

Examples

```
vEdge# clock set time 14:30:00 date 2013-11-25
vEdge# show uptime
14:30:03 up 13:51, 1 user, load average: 0.00, 0.01, 0.05
```

Related Topics

```
ntp, on page 358 show uptime, on page 1038
```

commit

Confirm or cancel a pending commit operation. You issue this **commit** command from operational mode. You establish a pending commit operation by using the **commit confirmed** configuration session management command.

commit (abort | confirm) [persist-id id]

Syntax Description

confirm	Confirm a Pending Commit Operation: Confirm a pending commit operation that was issued with the commit confirmed configuration command. You must confirm the commit operation with the time specified with the commit confirmed command; otherwise, the commit is canceled.
abort	Halt a Pending Commit Operation: Halt a pending commit operation that was issued with the commit confirmed command. This is the default operation for a pending commit operation. The commit is also canceled if the CLI session is terminated before you issue a commit confirm command.
persist-id id	Token to Identify the Pending Commit Operation: If you specified a token, <i>id</i> , when you initiated the pending commit operation, specify that token to either cancel or confirm the commit.

Command History

Release	Modification
14.1	Command introduced.

Examples

```
vEdge# commit confirm
Commit complete. Configuration is now permanent.
```

Related Topics

```
commit, on page 1072 show configuration commit list, on page 786
```

complete-on-space

Have the CLI automatically complete a command name when you type an unambiguous string and then press the space bar, or have the CLI list all possible completions when you type an ambiguous string and then press the space bar.

complete-on-space (false | true)

Syntax Description

false	Do Not Perform Command Completion: Do not have the CLI perform command completion when you press the space bar. This is the default setting.
true	Perform Command Completion: Have the CLI perform command completion when you press the space bar.

Command History

Release	Modification
14.1	Command introduced.
14.2	Default changed from true to false in Release 14.2.

Examples

```
vEdge# complete-on-space false

config

Enter configuration mode for vEdge devices. In configuration mode, you are editing a copy of the running configuration, called the candidate configuration, not the actual running configuration. Your changes take effect only when you issue a **commit** command.

Note

Cisco IOS XE routers such as aggregation and integrated services routers should use the command **config-transaction** to enter configuration mode. The **config terminal** command is not supported on SD-WAN routers.

config (exclusive | no-confirm | shared | terminal)

Syntax Description

(none)	Edit a private copy of the running configuration. This private copy is not locked, so another user could also edit it at the same time.
terminal	Allow Editing from This Terminal Only: Edit a private copy of the running configuration. This private copy is not locked, so another user could also edit it at the same time.
no-confirm	Do Not Allow a Commit Confirmation: Edit a private copy of the running configuration and do not allow the commit confirmed command to be used to commit the configuration.
exclusive	Exclusive Edit: Lock the running configuration and the candidate configuration, and edit the candidate configuration. No one else can edit the candidate configuration as long as it is locked.
shared	Shared Edit: Edit the candidate configuration without locking it. This option allows another person to edit the candidate configuration at the same time.

Command History

Release	Modification
14.1	Command introduced.

Examples

vEdge# config
Entering configuration mode terminal
vEdge(config)#

Syntax Description

[no] debug all	All: Control debugging for all software functions that can be debugged.
[no] debug aaa login (radius tacacs)	AAA Login via RADIUS or TACACS: Control debugging for login attempts using RADIUS or TACACS.

[no] debug chmgr all	Chassis Manager: Control debugging for the chassis manager.
	 misc — Control the debugging of miscellaneous cflowd events. pkt_tx — Control the debugging of cflowd packet transmissions.
	• level (high low)—Set the detail of the comments logged by the debugging operation. The default level, low, provides comments sufficient to help you understand the actions that are occurring. The level high provides greater detail for the live debugging that might typically be performed by the Cisco SD-WAN engineering team.
	• ipc —Control the debugging of all cflowd interprocess communications.
	• events —Control the debugging of events to which the cflowd process (daemon) responds, including when the process connects with a collector or loses connectivity with it, and when the source-interface as configured in the vSmart template is removed.
low)]	• cli —Control the debugging of messages that are logged as the result of a configuration change made either directly on the vEdge router or because the changes have been pushed from the vSmart controller to the router.
events ipc misc pkt_tx) [level (high	Control debugging for cflowd:
[no] debug cflowd (cli	Cflowd Traffic Flow Monitoring:
	• vpn <i>vpn-id</i> —Specify the VPN in which to perform debugging.
	• packets—Control the debugging of all BGP protocol packets.
	• ipcs—Control the debugging of all BGP interprocess communications.
	• fsm —Control the debugging of BGP finite-state machine transitions.
	• events—Control the debugging of BGP events, including damping events, finite-state machine events and transitions, keepalive message events, next-hop events, and routing table update events.
events fsm ipcs packets) vpn vpn-id	• all—Control the debugging of all BGP events, finite-state machine transitions, interprocess communications, and packets.
[no] debug bgp (all	BGP: Control debugging for BGP:

[no] debug cloudexpress (events ftm omp rtm	Cloud OnRamp for SaaS: Control debugging for Cloud OnRamp for SaaS (formerly CloudExpress service).
ttm) [level (high low)]	• events—Control the debugging of events to which the Cloud OnRamp for SaaS process (daemon) responds, including when the process connects with a collector or loses connectivity with it, and when the source-interface as configured in the vSmart template is removed.
	• ftm—Control debugging of the communication between Cloud OnRamp for SaaS and the forwarding table manager.
	• level (high low)—Set the detail of the comments logged by the debugging operation. The default level, low, provides comments sufficient to help you understand the actions that are occurring. The level high provides greater detail for the live debugging that might typically be performed by the Cisco SD-WAN engineering team.
	• omp—Control the debugging of all Cloud OnRamp for SaaS OMP operations.
	• rtm —Control the debugging of communication between the Cloud OnRamp for SaaS and the route table manager.
	• ttm—Control the debugging of communication between the Cloud OnRamp for SaaS and the tunnel table manager.
[no] debug config-mgr	Configuration Manager: Control debugging for the configuration manager.
(events pppoe ra) [level (high low)]	events—Control the debugging of events to which the configuration manager process (daemon) responds, including when the process connects with a collector or loses connectivity with it, and when the source-interface as configured in the vSmart template is removed.
	• level (high low)—Set the detail of the comments logged by the debugging operation. The default level, low, provides comments sufficient to help you understand the actions that are occurring. The level high provides greater detail for the live debugging that might typically be performed by the Cisco engineering team.
	• pppoe —Control the debugging of all Cloud OnRamp for SaaS OMP operations.
	• ra—Control the debugging of route advertisements to which the configuration manager responds.
[no]debug dbgd events	Debugger Process: Control debugging for the debugger process itself.
	• events—Control the debugging of events to which the debugger process (daemon) responds.

[no] debug dhcp-client	DHCP Client: Control the debugging of Dynamic Host Configuration Protocol
(all events packets)	(DHCP) client activities.
	• all—Control the debugging of all DHCP client events and packets.
	• events—Control the debugging of DHCP client protocol events.
	• packets—Control the debugging of all DHCP client packets.
[no] debug dhcp-helper (all events packets)	DHCP Helper: Control the debugging of Dynamic Host Configuration Protocol (DHCP) helper activities.
	• all—Control the debugging of all DHCP helper events and packets.
	• events—Control the debugging of DHCP helper protocol events.
	• packets—Control the debugging of all DHCP helper packets.
[no] debug fpm (all config dpi policy ttm)	Forwarding Policy Manager: Control debugging for the forwarding policy manager:
	• all—Control the debugging of events related to the forwarding policy manager, including configuration changes, application-aware routing events, and communication with the tunnel table manager.
	• config —Control the debugging of messages that are logged as a result of a policy configuration change made either directly on the vEdge router or because the changes have been pushed from the vSmart controller to the router.
	• dpi —Control the debugging of all application-aware routing (deep packet inspection) events.
	• policy —Control the debugging of messages that are logged as the result of policy programming events.
	• ttm—Control the debugging of communication between the forwarding policy manager and the tunnel table manager.
[no] debug ftm all	Forwarding Table Manager: Control debugging for the forwarding table manager operations.
[no] debug igmp (config	IGMP: Control debugging for IGMP.
events fsm ipc packets) [level (high low)]	• events—Control the debugging of IGMP events, including finite-state machine events and transitions, keepalive message events, next-hop events, and routing table update events.
	• fsm—Control the debugging of IGMP finite-state machine transitions.
	• ipcs—Control the debugging of all IGMP interprocess communications.
	• packets—Control the debugging of all IGMP protocol packets.

F 111 11 1/ 11	WE C + 111 ' C 4 C I' I'
[no] debug iked (all confd error events	IKE: Control debugging for the forwarding policy manager.
misc) [level (high low)]	• all—Control the debugging of all events related to IKE.
	confd—Control the debugging of Netconf activity to log all IKE-related Netconf configuration messages between the local device and the vManage NMS.
	• error—Control the debugging of IKE errors.
	• events—Control the debugging of IKE protocol events.
	• level (high low)—Set the detail of the comments logged by the debugging operation. The default level, low, provides comments sufficient to help you understand the actions that are occurring. The level high provides greater detail for the live debugging that might typically be performed by the Cisco SD-WAN engineering team.
	• misc—Control the debugging of miscellaneous IKE events.
[no] debug netconf traces	Netconf: Enable and disable Netconf activity to log all Netconf configuration messages between the local device and the vManage NMS.
	Netconf debug messages are logged to the /var/log/confd/netconf.trace file.
[no] debug omp (all	OMP: Control the debugging of OMP.
events ipcs packets)	all—Control the debugging of all OMP events, interprocess communications, and packets.
	• events—Control the debugging of OMP events.
	• ipcs—Control the debugging of all OMP interprocess communications.
	• packets—Control the debugging of all OMP protocol packets.
[no] debug ospf (all	OSPF: Control the debugging of OSPF.
events ipcs ism lsa nsm nssa packets) vpn	• all—Control the debugging of all OSPF functions.
vpn-id	• events—Control the debugging of OSPF events, including adjacencies, flooding information, designated router selection, and shortest path first (SPF) calculations.
	• ipcs—Control the debugging of all OSPF interprocess communications.
	• ism—Control the debugging of OSPF interface state machine transitions.
	• nsm—Control the debugging of OSPF network tate machine transitions.
	• Isa—Control the debugging of OSPF LSA messages.
	• nssa—Control the debugging of OSPF NSSA messages.
	• packets—Control the debugging of all OSPF protocol packets.
	1

[no] debug pim (auto-rp	PIM: Control debugging for PIM.
events fsm ipcs packets) [level (high low)] vpn vpn-id	all—Control the debugging of all PIM events, finite-state machine transitions, interprocess communications, and packets.
	• events—Control the debugging of PIM events, including finite-state machine events and transitions, keepalive message events, next-hop events, and routing table update events.
	• fsm—Control the debugging of PIM finite-state machine transitions.
	• ipcs—Control the debugging of all PIM interprocess communications.
	• packets—Control the debugging of all PIMP protocol packets.
	• vpn vpn-id—Specify the VPN in which to perform debugging.
[no] debug platform software sdwan tracker	Service chaining: (Cisco IOS XE Catalyst SD-WAN devices) Display the service log for the tracker, which probes service devices periodically to test whether the devices are reachable.
[no] debug resolver events [level (high low)]	Resolver: Control debugging for all resolver process events. The resolver process handles a plethora of tasks, including tracking ARP, MAC addresses, DNS, and connected interfaces.
	• level (high low)—Set the detail of the comments logged by the debugging operation. The default level, low, provides comments sufficient to help you understand the actions that are occurring. The level high provides greater detail for the live debugging that might typically be performed by the Cisco SD-WAN engineering team.
[no] debug rtm (events	Route Table Manager: Control debugging for the route table manager.
ipc next-hop packets rib) vpn vpn-id	• events—Control the debugging of route table manager events.
They vpn vpn ta	• ipc—Control the debugging of all route table manager interprocess communications.
	• next-hop—Control the debugging of the route table manager handling of next hops.
	• packets—Control the debugging of the route table manager handling of route exchange packets.
	• rib—Control the debugging of route table manager communication with the route table.
	• vpn <i>vpn-id</i> —Specify the VPN in which to perform debugging.
[no] debug snmp events	SNMP: Control debugging for all SNMP events.
[level (high low)]	• level (high low)—Set the detail of the comments logged by the debugging operation. The default level, low, provides comments sufficient to help you understand the actions that are occurring. The level high provides greater detail for the live debugging that might typically be performed by the Cisco SD-WAN engineering team.

[no] debug sysmgr all	System Manager: Control debugging for the system manager.	
[no] debug tcpd [level (high low)]	TCP Optimization Process: Control debugging for TCP optimization. • level (high low)—Set the detail of the comments logged by the debugging operation. The default level, low, provides comments sufficient to help you understand the actions that are occurring. The level high provides greater detail for the live debugging that might typically be performed by the Cisco SD-WAN engineering team.	
[no] debug transport events [level (high low)]	Transport Process: Control debugging for all vtracker transport process events. The vtracker process pings the vBond orchestrator every second. • level (high low)—Set the detail of the comments logged by the debugging operation. The default level, low, provides comments sufficient to help you understand the actions that are occurring. The level high provides greater detail for the live debugging that might typically be performed by the Cisco SD-WAN engineering team.	
[no] debug ttm events	Tunnel Table Manager: Control debugging for all tunnel table manager events.	
[no] debug vrrp (all events packets) vpn vpn-id	VRRP: Control debugging for the Virtual Router Redundancy Protocol (VRRP). • all—Control the debugging of all VRRP events and packets. • events—Control the debugging of VRRP events. • packets—Control the debugging of VRRP packets.	

Release	Modification
14.1	Command introduced.
16.3	Starting with Release 16.3, output is placed in the /var/log/tmplog/vdebug file, not the /var/log/vdebug file.
Cisco IOS XE Catalyst SD-WAN Release 17.3.1a	Added debug platform software sdwan tracker.

debug packet-trace condition

To enable packet tracing on Cisco vEdge devices, use the **debug packet-trace condition** command in privileged EXEC mode.

debug packet-trace condition [start | stop] [bidirectional] [circular] [destination-ip ip-address] [global-stat] [ingress-if interface] [logging] [source-ip ip-address] [vpn-id vpn-id]

C	Description	
NNTAY	IIACCLINTIUN	
OVIILUA	DUSCHINGUII	

bidirectional	(Optional) Enables bidirectional flow debug for source IP and destination IP.
circular	(Optional) Enables circular packet tracing. In this mode, the 1024 packets in the buffer are continuously over-written.
clear	(Optional) Clears all debug configurations and packet tracer memory.
destination-ip	(Optional) Specifies destination IPv4 address.
global-stat	(Optional) Specifies the match on select global statistic counter name.
ingress-if	(Optional) Specifies ingress interface name. Note: It is must to choose VPN to configure the interface.
logging	(Optional) Enables packet tracer debug logging.
source-ip	(Optional) Specifies source IP address.
start	(Optional) Starts conditional debugging.
stop	(Optional) Stops conditional debugging.
vpn-id	(Optional) Enables packet tracing for the specified VPN.

Command Default

None

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco SD-WAN Release 20.5.1	This command was introduced.
Cisco SD-WAN Release 20.8.1	A new keyword global-stat is added.

Usage Guidelines

The parameters after the keywords start and stop in the command syntax can be configured in any order.

Example

The following example shows how to configure conditions for packet tracing:

```
Device# debug packet-trace condition source-ip 10.1.1.1
Device# debug packet-trace condition vpn-id 0
Device# debug packet-trace condition interface ge0/1
Device# debug packet-trace condition stop
```

debug platform condition mpls match-inner

To match IPv4 or IPv6 traffic over an MPLS network on Cisco vEdge devices, use the **debug platform condition mpls match-inner** command in privileged EXEC mode.

debug platform condition [interface { interface-name interface-number }]

mpls depth-of-mpls-label match-inner {ipv4 | ipv6} { ipv4-source-prefix | any | host | payload-offset |
protocol } { ipv4-destination-prefix | any | host } { application | both | ingress | egress } [bidirection
] [allow-no-label]

no debug platform condition [interface { interface-name interface-number }] **mpls** depth-of-mpls-label **match-inner** {**ipv4** | **ipv6**} { ipv4-source-prefix | any | host | payload-offset | protocol } { ipv4-destination-prefix | any | host } { **application** | **both** | **ingress** | **egress** } [**bidirection**] [**allow-no-label**]

Syntax Description

debug	Debug device operations, generated or received traffic, and any error messages.
platform	Debug specific network platforms based on your requirement.
condition	Specify conditions to debug based on your requirement.
interface	(Optional) Debug a specific interface of your choice.
interface-name	Specify the the interface name.
interface-number	Specify the interface number.
mpls	Debug the MPLS network.
source prefix	Specifies IPv4 or IPv6 source prefix.
application	Debug Application conditions.
both	Debug ingress and egress debug simultaneously.
egress	Debug egress only.
ingress	Debug ingress only.
match-inner	Debug inline ACL filters for overlay packet over MPLS.
ipv4	Debug IPv4 conditions .
ipv6	Debug IPv6 conditions.
destination prefix	Specifies IPv4 or IPv6 destination prefix.
any	Specifies any source prefix.
payload-offset	Configures the ineer payload offset to locate the overlap IPv4 and IPv6 header.
host	Specifies a single destination host.
bidirection	(Optional) Allows to fileter packets in bidirection.
allow-no-label	(Optional) Allows to filter packets without MPLS labels.

Command Modes

Privileged EXEC (#)

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.11.1a	A new command debug platform condition mpls is added.

Example

The following example shows how to configure conditions for packet tracing:

```
Device# debug platform condition mpls match-inner ipv4
Device# debug platform condition mpls match-inner ipv4 any any
Device# debug platform condition mpls match-inner ipv4 any any both
Device# debug platform condition mpls match-inner ipv4 any any both
Device# debug platform condition mpls match-inner ipv4 any any both allow-no-label
```

debug-vdaemon

Enable and disable debugging mode for vdaemon software function. Debug output is placed in the /var/log/tmplog/vdebug file on the local device.

debug vdaemon { all | confd | error | events | hello | misc | packets } [high | low] no debug vdaemon { all | confd | error | events | hello | misc | packets } [high | low]

Syntax Description

| packets} {high | low}

{all | confd | error | events | hello | misc vDaemon Process: Control debugging for vDaemon, the Cisco SD-WAN software process:

- all: Control the debugging of all vdaemon process functions.
- confd: Control the debugging of vdaemon process CLI functions.
- error: Control the debugging error of vdaemon actions.
- events: Control the debugging of vdaemon process events.
- **hello**: Control the debugging of vdaemon hello packets.
- misc: Control the debugging of miscellaneous vdaemon process events.
- packets: Control the debugging of all vdaemon process packets.
- high: Displays verbose logging.
- low: Displays minimal logging.

Command History

Release	Modification
14.1	Command introduced.

Release	Modification
16.3	Starting with Release 16.3, output is placed in the /var/log/tmplog/vdebug file, not the /var/log/vdebug file.
Cisco SD-WAN Release 20.5.1	Added hello keyword for debug vdaemon command.

debug vdaemon peer

Enable and disable debugging mode for vdaemon software function. Debug output is placed in the /var/log/tmplog/vdebug file on the local device.

debug vdaemon peer public-ip ip-address public-port port-address facility { all | confd | error | events | hello | misc | packet } | level { high | low } no debug vdaemon peer public-ip ip-address public-port port-address facility { all | confd | error | events | hello | misc | packet } level { high | low }

Syntax Description

public-ip ip-address	Speicifes peer public ip address.
public-port port-address	Specifies peer public port address.
	Range: 0 to 65535
facility {all confd error	Facility: Control debugging of miscellaneous vdaemon actions:
events hello misc packet}	• all: Control the debugging of all vdaemon process functions.
F	• confd: Control the debugging of vdaemon process CLI functions.
	• error: Control the debugging error of vdaemon actions.
	• events: Control the debugging of vdaemon process events.
	• hello: Control the debugging of vdaemon hello packets.
	• misc: Control the debugging of miscellaneous vdaemon process events.
	• packet: Control the debugging of all vdaemon process packets.
level{high low}	Set the detail of the comments logged by the debugging operation. The default level, low , provides comments sufficient to help you understand the actions that are occurring. The level high provides greater detail for the live debugging that might typically be performed by the Cisco engineering team.

that might typically be performed by the Cisco engineering team.

Command History

Release	Modification
Cisco SD-WAN Release 20.5.1	This command was introduced.

Examples

The following is a sample output for **debug vdaemon peer** command. Verbose logs for a particular peer can be enabled, and hello log is displayed:

```
Device# debug vdaemon peer public-ip 10.0.12.22 public-port 23456 facility all level high

IP addr: 10.0.12.22 | Port: 23456 | Peer exist: true | misc:high events:high confd:high pkt:high hello:high error:high

Mar 10 11:32:56 vm6 VDAEMON[1592]: vbond_proc_msg[4957]: %VDAEMON_DBG_HELLO-3: peer publoc: 10.0.12.22:23456

Received a Hello from .. 10.0.12.22:23456 on loopback2 (my count 2 hello_vsmart_count 0) (my count 1 hello_vmanage_count 1)

Mar 10 11:32:56 vm6 VDAEMON[1592]: vdaemon_vm_rebalance_needed[805]: %VDAEMON_DBG_ERROR-3: peer publoc: 10.0.12.22:23456

Peer vmanage sys-ip 172.16.255.22 is the chosen one
```

exit

Exit from the CLI session. The **exit** and **quit** commands do the same thing.

exit

Command History

Release	Modification
14.1	Command introduced.

Examples

```
vEdge# exit
My-MacBook-Pro:~ me$
```

Related Topics

quit, on page 658 vshell, on page 1067

file list

List the files in a directory on the Cisco SD-WAN device.

file list *directory*

Syntax Description

directory	Name of a Directory: List the files in the specified directory on the Cisco SD-WAN device.
-----------	--

Examples

```
vEdge# file list /var
backups
confd
crash
lib
```

local lock log run spool tmp volatile

Command History

Release	Modification
14.1	Command introduced.

monitor event-trace sdwan

To monitor and control the event trace function for a Cisco SD-WAN subsystem, use the **monitor event-trace** command in the privileged EXEC mode. Event trace provides the functionality to capture the SD-WAN traces between the viptela daemons and SD-WAN subsystems.

Syntax Description

sdwan	Name of the Cisco SD-WAN subsystem that is the subject of the event trace. To get a list of components that support event tracing, use the monitor event-trace? command.
clear	Clears existing trace messages for the specified component from memory on the networking device.
continuous	Displays the latest event trace entries.
disable	Turns off event tracing for the specified component.
dump	The trace messages are saved in binary format.
enable	Enables event tracing for the specified component.
one-shot	Clears any existing trace information from memory, starts event tracing again, and disables the trace when the trace reaches the size specified.

Command Default

The event trace function is disabled by default.

Command Modes

Privileged EXEC

Global Configuration Mode

Command History

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.2.1r	This command was introduced.

Usage Guidelines

The amount of data collected from the trace depends on the trace message size configured using the **monitor event-trace** command in global configuration mode for each instance of a trace.

Use the **show monitor event-trace** command to display trace messages.

Use the **monitor event-trace** *sdwan* **dump** command to save trace message information for a single event. By default, trace information is saved in binary format.

Examples

The following example shows the privileged EXEC commands to stop event tracing, clear the current contents of memory, and reenable the trace function for the component. This example assumes that the tracing function is configured and enabled on the networking device.

```
Router# monitor event-trace sdwan disable
Router# monitor event-trace sdwan clear
Router# monitor event-trace sdwan enable
```

The following example shows how the **monitor event-trace one-shot** command accomplishes the same function as the previous example except in one command. In this example, once the size of the trace message file has been exceeded, the trace is terminated.

Router# monitor event-trace sdwan one-shot

The following example shows the command for writing trace messages for an event in binary format. In this example, the trace messages for the SD-WAN component are written to a file.

Router# monitor event-trace sdwan dump

monitor start

Begin monitoring a file on the local device. When a file is monitored, any logging information is displayed on the console as it is added to the file.

monitor start filename

Syntax Description

filename	Filename To Monitor: Name of the file to monitor.
----------	---

Command History

Release	Modification
15.4	Command introduced.

Examples

Start and stop monitoring a file, and view the files that are being monitored

```
VEdge# monitor start /var/log/vsyslog
VEdge# show jobs
JOB COMMAND

1 monitor start /var/log/vsyslog
VEdge# log:local7.notice: Dec 16 14:55:26 vsmart SYSMGR[219]: %Viptela-vsmart-SYSMGR-5-NTCE-200025: System clock set to Wed Dec 16 14:55:26 2015 (timezone 'America/Los_Angeles')

log:local7.notice: Dec 16 14:55:27 vsmart SYSMGR[219]: %Viptela-vsmart-SYSMGR-5-NTCE-200025: System clock set to Wed Dec 16 14:55:27 2015 (timezone 'America/Los_Angeles')

vEdge# monitor stop /var/log/vsyslog
VEdge# monitor stop /var/log/vsyslog
```

nslookup

Perform a DNS lookup.

nslookup [**vpn-id**] *dns-name*

Syntax Description

dns-name	DNS Name: Perform a DNS lookup to map a fully qualified domain name to one or more IP addresses. dns-name can be a hostname string, or an IPv4 or IPv6 address.
vpn-id vpn-id	VPN: Specify the VPN into which to send the ping packets. If you omit the VPN identifier, the default is VPN 0, which is the transport VPN.

Command History

Release	Modification
14.1	Command introduced.
16.3	In Release 16.3, added support for IPv6 addresses in VPN 0.

Examples

```
vEdge# nslookup vedge.dns.com
nslookup in vpn 0:
Server: 172.16.255.100
Address 1: 172.16.255.100 vedge.dns.com

Name:     vedge
Address 1: 172.16.255.100 vedge.dns.com

vEdge# nslookup vpn 0 fe80::20c:29ff:fe9b:a9bb
nslookup in VPN 0:
Server:    127.0.0.1
Address 1: 127.0.0.1 localhost.localdomain

Name:    fe80::20c:29ff:fe9b:a9bb
Address1: fe80::20c:29ff:fe9b:a9bb
```

ping

Verify that a network device is reachable on the network, by sending ICMP ECHO_REQUEST packets to them. This command is effectively identical to the standard UNIX **ping** command.

```
ping (hostname | ip-address)
ping vpn vpn-id (hostname | ip-address)
```

ping [count number] [rapid] [size bytes] [source (interface-name | ip-address)] [wait seconds] vpn vpn-id
(hostname | ip-address)

Syntax Description

(hostname ip-address)	Device to Ping: Name or IPv4 or IPv6 address of the host to ping. For an IPv4 address in a service VPN, you can ping the primary and the secondary addresses.
count number	Number of Ping Requests to Send: Number of ping requests to send. If you do not specify a count, the command operates until you interrupt it by typing Control-C.
rapid	Rapid Pinging: Send five ping requests in rapid succession and display abbreviated statistics, only for packets transmitted and received, and percentage of packets lost.
size bytes	Size of Ping Request Packets: Size of the packet to send. Default: 64 bytes (56 bytes of data plus 8 bytes of ICMP header).
source (interface-name ip-address)	Source of Ping Packets: Interface or IP address from which to send to ping packets. You cannot specify the loopback0 interface in this option.
wait seconds	Time to Wait between Each Ping Packet: Time to wait for a response to a ping packet. Default: 1 second.
vpn vpn-id	VPN in which to Ping: Specify the VPN into which to send the ping packets.

Release	Modification
14.1	Command introduced.
16.3	Added support for IPv6 host addresses in VPN 0.
17.2.2	Added support for pinging secondary IPv4 addresses.

Examples

```
vEdge# ping vpn 0 10.0.14.4
PING 10.0.14.4 (10.0.14.4): 56 data bytes
64 bytes from 10.0.14.4: seq=0 ttl=63 time=0.642 ms

prompt1

Set the operational prompt.

prompt1 string

Syntax Description

string Operational Prompt: Set the operational prompt.

The prompt can contain regular ASCII characters and the following special characters. Enclose the entire string in quotation marks:

- \d—Current date in the format yyyy-mm-dd (for example, 2013-12-02).
- \h—Hostname up to the first period (.). You configure the hostname with the **system hostname** command.
- \H—Full hostname. You configure the hostname with the **system hostname** command.
- \s—Source IP address of the local device.
- \t—Current time in 24-hour hh:mm:ss format.
- \A—Current time in 24-hour format.
- \T—Current time in 12-hour *hh:mm:ss* format.
- \@—Current time in 12-hour *hh:mm* format.
- \u—Login username of the current user.
- \m—Mode name.
- $\mbox{\sc hm}\{n\}$ —Mode name, but the number of trailing components in the displayed path is limited to be a maximum of n, which is an integer. Characters removed are replaced with an ellipsis (...).
- \M—Mode name in parentheses.
- $M\{n\}$ —Mode name in parentheses, but the number of trailing components in the displayed path is limited to be a maximum of n, which is an integer. Characters removed are replaced with an ellipsis (...).

reboot

Reboot the Cisco SD-WAN device.

Any user can issue the **reboot** command, but the underlying logging mechanism does not log the user name. If you subsequently issue a **show reboot** history command, it shows that the reboot request was issued by an unnamed user.

Note

You cannot issue the **reboot** command while a software upgrade is in progress.

reboot [now] reboot other-boot-partition [no-sync]

now	Reboot Immediately: Reboot the device immediately, with no prompt asking you to confirm that you want to reboot.
other-boot-partition	Reboot and Use the Software Image on the Other Disk Partition: (Available in releases 15.3 and earlier.)
	When rebooting the device, start the software image that is installed on the other disk partition. The software prompts you to confirm that you really want to reboot. If the other partition cannot be mounted or if the directory on the other partition is unreadable, an error message is displayed and the reboot operation is canceled.
other-boot-partition no-sync	Switch to the Other Software Image without Rebooting: (Available in releases 15.3 and earlier.)
	Switch to the software image that is installed on the other disk partition without rebooting the device. If the other partition cannot be mounted or if the directory on the other partition is unreadable, an error message is displayed and the switch operation is canceled.

Release	Modification
14.1	Command introduced.
14.2	Starting with the 14.2 release, you cannot issue the reboot command when a software upgrade is in progress.
15.3	Starting with the 15.3 release, the reboot other-boot-partition command prompts for confirmation.
15.4	Starting with 15.4 release, the reboot other-boot-partition command is replaced with the request software activate command.

Examples

Reboot

show boot-partition

vEdge# show boot-partition (available in Releases 15.3 and earlier)

```
PARTITION ACTIVE VERSION

1 X 14.2.4

request admin-tech

Collect system status information in a compressed tar file, to aid in troubleshooting and diagnostics. This tar file, which is saved in the user's home directory, contains the output of various commands and the contents of various files on the local device, including syslog files, files for each process (daemon) running on the device, core files, and configuration rollback files. For aid in troubleshooting, send the file to Cisco SD-WAN customer support.

If your Cisco SD-WAN device contains a large number of crash log files, it might take a few minutes for the **request admin-tech** command to complete.

On a single device, you can run only one **request admin-tech** command at a time. If a command is in progress, the device does not let a second one start.

When a process (daemon) on a Cisco SD-WAN device fails and that failure results in the device rebooting, the device automatically runs a **request admin-tech exclude-cores exclude-logs** file before the the device is rebooted.

To retrieve the admin-tech file from the Cisco SD-WAN device, use SCP. To do this, you must have login access to the device. To copy the file from the Cisco SD-WAN device, enter the shell from the Cisco SD-WAN CLI and issue a command in the following format:

```
vEdge# vshell
vEdge:~$ scp filename .tar.gz username@host-name:path-name
```

request admin-tech [delete-filename filename] [exclude-cores] [exclude-logs] [exclude-tech]

vManage Equivalent

Tools ▶ Operational Commands ▶ Select device ▶ More Actions icon ▶ Admin Tech

(none)	Collect all system status information, including core files, log files, and the process (daemon) and operational-related files that are stored in the /var/tech directory on the local device.
exclude-cores	Do Not Include Core Files: Do not include any core files in the compressed tar file. Core files are stored in the /var/crash directory on the local device.

exclude-logs	Do Not Include Log Files: Do not include any log files in the compressed tar file. Log files are stored in the /var/log directory on the local device.
exclude-logs	Do Not Include Process-Related Files: Do not include any process (daemon) and operational-related files in the compressed tar file. These files are stored in the /var/tech directory on the local device.

Release	Modification
14.1	Command introduced.
16.1	Added support for running only one request admin-tech command at a time.
16.3	Added delete-file-name, exclude-cores, exclude-logs, and exclude-tech options.
17.1	Added automatic collection of admin-tech information after a process fails.

Examples

Create an admin tech file and copy it to a user's home directory on a host in the network. For the SCP command, you must specify the full pathname of where to place the copied file.

```
vEdge# request admin-tech
Requested admin-tech initiated.
Created admin-tech file '/home/admin/20170712-123416-admin-tech.tar.gz'
vEdge# vshell
vEdge:~$ ls
20170712-123416-admin-tech.tar.gz\ archive\_id\_rsa.pub\ cacert.pem\ vEdge-signed-cert.pem\ vEdge-signed-cert.pem\

request certificate

Install a certificate on the Cisco SD-WAN device (on vSmart controllers and vBond orchestrators only).

request certificate install file-path [vpn vpn-id]

Syntax Description

file-path	Path to Certificate File: Install the certificate in specified filename.
J Y	The file can be in a your home directory on the local device, or it can be on a remote device reachable through VPN 0 and using FTP, HTTP, SCP, or TFTP. If you are using SCP, you are prompted for the directory name and filename. No file path name is provided.
	file-path can be one of the following:
	• filename—Path to a file in your home directory on the local Cisco SD-WAN device.
	• ftp: file-path—Path to a file on an FTP server.
	• http:// url/file-path—Path to a file on a webserver.
	• scp: user@host:file-path
	• tftp: <i>file-path</i> —Path to a file on a TFTP server.
vpn	Specific VPN: VPN in which the certificate file is located.
vpn-id	When you include this option, one of the interfaces in the specified VPN is used to retrieve the file. The interfaces on a vSmart controller are only in VPN 0, the VPN reserved for the control plane, so you can omit this option because vSmart images are always retrieved from VPN 0.

Command History

Release	Modification
14.1	Command introduced.

Related Topics

request container image install

Install a vSmart software image on a vSmart controller container host (on vSmart controller container hosts only).

request container image install filename [vpn vpn-id]

Syntax Description

filename	Name of vSmart Software Image: Install the vSmart controller software image in the specified filename. The file can be in your home directory on the local device, or it can be on a remote device reachable through FTP, HTTP, SCP, or TFTP. If you are using SCP, you are prompted for the directory name and filename. No file path name is provided. <i>filename</i> has the format viptela- <i>release-number</i> -x86_64.tar.gz.
vpn <i>vpn-id</i> When you include this option, one of the interfaces in the specified VPN is used software image. The interfaces on a vSmart controller are only in VPN 0, the VP the control plane, so you can omit this option because vSmart images are always VPN 0.	
	When you include this option, one of the interfaces in the specified VPN is used to retrieve the software image. The interfaces on a vSmart controller are only in VPN 0, the VPN reserved for the control plane, so you can omit this option because vSmart images are always retrived from VPN 0.

Command History

Release	Modification
16.2	Command introduced.

Related Topics

container, on page 147

request container image remove, on page 665

request container image remove

Install a vSmart software image on a vSmart controller container host (on vSmart controller container hosts only).

request container image remove filename

Syntax Description

filename Name of vSmart Software Image: Name of image that is installed on the vSmart controller container.

Release	Modification
16.2	Command introduced.

Related Topics

container, on page 147 request container image install, on page 665

request control-tunnel add

Create a temporary tunnel to use when debugging a failed control connection (on vEdge routers only). One case when you might want to create a temporary tunnel is when a control connection fails to come up because of firewall rules or NAT issues. The Cisco SD-WAN software's forwarding process drops failed connections, so creating a temporary one allows you to triage the problem.

 $\textbf{request control-tunnel add local-private-ip} \ ip-address \ \textbf{local-private-port} \ port-number \ \textbf{remote-public-ip} \ ip-address \ \textbf{remote-public-port} \ port-number$

Syntax Description

local-private-port ip-address port-number	Local Private IP Address and Port Number: Private IP address and port number for the local side of the tunnel connection. port-number can be a value from 0 through 65535.
remote-public-ip ip-address remote-public-port port-number	Remote Public IP Address and Port Number: Public IP address and port number for the remote side of the tunnel connection. can be a value from 0 through 65535. port-number

Command History

Release	Modification
16.1	Command introduced.

Examples

```
vEdge# request control-tunnel add local-private-ip 10.1.14.14
Value for 'local-private-port' (<0..65535>): 22234

Value for 'remote-public-ip' (<IP address>): 10.0.12.20
Value for 'remote-public-port' (<0..65535>): 23456
vEdge#
```

Related Topics

request control-tunnel delete

Delete a temporary tunnel that you created to debug a failed control connection (on vEdge routers only). One case when you might want to create a temporary tunnel is when a control connection fails to come up because of firewall rules or NAT issues. The Cisco SD-WAN software's forwarding process drops failed connections, so creating a temporary one allows you to triage the problem.

 $\textbf{request control-tunnel delete local-private-ip} \ ip-address\ \textbf{local-private-port}\ port-number\ \textbf{remote-public-ip} ip-address\ \textbf{remote-public-port}\ port-number$

Syntax Description

local-private-ip ip-address local-private-port port-number	Local Private IP Address and Port Number: Private IP address and port number for the local side of the tunnel connection. port-number can be a value from 0 through 65535.
remote-public-ip ip-address remote-public-port port-number	Remote Public IP Address and Port Number: Public IP address and port number for the remote side of the tunnel connection. port-number can be a value from 0 through 65535.

Command History

Release	Modification
16.1	Command introduced.

Related Topics

request controller add serial-num

Send the certificate serial number of a vManage NMS or a vSmart controller to the vBond orchestrator (on vManage NMSs only).

request controller add serial-num number

Syntax Description

number Serial Number: Certificate	erial number to send to the vManage or vSmart controller.
-------------------------------------	---

Command History

Release	Modification
15.4	Command introduced to replace the request vsmart add serial-num command.

Usage Guidelines

Note

The **request controller add serial-num** command to add serial numbers is not supported on Cisco SD-WAN 20.x releases as changes are not persistent across reboots. You can add serial numbers through Cisco vManage. For more details on controller serial numbers, see Controller Serial Numbers to Cisco vBond Orchestrator.

Related Topics

request controller delete serial-num

request controller delete serial-num—Delete a vSmart serial number from the vSmart controller serial number file on the local device.

request controller delete serial-num number

Syntax Description

number	Serial Number: vSmart serial number to delete from the vSmart serial number file on the local
	device.

Command History

Release	Modification
15.4	Command introduced to replace the request vsmart delete serial-num command.

Usage Guidelines

Note

The **request controller delete serial-num** command to delete serial numbers is not supported on Cisco SD-WAN 20.x releases as changes are not persistent across reboots. You can delete serial numbers through Cisco vManage.

request controller-upload serial-file

request controller-upload serial-file—Upload the controller certificate serial number file to the local device (on vManage NMSs only). The local device retains these serial numbers even after you reboot it.

request controller-upload serial-file filename [vpn vpn-id]

Syntax Description

filename	Name of Certificate File: Install the specified file containing the list of serial numbers for the vManage NMSs and vSmart controllers in the overlay network. The file can be in your home directory on the local device, or it can be on a remote device reachable through FTP, HTTP, SCP, or TFTP. If you are using SCP, you are prompted for the directory name and filename. No file path name is provided.
vpn vpn-id	Specific VPN: VPN in which the certificate file is located. When you include this option, one of the interfaces in the specified VPN is used to retrieve the file. The interfaces on a vSmart controller are only in VPN 0, the VPN reserved for the control plane, so you can omit this option because vSmart images are always retrieved from VPN 0.

Command History

Release	Modification
15.4	Command introduced to replace the request vsmart-upload serial-file command.

Related Topics

request controller add serial-num, on page 667 request controller delete serial-num, on page 668

request csr upload

request csr upload—Upload a certificate signing request (CSR) to the Cisco SD-WAN device (on vSmart controllers and vBond orchestrators only).

request csr upload path [regen-rsa] [regen-uuid] [vpn vpn-id]

path	Path to Certificate File: Upload the CSR in the file at the specified path. The path can be in a directory on the local device or on a remote device reachable through FTP, HTTP, SCP, or TFTP. If you are using SCP, you are prompted for the directory name and filename. No file path name is provided.
regen-rsa	(Optional) Regenerate RSA Key Pair: Generate a new RSA public-private key pair. The RSA key pair is stored in the server key file in the /usr/share/viptela directory on the local device.

regen-uuid	(Optional) Regenerate UUID: Generate a new CSR with a unique UUID that is different from the previous UUID. You can specify this option only on a vBond orchestrator virtual machi (VM). The option is not available on vEdge router hardware, because the router's UUID is it chassis number.	
vpn vpn-id	(Optional) Specific VPN: VPN in which the CSR file is located. When you include this option, one of the interfaces in the specified VPN is used to retrieve the file. The interfaces on a vSmart controller are only in VPN 0, the VPN reserved for the control plane, so you can omit this option because vSmart images are always retrieved from VPN 0.	

Release	Modification
14.1	Command introduced.
14.2	Added the org-name and regen-rsa options.
15.3	Removed the org-name option. The command now prompts for the organization name.
17.1	Added support for multitenancy.

Examples

```
vSmart# request csr upload home/admin/vm9.csr
Uploading CSR via VPN 0
Enter organization name : Cisco SD-WAN
Re-enter organization name : Cisco SD-WAN
Generating CSR for this VSmart device
......[DONE]
Copying ... /home/admin/vm9.csr via VPN 0
CSR upload successful
```

When the vBond orchestrator or vSmart controller is part of a software multitenant architecture, the command also prompts for the service provider organization name.

```
vSmart# request csr upload home/admin/vm9.csr
Uploading CSR via VPN 0
Enter service provider organization name : SP Inc
Re-enter service provider organization name : SP Inc
Enter organization name : Cisco SD-WAN
Re-enter organization name : Cisco SD-WAN
Generating CSR for this vSmart device
......[DONE]
Copying ... /home/admin/vm9.csr via VPN 0
CSR upload successful
```

request daemon ncs restart

request daemon ncs restart—Restart the NCS network configuration process (on vManage NMSs only). This process tracks the configurations of Cisco vEdge devices that are being managed by the vManage NMS.

request daemon ncs restart

Command History

Release	Modification
16.1.1	Command introduced.

Examples

vManage# request daemon ncs restart vManage#

Related Topics

request nms application-server, on page 680

request device

request device—Add or delete a vEdge router chassis number on the vBond orchestrator that is acting as a ZTP server.

request device add chassis-number number strong>serial-numbernumber validity [invalid | valid] vbond ip-address org-name name [port port-number] [enterprise-root-ca path] request device delete chassis-number number

chassis-number number	Chassis Number: vEdge router chassis number.
validity invalid valid	Device Validity: Whether the vEdge router is allowed to join the overlay network (valid) or is not allowed (invalid).
enterprise-root-ca path	Enterprise Root CA: Path to the enterprise root CA. The path can be an HTTP, FTP, or TFTP path.
org-name name	Organization Name: Name of your organization as specified in the device certificates.
port port-number	Port on the vBond Orchestrator: Port to use on the vBond orchestrator to reach the WAN network.
strong>serial-numbernumber	Serial Number: vEdge router serial number.

Release	Modification
14.3	Command introduced.

Examples

```
vBond# request device add chassis-number 12345 serial-number 6789 validity valid vbond 10.1.14.1 org-name cisco
Adding Chassis number 12345 to the database
Successfully added the chassis-number

request device-upload

request device—Add vEdge router chassis numbers by uploading a file that contains the device information onto the vBond orchestrator that is acting as a ZTP server.

request device-upload chassis-file file-path [vpn vpn-id]

chassis-file file-path	Filename: Name of a CSV file containing the chassis information required by the ZTP server.
	file-path can be one of the following:
	• filename—Path to a file in your home directory on the local Cisco vEdge device.
	• ftp: file-path—Path to a file on an FTP server.
	• http:// url/file-path—Path to a file on a webserver.
	• scp: user@host:file-path
	• file-path—Path to a file on a TFTP server.
	Each row in the CSV file must contain the following information for each vEdge router:
	Chassis number
	Serial number
	Validity (either valid or invalid)
	• vBond IP address
	vBond port number (entering a value is optional)
	Organization name
	Path to the root certification (entering a value is optional)
file-path vpn vpn-id	VPN: vpn <i>vpn-id</i> VPN in which the remote server is located.

Release	Modification
14.3	Command introduced.

Examples

The following example uploads the device information from the local router. Here, the root CA path is omitted, but the comma preceding its value is required.

```
vBond# vshell
vm4vBond~$ cat ztp-chassis-file
12345,6789,valid,10.1.14.1,12345,cisco,
vBond:~$ exit
exit
vBond request device-upload chassis-file /home/admin/ztp-chassis-file
Uploading chassis numbers via VPN 0
Copying ... /home/admin/ztp-chassis-file via VPN 0
Successfully loaded the chassis numbers file to the database.
Uploading the serial numbers to the vedge-list ...
Uploading serial numbers via VPN 0
Copying ... /home/admin/vedge_serial_entries via VPN 0
```

Successfully loaded the vEdge serial numbers vBond# show ztp entries $\ensuremath{^{\text{T}}}$

INDEX	CHASSIS NUMBER		VALIDITY	VBOND IP	. 201.2	ORGANIZATION NAME	ROOT CERT PATH

request download

request download—Download a software image or other file to the Cisco SD-WAN device (on vEdge routers and vSmart controllers only).

request download [vpn vpn-id] filename

Syntax Description

filer	name	Name of Software Image or File: Download a software image or other file to the local Cisco SD-WAN device. The file can be on a remote device reachable through FTP, HTTP, HTTPS, SCP, or TFTP. If you are using SCP, you are prompted for the directory name and filename; no file path name is provided. The file is placed in your home directory on the local device.
vpn	1 vpn-id	Specific VPN: VPN in which the remote device containing the file to be downloaded is located. When you include this option, one of the interfaces in the specified VPN is used to retrieve the software image.

Command History

Release	Modification	
15.3.3	Command introduced on vEdge 100 routers.	
15.4	Available on all routers and on vSmart controllers.	

Related Topics

request execute

request execute—Execute a shell command from within the Cisco SD-WAN CLI.

request execute [vpn vpn-id] command (in Releases 15.4 and later)

request execute [vpn vpn-id] "command" (in Releases 15.3 and earlier)

Syntax Description

command	Command: Run the specified command in the UNIX shell while still remaining in the Cisco SD-WAN CLI. In Releases 15.3 and earlier, you must enclose the command within quotation marks.
vpn vpn-id	VPN: Specific to the VPN in which to execute the command. The default <i>vpn-id</i> is VPN 0.

Command History

Release	Modification
14.1	Command introduced.
15.4	Enclosing the shell command in quotation marks is no longer necessary.

Examples

To open an SSH connection from a vManage NMS to an IOS XE router, you must specify the port number, which is 830.

```
vManage# request execute vpn 0 ssh 172.16.255.15 ssh: connect to host 172.16.255.15 port 22: Connection refused vManage# request execute vpn 0 ssh 172.16.255.15 -p 830 admin@172.16.255.15's password:

request firmware upgrade

request firmware upgrade—Upgrade the boot loader (on vEdge routers only). After running this command, you must reboot the router.

request firmware upgrade filename

Syntax Description

file	ename	Boot Loader Filename: Name of the boot loader file. This file must be on the local device. To get
		the boot loader file, contact Cisco SD-WAN Customer Support.

Command History

Release	Modification
15.3.5	Command introduced.

Examples

```
\label{eq:vedge} $$ vEdge\# \ request firmware upgrade u-boot-n820c.bin $$ vEdge\# \ reboot $$
```

Related Topics

reboot, on page 658

request interface-reset

request interface-reset—Reset an interface. This command shuts down and then restarts an interface. The operation occurs so quickly that no indication of the interface's being down is reported in the IF STATUS fields in the output of the **show interface** command.

request interface-reset interface interface-name vpn vpn-id

Syntax Description

interface interface-name	Interface Name: Name of the interface to reset.					
vpn vpn-id	VPN: VPN in which the interface resides.					

Command History

Release	Modification
15.3	Command introduced.

Examples

```
vEdge# request interface-reset interface ge0/4 vpn 1 vEdge#
```

Related Topics

request ipsec ike-rekey

request ipsec ike-rekey—Force the generation of new keys for an IKE session (on vEdge routers only). **request ipsec ike-rekey vpn** *vpn-id* **interface ipsec** *number*

Syntax Description

•	Interface Name: Name of the IPsec interface on which to force the generation of new keys for an IKE session.	
vpn vpn-id	VPN: VPN in which the IPsec interface is located.	

Command History

Release	Modification
17.2	Command introduced.

Examples

Generate a new key for an IKE session. After the new key is generated, the SPI for the session changes and the uptime for the sessions resets to zero. You cannot directly display the old and new keys.

```

request nms all

request nms all—Start, stop, and perform other operations on all vManage cluster components running on the local vManage NMS (on vManage NMSs only). The cluster components are the application server (the HTTP web server for the vManage NMS), the vManage configuration and statistics databases, the messaging and coordination server, and the load balancer.

request nms all (diagnostics | jcmd option | restart | start | status | stop)

Syntax Description

status	Determine the Status of All vManage Cluster Components: Determine the status of all vManage cluster components.					
jcmd option	Display Java Process Information: Display information from Java processes running on all vManage cluster components.					
	option can be one of the following:					
	• gc-class-histo—Histogram of the Java garbage collector. Garbage collection identifies which objects are being used in heap memory.					
	• gc-class-stats—Statistics of the Java garbage collector.					
	• thread-print—Information about the Java threads.					
	• vm-cmd—Java virtual machine commands.					
	• vm-flags—Java virtual machine flags.					
	• vm-sys-props—Java virtual machine system properties.					
	• vm-uptime—Java virtual machine uptime.					
	• vm-ver—Java virtual machine version .					
restart	Restart All vManage Cluster Components.					
diagnostics	ics Run Diagnostics on All vManage Cluster Components.					
start	Start All vManage Cluster Components.					
stop	Stop All vManage Cluster Components.					

Command History

Release	Modification
16.1	Command introduced.
16.2.3	Added the diagnostics option.

Examples

```
vManage# request nms all status

NMS application server
    Enabled: true
    Status: running PID:5877 for 2232s

NMS configuration database
    Enabled: true
    Status: running PID:9132 for 235s

NMS coordination server
    Enabled: true
    Status: running PID:28143 for 9591s

NMS messaging server
    Enabled: true
```

Status: running PID:22267 for 11508s

NMS statistics database
 Enabled: true
 Status: running PID:472 for 48357s

NMS load balancer
 Enabled: false
 Status: not running

Related Topics

request nms application-server, on page 680 request nms configuration-db, on page 685 request nms coordination-server, on page 687 request nms messaging-server, on page 688 request nms statistics-db, on page 691

request nms application-server

request nms application-server—Start, stop, and perform other operations on a vManage HTTP web server (on vManage NMSs only).

request nms application-server (diagnostics | jcmd option | resize-data-partition | restart | software option | start | status | stop | update-logo filename)

status	Determine the status of the local vManage web server.
jcmd option	Display Java Process Information: Display information from a Java process running on the vManage web server.
	option can be one of the following:
	• gc-class-histo—Histogram of the Java garbage collector. Garbage collection identifies which objects are being used in heap memory.
	• gc-class-stats—Statistics of the Java garbage collector.
	• gc-heap-dump—Snapshot of the Java garbage collector.
	• thread-print —Information about the Java threads running on the vManage web server.
	• vm-cmd—Java virtual machine commands on the vManage web server.
	• vm-flags—Java virtual machine flags on the vManage web server.
	• vm-sys-props—Java virtual machine system properties on the vManage web server.
	• vm-uptime—Java virtual machine uptime on the vManage web server.
	• vm-ver—Java virtual machine version on the vManage web server.

update-logo large-logo-filename small-logo-filename	Load a Custom Logo onto the vManage Web Server: Load a logo image to use in the upper left corner of all vManage web application server screens. You can load two files, a larger version, which is displayed on wider browser screens, and a smaller version, which is displayed when the screen size narrows. Both files must be PNG files located on the local device, and both must be 1 MB or smaller in size. For best resolution, it is recommended that the image for the large logo be 180 x 33 pixels, and for the small logo 30 x 33 pixels.
resize-data-partition	Resize Third vManage Partition: Automatically resize the third partition on the vManage NMS if the hypervisor has increased the size of this partition. This partition is the vManage database volume and contains all vManage databases and information related to them. vManage NMS calculates the size of the database volume only when it is initially created. If the hypervisor capabilities cause the database volume size to increase, the vManage NMS recognizes this space and can utilize it only if you issue the request nms application-server resize-data-partition command.
restart	Restart the vManage Web Server: Restart the local vManage web server.
diagnostics	Run Diagnostics on vManage Web Server: Run diagnostics on the vManage web server.
start	Start the local vManage web server.
stop	Stop the vManage Web Server: Stop the local vManage web server.
software option	Web Application Server Software Control: Control the software running on the vManage application server. can be:
	option can be:
	• reset—Undo a software upgrade on the vManage server, and return to the previous software image.
	• upgrade <i>filename</i> —Upgrade the software on the vManage server to the image in the specified file.
	• version—Display the version of software running on the vManage server.

Release	Modification
16.1	Command introduced.
16.2.2	Added version option.
16.2.3	Added software option and move version option under software , and added diagnostics option.
17.2	Added resize-data-partition, software reset, and software upgrade options.
20.4	gc-heap-dump jcmd option is visible for netadmin user without unhide command.

Release	Modification
20.13.1	Added status to the command output. When using the status option, the command output indicates whether there is a schema violation in the configuration database.

Examples

Perform various operations on the local vManage application server

```
vManage# request nms application-server status
NMS application server
   Enabled: true
   Status: running PID:28271 for 7313s
vManage# request nms application-server stop
vManage# request nms application-server restart
NMS application server is not running
Successfully started NMS application server
vManage# request nms application-server status
NMS application server
   Enabled: true
   Status: running PID:5877 for 6s
vManage# request nms application-server jcmd vm-uptime
NMS application server
5877:
21.357 s
vManage#
```

Determine the version of software running on the vManage NMS web server

```
vManage# request nms application-server version

NMS application server is running version bamboo-20160805-0008 on vManage version 16.2.2
```

Check for Database Schema Violation

The following example, which includes the status option, displays the NMS application server status. Starting from Cisco Catalyst SD-WAN Manager Release 20.13.1, the command indicates whether there are any schema violations in the configuration database. In this example, the command output includes a message indicating a schema violation. If you encounter a schema violation, contact Cisco Customer Support to resolve the issue.

```
SDWAN-Manager# request nms application-server status

NMS application server

Enabled: false

Message: Schema Violation

Status: not running

SDWAN-Manager#
```

request nms cluster diagnostics

To analyze the health of a Cisco SD-WAN Manager cluster, use the **request nms cluster diagnostics** command in privileged EXEC mode.

request nms cluster diagnostics

Syntax Description

This command has no arguments or keywords.

Command Default

None

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco vManage Release 20.9.1	This command was introduced.

Usage Guidelines

Run the command directly on the Cisco SD-WAN Manager device for which you are running the Cisco SD-WAN Manager cluster.

The **request nms cluster diagnostics** command provides Cisco SD-WAN Manager cluster diagnostics information and status information for the following Cisco SD-WAN Manager services:

- · Application server
- Messaging server
- Configuration database
- Statistics database service
- Coordination server

Examples

The following is a sample output from the **request nms cluster diagnostics** command:

Device# request nms cluster diagnostics

Note: This output only compares the cluster configuration of each service running on this specific vManage against its operational state. For overall cluster health, please check the Cluster Status page on UI.

hosts in cluster:

10.0.105.39 10.0.105.38 10.0.105.32

Checking services running on 10.0.105.32

persona: COMPUTE AND DATA

Check application-server cluster status status: OK

```
check configuration-db status
Get cluster overview:
id, addresses, databases, groups
"8b82367b-5e47-496f-b9ef-683c61ada642", ["bolt://10.0.105.32:7687",

status: coordination server's config & operational states are Consistent
```

Related Commands

Commands	Description
request admin-tech	Collect system status information in a compressed tar file to aid in troubleshooting and diagnostics.
request nms all	Start, stop, and perform other operations on all Cisco SD-WAN Manager cluster services.
request nms application-server	Start, stop, and perform other operations on a Cisco SD-WAN Manager HTTP web server.
request nms configuration-db	Start, stop, and perform other operations on the localCisco SD-WAN Manager configuration database.
request nms coordination-server	Start, stop, and perform other operations on the local Cisco SD-WAN Manager coordination server.
request nms messaging-server	Start, stop, and perform other operations on the local Cisco SD-WAN Manager messaging server.
request nms statistics-db	Start, stop, and perform other operations on the local Cisco SD-WAN Manager statistics database.
request nms-server	Start and stop a Cisco SD-WAN Manager server and display the status of the server.
request nms server-proxy	Display the status of the Cisco SD-WAN Manager server-proxy for the configured management IP address and port.

request nms configuration-db

To start, stop, and perform other operations on the local Cisco SD-WAN Manager configuration database use the **request nms configuration-db** in privileged EXEC mode. The Cisco SD-WAN Manager configuration database stores device and feature templates and configurations created on the local device.

request nms configuration-db $\{$ backup path $path \mid$ configure \mid diagnostics \mid disable-daily-backup \mid enable-daily-backup \mid jcmd \mid restart \mid restore path $path \mid$ start \mid status \mid stop \mid update-admin-user \mid upgrade $\}$

	T
backup path path	Performs back up of the configuration database to the specified file location.
configure	Configures the local Cisco SD-WAN Manager configuration database.
diagnostics	Runs diagnostics on local Cisco SD-WAN Manager configuration database.
disable-daily-backup	Disables local Cisco SD-WAN Manager configuration database daily backup cronjob.
enable-daily-backup	Enables local Cisco SD-WAN Manager configuration database daily backup cronjob.
	Up to three backups files are stored in the location that you specify with the backup path <i>path</i> keyword. A back up file is named configdb-daily. <i>x</i> .tar.gz, where <i>x</i> is 1, 2, or 3. After three backup files are stored, the oldest file is overwritten when the next backup is performed.
jcmd option	Displays information from the Java processes running on the local Cisco SD-WAN Manager configuration database.
	option can be one of the following:
	• gc-class-histo—Histogram of the Java garbage collector. Garbage collection identifies which objects are being used in heap memory.
	• gc-class-stats—Statistics of the Java garbage collector.
	• thread-print—Information about the Java threads running on the vManage web server.
	• vm-cmd—Java virtual machine commands on the vManage web server.
	• vm-flags—Java virtual machine flags on the vManage web server.
	• vm-sys-props—Java virtual machine system properties on the vManage web server.
	• vm-uptime—Java virtual machine uptime on the vManage web server.
	• vm-ver—Java virtual machine version on the vManage web server.
restart	Restarts the Cisco SD-WAN Manager configuration database.
restore path path	Restores Cisco SD-WAN Manager configuration database from the file located at a specified path.

start	Starts the local Cisco SD-WAN Manager configuration database.
status	Determines the status of the local Cisco SD-WAN Manager configuration database.
stop	Stops the Cisco SD-WAN Manager Configuration Database: Stop the local vManage configuration database.
update-admin-user	Updates configuration database admin user information.
upgrade	Upgrades the configuration database on any one node in the cluster.

Release	Modification
16.1	Command introduced.
16.2.3	This command was modified. The diagnostics keyword is added.
20.3.1	This command was modified. The following keywords were added: disable-daily-backup, enable-daily-backup, upgrade

Examples

Perform various operations on the localCisco SD-WAN Manager configuration database

```
vManage# request nms configuration-db status
NMS configuration database
   Enabled: true
   Status: running PID:25778 for 10601s
vManage# request nms configuration-db stop
Successfully stopped NMS configuration database
vManage# request nms configuration-db restart
Successfully restarted NMS configuration database
vManage# vManage
NMS configuration database
   Enabled: true
   Status: running PID:9132 for 5s
vManage# request nms configuration-db jcmd vm-ver
NMS configuration database
9132:
Java HotSpot(TM) 64-Bit Server VM version 25.72-b15
JDK 8.0 72
Verify if the daily backup is enabled:
vmanage# request nms configuration-db status
NMS configuration database
      Enabled: true
      Status: running PID:25778 for 10601s
      Daily Backup: Enabled
```

Related Topics

request nms all, on page 678
request nms application-server, on page 680
request nms coordination-server, on page 687
request nms messaging-server, on page 688
request nms statistics-db, on page 691

request nms coordination-server

request nms coordination-server—Start, stop, and perform other operations on the local vManage coordination server (on vManage NMSs only). The vManage coordination and messaging server work together to distribute messages and share state among all the vManage NMSs in a vManage cluster.

request nms coordination-server (diagnostics | jcmd option | restart | start | status | stop)

status	Determine the Status of the Coordination Server: Determine the status of the local coordination server.
jcmd option	Display Java Process Information: Display information from Java processes running on the coordination server.
	option can be one of the following:
	• gc-class-histo—Histogram of the Java garbage collector. Garbage collection identifies which objects are being used in heap memory.
	• gc-class-stats—Statistics of the Java garbage collector.
	• thread-print—Information about the Java threads running on the vManage web server.
	• vm-cmd—Java virtual machine commands on the vManage web server.
	• vm-flags—Java virtual machine flags on the vManage web server.
	• vm-sys-props—Java virtual machine system properties on the vManage web server.
	• vm-uptime—Java virtual machine uptime on the vManage web server.
	• vm-ver—Java virtual machine version on the vManage web server.
restart	Restart the Coordination Server: Restart the local coordination server.
diagnostics	Run Diagnostics on the Coordination Server: Run diagnostics on the local vManage coordination server.
start	Start the Coordination Server: Start the local coordination server.
stop	Stop the Coordination Server: Stop the local coordination server.

Release	Modification
16.1	Command introduced.
16.2.3	Added the diagnostics option.

Examples

Perform various operations on the local vManage coordination server

```
vManage# request nms coordination-server status
NMS coordination server
    Enabled: true
    Status: running PID:28143 for 11160s
vManage#
```

request nms messaging-server

request nms messaging-server—Start, stop, and perform other operations on the local vManage messaging server (on vManage NMSs only). The vManage coordination and messaging server work together to distribute messages and share state among all the vManage NMSs in a vManage cluster.

request nms messaging-server (diagnostics | jcmd option | restart | start | status | stop)

status	Determine the Status of the Messaging Server: Determine the status of the local messaging	
	server.	

jcmd option	Display Java Process Information: Display information from Java processes running on the messaging server.
	option can be one of the following:
	• gc-class-histo—Histogram of the Java garbage collector. Garbage collection identifies which objects are being used in heap memory.
	• gc-class-stats—Statistics of the Java garbage collector.
	• thread-print—Information about the Java threads running on the vManage web server.
	• vm-cmd—Java virtual machine commands on the vManage web server.
	• vm-flags—Java virtual machine flags on the vManage web server.
	• vm-sys-props—Java virtual machine system properties on the vManage web server.
	• vm-uptime—Java virtual machine uptime on the vManage web server.
	• vm-ver—Java virtual machine version on the vManage web server.
restart	Restart the Messaging Server: Restart the local messaging server.
diagnostics	Run Diagnostics on the Message Server: Run diagnostics on the local vManage message server.
start	Start the Messaging Server: Start the local messaging server.
stop	Stop the Messaging Server: Stop the local messaging server.

Release	Modification
16.1	Command introduced.
16.2.3	Added the diagnostics option.

Examples

Perform various operations on local vManage messaging server

```
vManage# request nms messaging-server status
NMS messaging server
    Enabled: true
    Status: running PID:22267 for 13679s
vManage#
```

request nms olap-db

To start, stop, or restart the Cisco vManage online analytical processing (OLAP) database, or to view the status of the database, use the **request nms olap-db** command in privileged EXEC mode.

request nms olap-db [start | stop | restart | status]

Syntax Description

start	Start the OLAP database.
stop	Stop the OLAP database.
restart	Restart the OLAP database.
status	Display the status of the OLAP database.

Command Default

The OLAP database service is started by default, and you don't have to manually start it.

Command Modes

Privileged EXEC mode.

Command History

Release	Modification
Cisco vManage Release 20.11.1	This command was introduced.

Example

The following example shows how to start the OLAP database:

```
vmanage# request nms olap-db start
```

Successfully started NMS OLAP database

The following example shows how to stop the OLAP database:

vmanage# request nms olap-db stop

Successfully stopped NMS OLAP database

The following example shows how to restart the OLAP database:

vmanage# request nms olap-db restart

Successfully restarted NMS OLAP database

The following example displays the status of the OLAP database:

```
vmanage# request nms olap-db status
```

NMS OLAP database

Enabled: true

Status: running PID:65218 for 2981335s

request nms statistics-db

Start, stop, and perform other operations on the local vManage statistics database (on vManage NMSs only). The vManage statistics database stores all real-time statistics from the local vManage NMS.

 $request \ nms \ statistics-db \ (allocate-shards \ | \ diagnostics \ | \ jcmd \ \mathit{option} \ | \ restart \ | \ status \ | \ stop)$

allocate-shards	Allocate Unassigned Database Shards. Check for unassigned shards in the vManage statistics database, and assign them.
diagnostics Run diagnostics on the local vManage statistics database.	
jemd option	Display information from a Java process running on the vManage web server. Option can be one of the following:
	• gc-class-histo—Histogram of the Java garbage collector. Garbage collection identifies which objects are being used in heap memory.
	• gc-class-stats—Statistics of the Java garbage collector.
	• thread-print—Information about the Java threads running on the vManage web server.
	• vm-cmd—Java virtual machine commands on the vManage web server.
	• vm-flags—Java virtual machine flags on the vManage web server.
	• vm-sys-props—Java virtual machine system properties on the vManage web server.
	• vm-uptime—Java virtual machine uptime on the vManage web server.
	• vm-ver—Java virtual machine version on the vManage web server.
restart	Restart the local vManage statistics database.
start	Start the local vManage statistics database.
status	Determine the status of the local vManage statistics database.
stop	Stop the local vManage statistics database.

Release	Modification
16.1	Command introduced.
16.2.3	Command modified. Diagnostics option added.
16.3	Command modified. allocate-shards option added

Example

Perform various operations on local vManage statistics database:

```
vManage# request nms statistics-db status
NMS statistics database
Enabled: true
Status: running PID:472 for 48607s
vManage# request nms statistics-db stop
Successfully stopped NMS statistics database
vManage# request nms statistics-db restart
Successfully restarted NMS statistics database
vManage# request nms statistics-db status
NMS statistics database
   Enabled: true
   Status: running PID:10353 for 4s
vManage# request nms statistics-db jcmd vm-sys-props
NMS statistics database
10353:

```

request nms-server

Start and stop a vManage NMS, and display the status of the NMS (on vManage NMSs only).

```
request nms-server (start | status | stop)
```

Syntax Description

start	Start or restart the local vManage NMS.
status	Determine the status of the local vManage NMS.
stop	Stop the local vManage NMS.

Command History

Release	Modification
15.4	Command introduced.

Examples

Check the status of the local vManage NMS, stop and start the server

```
vManage# request nms-server status
NMS webserver is running
vManage# request nms-server stop
Successfully stopped NMS webserver
vManage# request nms-server status
NMS webserver is not running
vManage# request nms-server start
Successfully started NMS webserver
vManage# request nms-server status
NMS webserver is running
```

request nms server-proxy

To display the status of the NMS server-proxy for the configured management IP address and port, use the **request nms server-proxy** command.

request nms server-proxy set management-ip ip-address port

Syntax Description

set	Set NMS component.
management-ip Update service proxy management IP configuration	
ip-address	Enter the Cisco SD-WAN Manager management IP address.
	Default: 127.0.0.1
port	Enter the Cisco SD-WAN Manager management IP port.
	Default: 8443

Command History

Release	Modification
Cisco SD-WAN Release 20.7.1	This command was introduced.

The following sample output shows the Cisco SD-WAN Manager management IP address and port configurations:

```
Device# request nms server-proxy set management-ip
```

Enter the vmanage management ip address[127.0.0.1]:127.0.0.1

Enter the vmanage management ip port[8443]:8443

Restarted service proxy for management ip address update

request nms server-proxy set ratelimit

To configure rate limits for bulk and non-bulk APIs for a Cisco vManage node or cluster, use the **request nms server-proxy set ratelimit** command in the operational mode.

request nms server-proxy set ratelimit

Syntax Description

This command has no arguments or keywords.

Command Default

The rate limit per node for non-bulk APIs is 100 requests per second.

The rate limit per node for bulk APIs is 48 requests per minute.

For a Cisco vManage cluster, the default rate limit per node is multiplied by the number of nodes. For example, for a three-node cluster, the default rate limit is 144 (48*3) requests per minute across all three nodes.

Command Modes

Operational mode (#)

Command History

Release	Modification
Cisco vManage Release 20.10.1	This command is introduced.

Before you configure the rate limit, consider its effect on Cisco vManage resources.

Examples

The following example shows how you can configure the bulk API rate limit for a node. In this example, the rate limit is changed from 48 requests per minute to 50 requests per minute.

vManage# request nms server-proxy set ratelimit

```
Do you want to reconfigure rate limit for URL non bulk api [y/n] : n
Do you want to reconfigure rate limit for URL bulk api /dataservice/data/device/statistics
[y/n] : y
Enter the PER NODE rate limit for URL bulk api /dataservice/data/device/statistics [48 load balanced across all nodes at present] : 50
Enter the rate limit unit (second, minute, hour, day) for URL bulk api /dataservice/data/device/statistics [minute] : minute
```

Propagating rate limit update across all nodes. Please wait. vmanage#

The following example shows how you can configure the bulk API rate limit for a cluster from one of the nodes in the cluster. This example shows the configuration of the bulk API rate limit on one of the nodes on a three-node cluster. The existing bulk API rate limit per node is 48 requests per minute, and the bulk API rate limit for the cluster is 144 (48*3) requests per minute. The configuration changes the bulk API rate limit per node to 50 requests per minute and the bulk API rate limit for the cluster to 150 requests per minute.

```
vManage# request nms server-proxy set ratelimit
```

```
Do you want to reconfigure rate limit for URL non bulk api [y/n] : n
Do you want to reconfigure rate limit for URL bulk api /dataservice/data/device/statistics
[y/n] : y
Enter the PER NODE rate limit for URL bulk api /dataservice/data/device/statistics [144 load balanced across all nodes at present] : 50
Enter the rate limit unit (second, minute, hour, day) for URL bulk api /dataservice/data/device/statistics [minute] : minute
Propagating rate limit update across all nodes. Please wait.
Done. Please restart server-proxy on all nodes using "request nms server-proxy restart" command.
```

Related Commands

Command	Description
show nms server-proxy ratelimit	Displays rate limits configured on the Cisco vManage server-proxy for bulk and non-bulk APIs.

request on-vbond-controller

Delete the serial number of a vEdge router (on vBond orchestrators only).

request on-vbond-controller delete serial-number serial-number

Syntax Description

serial-number	vEdge router serial number to delete.
---------------	---------------------------------------

Command History

Release	Modification
14.1	Command introduced.
16.1	Command modified. on-vbond-vsmart to request on-vbond-controller option added.

request on-vbond-vsmart

Delete the serial number of a vEdge router (on vBond orchestrators only).

Starting with Release 16.1, this command has been renamed to request on-vbond-controller.

request on-vbond-vsmart delete serial-number serial-number

Syntax Description

serial-number	vEdge router serial number to delete.
---------------	---------------------------------------

Command History

Release	Modification
14.1	Command introduced.

request platform software sdwan bootstrap-config save

To save a bootstrap file to the device bootflash, on Cisco IOS XE Catalyst SD-WAN devices, use **request platform software sdwan bootstrap-config save** in EXEC mode.

request platform software sdwan bootstrap-config save

Command Default

None.

Command Modes

EXEC

Command History

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.3.1a	The command was introduced.

Usage Guidelines

To establish connectivity with the Cisco Catalyst SD-WAN controller, a device requires a minimum configuration. In most situations, this minimum bootstrap configuration (MBC) can be provided initially by plug-and-play (PnP). But in some situations, such as in remote sites where it may be preferable not to use PnP, it is helpful to have a saved bootstrap configuration that can connect the device to the controller.

The **request platform software sdwan bootstrap-config save** command saves the device configuration to the bootflash. The command can be used to save the configuration at any time, but it is intended for saving a minimum bootstrap configuration (MBC) file that enables the device to reconnect to the controller in case the full configuration is ever lost or removed.

When setting up a device, add to the configuration the details that are required to connect to the controller, and use this command to save the MBC. The file is saved to this location:

bootflash:/ciscosdwan.cfg

Example

The following example shows the command execution and output.

Device#request platform software sdwan bootstrap-config save Saving bootstrap file 'bootflash:/ciscosdwan.cfg'...
Done

request port-hop

Manually rotate to the next OMP port in the group of preselected OMP port numbers when a connection cannot be established, and continue the port hopping until a connection can be established (on vEdge routers only). Each connection attempt times out in about 60 seconds.

One case to issue this command is when NAT entries become stale.

request port-hop color color

Syntax Description

color Color of an individual WAN transport interface.

Values: 3g, biz-internet, blue, bronze, custom1, custom2, custom3, default, gold, green, lte, metro-ethernet, mpls, private1, private2, private3, private4, private5, private6, public-internet, red, and silver

Command History

Release	Modification
15.3.1	Command introduced.

Example

Request port hopping on TLOCs whose color is **lte**:

```
vEdge# request port-hop color lte vEdge#
```

show reboot history, on page 986

request reset logs

Clear the contents of all syslog logging files on the local device (on vEdge routers and vSmart controllers only). This operation also clears the contents of the WTMP file, which records all login and logout events that have occurred on the device. Resetting the logs does not require the device to be rebooted.

Command Hierarchy

request reset logs

Command History

Release	Modification
15.4	Command introduced.

Examples

The following example clears the syslog logging files on the vEdge device:

```
vEdge# file show /var/log/console-log
No license at startup, please load a valid licence.
licence error, could not read hardware identifier v4
licence error, could not read hardware identifier v5
...
vEdge# request reset logs
vEdge# show /var/log/console-log
vEdge#
```

request sla-dampening-reset color

To reset dampening on a tunnel for a color, use the **request sla-dampening-reset color** command in privileged EXEC mode.

Syntax

request sla-dampening-reset color color

Syntax Description

color color	Specifies an identifier for the transport tunnel for data traffic moving between vEdge routers. The color identifies a specific WAN transport provider.
	The following are the color values:
	3g, biz-internet, blue, bronze, custom1, custom2, custom3, default, gold, green, lte, metro-ethernet, mpls, private1 through private6, public-internet, red, silver
	Default:
	default
1	

Command History

Release	Modification
20.5.1	This command is introduced.

Example

The following example resets dampening on a tunnel for the public-internet color:

```
vEdge (config)# bfd app-route
vEdge (config)# bfd app-route poll-interval 60000
vEdge (config-bfd)# bfd app-route multiplier 3
vEdge (config)# bfd app-route color public-internet
vEdge (config-color-public-internet)# sla-damp-multipler 60
vEdge (config-color-public-internet)# exit
```

```
vEdge (config-color-public-internet)# exit
vEdge# request sla-dampening-reset color public-internet
```

request root-ca-crl

To install a file that contains the root certificate authority Certificate Revocation List (CRL), use the **request root-ca-crl install** command in privileged EXEC mode.

To uninstall a file that contains the root certificate authority CRL, use the **request root-ca-crl uninstall** command in privileged EXEC mode.

request root-ca-crl install filename [vpn vpn-id]

request root-ca-crl uninstall

Syntax Description

install filename	Installs the specified file that contains the root certificate authority CRL.	
vpn vpn-id	Specifies the VPN in which the CRL file is located.	
uninstall	Uinstalls the file that contains the root certificate authority CRL from the device.	

Command Modes

Privileged EXEC

Command History

Release	Modification
Cisco SD-WAN Release 20.7.1	This command was introduced.

Usage Guidelines

- The file that contains the root certificate authority CRL is installed in the /usr/share/viptela/root-ca.crl directory in the device. The file can be in the home directory in your local device, or in a remote device that can be reached through FTP, HTTP, SCP, or TFTP. If you are using SCP, you are prompted for the directory name and filename. No file path name is provided.
- When you include the VPN option, one of the interfaces in the specified VPN is used to retrieve the file that contains the root certificate authority CRL. You can omit this option for a Cisco Catalyst SD-WAN Controller because its interfaces are only in VPN 0, which is the VPN that is reserved for the control plane, and Cisco Catalyst SD-WAN Controller images are always retrieved from VPN 0.

Examples

The following example shows how to install the master root.crl file:

```
vEdge # request root-ca-crl install /home/admin/master_root.crl
Uploading root-ca-crl via VPN 0
Copying /home/admin/master_root.crl to /tmp/vconfd/root-ca.crl.tmp via VPN 0
install_crl new_crl /tmp/vconfd/root-ca.crl.tmp destination_crl /usr/share/viptela/root-ca.crl
send install crl notification
```

The following example shows how to uninstall installs the master root.crl file:

```
vEdge # request root-ca-crl uninstall
Setting root-ca-crl-installed to false
send_uninstall_crl_notification
Successfully uninstalled the root CA CRL
```

request root-cert-chain

Install or uninstall a file containing the root certificate key chain.

Command Hierarchy

request root-cert-chain install filename [vpn vpn-id]

request root-cert-chain uninstall

Syntax Description

install filename	Install the specified file containing the root certificate chain The file can be in a your home directory on the local device, or it can be on a remote device reachable through FTP, HTTP, SCP, or TFTP. If you are using SCP, you are prompted for the directory name and filename. No file path name is provided.
vpn vpn-id	VPN in which the certificate file is located. When you include this option, one of the interfaces in the specified VPN is used to retrieve the file. The interfaces on a vSmart controller are only in VPN 0, the VPN reserved for the control plane, so you can omit this option because vSmart images are always retrieved from VPN 0.
uninstall	Uninstall the file containing the root certificate key chain from the Cisco vEdge device.

Command History

Release	Modification
14.1	Command introduced.

request security ipsec-rekey

Force IPsec to generate new keys (on vEdge routers only). Use this command when the IPsec keys have been compromised. After you issue this command, the old key continues to be used until it times out.

Command Hierarchy

request security ipsec-rekey

Command History

Release	Modification
14.2	Command introduced.

Examples

In this example, the SPIs (keys) for TLOC 172.16.255.15 change from 256 and 257 to 257 and 258:

vEdge# show tunnel local-sa
TLOC ADDRESS TLOC COLOR SPI IP PORT KEY HASH

172.16.255.15 172.16.255.15	lte lte	256 257	10.1.15.15 10.1.15.15	12346 12346	*****b93a ****b93a
vEdge# request	security ipsec-rel	key			
vEdge# show tun	nel local-sa				
TLOC ADDRESS	TLOC COLOR	SPI	IP	PORT	KEY HASH
172.16.255.15 172.16.255.15	lte lte	257 258	10.1.15.15 10.1.15.15	12346 12346	*****b93a *****a19d

rekey, on page 425

show bfd sessions, on page 751

show ipsec inbound-connections, on page 875

show ipsec local-sa, on page 876

show ipsec outbound-connections, on page 877

request software activate

Activate a software image on the local Cisco SD-WAN device (on vEdge routers and vSmart controllers only). Starting from Release 15.4, this command replaces the **reboot other-boot-partition** command.

Command Hierarchy

request software activate software-image [clean] [now]

Syntax Description

now	Activate the specified software image immediately, with no prompt asking you to confirm that you want to activate.			
	Note Beginning with Cisco IOS XE Catalyst SD-WAN Release 17.14.1a, this option is no longer supported.			
clean	Activate the specified software image, but do not associate the existing configuration file, and do not associates any files that store information about the device history, such as log and trace files, with the newly activated software image.			
	Note Beginning with Cisco IOS XE Catalyst SD-WAN Release 17.10.1a, this option is no longer supported.			
software-image	Name of the software image to activate on the device.			

Command History

Release	Modification	
15.3.3	Command introduced for vEdge 100 routers.	
15.4	Command supported on all vEdge routers and vSmart controllers.	

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.10.1a	The clean option is no longer supported.
Cisco IOS XE Catalyst SD-WAN Release 17.14.1a	The now option is no longer supported.

Examples

The following example activates a software image:

```
vEdge# request software activate 15.3.3
This will reboot the node with the activated version.
Are you sure you want to proceed? [yes,NO]
```

Related Topics

```
request download, on page 674
request software install-image, on page 709
request software remove, on page 710
request software reset, on page 711

request software set-default, on page 713
request software verify-image, on page 715
show software, on page 1010
show version, on page 1040
```

request software install

Download, install, and activate a software image on the Cisco SD-WAN device (on all devices except vEdge 100 routers). Before the software is installed, the software image is verified to determine that it is valid and that it has been signed. If the verification process fails, the software image installation is not performed.

Command Hierarchy

request software install filename [download-timeout minutes] [reboot [no-sync]] [vpn vpn-id]

Syntax Description

download-timeoutminutes	Specifies the installation timeout value. How long to wait before canceling
	requests to install software. The duration ranges from 1 through 1440 minutes
	(24 hours). The default time is 60 minutes.

filename	Install the software image in specified filename. The file can be in your home directory on the local device, or it can be on a remote device reachable through FTP, HTTP, SCP, or TFTP. If you are using SCP, you are prompted for the directory name and filename. No file path name is provided.
	For a vEdge router, filename has the format SD-WAN-release-number-mips64.tar.bz2 (this image includes both the vEdge and the software for a hardware-based vBond orchestrator).
	For a vSmart controller and software-based vBond orchestrator, filename has the format SD-WAN-release-number-x86_64.tar.bz2.
	For a vManage NMS, filename has the format vmanage-release-number-x86_64.tar.bz2.
	In all the image names, the release number consists of the last two digits of the release year and a number that indicates which release it is in that year. An example of a vEdge image name is SD-WAN-16.1-mips64.tar.bz2, for the first image released in 2016.
	When you upgrade the software on a vManage NMS, you should back up the vManage storage partition before performing the upgrade. See Restore the vManage NMS.
rebootno-sync	Reboot the device after installation of the software image completes. By default, the device's current configuration is copied to the other hard-disk partition and is installed with the new software image. If you include the no-sync option, the software is installed in the other hard-disk partition, and it is installed with the factory-default configuration. The existing configuration and any files that store information about the device history, such as log and trace files, are not copied to the other partition. Effectively, the no-sync option restores the device to its initial factory configuration.
vpn vpn-id	VPN in which the image is located. When you include this option, one of the interfaces in the specified VPN is used to retrieve the software image. The interfaces on a vSmart controller are only in VPN 0, the VPN reserved for the control plane, so you can omit this option because vSmart images are always retrived from VPN 0.

Command History

Release	Modification
14.1	Command introduced.
14.2	no-sync option added.
15.3.5	download-timeout option and prompt for backing up vManage database are added.
16.1	Support for signed images and image verification added.

Examples

To upgrade the software on a vManage NMS:

```
vEdge# request software install /home/admin/vmanage-15.2.0-x86 64.tar.bz2 reboot
It is recommended that you back up the vManage storage partition before upgrade. Proceed
with upgrade? [y/n]: n
vManage storage partition not backed up. Stopping upgrade.
vManage# request software install /home/admin/vmanage-15.2.0-x86_64.tar.bz2 reboot
It is recommended that you back up the vManage storage partition before upgrade. Proceed
with upgrade? [y/n]: Y
Prompted for vManage storage backup. Proceeding with upgrade

request software remove

Remove a software image from the local Cisco SD-WAN device (on vEdge routers and vSmart controllers only).

Command Hierarchy

request software remove file-system-name

Syntax Description

file-system-name	Name of the software image to delete from the device. You cannot delete the active image.
------------------	---

Command History

Release	Modification
15.3.3	Command introduced for vEdge 100 routers.
15.4	Support extended on all routers and on vSmart controllers.

Examples

Attempt to remove a software image:

```
vEdge# request software remove ?
Description: Display software versions
Possible completions:
   15.3.3
vEdge# request software remove 15.3.3
cannot remove active image
vEdge#
```

request software reset, on page 711
request software secure-boot, on page 712
request software set-default, on page 713
show software, on page 1010
show version, on page 1040

request software reset

Return the Cisco SD-WAN device to the default software image and default configuration. The default is either the factory-default image and configuration or the default image set with the **request software set-default** command.

When you issue this command, all non-default software images are removed from the device. Then, the device reboots with the default image and configuration.

In Releases 15.3 and earlier, this command reformats the boot partition and installs the software image again. During this process, which is very time-consuming, all logs and the configuration are lost. It is recommended that you issue a **request admin-tech** command to collect system-wide information before issuing this command and that you use this command only when you suspect that the filesystem is corrupt.

Command Hierarchy

request software reset

Command History

Release	Modification
14.1	Command introduced.

Examples

After the command completes, you are logged out of the device. You may need to press the Return key to complete the logout process.

```
vEdge# request software reset
Are you sure you want to reset to factory defaults? [yes,NO] yes
Broadcast message from root@vEdge (console) (Mon Apr 24 17:58:08 2017):
Mon Apr 24 17:58:08 PDT 2017: The system is going down for reboot NOW!

request software secure-boot

Check and enforce the secure boot state of the system software images and, for vEdge hardware routers, of the boot loader.

Command Hierarchy

request software secure-boot list request software secure-boot set request software secure-boot status

Syntax Description

request software secure-boot list	Check secure boot state and check whether software images on the device are secure or not secure.
request software secure-boot set	Remove insecure software images from the device and, for vEdge hardware routers, remove an insecure boot loader.
request software secure-boot status	Display the security status of the software images installed on the device.

Command History

Release	Modification
18.3.1	Command introduced.

Examples

```
vEdge# request software secure-boot list
Secure-image check found no insecure software versions
vEdge# request software secure-boot status
Secure-image status: HIGH
```

Related Topics

reboot, on page 658

request software install, on page 707
request software verify-image, on page 715
show boot-partition, on page 762
show software, on page 1010

request software set-default

Set a software image to be the default image on the device (on vEdge routers and vSmart controllers only). Performing this operation overwrites the factory-default software image, replacing it with an image of your choosing. It is recommended that you set a software image to be the default only after verifying that the software is operating as desired on the device and in your network.

Command Hierarchy

request software set-default image-name

Syntax Description

image-name	Name of the software image to designate as the default image on the device.
------------	---

Command History

Release	Modification
15.3.3	Command introduced for vEdge 100 routers.
15.4	Supported on all routers and on vSmart controllers.

Examples

```
vEdge# request software set-default 15.3.3
This will change the default software version.
Are you sure you want to proceed? [yes,NO] yes vEdge#
```

show software, on page 1010
show version, on page 1040

request software upgrade-confirm

Confirm that the upgrade to a new software image is successful. If the device configuration includes the **system upgrade-confirm** command, issuing the **request software upgrade-confirm** command within the time limit configured in the **upgrade-confirm** command confirms that the upgrade to the new software image has been successful. If this command is not issued, the device reverts automatically to the previously running software image.

If you have initiated the software upgrade from the vManage NMS, the vManage NMS automatically issues the **request software upgrade-confirm** command when the vEdge router finishes rebooting. If you have initiated the software upgrade manually from the vEdge router, you issue this command from the CLI.

Command Hierarchy

request software upgrade-confirm

Command History

Release	Modification
15.1	Command introduced.
15.2	Command support added for vBond orchestrator, vManage NMS, and vSmart controller.
15.4	Command renamed from request upgrade-confirm.

Examples

Configure an upgrade confirm time limit of 5 minutes, upgrade the software manually from the vEdge router CLI, and confirm that the upgrade has been successful:

```
vEdge# config
vEdge(config)# system upgrade-confirm 5
vEdge(system)# u
vEdge# request software install viptela-15.1.mips64.tar.bz2 reboot
[Software is installed, and router reboots and restarts.]
user$ ssh -l admin vEdge
Software upgrade completed. Device will revert to previous software version in '300' seconds unless confirmed.
Execute "request software upgrade-confirm" to confirm the upgrade.
vEdge#
[Less than 5 minutes elapse.]
vEdge# request software upgrade-confirm
Software upgrade confirmed.
vEdge#
```

Configure an upgrade confirm time limit of 5 minutes, upgrade the software, and log back in to the router, but do not confirm that the upgrade has been successful:

```
vEdge# config
vEdge(config)# system upgrade-confirm 5
vEdge(system)# commit and-quit
vEdge# request software install viptela-15.1.mips64.tar.bz2 reboot
[Software is installed, and router reboots and restarts.]
user$ ssh -1 admin vEdge
Software upgrade completed. Device will revert to previous software version in '300' seconds unless confirmed.
Execute "request software upgrade-confirm" to confirm the upgrade.
vEdge#
[More than 5 minutes elapse.]
Software upgrade not confirmed. Device will revert to previous software version.
vEdge#
```

Related Topics

request software install, on page 707

upgrade-confirm, on page 529

request software verify-image

Verify that a Cisco SD-WAN software image is valid and has been signed.

It is recommended that you issue a request software install or request software install-image command, or that you install device software from the vManage NMS, rather than using the request software verify-image command. Both these commands, as well as the vManage NMS image installation and upgrade processes, verify that the image is valid and has been signed before they install the software. If the verification process fails, the software image installation is not performed.

Command Hierarchy

request software verify-image filename

Syntax Description

filename Name of the Cisco SD-WAN software image file. This file is a compressed tar file (filename extension tar.gz) on the local device. The tar file names have the following format, where x.x.x represents the release version:

- vEdge router-viptela-x.x.x-mips64.tar.gz
- vBond and vSmart-viptela-x.x.x86 64.tar.gz
- vManage-vmanage-x.x.x86 64.tar.gz

Command History

Release	Modification
16.1	Command introduced.

Example

```
vManage# request software verify-image vmanage-16.1.0-x86 64.tar.gz
verify OK
Signature verified for rootfs.img
Signature verified for vmlinuz
vManage#
```

```

request stream capture

To debug issues related to loss of connectivity between Cisco vEdge devices and Cisco vManage, use the **request stream capture** command in privileged EXEC mode.

request stream capture { enable | disable | abort } { control | data } vpn vpn-id interface interface-name session-id [dst-ip ip-address | dst-port port | src-ip ip-address | src-port port | protocol number]

Syntax Description

enable	Enables capturing data stream.
disable	Disables capturing data stream.
abort	Terminates the data stream capturing process.
data	Captures data stream for the data plane.
control	Captures data stream information for the control plane.
vpn-id vpn-id	VPN ID to capture the data stream details for.
interface interface-name	Interface to capture data stream details for.
session-idsession-id	Session ID to capture the data stream details for.
dst-ip ip-address	(Optional) Destination IP address to capture the data stream details for.
dst-port port	(Optional) Destination port to capture the data stream details for.
src-ip ip-address	(Optional) Source IP address to capture the data stream details for.
src-port port	(Optional) Source port to capture the data stream details for.
protocol number	(Optional) Valid protocol number
	Range: 0 to 255

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco SD-WAN Release 20.6.1	This command was introduced.

Usage Guidelines

The parameters in this command syntax can be configured in any order.

Example

The following example shows how to enable stream capture for the specified details.

Device# request stream capture enable vpn1 interface ipsec1 data session-id s123

request upload

Upload a file from the Cisco SD-WAN device to another device in the network (on vEdge routers and vSmart controllers only).

Command Hierarchy

request upload [vpn vpn-id] destination filename

Syntax Description

filename	Name of file on the local SD-WAN device to upload to a remote device. If the file is not in your home directory, specify the full path.
destination	Remote device. It must be reachable through FTP, HTTP, SCP, or TFTP. If you are using SCP, you are prompted for the directory name and filename; no file path name is provided.
vpn vpn-id	VPN in which the remote device containing the file to be downloaded is located. When you include this option, one of the interfaces in the specified VPN is used to retrieve the software image.

Command History

Release	Modification
15.3.3	Command introduced for vEdge 100 routers only.
15.4	Command supported on all vEdge routers and on vSmart controllers.

request vedge

Add a vEdge serial number–chassis number pair to or delete a vEdge serial number-chassis number pair from the vEdge authorized serial number file on the local device.

Comamnd Hierarchy

request vedge [add | delete] serial-num number chassis-num number

Syntax Description

addserial-num number chassis-num number	Add vEdge Serial and Chassis Numbers. Add the specified vEdge serial and chassis number pair to the vEdge authorized serial number file on the local device.
deleteserial-num number chassis-num number	Delete vEdge Serial and Chassis Number. Remove the specified vEdge serial and chassis number from the vEdge authorized serial number file on the local device.

Command History

Release	Modification
14.1	Command introduced.

Related Topics

request vedge-cloud activate

Activate a vEdge Cloud router in the overlay network (on vEdge Cloud routers only). Before you can use this command, you must configure the organization name and the vBond orchestrator's IP address or DNS name on the vEdge Cloud router.

Command Hierarchy

request vedge-cloud activate chassis-number number token token

Syntax Description

chassis-number number	Chassis number of the vEdge Cloud router. To obtain the chassis number (UUID) in vManage NMS, select the Configuration > Devices screen. In the vEdge List, locate the Chassis Number column. If the router is not listed in the vEdge List, click Upload vEdge List to upload the serial number file that contains the vEdge Cloud router's information.
token token	Token identifier of the vEdge Cloud router. To obtain the token in vManage NMS, select the Configuration > Devices screen. In the vEdge List, locate the Serial No./Token column. If the router is not listed in the vEdge List, click Upload vEdge List to upload the serial number file that contains the vEdge Cloud router's information.

Command History

Release	Modification
17.1	Command introduced.

request vsmart add serial-num

Send the certificate serial number of a vManage NMS or a vSmart controller to the vBond orchestrator. If your network does not have a vManage NMS and you reboot the vSmart controller, the serial numbers sent with this command are lost. To have the vSmart controller retain the certificate serial numbers, use the request vsmart-upload command instead.

Starting in Release 15.4, this command is replaced by the request controller add command.

Command Hierarchy

request vsmart add serial-num number

Syntax Description

serial-num	Certificate serial number to send to the vManage or vSmart controller.
number	

Command History

Release	Modification	
14.1	Command introduced.	
15.4	Command is replaced by the request controller add.

show orchestrator valid-vsmarts, on page 943

request vsmart delete serial-num

Delete a vSmart serial number from the vSmart controller serial number file on the local device. Starting in Release 15.4, this command is replaced by the **request controller delete serial-num** command.

Command Hierarchy

request vsmart delete serial-num number

Syntax Description

Table 16: Syntax Description

number	vSmart serial number to delete from the vSmart serial number file on the local device.	
--------	--	--

Command History

Release	Modification
14.1	Command introduced.
15.4	Command replaced by request controller delete serial-numcommand.

show orchestrator valid-vsmarts, on page 943

request vsmart-upload serial-file

Upload the certificate serial number file to the local device (on vBond orchestrators and vManage NMSs only). The local device retains these serial numbers even after you reboot it. Starting in Release 15.4, this command is replaced by **request controller-upload serial-file** command.

Command Hierarchy

request vsmart-upload serial-file filename [vpn vpn-id]

Syntax Description

request vsmart-upload serial-file filename	Name of Certificate File. Install the specified file containing the list of serial numbers for the vSmart controllers and the vManage NMSs in the network. The file can be in a your home directory on the local device, or it can be on a remote device reachable through FTP, HTTP, SCP, or TFTP. If you are using SCP, you are prompted for the directory name and filename. No file path name is provided.
vpn vpn-id	Specific VPN in which the file is located. When you include this option, one of the interfaces in the specified VPN is used to retrieve the file. The interfaces on a vSmart controller are only in VPN 0, the VPN reserved for the control plane, so you can omit this option because vSmart images are always retrieved from VPN 0.

Command History

Release	Modification
14.1	Command introduced.
15.4	Command replaced by request controller-upload serial-file command.

request vsmart add serial-num, on page 719 request vsmart delete serial-num, on page 719

screen-length

Set the length of the terminal window. For most Cisco SD-WAN software commands, the output is rendered automatically either by the CLI or by templates that format the output. For these commands, any value that you set for screen-length command has no effect. Use the **more** and **nomore** command filters to control the length of the output.

Command Hierarchy

screen-length number

Syntax Description

screen-length number	Set the length of the terminal screen. Number can be a value from 0 through 256.
	When you set the screen length to 0, the CLI does not paginate command output.

Command History

Release	Modification
14.1	Command introduced.

Example

```
vEdge# screen-length 24 vEdge#
```

Related Topics

screen-width, on page 721 show cli, on page 781

screen-width

Set the width of the terminal window. For most Cisco SD-WAN software commands, the output is rendered automatically either by the CLI or by templates that format the output. For these commands, any value that you set for **screen-width** command has no effect. Use the **tab** and **notab** command filters to control the width of the output.

Command Hierarchy

screen-width number

show aaa usergroup

show aaa usergroup—List the groups configured for AAA role-based access to a Cisco vEdge device.

Command Syntax

show aaa usergroup

show aaa usergroup task [permission (read \mid write)]

show aaa usergroup users username

vManage Equivalent

For all Cisco vEdge devices:

Administration ► Manage Users

Syntax Description

show aaa usergroup	All Usergroups, Users, Tasks, and Permissions:
	List all configured usergroups, the users in those groups, and the task permissions that each group has.
show aaa usergroup task	All Usergroups, Tasks, and Permissions:
[permission (read write)]	List all configured usergroups and the task permissions that each group has.
show aaa usergroup users username	Usergroup Information for a User:
	For the specified user, list the group they are in and that group's task permissions.

Command History

Release	Modification
14.1.	Command introduced.

Examples

Show aaa usergroup

vEdge# sh GROUP	ow aaa USERS	usergroup TASK	PERMISSION
basic	-	system interface	read write read write
admin	admin	system interface policy routing security	read write read write read write read write read write
operator	eve	system interface policy routing security	read read read read read

$\verb"vEdge# show aaa usergroup task"$

show alarms

To view alarms history and view the watermarks configured for CPU, memory, and disk usage, and the disk read and write speeds, use the **show alarms** command in the operational mode.

show alarms { cpu-usage history memory-usage disk-usage disl	k-speed	}
--	---------	---

Syntax Description

cpu-usage	Shows configured CPU-usage watermarks.
history	Shows the history of alarms. The following options are available:
	• from: Displays alarms from timestamp (YYYY-MM-DDTHH:MM:SS)
	• last-n: Displays last-n alarms (default: 25)
	• severity: Shows alarms matching severity
	• skip-type: Skips displaying alarms matching type
	• to: Displays alarms till timestamp (YYYY-MM-DDTHH:MM:SS)
	• type: Shows alarms matching type

memory-usage	Shows configured memory-usage watermarks.				
disk-usage	Shows configured disk-usage watermarks.				
disk-speed	Shows configured watermarks for disk read and write speeds.				
	Note Watermarks for disk read and write speeds can only be configured in a Cisco vManage server.				

Command Modes

Operational mode (#)

Command History

Release	Modification
Cisco SD-WAN Release 20.7.1	This command is introduced.

Examples

The following is a sample output of the **show alarms cpu-usage** command:

Device# show alarms cpu-usage

	HIGH	MEDIUM	LOW

show app cflowd flows

show app cflowd flows—Display cflowd flow information (on vEdge routers only).

Command Syntax

show app cflowd flows [vpn vpn-id]

show app cflowd flows [**vpn** *vpn-id*] [*flow-parameter*]

show app cflowd flows vpn *vpn-id* **src-ip** *ip-address* **dest-ip** *ip-address* **src-port** *port-number* **dest-port** *port-number* **dscp** *value*

ip-proto protocol-number

vManage Equivalent

For vEdge routers only:

Monitor ► Network ► Real Time ► App Log Flows

Syntax Description

None	None
	Display cflowd flow information for all flows.
vpn vpn-id src-ip ip-address dest-ip ip-address src-port port-number dest-port port-number dscp value ip-proto protocol-number	Flow Key Elements Display cflowd flow information for a specific flow key element. You must specify all the key elements as shown in the syntax and in the order shown in the syntax. You can also just specify all the key elements until the last one that you are interested in, and again you must specify them in the order shown. For example, if you are interested only in filtering on the source and destination ports, you include only the VPN, source and destination addresses, and source and destination ports in the command; you can omit the last two key elements (DSCP and IP protocol). To select all values for a key elements, specify an asterisk (*) as a wildcard in place of the variable; for example, src-ip *.

flow-parameter	Flow Parameter:
	Display the flow that matches the specified flow parameter. These parameters correspond to a number of the column headers in the output of the plain show app cflowd flows command. <i>flow-parameter</i> can be one of the following:
	• egress-intf-name interface-name—Flow's outgoing interface.
	• icmp-opcode value—Flow's ICMP operational code.
	• ingress-intf-name interface-name—Flow's incoming interface.
	• max-length bytes—Maximum IP packet length in the flow.
	• min-length bytes—Minimum IP packet length in the flow.
	• nhop-ip ip-address—IP address of the flow's next hop.
	• start-time time—Flow's start time.
	• tcp-cntrl-bits bit—Flow's TCP control bit value.
	• time-to-expire seconds—Time until the flow expires.
	• total-bytes number—Total number of bytes in the flow.
	• total-packets number—Total number of packets in the flow.
vpn vpn-id	VPN
	Display cflowd information for flows in a specific VPN.

Command History

Release	Modification
14.3.	Command introduced.
15.4.	Options for flow parameters and IP address, ports, DSCP, and protocol added.

Examples

Show app cflowd flows

show app cflowd template

show app cflowd template—Display the cflowd template information that the vEdge router transmits periodically to the cflowd collector (on vEdge routers only).

Command Syntax

show app cflowd template [name template-name] [flow-active-timeout] [flow-inactive-timeout] [template-refresh]

Syntax Description

None	Options
	Display information about all the cflowd templates that the vEdge router has learned from a vSmart controller.
nametemplate-name	Specific Template
	Display information about the named cflowd template.
template-refresh	Template Refresh Values
	Display the template refresh values for the cflowd templates learned from a vSmart controller.
flow-active-timeout	Timeout Values
flow-inactive-timeout	Display the active or inactive flow timeout values for the cflowd templates learned from a vSmart controller.

Command History

Release	Modification
14.3.	Command introduced.

Examples

Show app cflowd template

```
vEdge# show app cflowd template

```

show app dpi applications

show app dpi applications—Display application-aware applications running on the vEdge router (on vEdge routers only).

Command Syntax

show app dpi applications [vpn vpn-id]

Syntax Description

None	List all applications running on the subnets connected to the vEdge router.
vpn vpn-id	Specific VPN
	List all applications running in the subnets in the specific VPN.

Command History

Release	Modification
15.2.	Command introduced.
17.1.2.	Removed Source IP and Total Flows fields from command output.

Examples

Show app dpi applications

vEdge# show app dpi applications

show app dpi flows

show app dpi flows—Display flow information for the application-aware applications running on the vEdge router (on vEdge routers only).

show app dpi flows [vpn vpn-id] [detail]

Syntax Description

None	List all application flows running on the subnets connected to the vEdge router.					
detail	Detailed Information					
	Display detailed information about DPI traffic flows, including total packet and octet counts, and which tunnel (TLOC) the flow was received and transmitted on.					
	Tunnels-in refers to packets sent from the device into a tunnel towards remote edge. Tunnels-out refers to packets received on the device from a remote edge.					
	Note This command displays all the flow information except for Border Gateway Protocols, Internet Control Message Protocol for IPv4, Internet Control Message Protocol for IPv6, Open Shortest Path First, Multicast Transfer Protocol, and Protocol-Independent Multicast in a policy as they are not supported. These application bypass DPI and matching DPI on the applications do not affect a policy.					
source-ip-address						
	Within a specific VPN, list the applications flows with the specified source IP address.					
vpn vpn-id	Specific VPN					
	List all application flows running in the subnets in the specific VPN.					

Command History

Release	Modification
15.2.	Command introduced.
16.2.	Added detail option.

Examples

Show app dpi flows

vEdge# show app dpi flows

```

show app dpi supported-applications

show app dpi supported-applications—List all the application-aware applications supported by the SD-WAN software on the vEdge router (on vEdge routers only).

Command Syntax

show app dpi supported-applications show app dpi supported-applications | tab

Syntax Description

None	List the application name and its family.
Pipe Output To Tabular Format	Pipe Output To Tabular Format List full information about the application, including its shortened and long name, family shortened and long name, and application identifier number.

Command History

Release	Modification
15.2.	Command introduced.

Usage Guidelines

To understand the applications available for each family, you can use command: **show app dpi supported-applications** | **inc <app_family>**.

The following example shows the supported application for Web family:

vEdge# show app dpi supported-applications | <web>

Examples

Display abbreviated application information:

Show app dpi supported-applications

vEdge# show app dpi supported-applications

show app log flow-count

show app log flow-count—Display the count of packet flows that are being logged (on vEdge routers only). Packet flows include a flow that matches an access list (ACL), a cflowd flow, or a DPI flow.

Command Syntax

show app log flow-count[vpn vpn-id]

Syntax Description

None	Display the count of all packet flows that are being logged.
vpnvpn-id	Specific VPN
	Display the count of packet flows in the specified VPN.

Command History

Release	Modification
16.3	Command introduced.

Examples

Show app log flow-count

```
vEdge# show app log flow-count

VPN COUNT

1 20
```

Related Topics

```

```

show app log flows

show app log flows—Display logging information for packet flows (on vEdge routers only). Packet flows include flows that match an access list (ACL), a cflowd flow, and a DPI flow. Packet flows are logged when you configure a log action in a localized data policy (ACL), data policy for cflowd traffic monitoring, or an application-aware routing policy

Command Syntax

show app log flows [**vpn** *vpn-id*] [*flow-parameter*]

vManage Screen

Monitor ► Network ► ACL Logs

Syntax Description

None	Display all flow logging information.
flow-parameter	Flow Parameter
	Display flow logging information for a specific parameter.
	flow-parameter can be one of egress-intf-name, icmp-opcode, ingress-intf-name, nhop-ip, policy-action, policy-direction, policy-name, start-time, tcp-cntrl-bits, time-to-expire, total-bytes, and total-pkts. These parameters correspond to the column headings in the output of the show app log flows command.
vpnvpn-id	Specific VPN
	Display the flow logging information in the specified VPN.

Command History

Release	Modification
16.3.	Command introduced.

Examples

show app log flows

vEdge # show app log flows

show app tcp-opt

show app tcp-opt—Display information about TCP-optimized flows (on vEdge routers only).

Command Syntax

show app tcp-opt (active-flows | expired-flows) show app tcp-opt summary

Syntax Description

active-flows	Active Flows
	Display information about active TCP-optimized flows.
expired-flows	Expired Flows
	Display information about expired TCP-optimized flows.
summary	Flow Summary
	Display a summary of the TCP-optimized flows.

Command History

Release	Modification
17.2.	Command introduced.

Examples

Display information about active and expired TCP-optimized flows:

Show app tcp-opt

```
vEdge# show app tcp-opt active-flows

show app-route sla-class

show app-route sla-class—Display information about the SLA classes operating on the vEdge router (on vEdge routers only).

Note that when the thresholds cross for one of these SLA classes, a notification and a syslog are triggered.

Command Syntax

show app-route sla-class

show app-route sla-class (latency [milliseconds] | **loss** [percentage] | **name** [string])

Syntax Description

None	Display information for all SLA classes configured and operating on the vEdge router
latency[milliseconds]	Packet Latency
	Display information for all packet latency values or for the specified latency value operating on the vEdge router.
loss[percentage]	Packet Loss
	Display information for all packet loss values or for the specified loss value operating on the vEdge router.
name[string]	SLA Class Name
	Display information for all SLA class names or for the specified class name operating on the vEdge router.

Command History

Release	Modification
15.2.	Command introduced.

Examples

The following output shows three SLA classes and the index numbers that identify these classes. The first line of the output shows the default SLA class (__all_tunnels_sc), and second and third lines show two configured SLA classes that are operating on the router (test_sla_class and test_sla_class1).

Show app-route sla-class

vEdge# show app-route sla-class

INDEX	NAME	LOSS	LATENCY
0	all tunnels sc	100	2147483647

```
1 test_sla_class 100 50
2 test_sla_class1 1 1
```

app-route-policy, on page 69 bfd color, on page 108 show app-route stats, on page 747 show bfd sessions, on page 751 show policy service-path, on page 977 show policy tunnel-path, on page 978

show app-route stats

show app-route stats—Display statistics about data traffic traffic jitter, loss, and latency and other interface characteristics for all operational data plane tunnels (on vEdge routers only). The command also displays the index of the SLA classes that are dampened and the dampening left for the SLA class. You can use the information from the command output to fashion application-aware routing policy.

Command Syntax

show app-route-statsshow app-route stats local-color color [remote-system-ip ip-address] show app-route stats remote-color color [remote-system-ip ip-address] show app-route stats remote-system-ip ip-address

Syntax Description

None	Display data traffic statistics for all data plane tunnel connections.
local-colorcolor	Local TLOC Color
	Display data traffic statistics for the specified local TLOC color.
remote-system-ipip-address	Remote System IP Address
	Display data traffic statistics for the specified remote system.
remote-colorcolor	Remote TLOC Color
	Display data traffic statistics for the specified remote TLOC color.

Release	Modification
14.2.	Command introduced.
15.2.	sla-class-index option added.
15.3.	Syntax changed and simplified.

Release	Modification
20.5	The commands displays the index of the SLA classes that are dampened and the dampening left for the SLA class.

Examples

show app-route stats

vEdge# show app-route stats

show arp

show arp—Display the IPv4 entries in the Address Resolution Protocol (ARP) table, which lists the mapping of IPv4 addresses to device MAC addresses.

To display IPv6 ARP table entries, use the **show ipv6 neighbor** command.

Command Syntax

show arp [**vpn** *vpn-id*]

Syntax Description

None	List all the IPv4 entries in the ARP table.
vpnvpn-id	VPN
	List the ARP table entries for the specified VPN.

Command History

Release	Modification
14.1.	Command introduced.

Examples

Show arp

```
Cisco vEdge# show arp

IF

show bfd history

show bfd history—Display the history of the BFD sessions running on a vEdge router (on vEdge routers only). BFD sessions between vEdge routers start automatically, with requiring any configuring, as soon as at least two vEdge routers are running in the Cisco SD-WAN network. The sessions run over an IPsec tunnel between the two devices.

Command Syntax

show bfd history [color color] [site-id site-id] [state state] [system-ip ip-address]

Syntax Description

None	Show the history of all the BFD sessions running on the vEdge router.
state state	BFD State
	Display the history of BFD sessions in a particular state. <i>state</i> can be one of the following: admin-down , down , init , invalid , and up .
color color	Color
	Display the history of BFD sessions for a specific traffic flow.
site-id site-id	Site ID
	Display the history of BFD sessions to a specific Cisco SD-WAN network site.

system-ip ip-address	System IP
	Display the history of BFD sessions to a specific device in the Cisco SD-WAN network.

Command History

Release	Modification
14.1.	Command introduced.
Cisco SD-WAN Release 20.3.1	New status added to STATE column: inactive indicates that an on-demand tunnel is in Inactive mode on a device with on-demand tunnels enabled.

Examples

show bfd history

show bfd sessions

show bfd sessions—Display information about the BFD sessions running on the local vEdge router (on vEdge routers only). BFD sessions between vEdge routers start automatically, without requiring any configuring, as soon as at least two vEdge routers are running in the Cisco SD-WAN network. The BFD sessions run over an IPsec connection between the two devices.

Command Syntax

show bfd sessions [color color] [site-id site-id] [state state] [system-ip ip-address]

Syntax Description

None	Show the history of all the BFD sessions running on the vEdge router.
state state	BFD State
	Display the history of BFD sessions in a particular state. <i>state</i> can be one of the following: admin-down , down , init , invalid , and up .
color color	Color
	Display the history of BFD sessions for a specific traffic flow.
site-id id	Site ID
	Display the history of BFD sessions to a specific Cisco SD-WAN network site.
system-ip ip-address	System IP
	Display the history of BFD sessions to a specific device in the Cisco SD-WAN network.

Command History

Release	Modification
14.1.	Command introduced.
16.3.	Added support to display IPv6 end points.

Examples

Display BFD session information for network end points:

Show bfd sessions

show bfd summary

show bfd summary—Display summary information about the BFD sessions running on the local vEdge router (on vEdge routers only). BFD sessions between vEdge routers start automatically, with requiring any configuring, as soon as at least two vEdge routers are running in the Cisco SD-WAN network. The sessions run over an IPsec connection between the two devices.

Command Syntax

show bfd summary [bfd-sessions-flap | bfd-sessions-max | bfd-sessions-total | bfd-sessions-up]

Syntax Description

None	Display all summary information about BFD sessions running on the vEdge router.
<string>bfd-sessions-up</string>	BFD Sessions That Are Up
	Display the current number of BFD sessions that are in the Up state.
bfd-sessions-flap	BFD Transitions
	Display the number of BFD sessions that have transitioned from the Up state.
bfd-sessions-max	Maximum Number of BFD Sessions
	Display the total number of BFD sessions that have been created since the vEdge router booted up.
bfd-sessions-total	Total Number of BFD Sessions
	Display the current number of BFD sessions running on the vEdge router.

Command History

Release	Modification
15.2.	Command introduced.
17.1.	Display configured BFD app-route poll interval in command output.

Examples

Show bfd summary

vEdge#	show b	fd summary	
session	ns-total	L 4	
session	ıs-up	4	
sessions-max		4	
session	ns-flap	4	
poll-ir	nterval	6	00000

bfd app-route, on page 107 bfd color, on page 108 show bfd history, on page 750 show bfd sessions, on page 751 show bfd tloc-summary-list, on page 755

show bfd tloc-summary-list

show bfd tloc-summary-list—Display BFD session summary information per TLOC (on vEdge routers only).

Command Syntax

show bfd tloc-summary-list

 $show\ bfd\ tloc\text{-}summary\text{-}list\ \textit{interface-name}\ [\textbf{gre}\ |\ \textbf{ipsec-ike}]\ [\textbf{sessions-flap}\ |\ \textbf{sessions-total}\ |\ \textbf{se$

Syntax Description

None	Display all summary information about BFD sessions running on the vEdge router.
sessions-up	BFD Sessions That Are Up
	Display the current number of BFD sessions that are in the Up state.
sessions-flap	BFD Transitions
	Display the number of BFD sessions that have transitioned from the Up state.
[gre ipsec ipsec-ike]	Encapsulation Type
	Display information about BFD session with a specific encapsulation type.
interface-name	Specific Interface
	Display information about BFD sessions on the specified interface.
sessions-total	Total Number of BFD Sessions
	Display the current number of BFD sessions running on the vEdge router.

Release	Modification
16.2.3.	Command introduced.
17.2.	Added ipsec-ike option.

Examples

Show bfd tloc-summary-list

vEdge1# show bfd tloc-summary-list

		SESSIONS	SESSIONS	SESSIONS
IFNAME	ENCAP	TOTAL	UP	FLAP
ge0_0	ipsec	10	9	9
ge0 3	ipsec	10	9	9

vEdge2# show bfd tloc-summary-list ge0/4 ipsec

bfd tloc-summary-list ge0/4 ipsec Interface name ge0/4 Encapsulation ipsec sessions-total 0 sessions-up 0 sessions-flap 0

show bgp neighbor

show bgp neighbor—List the router's BGP neighbors (on vEdge routers only).

Command Syntax

show bgp neighbor [vpn vpn-id] [detail]

show bgp neighbor address-family [address-family-property] [detail]

Syntax Description

None	List all BGP neighbors.
address-family[address-family-property]	BGP Address Family Properties
	List information about a specific BGP address family property. address-family-property can be one of the following: accepted-prefix-count, afi, as-path-unchanged, def-originate-routemap, inbound-soft-reconfig, max-prefix-restart-interval, max-prefix-threshold-warning, max-prefix-warning-only, maximum-prefix-count, med-unchanged, nexthop-self, nexthop-unchanged, policy-in, policy-out, private-as, route-reflector-client, sent-community, and sent-def-originate.

detail	Detailed Information	
	Show detailed information.	
vpnvpn-id	VPN	
	List the entries in the ARP table for the specified VPN.	

Command History

Release	Modification
14.1.	Command introduced.

show bgp routes

show bgp routes—List the router's BGP neighbors (on vEdge routers only).

Command Syntax

show bgp routes [prefix/length] [vpn vpn-id] [detail]

Syntax Description

None	List all BGP neighbors.
detail	Detailed Information Show detailed information.
prefix/length prefix vpn vpn-id	Route Prefix Show the BGP route information for the specified route prefix. If you omit the prefix length, you must specify a VPN identifier so that the Cisco SD-WAN software can find the route that best matches the prefix.
vpn vpn-id	VPN List the BGP routes for the specified VPN.

Release	Modification
14.1.	Command introduced.

Examples

Show bgp routes

vEdge# show bgp routes vpn 1

show boot-partition

show boot-partition—Display the active boot partition and the software version installed in the boot partitions. Starting in Release 15.4, this command is replaced with the show software command.

Command Syntax

show boot-partition [partition-number]

Syntax Description

None	Display information about the boot partitions on the device, including which partition is active and what software version is installed on each partition.
partition-number	Specific Partition
	Display information for the specific boot partition. <i>partition-number</i> can be 1 or 2.

Release	Modification
14.1.	Command introduced.
15.3.	Command available in this release and earlier.
15.4.	Replaced with show software command.

Examples

Show boot-partition

```
      vEdge# show boot-partition

      PARTITION

show bridge interface

show bridge interface—List information about the interfaces on which bridging is configured (on vEdge routers only).

Command Syntax

show bridge interface

show bridge interface bridge-id [interface-name [(admin-status | encap-type | ifindex | mtu | oper-status | rx-octets | rx-pkts | tx-octets | tx-pkts | vlan)]

Syntax Description

None	List information about all interfaces on which bridging ia configured.
bridge-id	Specific Bridging Domain
	List information about the interface associated with a specific bridging domain.
interface-name(admin-status	Specific Bridging Domain Property
encap-type ifindex mtu oper-status rx-octets rx-pkts tx-octets tx-pkts vlan)	List information about a specific interface or about a property associated with a specific interface. The options correspond to the column headings in the show bridge interface command output.

Release	Modification
15.3.	Command introduced.

Examples

Show bridge interface

vEdge# show bridge interface

			ADMIN	OPER	ENCAP			RX	RX	TX	TX

show certificate installed

show certificate installed—Display the decoded certificate signing request installed on a vBond orchestrator, vManage NMS or vSmart controller. This is the CSR that has been signed by the root CA. Information displayed includes the serial number, the signature algorithm, the issuer, the certificate validity, the public key algorithm and public key, and the signature algorithm.

On a vEdge router, display the board ID certificate.

Command Syntax

show certificate installed

Syntax Description

None

Command History

Release	Modification
14.2.	Command introduced.
15.3.5.	Added command support on vEdge routers.

Examples

Show certificate installed

```
vSmart# show certificate installed

show certificate root-ca-cert

show certificate root-ca-cert—Display the root certificate installed on a Cisco vEdge device. Information displayed includes the serial number, the signature algorithm, the issuer, the certificate validity, the public key algorithm and public key, and the signature algorithm.

Command Syntax

show certificate root-ca-cert

Syntax Description

None

Command History

Release	Modification
14.2.	Command introduced.

Examples

Show certificate root-ca-cert

```
vSmart# show certificate root-ca-cert
Certificate:

show certificate root-ca-crl

To display the decoded CRL of the installed root certificate authority, use the **show certificate root-ca-crl** command in privileged EXEC mode.

show certificate root-ca-crl

Command Modes

Privileged EXEC

Command History

Release	Modification
Cisco SD-WAN Release 20.7.1	This command was introduced.

Examples

The following is sample output from the **show certificate root-ca-crl** command showing the decoded CRL of the installed root certificate authority

```
vEdge # show certificate root-ca-crl
Certificate Revocation List (CRL):

show certificate serial

show certificate serial—Display the serial number for a vBond orchestrator or a vSmart controller. Display the serial number and chassis number for a vEdge router.

Command Syntax

show certificate serial

Syntax Description

None

Command History

Release	Modification
14.1.	Command introduced.

Examples

Show certificate serial

```
vEdge# show certificate serial
Chassis num = 1102136130018 Board id serial num : 10000161
```

Related Topics

request vsmart-upload serial-file, on page 720

show certificate installed, on page 772 show certificate root-ca-cert, on page 776 show certificate signing-request, on page 779 show certificate validity, on page 781

show certificate signing-request

show certificate signing-request—Display the certificate signing requests installed on a vBond orchestrator, vManage NMS, or vSmart controller. This CSR is the one that has been signed by the device's private key.

Command Syntax

show certificate signing-request [decoded]

Syntax Description

None	Display the certificate signing request hash.
decoded	Decoded Certificate Signing Request
	Display the decrypted hashed certificate signing request.

Command History

Release	Modification
14.2.	Command introduced.

Examples

vSmart# show certificate signing-request

show certificate validity

show certificate validity—Display how long a certificate is valid for (on vSmart controllers and vBond orchestrators only).

Command Syntax

show certificate validity

Syntax Description

None

Command History

Release	Modification
14.1.	Command introduced.

Examples

Show certificate validity

```
vSmart# show certificate validity
The certificate is valid from Apr 20 21:03:38 2015 GMT (Current date is Mon Apr 20 23:00:19 GMT 2015 )
& valid until Apr 19 21:03:38 2016 GMT
```

show clock

show clock—Display the system time.

Command Syntax

show clock

Syntax Description

None Display	time in the local timezone.
--------------	-----------------------------

universal
Display time in UTC.

Command History

Release	Modification
14.1.	Command introduced.
14.2.	Introduced universal option.

Examples

Show clock

vEdge# show clock
Mon Jul 7 13:36:00 PDT 2014
vEdge# show clock universal
Mon Jul 7 20:36:05 UTC 2014

Related Topics

show uptime, on page 1038 timestamp, on page 1051

show cloudexpress applications

show cloudexpress applications—Display the best path for applications configured with Cloud OnRamp for SaaS (formerly called CloudExpress service) (on vEdge routers only). The best path could be a local interface with Direct Internet Access (DIA), or the path to a remote gateway.

Command Syntax

show cloudexpress applications vpn-id

Syntax Description

None	Display the best interface for all applications in all VPNs configured with Cloud OnRamp for SaaS.
vpn-id	Specific VPN
	Display the best interface for all applications in VPN x configured with Cloud OnRamp for SaaS.

Command History

Release	Modification
16.3.	Command introduced.

Examples

Show cloudexpress applications

vEdge# show cloudexpress applications

		EXIT	GATEWAY			
LOCA VPN COLO	APPLICATION	TYPE	SYSTEM IP	INTERFACE	LATENCY	LOSS
1 lt.e	salesforce	gateway	172.16.255.14	_	103	1
1 lte	google_apps lte	gateway	172.16.255.14	-	47	0

Related Topics

show cloudexpress gateway-exits

show cloudexpress gateway-exits—Display loss and latency on each gateway exit for applications configured with Cloud OnRamp for SaaS (formerly called CloudExpress service) (on vEdge routers only).

Command Syntax

show cloudexpress gateway-exits vpn-id

Syntax Description

None	Display loss and latency on each gateway exit for all applications in all VPNs configured with Cloud OnRamp for SaaS.
vpn-id	Specific VPN
	Display loss and latency on each gateway exit for all applications in VPN x configured with Cloud OnRamp for SaaS.

Command History

Release	Modification
16.3	Command introduced.

Examples

vEdge# show cloudexpress gateway-exits

VPN	APPLICATION	GATEWAY IP	LATENCY	LOSS		REMOTE COLOR

show cloudexpress local-exits

show cloudexpress local-exits—Display application loss and latency on each Direct Internet Access (DIA) interface enabled for Cloud OnRamp for SaaS (formerly called CloudExpress service) (on vEdge routers only).

Command Syntax

show cloudexpress local-exits vpn-id

Syntax Description

None	Display application loss and latency for all applications on all DIA interfaces in all VPNs enabled for Cloud OnRamp for SaaS.
vpn-id	Specific VPN
	Display application loss and latency for all applications on all DIA interfaces in a specific VPN enabled for Cloud OnRamp for SaaS.

Command History

Release	Modification
16.3	Command introduced.

Examples

Show cloudexpress local-exits

 $\verb|vEdge#| show cloudexpress local-exits|$

# show container images

**show container images**—List the Cisco SD-WAN software images associated with the vSmart controller containers (on vContainer hosts only).

## **Command Syntax**

show container images [instances instance-name]

#### **Syntax Description**

None	List information about the software images for all containers.				
instances instance-name	Specific Container Instance				
	List information about the software images for the specified instance.				

## **Command History**

Release	Modification
16.2.	Command introduced.

## **Examples**

## **Show container images**

vContainer# show container images

VERSION INSTANCE

```
99.99.999-2440 first_vsmart
second_vsmart
99.99.999-2444 vm10
```

container, on page 147 show container instances, on page 788

## show container instances

**show container instances**—List information about the vSmart controller containers running on the container host (on vContainer hosts only).

## **Command Syntax**

**show container instances** [instance-parameter]

## **Syntax Description**

None	List information about all the vSmart controller containers running on the container host
instance-parameter	Specific Instance Parameter
	List information about a specific parameter for a container instance.instance-parameter can be one of the following, which correspond to the column headers in the command output:
	• admin-state(down up)
	• imageimage-name
	• interface(host-ip-addressip-address ip-addressip-address)
	• oper-state(down  up)
	• personalitydevice-type

Release	Modification
16.2.	Command introduced.

## **Examples**

#### **Show container instances**

vContainer# show container instances

NAME	ADMIN STATE		IMAGE	PERSONALITY	IF NAME	IP ADDRESS	HOST IP ADDRESS

# show control affinity config

**show control affinity config**—Display configuration information about the control connections between the vEdge router and one or more vSmart controllers (on vEdge routers only).

#### **Command Syntax**

**show control affinity config** [index [parameter]]

### **Syntax Description**

None	Display information about all control connections between the vEdge router and vSmart controllers
index[parameter]	Information about a Specific Parameter
	Display configuration information about a specific parameter, starting with the index number of the control connection. <i>parameter</i> can be one of the following: <b>affc-ccl</b> (current controller group ID list), <b>affc-equi</b> (equilibrium status), <b>affc-ervc</b> (count of effective required vSmart controllers), and <b>affc-interface</b> (interface name).

Release	Modification
16.1.	Command introduced.
16.2.	Display last-resort interface information.

#### **Examples**

## Show control affinity config

```
vEdge# show control affinity config
```

```
EFFECTIVE CONTROLLER LIST FORMAT - G(C),... - Where G is the Controller Group ID
C is the Required vSmart Count

CURRENT CONTROLLER LIST FORMAT - G(c)s,... - Where G is the Controller Group ID
c is the current vSmart count
s Status Y when matches, N when

does not match

the vSmart belongs

UNASSIGNED CONNECTED CONTROLLERS - System IP(G),.. - System IP of the unassigned vSmart

G is the group ID to which

the vSmart belongs

UNASSIGNED CONNECTED CONTROLLERS

UNASSIGNED CONNECTED

CONTROLLERS
```

```
0 ge0/2 172.16.255.19( 1), 172.16.255.20( 2)
```

show control affinity config, on page 789 show control connections, on page 791 show control local-properties, on page 797

## show control connection-info

**show control connection-info**—Display information about the control plane connections on the Cisco vEdge device.

### **Command Syntax**

show control connection-info

#### **Syntax Description**

None

#### **Command History**

Release	Modification
14.3.	Command introduced.

#### **Examples**

### **Show control connection-info**

```
vEdge# show control connection-info control connection-info "Per-Control Connection Rate: 300 pps"
```

#### **Related Topics**

control-session-pps, on page 152

## show control connections

**show control connections**—Display information about active control plane connections (on vSmart controllers and vEdge routers only).

#### **Command Syntax**

show control connections [controller-group-id number] [detail]
show control connections instance-id [vbond | vedge | vsmart] [parameters] [detail]

## **Syntax Description**

None	Display information about the active control plane connections to all Cisco vEdge devices in the local domain. Each connection exists on a DTLS connection between the local device and a remote device in the Cisco SD-WAN overlay network.			
<b>vbond</b> [parameters]	Connections to vBond Orchestrators			
	(On vSmart controllers only.) Display information about the active control plane connections between a vSmart controller and vBond systems in the domain. <i>parameters</i> is one or more of the column headers in the <b>show control connections</b> command output.			
vedge[parameters]	Connections to vEdge Routers			
	(On vSmart controllers only.) Display information about the active control plane connections between a vSmart controller and vEdge routers in the domain. <i>parameters</i> is one or more of the column headers in the <b>show control connections</b> command output.			
	Note The interface marked as "last-resort" or admin down is skipped when calculating the number of control connections and partial status is determined based on the other tlocs which are UP. Since the last resort is expected to be down, it is skipped while calculating the partial connection status. Same is the case with admin down interfaces when a particular interface is configured as shutdown.			
	For example, when LTE transport is configured as a last resort circuit, and if the Edge device has 3 tlocs in total including the one with LTE interface, then the device reports partial on 2(4) control connection status.			
vsmart[parameters]	Connections to vSmart Controllers			
	(On vEdge routers only). Display information about the active control plane connections between a vEdge router and vSmart controllers in the domain. <i>parameters</i> is one or more of the column headers in the <b>show control connections</b> command output.			
controller-group-id	Controller Group			
number (On vEdge routers only). Display information about a specific controller can be a value from 0 through 100.				
detail	Detailed Information			
	Display detailed information.			

## **Command History**

Release	Modification
14.1.	Command introduced.
16.2.	Controller group ID added to vEdge router output.
16.3.	Added IPv6 addresses and ports to output.
18.2.	Added Proxy column to vEdge router output.

Note

The commands **show control connections** and **show control valid-vedges** are supported on vEdge platforms only and do not support on devices with ACT2/TAM modules.

Note

The control connections with Cisco vManange goes down for subnet IP 172.17.0.0/16 range on transport interfaces. The IP 172.17.0.0/16 is a reserved range and cannot be used on transport interfaces.

## **Examples**

#### **Show control connections**

vEdge# show control connections

# show control connections-history

**show control connections-history**—Display information about control plane connection attempts initiated by the local device.

## **Command Syntax**

show control connections-history [index] [detail] show control connections-history connection-parameter [detail]

#### **Syntax Description**

None	List the history of connections and connection attempts by this Cisco vEdge device.		
detail	Detailed Output		
	List detailed connection history information, which includes transmit and receive statistics.		
connection-parameter	Specific Connection Parameter		
	List the connection history only for those items match the connection parameter. <i>connection-parameter</i> can be one of the following: <b>domain-id,peer-type, private-ip, private-port, public-ip, public-port, site-id</b> , and <b>system-ip</b> . These values corresponds to the column headers in the output of the show control connections-history command.		

index	Specific History Item
	List the connection history only for the specific item in the history list.

#### **Command History**

Release	Modification
14.1.	Command introduced.

#### **Examples**

DOWNTIME

#### **Show control connections-history**

#### vSmart# show control connections-history

```
Legend for Errors
ACSRREJ
         - Challenge rejected by peer.
                                                      NOVMCFG
                                                                - No cfg in vmanage for
device.
BDSGVERFL - Board ID Signature Verify Failure.
                                                                - No/Bad chassis-number
                                                      NOZTPEN
entry in ZTP.
BIDNTPR - Board ID not Initialized.
                                                      ORPTMO
                                                               - Server's peer timed out.
BIDNTVRFD - Peer Board ID Cert not verified.
                                                     RMGSPR
                                                               - Remove Global saved peer.
CERTEXPRD - Certificate Expired
                                                      RXTRDWN - Received Teardown.
CRTREJSER - Challenge response rejected by peer.
                                                     RDSIGFBD - Read Signature from Board
ID failed.
CRTVERFL
          - Fail to verify Peer Certificate.
                                                      SSLNFAIL - Failure to create new
SSL context.
CTORGNMMIS - Certificate Org name mismatch.
                                                    SERNTPRES - Serial Number not present.
                                                      SYSIPCHNG - System-IP changed.
DCONFAIL - DTLS connection failure.
          - Device memory Alloc failures.
                                                      TMRALC
                                                              - Memory Failure.
DEVALC
          - DTLS HandShake Timeout.
                                                      TUNALC
                                                                - Memory Failure.
DHSTMO
                                                      TXCHTOBD - Failed to send challenge
DISCVBD
          - Disconnect vBond after register reply.
to BoardID.
DISTLOC
          - TLOC Disabled.
                                                       UNMSGBDRG - Unknown Message type or
Bad Register msg.
DUPSER
         - Duplicate Serial Number.
                                                       UNAUTHEL - Recd Hello from
Unauthenticated peer.
DUPCLHELO - Recd a Dup Client Hello, Reset Gl Peer.
                                                    VBDEST
                                                             - vDaemon process terminated.
          - SSL Handshake failure.

# show control local-properties

**show control local-properties**—Display the basic configuration parameters and local properties related to the control plane (on vEdge routers, vManage NMSs, and vSmart controllers only).

#### **Command Syntax**

**show control local-properties** [parameter]

## **Syntax Description**

parameter	Information about a Specific Parameter
	Display configuration information about a specific parameter. <i>parameter</i> can be one of the following: board-serial, certificate-not-valid-after, certificate-not-valid-before, certificate-status, certificate-validity, device-type, dns-cache-flush-interval, dns-name, domain-id, ip-address-list, keygen-interval, max-controllers, no-activity, number-active-wan-interfaces, number-vbond-peers, organization-name, port-hopped, protocol, register-interval, retry-interval, root-ca-chain-status, root-ca-crl-status site-id, system-ip, time-since-port-hop, tls-port, uuid, vbond-address-list, vedge-list-version, vsmart-list-version, and wan-interface-list.

## **Command History**

Release	Modification
14.1.	Command introduced.
16.1.	Added instance field to output for vSmart controllers and vManage NMSs.
16.2.	Added SPI Time Remaining and Last-Resort Interface fields to output for vEdge routers.
16.3.	Added display information about IPv6 WAN interfaces, NAT type, low-bandwidth interface, and vManage connection preference.
17.7	Added root-ca-crl-status parameter.
Cisco SD-WAN Release 20.7.1	Added the Hierarchical SD-WAN region assignment to the <b>REGION IDs</b> column.
Cisco SD-WAN Release 20.8.1	For Hierarchical SD-WAN architectures, the <b>REGION IDs</b> column shows the secondary region also.

## **Examples**

## Show control local-properties

vEdge# show control local-propersonality organization-name certificate-status root-ca-chain-status root-ca-crl-status	pperties vedge Cisco, Inc. Installed Installed Installed

# show control statistics

**show control statistics**—Display statistics about the packets that a vEdge router or vSmart controller has transmitted and received in the process of establishing and maintaining secure DTLS connections to Cisco vEdge devices in the overlay network (on vEdge routers and vSmart controllers only).

#### **Command Syntax**

**show control statistics** [counter-name]

# **Syntax Description**

None	Display statistics about all packets sent and received by the vEdge router or vSmart controller as it establishes and maintains DTLS tunnel connections to the Cisco vEdge devices in the overlay network.
counter-name	Statistics about a Specific Counter
	Display the statistics for the specific counter. For a list of counters, see the Example Output below.

# **Command History**

# show control summary

**show control summary**—List a count of Cisco vEdge devices that the local device is aware of. For devices running on virtual machines (VMs) that have more than one core, this command shows the number of devices that each vdaemon process instance is handling.

# **Command Syntax**

**show control summary** [instance]

### **Syntax Description**

None	Display a count of all the vBond orchestrators, vEdge routers, vManage NMSs, and vSmart controllers in the overlay network.
instance	Devices for a Specific vdaemon Process  Display a count of devices for a specific instance of a vdaemon process. Cisco vEdge devices that run on VMs that have more than one core automatically spawn one vdaemon process for each core, to load-balance the Cisco SD-WAN software functions across all the CPUs in the VM server.

# **Command History**

Release	Modification
14.1.	Command introduced.
15.3.3.	Added support for multiple vdaemon processes (for vManage NMS only).
15.4.	Added support for multiple vdaemon processes for all devices running as VMs.
16.3.	Added display of IPv6 addresses and ports.

# **Examples**

### **Show control summary**

vEdge# show control summary

INSTANCE	VBOND COUNTS	VMANAGE COUNTS			PROTOCOL	LISTENING IP	LISTENING IPV6	LISTENING PORT	
0	1	0	2	3	dtls	10.0.12.22		12346	
1	1	0	0	2	dtls	10.0.12.22	-	12446	

# **Related Topics**

show control connections, on page 791 show orchestrator summary, on page 941

# show control valid-vedges

**show control valid-vedges**—List the chassis numbers of the valid vEdge routers in the overlay network (on vSmart controllers only).

# **Command Syntax**

show control valid-vedges

# **Syntax Description**

None

# **Command History**

Release	Modification	
14.1.	Command introduced.	
14.2	Command renamed from show control valid-devices	

# **Examples**

# Show control valid-vedges

vSmart# show control valid-vedges

	SERIAL	
CHASSIS NUMBER	NUMBER	VALIDITY
110D113140004	10000266	valid

# **Related Topics**

show control connections, on page 791 show control valid-vsmarts, on page 805 show orchestrator valid-vedges, on page 942

# show control valid-vsmarts

List the serial numbers of the valid vSmart controllers in the overlay network (on vEdge routers and vSmart controllers only).

**show control valid-vsmarts** [serial-number]

# **Syntax Description**

None	Display the serial numbers of all valid vSmart controllers in the overlay network.
Serial Number	serial-number List whether a specific vSmart serial number is valid.

### **Command History**

Release	Modification
14.1.	Command introduced.

### **Examples**

#### **Show control valid-vsmarts**

### **Related Topics**

show control connections, on page 791 show control valid-vedges, on page 804 show orchestrator valid-vsmarts, on page 943

# show crash

Display a list of the core files on the local device. Core files are saved in the /var/crash directory on the local device. They are readable by the "admin" user.

**show crash** [index-number] [**core-filename** filename]

# **Syntax Description**

None	List all core files on the local device.
Core Filename	<b>core-filename</b> List a specific core filename.
File Index Number	index-number List a specific file by file index number.

# **Command History**

Release	Modification
14.1.	Command introduced.

# **Examples**

### **Show crash**

```
vSmart# show crash

INDEX CORE TIME CORE FILENAME

Tue Sep 2 17:13:43 2014 core.ompd.866.vsmart.1409703222
```

# **Related Topics**

# show crypto pki trustpoints status

To display the trustpoint information, use the show crypto pki trustpoints status command.

show crypto pki trustpoints label status

# **Syntax Description**

label	A user-specified label that is referenced within the <b>crypto pki</b>
	trustpoint command.

**Command Default** 

None

**Command Modes** 

Privileged EXEC (#)

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.2.1r	This command was introduced.
Cisco SD-WAN Release 20.1.1	This command was introduced.

### Example

This example shows how to display the trustpoint information:

# show devices

Display information about the Cisco vEdge devices that a vManage NMS is managing (on vManage NMSs only).

show devices [device device-name] [commit-queue] [state state]

None	List information about all devices that the vManage NMS is managing.
Queue Length	<b>commit-queue</b> List information about the queue length.
Specific Device	<b>device</b> device-name List information about a specific device that the vManage NMS is managing.
Specific State	state state List information about a specific state. state can be admin-state, last-transaction-id, oper-state, and oper-state-error-tag. These states correspond to the column headings in the output of the show devices command.

Release	Modification
14.2.	Command introduced.

# **Examples**

Display information about all the Cisco vEdge devices that a vManage NMS is managing:

# **Show devices**

vManage# show devices

					OPER	
					STATE	LAST
	QUEUE	WA	ITING	OPER	ERROR	TRANSACTION
NAME	LENGTH	FO	R	STATE	TAG	ID

# show hardware environment

Display status information about the router components, including component temperature (on vEdge routers only).

show hardware environment [Fans [fan-name]] [PEM [pem-name]] [PIM [pim-name] [Temperature [component-name]] [USB]show hardware environment (measurement | status)

None	None:	
	Display status information about all router components.	
measurement	Component Measurement:	
	List the components and the information in the Measurement column, such as a component's temperature.	
status	Component Status:	
	List the components and the information in the Status column.	
Temperature [	Component Temperature:	
component-name]	Display the temperature of all router components or of a specific component.	

Fans [fan-name]	Fan Information:
	Display information about all the fans or about a specific fan. Note that the Cisco SD-WAN software maintains the fans at an optimal fan speed, raising the speed as the ambient temperature increases and decreasing the speed as the temperature decreases, to keep the vEdge router operating at the lowest possible temperature in the green temperature threshold.
PEM [ pem-name]	PEM Information:
	Display information about all the power supply modules or about a specific power supply.
PIM [ pim-name]	PIM Information:
	Display information about all the Pluggable Interface Modules (PIMs) or about a specific PIM.
USB	USB Information:
	USB Display information about USB controllers.

Release	Modification
14.1	Command introduced.
17.1	Display status of router LEDs in the command output.

# **Output Fields**

# **LEDs**

In Releases 17.1 and later, the command output shows the status of the hardware router LEDs, as follows:

- vEdge 100b—System LED
- vEdge 100m—System and WWAN LEDs
- vEdge 100wm—System, WLAN, and WWAN LEDs
- vEdge 1000—Status and System LEDs
- vEdge 2000—PIM Status, Status, and System LEDs

# **Example**

 $\verb|vEdge#| show hardware environment| \\$

# show hardware poe

**show hardware poe**—Display the status of PoE interfaces (on vEdge 100 series routers only). **show hardware poe** 

# **Syntax Description**

None

None	Display status information about all router components.
Component Measurement	<b>measurement</b> List the components and the information in the Measurement column, such as a component's temperature.
Component Status	<b>status</b> List the components and the information in the Status column.

Component	<b>Temperature</b> [component-name] Display the temperature of all router components
Temperature	or of a specific component.

Fan
Fan Information

**Fans** [fan-name] Display information about all the fans or about a specific fan. Note that the Cisco SD-WAN software maintains the fans at an optimal fan speed, raising the speed as the ambient temperature increases and decreasing the speed as the temperature decreases, to keep the vEdge router operating at the lowest possible temperature in the green temperature threshold.

### **Examples**

vEdge# <b>sh</b>	ow hardw	are poe		POE	MAXIMUM	USED	DEVICE	INTERFACE
ADMIN	N STATUS		POWER					
Enabled					ge0,	/0	Uр	

### **Command History**

Command introduced in Cisco SD-WAN Software Release 18.2.

#### **Related Topics**

# show history

**show history**—Display the history of the commands issued in operational mode. **show history** [*number*]

# **Syntax Description**

None	None:
	List all operational commands that have been issued during the current login session.
number	Specific Number of Commands:
	Display the specified number of most recent commands that have been issued in operational mode.

# **Command History**

Release	Modification
14.1	Command introduced.

# **Output Fields**

The output fields are self-explanatory.

### **Example**

```
vm4(config) # show history 12

02:07:53 -- show configuration merge banner

02:09:45 -- show configuration rollback changes 14

02:10:11 -- show full-configuration

02:14:20 -- show full-configuration banner

02:15:52 -- show configuration running

02:18:18 -- show configuration running banner

02:22:06 -- show configuration rollback changes 1

# show igmp groups

**show igmp groups**—Display information about multicast groups (on vEdge routers only). **show igmp groups** [vpn vpn-id]show igmp groups vpn vpn-id group-property

# **Syntax Description**

None	None:
	Display information about all multicast groups.
group-property	Group Properties:
	group-property Display group information for a specific IGMP multicast group. group-property can be one of the following: event, expires, state, up-time, v1-expires, and v1-members-present. Note that these options correspond to the column heads in the output of the plain show igmp groups command.
vpn [vpn-id]	VPN:
	Display multicast group information for interfaces in a specific VPN.

# **Command History**

Release	Modification
14.3	Command introduced.

# **Output Fields**

The output fields are self-explanatory.

# **Example**

# vEdge# show igmp groups

1	ge0/5	229.229.229.229	false	members-present	0:01:33:52			init-event
VPN	NAME	GROUP	PRESENT	STATE	UPTIME	EXPIRES	EXPIRES	EVENT
	IF		MEMBERS				V1	
			V1

# show igmp interface

**show igmp interface**—Display information about the interfaces on which IGMP is enabled on the router (on vEdge routers only).

show igmp interface [vpn vpn-id]show igmp interface vpn vpn-id igmp-property

# **Syntax Description**

None	None:
	Display information about all interfaces on which IGMP is enabled.
igmp-property	IGMP Options:
	Display interface information for a specific IGMP property. <i>igmp-property</i> can be one of the following: <b>event</b> , <b>group-count</b> , <b>if-addr</b> , <b>querier</b> , <b>querier-ip</b> , and <b>state</b> . Note that these options correspond to the column heads in the output of the plain <b>show igmp interface</b> command.
vpnvpn-id	VPN
	<b>vpn</b> <i>vpn-id</i> Display IGMP information for interfaces in a specific VPN.

# **Command History**

Release	Modification
14.3	Command introduced.

# **Output Fields**

The output fields are self-explanatory.

# **Example**

#### vEdge# show igmp interface

VPN	IF NAME	IF ADDR	GROUP COUNT	QUERIER	QUERIER IP	QUERY INTERVAL	STATE	OTHER QUERIER EXPIRY	EVENT
	_	10.20.24.15/24 56.0.1.15/24	0	true true	10.20.24.15 56.0.1.15		*		init-event init-event

# show igmp summary

**show igmp summary**—Display information about the IGMP version and IGMP timers (on vEdge routers only).

**show igmp summary** [*igmp-property*]

# **Syntax Description**

None	None:
	Display all IGMP version and timer information.
igmp-property	IGMP Properties:
	<i>igmp-property</i> Display information for a specific IGMP property. <i>group-property</i> can be one of the following: <b>last-member-query-count</b> , <b>last-member-query-response-time</b> , <b>querier-timeout</b> , <b>query-interval</b> , <b>query-response-time</b> , and <b>version</b> . Note that these options correspond to the column heads in the output of the plain <b>show igmp summary</b> command.

# **Command History**

Release	Modification
14.3	Command introduced.

# **Output Fields**

Output Field	Description
Last Member Query Count	How many group-specific query messages the router sends when it has receives a Leave Group message for a group before assuming that no members of the group remain on the interface. When no members appear to be present, the vEdge router removes the IGMP state for the group.
Last Member Query Response	How long the router waits, in seconds, to receive a response a group-specific query message. The default value is 1 second (1000 milliseconds). You cannot modify this value.

Output Field	Description
Other Querier Timeout	How long to wait for another IGMP querier to time out before assuming the role of querier. If IGMP on an interface or circuit detects another querier that has a lower IP than its own, it must become a non-querier on that network, and it starts watching for query messages from the querier. If the vEdge router has not received a query message from the querier in the Other Querier Timeout interval, it resumes the role of querier. The default other querier timeout value is 125 seconds. You cannot modify this value.
Query Interval	How often the router sends IGMP general query messages to solicit membership information. The default is 125 seconds. You cannot modify this value.
Query Response Interval	Maximum amount of time, in seconds, that the router waits to receive a response to a general query message. The default is 10 seconds. You cannot modify this value.
Version	IGMP version. Currently, vEdge routers run only IGMPv2.

# **Example**

```
vEdge# show igmp summary
```

Version 2
Query Interval 125 seconds
Query Response Interval 10 seconds
Last Member Query Response 1 seconds
Last Member Query Count 2
Other Querier Timeout 255 seconds

# show interface

**show interface**—Display information about IPv4 interfaces on a Cisco vEdge device. **show interface** [**detail**] [*interface-name*] [**vpn** *vpn-id*]

]	None	None:	
		Display standard information about the interfaces on the Cisco vEdge device.	

detail	Detailed Interface Information:  Display detailed information about the interfaces (available only on vEdge routers).
interface-name	Specific Interface:  Display information about a specific interface. On vEdge routers, <i>interface-name</i> can be a physical interface ( <b>ge</b> <i>slot/port</i> ), a subinterface or VLAN ( <b>ge</b> <i>slot/port.vlan-number</i> ), the interface corresponding to the system IP address ( <b>system</b> ), the management interface (typically, <b>eth0</b> ), or a GRE tunnel ( <b>gre</b> <i>number</i> ). On vSmart controllers, <i>interface-name</i> can be an interface ( <b>eth</b> <i>number</i> ) or the interface corresponding to the system IP address ( <b>system</b> ).
vpn vpn-id	Specific VPN: Display information about interfaces in a specific VPN.

Release	Modification
14.1	Command introduced.

# **Output Fields**

The following are the fields in the show interface command output:

Output Fields	Description							
1Duplex	Whether the interface is operating in duplex or simplex mode. This field does not apply to virtual interfaces, such as GRE, IRB, loopback, and system interfaces							
Encapsulation Type	Encapsulation configured on the interface with the encapsulation command.							
Hardware Address	MAC address of the interface.							
If Admin Status	Administrative status of the interface; that is, its status as a result of the interface's configuration. The status can be either Up or Down. By default, interfaces are administratively down, and you must include the no shutdown command in the interface's configuration to bring the interface up. An interface that is both administratively and operationally up is able to transmit and receive traffic. To bring down an interface administratively, include the shutdown command in the interface's configuration.							
If Oper Status	Operational status of the interface; that is, its status as a result of operational factors. The status can be either Up or Down. An interface can be operationally up if it is Interface is administratively up, the interface link layer state is up, and the interface initialization has completed. An interface that is both administratively and operationally up is able to transmit and receive traffic. If the operational status is down, the interface is functionally down and is not able to transmit or receive any traffic.							
MTU	MTU size for packets being send over the interface.							

Output Fields	Description						
Port Type	Describes the port's function from the point of view of the overlay network. It can be one of the following:						
	<b>loopback</b> —Loopback interface. The device's system IP address is listed as a loopback interface.						
	service—Interface for data traffic.						
	transport—Interface running a DTLS control session.						
RX Packets and TX Packets	For GRE interfaces, these fields show counts of the data traffic received and transmitted on GRE tunnels. To display GRE keepalive traffic counts, use the show tunnel gre-keepalives command. To display all GRE tunnel statistics, use the show tunnel statistics gre command.						
Speed	Speed of the interface, in megabits per second (Mbps). This field does not apply to virtual interfaces, such as GRE, IRB, loopback, and system interfaces.						
TCP MSS Adjust	Maximum segment size (MSS) of TCP SYN packets on the interface. For more information see tcp-mss-adjust.						
Uptime	How long the interface has been up, in days, hours, minutes, and seconds.						

The following are the additional fields included in the show interface detail command output:

- addr-type—Type of address configured on the interface, either IPv4 or IPv6, and how the address is configured, either dynamic or static.
- allow-service—Services allowed on the interface. For more information, see allow-service.
- arp-add-fails—Packets for which an ARP entry in the forwarding plane could not be created.
- bad-label—Packets dropped because of an invalid next-hop label record for a destination.
- cpu-policer-drops—Packets destined to the control plane dropped because they exceeded the CPU policer limit.
- dot1x-rx-pkts—802.1X packets received on the interface.
- dot1x-tx-pkts—802.1X packets transmitted on the interface.
- filter-drops—Packets dropped because of an implicit or explicit localized data policy (ACL) filter configuration.
- icmp-redirect-rx-drops—
- icmp-redirect-tx-drops—ICMP redirect packets dropped by the interface.
- if-addr, ip-address/broadcast-addr/secondary—Interface's primary unicast and broadcast addresses, and interface's secondary address, if one is configured.
- ifindex—Interface's SNMP index number.
- if-tracker-status—Whether interface tracking is enabled. For more information, see tracker.
- interface-disabled—Incoming packets dropped because the interface port is not enabled.

- mirror-drops—Fragmented packets that are being mirrored to a destination.
- route-lookup-fail—Packets that could not be forwarded because no route is present in the forwarding table (FIB).
- rx-arp-non-local-drops—Received ARP packets that do not match the destination IP address of any local IP address.
- rx-arp-replies—Received ARP replies
- rx-arp-rate-limit-drops—Currently, the software does not increment this counter.
- rx-arp-reply-drops—Currently, the software does not increment this counter.
- rx-arp-request-fail—Packets that could not be received because there is not corresponding MAC address.
- rx-arp-requests—Received ARP requests.
- rx-broadcast-pkts—Received broadcast packets.
- rx-drops—Received packets that were dropped.
- rx-errors—Received packets that were errored.
- rx-ip-ttl-expired—Received IP packets whose time-to-live value expired.
- rx-multicast-pkts—Received multicast packets.
- rx-non-ip-drops—Received packets other than IP or ARP packets that the interface dropped.
- rx-oversize-errors—Currently, the software does not increment this counter.
- rx-octets—Number of octets in received packets.
- rx-packets—Received packets.
- rx-policer-drops—Incoming packets dropped because of the rate exceeded the configured ingress policer rate.
- rx-policer-remark—Received packets remarked as the result of a policer.
- rx-pps—Receipt rate of packets, in packets per second.
- rx-replay-integrity-drops—Received packets dropped because the IPsec packet arrive outside of the anti-replay window or because the integrity check performed by ESP or AH failed. To view the configured anti-replay window, use the show security-info command. To modify the anti-replay window size, use the security ipsec replay-window configuration command.
- rx-undersize-errors—Currently, the software does not increment this counter.
- rx-wred-drops—Incoming packets dropped because of a RED drop profile associated with an interface queue. To configure a RED drop profile, use the drops option when configuring a QoS scheduler.
- shaping-rate—Traffic rate on the interface if rate is configured with the shaping-rate command to be less than the maximum rate.
- split-horizon-drops—BGP packets dropped as a result of split-horizon determination that the router was advertising a route back on the same interface from which it was learned.

- tx-arp-rate-limit-drops—Number of ARP packets generated by the forwarding plane that exceed the CPU rate limit, which is 16 ARP packets sent towards the CPU and 128 ARP packets send towards physical ports.
- tx-broadcast-pkts—Transmission rate of broadcast packets, in packets per second.
- tx-drops—Transmitted packets that were dropped.
- tx-errors—Transmitted packets that were errored.
- tx-icmp-mirrored-drops—ICMP redirect packets dropped by the system.
- tx-icmp-policer-drops—ICMP packets generated by the system that were dropped because of ICMP policer limits.
- tx-multicast-pkts—Transmitted multicast packets.
- tx-no-arp-drops—Packets dropped in the forwarding plane because of a missing ARP entry for a destination IP address.
- tx-octets—Number of octets in transmitted packets.

# show interface arp-stats

**show interface arp-stats**—Display the ARP statistics for each interface (on vEdge routers only). **show interface arp-stats [vpn** *vpn-id*] [*interface-name*]

# **Syntax Description**

None	None:
	Display standard information about ARP statistics for each interface.
interface-name	Specific Interface:
	Display ARP statistics for a specific interface.
vpnvpn-id	VPN:
	Display ARP statistics for interfaces in a specific VPN.

# **Command History**

Release	Modification
14.1	Command introduced.

### **Output Fields**

The following are the fields included in the show interface arp-stats command output:

- rx-arp-requests/tx-arp-replies, RX Requests/Tx Replies—Number of ARP requests received on the interface, and number of replies sent to these ARP requests.
- tx-arp-requests/rx-arp-replies, TX Requests/Rx Replies—Number of ARP requests sent on the interface, and number of replies received to these ARP requests.
- arp-add-fails, Add Fails—Packets for which an ARP entry in the forwarding plane could not be created.

- rx-arp-reply-drops, RX Reply Drops—Currently, the software does not increment this counter.
- rx-arp-rate-limit-drops, RX Rate Limit Drops—Currently, the software does not increment this counter.
- tx-arp-rate-limit-drops, TX Rate Limit Drops—Number of ARP packets generated by the forwarding plane that exceed the CPU rate limit, which is 16 ARP packets sent towards the CPU and 128 ARP packets send towards physical ports.
- rx-arp-non-local-drops, RX Non-Local Drops—Received ARP packets that do not match the destination IP address of any local IP address.
- tx-arp-request-fail—Packets that could not be transmitted because an ARP request for the MAC address corresponding to the destination IP address was unable to retrieve a MAC address.
- tx-no-arp-drops, TX No ARP Drops—Packets dropped in the forwarding plane because of a missing ARP entry for a destination IP address.

# **Example**

# show interface errors

**show interface errors**—Display error statistics for interfaces (on vEdge routers only). **show interface errors [vpn** *vpn-id*] [*interface-name*]

### **Syntax Description**

None	None:
	Display standard information about errors for each interface.
interface-name	Specific Interface:
	Display error information for a specific interface.
vpnvpn-id	VPN:
	Display error information for interfaces in a specific VPN.

### **Command History**

Release	Modification
14.1	Command introduced.

# **Output Fields**

Following are explanations of the output fields:

- arp-add-fails—Packets for which an ARP entry in the forwarding plane could not be created.
- bad-label—Packets dropped because of an invalid next-hop label record for a destination.
- cpu-policer-drops—Packets destined to the control plane dropped because they exceeded the CPU policer limit.
- filter-drops—Packets dropped because of an implicit or explicit localized data policy (ACL) filter configuration.
- fragment-df-drops—Packets dropped because their size is larger than the configure MTU, if the Don't Fragment bit is set.
- interface-disabled—Incoming packets dropped because the interface port is not enabled.
- ip-fwd-null-hop—Packets that could not be forwarded because the next-hop address was invalid or the next hop was unavailable.
- ip-fwd-unknown-nh-type—Packets dropped because the next-hop type was unknown.
- mirror-drops—Fragmented packets that are being mirrored to a destination.
- port-disabled-rx—Incoming packets dropped because the interface port is not enabled.
- port-disabled-tx—Outgoing packets dropped because the interface port is not enabled.
- route-lookup-fail—Packets that could not be forwarded because no route is present in the forwarding table (FIB).

- rx-arp-cpu-rate-limit-drops—ARP reply packets dropped because the number of packets exceeded the CPU rate limit.
- rx-arp-non-local-drops—Received ARP packets that do not match the destination IP address of any local IP address.
- rx-arp-rate-limit-drops—Currently, the software does not increment this counter.
- rx-arp-reply-drops—Currently, the software does not increment this counter.
- rx-dmac-filter-drops—Received packets that do not match the destination MAC address corresponding to the Layer 3 interface.
- rx-fcs-align-errors— In MIPS-based Cisco vEdge devices, like Cisco vEdge 1000 or Cisco vEdge 2000, this counter is the sum of all dropped error packets. The errors may be caused due to:
  - FCS (frame check sequence) errors
  - alignment errors

These errors are detected at the hardware layer but are not related to DMAC (Destination MAC) filter drop or lack of room in the receiver FIFO.

- rx-implicit-acl-drops—Received packets dropped because of an implicit route policy (access list). Router tunnel interfaces also have implicit ACLs, which are also referred to as services. Some of these are present by default on the tunnel interface, and they are in effect unless you disable them. Through configuration, you can also enable other implicit ACLs. On vEdge routers, the following services are enabled by default: DHCP (for DHCPv4 and DHCPv6), DNS, and ICMP. You can also enable services for BGP, Netconf, NTP, OSPF, SSHD, and STUN. To enable the logging of the headers of packets dropped because they do not match a service configure with an allow-service command, configure policy implicit-acl-logging (on vEdge routers only).
- rx-inb-errors—Currently, the software does not increment this counter.
- rx-interface-not-found—Packets dropped because of an invalid VLAN tag.
- rx-ip-errors—Received packets whose IP or Thernet header could not be parsed.
- rx-ip-ttl-expired—Received IP packets whose time-to-live value expired.
- rx-non-ip-drops—Received packets other than IP or ARP packets that the interface dropped.
- rx-oversize-errors—Currently, the software does not increment this counter.
- rx-policer-drops—Incoming packets dropped because of the rate exceeded the configured ingress policer rate.
- rx-replay-integrity-drops—Received packets dropped because the IPsec packet arrive outside of the anti-replay window or because the integrity check performed by ESP or AH failed. To view the configured anti-replay window, use the show security-info command. To modify the anti-replay window size, use the security ipsec replay-window configuration command.
- rx-undersize-errors—Currently, the software does not increment this counter.
- rx-wred-drops—Incoming packets dropped because of a RED drop profile associated with an interface queue. To configure a RED drop profile, use the drops option when configuring a QoS scheduler.
- split-horizon-drops—BGP packets dropped as a result of split-horizon determination that the router was advertising a route back on the same interface from which it was learned.

- tx-arp-rate-limit-drops—Number of ARP packets generated by the forwarding plane that exceed the CPU
  rate limit, which is 16 ARP packets sent towards the CPU and 128 ARP packets send towards physical
  ports.
- tx-arp-request-fail—Packets that could not be transmitted because an ARP request for the MAC address corresponding to the destination IP address was unable to retrieve a MAC address.
- tx-collision-drops—Packets dropped because the interface attempted to send packets at the same time.
- tx-fragment-drops—Packets dropped because of issues related to fragmentation, such as when a fragment exceeds the MTU size when the DF bit is set and when issues occur in reassembling packets after fragmentation.
- tx-fragment-needed—Packets requiring fragmentation because they are larger than the interface's MTU.
- tx-icmp-mirrored-drops—ICMP redirect packets dropped by the system.
- tx-icmp-policer-drops—ICMP packets generated by the system that were dropped because of ICMP policer limits.
- tx-interface-disabled—Currently, the software does not increment this counter.
- tx-no-arp-drops—Packets dropped in the forwarding plane because of a missing ARP entry for a destination IP address.
- tx-underflow-pkts—Packets dropped during transmission because packet data was not made available to the TX FIFO in time. This situation can result in FCS errors on the receiving side.

# show interface queue

**show interface queue**—Display interface queue statistics (on vEdge routers only). **show interface queue [vpn** *vpn-id*] [*interface-name*]

### **Syntax Description**

None	None:
	Display standard interface queue statistics.
interface-name	Specific Interface:
	Display interface queue statistics for a specific interface.
vpnvpn-id	VPN:
	Display interface queue statistics for interfaces in a specific VPN.

Note

The queue drop details are dispalyed when you pass commands, **show interface statistics** and **show interface port-stats**.

## **Command History**

Release	Modification
14.1	Command introduced.
19.1	Added attributes to the command output: queue-depth, max-depth, avg-queue, queue-pps, queue-drop-pps

### **Output Fields**

### **QNUM**

Queue number. Hardware vEdge routers have 8 queues, numbered 0 through 7. From 17.2.7 Release onwards, vEdge Cloud software router have 8 queues, numbered 0 through 7.

The remaining output fields are self-explanatory.

### **Example**

vedge# show interface queue ge0/0

# show interface sfp detail

show interface sfp detail—Display detailed SFP status and digital diagnostic information for bytes 0 through 95 of an SPF A0 section, as described in SFF-8472 (on vEdge routers only). This command also provides information about the types of fiber supported, the distance the SFP can drive, and the wavelength used by the SFP. The output of this command is useful for diagnosing issues with a troublesome SFP link.

**show interface sfp detail** [interface-name]

# **Syntax Description**

None	None:
	Display detailed information for all interfaces in the router.

### **Command History**

Release	Modification
16.1	Command introduced.

### **Output Fields**

The output fields are drawn from the SFP addresses listed below. Not all fields are valid or make sense for all SFP types.

### Table 17: SFP Types

Field Name	Value	SFP Address
Physical identifier	Physical device identifier	A0.0-1
Connector type	Values such as LC, SC, and RJ45	A0.2
Transceiver compliance (compatibility)	List of compliance values	A0.3 to A0.10, A0.36
Encoding	Values such as 8b10b and 64b66b	A0.11
Nominal speed	Speed, in bps	A0.12, A0.66 to A0.67
Rate select options	Rate identifiers	A0.13
Single-mode fiber link length	Length, in km	A0.14 to 15
50-µm multimode (OM2) fiber link length	Length, in meters	A0.16
65-µm multimode (OM1) fiber link length	Length, in meters	A0.17

Field Name	Value	SFP Address
50-μm multimode (OM4) active cable/copper link length	Length, in meters	A0.18
50-µm multimode (OM3) fiber link length	Length, in meters	A0.19
Vendor name	16-byte ASCII string	A0.20 to A0.35
Vendor OUI	3-byte hexadecimal string	A0.37 to A0.39
Vendor part number	16-byte ASCII string	A0.40 to A0.55
Vendor revision	4-byte ASCII string	A0.56 to A0.59
Vendor serial number	16-byte ASCII string	A0.68 to A0.83
Date code	Date string as yymmddll, where l is the lot code	A0.84 to A0.91
Laser wavelength	Value or compliance string, in nm	A0.60 to A0.61
Feature options	List of bits, as strings	A0.64 to A0.65
Diagnostic monitoring options	List of bits, as strings	A0.92
Enhanced options	List of bits, as strings	A0.93
SFP compliance level	Compliance specification string	A0.94

### **Fiber SFPs**

### **Example**

```
vEdge-1000# show interface sfp detail ge0/5
sfp detail ge0/5
Present
                          Yes
Physical identifier SFP/SFP+
Connector type "LC (Lucent connector)"
Transceiver compliance "1000 Base-SX"
                 8b/10b
Encoding
                          "1.20 Gbps"

# show interface sfp diagnostic

**show interface sfp diagnostic**—Display SFP diagnostic information for fiber-based SFPs only (on vEdge routers only). This data is taken from bytes in the SFP A2 page, as described in SFF-8472. This section is not available for copper RJ45 SFPs.

The data for this output is stored in the A2 page of the SFP, and it contains minimum/maximum threshold parameters for laser transmitters and receivers, as well as dynamic run-time data values. This data page also might contain calibration data if the devices were externally calibrated. In this show command, the calibration data is used, if populated; however, it is not specifically be displayed.

# **show interface sfp diagnostic** [interface-name]

## **Syntax Description**

None	None:
	Display SFP diagnostic information for all interfaces in the router.
interface-name	Interface Name:
	Display SFP diagnostic information for the specific interface.

### **Command History**

Release	Modification
16.1	Command introduced.

### **Output Fields**

The output fields are drawn from the SFP addresses listed below. Not all fields are valid or make sense for all SFP types.

The following information is displayed for SFP diagnostics. Measurement information is presented as floating-point data.

Threshold and measurement data are all floating point data and are specified for accuracy relative to the source data. Measurement units are included in the value label.

In addition to allowing current measurements to be display, each of the following measurements has associated flag status indicating whether the measurement is in or out of alarm or warning state. This data is sourced from A2.112-117 SFP data.

Based on options declared to be supported by the SFP, several bit-based statuses are included in the display output. These include items such as select, transmit disable state, and receive loss-of-signal state, and are from A2.110.

Measurement	High Warning	High Alarm	Low Warning	Low Alarm	Current
Optical laser temperature	A2.44 to A2.45	A2.40 to A2.41	A2.46 to A2.47	A2.42 to A2.43	A2.106 to A2.107
Optical TEC current	A2.52 to A2.53	A2.48 to A2.49	A2.54 to A2.55	A2.50 to A2.51	A2.108 to A2.109
Receive power	A2.36 to A2.37	A2.32 to A2.33	A2.38 to A2.39	A2.34 to A2.35	A2.104 to A2.105
SFP temperature	A2.4 to A2.5	A2.0 to A2.1	A2.6 to A2.7	A2.2 to A2.3	A2.96 to A2.97
Supply voltage	A2.12 to A2.13	A2.8 to A2.9	A2.14 to A2.15	A2.10 to A2.11	A2.98 to A2.99
Transmit bias current	A2.20 to A2.21	A2.16 to A2.17	A2.22 to A2.23	A2.18 to A2.19	A2.100 to A2.101

### For a 1-Gigabit Ethernet copper SFP:

```
vEdge-1000# show interface sfp diagnostic ge0/3
{\it sfp} diagnostic {\it ge0/3}
Present
                      Yes
Diagnostics supported Yes
SFP control/status

# show interface statistics

show interface statistics—Display interface statistics (on vEdge routers only).

show interface statistics [vpn vpn-id] [interface-name]show interface detail statistics [diff] [interface interface-name] [vpn vpn-id]

# **Syntax Description**

None	None:
	Display standard interface statistics. Interface traffic rates are computed every 10 seconds.
diff	Statistics Changes:
	Display the changes in statistics since you last issued the <b>show interface statistics</b> command.
interface-name	Interface Name:
	Display interface statistics for a specific interface.
vpnvpn-id	VPN:
	Display interface statistics for interfaces in a specific VPN.

# **Command History**

Release	Modification
14.1	Command introduced.

# **Output Fields**

The output fields are self-explanatory.

# **Example**

vEdae#	show	interface	statistics

# show ip dns-snoop

Display details of a fully qualified domain name (FQDN) and its corresponding IP address mapping information.

The DNS snooping agent (DSA) maintains an "IP cache" table of fully qualified domain names (FQDN) and their corresponding IP addresses. The command displays the complete information in this table (all option), or details for specific FQDN's (pattern option) or IP addresses (address option).

(for Cisco IOS XE SD-WAN devices)

# **Command Syntax**

**show ip dns-snoop** {address ip-address | all pattern pattern}

### **Syntax Description**

address ip-address	Display details for a specific IP address in the DSA IP cache table.
all	Display details for all IP addresses in the DSA IP cache table.
pattern pattern	Display details for a specific FQDN in the DSA IP cache table, matching a text pattern.

### **Command Mode**

Privileged EXEC mode

### **Command History**

Release	Modification
Cisco IOS XE Amsterdam 17.2	Command introduced.

### **Examples**

## Example

Device# show ip dns	s-snoop all			
IP Address	Client(s)	Expire	RegexId	Dirty Match
192.168.0.1	0x1 992	0xef270000	0x00	cisco\.com

# show ip fib

To display the IPv4 entries in the local forwarding table (on Cisco vEdge routers only), use the **show ip fib** command in privileged EXEC mode.

**show ip fib** [ **vpn** *vpn-id* ] [ *ipv4-prefix/length* ] [ **tloc** { **color** *color* | **tloc-ip** *ip-address* } ]

### **Syntax Description**

None:
List standard information about the IPv4 entries in the forwarding table.

ipv4-prefix/length	Specific Prefix: List the forwarding table entry for the specified IPv4 prefix.
tloc [color color   tloc-ip ip-address]	TLOC-Specific Entries: Display forwarding table IPv4 entries for specific TLOCs.
vpn vpn-id	VPN-Specific Routes: List only the forwarding table IPv4 entries for the specified VPN.

# **Command History**

Release	Modification
14.1	Command introduced.
Cisco SD-WAN Release 20.9.1	This command was modified. Support was added to display interservice replicated route VPN.

# **Examples**

The following is a sample output from the **show ip fib vpn** command that shows the replicated route VPNs:

vEdge# show ip fib vpn 102

VPN COLO	PREFIX R	NEXTHOP IF NAME	NEXTHOP ADDR	NEXTHOP LABEL	NEXTHOP VPN	SA INDEX	TLOC IP
102	10.0.100.0/24	ge0/4.105	_	-	-	-	-

### **Operation Commands**

ip route

ipv6 route

route-consistency-check

show interface

show ip routes

show ipv6 fib

show omp routes

# **Related Topics**

ip route, on page 270 ipv6 route, on page 278 route-consistency-check, on page 435 show interface, on page 829 show ip routes, on page 867 show ipv6 fib, on page 880 show omp routes, on page 916

# show ip mfib oil

**show ip mfib oil**—Display the list of outgoing interfaces from the Multicast Forwarding Information Base (MFIB) (on vEdge routers only).

**show ip mfib oil show ip mfib oil** [group-number] [group-address] [source-address] [mcast-oil-list number]

## **Syntax Description**

None	None:
	List standard information about outgoing interfaces from the MFIB.
group-number group-address	Specific Information:
source-address mcast-oil-list	List more specific information from the MFIB.

# **Command History**

Release	Modification
14.2	Command introduced.

## **Output Fields**

The output fields are self-explanatory.

### **Example**

vEdge# show ip mfib oil

VPN ID	GROUP	SOURCE	INDEX	OIL INTERFACE	OIL REMOTE SYSTEM
1	224.0.1.39				
1	225.0.0.1	0.0.0.0	0	_	172.16.255.14

### **Operational Commands**

show ip mfib summary

show ip mfib stats

## **Related Topics**

show ip mfib summary, on page 863 show ip mfib stats, on page 862

# show ip mfib stats

**show ip mfib stats**—Display packet transmission and receipt statistics for active entries in the Multicast Forwarding Information Base (MFIB) (on vEdge routers only). Packet rates are computed every 10 seconds.

### **Command Syntax**

show ip mfib stats

# **Syntax Description**

None

### **Output Fields**

# Rx Policy Drop, Tx Policy Drop

The number of inbound or outbound packets dropped as the result of applying a policy. The remaining output fields are self-explanatory.

# **Command History**

Release	Modification
14.2	Command introduced.
16.3	Added Rx Policy Drop and Tx Policy Drop fields to command output.

### **Examples**

vEdge# show ip mfib stats

								RX	RX	TX	TX			RX	TX	INVALI	D
			RX	RX	TX	TX	CTRL	PACKETS	OCTETS	PACKETS	OCTETS	AVG	RPF	POLICY	POLICY	OIL	TX

show ip nat interface-statistics

### **Related Topics**

nat, on page 348

show ip nat interface, on page 865

show ip nat interface-statistics, on page 866

# show ip nat interface

**show ip nat interface**—List the interfaces on which NAT is enabled and the NAT translational filters on those interfaces (on vEdge routers only).

### **Command Syntax**

**show ip nat interface** [nat-vpn vpn-id] [nat-parameter]

## **Syntax Description**

Nme	List information about all NAT interfaces in all VPNs.
-----	--------------------------------------------------------

## Table 18: Syntax Description

nat-parameter	Specific NAT Interface Parameter:
	List specific NAT interface information. <i>nat-parameter</i> can be one of the following, which correspond to the column heads in the command output: <b>fib-filter-count</b> , <b>filter-type</b> , <b>ip</b> , <b>mapping-type</b> , and <b>number-ip-pools</b> .
nat-vpn vpn-id	Specific VPN: List information for NAT interface only for the specified VPN.

# **Command History**

Release	Modification
14.2.	Command introduced.

## **Output Fields**

In the Map Type field, all SD-WAN NAT types are endpoint-independent.

The other output fields are self-explanatory.

### Output

vEdge# show ip nat interface

					FIB		NUMBER
VPN	IFNAME	MAP TYPE	FILTER TYPE	FILTER COUNT	FILTER COUNT	IP	IP POOLS

# show ip nat interface-statistics

**show ip nat interface-statistics**—List packet, NAT, and ICMP statistics for the interfaces on which NAT is enabled (on vEdge routers only).

### **Command Syntax**

show ip nat filter interface-statistics [nat-vpn vpn-id]

# **Syntax Description**

### Table 19: Syntax Description

None	Display statistics for all interfaces in all VPNs.
nat-vpn	VPN:
vpn-id	Display statistics for the interfaces in the specified VPN.

### **Command History**

# show ip routes

To display the IPv4 entries in the local route table, use the **show ip routes** command in privileged EXEC mode. On Cisco vSmart controllers, the route table incorporates forwarding information.

show ip routes [ vpn vpn-id ] [ ipv4-address ] [ ipv4prefix/length ] [ bgp ] [ connected ] [ gre ] [ nat ] [ natpool-inside ] [ natpool-outside ] [ omp ] [ ospf ] [ static ] [ summary [ protocol protocol ] ] [ detail ]

# **Syntax Description**

	None: List standard information about the entries in the local IPv4 route table.
detail	Detailed Information: List detailed information about the entries in the local IPv4 route table.
ipv4-address ipv4prefix /length vpn vpn-id	IP Address or Route Prefix: List route information for the specified route prefix. If you omit the prefix length, you must specify a VPN identifier so that the Cisco SD-WAN software can find the route that best matches the prefix.
nat	NAT Routes: List routes learned from static routes that are advertised to a different VPN (configured using the <b>ip route vpn</b> command).
natpool-inside natpool-outside	NAT Pool Routes: List routes learned from NAT pools that are advertised by OMP ( <i>natpool-inside</i> ) and routes learned from the service side ( <i>natpool-outside</i> ) for Cisco vEdge devices acting as NATs.
protocol	Routes Learned from a Protocol or Connected Networks: List routes learned from one or more specific protocols—bgp, connected, gre, omp, ospf, and static. The protocol static includes both routes that are statically configured on the local device as well as routes learned from a DHCP server if one or more interfaces in VPN 0 are configured to learn their IP addresses via DHCP.
summary [summary protocol]	Summary of Routes: List summary information about the IP routes in the route table or about routes learned from the specified protocol. Protocol can be bgp, connected, omp, ospf, or static.
vpn vpn-id	VPN-Specific Routes: List only the route table entries for the specified VPN.

Note

Any BFD event (up/down) for a vEdge peer will result in withdrawal and re-installation of all OMP routes learnt from the remote vEdge, consequently, re-setting the uptime as well.

# **Command History**

Release	Modification
14.1	Command introduced.
16.3	Added support for displaying NAT-related routes.
17.1	Display omp-tag and ospf-tag fields in detailed output.
17.2	Renamed natpool-omp and natpool-service options to natpool-inside and natpool-outside.
Cisco SD-WAN Release 20.9.1	This command was modified. Support was added to display interservice VPN route replication in detailed output.

# show ipsec ike inbound-connections

**show ipsec ike inbound-connections**—Display information about the IKE sessions that remote IKE peers have established to the local router (on vEdge routers only).

### **Command Syntax**

show ipsec ike inbound-connections

show ipsec ike inbound-connections source-ip-address [source-port [destination-ip-address [destination-port ]]] [ (ciphersuite suite | new-key-hash hash | new-spi spi | old-key-hash hash | old-spi spi )]]]

### Syntax Description

	None:
	Display information for all the IKE sessions that have been established to the local router.
source-ip-address	Specific IKE-Enabled IPsec Tunnel Connection:
[source-port[destination-ip-address[destination-port]]][(ciphersuite suite   new-key-hash hash  new-spi spi  old-key-hash hash   old-spi spi)]]]]	Display information for a specific IKE-enabled IPsec tunnel.

### **Command History**

Release	Modification
17.2	Command introduced.

### Example

For the following example, the output of the **show ipsec ike inbound-connections** command on the vEdge1 router shows the IKE-enabled IPsec tunnel connection that originates on the vEdge2 router, whose tunnel source IP address is 10.1.16.16. The command output on the vEdge2 router shows the connection from vEdge1, whose tunnel source IP address is 10.1.15.15.

# show ipsec ike outbound-connections

**show ipsec ike outbound-connections**—Display information about the IKE sessions that the local router has established to remote IKE peers (on vEdge routers only).

### **Command Syntax**

show ipsec ike outbound-connections

**show ipsec ike outbound-connections** *source-ip-address* [*source-port* [*destination-ip-address* [*destination-port*] [*spi*]]][ (**ciphersuite** *suite* | **key-hash** *hash* | **tunnel-mtu** *mtu* )]]]]

### **Syntax Description**

	None:
	Display information for all the IKE sessions that have been established to remote IKE peers.
source-ip-address [source-port	Specific IKE-Enabled IPsec Tunnel Connection:
[destination-ip-address] [destination-port] [spi] ] ] [ (ciphersuite suite  tunnel-mtu mtu) ] ] ]	Display information for a specific IKE-enabled IPsec tunnel.
]	

## **Command History**

Release	Modification
17.2	Command introduced.

#### **Examples**

On the vEdge1 router, the output of the **show ipsec ike outbound-connections** command shows the IKE-enabled IPsec tunnel connection that originates from the local router, whose tunnel source IP address is 10.1.15.15. The command output on the vEdge2 router shows the connection originating from that router, 10.1.15.15.

# show ipsec outbound-connections

**show ipsec outbound-connections**—Display information about the IPsec connections to remote routers (on Cisco vEdge devices only).

## **Command Syntax**

**show ipsec outbound-connections** [source-ip-address]

show ipsec outbound-connections [authentication-used string |tunnel-mtu number] show ipsec outbound-connections (remote-tloc-address ip-address | remote-tloc-color color)

	None:
	Display information for all the IPsec connections that originate on the local Cisco vEdge device.
authentication-used string	Authentication Type:
	Display information for the IPsec connections that use the specified authentication.

remote-tloc-address ip-address	TLOC Address:
	Display the IPsec connection information for a specific TLOC address.
remote-tloc-color color	TLOC Color:
	Display the IPsec connection information for a specific TLOC color.
tunnel-mtu number	Tunnel MTU Size:
	Display information for the IPsec connections with the specified MTU size.

Release	Modification
14.1	Command introduced.
15.2	Command renamed from <b>show tunnel outbound-connections</b> .
16.2	Display negotiated encryption algorithm in command output.
Cisco SD-WAN Release 20.6.1	The output of this command was modified. Starting from Cisco SD-WAN Release 20.6.1, the command output replaces the Authentication Used column with the Integrity Used column.  The values null, ah-shal-hmac, ah-no-id, and shal-hmac are replaced with none, ip-udp-esp, ip-udp-esp-no-id, and esp respectively.

## **Examples**

The following is a sample output of the **show ipsec outbound-connections** for Cisco SD-WAN Release 20.6.1 and later.

Device# show s	dwan ipsec	outbound-con	nections

# show ipv6 dhcp interface

**show ipv6 dhcp interface**—Display information about interfaces that are DHCPv6 clients (on Cisco vEdge devices and Cisco Catalyst SD-WAN Controllersonly).

#### **Command Syntax**

show ipv6 dhcp interface [vpn vpn-id] [interface-name]
show ipv dhcp interface [dns-list] [state]

#### **Syntax Description**

	None:
	Display information about all interfaces that are DHCPv6 clients.
dns-list	DNS Servers:
	Display the DHCPv6 client DNS information.
state	Lease State:
	Display the DHCPv6 client interface state information.
vpn	VPN:
vpn-id	Display DHCPv6 client interface information for a specific VPN.

### **Output Fields**

The state can be one of bound, init, rebind, release, renew, and request.

The DNS column lists the IPv6 addresses of the DNS servers returned by DHCPv6.

The remaining output fields are self-explanatory.

Release	Modification
16.3	Command introduced.

## **Examples**

vEdge# show ipv6 dhcp interface

VPN INTERFACE GATEWAY INDEX	STATE	ACQUIRED IP	SERVER	LEASE TIME	TIME REMAINING	
0 ge0/1	init	_		_	_	
0 ge0/2	bound	2001::a00:55e/64	0:1:0:1:1f:80:20:ef:0:c:29:6:79:94	0:02:00:00	0:01:58:08	-
0 f	ec0::1

#### Example 3

vSmart# show ipv6 interface eth1

					IF	IF					
TCP	AF			LINK	ADMIN	OPER	ENCAP				SPEED
	TYPE IPV6 ST UPTIME		TX PACKETS	LOCAL	STATUS	STATUS	TYPE	PORT TYPE	MTU	HWADDR	MBPS
0 eth1 full -	-	:a0:5:0:20c:2	29ff:fea4 163339	:333d/64 -	Up	Up	null	transport	1500	00:0c:29:a4:33:3d	1000

#### **Related Topics**

```
show interface, on page 829
show ipv6 neighbor, on page 884
show ipv6 routes, on page 887
```

## show ipv6 neighbor

**show ipv6 neighbor**—Display the entries in the Address Resolution Protocol (ARP) table for IPv6 neighbors, which lists the mapping of IPv6 addresses to device MAC addresses (on Cisco vEdge devices and Cisco Catalyst SD-WAN Controllers only).

#### **Command Syntax**

show ipv6 neighbor [vpn vpn-id]

## **Syntax Description**

	None:
	List all the IPv6 entries in the ARP table.
vpn vpn-id	Specific VPN:
	List the IPv6 ARP table entries for the specified VPN.

#### **Output Fields**

The output fields are self-explanatory.

#### **Command History**

Release	Modification
16.3	Command introduced.

#### **Examples**

#### vEdge# show ipv6 neighbor

VPN	NAME	IP	MAC	STATE	IDLE TIMER	UPTIME
0	ge0/2	2001::2	00:0c:bd:06:47:57	static	-	0:00:00:37
0	5	fe80::20c:bdff:fe06:4757				0:00:00:38
0	ge0/2	fe80::250:b6ff:fe0f:1c84	00:50:b6:0f:1c:84	dynamic	0:00:00:00	0:00:00:34

#### **Related Topics**

```
clear arp, on page 584
show arp, on page 749
show ipv6 interface, on page 881
show ipv6 routes, on page 887
```

# show ipv6 policy access-list-associations

**show ipv6 policy access-list-associations**—Display the IPv6 access lists that are operating on each interface (on Cisco vEdge devices only).

### **Command Syntax**

show ipv6 policy access-list-associations

#### **Syntax Description**

None

### **Output Fields**

The output fields are self-explanatory.

## **Command History**

Release	Modification
16.3	Command introduced.

#### **Example**

vEdge# show ipv6 policy access-list-associations

	INTERFACE	INTERFACE
NAME	NAME	DIRECTION
ipv6-policy	ge0/2	out

#### **Related Topics**

```
access-list, on page 30 show policy access-list-associations, on page 966
```

# show ipv6 policy access-list-counters

**show ipv6 policy access-list-counters**—Display the number of packets counted by IPv6 access lists configured on the Cisco vEdge device (on Cisco vEdge devices only).

#### **Command Syntax**

show ipv6 policy access-list-counters

## **Syntax Description**

None

#### **Output Fields**

The output fields are self-explanatory.

Release	Modification
16.3	Command introduced.

### **Example**

vEdge# show ipv6 policy access-list-counters

NAME	COUNTER NAME	PACKETS	BYTES
ipv6-policy	ipv6-counter	1634	135940

## **Related Topics**

access-list, on page 32 show policy access-list-counters, on page 967

# show ipv6 policy access-list-names

**show ipv6 policy access-list-names**—Display the names of the IPv6 access lists configured on the Cisco vEdge device (on Cisco vEdge devices only).

#### **Command Syntax**

show policy access-list-names

#### **Syntax Description**

None

#### **Output Fields**

The output fields are self-explanatory.

#### **Command History**

Release	Modification
16.3	Command introduced.

## **Examples**

vEdge# show ipv6 policy access-list-names

NAME -----ipv6-policy

## **Related Topics**

access-list, on page 32 show policy access-list-names, on page 968

## show ipv6 policy access-list-policers

**show ipv6 policy access-list-policers**—Display information about the policers configured in IPv6 access lists (on Cisco vEdge devices only).

#### **Command Syntax**

show ipv6 policy access-list-policers

#### **Syntax Description**

None

#### **Output Fields**

The output fields are self-explanatory.

#### **Command History**

Release	Modification
16.3	Command introduced.

#### **Examples**

Display a list of policers configured in access lists. This output shows that the policer named "p1_police" was applied in sequence 10 in the access list "ipv6_p1" in sequences 10, 20, and 30 in the "ipv6_plp" access list.

#### vEdge# show policy access-list-policers

NAME	POLICER NAME	PACKETS
ipv6_p1 ipv6_plp	10.p1_police 10.p1_police 20.p1_police 30.p2_police	0

#### **Related Topics**

clear policer statistics, on page 619 show policer, on page 965 show policy access-list-policers, on page 969

## show ipv6 routes

**show ipv6 routes**—Display the IPv6 entries in the local route table. On Cisco Catalyst SD-WAN Controllers, the route table incorporates forwarding information.

#### **Command Syntax**

show ipv6 routes [detail] [ipv6-address] [ipv6-prefix/length] [bgp] [connected] [omp] [ospf] [static] [summary protocol protocol] [vpn vpn-id]

show ipv6 routes vpn vpn-id [detail] [ipv6-address] [ipv6-prefix/length] [bgp] [connected] [omp] [ospf] [static]

#### **Syntax Description**

	None:
	List standard information about the entries in the local IPv6 route table.
detail	Detailed Information:
	List detailed information about the entries in the local IPv6 route table.
ipv6-address	IP Address or Route Prefix:
ipv6-prefix/length	List route information for the specified IPv6 route prefix. If you omit the prefix
prefix <b>vpn</b> vpn-id	length, you must specify a VPN identifier so that the Cisco SD-WAN software can find the route that best matches the prefix.
	Routes Learned from a Protocol:
	List routes learned from one or more specific protocols—bgp, connected, omp, ospf, and static. The protocol static includes both routes that are statically configured on the local device as well as routes learned from a DHCP server if one or more interfaces in VPN 0 are configured to learn their IP addresses via DHCP.
summary protocol	Summary of Routes Learned from a Protocol:
protocol	List summary information about the IP routes in the route table or about routes learned from the specified protocol. <i>protocol</i> can be <b>bgp</b> , <b>connected</b> , <b>omp</b> , <b>ospf</b> , or <b>static</b> .
vpn vpn-id	VPN-Specific Routes:
	List only the route table entries for the specified VPN.

#### **Output Fields**

The output fields are self-explanatory.

#### **Command History**

Release	Modification
16.3	Command introduced.

#### **Examples**

```
vEdge# show ipv6 routes
Codes Proto-sub-type:
  IA -> ospf-inter-area,
E1 -> ospf-external1, E2 -> ospf-external2,
N1 -> ospf-nssa-external1, N2 -> ospf-nssa-external2,
   e -> bgp-external, i -> bgp-internal
Codes Status flags:
F -> fib, S -> selected, I -> inactive,
B -> blackhole, R -> recursive
                                                         PROTOCOL NEXTHOP
                                                                                       NEXTHOP
                                                                                                              NEXTHOP

                                                                                                              VPN
                                                                                                                     TLOC IP
                                                                                                                                                COLOR
                                                                                       ADDR
```

#### **Related Topics**

```
show ip routes, on page 867
show ipv6 interface, on page 881
show ipv6 neighbor, on page 884
```

## show jobs

**show jobs**—View a list of the files that are currently being monitored on the local device. This command is the same as the UNIX jobs command.

#### **Command Syntax**

show jobs

#### **Syntax Description**

None

#### **Output Fields**

The output fields are self-explanatory.

#### **Command History**

Release	Modification
15.4	Command introduced.

#### **Examples**

Start and stop monitoring a file, and view the files that are being monitored:

```
vEdge# monitor start /var/log/vsyslog
vEdge# show jobs
JOB COMMAND
1  monitor start /var/log/vsyslog
vEdge# log:local7.notice: Dec 16 14:55:26 vsmart SYSMGR[219]:
%Viptela-vsmart-SYSMGR-5-NTCE-200025: System clock set to Wed Dec 16 14:55:26 2015 (timezone 'America/Los_Angeles')
log:local7.notice: Dec 16 14:55:27 vsmart SYSMGR[219]: %Viptela-vsmart-SYSMGR-5-NTCE-200025:
System clock set to Wed Dec 16 14:55:27 2015 (timezone 'America/Los_Angeles')
vEdge# monitor stop /var/log/vsyslog
vEdge#
```

#### **Related Topics**

```
job stop, on page 647
monitor start, on page 649
monitor stop, on page 650
```

## show licenses

**show licenses**—Display the licenses for the software packages used by the Cisco SD-WAN software.

#### **Command Syntax**

show licenses [list | package package-name]

#### **Syntax Description**

	None:
	Display the licenses for all the software packages used by the Cisco SD-WAN software.
package package-name	Display the License for an Individual Package: Display the license for a specific software package.
list	List the Software Package Licenses: List the software packages used by the Cisco SD-WAN software.

#### **Output Fields**

The output of the **show licenses** command is quite extensive. To read all the licenses, it is recommended that you save the command output to a file:

vEdge# **show licenses** | **save** *filename* 

## **Command History**

Release	Modification
14.1	Command introduced.

#### **Examples**

vEdge# **show licenses list**

### **Related Topics**

show version, on page 1040

## show log

**show log**—Display the contents of system log (syslog) files.

#### **Command Syntax**

**show log** *filename* [tail *number*]

#### **Syntax Description**

Filename	Filename:
	Name of the syslog file.
tail number	Last Lines in the File: Display the last lines in the file. In <i>number</i> , specify the number of lines to display.

#### **Output Fields**

The output fields are self-explanatory.

#### **Command History**

Release	Modification
17.1	Command introduced.

#### **Example**

```
vEdge# show log messages tail 10

# show logging

**show logging**—Display the settings for logging syslog messages.

#### **Command Syntax**

**show logging** [logging-parameter]

#### **Syntax Description**

	None:
	Display all logging information.
logging-parameter	Specific Logging Parameter:
	Display information for a specific logging parameter. <i>logging-parameter</i> can be disk_filename, disk_filerotate, disk_filesize, disk_priority, disk_status, host_name, host_priority, host_status, and host_vpn_id.

#### **Output Fields**

The output fields are self-explanatory.

#### **Command History**

Release	Modification
14.1	Command introduced.

#### **Example**

#### Edge# show logging

```
System logging to in vpn 0 is disabled
Priority for host logging is set to: info

System logging to disk is enabled
Priority for disk logging is set to: info
File name for disk logging is set to: /var/log/vsyslog
File size for disk logging is set to: 10 MB
File recycle count for disk logging is set to: 10

Syslog facility is set to: local7
```

## **Related Topics**

```
file list, on page 643
file show, on page 644
logging disk, on page 300
logging server, on page 307
show crash, on page 805
```

show log, on page 892

## show logging process

To view messages logged by binary trace for a process or processes, use the **show logging process** command in the privileged EXEC mode.

**show logging process** process-name [ extract-pcap to-file path | [ end timestamp ts ] [ module name ] [ internal ] [ start { last { n { days | hours | minutes | seconds } clear boot } | timestamp ts } [ end { last { n { days | hours | minutes | seconds | clear boot | | timestamp ts | ] ] [ level | | fru | slot ] [ reverse | [ trace-on-failure | metadata ] [ to-file | path ] ] ] **Syntax Description** Shows logs for one or more Cisco SD-WAN processes. You can process-name specify a comma-separated list of processes, for example, fpmd, For the list of Cisco SD-WAN processes for which binary trace is supported see the table 'Supported Cisco SD-WAN Daemons' under 'Usage Guidelines'. extract-pcap to-file path Extracts peap data to a file. end timestamp ts Shows logs up to the specified timestamp. module name Selects logs for specific modules. internal Selects all logs. start{ last  $\{ n \}$  days | hours | minutes | Shows logs collected between the specified start and end times. seconds} | clear | boot} | timestamp ts [end { last { n {days | hours | minutes} | seconds} | clear | boot} | timestamp tslevel level Shows logs for the specified and higher levels. fru slot Shows logs from a specific FRU. reverse Shows logs in reverse chronological order. to-file path Decodes files stored in disk and writes output to file. trace-on-failure Shows the trace on failure summary. metadata Shows metadata for every log message.

**Command Default** 

None

**Command Modes** 

Privileged EXEC

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	Command support introduced for select Cisco SD-WAN processes. See the table 'Supported Cisco SD-WAN Daemons' under 'Usage Guidelines'.

#### **Usage Guidelines**

#### Table 20: Supported Cisco SD-WAN Daemons

Cisco SD-WAN Daemons	Supported from Release
• fpmd	Cisco IOS XE Catalyst SD-WAN Release 17.4.1a
• ftm	
• ompd	
• vdaemon	
• cfgmgr	

#### Example

```

```

## show logging profile sdwan

To view messages logged by binary trace for Cisco-SD-WAN-specific processes and process modules, use the **show logging profile sdwan** command in the privileged EXEC mode. The messages are displayed in chronological order.

show logging profile sdwan

[ extract-pcap to-file path | [ end timestamp ts ] [ module name ] [ internal ] [ start { last { n { days | hours | minutes | seconds } clear boot } | timestamp ts } [ end { last { n { days | hours | minutes | seconds } clear boot } | timestamp ts } ] ] [ level level ] [ fru slot ] [ reverse | [ trace-on-failure | metadata ] [ to-file level ] ]

## **Syntax Description**

extract-pcap to-file path	Extracts peap data to a file.
end timestamp ts	Shows logs up to the specified timestamp.
module name	Selects logs for specific modules.
internal	Selects all logs.
start{ last { n {days   hours   minutes   seconds}   clear   boot}   timestamp ts}[end{ last { n {days   hours   minutes   seconds}   clear   boot}   timestamp ts}]	Shows logs collected between the specified start and end times.
level level	Shows logs for the specified and higher levels.
fru slot	Shows logs from a specific FRU.
reverse	Shows logs in reverse chronological order.
to-file path	Decodes files stored in disk and writes output to file.
trace-on-failure	Shows the trace on failure summary.
metadata	Shows metadata for every log message.

#### **Command Default**

None

#### **Command Modes**

Privileged EXEC

## **Command History**

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	Command support introduced for select Cisco SD-WAN processes. See the table 'Supported Cisco SD-WAN Daemons' under 'Usage Guidelines'.

## **Usage Guidelines**

#### Table 21: Supported Cisco SD-WAN Daemons

Cisco SD-WAN Daemons	Supported from Release
• fpmd	Cisco IOS XE Catalyst SD-WAN Release 17.4.1a
• ftm	
• ompd	
• vdaemon	
• cfgmgr	

The following example shows a truncated output of the **show logging profile sdwan start last boot internal** command. From the timestamps, we can see that the messages are shown in a chronological order.

```
Device# show logging profile sdwan start last boot internal
Logging display requested on 2020/11/18 18:59:16 (UTC) for Hostname: [Device], Model:
[ISR4451-X/K9], Version: [17.04.01], SN: [FOC23125GHG], MD SN: [FGL231432EQ]

## show monitor event-trace sdwan

To display event trace messages for Cisco SD-WAN subsystem components, use the **show monitor event-trace** command in the privileged EXEC mode.

**show monitor event-trace sdwan** [all] *component* { all | back *hour:minute* | clock *hour:minute* | from-boot *seconds* | latest | parameters }

all-traces	(Optional) Displays all event trace messages in memory to the console.
all	Displays all event trace messages currently in memory.
back mmm   hhh:mm }	Specifies how far back from the current time you want to view messages. For example, you can gather messages from the last 30 minutes. The time argument is specified either in minutes or in hours and minutes format (mmm or hh:mm).
clock hh:mm	Displays event trace messages starting from a specific clock time in hours and minutes format (hh:mm).
date	(Optional) Day of the month.
month	(Optional) Displays the month of the year.
from-boot seconds	Displays event trace messages starting from a specified number of seconds after booting (uptime).
latest	Displays only the event trace messages since the last command was entered.

parameters	Displays the trace parameters. The only parameter displayed is the size (number of trace messages) of the trace file.
detail	(Optional) Displays detailed trace information.

#### **Command Modes**

Privileged EXEC

#### **Command History**

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.2.1r	This command was introduced.

#### **Usage Guidelines**

The trace function is not locked while information is being displayed to the console, which means that new trace messages can accumulate in memory. If entries accumulate faster than they can be displayed, some messages can be lost. If this happens, the **show monitor event-trace** command will generate a message indicating that some messages might be lost; however, messages will continue to display on the console. If the number of lost messages is excessive, the **show monitor event-trace** command will stop displaying messages.

#### Example

The following is sample output from the **show monitor event-trace** command for the SD-WAN device. Notice that each trace message is numbered and is followed by a time stamp (derived from the device uptime). Following the time stamp is the component-specific message data.

```
Device# show monitor event-trace sdwan all
*Nov 6 23:30:51.393: <-cfg[2] A: vrf activate IPv4 table 0x3
*Nov 6 23:30:51.754: <-fib[2] A: vrf_activate IPv4 table 0x3

# show multicast replicator

show multicast replicator—List information about multicast replicators (on Cisco vEdge devices only).

#### **Command Syntax**

show multicast replicator [vpn vpn-id]

#### **Syntax Description**

	None:
	List standard information about multicast replicators.
vpn vpn-id	VPN-Specific Replicators:
vpn-id	List only the multicast replicators in the specified VPN.

### **Output Fields**

The output fields are self-explanatory.

#### **Command History**

Release	Modification
14.2	Command introduced.

## **Example**

vEdge# show multicast replicator

	REPLICATOR	REPLICATOR	LOAD
VPN	ADDRESS	STATUS	PERCENT
1	172.16.255.14	UP	_

### **Related Topics**

```

# show multicast rpf

show multicast rpf—List multicast reverse-path forwarding information (on Cisco vEdge devices only).

#### **Command Syntax**

show multicast rpf [vpn vpn-id]

#### **Syntax Description**

	None:
	List standard RPF information.
vpn vpn-id	VPN-Specific RPF Information:
vpn-id	List the RPF information only for the specified VPN.

#### **Output Fields**

The output fields are self-explanatory.

#### **Command History**

Release	Modification
14.2	Command introduced.

#### **Example**

vEdge# show multicast rpf

```
| RPF | RPF
```

# show multicast topology

**show multicast topology**—List information related to the topology of the multicast domain (on Cisco vEdge devices only).

## **Command Syntax**

**show multicast topology** [**vpn** *vpn-id*]

#### **Syntax Description**

	None:
	List standard information related to the topology of the multicast domain.
vpn vpn-id	VPN-Specific Topology Information:
	List multicast topology information only for the specified VPN.

### **Output Fields**

The output fields are self-explanatory.

## **Command History**

Release	Modification
14.2	Command introduced.

### **Example**

vEdge show multicast topology

## show nms-server running

**show nms-server running**—Display whether a vManage NMS server is operational (on vManage NMSs only).

#### **Command Syntax**

show nms-server running

#### **Syntax Description**

None

#### **Output Fields**

The output fields are self-explanatory.

Release	Modification
16.2	Command introduced.

Display the operational status of a vManage server.

```
vManage# show nms-server running nms-server running true
```

## **Related Topics**

request nms-server, on page 694

## show notification stream

**show notification stream**—Display notifications about events that have occurred on the Cisco SD-WAN device.

## **Command Syntax**

**show notification stream viptela** [from date-time] [last number] [to date-time]

#### **Syntax Description**

	None: Display notifications about all events.
to (ccyy-mm-dd   hh:mm:ss   ccyy-mmThh:mm:ss)	Event End Time: Display notifications of events that have occurred up until the specified date and time.
to (ccyy-mm-dd   hh:mm:ss   ccyy-mmThh:mm:ss)	Event Start Time:  Display notifications of events that have occurred up until the specified date and time.
to number	Most Recent Events:  Display the most recent event notifications up to the specified number of events.

## **Output Fields**

The output fields are self-explanatory.

Release	Modification
14.1	Command introduced.

```

## show ntp associations

**show ntp associations**—Display information about the status connections to peers.

#### **Command Syntax**

show ntp associations

#### **Syntax Description**

None

## **Output Fields**

The output fields are self-explanatory.

## **Command History**

Release	Modification
14.1	Command introduced.

#### **Example**

vEdge# show ntp associations

IDX	ASSOCID	STATUS	CONF	REACHABILITY	AUTH	CONDITION	LAST EVENT	COUNT
1	18402	80a3	yes	no	none	reject	unreachable	10
2	18403	967a	yes	yes	none	sys.peer	sys_peer	7

## **Related Topics**

ntp, on page 358 show ntp peer, on page 907

# show ntp peer

**show ntp peer**—Display information about the NTP peers with which the Cisco SD-WAN software is synchronizing its clocks.

## **Command Syntax**

show ntp peer [index] [parameter]

## **Syntax Description**

	None:					
	Display standard information about the interfaces on the Cisco SD-WAN device.					
parameter	Specific Parameter:					
	Display information about a specific NTP parameter. <i>parameter</i> can be one of the following: <b>delay</b> , <b>jitter</b> , <b>offset</b> , <b>poll</b> , <b>reach</b> , <b>refif</b> , <b>remote</b> , <b>st</b> , <b>type</b> , and <b>when</b> .					
index	Specific Peer:					
	Display information about a specific peer, identified by its index number in the <b>show ntp peer</b> command output.					

## **Output Fields**

The output fields are self-explanatory.

Release	Modification
14.1	Command introduced.

#### **Example**

vEdge#	show	ntp	peer	
--------	------	-----	------	--

INDEX	REMOTE	REFID	ST	TYPE	WHEN	POLL	REACH	DELAY	OFFSET	JITTER	
1	107 107 1 0										
_	127.127.1.0			_			•				
2	*98.191.213.7	18.26.4.105	2	u	113	1024	377	140.919	-4.328	13.535	

## **Related Topics**

ntp, on page 358

show ntp associations, on page 906

# show omp cloudexpress

**show omp cloudexpress**—Display OMP routes for applications configured with Cloud OnRamp for SaaS (formerly called CloudExpress service) (on Cisco vEdge devices only).

### **Command Syntax**

show omp cloudexpress [detail]

#### **Syntax Description**

	None:	
	Display OMP routes for all applications in all VPNs configured with Cloud OnRamp for SaaS.	
detail	Detailed Information:	
	List detailed information.	

## **Output Fields**

The output fields are self-explanatory.

Release	Modification
16.3	Command introduced.
Cisco SD-WAN Release 20.7.1	Added APP TYPE and SUBAPP ID columns to the command output.

The following example shows the command output as it appears beginning with Cisco SD-WAN Release 20.7.1.

```
vEdge#show omp cloudexpress
Code:
C -> chosen
I -> installed
Red -> redistributed
Rej -> rejected
L -> looped
R -> resolved
S -> stale
Ext -> extranet
Inv -> invalid
              APP APP SUBAPP
             ID TYPE ID APP NAME FROM PEER
VPN ORIGINATOR
                                              STATUS
______
  172.16.255.15 3 2 0 amazon aws 172.16.255.15 C,R
                            172.16.255.20 C,R
  172.16.255.16 3 0 0 amazon_aws 172.16.255.16 C,R
                                 172.16.255.20 C,R
```

The following example shows the command output as it appears for releases before Cisco SD-WAN Release 20.7.1.

```
vEdge#show omp cloudexpress
Code:
C -> chosen
I -> installed
Red -> redistributed
Rej -> rejected
L -> looped
R -> resolved

# show omp multicast-auto-discover

**show omp multicast-auto-discover**—List the peers that support multicast (on Cisco vEdge devices and vSmart controllers only).

# **Command Syntax**

show omp multicast-auto-discover [detail]

 $show\ omp\ multicast-auto-discover\ [detail]\ [family\ ipv4]\ [entries\ advertised\ {\it destination-peer-address}]$ 

 $show\ omp\ multicast-auto-discover\ [detail]\ [family\ ipv4]\ [entries\ received\ source-peer-address]\ [loss-reason\ reason\ |\ status\ status\ ]$ 

# **Syntax Description**

family ipv4 entries advertised [destination-peer-address]	None: List standard information about the PIM IPsec tunnels.  Advertised Multicast Sources: List the multicast sources advertised.
detail	Detailed Information: List detailed information.
family ipv4 entries received source-peer-address [loss-reason reason   status status]	Received Multicast Sources  List the multicast sources received.  Include the loss-reason option to list specific reasons for losses of multicast sources. reason can be distance, invalid, none, omp-version, origin-metric, origin-protocol, origin-protocol-subtype, peer-id, personality, preference, site-id, stale-entry, tloc-id, and tloc-preference.  Include the status option to list specific route-table status. status can be C (for chosen), Ext (for extranet), I (for installed), Inv (for invalid), L (for
	(for chosen), <b>Ext</b> (for extranet), <b>I</b> (for installed), <b>Inv</b> (for invalid), <b>L</b> (fo looped), <b>R</b> (for resolved), <b>Red</b> (for redistributed), <b>Rej</b> (for rejected), <b>S</b> (for stale), and <b>U</b> (for unknown).

# **Output Fields**

The output fields are self-explanatory.

# **Command History**

Release	Modification
14.2	Command introduced.

#### **Example**

```
vEdge# show omp multicast-auto-discover
Code:
C   -> chosen
I   -> installed
Red   -> redistributed
Rej   -> rejected
L   -> looped
R   -> resolved
```

```
S -> stale
Ext -> extranet
Inv -> invalid
```

# **Related Topics**

show omp multicast-auto-discover, on page 909 show multicast topology, on page 902

# show omp peers

**show omp peers**—Display information about the OMP peering sessions that are active on the local vSmart controller or Cisco vEdge device.

# **Command Syntax**

show omp peers [detail]

show omp peers ip-address [detail]

# **Syntax Description**

	None:
	List information about all OMP peering sessions on the local device.
detail	Detailed information:
	Display detailed information.
ip-address	Specific OMP Peer:
	Display configuration OMP peering session information about a specific peer.

# **Output Fields**

Field	Explanation
Domain ID	Identifier of the domain that the device is a member of.
downcount	Number of times an OMP peering session has gone down.
last-downtime	The last time that an OMP peering session went down.
last-uptime	The last time that an OMP peering session came up.
Peer or peer	IP address of the connected Cisco SD-WAN device.
Region ID	Region assigned for Hierarchical SD-WAN.
	When you use the command on a device, this is the region to which the device is assigned.
	When you use the command on a Cisco SD-WAN Controller, this shows the region(s) that the Cisco SD-WAN Controller is managing.
	For information, see Hierarchical SD-WAN.
R/I/S	Number of routes received, installed, and sent over the OMP session.
routes-installed	Number of routes installed over the OMP session.
routes-received	Number of routes received over the OMP session.
routes-sent	Number of routes sent over the OMP session.
services-installed	Number of services installed that were learned over OMP sessions.
services-received	Number of services received over OMP sessions.
services-sent	Number of services advertised over OMP sessions.
Site ID	Identifier of the Cisco SD-WAN administrative site where the connected Cisco SD-WAN device is located.
state	Operational state of the connection to the Cisco SD-WAN device:
	• down—The connection is not functioning.
	• down-in-gr—A connection on which OMP grace restart is enabled is down.
	init—The connection is initializing.
	up—The connection is operating.

Field	Explanation
tlocs-installed	Number of TLOCs installed that were learned over OMP sessions.
tlocs-received	Number of TLOCs received over OMP sessions.
tlocs-sent	Number of TLOCs advertised over OMP sessions.
Type or type	Type of Cisco SD-WAN device:
	vEdge - Cisco vEdge device
	vsmart - vSmart controller
upcount	Number of times an OMP peering session has come up.
Uptime	How long the OMP session between the Cisco SD-WAN devices has been up and operational.

# **Command History**

Release	Modification
14.1	Command introduced.
14.3	Down-in-gr stated added.
Cisco SD-WAN Release 20.6.1	Added Region ID to output.

# show omp routes

To display information about OMP routes on Cisco Catalyst SD-WAN Controllers and Cisco vEdge devices only, use the **show omp routes** command. OMP routes carry information that the learns from the routing protocols running on its local network including routes learned from BGP and OSPF as well direct, connected, and static routes.

# **Command Syntax**

show omp routes [ ipv4 prefix IP / length ] [ family family-address ] [ vpn vpn-id ] [ advertised ] [ received ] [ detail ]

# **Syntax Description**

	None:
	Lists routing information about all OMP peering sessions on the local device.
ipv4 prefix	Displays the route prefix.
	Lists OMP route information for the specified route prefix.
IP	Displays IP address of the specific route.
	Lists OMP IP address for the specific route.
length	Displays the route length.
detail	Detailed information:
	Lists detailed route information about OMP peering sessions on the local device.
family family	Family:
address	Lists OMP route information for the specified IP family. <i>family address</i> can be <i>ipv4</i> or <i>ipv6</i> .
vpn vpn-id	VPN-Specific Routes:
	Lists the OMP routes for the specified VPN.
received	Received Servers:
	Displays the services received by OMP peering sessions.
advertised	Advertised Servers:
	Displays the services advertised by OMP peering sessions.

# **Command History**

Release	Modification
14.1	Command introduced.
Cisco SD-WAN Release 20.7.1	advertised and received are added in this release.
Cisco SD-WAN Release 20.7.1	Added <b>REGION ID</b> to the output to show the Hierarchical SD-WAN region ID.
Cisco SD-WAN Release 20.8.1	Added <b>PREFERENCE</b> and <b>AFFINITY GROUP NUMBER</b> to the output to indicate the affinity group preference order and the affinity ID.

# **Examples**

The following is a sample output from the **show omp routes** command:

```
vEdge# show omp routes

# show omp services

**show omp services**—Display the services learned from OMP peering sessions (on vSmart controllers and Cisco vEdge devices only).

# **Command Syntax**

show omp services [vpn vpn-id] [detail]

show omp services [advertised | received] [vpn vpn-id] [detail] show omp services [vpn vpn-id] originator ip-address [advertised | received] [detail] show omp services [vpn vpn-id] service service-name [advertised | received] [detail]

# **Syntax Description**

	None:
	List information about the services learned from OMP peering sessions.
advertised	Advertised Services:
	List information about the services advertised by OMP peering sessions.
detail	Detailed Information:
	Display detailed information.
received	Received Services:
	List information about the services received by OMP peering sessions.
originator	Service Originator:
ip-address	List the services learned from a specific OMP peer.
service service-name	Specific Service:
	List information about the specific service.
vpn vpn-id	VPN:
	List OMP service information learned from a specific VPN.

# **Output Fields**

The output fields are self-explanatory.

# **Command History**

Release	Modification
14.1	Command introduced.

# show omp summary

**show omp summary**—Display information about the OMP sessions running between vSmart controllers and Cisco vEdge devices (on vSmart controllers and Cisco vEdge devices only).

# **Command Syntax**

**show omp summary** [parameter-name]

# **Syntax Description**

	None:		
	List information about the OMP peering sessions running on the local device		
parameter-name	Information about a Specific Parameter:		
	Display configuration information about a specific OMP peering session parameter. parameter-name can be one of the following: adminstate, devicetype, ompdowntime, ompuptime, operstate, peers, routes-installed, routes-received, routes-sent, services-installed, services-sent, tlocs-installed, tlocs-received, tlocs-sent, and vsmart-peers. For an explanation of these parameters, see the Output Fields below.		

# **Output Fields**

Field	Explanation
admin-state	Administrative state of the OMP session. It can be UP or DOWN.
omp-uptime	How long the OMP session has been up and operational.
oper-state	Operational status of the OMP session. It can be UP or DOWN.

Field	Explanation
personality	Cisco vEdge device personality.
routes-installed	Number of routes installed over the OMP session.
routes-received	Number of routes received over the OMP session.
routes-sent	Number of routes sent over the OMP session.
services-installed	Number of services installed that were learned over OMP sessions.
services-received	Number of services received over OMP sessions.
services-sent	Number of services advertised over OMP sessions.
tlocs-installed	Number of TLOCs installed that were learned over OMP sessions.
tlocs-received	Number of TLOCs received over OMP sessions.
tlocs-sent	Number of TLOCs advertised over OMP sessions.
vsmart-peers	Number of vSmart peers that are up.

# show omp tlocs

To display information learned from the TLOC routes advertised over the OMP sessions running between and Cisco Catalyst SD-WAN Controllers and Cisco vEdge devices only, use the **show omp tlocs** command in privileged EXEC mode.

# **Command Syntax**

show omp tlocs [detail] [color lte] [encap ipsec] [ip ip-address] [advertised] [received]

# **Syntax Description**

	None:
	Lists information about all TLOCs that the local device has learned about.
detail	Detailed information:
	Displays the detailed information.
color lte	Color Information:
	Displays the TLOC color information.
encap ipsec	TLOC Encapsulation:
	Displays the TLOC encapsulation information.
ip	TLOC IP Address:
ip-address	Displays the TLOC IP address.
received	Received Servers:
	Displays the services received by OMP peering sessions.
advertised	Advertised Servers:
	Displays the services advertised by OMP peering sessions.

# **Command History**

Release	Modification
14.1	Command introduced.
16.3	Add display of IPv6 information.
Cisco SD-WAN Release 20.7.1	advertised and received are added in this release.

# **Examples**

The following is a sample output from the **show omp tlocs** command:

```
vEdge# show omp tlocs

# show omp verify-routes

To verify if a route prefix is available, use the **show omp verify-routes** command in privileged EXEC mode.

show omp verify-routes vpn vpn-id prefix/length

# **Syntax Description**

vpn	Lists the Overlay Management Protocol (OMP) routes for the specified VPN.
vpn-id	Specifies the VPN ID to be verified.
prefix/length	Specifies route prefix and length.
	Lists OMP route information for the specified route prefix.

#### **Command Default**

This command has no default behavior.

# **Command Modes**

Privileged EXEC (#)

# **Command History**

Release	Modification
Cisco SD-WAN Release 20.8.1	This command was introduced.

# **Usage Guidelines**

This command helps to reduce the number of steps needed for troubleshooting an OMP prefix by verifying the received and installed RIB and FIB entries, corresponding TLOCs, and BFD sessions.

#### **Examples**

The following is a sample output from the **show omp verify-routes** command displaying a prefix table with the prefix's verification details:

```
Device# show omp verify-routes vpn 1 10.2.2.0/24
Codes Route/TLOC Status:
C
   -> chosen
    -> installed
Red -> redistributed
Rej -> rejected
    -> looped
R
    -> resolved
    -> stale
S

Table 22: show omp verify-routes Field Descriptions

Field	Description
FROM PEER	Displays the IP address of the peer from which the route is received.
PATH ID	Displays the ID of the OMP path.
LABEL	Displays the service label.
STATUS	Displays the status information codes of routes.
ATTRIBUTE TYPE	Displays the attribute type information regarding the route installation in RIB.
TLOC IP	Displays the TLOC IP address.
TLOC COLOR	Displays the TLOC color information.
TLOC ENCAP	Displays the TLOC encapsulation information.
TLOC STATUS	Displays the status information codes of TLOC.
PREFERENCE	Displays the preference information of TLOC.
BFD STATUS	Displays the connectivity status of a BFD session of a route.
RIB STATUS	Displays the code information of routes installed in RIB.

# show orchestrator connections

**show orchestrator connections**—List the Cisco SD-WAN devices that have active DTLS connections to the vBond orchestrator (on vBond orchestrators only).

# **Command Syntax**

show orchestrator connections [vsmart [site-id]] [detail]

#### **Syntax Description**

	None:
	List information about all the Cisco SD-WAN devices that have active DTLS connections to the vBond orchestrator.
vsmart	Connections to vSmart Controllers:
[site-id]	List information about the vSmart controllers that have active DTLS connections to the vBond orchestrator or about a vSmart controller at a specific site in the Cisco SD-WAN network.
detail	Detailed Information:
	Display information about the vBond connections and about the handshaking packets that are exchanged when a connection is being established, maintained, and torn down.

# **Output Fields**

For the State columen, the operational state can be one of the following: challenge_ack, challenge_resp, connect, down, handshake, tear_down, trying, and up.

The remaining output fields are self-explanatory.

# **Command History**

Release	Modification
14.1	Command introduced.

# **Examples**

# **Example 1**

# show orchestrator connections-history

**show orchestrator connections-history**—List the history of connections and connection attempts made by the vBond orchestrator (on vBond orchestrators only).

# **Command Syntax**

show orchestrator connections-history [index] [detail]

show orchestrator connections-history connection-parameter [detail]

# **Syntax Description**

	None: List the history of connections and connection attempts between Cisco vEdge devices and the vBond orchestrator.
detail	Detailed Output:  List detailed connection history information and information about the handshaking packets that are exchanged when a connection is being established, maintained, and torn down.
connection-parameter	Specific Connection Parameter:  List the connection history only for those items match the connection parameter.  connection-parameter can be one of the following: domain-id, peer-type, private-ip, private-port, public-ip, public-port, site-id, and system-ip. These values corresponds to the column headers in the output of the show orchestrator connections-history command.
index	Specific History Item: List the connection history only for the specific item in the history list.

# **Output Fields**

Field	Explanation
Domain ID	Administrative state of the interface:
	state-down—The interface has not been configured.
	state-up—The interface has been configured.
Index	Index counter of the connection operation. The initial operation has an index of 0. The newest operation is listed first.

Field	Explanation
Peer Type	Type of Cisco SD-WAN device:
	vmanage—vManage management configuration system.
	vsmart—vSmart controller.
Private IP	Private IP address of the connected Cisco SD-WAN device. If the Cisco SD-WAN device is behind a NAT device, the private and public IP addresses are different.
Private Port	Private UDP port number used to connect to the vBond orchestrator. If the Cisco SD-WAN device is behind a NAT device, the private and public UDP port numbers are likely different.
Public IP	Public IP address of the connected Cisco SD-WAN device.
Public Port	Public UDP port number used to connect to the vBond orchestrator.
Site ID	Identifier of the Cisco SD-WAN administrative site where the connected Cisco SD-WAN device is located.
State	Operational state of the connection to the Cisco SD-WAN device. It can be one of the following: challenge, challenge_ack, challenge_resp, connect, down, handshake, tear_down, trying, and up.
System IP	System IP address of the Cisco SD-WAN device.
Uptime	How long the connection between the Cisco SD-WAN device and the vBond orchestrator has been up and operational.

# **Command History**

Release	Modification
14.1	Command introduced.

Legend for Errors

BDSGVERFL - Board ID signature verify failure

ORPTMO - Remote client peer timeout

BIDNTPR - Board ID not initialized	RMGSPR - Remove global saved peer					
BIDNTVRFD - Peer board ID certificate not verified	RXTRDWN - Received teardown					
CRTREJSER - Challenge response rejected by peer	RDSIGFBD - Read signature from board ID failed					
CRTVERFL - Fail to verify peer certificate	SSLNFAIL - Failure to create new SSL context					
CTORGNMMIS - Certificate organization name mismatch	SERNTPRES - Serial number not present					
DCONFAIL - DTLS connection failure	TMRALC - Memory failure					
DEVALC - Device memory allocation failures	TUNALC - Memory failure					
DHSTMO - DTLS handshake timeout	UNMSGBDRG - Unknown message type or bad register message					
DISCVBD - Disconnect vBond after register reply	UNAUTHEL - Recd hello from unauthenticated peer					
DISTLOC - TLOC disabled	VBDEST - vDaemon process terminated					
DUPSER - Duplicate serial number	VECRTREV - vEdge certification revoked					
<pre>IP_TOS - Socket options failure</pre>	VSCRTREV - vSmart certificate revoked					
LISFD - Listener socket FD error	VB_TMO - Peer vBond timed out					
MEMALCFL - Memory allocation failure	VM_TMO - Peer vManage timed out					
NOACTVB - No active vBond found to connect to	<pre>VP_TMO - Peer vEdge timed out</pre>					
NOERR - No error	VS_TMO - Peer vSmart timed out					
NOSLPRCRT - Unable to get peer's certificate	XTVSTRDN - Extra vSmart teardown

# show orchestrator summary

**show orchestrator summary**—Display a count of the Cisco vEdge devices, vManage Network Management Systems (NMSs), and vSmart controllers in the overlay network (on vBond orchestrators only). For vBond orchestrators running on virtual machines (VMs) that have more than one core, this command shows the number of devices that each vdaemon process is handling.

# **Command Syntax**

**show orchestrator summary** [instance]

# **Syntax Description**

	None:
	Display a count of all the Cisco vEdge devices, vManage NMSs, and vSmart controllers in the overlay network.
instance	Devices for a Specific vdaemon Process:
	Display a count of devices for a specific instance of a vdaemon process. Cisco SD-WAN devices that run on VMs that have more than one core automatically spawn one vdaemon process for each core, to load-balance the Cisco SD-WAN software functions across all the CPUs in the VM server.

# **Output Fields**

The output fields are self-explanatory.

#### **Command History**

Release	Modification
14.1	Command introduced.
15.4	Add support for multiple vdaemon processes.
16.3	Add support for IPv6.

# **Example**

vBond# show orchestrator summary

INSTANCE	VMANAGE COUNTS			PROTOCOL	LISTENING IP	LISTENING IPV6	LISTENING PORT
0	2	4	0	dtls	10.1.14.14	::	12346

# **Related Topics**

show control summary, on page 803 show orchestrator connections, on page 932

# show orchestrator valid-vedges

**show orchestrator valid-vedges**—List the chassis numbers of the valid Cisco vEdge devices in the overlay network (on vBond orchestrators only).

#### **Command Syntax**

show orchestrator valid-vedges

#### **Syntax Description**

None

# **Output Fields**

The output fields are self-explanatory.

#### **Command History**

Release	Modification
14.1	Command introduced.
14.2	Command renamed from show orchestrator valid-devices.

#### **Example**

vBond# show orchestrator valid-vedges

CHASSIS NUMBER	SERIAL NUMBER	VALIDITY
110D113140004	10000266	valid
110D115140004 110D145130082	10000200	staging
110D252130046	100001FF	valid
110D252130049	1000020B	valid
110D252130057	1000020C	staging
R260C126140004	10000369	valid

#### **Related Topics**

# show orchestrator valid-vmanage-id

**show orchestrator valid-vmanage-id**—List the chassis numbers of the valid vManage NMSs in the overlay network (on vBond orchestrators only).

# **Command Syntax**

**show orchestrator valid-vmanage-id** [serial-number]

# **Syntax Description**

	None:
	Display the chassis numbers of all valid vManage NMSs in the overlay network.
serial-number	Serial Number:
	List whether a specific vManage chassis number is valid.

# **Output Fields**

The output fields are self-explanatory.

#### **Command History**

Release	Modification
16.3.1	Command introduced.

# **Example**

vBond# show orchestrator valid-vmanage-id

# **Related Topics**

```

# show ospf database

**show ospf database**—List the entries in the OSPF Link-State Advertisement (LSA) database (on Cisco vEdge devices only).

# **Command Syntax**

**show ospf database** [**vpn** *vpn-id*] [*ospf-parameter*] [**detail**]

# **Syntax Description**

	None:
	List all the entries in the OSPF LSA database.
detail	Detailed Information:
	List detailed information about the entries in the OSPF LSA database.
ospf-parameter	Specific OSPF Property:
	List information about a specific OSPF property. <i>ospf-property</i> can be one of the following: adv-route, area, area-local-opaque, as-external-opaque, asbr-summary, external, group-member, link-id, link-local-opaque, network, nssa-external, router, summary, and type-ext-attributes.
vpn vpn-id	VPN-Specific Routes
	List the OSPF routing process information for the specified VPN.

# **Output Fields**

The output fields are self-explanatory.

# **Command History**

Release	Modification
14.1	Command introduced.

# **Example**

# Example 1

# show ospf database-summary

**show ospf database-summary**—List how many of each type of LSA is present in the OSPF database, along with the total number of LSAs in the database (on Cisco vEdge devices only).

# **Command Syntax**

show ospf database-summary [vpn vpn-id] [ospf-lsa]

### **Syntax Description**

	None:
	List a summary of all the LSAs in the OSPF LSA database.
ospf-lsa	Specific OSPF LSA Type:
	List information about a specific OSPF LSA. <i>ospf-lsa</i> can be one of the following: <b>as-external-lsa</b> , <b>network-lsa</b> , <b>nssa-lsa</b> , <b>router-lsa</b> , <b>summary-lsa</b> , and <b>total-lsa</b> .

vpn	VPN-Specific Routes
vpn-id	List the OSPF routing process information for the specified VPN.

### **Output Fields**

The output fields are self-explanatory.

# **Command History**

Release	Modification
14.1	Command introduced.

### **Example**

vEdge# show ospf database-summary

					AS		
		ROUTER	NETWORK	SUMMARY	EXTERNAL	NSSA	TOTAL

# show ospf routes

Display the entries that the route table has learned from OSPF (on vEdge routers only).

**show ospf routes** [detail] [prefix/length] [vpn vpn-id]show ospf routes vpn vpn-id [route-type [prefix/length]]

# **Syntax Description**

None	List standard information about the entries the route table has learned from OSPF.
Detailed Information	<b>detail</b> List detailed information about the entries the route table has learned from OSPF.
Route Prefix	prefix/length prefix vpn vpn-id List route information for the specified route prefix learned from OSPF. If you omit the prefix length, you must specify a VPN identifier so that the Cisco SD-WAN software can find the route that best matches the prefix.

Specific OSPF Route Type	route-type [prefix/length] List the information about entries for specific OSPF route types and optionally learned from the specified IP prefix. For a list of route types, see the Output Fields table below.	
VPN-Specific Routes	<b>vpn</b> <i>vpn- id</i> List only the route table entries for the specified VPN.

# show packet-capture

To view details of the packets captured, use the **show packet-capture** command in privileged EXEC mode.

**show packet-capture** [ **details** [ **interface** *interface-name* | **packets-captured** *packets* | **session-id** *session-id* | **vpn** *vpn-id* ] ]

## **Syntax Description**

interface interface-name	(Optional) Name of the interface.
packets-captured packets	(Optional) Number of packets.
session-id session-id	(Optional) Session ID.
vpn vpn-id	(Optional) VPN ID.

# **Command Default**

This command has no default behavior.

# **Command Modes**

Privileged EXEC (#)

## **Command History**

Release	Modification
Cisco SD-WAN Release 20.6.1	This command was introduced.

# **Example**

Following is a sample output from the **show packet-capture** command using the keyword **details**.

```
Device# show packet-capture details
SESSION PACKETS
VPN INTERFACE ID CAPTURED STATE
```

1 ipsec1 s123 59 Running

# show packet-trace

To view detailed packet tracer statistics for the specified trace ID or summary statistics for all the filtered packets, up to 1024 records, use the **show packet-trace** command in privileged EXEC mode.

show packet-trace [details trace-id] [statistics [trace-id | decision string | destination-ip ip-address | destination-interface | interface | destination-port | duration seconds | source-interface | sou

## **Syntax Description**

details trace-id	(Optional) Displays packet trace details for the specified trace ID.
statistics	(Optional) Displays packet trace statistics for the parameter specified.
trace-id	(Optional) Displays packet statistics for the specified trace-id. Range: 0 to 1023.
decision string	(Optional) Displays packet drop/forward information.
destination-ip ip-address	(Optional) Displays packet trace statistics for the specified destination IPv4 address.
destination-interface interface	(Optional) Displays statistics for the specified destination-interface.
destination-port port	(Optional) Displays packet trace statistics for the specified destination port. Range: 0 to 65535.
duration seconds	(Optional) Displays packet trace statistics for the specified duration in μsecs.
source-interface interface	(Optional) Displays packet trace statistics for the specified source interface.
source-ip ip-address	(Optional) Displays packet trace statistics for the specified source IPv4 address.
source-port port	(Optional) Displays packet trace statistics for the specified source port. Range: 0 to 65535.

#### **Command Default**

None

## **Command Modes**

Privileged EXEC (#)

# **Command History**

Release	Modification
Cisco SD-WAN Release 20.5.1	This command was introduced.

# **Example**

This is the sample output for the show packet-trace details command, which is displayed for the specified trace ID 10.

Device# show packet-trace details 10

Pkt-id	src_	_ip	(in	gre	ss_	if)		de	est_	_ip	(egi	ress	s_i:	E)		Dui	rati	ion		De	ecis	sion	า

# show platform resources

#### **Table 23: Feature History**

Feature Name	Release Information	Description
Crypto Utilization in Show Platform Resources Command		This feature adds information about crypto utilization to the <b>show platform resources</b> command on the supported routers.

To monitor system resources, including crypto utilization, use the **show platform resources** command in privileged EXEC mode.

## show platform resources

# **Syntax Description**

This command has no arguments or keywords.

### **Command Default**

No default behavior or values.

### **Command Modes**

Privileged EXEC

# **Command History**

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	The command is modified. The command output is enhanced to include crypto-utilization information on the supported routers.

# **Usage Guidelines**

Crypto utilization is displayed only for the following supported routers:

- Cisco ASR 1000-ESP100 CN6870 (15-13063-01)
- Cisco ASR 1000-ESP200 2x CN6880 (15-13062-01)
- Cisco ASR 1001-X CN6645 (15-14203-01)
- Cisco ASR 1002-X CN6335 (15-13267-01)
- Cisco ASR 1001-HX CN6870-800 (15-13063-01)
- Cisco ASR 1002-HX CN6880-1200 (15-13062-01)
- Cisco ASR1000-ESP100-X
- · Cisco ASR 1000-ESP200-X
- Cisco Catalyst 8500-12X
- Cisco Catalyst 8500-12X4QC

Note

Some of the supported routers above have a "- CN6XXX" designation trailing the Cisco product name, indicating the part number of the particular Cavium/Marvell network processor used.

The following is a sample output from the **show platform resources** command that is run on a Cisco ASR 1000 Series router:

### # show platform resources

**State Acronym: H - Healthy, W - Warning, C - Critical

# show policer

Display information about the policers that are in effect (on vEdge routers only).

**show policer** [burst bytes] [oos-action action] [oos-pkts number] [rate bps]

# **Syntax Description**

None	Display information about all policers.	
Specific Burst Size	<b>burst</b> bytes Display information about policers that match the specified burst size. Range: 0 through 2 ⁶⁴ – 1 bytes	
Specific Out-of-Specification Action	oos-action action Display information about policers that match the specified OOS action. A policed packet is out of specification when the policer does not allow it to pass. Depending on the policer configuration, these packets are either dropped or they are remarked, which sets the packet loss priority (PLP) value on the egress interface to high. Action: drop, remark	
Specific Out-of-Specification Packet Count	oos-pkts <i>number</i> Display information about policers that match the specified OOS packet count. <i>Range:</i> 0 through $2^{64} - 1$	
Specific Bandwidth	<b>rate</b> <i>bps</i> Display information about policers that match the specified bandwidth. <i>Range:</i> 0 through $2^{64} - 1$ bps	

# **Command History**

Release	Modification
14.1.	Command introduced.
16.3	Added burst, oos-action, oos-pkts, and rate options.

# **Examples**

Display the policers that are in effect on the router:

### Show policer

```
        vEdge# show policer

        NAME
        INDEX
        DIRECTION
        RATE
        BURST
        ACTION
        PKTS

        ge0_0_llq
        10
        out
        20000000000
        15000
        drop
        0

        ge0_3_llq
        11
        out
        20000000000
        15000
        drop
        0
```

# **Related Topics**

```
clear policer statistics, on page 619

```

# show policy access-list-policers

Display information about the policers configured in IPv4 access lists (on vEdge routers only). show policy access-list-policers

### **Syntax Description**

None

## **Command History**

Release	Modification	
14.1	Command introduced.	
16.2.5	Add the policy sequence number to the policer name.	

# **Example**

Display a list of policers configured in access lists. This output shows that the policer named "p1_police" was applied in sequence 10 in the access list "acl_p1" in sequences 10, 20, and 30 in the "acl_plp" access list.

#### vEdge# show policy access-list-policers

NAME	POLICER NAME	OOS PACKETS
acl_p1 acl_plp	10.p1_police 10.p1_police 20.p1_police 30.p2_police	0

## **Related Topics**

```
clear policer statistics, on page 619
show ipv6 policy access-list-policers, on page 887
show policer, on page 965
```

# show policy data-policy-filter

Display information about data policy filters for configured counters and policers, and for out-of-sequence packets (on vEdge routers only).

show policy data-policy-filter

### **Syntax Description**

None

# **Command History**

Release	Modification
14.1	Command introduced.
16.2.5	Add the policy sequence number to the policer name
17.1	Add out-of-specification bytes (OOS Btytes) column to command output.

## **Examples**

## Example 1

Display the number of packets and bytes for four configured data policy counters:

```
v \\ \texttt{Smart} \\ \# \\ \\ \textbf{show running-config policy data-policy} \\
```

```
policy
 data-policy Local-City-Branch
   vpn-list-Guest-VPN
    sequence 10
     action accetp
       count Guest-Wifi-Traffic
       cflod
    default-action accept
  vpn-list Service-VPN
   sequence 10
     match
       destination-data-prefix-list Business-Prefixes
       destination-port 80
     action accept
       count Business-Traffic
        cflowd
    sequence 20
     match
       destination-port 10090
       protocol 6
     action accept
       count Other-Branch-Traffic
        cflowd
```

```
sequence 30
action accept
count Misc-Traffic
cflowd
!
default-action accept
!
```

#### vEdge# show policy data-policy-filter

NAME	NAME	COUNTER NAME	PACKETS	BYTES	NAME	PACKETS	BYTES
Local-City-Branch		Business-Traffic Other-Branch-Traffic	92436 1663339139	12422330320 7082643 163093277861 5118593007			

## Example 2

Display packet information for policers. This output shows that the policer named "police" was applied in sequences 10, 20, and 30 in the data policy "dp1" and in sequence 10 in the "dp2" data policy.

### vEdge# show policy data-policy-filter

NAME	NAME	COUNTER NAME	PACKETS	BYTES	POLICER NAME	OOS PACKETS	OOS BYTES
dp1	vpn_1_list	police_count police count20	0	0	10.police	0	
		police_counce	O	0	-	0	
					30.police	0	
dp2	vpn 1 list				10.police	0	

# Example 3

For a data policy that includes a policer, display the policers:

#### vEdge# show policy from-vsmart

```
from-vsmart data-policy dp1
direction from-service
vpn-list vpn 1 list
 sequence 10
  match
   protocol 1
  action accept
   count police count
   set
    policer police
  sequence 20
  action accept
   count police_count20
    policer police
  sequence 30
  action accept
   set
    policer police
  default-action accept
from-vsmart policer police
 rate 10000000
burst 1000000
```

```
exceed remark
from-vsmart lists vpn-list vpn_1_list
vpn 1
```

vEdge# show policy data-policy-filter

NAME	NAME	COUNTER NAME	PACKETS	BYTES	POLICER NAME	OOS PACKETS	OOS BYTES
dp1	vpn_1_list	police_count police_count20	0	0	10.police 20.police 30.police	0

Table 25: show policy ef-stats Field Descriptions

Field	Description
CORE NUM	Core Number
EF NUM	Number of elephant flows identified at present.
CUSTOM MATCH	Number of elephant flows identified at present because of a matched sequence.
CUR CPU USAGE	Current CPU usage.

# show policy from-vsmart

Display a centralized data policy, an application-aware policy, or a cflowd policy that a vSmart controller has pushed to the vEdge router (on vEdge routers only). The vSmart controller pushes the policy via OMP after it has been configured and activated on the controller.

### show policy from-vsmart

show policy from-vsmart [app-route-policy] [cflowd-template [template-option]] [data-policy] [lists (data-prefix-list | vpn-list)] [policer] [sla-class]

# **Syntax Description**

None	None: Display all the data policies that the vSmart controller has pushed to the vEdge router.
app-route-policy	Application Route Policies: Display only the application-aware routing policies that the vSmart controller has pushed to the vEdge router.
cflowd-template [template-option]	cflowd Templates: Display only the cflowd template information that that vSmart controller has pushed to the vEdge router.
	template-option can be one of collector, flow-active-timeout, flow-inactive-timeout, and template-refresh.
data-policy	Data Policies: Display only the data policies that the vSmart controller has pushed to the vEdge router.

lists (data-prefix-list   vpn-list)	Lists: Display only the policy-related lists that the vSmart controller has pushed to the vEdge router.
policer	Policers: Display only the policers that the vSmart controller has pushed to the vEdge router.
sla-class	SLA Classes: Display only the SLA classes for application-aware routing that the vSmart controller has pushed to the vEdge router.

## **Command History**

Release	Modification
14.1	Command introduced.
14.2	Command renamed from show omp data-policy to show policy from-vsmart.
14.3	cflowd-template option added.

# **Examples**

# Example 1

```

# show policy qos-map-info

Display information about the QoS maps are applied to each interface (on vEdge routers only). **show policy qos-map-info** [map-name]

### **Syntax Description**

None	Display information for all QoS maps.
[map-name]	Specific Map: Display information for a specific QoS map.

## **Command History**

Release	Modification
14.1	Command introduced.

# **Example**

# 

## **Related Topics**

show policy qos-scheduler-info, on page 976

# show policy qos-scheduler-info

Display information about the configured QoS schedulers and the associated QoS map (on vEdge routers only).

**show policy qos-scheduler-info** [scheduler-name]

## **Syntax Description**

None	Display information for all configured QoS schedulers.
scheduler-name	Specific Scheduler: Display information for a specific QoS scheduler.

# **Command History**

Release	Modification
14.1	Command introduced.

### **Example**

vEdge# show policy QOS SCHEDULER NAME	qos-schedule BANDWIDTH PERCENT	er-info BUFFER PERCENT	QUEUE	QOS MAP NAME
VOICE DEFAULT BULK-DATA NETWORK-CONTROL STREAMING-VIDEO VOICE-SIGNALLING BUSINESS-CRITICAL	50 12 5 3 3 3	50 12 5 3 3 3	0 7 6 3 2 3	my_qos_map my_qos_map my_qos_map my_qos_map my_qos_map my_qos_map my_qos_map

INTERACTIVE-VIDEO	5	5	1	my_qos_map
TRANSACTIONAL-DATA	7	7	5	my qos map

show policy qos-map-info, on page 975

# show policy service-path

Determine the next-hop information for an IP packet that a vEdge router sends out a service-side interface (on vEdge routers only). You identify the IP packet by specifying fields in the IP header. You can use this command when using application-aware routing, to determine that path taken by the packets associated with a DPI application.

show policy service-path vpn-id vpn-id interface interface-name source-ip ip-address dest-ip ip-address protocol number source-port port-number dest-port port-number [all | app application-name | dscp value]

### **Syntax Description**

all	All Possible Paths: Display all possible paths for a packet.		
dest-ip ip-address dest-port port-number	Destination IP Address and Port Number: IP address and port number of the remote end of the IPsec tunnel.		
app application-name	DPI Application: Display the packets associated with the specified DPI application.		
dscp value	DSCP Value: DSCP value being used on the IPsec tunnel. Range: 0 through 63		
interface interface-name	Interface: Name of the local interface being used for the IPsec tunnel.		
protocol number	Protocol: Number of the protocol being used on the IPsec tunnel.		
source-ip ip-address source-port port-number	Source IP Address and Port Number: IP address and port number of the local end of the IPsec tunnel.		
vpn-id vpn-id	VPN: Identifier of the service VPN.		

# **Command History**

Release	Modification
15.1	Command introduced.
15.3	all and app options added.

### **Example**

```
vEdge# show policy service-path vpn 0 interface ge0/0 source-ip 172.0.101.15 dest-ip 172.0.101.16 protocol 1 source-port 1 dest-port 1 all Number of possible next hops: 1
```

```
Next Hop: Svc_GRE
Source: 10.1.15.15 Destination: 10.1.16.16
```

```
show app-route sla-class, on page 746 show app-route stats, on page 747 show ip fib, on page 856 show ip routes, on page 867 show policy tunnel-path, on page 978
```

# show policy tunnel-path

Determine the next-hop information for an IP packet that a vEdge router sends out a WAN transport tunnel interface (on vEdge routers only). You identify the IP packet by specifying fields in the IP header. You can use this command when using application-aware routing, to determine that path taken by the packets associated with a DPI application.

show policy service-path vpn-id vpn-id interface interface-name source-ip ip-address dest-ip ip-address protocol number source-port port-number dest-port port-number [all | app application-name | dscp value]

## **Syntax Description**

all	All Possible Paths: Display all possible paths for a packet.
dest-ip ip-address dest-port port-number	Destination IP Address and Port Number: IP address and port number of the remote end of the IPsec tunnel.
app application-name	DPI Application: Display the packets associated with the specified DPI application.
dscp value	DSCP Value: DSCP value being used on the IPsec tunnel.
interface interface-name	Interface: Name of the local interface being used for the IPsec tunnel.
protocol number	Protocol: Number of the protocol being used on the IPsec tunnel.
source-ip ip-address source-port port-number	Source IP Address and Port Number: IP address and port number of the local end of the IPsec tunnel.
vpn-id vpn-id	VPN: Identifier of the transport VPN.

# **Command History**

Release	Modification
15.2	Command renamed from <b>show app-route path</b> and introduced.
15.3	all and app options added.

## **Example**

```
vEdge# show policy tunnel-path vpn 0 interface ge0/2 source-ip 10.0.5.11 dest-ip 10.0.5.21
protocol 6
source-port 12346 dest-port 12346
Nexthop: Direct
Interface ge0/2 index: 3
```

## **Related Topics**

show app-route stats, on page 747 show app-route sla-class, on page 746 show policy service-path, on page 977

# show policy zbfw filter-statistics

Display a count of the packets that match a zone-based firewall's match criteria and the number of bytes that match the criteria (on vEdge routers only).

show policy zbfw filter-statistics

### **Syntax Description**

None

## **Command History**

Release	Modification
18.2	Command introduced.

### **Example**

For the configured zone-based firewalls, display the number of packets and the number of bytes that match the match criteria in the firewalls:

```
vEdge# show policy zbfw filter-statistics
```

NAME	COUNTER	NAME	PACKETS	BYTES
ZONE-POLICY-1	counter	seq_1	2	196

## **Related Topics**

```

No syn in listen state : 0 Internal TCP invalid direction : 0

## Table 26: Statistics Information

Statistics	Description
Total zone-based firewall packets	The total number of packets passing through firewall.
Self zone packets	Packets that are directed to/going out from the router (not pass through traffic).
Fragments	Packet Fragments counter.
Fragment failures	Failure to reassemble fragments.
State check failures	Any TCP state check failures found during flow add or flow inspect process, will be counted towards this counter.
Fragment state check failures	For fragmented packets, if the first packet has failed state check and dropped, drop other fragments and increment the counter.
Flow addition failures	Failed to add a flow record for a given traffic flow.
Unsupported protocol	Packets where the protocol number not supported by firewall.
Number of flow entries	Points to the number of sessions created.
Exceeded maximum TCP half-open	After the max half open TCP connections have reached (which is set by tcp-syn-flood-limit), this counter gets incremented.
Mailbox message full	SMTP 554, mailbox full.
No pair in same zone	Packets belonging to same zones and no zone pair. Basically packets across interfaces belonging to same zone.
No-zone-to-no-zone packets	None of the VPN's (source/destination) are part of any zones, then allow the packets to go through.
Zone-to-no-zone internet	When one VPN is part of a zone, and other VPN is a Internet VPN0 AND its not part of the zone, then if "zone-to-nozone-internet" is <b>allow</b> , this counter will be incremented.
Umbrella registration packets	Initial Umbrella registration packets.
No pair Self zone packets	If no zone pair found and if its a self-zone packet allow the packet.
TCP retransmitted segments	TCP retransmitted segments.
TCP out-of-order segments	Out of order segments that arrive during ESTAB, CLOSEWAIT OR LASTACK, are allowed implicitly.
During policy change	Packets dropped during policy change due to reconfig.
Invalid filter	No longer a valid policy filter, then increment this counter.

Statistics	Description			
No pair for different zone	No zone pair between different zones, then drop the packet and increment the counter.			
Zone-to-no-zone packets	All traffic from Zone to a No-Zone will be dropped.			
Zone-to-no-zone internet	When one VPN is part of a zone, and other VPN is a Internet VPN0 AND its not part of the zone, then if "zone-to-nozone-internet" is <b>deny</b> , this count will be incremented.			
Internal invalid tcp state	If the TCP state check for the flow, does not match any of the valid states such as LISTEN, SYNSENT, SYNRCVD, ESTABLISHED, CLOSEWAIT, LASTACK OR TIMEWAIT.			
Stray seg	A TCP segment is received that should not have been received through the TCP state machine such as a TCP SYN packet being received in the listen state from the responder.			
Invalid flags	This can be caused by:			
	1. During LISTEN state, a TCP peer receives a RST or an ACK			
	2. Expected SYN/ACK is not received from the responder.			
	3. TCP initial SYN packet has flags other than SYN.			
Syn with data	If the SYN packet contains payload for some reason, then drop the packet.			
Invalid win scale option	Caused by incorrect window scale option byte length.			
Invalid seg synsent state	An invalid TCP segment in SYNSENT state is caused by:			
	1. SYN/ACK has payload.			
	2. SYN/ACK has other flags (PSH, URG, FIN) set.			
	3. Receive a non-SYN packet from initiator.			
Invalid ack numif	This drop could be caused by one of these reasons:			
	1. ACK not equals to the next_seq# of the TCP peer.			
	2. ACK is greater than the most recent SEQ# sent by the TCP peer.			
Invalid ack flag	Drop the packet if			
	1. Expecting ACK flag, but not set during different TCP states.			
	2. ACK flag is set and other flags (such as RST) is set.			
Reset to Responder	Send RST to responder in SYNSENT state when ACK# is not equal to ISN+1.			
Retrans invalid flags	If this is retransmitted packet and already ACKed drop the packet.			

Statistics	Description
Reset in window	A RST packet is observed within the window of an already established TCP connection.
Invalid sequence number	In SYNRCVD state, drop the packet if,
	• If Seq number is less than ISN
	If receiver window is zero, then drop any segment with Data and drop any out-of-order segments.
	If receiver window is non-zero, then drop any segment whose SEQ falls beyond the window.
Invalid seg synrcvd state	In SYNRCVD state, drop the packet if, receive a retransit SYN with payload from initiator.
Syn in window	If a SYN is received in an already established connection, then drop the packet.
Unexpected TCP payload	In SYNRCVD state, if a packet with payload from responder to initiator direction is received, drop the packet.
Invalid seg pkt too old	Packet is too old - one window behind the other side's ACK. This could happen in ESTABLISHED, CLOSEWAIT and LASTACK state.
Invalid seg pkt win overflow	This occurs when incoming segment size overflows receiver's window. This check is done during TCP ESTAB, CLOSEWAIT and LASTACK state processing.
Invalid seg pyld after fin send	Payload received after FIN sent. This could happen in CLOSEWAIT state.
No syn in listen state	During TCP LISTEN state processing, if the packet received is not SYN packet, then drop the packet.
Internal TCP invalid direction	Packet direction undefined.

## **Related Topics**

clear policy zbfw global-statistics, on page 621

# show policy zbfw sessions

Display the session flow information for all zone pairs configured with a zone-based firewall policy (on vEdge routers only).

show policy zbfw sessions

## **Syntax Description**

None

## **Command History**

Release	Modification
18.2	Command introduced.

## **Example**

For the configured zone-based firewalls, display the number of packets and the number of bytes that match the match criteria in the firewalls:

vEdge# show policy zbfw sessions

ZONE PAI	R VPN	SOURCE IP ADDRESS	DESTINATION IP ADDRESS	SOURCE PORT	DESTINATION PORT	PROTOCOL	SOURCE VPN	DESTINATION VPN	IDLE TIMEOUT	OUTBOUND PACKETS	OUTBOUND OCTETS	INBOUND PACKETS	INBOUND OCTETS	FILTER STATE
zp1	1	10.20.24.17	10.20.25.18	44061	5001	TCP	1	1	0:00:59:59	12552	17581337	6853	463590	established

### **Related Topics**

reboot, on page 658 show system status, on page 1023

## show running-config

Display the active configuration that is running on the Cisco vEdge device. Use the **details** filter with this command to display the default values for configured components.

**show running-config** [configuration-hierarchy]

show running-config [configuration-hierarchy] | details

### **Syntax Description**

None	Display the full active configuration.
details	Default Values in Running Configuration: Display the default values for the components configured in the running configuration.
configuration-hierarchy	Specific Configuration Hierarchy: Display the active configuration for a specific hierarchy in the configuration.

#### **Command History**

Release	Modification
14.1	Command introduced.
Cisco SD-WAN Release 20.8.1	Added <b>secondary-region</b> to the output to show the Hierarchical SD-WAN region ID, and <b>region</b> to show the secondary region mode. Added <b>transport-gateway</b> to the output to indicate the enabled/disabled status. Added <b>affinity-group</b> and <b>affinity-group preference</b> to the output to indicate the affinity group ID assigned to the device and the preference order.

## **Examples**

#### Example 1

```
vEdge# show running-config system

# show sdwan appqoe

To view infrastructure statistics, NAT statistics, resource manager resources and statistics, TCP optimization status, and service chain status, use the **show sdwan appqoe** command in privileged EXEC mode.

show sdwan appqoe { infra-statistics | nat-statistics | rm-statistics | ad-statistics | aoim-statistics | rm-resources | tcpopt status | service-chain status | libuinet-statistics [ sppi | verbose ] }

## **Syntax Description**

infra-statistics	Displays infra statistics
nat-statistics	Displays NAT statistics
rm-statistics	Displays resource manager status
ad-statistics	Displays the status for auto discovery of peer devices
aoim-statistics	Displays the statistics for one time exchange of information between peer devices
rm-resources	Displays resource manager resources
tcpopt status	Displays information about TCP optimization
service-chain status	Displays service chain status
libuinet-statistics sppi verbose	Displays libuinet statistics

## show sdwan appqoe flow closed

To view the closed appqoe flows, use the **show sdwan appqoe flow closed** command in privileged EXEC mode.

show sdwan appqoe flow closed  $\{$  all | detail | flow-id | server-port port-number | server-ip | server-port port-number | client-ip | client-ip | server-port port-number | server-port | port-number | error | detail | flow-id | | | server-port |

#### **Syntax Description**

all	Displays all flows
detail	Displays flow details for all flows
flow-id flow-id	Filters flows by flow-id

server-ip server-ip	Filters flows by the server IP address
client-ip client-ip	Filters flows by the client IP address
server-port port-number	Filters flows by server port number. Range: 1 to 65535
error	Displays the latest flows with errors.

#### **Command Modes**

Privileged EXEC (#)

## **Command History**

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.2.1r	This command was introduced.

Cisco IOS XE Catalyst SD-WAN Release 17.6.1a A new keyword **error** was introduced.

The following is a sample out from the **show sdwan appgoe flow closed all** command:

```
Device# show sdwan appqoe flow closed all Current Historical Optimized Flows: 6
```

## show sdwan cloudexpress applications

To display the best path that Cloud onRamp for SaaS has selected for each configured SaaS application, on Cisco IOS XE Catalyst SD-WAN devices, use the **show sdwan cloudexpress applications** command in privileged EXEC mode.

show sdwan cloudexpress applications

#### **Syntax Description**

None.

#### **Command Mode**

Privileged EXEC mode

## **Command History**

Release	Modification
Cisco IOS XE Release 17.2	This command was introduced.

#### **Examples**

#### **Example**

```
Device# show sdwan cloudexpress applications
cloudexpress applications vpn 1 office365
exit-type local
interface GigabitEthernet1
latency 1
loss
cloudexpress applications vpn 1 amazon aws
exit-type
               gateway
gateway-system-ip 10.0.0.1
               1
latency
                0
loss
                lte
local-color
               lte
remote-color
cloudexpress applications vpn 1 dropbox
exit-type
               gateway
gateway-system-ip 10.0.0.1
latency
                19
                 0
local-color
                1 t.e
remote-color
                lte
```

## show sdwan cloudexpress gateway-exits

To display the Quality of Experience (QoS) measurements received from gateway sites, for Cloud onRamp for SaaS, on Cisco IOS XE Catalyst SD-WAN devices, use the **show sdwan cloudexpress gateway-exits** 

command in privileged EXEC mode. The output may include entries for branch sites, and for branch sites with direct internet access (DIA).

show sdwan cloudexpress gateway-exits

#### **Syntax Description**

This command has no arguments or keywords.

#### **Command Mode**

Privileged EXEC mode

#### **Command History**

Release	Modification
Cisco IOS XE Release 17.2	This command was introduced.

#### **Examples**

#### Example

```
Device# show sdwan cloudexpress gateway-exits
cloudexpress gateway-exits vpn 1 office365 10.0.0.1
latency 2
            50
local-color lte
remote-color lte
cloudexpress gateway-exits vpn 1 amazon aws 10.0.0.2
latency
loss
local-color lte
remote-color lte
cloudexpress gateway-exits vpn 1 dropbox 10.0.0.2
latency 19
loss
local-color lte
remote-color lte
```

## show sdwan cloudexpress local-exits

To display the list of applications enabled for Cloud onRamp for SaaS probing, on Cisco IOS XE Catalyst SD-WAN devices, and the interfaces on which the probing occurs, use the **show sdwan cloudexpress local-exits** command in privileged EXEC mode. Each line of the output applies to a specific application and interface, and includes the average latency and loss for each application and interface. The interfaces may include branch site direct internet access (DIA) interfaces, and gateway site interfaces.

show sdwan cloudexpress local-exits

### **Syntax Description**

This command has no arguments or keywords.

#### **Command Mode**

Privileged EXEC mode

### **Command History**

Release	Modification
Cisco IOS XE Release 17.2	This command was introduced.

### **Examples**

### **Example**

Devi	ce# snow sawan	cloudexpress local-exits		
VPN	APPLICATION	INTERFACE	LATENCY	LOSS
1	office365	GigabitEthernet1	1	43
1	office365	GigabitEthernet5	1	42

## show sdwan cloudexpress service-area-applications

To display the applications enabled for Cloud onRamp for SaaS and the best path that has been selected for each, use the **show sdwan cloudexpress service-area-applications** command in Privileged EXEC mode.

#### show sdwan cloudexpress service-area-applications

^-	mm		a.	n	_£.		14
Lυ	шш	ıan	u	v	ei	au	ш

Not applicable.

## **Command Modes**

Privileged EXEC

## **Command History**

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	This command is introduced.

## **Usage Guidelines**

The output includes separate sections with the details for each unique combination of:

- Service area (Microsoft Exchange traffic is currently the only possible value)
- VPN
- Application

For each combination, the output includes:

- exit-type:
  - **Local**: The application traffic uses the local interface for example a Direct Internet Access (DIA) interface at a branch site.
  - Gateway: The application traffic uses a remote gateway.

- None: Cloud on Ramp for SaaS has not determined a best path for the application traffic.
- interface: Interface for current best path.
- latency: Last measured latency.
- loss: Last measured packet loss.
- override-status: Score for the path:
  - **OK**: Acceptable for application traffic.
  - NOT-OK: Not acceptable for application traffic.
  - INIT: Insufficient data.

#### **Example**

In the following example, the output snippet shows the best-path information for the office 365 application, for VPN 1 only. In the example, Office 365 traffic on VPN 1 is using a local interface (GigabitEthernet0/0/2).

```
Device#show sdwan cloudexpress service-area-applications cloudexpress service-area-applications Exchange vpn 1 office365 exit-type local interface GigabitEthernet0/0/2 latency 3 loss 0 override-status OK
```

## show sdwan policy

Display information about policy configuration on the IOS XE router.

```
show sdwan policy app-route-policy filter
show sdwan policy access-list-associations
show sdwan policy access-list-counters
show sdwan policy access-list-names
show sdwan policy data policy filter
show sdwan policy from-vsmart
show sdwan policy from-vsmart lists
```

## **Syntax Description**

The options for the **show sdwan policy** commands are the same as for the equivalent vEdge router commands.

#### **Command History**

Release	Modification
16.9.1	Command introduced.

Note

The **show sdwan policy data-policy-filter** commands display in different formats depending on if the counter has a value or not. If the counter has a value, the output for the show sdwan policy data-policy-filter displays in a linear format. If the counter does not have a value, the output displays in a tabular format.

#### Example

The example output for the **show sdwan policy** commands is the same as for the equivalent vEdge router commands. Below is an example output for the **show sdwan policy app-route-policy-filter** command.

```
ISR4K# show sdwan policy app-route-policy-filter
app-route-policy-filter app route policy pm9008
app-route-policy-vpnlist all vpns
 app-route-policy-counter count_appr_pm9008_1001
  packets 15126027
  bytes 15305251759
 app-route-policy-counter count appr pm9008 1002
  packets 10364400
  bytes 11151607158
  app-route-policy-counter count appr pm9008 1003
  packets 0
  bytes 0
  app-route-policy-counter count appr pm9008 1004
  packets 265882
  bytes
         34997066
```

#### CSR# show sdwan policy data-policy-filter

NAME	NAME	COUNTER NAME	PACKETS	BYTES	POLICER NAME	OOS PACKETS	OOS BYTES
TCP_Proxy	1	TCP1 TCP2	0	0 0			
		default action count	0	0			

When counter has some value it has below output pattern.

```
CSR# show sdwan policy data-policy-filter
data-policy-filter TCP_Proxy
data-policy-counter TCP1
   packets 764954
   bytes 1009386894
   data-policy-counter TCP2
   packets 163154
   bytes 14693558
   data-policy-counter default_action_count
   packets 22
   bytes 7524
```

## **Related Topics**

show sdwan, on page 990

# show sdwan policy service-path

To display the next-hop information for an IP packet that a Cisco IOS XE router received from a service-side interface, use the **show sdwan policy service-path** command in the privileged EXEC mode.

show sdwan policy service-path vpn-id vpn-id interface interface-name source-ip ip-address dest-ip ip-address protocol number source-port port-number dest-port port-number [all | app application-name | dscp value]

## **Syntax Description**

vpn-id vpn-id	Identifies the service VPN.		
interface interface-name	Specifies the name of the local interface being used for the IPsec tunnel.		
source-ip ip-address	Specifies the source IP address number of the local end of the IPsec tunnel.		
dest-ip ip-address	Specifies the destination IP address of the remote end of the IPsec tunnel.		
protocol number	Specifies the number of the protocol being used on the IPsec tunnel.		
source-port port-number	Specifies the port number of the local end of the IPsec tunnel.		
dest-port port-number	Specifies the port number of the remote end of the IPsec tunnel.		
all	Displays all possible paths for a packet.		
app application-name	Displays the packets associated with the specified DPI application.		
dscp value	Specifies the DSCP value being used on the IPsec tunnel. <i>Range:</i> 0 through 63		

#### **Command Default**

NA

## **Command Modes**

Privileged EXEC

### **Command History**

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.2.1r	This command was introduced.

#### **Usage Guidelines**

You identify the IP packet by specifying fields in the IP header. You can use this command when using application-aware routing, to determine that path taken by the packets associated with a DPI application.

## **Example**

```
Device#show sdwan policy service-path
vpn 1 interface GigabitEthernet 5 source-ip 10.20.24.17 dest-ip 10.20.25.18
protocol 1 Next Hop: IPsec
Source: 10.1.15.15 12346 Destination: 10.1.16.16 12366
Local Color: lte Remote Color: lte Remote System IP: 172.16.255.16
```

## show sdwan policy tunnel-path

To display the next-hop information for an IP packet that a Cisco IOS XE router received from a WAN transport tunnel interface, use the **show sdwan policy tunnel-path** command in the privileged EXEC mode.

show sdwan policy tunnel-path vpn-id vpn-id interface interface-name source-ip ip-address dest-ip ip-address protocol number source-port port-number dest-port port-number [all | app application-name | dscp value]

### **Syntax Description**

vpn-id vpn-id	Identifies the service VPN.		
interface interface-name	Specifies the name of the local interface being used for the IPsec tunnel.		
source-ip ip-address	Specifies the source IP address number of the local end of the IPsec tunnel.		
dest-ip ip-address	Specifies the destination IP address of the remote end of the IPsec tunnel.		
protocol number	Specifies the number of the protocol being used on the IPsec tunnel.		
source-port port-number	Specifies the port number of the local end of the IPsec tunnel.		
dest-port port-number	Specifies the port number of the remote end of the IPsec tunnel.		
all	Displays all possible paths for a packet.		
app application-name	Displays the packets associated with the specified DPI application.		
dscp value	Specifies the DSCP value being used on the IPsec tunnel. <i>Range</i> : 0 through 63		

#### **Command Default**

NA

## **Command Modes**

Privileged EXEC

#### **Command History**

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.2.1r	This command was introduced.

## **Usage Guidelines**

You identify the IP packet by specifying fields in the IP header. You can use this command when using application-aware routing, to determine that path taken by the packets associated with a DPI application.

### **Example**

```
Device#show sdwan policy tunnel-path
vpn 0 interface ge0/2 source-ip 10.0.5.11 dest-ip 10.0.5.21 protocol 6
source-port 12346 dest-port 12346
Nexthop: Direct Interface ge0/2 index: 3
```

## show security-info

List the configured security information for IPsec tunnel connections (on vEdge routers only).

show security-info [ authentication-type  $\mid$  encryption-supported  $\mid$  fips-mode  $\mid$  pairwise-keying  $\mid$  rekey  $\mid$  replay-window ]

## **Syntax Description**

None	Lists information about all configured IPsec tunnel security parameters.		
authentication-type	Lists the configured authentication type for IPsec tunnels.		
encryption-supported	Lists the supported encryption type.		
fips-mode	Displays whether fips mode is enabled or disabled.		
pairwise-keying	Displays whether pairwise-keying is enabled or disabled.		
rekey	Lists the configured rekeying time for IPsec tunnels, in seconds.		
replay-window	Lists the configured replay window size for IPsec tunnels.		

### **Command History**

Release	Modification	
14.2	Command introduced.	
16.2	Added support for displaying authentication negotiation.	
17.2	Added FIPS status	
Cisco SD-WAN Release 20.6.1	The output of this command was modified to included an additional field, security-info integrity-type.	

The following is a sample output from the **show security-info** command applicable to Cisco SD-WAN Release 20.6.1 and later.

## vm4# show security-info

```
security-info authentication-type deprecated security-info rekey 86400 security-info replay-window 512 security-info encryption-supported "AES_GCM_256 (for unicast & multicast)" security-info fips-mode Enabled security-info pairwise-keying Disabled security-info integrity-type "ip-udp-esp esp"
```

The following is a sample output from the **show security-info** command applicable to releases before Cisco SD-WAN Release 20.6.1.

## vEdge# show security-info

```
security-info authentication-type "SHA1_HMAC / NULL" security-info rekey 3600000 security-info replay-window 512 security-info encryption-supported "AES_GCM_256 and, for multicast, AES_256_CBC" security-info fips-mode Enabled
```

## **Related Topics**

ipsec, on page 274

## show nms server-proxy ratelimit

To view rate limits for bulk and non-bulk APIs, use the **show nms server-proxy ratelimit** command in the operational mode.

#### show nms server-proxy ratelimit

## **Syntax Description**

This command has no arguments or keywords.

#### **Command Modes**

Operational mode (#)

#### **Command History**

Release	Modification		
Cisco vManage Release 20.10.1	This command is introduced.		

#### **Examples**

The following is a sample output of the **show nms server-proxy ratelimit** command on a single Cisco vManage node:

vManage# show nms server-proxy ratelimit

```
Non Bulk API: 100/second (per node)
Bulk API: 48/minute (per node)
```

The following is a sample output of the **show nms server-proxy ratelimit** command on a Cisco vManage node belonging to a three-node cluster:

```
vManage# show nms server-proxy ratelimit
Non Bulk API: 100/second (per node)
Bulk API: 150/minute (across cluster)
```

#### **Related Commands**

Command	Description
request nms server-proxy set ratelimit	Configures rate limits for bulk and non-bulk APIs on the Cisco vManage server-proxy.

## show software

List the software images that are installed on the local device (on vEdge routers and vSmart controllers).

show software image-name [active | confirmed | default | previous | timestamp]

show software

## **Syntax Description**

None	List information about all software images installed on the local device.
[active   confirmed   default   previous   timestamp]	Software Image Status: List whether the image is the actively running image, the default image, or the previously running image, when the image was installed, and who confirmed the software installation.
image-name	Specific Software Image: List information about a specific software image.

## **Command History**

Release	Modification	
15.3.3	Command introduced for vEdge 100 routers only.	
15.4	Command available on all Cisco SD-WAN devices.	

## **Example**

vEdge# show software

VERSION	ACTIVE	DEFAULT	PREVIOUS	CONFIRMED	TIMESTAMP
15.3.3	true	true	false	-	2015-10-08T12:54:50-00:00

## **Related Topics**

request download, on page 674
request software activate, on page 706
request software install-image, on page 709
request software remove, on page 710
request software reset, on page 711

## show support omp peer

To display information about the active OMP peer sessions on the local Cisco SD-WAN Controller or Cisco vEdge device, use the **show support omp peer** command in privilege EXEC mode.

show support omp peer peer-ip ip-address

#### **Syntax Description**

**peer-ip** System-IP address of the connected Cisco Catalyst SD-WAN device.

*ip-address* Display configuration OMP peer session information about a specific peer.

#### Command Modes

Privileged EXEC (#)

## **Command History**

Release	Modifications
Cisco SD-WAN Release 20.8.1	This command was introduced.
Cisco Catalyst SD-WAN Control Components Release 20.11.1	Added the <b>TLOC color supported list</b> field in the output.

### **Usage Guidelines**

Detailed information about OMP peer is displayed along with all timers and assigned policies in XML format.

The following is a sample output from the **show support omp peer** command:

Device# show support omp peer peer-ip 172.16.255.41

```

The following example, executed on a Cisco SD-WAN Controller, shows the TLOC colors that the peer device 10.0.0.15 is advertising—in this case, Ite and 3g.

```
vsmart# show support omp peer peer-ip 10.0.0.15 | inc color ed bitmap: 0xc0, TLOC color supported list: lte 3g
```

## show system buffer-pool-status

Display statistics about internal data packet buffers, which are used in the forwarding path.

## show system buffer-pool-status

## **Syntax Description**

None

## **Command History**

Release	Modification	
17.2	Command introduced.	

## **Example**

vEdge#	show system	buffer-pool-	-status
Pool	Block-Size	Max-Blocks	Avail-Blocks
0	0	655209	
1	0	677233	
2	0	3920	
3	0	10201	
4	0	7982	
5	0	8180	
6	0	6140	
7	0	0	

## **Related Topics**

```
show interface queue, on page 845 show interface statistics, on page 854 show system statistics, on page 1018
```

# show system netfilter

Display the iptable entries, also called iptable/netfilter entries, on the local device (on vSmart controllers and vManage NMSs only). The netfilter is a kernel module that does packet filtering based on firewall rules.

## show system netfilter

## **Syntax Description**

None

## **Command History**

Release	Modification	
15.4.3	Command introduced.	

## **Example**

vSmart# show system netfilter Chain INPUT (policy ACCEPT 60302 packets, 6353K bytes)

iptables-enable, on page 275

# show system on-demand

To display the status of on-demand tunnels, use the **show system on-demand** command in privileged EXEC mode.

	show	[sdwan]	system	on-demand	[remote-system]	[ system-ip	ip-address ]
Syntax Description	sdwar	1	Include <b>sdwan</b> only when using the command on a Cisco IOS XE Catalyst SD-WAN device, not on a Cisco vEdge device.				

#### remote-system

Use **remote-system** to include on-demand tunnel information about all connected devices.

For example, if device A has numerous on-demand tunnels configured to other devices, and you use (for a Cisco IOS XE Catalyst SD-WAN device) **show sdwan system on-demand remote-system** on device A, the output includes information for each site that device A is connected to. The information for each site includes whether the site has on-demand tunnels enabled, whether the tunnel to the site is active, inactive, or not in on-demand tunnel mode, and so on.

Without this keyword, the command provides only the local status of the device on which the command is executed. For example, if you execute this command on device A, without **remote-system**, the output shows only the local on-demand tunnel status of device A.

# **system-ip** *ip-address*

Displays the output only for the specified device.

#### **Command Default**

Not applicable.

#### **Command Modes**

Privileged EXEC

#### **Command History**

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.3.1a	
Cisco vManage Release 20.3.1	introduced.

### **Usage Guidelines**

Use this command on a hub or spoke device. The output shows the following:

- SITE-ID: Site ID.
- SYSTEM-IP: IP address of the device.
- ON-DEMAND:
  - yes: On-demand tunnels are enabled on the device.
  - no: On-demand tunnels are not enabled on the device.
- STATUS:
  - active: The on-demand tunnel to this device is active.
  - inactive: The on-demand tunnel to this device is inactive.
  - **not-on-demand**: On-demand tunnels are enabled on the device, but this tunnel is not in on-demand mode because another device at the same multi-home site does not have on-demand tunnels enabled.
- IDLE-TIMEOUT-CFG(min): Configured on-demand tunnel timeout (minutes) for this device.
- IDLE-TIMEOUT-EXPIRY(sec): Seconds before timeout for this on-demand tunnel.

#### **Example**

In the following example, **show sdwan system on-demand** is executed on a Cisco IOS XE Catalyst SD-WAN device, so it includes the **sdwan** keyword.

The output shows the on-demand tunnel configuration of the device on which the command was executed, which is at site 800 in the example. On-demand tunnels are enabled.

Device# <b>show</b>	sdwan system	on-demand		
SITE-ID	SYSTEM-IP	ON-DEMAND	STATUS	IDLE-TIMEOUT-CFG (min)
800	10.0.0.18	yes	active	10

#### **Example**

In the following example **show sdwan system on-demand remote-system** is executed on a Cisco IOS XE Catalyst SD-WAN device, so it includes the **sdwan** keyword.

The output shows the status of 5 devices at a total of 4 sites. Site 500 is a multi-home site, with 2 devices. Because one of the devices at site 500 (10.0.0.15) does not have on-demand tunnels enabled, the other device at the site (10.0.016) has a status of not-on-demand even though that device has on-demand tunnels enabled.

Device#show	sdwan system	on-demand	remote-system	
SITE-ID	SYSTEM-IP	ON-DEMAND	STATUS	IDLE-TIMEOUT-EXPIRY(sec)
300	10.0.0.11	yes	inactive	-
200	10.0.0.12	no	-	-
400	10.0.0.14	yes	active	48
500	10.0.0.15	no	-	-
500	10.0.0.16	yes	not-on-dema	and -

In the following example, **system-ip** is used to display the status of a single device.

Device#show	v sdwan sy	ystem on	-demand	remote-system	system-ip	10.0.0.10
SITE-ID	SYSTEM-II	P ON-	-DEMAND	STATUS	IDLE-TI	MEOUT-EXPIRY(sec)
400	10.0.0.10	0 .	ves	active		33

# show system statistics

Display system-wide forwarding statistics (on vEdge routers only).

show system statistics [diff]

#### **Syntax Description**

None	Display all system statistics.
diff	Statistics Changes: Display the changes in statistics since you last issued the <b>show system statistics</b> command.

#### **Command History**

Release	Modification
14.1	Command introduced.
16.3.2	Add display BFD PMTU statistics.

#### Example

#### $\mbox{vEdge\# show system statistics}$

```

## show system status

Display time and process information for the device, as well as CPU, memory, and disk usage data.

show system status

#### **Syntax Description**

None

#### **Command History**

Release	Modification
14.1	Command introduced.
15.3	Changed format of command output for vEdge 100 routers.
15.4	Changed format of command output changed for all devices.
16.3.2	Added system state field to output on vEdge routers.
17.1	Added CPU-reported reboot field to output on hardware vEdge routers.
17.2	Added CPU allocation field to output on hardware vEdge routers; added FIPS state.

## **Examples**

#### Example 1

In Releases 17.1 and later:

```
\texttt{vEdge} \texttt{\#} \ \textbf{show} \ \textbf{system} \ \textbf{status}
```

```
Cisco SD-WAN (tm) vedge Operating System Software Copyright (c) 2013-2018 by Cisco, Inc.
Version: 17.1.0

System logging to host is disabled
System logging to disk is enabled

System state:

GREEN. All daemons up
System FIPS state:

Enabled
```

Last reboot: Initiated by user - activate 17.1.0.

CPU-reported reboot: Warm

Boot loader version: U-Boot 2013.07-ga9b015 (Build time: May 12 2016 - 13:58:12)

System uptime: 0 days 03 hrs 27 min 26 sec Current time: Tue Mar 28 12:59:02 PDT 2017

Load average: 1 minute: 0.11, 5 minutes: 29, 15 minutes: 38

Processes: 241 total

CPU allocation: 32 total, 3 control, 29 data, 1 tcpd

CPU states: 11.00% user, 10.10% system, 78.90% idle

Memory usage: 2973024K total, 752796K used, 1865932K free

65348K buffers, 288948K cache

Disk usage: Filesystem Size Used Avail Use % Mounted on

## show tech-support

To display general information about the Cisco SD-WAN devices, use the **show tech-support** command in the privileged EXEC mode.

#### show tech-support

#### **Syntax Description**

This command has no arguments or keywords.

#### **Command Default**

NA

#### **Command Modes**

Privileged EXEC

#### **Command History**

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.2.1r	Command introduced to display the admin-tech and memory details.

## **Usage Guidelines**

When a Cisco device reboots, it collects system status information in a compressed tar file to aid in troubleshooting and diagnostics. The tar file is saved in your system's home directory and contains the following information:

- output of commands
- content of files on the local device
- core files
- syslog files for each process
- configuration rollback files

This command is useful for collecting a large amount of information about devices for troubleshooting. The output of this command can be provided to technical support representatives when reporting a problem. The command output displays the output of a number of show commands at once. The output from this command varies depending on your platform and configuration. Where as, the command **request admin-tech** collects all system status information, including core files, log files, and the process (daemon) and operational-related files that are stored in the /var/tech directory on the local device. For more information on **admin-tech** command, see request admin-tech. The **show tech-support** command displays the output from the following **show** commands, as listed in the order below:

show platform

- show platform software status control-processor brief
- show platform resources
- · show memory statistics history
- show memory allocating-process total
- · show process memory sorted
- show process memory platform sorted
- show memory lite-chunks totals
- · show buffer
- · show buffer usage
- · show region
- show memory dead totals
- show chunk brief

## **Example**

The following is sample output from the **show tech-support** command. Following are the excerpts from /var/tech/ios file extracted from the admin-tech tar file which shows that the corresponding command output is captured in admin-tech.

Device# show tech-support show tech-support memory

# show tenant-mapping

On a Cisco vBond Orchestrator, to view the mapping of tenants to multitenant Cisco vSmart Controllers, use the **show tenant-mapping** command.

**show tenant-mapping** [vSmart-serial-number]

#### **Syntax Description**

[vSmart-serial-number] (Optional) Spec

(Optional) Specify the serial number of a specific Cisco vSmart Controller to view the tenants assigned to it.

#### **Command Default**

None

#### **Command Modes**

#

#### **Command History**

Release	Modification
Cisco SD-WAN Release 20.4.1	Command introduced.

### **Example**

vBond# show tenant-mapping

```
VSMART
SERIAL

NUM TENANT NAMES TENANT COUNT

12345990 [ "multitenancy-Customer6" "multitenancy-Customer4" "multitenancy-Customer3" "multitenancy-Customer1" ] 4
12345992 - 0
12345994 [ "multitenancy-Customer6" "multitenancy-Customer5" "multitenancy-Customer3" "multitenancy-Customer2" ] 4
12345997 - 0
12345998 - 0
12346001 [ "multitenancy-Customer5" "multitenancy-Customer4" "multitenancy-Customer2" "multitenancy-Customer1" ] 4
```

# show tenant omp peers

To view information about the OMP peering sessions that are active on the multitenant Cisco vSmart Controller for a particular tenant, use the **show tenant** *tenant-name* **omp peers** command.

**show tenant** tenant-name **omp peers** [peer-ip-address] [detail]

#### **Syntax Description**

tenant-name	Specify the name of a tenant assigned to the multitenant Cisco vSmart Controller.
peer-ip-address	(Optional) View OMP peering session information for a specific peer.

detail	(Optional) View detailed information.
detail	(Optional) View detailed information.

#### **Command Default**

None

#### **Command Modes**

#

#### **Command History**

Release	Modification
Cisco SD-WAN Release 20.4.1	Command introduced.

### **Example**

 $vSmart \# \ \textbf{show tenant multitenancy-Customer1 omp peers}$ 

 $R \rightarrow routes received$ 

I -> routes installed

S -> routes sent

		DOMAIN	OVERLAY	SITE			
PEER	TYPE	ID	ID	ID	STATE	UPTIME	R/I/S
172.16.255.14	vedge	1	1	400	up	23:09:40:04	4/0/0
172.16.255.15	vedge	1	1	500	up	0:14:33:55	0/0/0
172.16.255.24	vsmart	1	1	103	up	44:06:36:31	4/0/4

# show tenant omp routes

To view information about information about OMP routes for a tenant on a multitenant Cisco vSmart Controller, use the **show tenant** *tenant-name* **omp routes** command.

**show tenant** tenant-name **omp routes** [ **family** family-address ] [ **vpn** vpn-id ] [ prefix | ip-address ] [ **advertised** | **received** ] [**detail**]

## **Syntax Description**

tenant-name	Specify the name of a tenant assigned to the multitenant Cisco vSmart Controller.
prefix	(Optional) Lists OMP route information for the specified route prefix.
ip-address	(Optional) Displays IP address of specific route.
familyfamily-address	Lists OMP route information for the specified IP family. <i>family-address</i> can be <b>ipv4</b> or <b>ipv6</b> .

vpnvpn-id	Lists the OMP routes for the specified VPN.
detail	Lists detailed route information about OMP peering sessions.

#### **Command Default**

None

#### **Command Modes**

#

## **Command History**

Release	Modification
Cisco SD-WAN Release 20.4.1	Command introduced.

### **Example**

vSmart# show tenant multitenancy-Customer1 omp routes

-----

omp route entries for vpn 1 route 172.16.33.0/24

_____

## show tenant-summary

To view information about the tenants assigned to a multitenant Cisco vSmart Controller, use the **show tenant-summary** command.

show tenant-summary [ max-tenants | num-active-tenants | tenant-org-names [tenant-name] [detail] | detail ]

## **Syntax Description**

max-tenants	View the maximum number of tenants that can be assigned to the Cisco vSmart Controller.
num-active-tenants	View the number of tenants assigned to the Cisco vSmart Controller.
tenant-org-names[tenant-name][detail]	Enter only the <b>tenant-org-names</b> argument to view information on the tenants assigned to the Cisco vSmart Controller, and the tenant and VPN IDs for each tenant.
	(Optional) Enter a tenant name along with <b>tenant-org-names</b> to view information about a specific tenant.
	(Optional) Enter the <b>detail</b> keyword for more detailed information for all or one of the tenants assigned to the Cisco vSmart Controller.
detail	Enter the <b>detail</b> keyword for detailed information for all the tenants assigned to the Cisco vSmart Controller.

#### **Command Default**

None

#### **Command Modes**

#

## **Command History**

Release	Modification
Cisco SD-WAN Release 20.4.1	Command introduced.

#### **Example**

```
vSmart# show tenant-summary
tenant-summary max-tenants 24
tenant-summary num-active-tenants 4

TENANT TENANT ORG NAME ID VPN ID

multitenancy-Customer1 1 1003
multitenancy-Customer2 2 1004
multitenancy-Customer3 3 1005
multitenancy-Customer4 4 1006
```

# show transport connection

Display the status of the DTLS connection to a vBond orchestrator (on vEdge routers and vSmart controllers only).

show transport connection

**show transport connection** [ip-address] [history [index [state state]]]

#### **Syntax Description**

history [index]	Connection History and Index: Display the complete connection history or the connection history of a specific indexed item.
state state	Connection State: Display connections with the specified state.  state can be up or down.
ip-address	vBond Address: IP address of the vBond orchestrator or the DNS name that points to the vBond orchestrator.

## **Command History**

Release	Modification
14.1	Command introduced.

#### **Example**

#### vEdge# show transport connection

track-transport, on page 511

# show tunnel gre-keepalives

Display information about the keepalive packets transmitted and received on GRE tunnels that originate on the local router (on vEdge routers only).

show tunnel gre-keepalives [vpn-id]

### **Syntax Description**

None	Display keepalive information for all GRE tunnels.
vpn-id	Specific VPN: Display keepalive information for GRE tunnels in a specific VPN.

### **Command History**

Release	Modification
15.4.1	Command introduced.

#### Example

#### vEdge# show tunnel gre-keepalives

							REMOTE	REMOTE					
	IF			ADMIN	OPER	KA	TX	RX	TX	RX	TX	RX	
VPN	NAME	SOURCE IP	DEST IP	STATE	STATE	ENABLED	PACKETS	PACKETS	PACKETS	PACKETS	ERRORS	ERRORS	TRANSITIONS

0	gre2	10.0.5.11	172.168.122.11	up	down	true	0	0	644	0	0	0	0

#### **Related Topics**

keepalive, on page 282 show interface, on page 829 show tunnel statistics, on page 1036 tunnel-destination, on page 519 tunnel-source, on page 523

## show tunnel inbound-connections

Display information about the IPsec tunnel connections that originate on the local router, showing the TLOC addresses for both ends of the tunnel (on vEdge routers only).

In Releases 15.2 and later, this command has been renamed to **show ipsec outbound-connections**.

#### show tunnel inbound-connections

**show tunnel inbound-connections** *local-tloc-address* [*local-color* [*remote-tloc-address* [*remote-color* [(dest-ip | dest-port | source-ip | source-port)]]]]

#### **Syntax Description**

None	Display information for all the IPsec connections that originate on the vEdge router. The tunnel connections are listed in order according to the local TLOC address.
local-tloc-address [local-color   [remote-tloc-address [remote-color [(dest-ip   dest-port   source-ip   source-port)]]]]	

#### **Command History**

Release	Modification
14.1	Command introduced.
15.2	Command renamed to show ipsec outbound-connections

#### **Example**

vEdge# show tunr	nel inbou	ind-connections					
SOURCE	SOURCE	DEST	DEST	REMOTE	REMOTE	LOCAL	LOCAL
IP	PORT	IP	PORT	TLOC ADDRESS	TLOC COLOR	TLOC ADDRESS	TLOC COLOR
10.1.14.14	12350	10.0.5.11	12346	172.16.255.14	lte	172.16.255.11	lte

10.1.16.16	12346	10.0.5.11	12346	172.16.255.16	lte	172.16.255.11	lte
10.0.5.21	12346	10.0.5.11	12346	172.16.255.21	lte	172.16.255.11	lte

#### **Related Topics**

show tunnel local-sa, on page 1035 show ipsec outbound-connections, on page 877

## show tunnel local-sa

Display the IPsec tunnel security associations for the local TLOCs (on vEdge routers only).

In Releases 15.2 and later, this command has been renamed to show ipsec local-sa.

show tunnel local-sa

show tunnel local-sa tloc-address [color [spi [(auth-key-hash | encrypt-key-hash | ip | port)]]]]

#### **Syntax Description**

	Display information for all the IPsec tunnels that originate on the router. The tunnel connections are listed in order according to the local TLOC address.	
$\begin{array}{l} \textit{tloc-address}  [\textit{color}  [\mathbf{spi}  [(\mathbf{auth\text{-}key\text{-}hash}     \mathbf{encrypt\text{-}key\text{-}hash}     \mathbf{ip}     \mathbf{port})  ]  ]  ]  \end{array}$	Specific SA: Display information for a specific security association.	

## **Command History**

Release	Modification
14.1	Command introduced.
15.2	Command renamed to <b>show ipsec local-sa</b> .

#### Example

#### vEdge# show tunnel local-sa

ELOG ADDDEGG	mina aninb	an-	SOURCE	SOURCE	
TLOC ADDRESS	TLOC COLOR	SPI 	1P	PORT	KEY HASH
172.16.255.15	lte	260	10.1.15.15	12346	*****0979

#### **Related Topics**

rekey, on page 425 request security ipsec-rekey, on page 705 show tunnel inbound-connections, on page 1035 show ipsec outbound-connections, on page 877

## show tunnel statistics

Display information about the packets transmitted and received on the data plane tunnels that originate on the local router (on vEdge routers only).

show tunnel statistics

show tunnel statistics bfd

show tunnel statistics dest-ip ip-address

show tunnel statistics dest-port port-number

show tunnel statistics ipsec

show tunnel statistics source-ip ip-address

 ${\bf show\ tunnel\ statistics\ source-port\ } port\text{-}number$ 

show tunnel statistics tunnel-protocol (gre | ipsec)

## **Syntax Description**

None	Display statistics for all data plane tunnels, for both IPsec and GRE tunnels. Note that the output fields are specific for IPsec, so for GRE tunnels, the values for all fields are zero or empty.
bfd	BFD Tunnels: Display statistics for all BFD tunnels.
dest-ip ip-addressdest-port port-number	Destination IP Address or Port: Display statistics for the specified destination address or destination port number.
ipsec	IPsec Tunnels: Display statistics for IPsec tunnels.
source-ip ip-addresssource-port port-number	Source IP Address or Port: Display statistics for the specified source address or source port number.
tunnel-protocol (gre   ipsec)	Tunnel Protocol: Display tunnel statistics for either GRE or IPsec tunnels. To display the count of data packets, use the <b>show interface</b> command. To display the count of only GRE keepalive packets, use the <b>show tunnel gre-keepalives</b> command.

## **Command History**

Release	Modification
14.1	Command introduced.
15.4.1	Added support for GRE tunnels.
16.3.2	Added <b>bfd</b> option and display BFD hello and PMTU packet statistics.

## Example

## Example 1

## show umbrella deviceid

To display the Umbrella registration status, for Cisco IOS XE Catalyst SD-WAN devices, use the **show umbrella deviceid** command.

show umbrella deviceid

## **Syntax Description**

This command has no arguments or keywords.

### **Command History**

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.2.1r	This command was introduced.

#### **Examples**

The command displays a table with the registration details:

Column	Description
VRF	Virtual routing forwarding (VRF) instance.
Tag	VPN number from which registration is successful.
Status	Created or Unsuccessful.
Device-id	Unique number associated with the registration.

```
Device# show umbrella deviceid
Device registration details
VRF Tag
1 vpn1
```

Status Device-id ab00f5cee26f962e

## show uptime

Show how long the system has been running. This command is the same as the UNIX uptime command.

## show uptime

## **Syntax Description**

None

#### **Command History**

Release Modification	
14.1	Command introduced.

#### **Example**

```
vEdge# show uptime
16:34:32 up 6:29, 1 user, load average: 0.04, 0.05, 0.05
```

## **Related Topics**

show system status, on page 1023

## show users

Display the users currently logged in to the device.

show users

## vManage Equivalent

For all Cisco vEdge devices:

**Monitor** > **Network** > **Real Time** > **Users** 

## **Syntax Description**

None

### **Command History**

Release	Modification			
14.1	Command introduced.			

#### **Example**

#### **Example**

vEdge# show users

AUTH
SESSION USER CONTEXT FROM PROTO GROUP LOGIN TIME

```
96 admin cli 10.0.1.1 ssh netadmin 2014-07-24T14:57:43+00:00
```

### **Related Topics**

```
aaa, on page 26 request aaa unlock-user, on page 660
```

## show version

Display the active version of the Cisco SD-WAN software running on the device.

show version

## **Syntax Description**

None

#### **Command History**

Release	Modification		
14.1	Command introduced.		

#### **Example**

#### **Example**

```
vEdge# show version 15.3.3
```

#### **Related Topics**

request software install, on page 707

## show vrrp

Display information about the configured VRRP interfaces and groups (on vEdge routers only).

 $\textbf{show vrrp [interfaces } \textit{interface-name}] \ [\textbf{groups } \textit{group-number } [\textit{vrrp-parameter}] \ ]$ 

**show vrrp vpn** vpn-id [interfaces interface-name] [groups group-number [vrrp-parameter]]

### **Syntax Description**

	None: Display information about all VRRP interfaces and groups configured on the local vEdge router, for all VPNs.
interfaces interface-name	Interface: Display VRRP information for a specific interface.
vpn vpn-id	VPN: Refresh the dynamic ARP cache entries for the specific VPN.

groups group-number	VRRP Group: Display information for a specific VRRP group.					
groups group-number vrrp-parameter	VRRP Parameter: Display information about a specific VRRP parameter in a VRRP group. <i>vrrp-parameter</i> can be one of the following, which correspond to the header fields in the <b>show vrrp</b> output:					
	• advertisement-timer [number]					
	• last-state-change-time [ccyy-mm-ddthh:mm:ss]					
	• master-down-timer [number]					
	• omp-state [down   up]					
	• prefix-list-state [resolved   unresolved]					
	• priority [number]					
	• track-prefix-list [prefix-list-name]					
	• virtual-ip [ip-address]					
	• virtual-mac [mac-address]					
	• vrrp-state [backup   init   master]					

## **Command History**

Release	Modification		
14.1	Command introduced.		

## **Related Topics**

show interface, on page 829 vrrp, on page 550

## show wlan clients

Display information about the clients on the wireless WAN (on vEdge routers only).

show wlan clients [vap-number]

## **Syntax Description**

vap-number	Specific VAP: Display information about the clients connected to a specific virtual access point.
------------	---------------------------------------------------------------------------------------------------

## **Command History**

Release	Modification			
16.3	Command introduced.			

### **Example**

### **Example**

Display information about all clients connected to all VAPs on the WLAN:

#### vEdge# show wlan clients

VAP	CLIENT ID	MAC	MODE	BAND	CHANNEL	CHANNEL BANDWIDTH	DATA SECURITY	RX RATE	RSSI	ASSOC TIME

### **Related Topics**

show interface, on page 829 show wlan interfaces, on page 1042 show wlan radios, on page 1043

## show wlan interfaces

Display information about the virtual access point (VAP) interfaces (on vEdge routers only).

Note

The **show interface** command displays no information about VAP interfaces.

## show wlan interfaces [detail] [vap-id]

detail	Detailed VAP Interface Information: Display detailed information about the VAP interfaces.
vap-id	Specific VAP: Display information about a specific virtual access point.

## **Command History**

Release	Modification
16.3	Command introduced.

#### **Examples**

#### **Example 1**

Display regular and detailed information about all the VAP interfaces on the WLAN:

ADMIN OPER

vEage	# snow wian interiac	es		MGMT			ADMIN	OPER	NUM

### Example 2

Display information about a specific VAP:

#### vEdge# show wlan interfaces

VAP	SSID	BSSID	DATA SECURITY	MGMT SECURITY	BAND	MODE	ADMIN STATUS		NUM CLIENTS	
-		80:b7:09:01:39:0a 80:b7:09:01:39:0b				802.11ac 802.11ac	-	Up Up	0	

#### vEdge# show wlan interfaces vap1

```
vap1 :
    IEEE 802.11ac    5 GHz SSID: test2
    Admin status: Up, Oper status: Up
    BSSID: 80:b7:09:01:39:0b
    Data security: wpa2-personal
    Management security: none
    Description:
    Bit rate: 1300 Mbps
    Transmit power: 25 dBm
    Active clients: 1, Max clients: 25
```

### **Related Topics**

show interface, on page 829 show wlan clients, on page 1041 show wlan radios, on page 1043

## show wlan radios

Display information about the WLAN radios (on vEdge routers only).

**show wlan radios** [radio-name [parameter]]

#### **Syntax Description**

	None: Display information about all WLAN radios.
radio-name [parameter]	Specific Radio: Display information about a specific radio and about a specific radio parameter. <i>parameter</i> can be one of the column heads in the output of the regular <b>show wlan radios</b> command.

#### **Command History**

Release	Modification				
16.3	Command introduced.				

#### **Examples**

#### **Example 1**

Display information about all WLAN radios:

#### vEdge# show wlan radios

show wlan interfaces, on page 1042
```

## show wlan radius

Display information about the sessions with RADIUS servers being used for WLAN authentication (on vEdge routers only).

show wlan radius [vap number] [tag]

#### **Syntax Description**

tag	Tag Associated with a RADIUS Server: The tag can be from 4 through 16 characters long. You configure it with the <b>wlan interface vap</b> <i>number</i> <b>radius-servers</b> <i>tag</i> command.
vap	VAP Interface Virtual access point instance.
number	Range: 0 through 3

### **Command History**

Release	Modification
17.1	Command introduced.

### **Example**

#### Example 1

Display information about the RADIUS servers that are being used for WLAN authentication:

```
vEdge# show wlan radius
vap1 :
    Primary Server, Tag: tag dummy1, IP: 10.20.24.15, VPN: 1
    Priority: 0, Source interface:
    Authentication information
       Server Port: 1812, Active: true, Round trip time: 0
       Access requests : 0, retransmissions : 0, challenges
                             0, rejects : 0, malformed 0, pending requests : 0, timeouts
                                                         0, malformed responses : 0
       Access accepts
       Bad authenticators :
                                                                               : 0
                         : 0, packets dropped :

# show ztp entries

Display a list of the vEdge router chassis numbers that are present in the ZTP table on the vBond orchestrator that is acting as a ZTP server.

#### show ztp entries

show ztp entries [row-index] (chassis-number number | organization-name name | root-cert-path path | validity (valid | invalid) | vbond-ip ip-address | vbond-port number)

#### **Syntax Description**

	None: List all entries in the ZTP table.
chassis-number number   organization-name name   root-cert-path path   validity (valid   invalid)   vbond-ip ip-address   vbond-port number	Chassis Information: List the entries corresponding to the specific chassis-related information.
row-index	Table Row: List the ZTP entry corresponding to the specified row number in the ZTP table.

#### **Command History**

Release	Modification
15.3	Command introduced.

### Example

## Example 1

```
vBond# request device add chassis-number 12345 serial-number 6789 validity valid vbond 10.1.14.1 org-name viptela
Adding Chassis number 12345 to the database
Successfully added the chassis-number

Creating Serial file ..
Uploading serial numbers via VPN 0
Copying ... /home/admin/vedge_serial_entries via VPN 0
Successfully loaded the vEdge serial numbers
```

#### vBond# show ztp entries

INDEX	CHASSIS NUMBER		VALIDITY	VBOND IP		ORGANIZATION NAME	CERT PATH
1	12345	6789	valid	10.1.14.1	12345	viptela

request device, on page 671 request device-upload, on page 672

# tcpdump

Print a description of the contents of control plane packets on a network interface that match a boolean expression. This command is the same as the UNIX **tcpdump** command.

tcpdump [help] [interface interface-name] [options "unix-options"] [vpn vpn-id]

### **Syntax Description**

interface interface-name	Interface to Watch: Name of the interface on which to perform a TCP dump.
options " unix-options "	Options: One or more of the UNIX <b>tcpdump</b> command options, from among the following: [-AbdDefhHIJKILnNOpqStuUv] [-B size] [-c count] [-E algorithm:secret] [-j timestamp-type] [-M secret] [-T type] [-y data-link-type] [expression]  You must enclose unix-options in quotation marks.  For an explanation of the options, see http://www.tcpdump.org/tcpdump_man.html.
vpn vpn-id	VPN to Watch: VPN identifier in which the interface is located.

For an explanation of the remaining standard UNIX options, see http://www.tcpdump.org/tcpdump_man.html.

## **Command History**

Release	Modification
14.1	Command introduced.
16.3	Updated the command options.

## Example

#### Example 1

```
vEdge# tcpdump vpn 1
tcpdump in vpn 1
tcpdump: verbose output suppressed, use -v or -vv for full protocol decode
listening on ge0_0, link-type EN10MB (Ethernet), capture size 65535 bytes
19:29:49.765224 TP 10.2.2.11 > 224.0.0.5: OSPFv2, Hello, length 48

```

## test policy match control-policy

To determine the sequence number that matches a particular input variable and a policy name, use the **test policy match control-policy** command in privileged EXEC mode.

test policy match control-policy policy name input variable

#### **Syntax Description**

policy Name of a policy.

input variable The following are the input variables used to search for policies:

- carrier: Identifier of the carrier type. It primarily indicates whether the transport is public or private.
- color: Identifier of the Transport Locator (TLOC) type.
- color-list: Name of the list of colors defined in policy lists.
- **community-list**: Name of the BGP community list defined in policy lists.
- domain-id: Domain identifier, or ID related to group of devices in the same domain and associated with a TLOC.
- **expanded-community-list**: Name of community list of Regex BGP community strings defined in policy lists.
- group-id: Specific group id of devices.
- ipv4-prefix: An IPv4 prefix.
- ipv4-prefix-list: Name of the list of IPv4 prefixes defined in policy lists.
- ipv6-prefix: An IPv6 prefix.
- ipv6-prefix-list: Name of the list of IPv6 prefixes defined in policy lists.
- omp-tag: OMP tag value associated with the TLOC route in the route table on the device.
- origin: Source of the route, either BGP, OSPF, connected, static.
- **originator**: System-ip address of the originating node.
- **preference**: OMP path-selection preference. A higher value is a more preferred path. Preference value for a route or prefix in the local site.
- region: Region ID defined in hierarchical SDWAN.
- region-list: Name of the region list ids defined in policy lists.
- role: Search by one of the hierarchical SDWAN roles.
- **site-id**: Individual site contributor or more overlay network site identifiers. A site can have multiple nodes or TLOCs.
- site-list: Name of the site list. Search by the name of list of site ids defined in policy lists.
- tloc: TLOC used as next hop for the vRoute. Search by individual TLOC address.
- tloc-list: Name of the list of tlocs defined in policy lists.
- vpn: VPN to which the vRoute belongs. Search by individual VPN ID.
- vpn-list: Name of the list of VPN IDs defined in policy lists.

**Command Default** 

None

**Command Modes** 

Privileged EXEC (#)

#### **Command History**

Release	Modification

Cisco IOS XE Catalyst SD-WAN Release 17.8.1a This command was introduced.

### **Usage Guidelines**

For the following, use the **test policy match control-policy** command:

- When there are one or more control policies that are configured on a Cisco SD-WAN Controller.
- When a policy is configured, to check if an entity is assigned correctly under a policy's sequence.
- To troubleshoot large policies with multiple sequence numbers. This command returns the sequence number of the policy that matches input.

## **Examples**

The following sample output shows the sequence in control policy1 for vpn 2:

```
Device# test policy match control-policy control_policy1 vpn 2

Found: vpn 2 matches policy control_policy1 sequence 111
sequence: 111
match route [VPN-ID (0x100)]
vpn-id: 2
action: reject
set: [ (0x0) ]
```

The following sample output shows the sequence of the cp1 policy for prefix 10.1.1.1/32:

The following sample output shows the sequence of the cp1 policy for ipv6-prefix a:a:a:a:a:a:a:a:a:a:a/128:

#### Table 27: test policy match control-policy Field Descriptions

Field	Description
FOUND	Displays a statement informing about the policy's sequence with the search entity.
SEQUENCE	Displays the policy sequence added to the policy name.
VPN-ID	Displays the VPN ID of the policy match that is found.
ACTION	Displays the configured action for the given sequence in a policy.

Field	Description
	Displays the configured set actions when a route or a TLOC is accepted.

# timestamp

Control the inclusion of timestamp information in command output and logging files.

timestamp (disable | enable)

## **Syntax Description**

disable	Disable Timestamp Information: Disable the inclusion of timestamp information. This is the default.
enable	Enable Timestamp Information: Enable the inclusion of timestamp information.

## **Command History**

Release	Modification
14.1	Command introduced.

## **Example**

#### Example 1

```
vEdge# timestamp enable
vEdge# timestamp disable
Tue Feb 18 19:09:37.112 UTC
vEdge# timestamp enable
vEdge#
```

#### **Related Topics**

show clock, on page 782

# tools ip-route

Display IP routes and the routing cache. This command is effectively the standard Linux **ip-route** command. **tools ip-route** 

## **Syntax Description**

None

#### **Command History**

Release	Modification
16.1	Command introduced.

#### **Example**

#### **Example 1**

```
vEdge# tools ip-route
default via 10.0.5.13 dev eth1 proto zebra
10.0.1.0/24 dev eth0 proto kernel scope link src 10.0.1.19

```

#### **Related Topics**

show ip routes, on page 867

# tools iperf

Run tests to display various parameters related to timing, buffers, and the TCP and UDP protocols for IPv4 and IPv6 (on vEdge routers only). This command is similar to the standard **iperf** command.

tools iperf [options options] [vpn vpn-id]

tools iperf help

#### **Syntax Description**

help	Command Help: Display all the command options.
options options	Command Options: See the Example Output below for a list of all the <b>tools iperf</b> command options.
vpn vpn-id	Specific VPN: Run the command in a specific VPN.  Default: VPN 0

#### **Command History**

Release	Modification
17.1	Command introduced.

#### Example 1

```
vEdge# tools iperf helpUSAGE:
 Options:
  help
                           Show usage
   vpn
                           VPN or namespace
   options
                           iperf options
iperf --help in VPN 0
Usage: iperf [-s|-c host] [options]
       iperf [-h|--help] [-v|--version]
Client/Server:
 -f, --format
                 [kmKM] format to report: Kbits, Mbits, KBytes, MBytes
  -i, --interval #
                         seconds between periodic bandwidth reports
                       length of buffer to read or write (default 8 KB)
 -1, --len
                 #[KM]
  -m, --print mss
                         print TCP maximum segment size (MTU - TCP/IP header)
                <filename> output the report or error message to this specified file
  -o, --output
  -p, --port
                 # server port to listen on/connect to
  -u, --udp
                         use UDP rather than TCP
  -w, --window
               #[KM] TCP window size (socket buffer size)
  -B, --bind
                <host> bind to <host>, an interface or multicast address
  -C, --compatibility for use with older versions does not sent extra msgs
  -M, --mss
                          set TCP maximum segment size (MTU - 40 bytes)
  -N, --nodelay
                         set TCP no delay, disabling Nagle's Algorithm
  -V, --IPv6Version
                        Set the domain to IPv6
Server specific:
  -s, --server
                         run in server mode
  -U, --single udp
                         run in single threaded UDP mode
  -D, --daemon
                        run the server as a daemon
Client specific:
  -b, --bandwidth #[KM]
                         for UDP, bandwidth to send at in bits/sec
                          (default 1 Mbit/sec, implies -u)
                 <host> run in client mode, connecting to <host>
  -c, --client
  -d, --dualtest
                        Do a bidirectional test simultaneously
  -n, --num
                 #[KM] number of bytes to transmit (instead of -t)
  -r, --tradeoff
                        Do a bidirectional test individually
  -t, --time
                          time in seconds to transmit for (default 10 secs)
  -F, --fileinput <name>
                          input the data to be transmitted from a file
  -I, --stdin
                         input the data to be transmitted from stdin
                        port to receive bidirectional tests back on
  -L, --listenport #
  -P, --parallel #
                        number of parallel client threads to run
  -T, --ttl
              #
                         time-to-live, for multicast (default 1)
  -Z, --linux-congestion <algo> set TCP congestion control algorithm (Linux only)

options options	Command Options: See the Linux <b>minicom</b> man page for a list of all the <b>tools minicom</b> command options.

Release	Modification
17.1	Command introduced.

# **Example**

#### Example 1

Access the serial console of a remote device through the USB port on a vEdge 1000 router:

- Connect the USB port of a vEdge 1000 or vEdge 200 router to a console port, either on the router
  or another device.
- **2.** Exit from the CLI to the router's shell:

```
vEdge1000# vshell
```

**3.** Determine which USB port is connected:

```
# ls -lrt /dev/tty*
```

**4.** Return to the CLI:

# exit

**5.** Set the baud rate on the port:

```
vEdge-1000# tools minicom "-b 115200 /dev/ttyUSB-port
```

**6.** Press Ctrl-a and z, set up the port with the minicom tool, and save the configuration.

tools ss, on page 1060
```

# tools nping

Generate network packets, analyze responses, and measure response times. This command is effectively the standard Linux **nping** command.

nping generates network packets of different protocols. You can use the command as a simple ping utility to detect active hosts, and you can use it to generate raw packets to perform network stack stress tests, ARP poisoning, denial-of-service attacks, route tracing, among other things.

nping echo mode displays how generated probes change in transit so that you can track differences between transmitted and received packets.

Note

The nping command expects the echo response packet to be received on the same interface as the echo request transmit interface. If it is not the same, nping treats it as a failure.

**tools nping** (hostname | ip-address) [**options** options] [**vpn** vpn-id] **tools nping help**

  options
                           Nping options
Nping in VPN 0
Nping 0.6.47 ( http://nmap.org/nping )
Usage: nping [Probe mode] [Options] {target specification}
TARGET SPECIFICATION:
 Targets may be specified as hostnames, IP addresses, networks, etc.
 Ex: scanme.nmap.org, microsoft.com/24, 192.168.0.1; 10.0.*.1-24
PROBE MODES:
                                  : Unprivileged TCP connect probe mode.
 --tcp-connect
  --tcp
                                  : TCP probe mode.
 --udp
                                   : UDP probe mode.
                                  : ICMP probe mode.
 --icmp
                                  : ARP/RARP probe mode.
 --arp
 --tr, --traceroute
                                 : Traceroute mode (can only be used with
                                    TCP/UDP/ICMP modes).
TCP CONNECT MODE:
   -p, --dest-port <port spec> : Set destination port(s).
   -g, --source-port <portnumber> : Try to use a custom source port.
TCP PROBE MODE:
  -g, --source-port <portnumber> : Set source port.
  -p, --dest-port <port spec> : Set destination port(s).
   --seq <seqnumber>
                                  : Set sequence number.
  --flags <flag list>
                                 : Set TCP flags (ACK, PSH, RST, SYN, FIN...)
  --ack <acknumber>
                                 : Set ACK number.
  --win <size>
                                  : Set window size.
   --badsum
                                  : Use a random invalid checksum.
UDP PROBE MODE:
  -g, --source-port <portnumber> : Set source port.
   -p, --dest-port <port spec> : Set destination port(s).
   --badsum
                                 : Use a random invalid checksum.
ICMP PROBE MODE:
```

```
: ICMP type.
  --icmp-type <type>
  --icmp-code <code>
                                   : ICMP code.
  --icmp-id <id>
                                  : Set identifier.
  --icmp-seq <n>
                                 : Set sequence number.
  --icmp-redirect-addr <addr> : Set redirect address.
--icmp-param-pointer <pnt> : Set parameter problem
  --icmp-advert-ort : Set router advert : Set router advert : Set router advert :
                                  : Set router advertisement lifetime.
  --icmp-advert-entry <IP,pref> : Add router advertisement entry.
  --icmp-orig-time <timestamp> : Set originate timestamp.
  --icmp-recv-time <timestamp> : Set receive timestamp.
  --icmp-trans-time <timestamp> : Set transmit timestamp.
ARP/RARP PROBE MODE:
  --arp-type <type>
                                   : Type: ARP, ARP-reply, RARP, RARP-reply.
  --arp-sender-mac <mac>
                                 : Set sender MAC address.
  --arp-sender-ip <addr>
                                 : Set sender IP address.
  --arp-target-mac <mac>
                                 : Set target MAC address.
  --arp-target-ip <addr>
                                  : Set target IP address.
IPv4 OPTIONS:
                                   : Set source IP address.
 -S, --source-ip
  --dest-ip <addr>
                                  : Set destination IP address (used as an
                                    alternative to {target specification} ).
  --tos <tos>
                                   : Set type of service field (8bits).
  --id <id>
                                   : Set identification field (16 bits).
  --df
                                   : Set Don't Fragment flag.
  --mf
                                  : Set More Fragments flag.
  --ttl <hops>
                                  : Set time to live [0-255].
  --badsum-ip
                                  : Use a random invalid checksum.
  --ip-options \langle S|R \text{ [route]}|L \text{ [route]}|T|U \ldots \rangle : Set IP options
  --ip-options <hex string>
                                               : Set IP options
                                   : Set MTU. Packets get fragmented if MTU is
  --mtu <size>
                                    small enough.
IPv6 OPTIONS:
  -6. -- TPv6
                                   : Use IP version 6.
  --dest-ip
                                   : Set destination IP address (used as an
                                     alternative to {target specification}).
                                  : Set hop limit (same as IPv4 TTL).
  --hop-limit
  --traffic-class <class> : Set traffic class.
  --flow <label>
                                  : Set flow label.
ETHERNET OPTIONS:
  --dest-mac <mac>
                                  : Set destination mac address. (Disables
                                    ARP resolution)
  --source-mac <mac>
                                 : Set source MAC address.
  --ether-type <type>
                                 : Set EtherType value.
PAYLOAD OPTIONS:
                             : Include a custom F...
: Include a custom ASCII text.
  --data <hex string>
  --data-string <text>
  --data-length <len>
                                  : Include len random bytes as payload.
ECHO CLIENT/SERVER:
                               : Run Nping in client mode.
  --echo-client <passphrase>
  --echo-server <passphrase>
                                   : Run Nping in server mode.
  --echo-port <port>
                                   : Use custom <port> to listen or connect.
  --no-crypto
                                   : Disable encryption and authentication.
  --once
                                  : Stop the server after one connection.
 --safe-payloads
                                  : Erase application data in echoed packets.
TIMING AND PERFORMANCE:
  Options which take <time> are in seconds, or append 'ms' (milliseconds),
  's' (seconds), 'm' (minutes), or 'h' (hours) to the value (e.g. 30m, 0.25h).
  --delay <time>
                                  : Adjust delay between probes.
  --rate <rate>
                                   : Send num packets per second.
MTSC:
  -h, --help
                                   : Display help information.
  -V, --version
                                   : Display current version number.
  -c, --count <n>
                                   : Stop after <n> rounds.
  -e, --interface <name>
                                 : Use supplied network interface.
```

```
-H, --hide-sent
                                   : Do not display sent packets.
  -N, --no-capture
                                   : Do not try to capture replies.
  --privileged
                                  : Assume user is fully privileged.
  --unprivileged
                                  : Assume user lacks raw socket privileges.
  --send-eth
                                  : Send packets at the raw Ethernet layer.
  --send-ip
                                   : Send packets using raw IP sockets.
  --bpf-filter <filter spec>
                                   : Specify custom BPF filter.
OUTPUT:
                                   : Increment verbosity level by one.
  -v[level]
                                  : Set verbosity level. E.g: -v4
  -d
                                  : Increment debugging level by one.
  -d[level]
                                   : Set debugging level. E.g: -d3
                                   : Decrease verbosity level by one.
  -q
  -q[N]
                                  : Decrease verbosity level N times
  --quiet
                                  : Set verbosity and debug level to minimum.
  --debug
                                   : Set verbosity and debug to the max level.

tools netstat, on page 1055

# tools stun-client

Discover the local device's external IP address when that device is located behind a NAT device. This command obtains a port mapping for the device and optionally discovers properties about the Network Address Translator (NAT) between the local device and a server. This command is similar to a standard Linux **stun**, **stunc**, and **stun-client** commands.

Device discovery is done using the Session Traversal Utilities for NAT (STUN) protocol, which is defined in RFC 5389 .

 $\textbf{tools stun-client [options } options] \textbf{ server } (domain-name \mid ip\text{-}address) \textbf{ [port } port\text{-}number] \textbf{ [vpn } vpn\text{-}id] \\ \textbf{tools } \textbf{stun-client } \textbf{help}$ 

# **Syntax Description**

help	Command Help: Display all the command options.
options options	Command Options: See the Example Output below for a list of all the <b>tools stun-client</b> command options.
server (domain-name   ip-address)   [port port-number]	Remote STUN Server: Remote server to attach to, and port to use to reach the server. The default port number for UDP and TCP is 3478.
vpn vpn-id	Specific VPN: Run the command in a specific VPN.
	Default: VPN 0

#### **Command History**

Release	Modification
16.2	Command introduced.

#### **Examples**

#### Example 1

Perform a generic basic binding STUN test against Googles STUN server:

```
vEdge# tools stun-client vpn 0 options "--mode basic stun.1.google.com 19302" stunclient --mode basic stun.1.google.com 19302 in VPN 0 Binding test: success Local address: 50.247.64.109:56485 Mapped address: 50.247.64.109:56485
```

#### Example 2

Perform a full test to detect NAT type against Google's STUN server:

```
vEdge# tools stun-client vpn 0 options "--mode full stun.l.google.com 19302"
stunclient --mode full stun.l.google.com 19302 in VPN 0
Binding test: success
Local address: 50.247.64.109:33760
Mapped address: 50.247.64.109:33760
Behavior test: success
Nat behavior: Direct Mapping
Filtering test: success
Nat filtering: Endpoint Independent Filtering
```

#### Example 3

Perform a full NAT detection test using UDP source port 12346 (the default DTLS/IPsec port) against Google's STUN server:

```
vEdge# tools stun-client vpn 0 options "--mode full --localport 12346 stun.l.google.com
19302"
stunclient --mode full --localport 12346 stun.l.google.com 19302 in VPN 0
Binding test: success
```

```
Local address: 50.247.64.109:12346
Mapped address: 50.247.64.109:12346
Behavior test: success
Nat behavior: Direct Mapping
Filtering test: success
Nat filtering: Endpoint Independent Filtering
```

Display help for the **tools stun-client** command:

```
vEdge# tools stun-client help
The following options are supported:
    --mode MODE
   --localaddr INTERFACE
    --localport PORTNUMBER
    --family IPVERSION
   --protocol PROTO
    --verbosity LOGLEVEL
   --help
--mode (basic | full)
"basic" mode is the default and indicates that the client should perform a STUN binding
only. "full" mode indicates that the client should attempt to diagnose NAT behavior and
filtering methodologies if the server supports this mode. The NAT filtering test is supported
only for UDP.
--localaddr INTERFACE or IPADDRESS
Name of an interface (such as "eth0") or one of the available IP addresses assigned to a
network interface present on the host. The interface chosen is the preferred address for
sending and receiving responses with the remote server. The default is to let the system
decide
which address to send on and to listen for responses on all addresses (INADDR ANY).
--localport PORTNUM
PORTNUM is a value between 1 to 65535. It is the UDP or TCP port that the primary and
alternate interfaces listen on as the primary port for binding requests. If not specified,
system randomly chooses an available port.
--family IPVERSION
IPVERSION is either "4" or "6" to specify the usage of IPv4 or IPv6. The default value is
"4".
--protocol (udp | tcp)
"udp" is the default.
--verbosity LOGLEVEL
Set the logging verbosity level. 0 is the default, for minimal output and logging). 1 shows
slightly more, and 2 and higher show even more.
EXAMPLES
stunclient stunserver.org 3478
   Perform a simple binding test request with the server, listening at "stunserver.org".
stunclient --mode full --localport 9999 12.34.56.78
   Perform a full set of UDP NAT behavior tests from local port 9999 to the server, listening
    at IP address 12.34.56.78 (port 3478).
```

```
stunclient --protocol tcp stun.selbie.com
   Performs a simple binding test using TCP to server, listening on the default port of
3478
   at stun.selbie.com.
```

# traceroute

Display the path that packets take to reach a host or IP address on the network.

**traceroute interface** interface-name [size bytes] [options options] (hostname | ip-address)

traceroute vpn vpn-id [interface interface-name] [size bytes] [options " options "] (hostname | ip-address)

interface interface-name	Interface: Interface through which traceroute probe should send packets.
(hostname   ip-address)	Network Host: Hostname or IPv4 or IPv6 address of a system on the network.
options " options	Options: One or more options for the traceroute probe. <i>option</i> can be one or more of the following. Enclose the options in quotation marks (" ").
	• -d: Set the SO_DEBUG options to socket.
	• - <b>f</b> <i>first-ttl</i> : Report the traceroute probe results starting with the specified hop in the path.
	• -g gateway: Add an IP source route gateway to the outgoing packet.
	• -I (capital letter "i"): Use ICMP echo packets instead of UDP datagrams.
	• -i (lowercase letter "i") <i>interface-name</i> : Network interface from which to obtain the source IP address for outgoing traceroute probe packets.
	• - <b>m</b> <i>maximum-ttl</i> : Set the maximum time-to-live value, which is the maximum number of hops.
	• – <b>n</b> : Print numeric IP addresses.
	• - <b>p</b> <i>port</i> : Base UDP port number to use in traceroute probes. The default port is 33434.
	• -q probes: Number of probes to send per TTL. The default is 3.
	• -r: Bypass the normal route tables, and send the traceroute probe directly to a host
	• -s source-ip-address: Source IP address to use in the probe packets.
	• -t tos: Type-of-service value to use in the probe packets. The default is 0.
	• –v: Display output in verbose mode.
	• -w wait-time: Time, in seconds, to wait for a response. The default is 3 seconds.
	• - <b>z</b> pause-time: Time, in milliseconds, to pause between probes. The default is 0 milliseconds.

size bytes	Probe Packet Size: Size of the traceroute probe packets, in bytes. The maximum packet size is 32,768 bytes.
<b>vpn</b> vpn-id	VPN: VPN in which the network host is located.

Release	Modification
14.1	Command introduced.
14.2	Added interface, options, size, and vpn options.
16.3	Added support for IPv6 host addresses.

# **Usage Guidelines**

When a traceroute packet inside a service VPN arrives on the WAN interface:

• The Cisco vEdge device responds with a source IP of one of the interfaces in the service VPN.

Note

For Cisco vEdge devices, the **traceroute** command does not support UDP.

• The Cisco IOS XE Catalyst SD-WAN device responds with a source IP of the WAN interface where the packet is received.

In both cases, the packets are always encapsulated in IPSec.

#### **Examples**

#### Example 1

```
vEdge-112# traceroute vpn 1 192.168.111.30
Traceroute in vpn 1
traceroute to 192.168.111.30 (192.168.111.30), 30 hops max, 46 byte packets
1 172.23.2.2 (172.23.2.2) 0.171 ms 0.196 ms 0.126 ms
2 100.100.100.11 (100.100.100.11) 0.128 ms 0.197 ms 0.127 ms
3 100.100.100.12 (100.100.100.12) 0.165 ms 0.194 ms 0.146 ms
4 172.23.111.2 (172.23.111.2) 0.218 ms 0.227 ms 0.214 ms
5 192.168.111.30 (192.168.111.30) 1.173 ms 0.824 ms 1.239 ms
```

#### Example 2

```
vEdge# traceroute host 10.2.3.12 size 1000 vpn 1 options "-q1 -w1 -m5"
Traceroute -q1 -w1 -m5 10.2.3.12 in VPN 1
traceroute to 10.2.3.12 (10.2.3.12), 5 hops max, 1000 byte packets
1 10.20.24.15 (10.20.24.15) 0.254 ms
2 10.0.5.21 (10.0.5.21) 1.318 ms
3 10.2.3.12 (10.2.3.12) 1.310 ms
```

# vshell

Exit from the Cisco SD-WAN CLI to the Linux shell running on the device. In the shell, the default terminal is xterm.

Use the UNIX **exit** command to return to the CLI. If the shell session is inactive, it times out after 15 minutes, and the device returns to the Cisco SD-WAN CLI.

Once you are in the shell, you can use standard Linux commands to perform standard operations, such as listing files, changing directories, and copying files off the device. To edit a file, use the **vi** editor.

#### vshell

#### **Syntax Description**

None

#### **Command History**

Release	Modification
14.1	Command introduced.
15.4	Idle session timeout added.
15.4.3	Having xterm be default terminal added

#### Example

#### Example 1

```
vEdge# show version
15.4.3
vEdge# vshell
vEdge$ echo $TERM
xterm
vEdge:~$ exit
exit
vEdge#
```

To open an SSH connection from a vManage NMS to an IOS XE router, you must specify the port number, which is 830:

```
vManage# vshell
vManage:~$ ssh 172.16.255.15 -p 830
admin@172.16.255.15's password:
```

# **Overview of Configuration Management Commands**

The configuration management command reference pages describe the CLI commands that you use to manage a configuration on vSmart controllers, vEdge routers, and vBond orchestrators. You know that you are in configuration mode because the CLI prompt changes to include the string (**config**).

In the CLI, the configuration management commands are grouped together after the functional configuration commands, and they are organized alphabetically. Some of commands are organized into functional hierarchies. The top-level configuration management commands and command hierarchies are:

- abort—End the configuration session.
- clear—Remove all changes to the configuration.
- commit—Activate the configuration.
- describe—Display help about the configuration commands.
- do—Run an operational command without exiting from configuration mode.
- end—End the configuration session.
- exit—Exit from the current configuration level.
- help—Display help information about CLI commands.
- load—Load the configuration from an ASCII text file.
- no—Negate a command.
- pwd—Display the current configuration level.
- revert—Return to the running configuration.
- rollback—Return to a previously committed version of the configuration.
- save—Save the configuration to an ASCII text file.
- show—Display a configuration parameter.
- top—Return to the top level in the configuration.
- validate—Validate the configuration.

The configuration commands themselves are described under Configuration Commands.

# abort

Exit configure mode immediately, without displaying a prompt warning you to save uncommitted changes.

abort

#### **Syntax Description**

None

Release	Modification
14.1	Command introduced.

# **Example**

# Example 1

```
vedge1(config) # abort
vedge1#
```

#### **Related Topics**

```
clear, on page 1071
commit, on page 1072
rollback, on page 1080
```

# clear

Clear all changes made to the configuration during the current session.

clear

# **Syntax Description**

None

# **Command History**

Release	Modification
1	Command introduced.

# **Example**

# Example 1

```
vvedge1(config) # clear
All configuration changes will be lost. Proceed? [yes, NO] yes
vedge1(config) #
```

# **Related Topics**

```
abort, on page 1070 rollback, on page 1080
```

# commit

Activate the commands in the configuration on the Cisco vEdge device and make it the running configuration. You issue this **commit** command from configuration mode.

**commit** (abort | and-quit | check | confirmed [timeout] [persist] | no-confirm) [comment text] [label text] [persist-id id] [save-running filename]

	·
	None: Activate the commands in the configuration and remain at the same hierarchy in configuration mode.
comment text	Add a text comment about the commit operation. If the text string contains spaces, enclose the entire string in quotation marks (" "). Any comments are display in the output of the <b>show configuration commit list</b> command.
label text	Add a text label that describes the commit operation. If the text string contains spaces, enclose the entire string in quotation marks (" "). Any labels are display in the output of the <b>show configuration commit list</b> command.
and-quit	Exit from Configuration Mode: Active the configuration and return to operational mode.
abort	Halt a Commit Operation: Halt a provisional commit operation.
confirmed [timeout] [persist]	Provisional Commit Operation: Commit the current configuration to the running configuration. If no <b>commit confirm</b> command is issued before the timeout period, specified in minutes, expires, the configuration reverts to what was active before the <b>commit confirmed</b> command was issued. The default timeout is 10 minutes. The configuration session terminates after you issue this command, because no further editing is possible. This command is available only in <b>configure exclusive</b> and <b>configure shared</b> mode when the system has been configured with a candidate configuration. If the CLI session is terminated before the <b>commit confirm</b> command is issued, the configuration reverts to the previously active configuration. If you include the <b>persist</b> option, you can terminate the CLI session before you issue the <b>commit confirm</b> command, and you can then confirm the pending commit in a later session by supplying the persist token as an argument to the <b>commit</b> command using the <b>persist-id</b> option.
	A <b>commit confirmed</b> command is valid only for the candidate datastore where the configuration parameter / <b>confdConfig/datastores/running/access</b> is set to <b>writable-through-candidate</b> in the confd.conf file and the configuration mode is set to either <b>configure exclusive</b> or <b>configure shared</b> mode. A candidate datastore provides a temporary work space in which a copy of the running configuration for the Cisco vEdge device is stored. You can create and modify the running configuration before committing the running configuration to the device.
	On Cisco vEdge devices, we have enabled writable-through-candidate in the confd file, which means that <b>commit confirmed</b> works only for <b>configure exclusive</b> or <b>configure shared</b> modes. By default, the configuration enters <b>configure private</b> mode, and therefore, your changes are written directly to the running configuration rather than to the candidate datastore. If you intend to use <b>commit confirmed</b> , use <b>configure exclusive</b> or <b>configure shared</b> modes.

persist-id id	Persist Token: If a prior confirming commit operation has been performed with the persist argument, include the <b>persist-id</b> option, specifying the same persist token, to modify the ongoing confirming commit process. This allows you, for example, to cancel an ongoing persist commit operation or extend the timeout.
save-running filename	Save the Configuration to a File: Save a text copy of the running configuration to the specified file.
check	Validate the Configuration: Validate current configuration and indicate any configuration errors.

Release	Modification
14.1	Command introduced.
15.2	"system is-vmanaged" warning added

#### **Example**

#### Example 1

```
vedge1(config-system)# commit and-quit
Commit complete.
vedge1#
```

#### Example 2

```
vm5# config exclusive
Entering configuration mode exclusive
Warning: uncommitted changes will be discarded on exit
vm5(config)# vpn 3
vm5(config-vpn-3)# commit confirmed
Warning: The configuration will be reverted if you exit the CLI without
performing the commit operation within 10 minutes.
vm5(config-vpn-3)# commit
Commit complete. Configuration is now permanent.
vm5(config-vpn-3)# exit
```

# **Related Topics**

# describe

Display internal information about how a configuration command is implemented.

describe command

# **Syntax Description**

command Information about a Command: Display internal information about a command's implementation.

### **Command History**

Release	Modification
14.1	Command introduced.

# **Example**

# Example 1

vm4(config) # describe vpn Common Source : YANG

Module : viptela-vpn
Namespace : http://viptela.com/vpn
Path : /vpn
Node : container
Revision : 2013-02-12

Exported agents : all

Checksum : 5b30372a4dedcad2a01633f79395720

# **Related Topics**

show parser dump, on page 957

# do

Run an operational command from within configuration mode.

do command

### **Syntax Description**

command
---------

#### **Command History**

Release	Modification
14.1	Command introduced.

#### Example 1

```
vedge1(config-vpn-0)# do show version
14.0b 20131206-2 build 52
vedge1(config)#
```

#### **Related Topics**

Overview of Operational Commands, on page 573

# end

Exit configuration mode.

end [no-confirm]

#### **Syntax Description**

	None: If no changes have been made to the configuration, exit configuration mode immediately. If changes have been made, you are asked to save the changes before existing configuration mode.	
no-confirm	Exit Immediately: Exit configuration mode immediately, without committing an changes to the configuration.	

# **Command History**

Release	Modification
1	Command introduced.

# **Example**

# Example 1

```
vedge1(config-banner)# end
Uncommitted changes found, commit them? [yes/no/CANCEL] no
vedge1#
```

# **Related Topics**

```
abort, on page 1070 exit, on page 1075
```

# exit

Exit from the current mode in the configuration, or exit configuration mode altogether.

# exit [configuration-mode] [level] [no-confirm]

# **Syntax Description**

	None: Exit from the current level in the configuration, and move up one hierarchy level.
configuration-mode	Exit Configuration Mode: If changes have been made to the configuration, you are prompted to commit them.
no-confirm	Exit Configuration Mode Immediately: Exit configuration mode immediately, without being prompted to commit any changes to the configuration.
level	Exit the Current Level: Exit from the current level in the configuration, and move up one hierarchy level. This is the default behavior if you type the <b>exit</b> command with no options.

# **Command History**

Release	Modification
14.1	Command introduced.

# **Example**

# Example 1

```
vedge1(config) # vpn 0 interface ge0/0
vedge1(config-interface-ge0/0) # exit
vedge1(config-vpn-0) #vedge1(config-banner) # exit configuration-mode
Uncommitted changes found, commit them? [yes/no/CANCEL] no
vedge1#
```

# **Related Topics**

end, on page 1075

# help

Display help information about a command.

help command

command	Help about a Command: Display short help information about a command.
---------	-----------------------------------------------------------------------

Release	Modification
14.1	Command introduced.

# **Example**

# Example 1

vedge1(config)# help banner
Help for command: banner
Set banners

#### **Related Topics**

show parser dump, on page 1091 show parser dump, on page 957

# load

Load the configuration from a file.

load (merge | override | replace) file-path

# **Syntax Description**

file-path	File Path: Path to the directory and filename of the file containing the configuration. It can be one of the following:
	• ftp:// user:password@host:port/file-path—Path to a file on an FTP server.
	• scp:// user @ host : file-path
	• / file-path / filename—Path to a file on the local Cisco vEdge device.
merge file-path	Merge with the Existing Configuration: Merge the configuration in the specified file with the current configuration.
override file-path	Override the Existing Configuration: Delete the current configuration and then replace it with a new configuration, which is loaded from the specified file.
replace file-path	Replace the Existing Configuration: Replace the corresponding parts of the current configuration with the contents of the specified file. This option differs from the <b>override</b> option in that only the parts of the configuration contained in the specified file are replaced. The rest of the configuration is unchanged.

Note

load override and load merge is not supported on Cisco IOS XE devices.

Release	Modification
14.1	Command introduced.

# **Example**

# Example 1

Load the configuration from a file on the router:

```
vm4(config) # load replace test-configuration-file
Loading.
1.18 KiB parsed in 0.09 sec (12.05 KiB/sec)
vm4(config) #
```

# **Related Topics**

```
file list, on page 643
rollback, on page 1080
save, on page 1082
```

# no

Delete or unset a configuration command or parameter.

no command

#### **Syntax Description**

command Delete or Unset a Command: Delete or unset the specified command from the configurat	on.
----------------------------------------------------------------------------------------------	-----

#### **Command History**

Release	Modification
14.1	Command introduced.

#### **Examples**

#### Example 1

Delete the login banner from the configuration:

```
vm4(config) # banner login "Welcome to vEdge4"
vm4(config-banner) # commit and-quit
Commit complete.
vm4# show running-config banner
banner
```

```
login "Welcome to vEdge4"
!
vm4# config
Entering configuration mode terminal
vm4(config)# no banner login
vm4(config)# commit and-quit
Commit complete.
vm4# show running-config banner
% No entries found.
```

Enable the operation of an interface:

```
vm4# show running-config vpn 0 interface ge0/7vpn 0
interface ge0/7
  ip address 10.0.100.14/24
  no shutdown
!
```

# pwd

Display the current path in the configuration hierarchy.

#### pwd

# **Syntax Description**

None

#### **Command History**

Release	Modification
14.1	Commad introduced.

### **Example**

#### Example 1

```
vedge1(config) # pwd
At top level
vedge1(config) # vpn 0 interface ge0/0
vedge1(config-interface-ge0/0) # pwd
Current submode path:
   vpn vpn-instance 0 \ interface ge0/0
vedge1(config-interface-ge0/0) #
```

# **Related Topics**

```
exit, on page 1075 top, on page 1092
```

# revert

Copy the running configuration into the current candidate configuration.

revert [no-confirm]

#### **Syntax Description**

	None: Copy the running configuration into the current candidate configuration, thus losing all configuration changes that have been made during this session. You are prompted to confirm this action.
no-confirm	Return to the Running Configuration Immediately: Immediately copy the running configuration into the current candidate configuration, thus losing all configuration changes that have been made during this session. You are not prompted to confirm this action.

#### **Command History**

Release	Modification
14.1	Command introduced.

# **Example**

### **Example 1**

```
vedgel(config)# revert
% No configuration changes.
vedgel(config)# no banner
vedgel(config)# revert
All configuration changes will be lost. Proceed? [yes, NO] no Aborted: by user
vedgel(config)#
```

### **Related Topics**

```
load, on page 1077 rollback, on page 1080
```

# rollback

Return to a previously committed configuration.

 $\textbf{rollback} \ (\textbf{configuration} \ [\textit{number}] \ | \ \textbf{selective} \ \textit{number})$ 

#### **Syntax Description**

rollback configuration	Return to the Previously Committed Configuration: Return to the most recently committed configuration. You are not prompted to confirm this action, and you lose all configuration changes that have been made during this session.
rollback configuration [number]	Return to an Earlier Committed Configuration: Return to the configuration changes made in all commit operations up to a particular rollback number. If you omit the number, you return to the previously committed configuration, which is rollback 0. Use the <b>rollback configuration?</b> to display the configuration numbers and the dates and times that the configurations were committed. For example, the command <b>rollback configuration 1</b> returns to the configuration changes made in rollback versions 0 and 1.
rollbackselective	Return to a Particular Earlier Committed Configuration: Return to the configuration changes made in a specific commit operation. Use the <b>rollback configuration?</b> to display the configuration numbers and the dates and times that the configurations were committed. For example, the command <b>rollback configuration 1</b> returns to the configuration changes made in rollback version 1.

#### **Command History**

Release	Modification
14.1	Command introduced.

#### **Examples**

# Example 1

Roll back to the last two sets of configuration changes:

```
vsmart(config) # do show running-config policy
% No entries found.
\verb|vsmart(config)| \# \textbf{ policy lists site-list s site-id } \mathbf{10}
\verb|vsmart(config-site-list-s)| \# \textbf{ commit}|
Commit complete.
config# do show running-config policy
policy
lists
  site-list s
   site-id 10
!
!vsmart(config-lists)# vpn-list v vpn 1
vsmart(config-vpn-list-v) # commit
Commit complete.
vsmart(config-vpn-list-v)#
vsmart(config) # do show running-config policy
policy
lists
  vpn-list v
   vpn 1
  site-list s
```

```
site-id 10
 !
 !
!
vsmart(config) # rollback configuration
Possible completions:
        2013-12-12 12:01:05 by admin via cli
 1
        2013-12-12 12:00:50 by admin via cli
 <cr> latest
vsmart(config) # rollback configuration 1
                                              =====> rollback 0 and 1 are applied
vsmart(config)# show configuration
policy
lists
 no vpn-list v
 no site-list s
```

Roll back to only the second previous configuration:

```
vsmart(config) # clear
All configuration changes will be lost. Proceed? [yes, NO] yes
vsmart(config) # show configuration
% No configuration changes found.
vsmart(config) # rollback selective
Possible completions:
0 2013-12-12 12:01:05 by admin via cli
1 2013-12-12 12:00:50 by admin via cli

<cr> latest
vsmart(config) # rollback selective 1 =======> Only rollback 1 applied
vsmart(config) # top show configuration
policy
lists
    no site-list s
!
!
```

#### **Related Topics**

```
load, on page 1077 revert, on page 1080
```

# save

Save the entire current configuration or parts of it to a file.

save file-path[hierarchy] [overwrite]

#### **Syntax Description**

file-path	File Path: Path to the directory and filename of the file containing the configuration. It can be one of the following:  • ftp: file-path—Path to a file on an FTP server.  • scp: user @ host: file-path.
overwrite	• / file-path / filename—Path to a file on the local Cisco vEdge device.  Overwrite an Existing File: Overwrite the contents of an existing file.
save filename	Save the Entire Configuration: Save the entire configuration to a file.
save filename hierarchy	Save a Portion of the Configuration: Save the specified configuration hierarchy to a file.

# **Command History**

Release	Modification
14.1	Command introduced.

#### **Example**

# Example 1

Save the configuration to a file:

```
vedge1(config)# save config-system system
Saving system
vedge1(config)# do file show config-system
system
host-name vedge1
system-ip 172.16.255.1

  task policy read
  task routing read
  task security read
  password $1$zvOh58pk$QLX7/RS/F0c6ar94.x12k.
```

```
!
user eve
password $1$aLEJ6jve$aBpPQpkl3h.SvA2dt4/6E/
group operator
!
!
logging
disk
enable
!
!
```

# **Related Topics**

```
file list, on page 643
file show, on page 644
load, on page 1077
```

# show configuration

Display changes that have been made to the configuration during the current editing session. The changes are displayed is the same format as the configuration is displayed when you issue a **show full-configuration** configuration command or a **show running-config** operational command.

**show configuration** [hierarchy]

### **Syntax Description**

	None: Show all configuration changes.
hierarchy	Specific Hierarchy: Show all the changes in a specific configuration hierarchy.

#### **Command History**

Release	Modification
14.1	Command introduced.

#### **Example**

#### Example 1

Display all configuration changes:

```
vm4(config)# banner motd "Welcome to vEdge4"
vm4(config-banner)# top
vm4(config)# show configuration
banner
motd "Welcome to vEdge4"
```

### **Related Topics**

show configuration commit, on page 1085 show configuration diff, on page 1086 show configuration merge, on page 1087 show configuration running, on page 1089 show full-configuration, on page 1090

# show configuration commit

Display the configuration changes that took effect as the result of a previous commit operation.

 $\textbf{show configuration commit changes} \ (\textit{rollback-number} \ | \ \textbf{latest})$ 

show configuration commit changes diff (rollback-number | latest)

show configuration commit list [number]

#### **Syntax Description**

(rollback-number   latest)	Configuration Changes Since a Specific Commit: List the configuration changes since a specific commit operation. <i>rollback-number</i> is the commit identifier. <b>latest</b> is the last commit operation. The changes are displayed is the same format as the configuration is displayed when you issue a <b>show full-configuration</b> configuration command or a <b>show running-config</b> operational command.
diff (rollback-number   latest)	Configuration Changes Since a Specific Commit, in Diff Format: List the configuration changes since a specific commit operation. <i>rollback-number</i> is the commit identifier. <b>latest</b> is the last commit operation. The changes are displayed is a UNIX diff-style format.
list [number]	Show the Configuration Commit History: List the commit identifiers and information about the previous commit operations.

#### **Command History**

Modification
Command ntroduced.

# **Examples**

#### Example 1

Display configuration changes:

```
vm4(config) # show configuration commit changes diff 1
+banner
+ login "Welcome to vEdge4"
+'
```

```
vm4(config) # show configuration commit changes 1
banner
  login "Welcome to vEdge4"
!
```

List an abridged commit history:

```
vm4(config) # show configuration commit list 10
2014-03-12 01:00:32
                     Client

# top

Move to the top level of the configuration hierarchy.

**top** [configuration-command]

#### **Syntax Description**

	None: Move to the top level of the configuration hierarchy.
configuration-command	Execute a Configuration Command: Execute a configuration command from the top level of the configuration hierarchy without actually moving to the top level of the configuration hierarchy.

Release	Modification
14.1	Command introduced.

## **Example**

## Example 1

```
vedgel(config-interface-ge0/0) # top
vedgel(config) # system aaa usergroup operator
vedgel(config-usergroup-operator) # top banner motd "Welcome"
vedgel(config-usergroup-operator) # top show configuration
banner
motd Welcome
!
vedgel(config-usergroup-operator) #
```

# **Command Filters for CLI Operational Commands**

Overview of Command Filters for CLI Operational Commands	
append	Append the command output to a file.
begin	Display the command output beginning with the line that contains the specified string. The string is case-sensitive.
best-effort	Display the command output or continue loading a file even if some kind of failure has occurred that might interfere with the process.
context-match	Display the upper hierarchy in which a command or string appears in the configuration.
count	Count the number of lines in the command output. The count of lines includes the line on which you type the command.
de-select	Do not display a field in the command output.
details	Display the default values for commands in the running configuration.
display xml	Render the command output as XML.
exclude	Exclude the lines that contain the string defined by the regular expression from the command output.
include	Include only the lines that contain the string defined by the regular expression in the command output.
linnum	Number the lines in the command output. This command effectively counts the numbers of lines in the output.
match-all	Display the command output that matches all command-output filters.
match-any	Display the command output that matches any one of the command-output filters.
more	Paginate the command output. This is the default behavior.

nomore	Do not paginate command output.
notab	Display tabular command output in a list rather than in a table.
repeat	Redisplay the output of a show command periodically.
save	Save the command output to a file.
select	Display fields to display in the command output.
sort-by	Arrange the command output based on the values in a particular field.
tab	Display tabular command output in table even if the table is wider than the width of the screen.
until	Display the command output, ending with the line that contains the specified string. The string is case-sensitive.

# **Overview of Command Filters for CLI Operational Commands**

This section describes the command filters you can use with CLI operational commands to modify operational command output or redirect the output to a file. To enter the filters, type a pipe (|) at the end of the command and then type the filter. You can include multiple filters after a command. Precede each filter with a pipe symbol.

The CLI filter commands are:

- append
- begin
- best-effort
- · context-match
- count
- de-select
- details
- · display xml
- exclude
- include
- match-all
- match-any
- more
- nomore
- notab
- repeat
- save
- select
- sort-by
- tab
- until

Note that not all filters are available with all commands.

# append

Append the command output to a file.

append filename

## **Syntax Description**

filename Name of File: Append the command output to the specified filename.

Release	Modification	
14.1	Command introduced.	

## **Example**

#### Example 1

```
vedge1# show interface | append interface-file
vedge1# file list
interface-file
vedge1
```

#### **Related Topics**

```
file list, on page 643
file show, on page 644
save, on page 1112
```

# begin

Display the command output beginning with the line that contains the specified string. The string is case-sensitive.

begin string

#### **Syntax Description**

string | String to Match: Text string to find to start displaying command output. The string is case-sensitive.

#### **Command History**

Release	Modification	
14.1	Command introduced.	

#### **Example**

```

# notab

Display tabular command output in a list rather than in a table. Note that if tabular command output is wider that the screen width, the output is automatically displayed in a list. Use the **tab** filter to override this display behavior. Use the **screen-width** command to set the screen width, or simply drag the terminal window to the desired size. Changing the screen size by dragging the window overrides the width set by the **screen-width** command.

#### notab

#### **Syntax Description**

None
