

Operational Commands

Note

For a list of Cisco IOS XE SD-WAN commands qualified for use in Cisco vManage CLI templates, see List of Commands Qualified in Cisco IOS XE Release 17.x. For information about specific commands, see the appropriate chapter in Cisco IOS XE SD-WAN Qualified Command Reference Guide.

- Overview of Operational Commands, on page 9
- clear app cflowd flow-all, on page 10
- clear app cflowd flows, on page 12
- clear app cflowd statistics, on page 13
- clear app dpi all, on page 14
- clear app dpi apps, on page 15
- clear app dpi flows, on page 16
- clear app log flow-all, on page 17
- clear app log flows, on page 18
- clear arp, on page 20
- clear bfd transitions, on page 21
- clear bgp all, on page 22
- clear bgp neighbor, on page 22
- clear bridge mac, on page 23
- clear bridge statistics, on page 24
- clear cellular errors, on page 24
- clear cellular session statistics, on page 25
- clear cloudexpress computations, on page 26
- clear cloudinit data, on page 27
- clear control connections, on page 28
- clear control connections-history, on page 28
- clear control port-index, on page 29
- clear crash, on page 30
- clear dhcp server-bindings, on page 30
- clear dhcp state, on page 31
- clear dns cache, on page 32
- clear dot1x client, on page 33
- clear history, on page 34

- clear igmp interface, on page 34
- clear igmp protocol, on page 35
- clear igmp statistics, on page 35
- clear installed-certificates, on page 36
- clear interface statistics, on page 38
- clear ip leak routes vpn, on page 39
- clear ip mfib record, on page 39
- clear ip mfib stats, on page 40
- clear ip nat filter, on page 40
- clear ip nat statistics, on page 41
- clear ipv6 dhcp state, on page 42
- clear ipv6 neighbor, on page 43
- clear ipv6 policy, on page 44
- clear omp all, on page 44
- clear omp peer, on page 45
- clear omp routes, on page 47
- clear omp tlocs, on page 47
- clear orchestrator connections-history, on page 48
- clear ospf all, on page 49
- clear ospf database, on page 50
- clear pim interface, on page 50
- clear pim neighbor, on page 51
- clear pim protocol, on page 52
- clear pim rp-mapping, on page 53
- clear pim statistics, on page 54
- clear policer statistics, on page 55
- clear policy, on page 56
- clear policy zbfw filter-statistics, on page 56
- clear policy zbfw global-statistics, on page 57
- clear policy zbfw sessions, on page 57
- clear pppoe statistics, on page 58
- clear reverse-proxy context, on page 59
- clear system statistics, on page 61
- clear tunnel statistics, on page 63
- clear wlan radius-stats, on page 63
- clock, on page 64
- commit, on page 65
- complete-on-space, on page 66
- config, on page 66
- debug, on page 67
- debug packet-trace condition, on page 74
- debug platform condition mpls match-inner, on page 75
- debug-vdaemon, on page 77
- debug vdaemon peer, on page 78
- exit, on page 79
- file list, on page 79

- file show, on page 80
- help, on page 81
- history, on page 81
- idle-timeout, on page 82
- job stop, on page 83
- logout, on page 83
- monitor event-trace sdwan, on page 84
- monitor start, on page 85
- monitor stop, on page 86
- nslookup, on page 87
- paginate, on page 87
- ping, on page 89
- poweroff, on page 91
- prompt1, on page 92
- prompt2, on page 93
- quit, on page 94
- reboot, on page 94
- request aaa unlock-user, on page 96
- request admin-tech, on page 97
- request certificate, on page 100
- request container image install, on page 101
- request container image remove, on page 101
- request control-tunnel add, on page 102
- request control-tunnel delete, on page 103
- request controller add serial-num, on page 103
- request controller delete serial-num, on page 104
- request controller-upload serial-file, on page 105
- request csr upload, on page 105
- request daemon ncs restart, on page 107
- request device, on page 107
- request device-upload, on page 108
- request download, on page 110
- request execute, on page 111
- request firmware upgrade, on page 112
- request interface-reset, on page 112
- request ipsec ike-rekey, on page 113
- request ipsec ipsec-rekey, on page 114
- request nms all, on page 114
- request nms application-server, on page 116
- request nms cluster diagnostics, on page 119
- request nms configuration-db, on page 121
- request nms coordination-server, on page 123
- request nms messaging-server, on page 124
- request nms olap-db, on page 126
- request nms statistics-db, on page 127
- request nms-server, on page 130

- request nms server-proxy, on page 131
- request nms server-proxy set ratelimit, on page 131
- request on-vbond-controller, on page 132
- request on-vbond-vsmart, on page 133
- request platform software sdwan bootstrap-config save, on page 133
- request port-hop, on page 134
- request reset configuration, on page 135
- request reset logs, on page 138
- request sla-dampening-reset color, on page 139
- request root-ca-crl, on page 140
- request root-cert-chain, on page 141
- request security ipsec-rekey, on page 141
- request software activate, on page 142
- request software install, on page 143
- request software install-image, on page 145
- request software remove, on page 146
- request software reset, on page 147
- request software secure-boot, on page 148
- request software set-default, on page 149
- request software upgrade-confirm, on page 149
- request software verify-image, on page 151
- request stream capture, on page 152
- request upload, on page 153
- request vedge, on page 153
- request vedge-cloud activate, on page 154
- request vsmart add serial-num, on page 155
- request vsmart delete serial-num, on page 155
- request vsmart-upload serial-file, on page 156
- screen-length, on page 157
- screen-width, on page 157
- show aaa usergroup, on page 158
- show alarms, on page 160
- show app cflowd collector, on page 162
- show app cflowd flow-count, on page 163
- show app cflowd flows, on page 164
- show app cflowd statistics, on page 166
- show app cflowd template, on page 167
- show app dpi applications, on page 168
- show app dpi flows, on page 169
- show app dpi summary statistics, on page 171
- show app dpi supported-applications, on page 172
- show app log flow-count, on page 177
- show app log flows, on page 178
- show app tcp-opt, on page 180
- show app-route sla-class, on page 182
- show app-route stats, on page 183

- show arp, on page 185
- show bfd history, on page 186
- show bfd sessions, on page 187
- show bfd summary, on page 190
- show bfd tloc-summary-list, on page 191
- show bgp neighbor, on page 192
- show bgp routes, on page 194
- show bgp summary, on page 197
- show boot-partition, on page 198
- show bridge interface, on page 199
- show bridge mac, on page 200
- show bridge table, on page 201
- show cellular modem, on page 202
- show cellular network, on page 203
- show cellular profiles, on page 205
- show cellular radio, on page 206
- show cellular sessions, on page 207
- show cellular status, on page 208
- show certificate installed, on page 208
- show certificate reverse-proxy, on page 210
- show certificate root-ca-cert, on page 212
- show certificate root-ca-crl, on page 213
- show certificate serial, on page 214
- show certificate signing-request, on page 215
- show certificate validity, on page 217
- show cli, on page 217
- show clock, on page 218
- show cloudexpress applications, on page 219
- show cloudexpress gateway-exits, on page 220
- show cloudexpress local-exits, on page 221
- show configuration commit list, on page 222
- show container images, on page 223
- show container instances, on page 224
- show control affinity config, on page 225
- show control affinity status, on page 226
- show control connection-info, on page 227
- show control connections, on page 227
- show control connections-history, on page 230
- show control local-properties, on page 233
- show control statistics, on page 237
- show control summary, on page 239
- show control valid-vedges, on page 240
- show control valid-vsmarts, on page 241
- show crash, on page 241
- show crypto pki trustpoints status, on page 242
- show devices, on page 243

- show dhcp interface, on page 244
- show dhep server, on page 245
- show dot1x clients, on page 246
- show dot1x interfaces, on page 247
- show dot1x radius, on page 248
- show hardware alarms, on page 250
- show hardware environment, on page 251
- show hardware inventory, on page 254
- show hardware poe, on page 256
- show hardware real time information, on page 257
- show hardware temperature-thresholds, on page 258
- show history, on page 260
- show igmp groups, on page 261
- show igmp interface, on page 262
- show igmp statistics, on page 263
- show igmp summary, on page 264
- show interface, on page 265
- show interface arp-stats, on page 271
- show interface description, on page 273
- show interface errors, on page 275
- show interface packet-sizes, on page 278
- show interface port-stats, on page 280
- show interface queue, on page 281
- show interface sfp detail, on page 283
- show interface sfp diagnostic, on page 287
- show interface statistics, on page 290
- show ip dns-snoop, on page 291
- show ip fib, on page 292
- show ip mfib oil, on page 297
- show ip mfib stats, on page 298
- show ip mfib summary, on page 299
- show ip nat filter, on page 300
- show ip nat interface, on page 301
- show ip nat interface-statistics, on page 302
- show ip routes, on page 303
- show ipsec ike inbound-connections, on page 307
- show ipsec ike outbound-connections, on page 308
- show ipsec ike sessions, on page 310
- show ipsec inbound-connections, on page 311
- show ipsec local-sa, on page 312
- show ipsec outbound-connections, on page 313
- show ipv6 dhcp interface, on page 315
- show ipv6 fib, on page 316
- show ipv6 interface, on page 317
- show ipv6 neighbor, on page 320
- show ipv6 policy access-list-associations, on page 320

- show ipv6 policy access-list-counters, on page 321
- show ipv6 policy access-list-names, on page 322
- show ipv6 policy access-list-policers, on page 323
- show ipv6 routes, on page 323
- show jobs, on page 325
- show licenses, on page 326
- show log, on page 328
- show logging, on page 329
- show logging process, on page 330
- show logging profile sdwan, on page 331
- show monitor event-trace sdwan, on page 334
- show multicast replicator, on page 335
- show multicast rpf, on page 337
- show multicast topology, on page 338
- show multicast tunnel, on page 339
- show nms-server running, on page 340
- show notification stream, on page 341
- show ntp associations, on page 342
- show ntp peer, on page 343
- show omp cloudexpress, on page 344
- show omp multicast-auto-discover, on page 345
- show omp multicast-routes, on page 347
- show omp peers, on page 348
- show omp routes, on page 352
- show omp services, on page 357
- show omp summary, on page 359
- show omp tlocs, on page 362
- show omp verify-routes, on page 366
- show orchestrator connections, on page 368
- show orchestrator connections-history, on page 370
- show orchestrator local-properties, on page 373
- show orchestrator reverse-proxy-mapping, on page 374
- show orchestrator statistics, on page 375
- show orchestrator summary, on page 377
- show orchestrator valid-vedges, on page 378
- show orchestrator valid-vmanage-id, on page 378
- show orchestrator valid-vsmarts, on page 379
- show ospf database, on page 380
- show ospf database-summary, on page 382
- show ospf interface, on page 383
- show ospf neighbor, on page 385
- show ospf process, on page 386
- show ospf routes, on page 388
- show packet-capture, on page 390
- show packet-trace, on page 391
- show parser dump, on page 393

- show pim interface, on page 394
- show pim neighbor, on page 395
- show pim rp-mapping, on page 396
- show pim statistics, on page 397
- show platform resources, on page 398
- show platform software trace level, on page 399
- show policer, on page 401
- show policy access-list-associations, on page 402
- show policy access-list-counters, on page 403
- show policy access-list-names, on page 404
- show policy access-list-policers, on page 405
- show policy data-policy-filter, on page 406
- show policy ef-stats, on page 408
- show policy from-vsmart, on page 409
- show policy qos-map-info, on page 411
- show policy qos-scheduler-info, on page 412
- show policy service-path, on page 413
- show policy tunnel-path, on page 414
- show policy zbfw filter-statistics, on page 415
- show policy zbfw global-statistics, on page 415
- show policy zbfw sessions, on page 419
- show ppp interface, on page 420
- show pppoe session, on page 421
- show pppoe statistics, on page 421
- show reboot history, on page 422
- show running-config, on page 423
- show sdwan, on page 426
- show sdwan appqoe, on page 428
- show sdwan appqoe flow closed, on page 431
- show sdwan appqoe flow flow-id, on page 432
- show sdwan appqoe flow vpn-id, on page 434
- show sdwan cloudexpress applications, on page 434
- show sdwan cloudexpress gateway-exits, on page 435
- show sdwan cloudexpress local-exits, on page 436
- show sdwan cloudexpress service-area-applications, on page 437
- show sdwan policy, on page 438
- show sdwan policy service-path, on page 439
- show sdwan policy tunnel-path, on page 441
- show security-info, on page 442
- show nms server-proxy ratelimit, on page 443
- show software, on page 443
- show support omp peer, on page 444
- show system buffer-pool-status, on page 448
- show system netfilter, on page 449
- show system on-demand, on page 450
- show system statistics, on page 452

- show system status, on page 456
- show tech-support, on page 460
- show tenant-mapping, on page 462
- show tenant omp peers, on page 463
- show tenant omp routes, on page 464
- show tenant-summary, on page 465
- show transport connection, on page 466
- show tunnel gre-keepalives, on page 467
- show tunnel inbound-connections, on page 468
- show tunnel local-sa, on page 469
- show tunnel statistics, on page 470
- show umbrella deviceid, on page 471
- show uptime, on page 472
- show users, on page 473
- show version, on page 473
- show vrrp, on page 474
- show wlan clients, on page 475
- show wlan interfaces, on page 476
- show wlan radios, on page 477
- show wlan radius, on page 479
- show ztp entries, on page 480
- tcpdump, on page 481
- test policy match control-policy, on page 482
- timestamp, on page 485
- tools ip-route, on page 485
- tools iperf, on page 486
- tools minicom, on page 488
- tools netstat, on page 489
- tools nping, on page 491
- tools ss, on page 494
- tools stun-client, on page 496
- traceroute, on page 499
- vshell, on page 501

Overview of Operational Commands

The operational command reference pages describe the CLI commands that you use to display the properties and operational status of vSmart controllers, vEdge routers, and vBond orchestrators in the overlay network. When you log in to the CLI on a Cisco vEdge device, you are in operational mode.

In the CLI, operational commands are organized alphabetically, and many commands are organized into functional hierarchies. The top-level operational commands and command hierarchies are:

- clear—Zero or erase information stored on the device or collected data.
- clock—Set the time.
- commit—Confirm a pending commit operation.

- complete-on-space—Enable the ability to type a space to have the CLI complete unambiguous commands.
- config—Enter configuration mode.
- exit—Configure basic system parameters.
- file—Configure the properties of a VPN, including the interfaces that participate in the VPN and the routing protocols that are enabled in the VPN.
- help—Display help information about CLI commands.
- history—Control the CLI command history cache.
- idle-timeout—Set how long a CLI session can be idle before the user is logged out.
- logout—Exit from the CLI session.
- no-Negate or cancel a command.
- nslookup—Perform a DNS name lookup.
- paginate—Set the number of lines of command output to display.
- ping—Ping a network device.
- poweroff—Power down the device.
- prompt1—Set the operational mode prompt.
- prompt2—Set the configuration mode prompt.
- pwd—Display the current path mode.
- quit—Exit from the CLI session.
- reboot—Reboot the device.
- request—Install various files onto the device.
- screen-length—Set the CLI screen length.
- screen-width—Set the CLI screen width.
- show—Display information about the status of the device or information stored on the device.
- tcpdump—Perform a TCP dump operation.
- timestamp—Enable timestamping.
- traceroute—Perform a traceroute operation.
- vshell—Exit to the shell on the device.

To filter operational command output, use the filters described in Command Filters for CLI Operational Commands.

clear app cflowd flow-all

Clear the cflowd flows in all VPNs (on vEdge routers only).

clear app cflowd flow-all

Command History

Release	Modification
14.3	Command introduced.

Examples

vEdge# show cflowd flows

vEdge# clear app cflowd flow-all vEdge# show app cflow flows % No entries found. vEdge#

Related Topics

cflowd-template clear app cflowd flows, on page 12 show app cflowd flows, on page 164

clear app cflowd flows

Clear the cflowd flows in a specific VPN (on vEdge routers only).

clear app cflowd flows vpn vpn-id [flow-property]

Syntax Description

flow-property	Specific Flow To Clear:
	Narrow down the exact flow to clear. <i>flow-property</i> can be one of:
	dest-ip prefix/length
	dest-port port-number(0 through 65535)
	dscp dscp-value(0 through 255)
	ip-proto protocol-number(0 through 255)
	src-ip prefix/length
	src-port port-number(0 through 65535)
vpn vpn-id	VPN:
	Specify the VPN in which to clear all cflowd flows.

Command History

Release	Modification
14.3	Command introduced.

clear app log flows

Clear the information logged about flows (on vEdge routers only). After you issue this command, collection of information about the flow resumes immediately.

clear app log flows [**dest-ip** *prefix*] [**dest-port** *number*] [**ip-proto** *number*] [**src-ip** *prefix*] [**src-port** *number*] **vpn** *vpn-id*

Syntax Description

none	Clear information logged about all flows on the router.
dest-ip prefix	Destination IP Prefix: Clear information logged about flows with the specified destination IP prefix.
dest-port number	Destination Port Number: Clear information logged about flows with the specified destination port number.
ip-protocol number	IP Protocol: Clear information logged about flows with the specified IP protocol number.
src-ip prefix	Source IP Prefix: Clear information logged about flows with the specified source IP prefix.

src-port number	Source Port Number:	
	Clear information logged about flows with the specified source port number.	
vpn vpn-id	Specific VPN:	
	Clear the logged flows in the specified VPN.	

Release	Modification
16.3	Command introduced.

clear arp

Refresh dynamically created IPv4 entries in the Address Resolution Protocol (ARP) cache (on vEdge routers and vSmart controllers only).

To clear IPv6 entries in the ARP cache, use the clear ipv6 neighbor command.

clear arp [interface interface-name] [ip-address] [vpn vpn-id]

Syntax Description

none	Refresh all dynamic ARP cache entries.
interface interface-name	Interface: Refresh the dynamic ARP cache entries associated with the specific interface.
ip-address	IP Address: Refresh the dynamic ARP cache entries for the specified IP address.
vpn vpn-id	VPN: Refresh the dynamic ARP cache entries for the specific VPN.

Command History

Release	Modification
14.1	Command introduced.

Examples

clear bgp neighbor

Reset the peering sessions with a specific BGP neighbor in a VPN (on vEdge routers only). **clear bgp neighbor** *ip-address* **vpn** *vpn-id* [**soft** (**in** | **out**)]

Syntax Description

ip-address vpn	Neighbor Address and VPN:	
vpn-id	Reset the connection to the specific BGP neighbor in the specified VPN.	

soft (in out)	Soft Reset:
	Perform a reset when the routing policy changes so that the new policy can take effect. With a soft reset, the route table is reconfigured and reactivated, but the BGP session itself is not reset. Use the in option to generate inbound route table updates from the BGP neighbor, and use the out option to have the local router send a new set of updated to the BGP neighbor.

Release	Modification
14.1	Command introduced.

Examples

```
vEdge# clear bgp neighbor 10.20.25.16 vpn 1 vEdge# show bgp neighbor

Release Information Edit section

ACSRREJ - Challenge rejected by peer. NOVMCFG - No cfg in vmanage for device.

BDSGVERTL - Board ID Signature Verify Failure. NOZTPEN - No/Bad chassis-number entry in ZTP.

BIDNTPR - Board ID not Initialized. ORPTMO - Server's peer timed out.

BIDNTVRFD - Peer Board ID Cert not verified. RMGSPR - Remove Global saved peer.

CERTEXPRD - Certificate Expired RXTRDWN - Received Teardown.

CRTREISER - Challenge response rejected by peer. RDSIGFBD - Read Signature from Board ID failed.

CRTVERFL - Fail to verify Peer Certificate. SSLNFAIL - Failure to create new SSL context.

```
CTORGNMMIS - Certificate Org name mismatch.
DCONFAIL - DTLS connection failure.
DEVALC - Device memory Alloc failures.
DHSTMO - DTLS HandShake Timeout.
                                                                                      SERNTPRES - Serial Number not present.
                                                                                      SYSIPCHNG - System-IP changed.
                                                                                      SYSIFCHNG - System-IP changed.

TMRALC - Memory Failure.

TUNALC - Memory Failure.

TXCHTOBD - Failed to send challenge to BoardID.

UNMSGBDRG - Unknown Message type or Bad Register msg.

UNAUTHEL - Recd Hello from Unauthenticated peer.

VBDEST - vDaemon process terminated.
                - Disconnect vBond after register reply.
DISTLOC
                - TLOC Disabled.
DUPSER - Duplicate Serial Number.
DUPCLHELO - Recd a Dup Client Hello, Reset Gl Peer.
                                                                                       VECRTREV

clear control port-index

To reset port-hop back to the base port on Cisco vEdge devices, use the **clear control port-index** command in privileged EXEC mode.

clear control port-index

Command Default This command has no default behavior.

Command Modes Privileged EXEC (#)

Command History	Release	Modification				
	Cisco SD-WAN Release 20.6.1	This command was introduced.				

Use the clear control port-index command to reach back to 12346 base port on all the WAN interfaces.

ExamplesThe following example shows how to clear the port-hopping bucket index:

Device# clear control port-index

clear crash

Delete the core files on the local device. Core files are saved in the /var/crash directory on the local device. **clear crash** *number*

Syntax Description

(none)	Clear all core and information files on the device.
number	Specific Core File: Clear the specific core file.
	$number$ is the index number listed in the ${\bf show}$ ${\bf crash}$ output.

Command History

Release	Modification
15.2	Command introduced.

Examples

```
vSmart# show crash
```

```
INDEX CORE TIME CORE FILENAME

O Tue Sep 2 17:13:43 2014 core.ompd.866.vsmart.1409703222

vSmart# clear crash
Are you sure you want to clear core and info files? [yes, NO]
vSmart# yes
vSmart# show crash
% No entries found.

clear dhcp server-bindings

Clear the bindings to DHCP servers (on vEdge routers only).

clear dhcp server-bindings vpn *vpn-id* **interface** *interface-name* [**client-mac** *mac-address*]

Syntax Description

interface interface-name	Interface to DHCP Server: Interface to use to reach the DHCP server.
--------------------------	--

client-mac client-mac	MAC Address of DHCP Server: Clear the entry for a single DHCP host based on the host's MAC address.
vpn vpn-id	VPN: Clear the DHCP bindings in a specific VPN.

Release	Modification	
14.3	Command introduced.	
15.1	client-mac option added.

```

clear dhcp state

Clear IPv4 DHCP state on the local device (on vEdge routers and vSmart controllers only). **clear dhcp state interface** *interface-name* [**vpn** *vpn-id*]

Syntax Description

interface interface-name	Clear the DHCP state of a specific interface.
vpn vpn-id	Clear the DHCP state of an interface in the specified VPN.

Command History

Release	Modification
14.3	Command introduced.

clear dns cache

Clear the cache of DNS entries on the local device. Use this command to clear stale entries from the DNS cache.

The DNS cache is populated when the device establishes a connection with the vBond orchestrator. For a vEdge router, this connection is transient, and the DNS cache is cleared when its connection to the vBond orchestrator is closed. For a vSmart controller, the connection to a vBond orchestrator is permanent.

clear dns cache

Command History

Release	Modification
15.3	Command introduced.

Examples

In the example output below, the entries in the DNS cache are highlighted in bold. After the DNS cache is cleared, it takes about 30 seconds for the vSmart controller to reestablish its connection with the vBond orchestrator and to repopulate its DNS cache.

timer

show control local-properties, on page 233

clear dot1x client

Deauthenticate a client connected on an 802.1X or 802.11i interface (on vEdge routers only). Reauthentication occurs automatically if the client attempts to use the interface again.

clear dot1x client mac-address interface interface-name

Syntax Description

mac-address	Client MAC Address: MAC address of the client to deauthenticate.
	To determine a client's MAC address, use the show dot1x clients command.
interface interface-name	Interface Name: Interface through which the client is reachable.
	To determine the interface name, use the show dot1x interfaces command.

Release	Modification
16.3	Command introduced.

Related Topics

igmp
show igmp interface, on page 262
```

clear igmp protocol

Flush all IGMP groups and relearn them (on vEdge routers only).

clear igmp interface vpn vpn-id

Syntax Description

vpn vpn-id	VPN: Flush all IGMP groups in a specific VPN.
-------------------	---

Command History

Release	Modification
14.3	Command introduced.

Related Topics

```
clear igmp interface, on page 34 clear igmp statistics, on page 35 igmp show igmp groups, on page 261
```

clear igmp statistics

Zero IGMP statistics (on vEdge routers only).

clear igmp statistics [vpn vpn-id]

Syntax Description

(none)	Clear IGMP statistics for all VPNs.
vpn vpn-id	VPN: Clear IGMP statistics in a specific VPN.

Command History

Release	Modification
14.3	Command introduced.

Examples

vEdge# show igmp statistics

VPN	RX GENERAL QUERY	RX GROUP QUERY	RX V1 REPORT	RX V2 REPORT	RX LEAVE	RX UNKNOWN	RX ERROR	TX GENERAL QUERY	TX GROUP QUERY	TX ERROR

clear ip leak routes vpn

To clear leaked routes for a VPN, use the clear ip leak routes vpn command.

clear ip leak routes vpn vpn-id

Command History

Release	Modification
Cisco SD-WAN Release 20.3.1	Command introduced.

clear ip mfib record

Clear the statistics for a particular group, source, or VPN from the Multicast Forwarding Information Base (MFIB) (on vEdge routers only).

clear ip mfib record group group-address **source** source-address **vpn** vpn-id [**upstream-iif** interface-name] [**upstream-tunnel** ip-address]

Syntax Description

group group-address source source-address vpn vpn-id	Clear Statistics from the MFIB: Clear the statistics for a particular group, source, or VPN from the MFIB.
upstream-iif interface-name	Upstream Interface: Clear the MFIB statistics for the specified upstream interface.
upstream-tunnel ip-address	Upstream Tunnel: Clear the MFIB statistics for the specified tunnel to a remote system.

Command History

Release	Modification
14.2	Command introduced.

Examples

 $\label{eq:vedge} $\operatorname{vEdge\#}$ clear ip mfib record group 254.1.1.1 vpn 1 source 255.1.1.1 $$\operatorname{vEdge\#}$ $$

clear ip mfib stats, on page 40 show ip mfib summary, on page 299

clear ip mfib stats

Clear all statistics from the Multicast Forwarding Information Base (MFIB) (on vEdge routers only).

clear ip mfib stats

Examples

```
vEdge# clear ip mfib stats
vEdge#
```

Command History

Release	Modification
14.2	Command introduced.

Related Topics

clear ip mfib record, on page 39 show ip mfib stats, on page 298

clear ip nat filter

Clear the NAT translational filters (on vEdge routers only).

clear ip nat filter [parameter]

Syntax Description

paran	ıeter	Filter Parameter: Clear NAT translation filters associated with the specified parameter.
		<i>parameter</i> can be nat-ifname, nat-vpn-id, private-dest-address, private-dest-port, private-source-address, private-source-port, private-vpn-id, and proto. These parameters correspond to some of the column headers in the show ip nat filter command output.

Command History

Release	Modification
14.2	Command introduced.

clear ipv6 dhcp state

Clear IPv6 DHCP state on the local device (on vEdge routers and vSmart controllers only).

clear ipv6 dhcp state interface interface-name [vpn vpn-id]

Syntax Description

interface interface-name	Interface: Clear the DHCP state of a specific interface.
vpn vpn-id	VPN: Clear the DHCP state of an interface in the specified VPN.

Command History

Release	Modification
16.3	Command introduced.

```
clear dhcp state, on page 31
show dhcp interface, on page 244
show dhcp server, on page 245
show ipv6 dhcp interface, on page 315
```

clear ipv6 neighbor

Refresh dynamically created IPv6 entries in the Address Resolution Protocol (ARP) cache (on vEdge routers and vSmart controllers only).

To clear IPv4 entries in the ARP cache, use the **clear arp** command.

 $\textbf{clear ipv6 neighbor [interface } \textit{interface-name}] \ [\textit{ip-address}] \ [\textbf{vpn} \ \textit{vpn-id}]$

Syntax Description

(none)	Refresh all dynamic ARP cache entries.
interface interface-name	Interface: Refresh the dynamic ARP cache entries associated with the specific interface.
ip-address	IP Addresss: Refresh the dynamic ARP cache entries for the specified IP address.
vpn vpn-id	VPN: Refresh the dynamic ARP cache entries for the specific VPN.

Command History

Release	Modification
16.3	Command introduced.

Examples

clear omp peer

Reset the OMP peering sessions with a specific peer (on vSmart controllers and vEdge routers only). When you reset a peering session, the routes to that peer are removed from the OMP route table, and they are reinstalled when the peer comes back up.

clear omp peer ip-address [soft (in |out)]

Syntax Description

(none)	Reset the specific peering session.
soft in out	Refresh the Peering Session: Re-apply the inbound or outbound policy to the specific peering session.

Command History

Release	Modification
14.1	Command introduced.

Examples

```
vEdge# show omp peers
R -> routes received
I -> routes installed
S -> routes sent

Legend for Errors
BDSGVERFL - Board ID signature verify failure
BIDNTPR - Board ID not initialized
BIDNTVRFD - Peer board ID certificate not verified
CRTREJSER - Challenge response rejected by peer
- Fail to verify near certificate
                                                                                        ORPTMO - Remote client peer timeout
RMGSPR - Remove global saved peer
RXTRDWN - Received teardown
RDSIGFBD - Read signature from board ID failed
SSLNFAIL - Failure to create new SSL context
CRTVERFL
                  - Fail to verify peer certificate
CRTYMER - Fail to verry peer certificate
CTORGNAMENTS - Certificate organization name mismatch
DCONFAIL - DTLS connection failure
DEVALC - Device memory allocation failures
DHSTMO - DTLS handshake timeout
                                                                                         SERNTPRES - Serial number not present
                                                                                                      - Memory failure
- Memory failure
                                                                                         UNMSGBDRG - Unknown message type or bad register message
                                                                                        UNAUTHEL - Recd hello from unauthentica

VBDEST - vDaemon process terminated

VECRTREV - vEdge certification revoked
DISCURD
                  - Disconnect vBond after register reply

clear ospf all

Reset OSPF in a VPN (on vEdge routers only).

clear ospf all vpn vpn-id

Syntax Description

vpn	VPN: Reset OSPF in the specified VPN.
vpn-id	

Command History

Release	Modification
14.1	Command introduced.

Examples

Related Topics

show ospf neighbor, on page 385

clear ospf database

Delete the entries in the OSPF link-state database learned from OSPF neighbors (on vEdge routers only). Use this command for troubleshooting OSPF or to reset the link-state database if you suspect that it has been corrupted.

clear ospf database vpn vpn-id

Syntax Description

vpn	VPN: Clear the OSPF link-state database of entries from the specified VPN.
vpn-id	

Command History

Release	Modification
14.2	Command introduced.

Examples

Related Topics

show ospf database, on page 380

clear pim interface

Clear PIM interfaces, and relearn all PIM neighbors and joins (on vEdge routers only).

clear pim interface vpn vpn-id [interface-name]

Syntax Description

interface-name vpn	Interface Name: Release the PIM neighbors and joins on a specific interface in	
vpn-id	a specific VPN.	

Command History

Release	Modification
14.2	Command introduced.

Examples

Related Topics

clear policer statistics

Clear the policer out-of-specification (OOS) packet statistics (on vEdge routers only). A policed packet is out of specification when the policer does not allow it to pass. Depending on the policer configuration, these packets are either dropped or they are remarked, which sets the packet loss priority (PLP) value on the egress interface to high.

clear policer statistics

Command History

Release	Modification
16.3	Command introduced.

Examples

Clear the policer OOS packet statistics

vEdge# show policer

NAME	INDEX	DIRECTION	RATE	BURST	OOS ACTION	OOS PKTS
ge0_0_11q ge0_3_11q	10 11	out out	200000000000000000000000000000000000000	15000 15000	drop drop	2499 3212
vEdge# cle vEdge# sho	-	cer statist er	ics		oos	oos
NAME	INDEX	DIRECTION	RATE	BURST	ACTION	PKTS
ge0_0_1lq ge0_3_1lq	10 11	out out	200000000000000000000000000000000000000	15000 15000	drop drop	0

clear policy

Reset all counters for IPv4 access lists or data policies (on vSmart controllers and vEdge routers only).

clear policy (access-list acl-name | app-route-policy policy-name | data-policy policy-name)

Syntax Description

access-list acl-name	Access List Counters: Zero the counters associated with the specified access list.
app-route-policy policy-name	Application-Aware Routing Policy Counter: Zero the counters associated with the specified application-aware routing policy.
data-policy policy-name	Data Policy Counters: Zero the counters associated with the specified data policy.

Command History

Release	Modification
14.1	Command introduced.

Related Topics

clear ipv6 policy, on page 44

clear policy zbfw filter-statistics

Clear the count of the packets that match a zone-based firewall's match criteria and the number of bytes that match the criteria (on vEdge routers only).

clear policy zbfw filter-statistics

Command History

Release	Modification
18.2	Command introduced.

Examples

Display statistics about packets that the router has processed with zone-based firewall policy

vEdge# show policy zbfw filter-staatistics

NAME	COUNTER	NAME		PACKETS	BYTES
ZONE-POLICY-1	counter	seq :	1	2	196

```
\begin{tabular}{ll} vEdge\# & \textbf{show policy zbfw filter-staatistics} \\ vEdge\# & \end{tabular}
```

show policy zbfw filter-statistics, on page 415

clear policy zbfw global-statistics

Zero the statistics about the packets processed by zone-based firewalls (on vEdge routers only).

clear policy zbfw global-statistics

Command History

Release	Modification
18.2	Command introduced.

Examples

Clear the statistics about packets that the router has processed with zone-based firewalls

```
vEdge# clear zbfw global-statistics
vEdge# show zbfw global-statistics

clear policy zbfw sessions

Clear the session flow information for zone pairs configured with a zone-based firewall policy (on vEdge routers only).

show policy zbfw sessions [name pair-name]

Syntax Description

(none)	Clear the session flow entries for all zone pairs.
name pair-name	Zone Pair Name: Clear the session flow entries for the specified zone pair.

Command History

Release	Modification
18.2	Command introduced.

Examples

Clear all session flow information

clear wlan radius-stats

Clear the statistics about the sessions with RADIUS servers being used for WLAN authentication (on vEdge routers only).

clear wlan radius-stats [vap number]

Syntax Description

_	VAP Interface: Virtual access point instance.
number	Range: 0 through 3.

Command History

Release	Modification
17.1	Command introduced.

Related Topics

show interface, on page 265 show wlan clients, on page 475 show wlan interfaces, on page 476 show wlan radios, on page 477 show wlan radius, on page 479

clock

Set the time and date on the device. If you have configured NTP on the device, the NTP time overwrites the time and date that you set with the **clock** command.

 ${\bf clock}\;{\bf set}\;{\bf date}\;ccyy\text{-}mm\text{-}dd$

clock set time hh:mm:ss.sss

Syntax Description

	Date: Set the date by specifying four-digit year, two-digit month, and two-digit day. The year can be from 2000 to 2060.
hh:mm:ss.sss	Time: Set the time by two-digit hour (using a 24-hour clock), two-digit minute, two-digit seconds, and an optional three-digit hundredths of seconds.

Note

You must set the time and date in a single command, but the order in which you specify them does not matter.

Command History

Release	Modification
14.1	Command introduced.

Examples

```
vEdge# clock set time 14:30:00 date 2013-11-25
vEdge# show uptime
14:30:03 up 13:51, 1 user, load average: 0.00, 0.01, 0.05
```

commit

Confirm or cancel a pending commit operation. You issue this **commit** command from operational mode. You establish a pending commit operation by using the **commit confirmed** configuration session management command.

commit (abort | confirm) [persist-id id]

Syntax Description

confirm	Confirm a Pending Commit Operation: Confirm a pending commit operation that was issued with the commit confirmed configuration command. You must confirm the commit operation with the time specified with the commit confirmed command; otherwise, the commit is canceled.
abort	Halt a Pending Commit Operation: Halt a pending commit operation that was issued with the commit confirmed command. This is the default operation for a pending commit operation. The commit is also canceled if the CLI session is terminated before you issue a commit confirm command.
persist-id id	Token to Identify the Pending Commit Operation: If you specified a token, <i>id</i> , when you initiated the pending commit operation, specify that token to either cancel or confirm the commit.

Command History

Release	Modification
14.1	Command introduced.

Examples

```
vEdge# commit confirm
Commit complete. Configuration is now permanent.
```

complete-on-space

Have the CLI automatically complete a command name when you type an unambiguous string and then press the space bar, or have the CLI list all possible completions when you type an ambiguous string and then press the space bar.

complete-on-space (false | true)

Syntax Description

false	Do Not Perform Command Completion: Do not have the CLI perform command completion when you press the space bar. This is the default setting.
true	Perform Command Completion: Have the CLI perform command completion when you press the space bar.

Command History

Release	Modification
14.1	Command introduced.
14.2	Default changed from true to false in Release 14.2.

Examples

```
vEdge# complete-on-space false
vEdge# hel
-----
syntax error: expecting
vEdge# complete-on-space true
vEdge# help
```

config

Enter configuration mode for vEdge devices. In configuration mode, you are editing a copy of the running configuration, called the candidate configuration, not the actual running configuration. Your changes take effect only when you issue a **commit** command.

Note

Cisco IOS XE routers such as aggregation and integrated services routers should use the command **config-transaction** to enter configuration mode. The **config terminal** command is not supported on SD-WAN routers.

config (exclusive | no-confirm | shared | terminal)

Syntax Description

(none)	Edit a private copy of the running configuration. This private copy is not locked, so another user could also edit it at the same time.
terminal	Allow Editing from This Terminal Only: Edit a private copy of the running configuration. This private copy is not locked, so another user could also edit it at the same time.
no-confirm	Do Not Allow a Commit Confirmation: Edit a private copy of the running configuration and do not allow the commit confirmed command to be used to commit the configuration.
exclusive	Exclusive Edit: Lock the running configuration and the candidate configuration, and edit the candidate configuration. No one else can edit the candidate configuration as long as it is locked.
shared	Shared Edit: Edit the candidate configuration without locking it. This option allows another person to edit the candidate configuration at the same time.

Command History

Release	Modification
14.1	Command introduced.

Examples

```
vEdge# config
Entering configuration mode terminal
vEdge(config)#
```

		• misc —Control the debugging of miscellaneous cflowd events.
[no] debug chmgr all Chassis Manager: Control debugging for the chassis manager.		• pkt_tx —Control the debugging of cflowd packet transmissions.
	[no] debug chmgr all	Chassis Manager: Control debugging for the chassis manager.

[no] debug cloudexpress (events ftm omp rtm	Cloud OnRamp for SaaS: Control debugging for Cloud OnRamp for SaaS (formerly CloudExpress service).
ttm) [level (high low)]	• events—Control the debugging of events to which the Cloud OnRamp for SaaS process (daemon) responds, including when the process connects with a collector or loses connectivity with it, and when the source-interface as configured in the vSmart template is removed.
	• ftm—Control debugging of the communication between Cloud OnRamp for SaaS and the forwarding table manager.
	• level (high low)—Set the detail of the comments logged by the debugging operation. The default level, low, provides comments sufficient to help you understand the actions that are occurring. The level high provides greater detail for the live debugging that might typically be performed by the Cisco SD-WAN engineering team.
	omp—Control the debugging of all Cloud OnRamp for SaaS OMP operations.
	• rtm —Control the debugging of communication between the Cloud OnRamp for SaaS and the route table manager.
	• ttm—Control the debugging of communication between the Cloud OnRamp for SaaS and the tunnel table manager.
[no] debug config-mgr	Configuration Manager: Control debugging for the configuration manager.
(events pppoe ra) [level (high low)]	events—Control the debugging of events to which the configuration manager process (daemon) responds, including when the process connects with a collector or loses connectivity with it, and when the source-interface as configured in the vSmart template is removed.
	• level (high low)—Set the detail of the comments logged by the debugging operation. The default level, low, provides comments sufficient to help you understand the actions that are occurring. The level high provides greater detail for the live debugging that might typically be performed by the Cisco engineering team.
	• pppoe—Control the debugging of all Cloud OnRamp for SaaS OMP operations.
	• ra—Control the debugging of route advertisements to which the configuration manager responds.
[no]debug dbgd events	Debugger Process: Control debugging for the debugger process itself.
	• events—Control the debugging of events to which the debugger process (daemon) responds.

[no] debug dhcp-client (all events packets)	DHCP Client: Control the debugging of Dynamic Host Configuration Protocol (DHCP) client activities.
	• all—Control the debugging of all DHCP client events and packets.
	• events—Control the debugging of DHCP client protocol events.
	• packets—Control the debugging of all DHCP client packets.
[no] debug dhcp-helper (all events packets)	DHCP Helper: Control the debugging of Dynamic Host Configuration Protocol (DHCP) helper activities.
	• all—Control the debugging of all DHCP helper events and packets.
	• events—Control the debugging of DHCP helper protocol events.
	• packets—Control the debugging of all DHCP helper packets.
[no] debug fpm (all config dpi policy ttm)	Forwarding Policy Manager: Control debugging for the forwarding policy manager:
	• all—Control the debugging of events related to the forwarding policy manager, including configuration changes, application-aware routing events, and communication with the tunnel table manager.
	• config —Control the debugging of messages that are logged as a result of a policy configuration change made either directly on the vEdge router or because the changes have been pushed from the vSmart controller to the router.
	• dpi —Control the debugging of all application-aware routing (deep packet inspection) events.
	• policy —Control the debugging of messages that are logged as the result of policy programming events.
	• ttm—Control the debugging of communication between the forwarding policy manager and the tunnel table manager.
[no] debug ftm all	Forwarding Table Manager: Control debugging for the forwarding table manager operations.
[no] debug igmp (config	IGMP: Control debugging for IGMP.
events fsm ipc packets) [level (high low)]	• events—Control the debugging of IGMP events, including finite-state machine events and transitions, keepalive message events, next-hop events, and routing table update events.
	• fsm—Control the debugging of IGMP finite-state machine transitions.
	• ipcs—Control the debugging of all IGMP interprocess communications.
	• packets—Control the debugging of all IGMP protocol packets.
L	1

[no] debug iked (all	IKE: Control debugging for the forwarding policy manager.
confd error events misc) [level (high low)]	• all—Control the debugging of all events related to IKE.
	• confd—Control the debugging of Netconf activity to log all IKE-related Netconf configuration messages between the local device and the vManage NMS.
	• error—Control the debugging of IKE errors.
	• events—Control the debugging of IKE protocol events.
	• level (high low)—Set the detail of the comments logged by the debugging operation. The default level, low, provides comments sufficient to help you understand the actions that are occurring. The level high provides greater detail for the live debugging that might typically be performed by the Cisco SD-WAN engineering team.
	• misc—Control the debugging of miscellaneous IKE events.
[no] debug netconf traces	Netconf: Enable and disable Netconf activity to log all Netconf configuration messages between the local device and the vManage NMS.
	Netconf debug messages are logged to the /var/log/confd/netconf.trace file.
[no] debug omp (all	OMP: Control the debugging of OMP.
events ipcs packets)	• all—Control the debugging of all OMP events, interprocess communications, and packets.
	• events—Control the debugging of OMP events.
	• ipcs—Control the debugging of all OMP interprocess communications.
	• packets—Control the debugging of all OMP protocol packets.
[no] debug ospf (all	OSPF: Control the debugging of OSPF.
events ipcs ism lsa nsm nssa packets) vpn	• all—Control the debugging of all OSPF functions.
vpn-id	• events—Control the debugging of OSPF events, including adjacencies, flooding information, designated router selection, and shortest path first (SPF) calculations.
	• ipcs—Control the debugging of all OSPF interprocess communications.
	• ism—Control the debugging of OSPF interface state machine transitions.
	• nsm—Control the debugging of OSPF network tate machine transitions.
	• Isa—Control the debugging of OSPF LSA messages.
	• nssa—Control the debugging of OSPF NSSA messages.
	• packets—Control the debugging of all OSPF protocol packets.
L	ı.

[no] debug pim (auto-rp	PIM: Control debugging for PIM.
events fsm ipcs packets) [level (high low)] vpn vpn-id	all—Control the debugging of all PIM events, finite-state machine transitions, interprocess communications, and packets.
	• events—Control the debugging of PIM events, including finite-state machine events and transitions, keepalive message events, next-hop events, and routing table update events.
	• fsm—Control the debugging of PIM finite-state machine transitions.
	• ipcs—Control the debugging of all PIM interprocess communications.
	• packets—Control the debugging of all PIMP protocol packets.
	• vpn vpn-id—Specify the VPN in which to perform debugging.
[no] debug platform software sdwan tracker	Service chaining: (Cisco IOS XE Catalyst SD-WAN devices) Display the service log for the tracker, which probes service devices periodically to test whether the devices are reachable.
[no] debug resolver events [level (high low)]	Resolver: Control debugging for all resolver process events. The resolver process handles a plethora of tasks, including tracking ARP, MAC addresses, DNS, and connected interfaces.
	• level (high low)—Set the detail of the comments logged by the debugging operation. The default level, low, provides comments sufficient to help you understand the actions that are occurring. The level high provides greater detail for the live debugging that might typically be performed by the Cisco SD-WAN engineering team.
[no] debug rtm (events	Route Table Manager: Control debugging for the route table manager.
ipc next-hop packets rib) vpn vpn-id	• events—Control the debugging of route table manager events.
They vpn vpn ta	• ipc—Control the debugging of all route table manager interprocess communications.
	• next-hop—Control the debugging of the route table manager handling of next hops.
	• packets—Control the debugging of the route table manager handling of route exchange packets.
	• rib—Control the debugging of route table manager communication with the route table.
	• vpn <i>vpn-id</i> —Specify the VPN in which to perform debugging.
[no] debug snmp events	SNMP: Control debugging for all SNMP events.
[level (high low)]	• level (high low)—Set the detail of the comments logged by the debugging operation. The default level, low, provides comments sufficient to help you understand the actions that are occurring. The level high provides greater detail for the live debugging that might typically be performed by the Cisco SD-WAN engineering team.

[no] debug sysmgr all	System Manager: Control debugging for the system manager.
[no] debug tcpd [level (high low)]	TCP Optimization Process: Control debugging for TCP optimization. • level (high low)—Set the detail of the comments logged by the debugging operation. The default level, low, provides comments sufficient to help you understand the actions that are occurring. The level high provides greater detail for the live debugging that might typically be performed by the Cisco SD-WAN engineering team.
[no] debug transport events [level (high low)]	Transport Process: Control debugging for all vtracker transport process events. The vtracker process pings the vBond orchestrator every second. • level (high low)—Set the detail of the comments logged by the debugging operation. The default level, low, provides comments sufficient to help you understand the actions that are occurring. The level high provides greater detail for the live debugging that might typically be performed by the Cisco SD-WAN engineering team.
[no] debug ttm events	Tunnel Table Manager: Control debugging for all tunnel table manager events.
[no] debug vrrp (all events packets) vpn vpn-id	VRRP: Control debugging for the Virtual Router Redundancy Protocol (VRRP). • all—Control the debugging of all VRRP events and packets. • events—Control the debugging of VRRP events. • packets—Control the debugging of VRRP packets.

Release	Modification
14.1	Command introduced.
16.3	Starting with Release 16.3, output is placed in the /var/log/tmplog/vdebug file, not the /var/log/vdebug file.
Cisco IOS XE Catalyst SD-WAN Release 17.3.1a	Added debug platform software sdwan tracker.

debug packet-trace condition

To enable packet tracing on Cisco vEdge devices, use the **debug packet-trace condition** command in privileged EXEC mode.

debug packet-trace condition [{ start | stop }] [bidirectional] [circular] [destination-ip ip-address] [global-stat] [ingress-if interface] [logging] [source-ip ip-address] [vpn-id vpn-id]

C	Description	
NNTAY	IIACCLINTIUN	
OVIILUA	DUSCHINGUII	

bidirectional	(Optional) Enables bidirectional flow debug for source IP and destination IP.
circular	(Optional) Enables circular packet tracing. In this mode, the 1024 packets in the buffer are continuously over-written.
clear	(Optional) Clears all debug configurations and packet tracer memory.
destination-ip	(Optional) Specifies destination IPv4 address.
global-stat	(Optional) Specifies the match on select global statistic counter name.
ingress-if	(Optional) Specifies ingress interface name. Note: It is must to choose VPN to configure the interface.
logging	(Optional) Enables packet tracer debug logging.
source-ip	(Optional) Specifies source IP address.
start	(Optional) Starts conditional debugging.
stop	(Optional) Stops conditional debugging.
vpn-id	(Optional) Enables packet tracing for the specified VPN.

Command Default

None

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco SD-WAN Release 20.5.1	This command was introduced.
Cisco SD-WAN Release 20.8.1	A new keyword global-stat is added.

Usage Guidelines

The parameters after the keywords start and stop in the command syntax can be configured in any order.

Example

The following example shows how to configure conditions for packet tracing:

```
Device# debug packet-trace condition source-ip 10.1.1.1
Device# debug packet-trace condition vpn-id 0
Device# debug packet-trace condition interface ge0/1
Device# debug packet-trace condition stop
```

debug platform condition mpls match-inner

To match IPv4 or IPv6 traffic over an MPLS network on Cisco vEdge devices, use the **debug platform condition mpls match-inner** command in privileged EXEC mode.

debug platform condition [interface { interface-name interface-number }]

mpls depth-of-mpls-label match-inner {ipv4 | ipv6} { ipv4-source-prefix | any | host | payload-offset |
protocol } { ipv4-destination-prefix | any | host } { application | both | ingress | egress } [bidirection]
[allow-no-label]

no debug platform condition [interface { interface-name interface-number }] **mpls** depth-of-mpls-label **match-inner** {**ipv4** | **ipv6**} { ipv4-source-prefix | any | host | payload-offset | protocol } { ipv4-destination-prefix | any | host } { **application** | **both** | **ingress** | **egress** } [**bidirection**] [**allow-no-label**]

Syntax Description

	ebug specific network platforms based on your requirement.
condition Sp	pecify conditions to debug based on your requirement.
interface (O	Optional) Debug a specific interface of your choice.
interface-name Sp	pecify the the interface name.
interface-number Sp	pecify the interface number.
mpls De	ebug the MPLS network.
source prefix Sp	pecifies IPv4 or IPv6 source prefix.
application De	ebug Application conditions.
both De	ebug ingress and egress debug simultaneously.
egress De	ebug egress only.
ingress De	ebug ingress only.
match-inner De	ebug inline ACL filters for overlay packet over MPLS.
ipv4 De	ebug IPv4 conditions .
ipv6 De	ebug IPv6 conditions.
destination prefix Sp	pecifies IPv4 or IPv6 destination prefix.
any Sp	pecifies any source prefix.
payload-offset Co	onfigures the ineer payload offset to locate the overlap IPv4 and IPv6 header.
host Sp	pecifies a single destination host.
bidirection (O	Optional) Allows to fileter packets in bidirection.
allow-no-label (O	Optional) Allows to filter packets without MPLS labels.

Command Modes

Privileged EXEC (#)

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.11.1a	A new command debug platform condition mpls is added.

Example

The following example shows how to configure conditions for packet tracing:

```
Device# debug platform condition mpls match-inner ipv4
Device# debug platform condition mpls match-inner ipv4 any any
Device# debug platform condition mpls match-inner ipv4 any any both
Device# debug platform condition mpls match-inner ipv4 any any both
Device# debug platform condition mpls match-inner ipv4 any any both allow-no-label
```

debug-vdaemon

Enable and disable debugging mode for vdaemon software function. Debug output is placed in the /var/log/tmplog/vdebug file on the local device.

debug vdaemon { all | confd | error | events | hello | misc | packets } [{ high | low }] no debug vdaemon { all | confd | error | events | hello | misc | packets } [{ high | low }]

Syntax Description

| packets} {high | low}

{all | confd | error | events | hello | misc vDaemon Process: Control debugging for vDaemon, the Cisco SD-WAN software process:

- all: Control the debugging of all vdaemon process functions.
- confd: Control the debugging of vdaemon process CLI functions.
- error: Control the debugging error of vdaemon actions.
- events: Control the debugging of vdaemon process events.
- hello: Control the debugging of vdaemon hello packets.
- misc: Control the debugging of miscellaneous vdaemon process events.
- packets: Control the debugging of all vdaemon process packets.
- high: Displays verbose logging.
- low: Displays minimal logging.

Command History

Release	Modification
14.1	Command introduced.

Release	Modification
16.3	Starting with Release 16.3, output is placed in the /var/log/tmplog/vdebug file, not the /var/log/vdebug file.
Cisco SD-WAN Release 20.5.1	Added hello keyword for debug vdaemon command.

debug vdaemon peer

Enable and disable debugging mode for vdaemon software function. Debug output is placed in the /var/log/tmplog/vdebug file on the local device.

debug vdaemon peer public-ip ip-address public-port port-address facility { all | confd | error | events | hello | misc | packet } level { high | low } no debug vdaemon peer public-ip ip-address public-port port-address facility { all | confd | error | events | hello | misc | packet } level { high | low }

Syntax Description

public-ip ip-address	Speicifes peer public ip address.
public-port port-address	Specifies peer public port address.
	Range: 0 to 65535
facility {all confd error	Facility: Control debugging of miscellaneous vdaemon actions:
events hello misc packet}	• all: Control the debugging of all vdaemon process functions.
1	• confd: Control the debugging of vdaemon process CLI functions.
	• error: Control the debugging error of vdaemon actions.
	• events: Control the debugging of vdaemon process events.
	• hello: Control the debugging of vdaemon hello packets.
	• misc: Control the debugging of miscellaneous vdaemon process events.
	• packet: Control the debugging of all vdaemon process packets.
level {high low}	Set the detail of the comments logged by the debugging operation. The default level, low , provides comments sufficient to help you understand the actions that are occurring. The level high provides greater detail for the live debugging that might typically be performed by the Cisco engineering team.

Command History

Release	Modification
Cisco SD-WAN Release 20.5.1	This command was introduced.

Examples

The following is a sample output for **debug vdaemon peer** command. Verbose logs for a particular peer can be enabled, and hello log is displayed:

```
Device# debug vdaemon peer public-ip 10.0.12.22 public-port 23456 facility all level high

IP addr: 10.0.12.22 | Port: 23456 | Peer exist: true | misc:high events:high confd:high pkt:high hello:high error:high

Mar 10 11:32:56 vm6 VDAEMON[1592]: vbond_proc_msg[4957]: %VDAEMON_DBG_HELLO-3: peer publoc: 10.0.12.22:23456

Received a Hello from .. 10.0.12.22:23456 on loopback2 (my count 2 hello_vsmart_count 0) (my count 1 hello_vmanage_count 1)

Mar 10 11:32:56 vm6 VDAEMON[1592]: vdaemon_vm_rebalance_needed[805]: %VDAEMON_DBG_ERROR-3: peer publoc: 10.0.12.22:23456

Peer vmanage sys-ip 172.16.255.22 is the chosen one
```

exit

Exit from the CLI session. The **exit** and **quit** commands do the same thing.

exit

Command History

Release	Modification
14.1	Command introduced.

Examples

```
vEdge# exit
My-MacBook-Pro:~ me$
```

Related Topics

quit, on page 94 vshell, on page 501

file list

List the files in a directory on the Cisco SD-WAN device.

file list *directory*

Syntax Description

directory	Name of a Directory: List the files in the specified directory on the Cisco SD-WAN device.
-----------	--

Examples

```
vEdge# file list /var
backups
confd
crash
lib
```

local lock log run spool tmp volatile

Command History

Release	Modification
14.1	Command introduced.

monitor event-trace sdwan

To monitor and control the event trace function for a Cisco SD-WAN subsystem, use the **monitor event-trace** command in the privileged EXEC mode. Event trace provides the functionality to capture the SD-WAN traces between the viptela daemons and SD-WAN subsystems.

monitor event-trace sdwan { clear | continuous | disable | dump | enable | one-shot }

Syntax Description

sdwan	Name of the Cisco SD-WAN subsystem that is the subject of the event trace. To get a list of components that support event tracing, use the monitor event-trace? command.
clear	Clears existing trace messages for the specified component from memory on the networking device.
continuous	Displays the latest event trace entries.
disable	Turns off event tracing for the specified component.
dump	The trace messages are saved in binary format.
enable	Enables event tracing for the specified component.
one-shot	Clears any existing trace information from memory, starts event tracing again, and disables the trace when the trace reaches the size specified.

Command Default

The event trace function is disabled by default.

Command Modes

Privileged EXEC

Global Configuration Mode

Command History

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.2.1r	This command was introduced.

Usage Guidelines

The amount of data collected from the trace depends on the trace message size configured using the **monitor event-trace** command in global configuration mode for each instance of a trace.

Use the **show monitor event-trace** command to display trace messages.

Use the **monitor event-trace** *sdwan* **dump** command to save trace message information for a single event. By default, trace information is saved in binary format.

Examples

The following example shows the privileged EXEC commands to stop event tracing, clear the current contents of memory, and reenable the trace function for the component. This example assumes that the tracing function is configured and enabled on the networking device.

```
Router# monitor event-trace sdwan disable
Router# monitor event-trace sdwan clear
Router# monitor event-trace sdwan enable
```

The following example shows how the **monitor event-trace one-shot** command accomplishes the same function as the previous example except in one command. In this example, once the size of the trace message file has been exceeded, the trace is terminated.

```
Router# monitor event-trace sdwan one-shot
```

The following example shows the command for writing trace messages for an event in binary format. In this example, the trace messages for the SD-WAN component are written to a file.

Router# monitor event-trace sdwan dump

monitor start

Begin monitoring a file on the local device. When a file is monitored, any logging information is displayed on the console as it is added to the file.

monitor start filename

Syntax Description

filename	Filename To Monitor: Name of the file to monitor.
----------	---

Command History

Release	Modification
15.4	Command introduced.

Examples

Start and stop monitoring a file, and view the files that are being monitored

```
VEdge# monitor start /var/log/vsyslog
VEdge# show jobs
JOB COMMAND

1 monitor start /var/log/vsyslog
VEdge# log:local7.notice: Dec 16 14:55:26 vsmart SYSMGR[219]: %Viptela-vsmart-SYSMGR-5-NTCE-200025: System clock set to Wed Dec 16 14:55:26 2015 (timezone 'America/Los_Angeles')

log:local7.notice: Dec 16 14:55:27 vsmart SYSMGR[219]: %Viptela-vsmart-SYSMGR-5-NTCE-200025: System clock set to Wed Dec 16 14:55:27 2015 (timezone 'America/Los_Angeles')

vEdge# monitor stop /var/log/vsyslog
VEdge# monitor stop /var/log/vsyslog
```

Related Topics

nslookup

Perform a DNS lookup.

nslookup [vpn-id vpn-id] dns-name

Syntax Description

dns-name	DNS Name: Perform a DNS lookup to map a fully qualified domain name to one or more IP addresses. dns-name can be a hostname string, or an IPv4 or IPv6 address.
vpn-id vpn-id	VPN: Specify the VPN into which to send the ping packets. If you omit the VPN identifier, the default is VPN 0, which is the transport VPN.

Command History

Release	Modification
14.1	Command introduced.
16.3	In Release 16.3, added support for IPv6 addresses in VPN 0.

Examples

Related Topics

ping

Verify that a network device is reachable on the network, by sending ICMP ECHO_REQUEST packets to them. This command is effectively identical to the standard UNIX **ping** command.

```
ping (hostname | ip-address)
ping vpn vpn-id (hostname | ip-address)
```

ping [count number] [rapid] [size bytes] [source (interface-name | ip-address)] [wait seconds] vpn vpn-id
(hostname | ip-address)

(hostname ip-address)	Device to Ping: Name or IPv4 or IPv6 address of the host to ping. For an IPv4 address in a service VPN, you can ping the primary and the secondary addresses.
count number	Number of Ping Requests to Send: Number of ping requests to send. If you do not specify a count, the command operates until you interrupt it by typing Control-C.
rapid	Rapid Pinging: Send five ping requests in rapid succession and display abbreviated statistics, only for packets transmitted and received, and percentage of packets lost.
size bytes	Size of Ping Request Packets: Size of the packet to send. Default: 64 bytes (56 bytes of data plus 8 bytes of ICMP header).
source (interface-name ip-address)	Source of Ping Packets: Interface or IP address from which to send to ping packets. You cannot specify the loopback0 interface in this option.
wait seconds	Time to Wait between Each Ping Packet: Time to wait for a response to a ping packet. Default: 1 second.
vpn vpn-id	VPN in which to Ping: Specify the VPN into which to send the ping packets.

Release	Modification
14.1	Command introduced.
16.3	Added support for IPv6 host addresses in VPN 0.
17.2.2	Added support for pinging secondary IPv4 addresses.

Examples

```
vEdge# ping vpn 0 10.0.14.4
PING 10.0.14.4 (10.0.14.4): 56 data bytes
64 bytes from 10.0.14.4: seq=0 ttl=63 time=0.642 ms

prompt1

Set the operational prompt.

prompt1 string

Syntax Description

string | Operational Prompt: Set the operational prompt.

The prompt can contain regular ASCII characters and the following special characters. Enclose the entire string in quotation marks:

- \d—Current date in the format yyyy-mm-dd (for example, 2013-12-02).
- \h—Hostname up to the first period (.). You configure the hostname with the **system hostname** command.
- \H—Full hostname. You configure the hostname with the **system hostname** command.
- \s—Source IP address of the local device.
- \t—Current time in 24-hour *hh:mm:ss* format.
- \A—Current time in 24-hour format.
- \T—Current time in 12-hour *hh:mm:ss* format.
- \@—Current time in 12-hour *hh:mm* format.
- \u—Login username of the current user.
- \m—Mode name.
- $\mbox{\sc hm}\{n\}$ —Mode name, but the number of trailing components in the displayed path is limited to be a maximum of n, which is an integer. Characters removed are replaced with an ellipsis (...).
- \M—Mode name in parentheses.
- \M {n}—Mode name in parentheses, but the number of trailing components in the displayed path is limited to be a maximum of n, which is an integer. Characters removed are replaced with an ellipsis (...).

Command History

reboot

Reboot the Cisco SD-WAN device.

Any user can issue the **reboot** command, but the underlying logging mechanism does not log the user name. If you subsequently issue a **show reboot** history command, it shows that the reboot request was issued by an unnamed user.

Note

You cannot issue the **reboot** command while a software upgrade is in progress.

reboot [now] reboot other-boot-partition [no-sync]

now	Reboot Immediately: Reboot the device immediately, with no prompt asking you to confirm that you want to reboot.
other-boot-partition	Reboot and Use the Software Image on the Other Disk Partition: (Available in releases 15.3 and earlier.)
	When rebooting the device, start the software image that is installed on the other disk partition. The software prompts you to confirm that you really want to reboot. If the other partition cannot be mounted or if the directory on the other partition is unreadable, an error message is displayed and the reboot operation is canceled.
other-boot-partition no-sync	Switch to the Other Software Image without Rebooting: (Available in releases 15.3 and earlier.)
	Switch to the software image that is installed on the other disk partition without rebooting the device. If the other partition cannot be mounted or if the directory on the other partition is unreadable, an error message is displayed and the switch operation is canceled.

Release	Modification
14.1	Command introduced.
14.2	Starting with the 14.2 release, you cannot issue the reboot command when a software upgrade is in progress.
15.3	Starting with the 15.3 release, the reboot other-boot-partition command prompts for confirmation.
15.4	Starting with 15.4 release, the reboot other-boot-partition command is replaced with the request software activate command.

Examples

request admin-tech

Collect system status information in a compressed tar file, to aid in troubleshooting and diagnostics. This tar file, which is saved in the user's home directory, contains the output of various commands and the contents of various files on the local device, including syslog files, files for each process (daemon) running on the device, core files, and configuration rollback files. For aid in troubleshooting, send the file to Cisco SD-WAN customer support.

If your Cisco SD-WAN device contains a large number of crash log files, it might take a few minutes for the **request admin-tech** command to complete.

On a single device, you can run only one **request admin-tech** command at a time. If a command is in progress, the device does not let a second one start.

When a process (daemon) on a Cisco SD-WAN device fails and that failure results in the device rebooting, the device automatically runs a **request admin-tech exclude-cores exclude-logs** file before the the device is rebooted.

To retrieve the admin-tech file from the Cisco SD-WAN device, use SCP. To do this, you must have login access to the device. To copy the file from the Cisco SD-WAN device, enter the shell from the Cisco SD-WAN CLI and issue a command in the following format:

```
vEdge# vshell
vEdge:~$ scp filename .tar.gz username@host-name:path-name
```

request admin-tech [delete-filename filename] [exclude-cores] [exclude-logs] [exclude-tech]

vManage Equivalent

Tools ▶ Operational Commands ▶ Select device ▶ More Actions icon ▶ Admin Tech

(none)	Collect all system status information, including core files, log files, and the process (daemon) and operational-related files that are stored in the /var/tech directory on the local device.
exclude-cores	Do Not Include Core Files: Do not include any core files in the compressed tar file. Core files are stored in the /var/crash directory on the local device.

exclude-logs	Do Not Include Log Files: Do not include any log files in the compressed tar file. Log files are stored in the /var/log directory on the local device.
exclude-logs	Do Not Include Process-Related Files: Do not include any process (daemon) and operational-related files in the compressed tar file. These files are stored in the /var/tech directory on the local device.

Release	Modification
14.1	Command introduced.
16.1	Added support for running only one request admin-tech command at a time.
16.3	Added delete-file-name, exclude-cores, exclude-logs, and exclude-tech options.
17.1	Added automatic collection of admin-tech information after a process fails.

Examples

Create an admin tech file and copy it to a user's home directory on a host in the network. For the SCP command, you must specify the full pathname of where to place the copied file.

```
vEdge# request admin-tech
Requested admin-tech initiated.
Created admin-tech file '/home/admin/20170712-123416-admin-tech.tar.gz'
vEdge# vshell

request certificate

Install a certificate on the Cisco SD-WAN device (on vSmart controllers and vBond orchestrators only).

request certificate install file-path [vpn vpn-id]

Syntax Description

file-path	Path to Certificate File: Install the certificate in specified filename.
	The file can be in a your home directory on the local device, or it can be on a remote device reachable through VPN 0 and using FTP, HTTP, SCP, or TFTP. If you are using SCP, you are prompted for the directory name and filename. No file path name is provided.
	file-path can be one of the following:
	• filename—Path to a file in your home directory on the local Cisco SD-WAN device.
	• ftp: file-path—Path to a file on an FTP server.
	• http:// url/file-path—Path to a file on a webserver.
	• scp: user@host:file-path
	• tftp: <i>file-path</i> —Path to a file on a TFTP server.
vpn	Specific VPN: VPN in which the certificate file is located.
vpn-id	When you include this option, one of the interfaces in the specified VPN is used to retrieve the file. The interfaces on a vSmart controller are only in VPN 0, the VPN reserved for the control plane, so you can omit this option because vSmart images are always retrieved from VPN 0.

Command History

Release	Modification
14.1	Command introduced.

Related Topics

request container image install

Install a vSmart software image on a vSmart controller container host (on vSmart controller container hosts only).

request container image install filename [vpn vpn-id]

Syntax Description

filename	Name of vSmart Software Image: Install the vSmart controller software image in the specified filename. The file can be in your home directory on the local device, or it can be on a remote device reachable through FTP, HTTP, SCP, or TFTP. If you are using SCP, you are prompted for the directory name and filename. No file path name is provided. <i>filename</i> has the format viptela- <i>release-number</i> -x86_64.tar.gz.
vpn vpn-id	When you include this option, one of the interfaces in the specified VPN is used to retrieve the software image. The interfaces on a vSmart controller are only in VPN 0, the VPN reserved for the control plane, so you can omit this option because vSmart images are always retrived from VPN 0.
	When you include this option, one of the interfaces in the specified VPN is used to retrieve the software image. The interfaces on a vSmart controller are only in VPN 0, the VPN reserved for the control plane, so you can omit this option because vSmart images are always retrived from VPN 0.

Command History

request control-tunnel add

Create a temporary tunnel to use when debugging a failed control connection (on vEdge routers only). One case when you might want to create a temporary tunnel is when a control connection fails to come up because of firewall rules or NAT issues. The Cisco SD-WAN software's forwarding process drops failed connections, so creating a temporary one allows you to triage the problem.

 $\textbf{request control-tunnel add local-private-ip} \ ip-address\ \textbf{local-private-port}\ port-number\ \textbf{remote-public-ip} ip-address\ \textbf{remote-public-port}\ port-number$

Syntax Description

local-private-port ip-address port-number	Local Private IP Address and Port Number: Private IP address and port number for the local side of the tunnel connection. port-number can be a value from 0 through 65535.
remote-public-ip ip-address remote-public-port port-number	Remote Public IP Address and Port Number: Public IP address and port number for the remote side of the tunnel connection. can be a value from 0 through 65535. port-number

Command History

Release	Modification
16.1	Command introduced.

Examples

```
vEdge# request control-tunnel add local-private-ip 10.1.14.14
Value for 'local-private-port' (<0..65535>): 22234

Value for 'remote-public-ip' (<IP address>): 10.0.12.20
Value for 'remote-public-port' (<0..65535>): 23456

request controller add serial-num

Send the certificate serial number of a vManage NMS or a vSmart controller to the vBond orchestrator (on vManage NMSs only).

request controller add serial-num number

Syntax Description

number Serial Number: Certificate	erial number to send to the vManage or vSmart controller.
-------------------------------------	---

Command History

Release	Modification	1
15.4	Command introduced to replace the request vsmart add serial-num command.	

Usage Guidelines

Note

The **request controller add serial-num** command to add serial numbers is not supported on Cisco SD-WAN 20.x releases as changes are not persistent across reboots. You can add serial numbers through Cisco vManage. For more details on controller serial numbers, see Controller Serial Numbers to Cisco vBond Orchestrator.

Related Topics

request controller delete serial-num

request controller delete serial-num—Delete a vSmart serial number from the vSmart controller serial number file on the local device.

request controller delete serial-num number

Syntax Description

number	Serial Number: vSmart serial number to delete from the vSmart serial number file on the local
	device.

Command History

Release	Modification
15.4	Command introduced to replace the request vsmart delete serial-num command.

Usage Guidelines

Note

The **request controller delete serial-num** command to delete serial numbers is not supported on Cisco SD-WAN 20.x releases as changes are not persistent across reboots. You can delete serial numbers through Cisco vManage.

request controller-upload serial-file

request controller-upload serial-file—Upload the controller certificate serial number file to the local device (on vManage NMSs only). The local device retains these serial numbers even after you reboot it.

request controller-upload serial-file filename [vpn vpn-id]

Syntax Description

filename	Name of Certificate File: Install the specified file containing the list of serial numbers for the vManage NMSs and vSmart controllers in the overlay network. The file can be in your home directory on the local device, or it can be on a remote device reachable through FTP, HTTP, SCP, or TFTP. If you are using SCP, you are prompted for the directory name and filename. No file path name is provided.
vpn vpn-id	Specific VPN: VPN in which the certificate file is located. When you include this option, one of the interfaces in the specified VPN is used to retrieve the file. The interfaces on a vSmart controller are only in VPN 0, the VPN reserved for the control plane, so you can omit this option because vSmart images are always retrieved from VPN 0.

Command History

Release	Modification
15.4	Command introduced to replace the request vsmart-upload serial-file command.

Related Topics

request controller add serial-num, on page 103 request controller delete serial-num, on page 104

request csr upload

request csr upload—Upload a certificate signing request (CSR) to the Cisco SD-WAN device (on vSmart controllers and vBond orchestrators only).

request csr upload path [regen-rsa] [regen-uuid] [vpn vpn-id]

path	Path to Certificate File: Upload the CSR in the file at the specified path. The path can be in a directory on the local device or on a remote device reachable through FTP, HTTP, SCP, or TFTP. If you are using SCP, you are prompted for the directory name and filename. No file path name is provided.
regen-rsa	(Optional) Regenerate RSA Key Pair: Generate a new RSA public-private key pair. The RSA key pair is stored in the server key file in the /usr/share/viptela directory on the local device.

regen-uuid	(Optional) Regenerate UUID: Generate a new CSR with a unique UUID that is different from the previous UUID. You can specify this option only on a vBond orchestrator virtual machine (VM). The option is not available on vEdge router hardware, because the router's UUID is its chassis number.
vpn vpn-id	(Optional) Specific VPN: VPN in which the CSR file is located. When you include this option, one of the interfaces in the specified VPN is used to retrieve the file. The interfaces on a vSmart controller are only in VPN 0, the VPN reserved for the control plane, so you can omit this option because vSmart images are always retrieved from VPN 0.

Release	Modification
14.1	Command introduced.
14.2	Added the org-name and regen-rsa options.
15.3	Removed the org-name option. The command now prompts for the organization name.
17.1	Added support for multitenancy.

Examples

```
vSmart# request csr upload home/admin/vm9.csr
Uploading CSR via VPN 0
Enter organization name : Cisco SD-WAN
Re-enter organization name : Cisco SD-WAN
Generating CSR for this VSmart device
......[DONE]
Copying ... /home/admin/vm9.csr via VPN 0
CSR upload successful
```

When the vBond orchestrator or vSmart controller is part of a software multitenant architecture, the command also prompts for the service provider organization name.

```
vSmart# request csr upload home/admin/vm9.csr
Uploading CSR via VPN 0
Enter service provider organization name : SP Inc
Re-enter service provider organization name : SP Inc
Enter organization name : Cisco SD-WAN
Re-enter organization name : Cisco SD-WAN
Generating CSR for this vSmart device
......[DONE]
Copying ... /home/admin/vm9.csr via VPN 0
CSR upload successful
```

request device

request device—Add or delete a vEdge router chassis number on the vBond orchestrator that is acting as a ZTP server.

request device add chassis-number number strong>serial-numbernumber validity [invalid | valid] vbond ip-address org-name name [port port-number] [enterprise-root-ca path] request device delete chassis-number number

chassis-number number	Chassis Number: vEdge router chassis number.
validity invalid valid	Device Validity: Whether the vEdge router is allowed to join the overlay network (valid) or is not allowed (invalid).
enterprise-root-ca path	Enterprise Root CA: Path to the enterprise root CA. The path can be an HTTP, FTP, or TFTP path.
org-name name	Organization Name: Name of your organization as specified in the device certificates.
port port-number	Port on the vBond Orchestrator: Port to use on the vBond orchestrator to reach the WAN network.
strong>serial-numbernumber	Serial Number: vEdge router serial number.

Release	Modification
14.3	Command introduced.

Examples

```
vBond# request device add chassis-number 12345 serial-number 6789 validity valid vbond 10.1.14.1 org-name cisco
Adding Chassis number 12345 to the database
Successfully added the chassis-number

Creating Serial file ..

request device-upload

request device—Add vEdge router chassis numbers by uploading a file that contains the device information onto the vBond orchestrator that is acting as a ZTP server.

request device-upload chassis-file file-path [vpn vpn-id]

chassis-file file-path	Filename: Name of a CSV file containing the chassis information required by the ZTP server.
	file-path can be one of the following:
	• filename—Path to a file in your home directory on the local Cisco vEdge device.
	• ftp: file-path—Path to a file on an FTP server.
	• http:// url/file-path—Path to a file on a webserver.
	• scp: user@host:file-path
	• file-path—Path to a file on a TFTP server.
	Each row in the CSV file must contain the following information for each vEdge router:
	Chassis number
	Serial number
	Validity (either valid or invalid)
	• vBond IP address
	vBond port number (entering a value is optional)
	Organization name
	Path to the root certification (entering a value is optional)
file-path vpn vpn-id	VPN: vpn <i>vpn-id</i> VPN in which the remote server is located.

Release	Modification
14.3	Command introduced.

Examples

The following example uploads the device information from the local router. Here, the root CA path is omitted, but the comma preceding its value is required.

```
vBond# vshell
vm4vBond~$ cat ztp-chassis-file
12345,6789,valid,10.1.14.1,12345,cisco,
vBond:~$ exit
exit
vBond request device-upload chassis-file /home/admin/ztp-chassis-file
Uploading chassis numbers via VPN 0
Copying ... /home/admin/ztp-chassis-file via VPN 0
Successfully loaded the chassis numbers file to the database.
Uploading the serial numbers to the vedge-list ...
Uploading serial numbers via VPN 0
Copying ... /home/admin/vedge_serial_entries via VPN 0
```

Successfully loaded the vEdge serial numbers vBond# show ztp entries $\ensuremath{^{\text{T}}}$

	CHASSIS	SERTAT.			VBOND	ORGANIZATION	ROOT
INDEX			VALIDITY	VBOND IP		NAME	PATH
1	12345	6789	valid	10.1.14.1	12345	cisco	

Related Topics

request download

request download—Download a software image or other file to the Cisco SD-WAN device (on vEdge routers and vSmart controllers only).

request download [vpn vpn-id] filename

Syntax Description

filename	Name of Software Image or File: Download a software image or other file to the local Cisco SD-WAN device. The file can be on a remote device reachable through FTP, HTTP, HTTPS, SCP, or TFTP. If you are using SCP, you are prompted for the directory name and filename; no file path name is provided. The file is placed in your home directory on the local device.
vpn vpn-id	Specific VPN: VPN in which the remote device containing the file to be downloaded is located. When you include this option, one of the interfaces in the specified VPN is used to retrieve the software image.

Command History

Release	Modification
15.3.3	Command introduced on vEdge 100 routers.
15.4	Available on all routers and on vSmart controllers.

Related Topics

request execute

request execute—Execute a shell command from within the Cisco SD-WAN CLI.

request execute [vpn vpn-id] command (in Releases 15.4 and later)

request execute [vpn vpn-id] "command" (in Releases 15.3 and earlier)

Syntax Description

command	Command: Run the specified command in the UNIX shell while still remaining in the Cisco SD-WAN CLI. In Releases 15.3 and earlier, you must enclose the command within quotation marks.
vpn vpn-id	VPN: Specific to the VPN in which to execute the command. The default <i>vpn-id</i> is VPN 0.

Command History

Release	Modification
14.1	Command introduced.
15.4	Enclosing the shell command in quotation marks is no longer necessary.

Examples

```
vSmart# request execute 1s
Execute command in vpn 0 - 1s
cacert.pem  vsmart-signed-cert-vm9.pem  vsmart-vm9.csr
vEdge# request execute vpn 512 ssh admin@10.0.1.1
```

To open an SSH connection from a vManage NMS to an IOS XE router, you must specify the port number, which is 830.

```
vManage# request execute vpn 0 ssh 172.16.255.15 ssh: connect to host 172.16.255.15 port 22: Connection refused vManage# request execute vpn 0 ssh 172.16.255.15 -p 830 admin@172.16.255.15's password:

request firmware upgrade

request firmware upgrade—Upgrade the boot loader (on vEdge routers only). After running this command, you must reboot the router.

request firmware upgrade filename

Syntax Description

filename	Boot Loader Filename: Name of the boot loader file. This file must be on the local device. To get
	the boot loader file, contact Cisco SD-WAN Customer Support.

Command History

Release	Modification
15.3.5	Command introduced.

Examples

```
\label{eq:vEdge} $$v$Edge$\# request firmware upgrade u-boot-n820c.bin $$v$Edge$\# reboot
```

Related Topics

reboot, on page 94

request interface-reset

request interface-reset—Reset an interface. This command shuts down and then restarts an interface. The operation occurs so quickly that no indication of the interface's being down is reported in the IF STATUS fields in the output of the **show interface** command.

request interface-reset interface interface-name vpn vpn-id

Syntax Description

interface interface-name	Interface Name: Name of the interface to reset.
vpn vpn-id	VPN: VPN in which the interface resides.

Command History

Re	lease	Modification
15.	.3	Command introduced.

Examples

```
\begin{tabular}{ll} vEdge \# & request interface-reset interface $ge0/4$ vpn 1 \\ vEdge \# & tabular & tabu
```

Related Topics

request ipsec ike-rekey

request ipsec ike-rekey—Force the generation of new keys for an IKE session (on vEdge routers only). **request ipsec ike-rekey vpn** *vpn-id* **interface ipsec** *number*

Syntax Description

ipsec number	Interface Name: Name of the IPsec interface on which to force the generation of new keys for an IKE session.
vpn vpn-id	VPN: VPN in which the IPsec interface is located.

Command History

Release	Modification
17.2	Command introduced.

Examples

Generate a new key for an IKE session. After the new key is generated, the SPI for the session changes and the uptime for the sessions resets to zero. You cannot directly display the old and new keys.

request nms all

request nms all—Start, stop, and perform other operations on all vManage cluster components running on the local vManage NMS (on vManage NMSs only). The cluster components are the application server (the HTTP web server for the vManage NMS), the vManage configuration and statistics databases, the messaging and coordination server, and the load balancer.

request nms all (diagnostics | jcmd option | restart | start | status | stop)

Syntax Description

status	Determine the Status of All vManage Cluster Components: Determine the status of all vManage cluster components.		
jcmd option	Display Java Process Information: Display information from Java processes running on all vManage cluster components.		
	option can be one of the following:		
	• gc-class-histo—Histogram of the Java garbage collector. Garbage collection identifies which objects are being used in heap memory.		
	• gc-class-stats—Statistics of the Java garbage collector.		
	• thread-print—Information about the Java threads.		
	• vm-cmd—Java virtual machine commands.		
	• vm-flags—Java virtual machine flags.		
	• vm-sys-props—Java virtual machine system properties.		
	• vm-uptime—Java virtual machine uptime.		
	• vm-ver—Java virtual machine version .		
restart	Restart All vManage Cluster Components.		
diagnostics	Run Diagnostics on All vManage Cluster Components.		
start	Start All vManage Cluster Components.		
stop	Stop All vManage Cluster Components.		

Command History

Release	Modification	
16.1	Command introduced.	
16.2.3	Added the diagnostics option.	

Examples

```
vManage# request nms all status

NMS application server
    Enabled: true
    Status: running PID:5877 for 2232s

NMS configuration database
    Enabled: true
    Status: running PID:9132 for 235s

NMS coordination server
    Enabled: true
    Status: running PID:28143 for 9591s

NMS messaging server
    Enabled: true
```

```
Status: running PID:22267 for 11508s

NMS statistics database
   Enabled: true
   Status: running PID:472 for 48357s

NMS load balancer
   Enabled: false
   Status: not running
```

Related Topics

request nms application-server, on page 116 request nms configuration-db, on page 121 request nms coordination-server, on page 123 request nms messaging-server, on page 124 request nms statistics-db, on page 127

request nms application-server

request nms application-server—Start, stop, and perform other operations on a vManage HTTP web server (on vManage NMSs only).

request nms application-server (diagnostics | jcmd option | resize-data-partition | restart | software option | start | status | stop | update-logo filename)

Syntax Description

status	Determine the status of the local vManage web server.
jcmd option	Display Java Process Information: Display information from a Java process running on the vManage web server.
	option can be one of the following:
	• gc-class-histo—Histogram of the Java garbage collector. Garbage collection identifies which objects are being used in heap memory.
	• gc-class-stats—Statistics of the Java garbage collector.
	• gc-heap-dump—Snapshot of the Java garbage collector.
	• thread-print —Information about the Java threads running on the vManage web server.
	• vm-cmd—Java virtual machine commands on the vManage web server.
	• vm-flags—Java virtual machine flags on the vManage web server.
	• vm-sys-props—Java virtual machine system properties on the vManage web server.
	• vm-uptime—Java virtual machine uptime on the vManage web server.
	• vm-ver—Java virtual machine version on the vManage web server.

update-logo large-logo-filename small-logo-filename	Load a Custom Logo onto the vManage Web Server: Load a logo image to use in the upper left corner of all vManage web application server screens. You can load two files, a larger version, which is displayed on wider browser screens, and a smaller version, which is displayed when the screen size narrows. Both files must be PNG files located on the local device, and both must be 1 MB or smaller in size. For best resolution, it is recommended that the image for the large logo be 180 x 33 pixels, and for the small logo 30 x 33 pixels.		
resize-data-partition	Resize Third vManage Partition: Automatically resize the third partition on the vManage NMS if the hypervisor has increased the size of this partition. This partition is the vManage database volume and contains all vManage databases and information related to them. vManage NMS calculates the size of the database volume only when it is initially created. If the hypervisor capabilities cause the database volume size to increase, the vManage NMS recognizes this space and can utilize it only if you issue the request nms application-server resize-data-partition command.		
restart	Restart the vManage Web Server: Restart the local vManage web server.		
diagnostics	Run Diagnostics on vManage Web Server: Run diagnostics on the vManage web server.		
start	Start the local vManage web server.		
stop	Stop the vManage Web Server: Stop the local vManage web server.		
software option	Web Application Server Software Control: Control the software running on the vManage application server. can be:		
	option can be:		
	• reset —Undo a software upgrade on the vManage server, and return to the previous software image.		
	• upgrade <i>filename</i> —Upgrade the software on the vManage server to the image in the specified file.		
	1		

Release	Modification
16.1	Command introduced.
16.2.2	Added version option.
16.2.3	Added software option and move version option under software , and added diagnostics option.
17.2	Added resize-data-partition, software reset, and software upgrade options.
20.4	gc-heap-dump jcmd option is visible for netadmin user without unhide command.

Release	Modification	
20.13.1	Added status to the command output. When using the status option, the command output indicates whether there is a schema violation in the configuration database.	

Examples

Perform various operations on the local vManage application server

```
vManage# request nms application-server status
NMS application server
   Enabled: true
   Status: running PID:28271 for 7313s
vManage# request nms application-server stop
vManage# request nms application-server restart
NMS application server is not running
Successfully started NMS application server
vManage# request nms application-server status
NMS application server
   Enabled: true
   Status: running PID:5877 for 6s
vManage# request nms application-server jcmd vm-uptime
NMS application server
5877:
21.357 s
vManage#
```

Determine the version of software running on the vManage NMS web server

```
vManage# request nms application-server version

NMS application server is running version bamboo-20160805-0008 on vManage version 16.2.2
```

Check for Database Schema Violation

The following example, which includes the status option, displays the NMS application server status. Starting from Cisco Catalyst SD-WAN Manager Release 20.13.1, the command indicates whether there are any schema violations in the configuration database. In this example, the command output includes a message indicating a schema violation. If you encounter a schema violation, contact Cisco Customer Support to resolve the issue.

```
SDWAN-Manager# request nms application-server status

NMS application server

Enabled: false

Message: Schema Violation

Status: not running

SDWAN-Manager#
```

request nms statistics-db, on page 127

request nms cluster diagnostics

To analyze the health of a Cisco SD-WAN Manager cluster, use the **request nms cluster diagnostics** command in privileged EXEC mode.

request nms cluster diagnostics

Syntax Description

This command has no arguments or keywords.

Command Default

None

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco vManage Release 20.9.1	This command was introduced.

Usage Guidelines

Run the command directly on the Cisco SD-WAN Manager device for which you are running the Cisco SD-WAN Manager cluster.

The **request nms cluster diagnostics** command provides Cisco SD-WAN Manager cluster diagnostics information and status information for the following Cisco SD-WAN Manager services:

- · Application server
- Messaging server
- Configuration database
- Statistics database service
- Coordination server

Examples

The following is a sample output from the **request nms cluster diagnostics** command:

Device# request nms cluster diagnostics

Note: This output only compares the cluster configuration of each service running on this specific vManage against its operational state. For overall cluster health, please check the Cluster Status page on UI.

hosts in cluster:

10.0.105.39 10.0.105.38 10.0.105.32

Checking services running on 10.0.105.32

persona: COMPUTE AND DATA

Check application-server cluster status status: OK

```
check configuration-db status
Get cluster overview:
id, addresses, databases, groups
"8b82367b-5e47-496f-b9ef-683c61ada642", ["bolt://10.0.105.32:7687",

```

Related Commands

Commands	Description
request admin-tech	Collect system status information in a compressed tar file to aid in troubleshooting and diagnostics.
request nms all	Start, stop, and perform other operations on all Cisco SD-WAN Manager cluster services.
request nms application-server	Start, stop, and perform other operations on a Cisco SD-WAN Manager HTTP web server.
request nms configuration-db	Start, stop, and perform other operations on the localCisco SD-WAN Manager configuration database.
request nms coordination-server	Start, stop, and perform other operations on the local Cisco SD-WAN Manager coordination server.
request nms messaging-server	Start, stop, and perform other operations on the local Cisco SD-WAN Manager messaging server.
request nms statistics-db	Start, stop, and perform other operations on the local Cisco SD-WAN Manager statistics database.
request nms-server	Start and stop a Cisco SD-WAN Manager server and display the status of the server.
request nms server-proxy	Display the status of the Cisco SD-WAN Manager server-proxy for the configured management IP address and port.

request nms configuration-db

To start, stop, and perform other operations on the local Cisco SD-WAN Manager configuration database use the **request nms configuration-db** in privileged EXEC mode. The Cisco SD-WAN Manager configuration database stores device and feature templates and configurations created on the local device.

request nms configuration-db $\{$ backup path $path \mid$ configure \mid disable-daily-backup \mid enable-daily-backup \mid jcmd \mid restart \mid restore path $path \mid$ start \mid status \mid stop \mid update-admin-user \mid upgrade \mid

Syntax Description

backup path path	Performs back up of the configuration database to the specified file location.
configure	Configures the local Cisco SD-WAN Manager configuration database.
diagnostics	Runs diagnostics on local Cisco SD-WAN Manager configuration database.
disable-daily-backup	Disables local Cisco SD-WAN Manager configuration database daily backup cronjob.
enable-daily-backup	Enables local Cisco SD-WAN Manager configuration database daily backup cronjob.
	Up to three backups files are stored in the location that you specify with the backup path <i>path</i> keyword. A back up file is named configdb-daily. <i>x</i> .tar.gz, where <i>x</i> is 1, 2, or 3. After three backup files are stored, the oldest file is overwritten when the next backup is performed.
jcmd option	Displays information from the Java processes running on the local Cisco SD-WAN Manager configuration database.
	option can be one of the following:
	• gc-class-histo—Histogram of the Java garbage collector. Garbage collection identifies which objects are being used in heap memory.
	• gc-class-stats—Statistics of the Java garbage collector.
	• thread-print—Information about the Java threads running on the vManage web server.
	• vm-cmd—Java virtual machine commands on the vManage web server.
	• vm-flags—Java virtual machine flags on the vManage web server.
	• vm-sys-props—Java virtual machine system properties on the vManage web server.
	• vm-uptime—Java virtual machine uptime on the vManage web server.
	• vm-ver—Java virtual machine version on the vManage web server.
restart	Restarts the Cisco SD-WAN Manager configuration database.
restore path path	Restores Cisco SD-WAN Manager configuration database from the file located at a specified path.

start	Starts the local Cisco SD-WAN Manager configuration database.
status	Determines the status of the local Cisco SD-WAN Manager configuration database.
stop	Stops the Cisco SD-WAN Manager Configuration Database: Stop the local vManage configuration database.
update-admin-user	Updates configuration database admin user information.
upgrade	Upgrades the configuration database on any one node in the cluster.

Release	Modification
16.1	Command introduced.
16.2.3	This command was modified. The diagnostics keyword is added.
20.3.1	This command was modified. The following keywords were added: disable-daily-backup, enable-daily-backup, upgrade

Examples

Perform various operations on the localCisco SD-WAN Manager configuration database

```
vManage# request nms configuration-db status
NMS configuration database
   Enabled: true
   Status: running PID:25778 for 10601s
vManage# request nms configuration-db stop
Successfully stopped NMS configuration database
vManage# request nms configuration-db restart
Successfully restarted NMS configuration database
vManage# vManage
NMS configuration database
   Enabled: true
   Status: running PID:9132 for 5s
vManage# request nms configuration-db jcmd vm-ver
NMS configuration database
9132:
Java HotSpot(TM) 64-Bit Server VM version 25.72-b15
JDK 8.0 72
Verify if the daily backup is enabled:
vmanage# request nms configuration-db status
NMS configuration database
      Enabled: true
      Status: running PID:25778 for 10601s
      Daily Backup: Enabled
```

request nms application-server, on page 116
request nms coordination-server, on page 123
request nms messaging-server, on page 124
request nms statistics-db, on page 127

request nms coordination-server

request nms coordination-server—Start, stop, and perform other operations on the local vManage coordination server (on vManage NMSs only). The vManage coordination and messaging server work together to distribute messages and share state among all the vManage NMSs in a vManage cluster.

request nms coordination-server (diagnostics | jcmd option | restart | start | status | stop)

Syntax Description

status	Determine the Status of the Coordination Server: Determine the status of the local coordination server.
jcmd option	Display Java Process Information: Display information from Java processes running on the coordination server.
	option can be one of the following:
	 gc-class-histo—Histogram of the Java garbage collector. Garbage collection identifies which objects are being used in heap memory.
	• gc-class-stats—Statistics of the Java garbage collector.
	• thread-print—Information about the Java threads running on the vManage web server.
	• vm-cmd—Java virtual machine commands on the vManage web server.
	• vm-flags—Java virtual machine flags on the vManage web server.
	• vm-sys-props—Java virtual machine system properties on the vManage web server.
	• vm-uptime—Java virtual machine uptime on the vManage web server.
	• vm-ver—Java virtual machine version on the vManage web server.
restart	Restart the Coordination Server: Restart the local coordination server.
diagnostics	Run Diagnostics on the Coordination Server: Run diagnostics on the local vManage coordination server.
start	Start the Coordination Server: Start the local coordination server.
stop	Stop the Coordination Server: Stop the local coordination server.

Release	Modification
16.1	Command introduced.
16.2.3	Added the diagnostics option.

Examples

Perform various operations on the local vManage coordination server

```
vManage# request nms coordination-server status
NMS coordination server
    Enabled: true
    Status: running PID:28143 for 11160s
vManage#
```

Related Topics

```

```

request nms messaging-server

request nms messaging-server—Start, stop, and perform other operations on the local vManage messaging server (on vManage NMSs only). The vManage coordination and messaging server work together to distribute messages and share state among all the vManage NMSs in a vManage cluster.

 $request \ nms \ messaging \text{-}server \ (diagnostics \mid jcmd \ \mathit{option} \mid restart \mid start \mid status \mid stop)$

Syntax Description

status	Determine the Status of the Messaging Server: Determine the status of the local messaging	
	server.	

jcmd option	Display Java Process Information: Display information from Java processes running on the messaging server.
	option can be one of the following:
	 gc-class-histo—Histogram of the Java garbage collector. Garbage collection identifies which objects are being used in heap memory.
	• gc-class-stats—Statistics of the Java garbage collector.
	• thread-print—Information about the Java threads running on the vManage web server.
	• vm-cmd—Java virtual machine commands on the vManage web server.
	• vm-flags—Java virtual machine flags on the vManage web server.
	• vm-sys-props—Java virtual machine system properties on the vManage web server.
	• vm-uptime—Java virtual machine uptime on the vManage web server.
	• vm-ver—Java virtual machine version on the vManage web server.
restart	Restart the Messaging Server: Restart the local messaging server.
diagnostics	Run Diagnostics on the Message Server: Run diagnostics on the local vManage message server.
start	Start the Messaging Server: Start the local messaging server.
stop	Stop the Messaging Server: Stop the local messaging server.

Release	Modification
16.1	Command introduced.
16.2.3	Added the diagnostics option.

Examples

Perform various operations on local vManage messaging server

```
vManage# request nms messaging-server status
NMS messaging server
    Enabled: true
    Status: running PID:22267 for 13679s
vManage#
```

Related Topics

```

request nms olap-db

To start, stop, or restart the Cisco vManage online analytical processing (OLAP) database, or to view the status of the database, use the **request nms olap-db** command in privileged EXEC mode.

request nms olap-db [{ start | stop | restart | status }]

Syntax Description

start	Start the OLAP database.
stop	Stop the OLAP database.
restart	Restart the OLAP database.
status	Display the status of the OLAP database.

Command Default

The OLAP database service is started by default, and you don't have to manually start it.

Command Modes

Privileged EXEC mode.

Command History

Release	Modification
Cisco vManage Release 20.11.1	This command was introduced.

Example

The following example shows how to start the OLAP database:

vmanage# request nms olap-db start

Successfully started NMS OLAP database

The following example shows how to stop the OLAP database:

vmanage# request nms olap-db stop

Successfully stopped NMS OLAP database

The following example shows how to restart the OLAP database:

vmanage# request nms olap-db restart

Successfully restarted NMS OLAP database

The following example displays the status of the OLAP database:

```
vmanage# request nms olap-db status
```

NMS OLAP database

Enabled: true

Status: running PID:65218 for 2981335s

request nms statistics-db

Start, stop, and perform other operations on the local vManage statistics database (on vManage NMSs only). The vManage statistics database stores all real-time statistics from the local vManage NMS.

 $request \ nms \ statistics-db \ (allocate-shards \ | \ diagnostics \ | \ jcmd \ \mathit{option} \ | \ restart \ | \ status \ | \ stop)$

Syntax Description

allocate-shards	Allocate Unassigned Database Shards. Check for unassigned shards in the vManage statistics database, and assign them.	
diagnostics	Run diagnostics on the local vManage statistics database.	
jemd option	Display information from a Java process running on the vManage web server. Option can be one of the following:	
	• gc-class-histo—Histogram of the Java garbage collector. Garbage collection identifies which objects are being used in heap memory.	
	• gc-class-stats—Statistics of the Java garbage collector.	
	• thread-print—Information about the Java threads running on the vManage web server.	
	• vm-cmd—Java virtual machine commands on the vManage web server.	
	• vm-flags—Java virtual machine flags on the vManage web server.	
	• vm-sys-props—Java virtual machine system properties on the vManage web server.	
	• vm-uptime—Java virtual machine uptime on the vManage web server.	
	• vm-ver—Java virtual machine version on the vManage web server.	
restart	Restart the local vManage statistics database.	
start	Start the local vManage statistics database.	
status	Determine the status of the local vManage statistics database.	
stop	Stop the local vManage statistics database.	

Release	Modification
16.1	Command introduced.
16.2.3	Command modified. Diagnostics option added.
16.3	Command modified. allocate-shards option added

Example

Perform various operations on local vManage statistics database:

```
vManage# request nms statistics-db status
NMS statistics database
Enabled: true
Status: running PID:472 for 48607s
vManage# request nms statistics-db stop
Successfully stopped NMS statistics database
vManage# request nms statistics-db restart
Successfully restarted NMS statistics database
vManage# request nms statistics-db status
NMS statistics database
   Enabled: true
   Status: running PID:10353 for 4s
vManage# request nms statistics-db jcmd vm-sys-props
NMS statistics database
10353:

request nms-server

Start and stop a vManage NMS, and display the status of the NMS (on vManage NMSs only).

```
request nms-server (start | status | stop)
```

Syntax Description

start	Start or restart the local vManage NMS.
status	Determine the status of the local vManage NMS.
stop	Stop the local vManage NMS.

Command History

Release	Modification
15.4	Command introduced.

Examples

Check the status of the local vManage NMS, stop and start the server

```
vManage# request nms-server status
NMS webserver is running
vManage# request nms-server stop
Successfully stopped NMS webserver
vManage# request nms-server status
NMS webserver is not running
vManage# request nms-server start
Successfully started NMS webserver
vManage# request nms-server status
NMS webserver is running
```

request nms server-proxy

To display the status of the NMS server-proxy for the configured management IP address and port, use the **request nms server-proxy** command.

request nms server-proxy set management-ip ip-address port

Syntax Description

set	Set NMS component.	
management-ip	Update service proxy management IP configuration.	
ip-address	Enter the Cisco SD-WAN Manager management IP address.	
	Default: 127.0.0.1	
port	Enter the Cisco SD-WAN Manager management IP port.	
	Default: 8443	

Command History

Release	Modification
Cisco SD-WAN Release 20.7.1	This command was introduced.

The following sample output shows the Cisco SD-WAN Manager management IP address and port configurations:

```
Device# request nms server-proxy set management-ip
```

Enter the vmanage management ip address[127.0.0.1]:127.0.0.1

Enter the vmanage management ip port[8443]:8443

/usr/bin/vconfd_serviceproxy_config.py:177: YAMLLoadWarning: calling yaml.load() without Loader=... is deprecated, a

s the default Loader is unsafe. Please read https://msg.pyyaml.org/load for full details.data = yaml.load(fread)

Restarted service proxy for management ip address update

request nms server-proxy set ratelimit

To configure rate limits for bulk and non-bulk APIs for a Cisco vManage node or cluster, use the **request nms server-proxy set ratelimit** command in the operational mode.

request nms server-proxy set ratelimit

Syntax Description

This command has no arguments or keywords.

Command Default

The rate limit per node for non-bulk APIs is 100 requests per second.

The rate limit per node for bulk APIs is 48 requests per minute.

For a Cisco vManage cluster, the default rate limit per node is multiplied by the number of nodes. For example, for a three-node cluster, the default rate limit is 144 (48*3) requests per minute across all three nodes.

Command Modes

Operational mode (#)

Command History

Release	Modification
Cisco vManage Release 20.10.1	This command is introduced.

Before you configure the rate limit, consider its effect on Cisco vManage resources.

Examples

The following example shows how you can configure the bulk API rate limit for a node. In this example, the rate limit is changed from 48 requests per minute to 50 requests per minute.

vManage# request nms server-proxy set ratelimit

```
Do you want to reconfigure rate limit for URL non bulk api [y/n] : n
Do you want to reconfigure rate limit for URL bulk api /dataservice/data/device/statistics
[y/n] : y
Enter the PER NODE rate limit for URL bulk api /dataservice/data/device/statistics [48 load balanced across all nodes at present] : 50
Enter the rate limit unit (second, minute, hour, day) for URL bulk api
```

/dataservice/data/device/statistics [minute] : minute

Propagating rate limit update across all nodes. Please wait. vmanage#

The following example shows how you can configure the bulk API rate limit for a cluster from one of the nodes in the cluster. This example shows the configuration of the bulk API rate limit on one of the nodes on a three-node cluster. The existing bulk API rate limit per node is 48 requests per minute, and the bulk API rate limit for the cluster is 144 (48*3) requests per minute. The configuration changes the bulk API rate limit per node to 50 requests per minute and the bulk API rate limit for the cluster to 150 requests per minute.

```
vManage# request nms server-proxy set ratelimit
```

```
Do you want to reconfigure rate limit for URL non bulk api [y/n] : n
Do you want to reconfigure rate limit for URL bulk api /dataservice/data/device/statistics
[y/n] : y
Enter the PER NODE rate limit for URL bulk api /dataservice/data/device/statistics [144 load balanced across all nodes at present] : 50
Enter the rate limit unit (second, minute, hour, day) for URL bulk api /dataservice/data/device/statistics [minute] : minute
Propagating rate limit update across all nodes. Please wait.
Done. Please restart server-proxy on all nodes using "request nms server-proxy restart" command.
```

Related Commands

Command	Description
show nms server-proxy ratelimit	Displays rate limits configured on the Cisco vManage server-proxy for bulk and non-bulk APIs.

request on-vbond-controller

Delete the serial number of a vEdge router (on vBond orchestrators only).

request on-vbond-controller delete serial-number serial-number

Syntax Description

serial-number	vEdge router serial number to delete.
---------------	---------------------------------------

Command History

Release	Modification
14.1	Command introduced.
16.1	Command modified. on-vbond-vsmart to request on-vbond-controller option added.

request on-vbond-vsmart

Delete the serial number of a vEdge router (on vBond orchestrators only).

Starting with Release 16.1, this command has been renamed to **request on-vbond-controller**.

request on-vbond-vsmart delete serial-number serial-number

Syntax Description

serial-number	vEdge router serial number to delete.
---------------	---------------------------------------

Command History

Release	Modification
14.1	Command introduced.

request platform software sdwan bootstrap-config save

To save a bootstrap file to the device bootflash, on Cisco IOS XE Catalyst SD-WAN devices, use **request platform software sdwan bootstrap-config save** in EXEC mode.

request platform software sdwan bootstrap-config save

Command Default

None.

Command Modes

EXEC

Command History

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.3.1a	The command was introduced.

Usage Guidelines

To establish connectivity with the Cisco Catalyst SD-WAN controller, a device requires a minimum configuration. In most situations, this minimum bootstrap configuration (MBC) can be provided initially by plug-and-play (PnP). But in some situations, such as in remote sites where it may be preferable not to use PnP, it is helpful to have a saved bootstrap configuration that can connect the device to the controller.

The **request platform software sdwan bootstrap-config save** command saves the device configuration to the bootflash. The command can be used to save the configuration at any time, but it is intended for saving a minimum bootstrap configuration (MBC) file that enables the device to reconnect to the controller in case the full configuration is ever lost or removed.

When setting up a device, add to the configuration the details that are required to connect to the controller, and use this command to save the MBC. The file is saved to this location:

bootflash:/ciscosdwan.cfg

Example

The following example shows the command execution and output.

Device#request platform software sdwan bootstrap-config save Saving bootstrap file 'bootflash:/ciscosdwan.cfg'...
Done

request port-hop

Manually rotate to the next OMP port in the group of preselected OMP port numbers when a connection cannot be established, and continue the port hopping until a connection can be established (on vEdge routers only). Each connection attempt times out in about 60 seconds.

One case to issue this command is when NAT entries become stale.

request port-hop color color

Syntax Description

color | Color of an individual WAN transport interface.

Values: 3g, biz-internet, blue, bronze, custom1, custom2, custom3, default, gold, green, lte, metro-ethernet, mpls, private1, private2, private3, private4, private5, private6, public-internet, red, and silver

Command History

Release	Modification
15.3.1	Command introduced.

Example

Request port hopping on TLOCs whose color is **lte**:

```
vEdge# request port-hop color lte vEdge#
```

Related Topics

```

Related Topics

show reboot history, on page 422

request reset logs

Clear the contents of all syslog logging files on the local device (on vEdge routers and vSmart controllers only). This operation also clears the contents of the WTMP file, which records all login and logout events that have occurred on the device. Resetting the logs does not require the device to be rebooted.

Command Hierarchy

request reset logs

Command History

Release	Modification
15.4	Command introduced.

Examples

The following example clears the syslog logging files on the vEdge device:

```
vEdge# file show /var/log/console-log
No license at startup, please load a valid licence.
licence error, could not read hardware identifier v4
licence error, could not read hardware identifier v5
...
vEdge# request reset logs
vEdge# show /var/log/console-log
vEdge#
```

request sla-dampening-reset color

To reset dampening on a tunnel for a color, use the **request sla-dampening-reset color** command in privileged EXEC mode.

Syntax

request sla-dampening-reset color color

Syntax Description

color color	Specifies an identifier for the transport tunnel for data traffic moving between vEdge routers. The color identifies a specific WAN transport provider.
	The following are the color values:
	3g, biz-internet, blue, bronze, custom1, custom2, custom3, default, gold, green, lte, metro-ethernet, mpls, private1 through private6, public-internet, red, silver
	Default:
	default

Command History

Release	Modification
20.5.1	This command is introduced.

Example

The following example resets dampening on a tunnel for the public-internet color:

```
vEdge (config) # bfd app-route
vEdge (config) # bfd app-route poll-interval 60000
vEdge (config-bfd) # bfd app-route multiplier 3
vEdge (config) # bfd app-route color public-internet
vEdge (config-color-public-internet) # sla-damp-multipler 60
vEdge (config-color-public-internet) # exit
```

```
vEdge (config-color-public-internet)# exit
vEdge# request sla-dampening-reset color public-internet
```

request root-ca-crl

To install a file that contains the root certificate authority Certificate Revocation List (CRL), use the **request root-ca-crl install** command in privileged EXEC mode.

To uninstall a file that contains the root certificate authority CRL, use the **request root-ca-crl uninstall** command in privileged EXEC mode.

request root-ca-crl install filename [vpn vpn-id]

request root-ca-crl uninstall

Syntax Description

install filename	Installs the specified file that contains the root certificate authority CRL.		
vpn vpn-id	Specifies the VPN in which the CRL file is located.		
uninstall	uinstall Uinstalls the file that contains the root certificate authority CRL from the dev		

Command Modes

Privileged EXEC

Command History

Release	Modification
Cisco SD-WAN Release 20.7.1	This command was introduced.

Usage Guidelines

- The file that contains the root certificate authority CRL is installed in the /usr/share/viptela/root-ca.crl directory in the device. The file can be in the home directory in your local device, or in a remote device that can be reached through FTP, HTTP, SCP, or TFTP. If you are using SCP, you are prompted for the directory name and filename. No file path name is provided.
- When you include the VPN option, one of the interfaces in the specified VPN is used to retrieve the file
 that contains the root certificate authority CRL. You can omit this option for a Cisco Catalyst SD-WAN
 Controller because its interfaces are only in VPN 0, which is the VPN that is reserved for the control
 plane, and Cisco Catalyst SD-WAN Controller images are always retrieved from VPN 0.

Examples

The following example shows how to install the master root.crl file:

```
vEdge # request root-ca-crl install /home/admin/master_root.crl
Uploading root-ca-crl via VPN 0
Copying /home/admin/master_root.crl to /tmp/vconfd/root-ca.crl.tmp via VPN 0
install_crl new_crl /tmp/vconfd/root-ca.crl.tmp destination_crl /usr/share/viptela/root-ca.crl
send install crl notification
```

The following example shows how to uninstall installs the master root.crl file:

```
vEdge # request root-ca-crl uninstall
Setting root-ca-crl-installed to false
send_uninstall_crl_notification
Successfully uninstalled the root CA CRL
```

request root-cert-chain

Install or uninstall a file containing the root certificate key chain.

Command Hierarchy

request root-cert-chain install filename [vpn vpn-id]

request root-cert-chain uninstall

Syntax Description

install filename	Install the specified file containing the root certificate chain The file can be in a your home directory on the local device, or it can be on a remote device reachable through FTP, HTTP, SCP, or TFTP. If you are using SCP, you are prompted for the directory name and filename. No file path name is provided.
vpn vpn-id	VPN in which the certificate file is located. When you include this option, one of the interfaces in the specified VPN is used to retrieve the file. The interfaces on a vSmart controller are only in VPN 0, the VPN reserved for the control plane, so you can omit this option because vSmart images are always retrieved from VPN 0.
uninstall	Uninstall the file containing the root certificate key chain from the Cisco vEdge device.

Command History

Release	Modification
14.1	Command introduced.

request security ipsec-rekey

Force IPsec to generate new keys (on vEdge routers only). Use this command when the IPsec keys have been compromised. After you issue this command, the old key continues to be used until it times out.

Command Hierarchy

request security ipsec-rekey

Command History

Release	Modification
14.2	Command introduced.

Examples

In this example, the SPIs (keys) for TLOC 172.16.255.15 change from 256 and 257 to 257 and 258:

vEdge# show tunnel local-sa
TLOC ADDRESS TLOC COLOR SPI IP PORT KEY HASH

172.16.255.15 172.16.255.15	lte lte	256 257	10.1.15.15 10.1.15.15	12346 12346	****b93a ****b93a
vEdge# request s	security ipsec-re	сеу			
vEdge# show tuni	nel local-sa				
TLOC ADDRESS	TLOC COLOR	SPI	IP	PORT	KEY HASH
172.16.255.15 172.16.255.15	lte lte	257 258	10.1.15.15 10.1.15.15	12346 12346	*****b93a *****a19d

request software activate

Activate a software image on the local Cisco SD-WAN device (on vEdge routers and vSmart controllers only). Starting from Release 15.4, this command replaces the **reboot other-boot-partition** command.

Command Hierarchy

request software activate software-image [clean] [now]

Syntax Description

now	Activate the specified software image immediately, with no prompt asking you to confirm that you want to activate.		
clean	Activate the specified software image, but do not associate the existing configuration file, and do not associates any files that store information about the device history, such as log and trace files, with the newly activated software image.		
	Note	Beginning with Cisco IOS XE Catalyst SD-WAN Release 17.10.1a, this option is no longer supported.	
software-image	Name of the software image to activate on the device.		

Command History

Release	Modification
15.3.3	Command introduced for vEdge 100 routers.
15.4	Command supported on all vEdge routers and vSmart controllers.
20.10	The clean option is no longer supported.

Examples

The following example activates a software image:

```
vEdge# request software activate 15.3.3
This will reboot the node with the activated version.
Are you sure you want to proceed? [yes,NO]
```

request software install

Download, install, and activate a software image on the Cisco SD-WAN device (on all devices except vEdge 100 routers). Before the software is installed, the software image is verified to determine that it is valid and that it has been signed. If the verification process fails, the software image installation is not performed.

Command Hierarchy

request software install filename [download-timeout minutes] [reboot [no-sync]] [vpn vpn-id]

Syntax Description

download-timeoutminutes	Specifies the installation timeout value. How long to wait before canceling
	requests to install software. The duration ranges from 1 through 1440 minutes
	(24 hours). The default time is 60 minutes.

filename	Install the software image in specified filename. The file can be in your home directory on the local device, or it can be on a remote device reachable through FTP, HTTP, SCP, or TFTP. If you are using SCP, you are prompted for the directory name and filename. No file path name is provided.
	For a vEdge router, filename has the format SD-WAN-release-number-mips64.tar.bz2 (this image includes both the vEdge and the software for a hardware-based vBond orchestrator).
	For a vSmart controller and software-based vBond orchestrator, filename has the format SD-WAN-release-number-x86_64.tar.bz2.
	For a vManage NMS, filename has the format vmanage-release-number-x86_64.tar.bz2.
	In all the image names, the release number consists of the last two digits of the release year and a number that indicates which release it is in that year. An example of a vEdge image name is SD-WAN-16.1-mips64.tar.bz2, for the first image released in 2016.
	When you upgrade the software on a vManage NMS, you should back up the vManage storage partition before performing the upgrade. See Restore the vManage NMS.
rebootno-sync	Reboot the device after installation of the software image completes. By default, the device's current configuration is copied to the other hard-disk partition and is installed with the new software image. If you include the no-sync option, the software is installed in the other hard-disk partition, and it is installed with the factory-default configuration. The existing configuration and any files that store information about the device history, such as log and trace files, are not copied to the other partition. Effectively, the no-sync option restores the device to its initial factory configuration.
vpn vpn-id	VPN in which the image is located. When you include this option, one of the interfaces in the specified VPN is used to retrieve the software image. The interfaces on a vSmart controller are only in VPN 0, the VPN reserved for the control plane, so you can omit this option because vSmart images are always retrived from VPN 0.

Release	Modification
14.1	Command introduced.
14.2	no-sync option added.
15.3.5	download-timeout option and prompt for backing up vManage database are added.
16.1	Support for signed images and image verification added.

Examples

To upgrade the software on a vManage NMS:

```
vEdge# request software install /home/admin/vmanage-15.2.0-x86 64.tar.bz2 reboot
It is recommended that you back up the vManage storage partition before upgrade. Proceed
with upgrade? [y/n]: n
vManage storage partition not backed up. Stopping upgrade.
vManage# request software install /home/admin/vmanage-15.2.0-x86_64.tar.bz2 reboot
It is recommended that you back up the vManage storage partition before upgrade. Proceed
with upgrade? [y/n]: Y
Prompted for vManage storage backup. Proceeding with upgrade
Starting download of image..
Copying file:///home/admin/vmanage-15.2.0-x86 64.tar.bz2via VPN 0
Successfully downloaded /home/admin/vmanage-15.2.0-x86 64.tar.bz2

request software secure-boot, on page 148
request software set-default, on page 149
show software, on page 443
show version, on page 473

request software reset

Return the Cisco SD-WAN device to the default software image and default configuration. The default is either the factory-default image and configuration or the default image set with the **request software set-default** command.

When you issue this command, all non-default software images are removed from the device. Then, the device reboots with the default image and configuration.

In Releases 15.3 and earlier, this command reformats the boot partition and installs the software image again. During this process, which is very time-consuming, all logs and the configuration are lost. It is recommended that you issue a **request admin-tech** command to collect system-wide information before issuing this command and that you use this command only when you suspect that the filesystem is corrupt.

Command Hierarchy

request software reset

Command History

Release	Modification
14.1	Command introduced.

Examples

After the command completes, you are logged out of the device. You may need to press the Return key to complete the logout process.

```
vEdge# request software reset
Are you sure you want to reset to factory defaults? [yes,NO] yes
Broadcast message from root@vEdge (console) (Mon Apr 24 17:58:08 2017):
Mon Apr 24 17:58:08 PDT 2017: The system is going down for reboot NOW!

request software secure-boot

Check and enforce the secure boot state of the system software images and, for vEdge hardware routers, of the boot loader.

Command Hierarchy

request software secure-boot list request software secure-boot set request software secure-boot status

Syntax Description

request software secure-boot list	Check secure boot state and check whether software images on the device are secure or not secure.
request software secure-boot set	Remove insecure software images from the device and, for vEdge hardware routers, remove an insecure boot loader.
request software secure-boot status	Display the security status of the software images installed on the device.

Command History

Release	Modification
18.3.1	Command introduced.

Examples

```
vEdge# request software secure-boot list
Secure-image check found no insecure software versions
vEdge# request software secure-boot status
Secure-image status: HIGH
```

request software upgrade-confirm

Confirm that the upgrade to a new software image is successful. If the device configuration includes the **system upgrade-confirm** command, issuing the **request software upgrade-confirm** command within the time limit configured in the **upgrade-confirm** command confirms that the upgrade to the new software image has been successful. If this command is not issued, the device reverts automatically to the previously running software image.

If you have initiated the software upgrade from the vManage NMS, the vManage NMS automatically issues the **request software upgrade-confirm** command when the vEdge router finishes rebooting. If you have initiated the software upgrade manually from the vEdge router, you issue this command from the CLI.

Command Hierarchy

request software upgrade-confirm

Command History

Release	Modification	
15.1	Command introduced.	
15.2	Command support added for vBond orchestrator, vManage NMS, and vSmart controller.	
15.4	Command renamed from request upgrade-confirm.	

Examples

Configure an upgrade confirm time limit of 5 minutes, upgrade the software manually from the vEdge router CLI, and confirm that the upgrade has been successful:

```
vEdge# config
vEdge(config)# system upgrade-confirm 5
vEdge(system)# u
vEdge# request software install viptela-15.1.mips64.tar.bz2 reboot
[Software is installed, and router reboots and restarts.]
user$ ssh -l admin vEdge
Software upgrade completed. Device will revert to previous software version in '300' seconds unless confirmed.
Execute "request software upgrade-confirm" to confirm the upgrade.
vEdge#
[Less than 5 minutes elapse.]
vEdge# request software upgrade-confirm
Software upgrade confirmed.
vEdge#
```

Configure an upgrade confirm time limit of 5 minutes, upgrade the software, and log back in to the router, but do not confirm that the upgrade has been successful:

```
vEdge# config
vEdge(config)# system upgrade-confirm 5
vEdge(system)# commit and-quit
vEdge# request software install viptela-15.1.mips64.tar.bz2 reboot
[Software is installed, and router reboots and restarts.]
user$ ssh -1 admin vEdge
Software upgrade completed. Device will revert to previous software version in '300' seconds unless confirmed.
Execute "request software upgrade-confirm" to confirm the upgrade.
vEdge#
[More than 5 minutes elapse.]
Software upgrade not confirmed. Device will revert to previous software version.
vEdge#
```

Related Topics

request software install, on page 143

upgrade-confirm

request software verify-image

Verify that a Cisco SD-WAN software image is valid and has been signed.

It is recommended that you issue a request software install or request software install-image command, or that you install device software from the vManage NMS, rather than using the request software verify-image command. Both these commands, as well as the vManage NMS image installation and upgrade processes, verify that the image is valid and has been signed before they install the software. If the verification process fails, the software image installation is not performed.

Command Hierarchy

request software verify-image filename

Syntax Description

filename Name of the Cisco SD-WAN software image file. This file is a compressed tar file (filename extension tar.gz) on the local device. The tar file names have the following format, where x.x.x represents the release version:

- vEdge router-viptela-x.x.x-mips64.tar.gz
- vBond and vSmart-viptela-x.x.x86 64.tar.gz
- vManage-vmanage-x.x.x86 64.tar.gz

Command History

R	elease	Modification
1	6.1	Command introduced.

Example

```
vManage# request software verify-image vmanage-16.1.0-x86 64.tar.gz
verify OK
Signature verified for rootfs.img
Signature verified for vmlinuz
vManage#
```

request stream capture

To debug issues related to loss of connectivity between Cisco vEdge devices and Cisco vManage, use the **request stream capture** command in privileged EXEC mode.

request stream capture { enable | disable | abort } { control | data } vpn vpn-id interface interface-name session-id session-id [{ dst-ip ip-address | dst-port port | protocol number }]

Syntax Description

enable	Enables capturing data stream.
disable	Disables capturing data stream.
abort	Terminates the data stream capturing process.
data	Captures data stream for the data plane.
control	Captures data stream information for the control plane.
vpn-id vpn-id	VPN ID to capture the data stream details for.
interface interface-name	Interface to capture data stream details for.
session-idsession-id	Session ID to capture the data stream details for.
dst-ip ip-address	(Optional) Destination IP address to capture the data stream details for.
dst-port port	(Optional) Destination port to capture the data stream details for.
src-ip ip-address	(Optional) Source IP address to capture the data stream details for.
src-port port	(Optional) Source port to capture the data stream details for.
protocol number	(Optional) Valid protocol number
	Range: 0 to 255

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco SD-WAN Release 20.6.1	This command was introduced.

Usage Guidelines

The parameters in this command syntax can be configured in any order.

Example

The following example shows how to enable stream capture for the specified details.

Device# request stream capture enable vpn1 interface ipsec1 data session-id s123

request upload

Upload a file from the Cisco SD-WAN device to another device in the network (on vEdge routers and vSmart controllers only).

Command Hierarchy

request upload [vpn vpn-id] destination filename

Syntax Description

filename	Name of file on the local SD-WAN device to upload to a remote device. If the file is not in your home directory, specify the full path.
destination	Remote device. It must be reachable through FTP, HTTP, SCP, or TFTP. If you are using SCP, you are prompted for the directory name and filename; no file path name is provided.
vpn vpn-id	VPN in which the remote device containing the file to be downloaded is located. When you include this option, one of the interfaces in the specified VPN is used to retrieve the software image.

Command History

Release	Modification
15.3.3	Command introduced for vEdge 100 routers only.
15.4	Command supported on all vEdge routers and on vSmart controllers.

request vedge

Add a vEdge serial number–chassis number pair to or delete a vEdge serial number-chassis number pair from the vEdge authorized serial number file on the local device.

Comamnd Hierarchy

request vedge [add | delete] serial-num number chassis-num number

Syntax Description

addserial-num number chassis-num number	Add vEdge Serial and Chassis Numbers. Add the specified vEdge serial and chassis number pair to the vEdge authorized serial number file on the local device.
deleteserial-num number chassis-num number	Delete vEdge Serial and Chassis Number. Remove the specified vEdge serial and chassis number from the vEdge authorized serial number file on the local device.

Command History

Release	Modification
	Command introduced.

request vedge-cloud activate

Activate a vEdge Cloud router in the overlay network (on vEdge Cloud routers only). Before you can use this command, you must configure the organization name and the vBond orchestrator's IP address or DNS name on the vEdge Cloud router.

Command Hierarchy

request vedge-cloud activate chassis-number number token token

Syntax Description

chassis-number number	Chassis number of the vEdge Cloud router. To obtain the chassis number (UUID) in vManage NMS, select the Configuration > Devices screen. In the vEdge List, locate the Chassis Number column. If the router is not listed in the vEdge List, click Upload vEdge List to upload the serial number file that contains the vEdge Cloud router's information.
token token	Token identifier of the vEdge Cloud router. To obtain the token in vManage NMS, select the Configuration > Devices screen. In the vEdge List, locate the Serial No./Token column. If the router is not listed in the vEdge List, click Upload vEdge List to upload the serial number file that contains the vEdge Cloud router's information.

Command History

Release	Modification
17.1	Command introduced.

request vsmart add serial-num

Send the certificate serial number of a vManage NMS or a vSmart controller to the vBond orchestrator. If your network does not have a vManage NMS and you reboot the vSmart controller, the serial numbers sent with this command are lost. To have the vSmart controller retain the certificate serial numbers, use the request vsmart-upload command instead.

Starting in Release 15.4, this command is replaced by the **request controller add** command.

Command Hierarchy

request vsmart add serial-num number

Syntax Description

serial-num	Certificate serial number to send to the vManage or vSmart controller.
number	

Command History

Release	Modification
14.1	Command introduced.
15.4	Command is replaced by the request controller add.

Related Topics

show orchestrator valid-vsmarts, on page 379

request vsmart-upload serial-file

Upload the certificate serial number file to the local device (on vBond orchestrators and vManage NMSs only). The local device retains these serial numbers even after you reboot it. Starting in Release 15.4, this command is replaced by **request controller-upload serial-file** command.

Command Hierarchy

request vsmart-upload serial-file filename [vpn vpn-id]

Syntax Description

request vsmart-upload serial-file filename	Name of Certificate File. Install the specified file containing the list of serial numbers for the vSmart controllers and the vManage NMSs in the network. The file can be in a your home directory on the local device, or it can be on a remote device reachable through FTP, HTTP, SCP, or TFTP. If you are using SCP, you are prompted for the directory name and filename. No file path name is provided.
vpn vpn-id	Specific VPN in which the file is located. When you include this option, one of the interfaces in the specified VPN is used to retrieve the file. The interfaces on a vSmart controller are only in VPN 0, the VPN reserved for the control plane, so you can omit this option because vSmart images are always retrieved from VPN 0.

Command History

Release	Modification
14.1	Command introduced.
15.4	Command replaced by request controller-upload serial-file command.

screen-length

Set the length of the terminal window. For most Cisco SD-WAN software commands, the output is rendered automatically either by the CLI or by templates that format the output. For these commands, any value that you set for screen-length command has no effect. Use the **more** and **nomore** command filters to control the length of the output.

Command Hierarchy

screen-length number

Syntax Description

screen-length number	Set the length of the terminal screen. Number can be a value from 0 through 256.
	When you set the screen length to 0, the CLI does not paginate command output.

Command History

Release	Modification	
14.1	Command introduced.	

Example

```
vEdge# screen-length 24 vEdge#
```

Related Topics

show aaa usergroup

show aaa usergroup—List the groups configured for AAA role-based access to a Cisco vEdge device.

Command Syntax

show aaa usergroup

show aaa usergroup task [permission (read \mid write)]

show aaa usergroup users username

vManage Equivalent

For all Cisco vEdge devices:

Administration ► Manage Users

Syntax Description

show aaa usergroup	All Usergroups, Users, Tasks, and Permissions:	
	List all configured usergroups, the users in those groups, and the task permissions that each group has.	
show aaa usergroup task	All Usergroups, Tasks, and Permissions:	
[permission (read write)]	List all configured usergroups and the task permissions that each group has.	
show aaa usergroup users username	Usergroup Information for a User:	
	For the specified user, list the group they are in and that group's task permissions.	

Command History

Release	Modification
14.1.	Command introduced.

Examples

Show aaa usergroup

vEdge# sho	USERS	sergroup TASK	PERMISSION

show alarms

To view alarms history and view the watermarks configured for CPU, memory, and disk usage, and the disk read and write speeds, use the **show alarms** command in the operational mode.

show alarms { cpu-usage | history | memory-usage | disk-usage | disk-speed }

Syntax Description

cpu-usage	Shows configured CPU-usage watermarks.		
history	Shows the history of alarms. The following options are available:		
	• from: Displays alarms from timestamp (YYYY-MM-DDTHH:MM:SS)		
	• last-n: Displays last-n alarms (default: 25)		
	• severity: Shows alarms matching severity		
	• skip-type: Skips displaying alarms matching type		
	• to: Displays alarms till timestamp (YYYY-MM-DDTHH:MM:SS)		
	• type: Shows alarms matching type		
memory-usage	Shows configured memory-usage watermarks.		
disk-usage	Shows configured disk-usage watermarks.		
disk-speed	Shows configured watermarks for disk read and write speeds.		
	Note Watermarks for disk read and write speeds can only be configured in a Cisco

show app cflowd flows

show app cflowd flows—Display cflowd flow information (on vEdge routers only).

Command Syntax

show app cflowd flows [vpn vpn-id]

show app cflowd flows [**vpn** *vpn-id*] [*flow-parameter*]

show app cflowd flows vpn vpn-id src-ip ip-address dest-ip ip-address src-port port-number dest-port port-number dscp value

ip-proto protocol-number

vManage Equivalent

For vEdge routers only:

Monitor ► Network ► Real Time ► App Log Flows

Syntax Description

None	None
	Display cflowd flow information for all flows.
vpn vpn-id src-ip ip-address dest-ip ip-address src-port port-number dest-port port-number dscp value ip-proto protocol-number	Flow Key Elements Display cflowd flow information for a specific flow key element. You must specify all the key elements as shown in the syntax and in the order shown in the syntax. You can also just specify all the key elements until the last one that you are interested in, and again you must specify them in the order shown. For example, if you are interested only in filtering on the source and destination ports, you include only the VPN, source and destination addresses, and source and destination ports in the command; you can omit the last two key elements (DSCP and IP protocol). To select all values for a key elements, specify an asterisk (*) as a wildcard in place of the variable; for example, src-ip *.

flow-parameter	Flow Parameter:
	Display the flow that matches the specified flow parameter. These parameters correspond to a number of the column headers in the output of the plain show app cflowd flows command. <i>flow-parameter</i> can be one of the following:
	• egress-intf-name interface-name—Flow's outgoing interface.
	• icmp-opcode value—Flow's ICMP operational code.
	• ingress-intf-name interface-name—Flow's incoming interface.
	• max-length bytes—Maximum IP packet length in the flow.
	• min-length bytes—Minimum IP packet length in the flow.
	• nhop-ip ip-address—IP address of the flow's next hop.
	• start-time time—Flow's start time.
	• tcp-cntrl-bits bit—Flow's TCP control bit value.
	• time-to-expire seconds—Time until the flow expires.
	• total-bytes number—Total number of bytes in the flow.
	• total-packets number—Total number of packets in the flow.
vpn vpn-id	VPN
	Display cflowd information for flows in a specific VPN.

Command History

Release	Modification
14.3.	Command introduced.
15.4.	Options for flow parameters and IP address, ports, DSCP, and protocol added.

Examples

Show app cflowd flows

show app cflowd template

show app cflowd template—Display the cflowd template information that the vEdge router transmits periodically to the cflowd collector (on vEdge routers only).

Command Syntax

show app cflowd template [name template-name] [flow-active-timeout] [flow-inactive-timeout] [template-refresh]

Syntax Description

None	Options
	Display information about all the cflowd templates that the vEdge router has learned from a vSmart controller.
nametemplate-name	Specific Template
	Display information about the named cflowd template.
template-refresh	Template Refresh Values
	Display the template refresh values for the cflowd templates learned from a vSmart controller.
flow-active-timeout	Timeout Values
flow-inactive-timeout	Display the active or inactive flow timeout values for the cflowd templates learned from a vSmart controller.

Command History

Release	Modification
14.3.	Command introduced.

Examples

Show app cflowd template

```
vEdge# show app cflowd template

app cflowd template name cflowd-server-10

app cflowd template flow-active-timeout 30

app cflowd template flow-inactive-timeout 30
```

app cflowd template template-refresh 600

show app dpi applications

show app dpi applications—Display application-aware applications running on the vEdge router (on vEdge routers only).

Command Syntax

show app dpi applications [vpn vpn-id]

Syntax Description

None	List all applications running on the subnets connected to the vEdge router.					
vpn vpn-id	Specific VPN					
	List all applications running in the subnets in the specific VPN.					

Command History

Release	Modification
15.2.	Command introduced.
17.1.2.	Removed Source IP and Total Flows fields from command output.

Examples

Show app dpi applications

vEdge# show app dpi applications

			EXPI:	RED

show app dpi flows

show app dpi flows—Display flow information for the application-aware applications running on the vEdge router (on vEdge routers only).

show app dpi flows [vpn vpn-id] [detail]

Syntax Description

None	List all application flows running on the subnets connected to the vEdge router.					
detail	Detailed Information					
	Display detailed information about DPI traffic flows, including total packet and octet counts, and which tunnel (TLOC) the flow was received and transmitted on.					
	Tunnels-in refers to packets sent from the device into a tunnel towards remote edge. Tunnels-out refers to packets received on the device from a remote edge.					
	Note This command displays all the flow information except for Border Gateway Protocols, Internet Control Message Protocol for IPv4, Internet Control Message Protocol for IPv6, Open Shortest Path First, Multicast Transfer Protocol, and Protocol-Independent Multicast in a policy as they are not supported. These application bypass DPI and matching DPI on the applications do not affect a policy.					
source-ip-address	Source IP Address					
	Within a specific VPN, list the applications flows with the specified source IP address.					
vpn vpn-id	Specific VPN					
	List all application flows running in the subnets in the specific VPN.					

Command History

Release	Modification
15.2.	Command introduced.
16.2.	Added detail option.

Examples

Show app dpi flows

vEdge# show app dpi flows

```

show app dpi supported-applications

show app dpi supported-applications—List all the application-aware applications supported by the SD-WAN software on the vEdge router (on vEdge routers only).

Command Syntax

show app dpi supported-applications show app dpi supported-applications | tab

Syntax Description

None	List the application name and its family.
Pipe Output To Tabular Format	Pipe Output To Tabular Format List full information about the application, including its shortened and long name, family shortened and long name, and application identifier number.

Command History

Release	Modification
15.2.	Command introduced.

Usage Guidelines

To understand the applications available for each family, you can use command: **show app dpi supported-applications** | **inc <app_family>**.

The following example shows the supported application for Web family:

vEdge# show app dpi supported-applications | <web>

Examples

Display abbreviated application information:

Show app dpi supported-applications

vEdge# show app dpi supported-applications

show app log flow-count

show app log flow-count—Display the count of packet flows that are being logged (on vEdge routers only). Packet flows include a flow that matches an access list (ACL), a cflowd flow, or a DPI flow.

Command Syntax

show app log flow-count[vpn *vpn-id*]

Syntax Description

None	Display the count of all packet flows that are being logged.
vpnvpn-id	Specific VPN
	Display the count of packet flows in the specified VPN.

Command History

Release	Modification
16.3	Command introduced.

Examples

Show app log flow-count

```
vEdge# show app log flow-count

VPN COUNT

1 20
```

```

show app log flows

show app log flows—Display logging information for packet flows (on vEdge routers only). Packet flows include flows that match an access list (ACL), a cflowd flow, and a DPI flow. Packet flows are logged when you configure a log action in a localized data policy (ACL), data policy for cflowd traffic monitoring, or an application-aware routing policy

Command Syntax

show app log flows [**vpn** *vpn-id*] [*flow-parameter*]

vManage Screen

Monitor ► Network ► ACL Logs

Syntax Description

None	Display all flow logging information.
flow-parameter	Flow Parameter
	Display flow logging information for a specific parameter.
	flow-parameter can be one of egress-intf-name, icmp-opcode, ingress-intf-name, nhop-ip, policy-action, policy-direction, policy-name, start-time, tcp-cntrl-bits, time-to-expire, total-bytes, and total-pkts. These parameters correspond to the column headings in the output of the show app log flows command.
vpnvpn-id	Specific VPN
	Display the flow logging information in the specified VPN.

Command History

Release	Modification
16.3.	Command introduced.

Examples

show app log flows

vEdge # show app log flows

show app tcp-opt

show app tcp-opt—Display information about TCP-optimized flows (on vEdge routers only).

Command Syntax

show app tcp-opt (active-flows | expired-flows) show app tcp-opt summary

Syntax Description

active-flows	Active Flows				
	Display information about active TCP-optimized flows.				
expired-flows	Expired Flows				
	Display information about expired TCP-optimized flows.				
summary	Flow Summary				
	Display a summary of the TCP-optimized flows.				

Command History

Release	Modification
17.2.	Command introduced.

Examples

Display information about active and expired TCP-optimized flows:

Show app tcp-opt

```
vEdge# show app tcp-opt active-flows

show app-route sla-class

show app-route sla-class—Display information about the SLA classes operating on the vEdge router (on vEdge routers only).

Note that when the thresholds cross for one of these SLA classes, a notification and a syslog are triggered.

Command Syntax

show app-route sla-class

show app-route sla-class (latency [milliseconds] | **loss** [percentage] | **name** [string])

Syntax Description

None	Display information for all SLA classes configured and operating on the vEdge router			
latency[milliseconds]	-			
	Display information for all packet latency values or for the specified latency value operating on the vEdge router.			
loss[percentage]	Packet Loss			
	Display information for all packet loss values or for the specified loss value operating on the vEdge router.			
name[string]	SLA Class Name			
	Display information for all SLA class names or for the specified class name operating on the vEdge router.			

Command History

Release	Modification
15.2.	Command introduced.

Examples

The following output shows three SLA classes and the index numbers that identify these classes. The first line of the output shows the default SLA class (__all_tunnels_sc), and second and third lines show two configured SLA classes that are operating on the router (test_sla_class and test_sla_class1).

Show app-route sla-class

vEdge# show app-route sla-class

INDEX	NAME		LOSS	LATENCY	
0	all	tunnels	sc	100	2147483647

```
1 test_sla_class 100 50
2 test_sla_class1 1 1
```

app-route-policy bfd color show app-route stats, on page 183 show bfd sessions, on page 187 show policy service-path, on page 413 show policy tunnel-path, on page 414

show app-route stats

show app-route stats—Display statistics about data traffic traffic jitter, loss, and latency and other interface characteristics for all operational data plane tunnels (on vEdge routers only). The command also displays the index of the SLA classes that are dampened and the dampening left for the SLA class. You can use the information from the command output to fashion application-aware routing policy.

Command Syntax

show app-route-statsshow app-route stats local-color color [remote-system-ip ip-address] show app-route stats remote-color color [remote-system-ip ip-address] show app-route stats remote-system-ip ip-address

Syntax Description

None	Display data traffic statistics for all data plane tunnel connections.
local-colorcolor	Local TLOC Color
	Display data traffic statistics for the specified local TLOC color.
remote-system-ipip-address	Remote System IP Address
	Display data traffic statistics for the specified remote system.
remote-colorcolor	Remote TLOC Color
	Display data traffic statistics for the specified remote TLOC color.

Release	Modification
14.2.	Command introduced.
15.2.	sla-class-index option added.
15.3.	Syntax changed and simplified.

Release	Modification
20.5	The commands displays the index of the SLA classes that are dampened and the dampening left for the SLA class.

show bfd history

show bfd history—Display the history of the BFD sessions running on a vEdge router (on vEdge routers only). BFD sessions between vEdge routers start automatically, with requiring any configuring, as soon as at least two vEdge routers are running in the Cisco SD-WAN network. The sessions run over an IPsec tunnel between the two devices.

Command Syntax

show bfd history [color color] [site-id site-id] [state state] [system-ip ip-address]

Syntax Description

None	Show the history of all the BFD sessions running on the vEdge router.
state state	BFD State
	Display the history of BFD sessions in a particular state. <i>state</i> can be one of the following: admin-down , down , init , invalid , and up .
color color	Color
	Display the history of BFD sessions for a specific traffic flow.
site-id site-id	Site ID
	Display the history of BFD sessions to a specific Cisco SD-WAN network site.

system-ip ip-address	System IP
	Display the history of BFD sessions to a specific device in the Cisco SD-WAN network.

Command History

Release	Modification
14.1.	Command introduced.
Cisco SD-WAN Release 20.3.1	New status added to STATE column: inactive indicates that an on-demand tunnel is in Inactive mode on a device with on-demand tunnels enabled.

Examples

show bfd history

show bfd sessions—Display information about the BFD sessions running on the local vEdge router (on vEdge routers only). BFD sessions between vEdge routers start automatically, without requiring any configuring, as soon as at least two vEdge routers are running in the Cisco SD-WAN network. The BFD sessions run over an IPsec connection between the two devices.

Command Syntax

show bfd sessions [color color] [site-id site-id] [state state] [system-ip ip-address]

Syntax Description

None	Show the history of all the BFD sessions running on the vEdge router.
state state	BFD State
	Display the history of BFD sessions in a particular state. <i>state</i> can be one of the following: admin-down , down , init , invalid , and up .
color color	Color
	Display the history of BFD sessions for a specific traffic flow.
site-id id	Site ID
	Display the history of BFD sessions to a specific Cisco SD-WAN network site.
system-ip ip-address	System IP
	Display the history of BFD sessions to a specific device in the Cisco SD-WAN network.

Command History

Release	Modification
14.1.	Command introduced.
16.3.	Added support to display IPv6 end points.

Examples

Display BFD session information for network end points:

Show bfd sessions

bfd color show bfd history, on page 186

show bfd summary, on page 190

show bfd tloc-summary-list, on page 191

show bfd summary

show bfd summary—Display summary information about the BFD sessions running on the local vEdge router (on vEdge routers only). BFD sessions between vEdge routers start automatically, with requiring any configuring, as soon as at least two vEdge routers are running in the Cisco SD-WAN network. The sessions run over an IPsec connection between the two devices.

Command Syntax

show bfd summary [bfd-sessions-flap | bfd-sessions-max | bfd-sessions-total | bfd-sessions-up]

Syntax Description

None	Display all summary information about BFD sessions running on the vEdge router.
<string>bfd-sessions-up</string>	BFD Sessions That Are Up
	Display the current number of BFD sessions that are in the Up state.
bfd-sessions-flap	BFD Transitions
	Display the number of BFD sessions that have transitioned from the Up state.
bfd-sessions-max	Maximum Number of BFD Sessions
	Display the total number of BFD sessions that have been created since the vEdge router booted up.
bfd-sessions-total	Total Number of BFD Sessions
	Display the current number of BFD sessions running on the vEdge router.

Command History

Release	Modification
15.2.	Command introduced.
17.1.	Display configured BFD app-route poll interval in command output.

Examples

Show bfd summary

vEdge#	show bfo	l summary
session	ns-total	4
session	ns-up	4
session	ns-max	4
session	ns-flap	4
poll-in	nterval	600000

bfd app-route bfd color show bfd history, on page 186 show bfd sessions, on page 187 show bfd tloc-summary-list, on page 191

show bfd tloc-summary-list

show bfd tloc-summary-list—Display BFD session summary information per TLOC (on vEdge routers only).

Command Syntax

show bfd tloc-summary-list

 $show\ bfd\ tloc\text{-}summary\text{-}list\ \textit{interface-name}\ [\textbf{gre}\ |\ \textbf{ipsec-ike}]\ [\textbf{sessions-flap}\ |\ \textbf{sessions-total}\ |\ \textbf{se$

Syntax Description

None	Display all summary information about BFD sessions running on the vEdge router.
sessions-up	BFD Sessions That Are Up
	Display the current number of BFD sessions that are in the Up state.
sessions-flap	BFD Transitions
	Display the number of BFD sessions that have transitioned from the Up state.
[gre ipsec ipsec-ike]	Encapsulation Type
	Display information about BFD session with a specific encapsulation type.
interface-name	Specific Interface
	Display information about BFD sessions on the specified interface.
sessions-total	Total Number of BFD Sessions
	Display the current number of BFD sessions running on the vEdge router.

Release	Modification
16.2.3.	Command introduced.
17.2.	Added ipsec-ike option.

Show bfd tloc-summary-list

vEdge1# show bfd tloc-summary-list

show bgp neighbor

show bgp neighbor—List the router's BGP neighbors (on vEdge routers only).

Command Syntax

show bgp neighbor [vpn vpn-id] [detail]

show bgp neighbor address-family [address-family-property] [detail]

Syntax Description

None	List all BGP neighbors.
address-family[address-family-property]	BGP Address Family Properties
	List information about a specific BGP address family property. address-family-property can be one of the following: accepted-prefix-count, afi, as-path-unchanged, def-originate-routemap, inbound-soft-reconfig, max-prefix-restart-interval, max-prefix-threshold-warning, max-prefix-warning-only, maximum-prefix-count, med-unchanged, nexthop-self, nexthop-unchanged, policy-in, policy-out, private-as, route-reflector-client, sent-community, and sent-def-originate.

detail	Detailed Information
	Show detailed information.
vpnvpn-id	VPN
	List the entries in the ARP table for the specified VPN.

Command History

Release	Modification
14.1.	Command introduced.

Examples

Show bgp neighbor

show bgp routes

show bgp routes—List the router's BGP neighbors (on vEdge routers only).

Command Syntax

show bgp routes [prefix/length] [vpn vpn-id] [detail]

Syntax Description

None	List all BGP neighbors.
detail	Detailed Information Show detailed information.
prefix/length prefix vpn vpn-id	Route Prefix Show the BGP route information for the specified route prefix. If you omit the prefix length, you must specify a VPN identifier so that the Cisco SD-WAN software can find the route that best matches the prefix.
vpn vpn-id	VPN List the BGP routes for the specified VPN.

Release	Modification
14.1.	Command introduced.

Show bgp routes

show boot-partition

show boot-partition—Display the active boot partition and the software version installed in the boot partitions. Starting in Release 15.4, this command is replaced with the show software command.

Command Syntax

show boot-partition [partition-number]

Syntax Description

	Display information about the boot partitions on the device, including which partition is active and what software version is installed on each partition.
partition-number	Specific Partition
	Display information for the specific boot partition. <i>partition-number</i> can be 1 or 2.

Release	Modification
14.1.	Command introduced.
15.3.	Command available in this release and earlier.
15.4.	Replaced with show software command.

Show boot-partition

show certificate installed

show certificate installed—Display the decoded certificate signing request installed on a vBond orchestrator, vManage NMS or vSmart controller. This is the CSR that has been signed by the root CA. Information displayed includes the serial number, the signature algorithm, the issuer, the certificate validity, the public key algorithm and public key, and the signature algorithm.

On a vEdge router, display the board ID certificate.

Command Syntax

show certificate installed

Syntax Description

None

Command History

Release	Modification
14.2.	Command introduced.
15.3.5.	Added command support on vEdge routers.

Examples

Show certificate installed

```
vSmart# show certificate installed

show certificate root-ca-cert

show certificate root-ca-cert—Display the root certificate installed on a Cisco vEdge device. Information displayed includes the serial number, the signature algorithm, the issuer, the certificate validity, the public key algorithm and public key, and the signature algorithm.

Command Syntax

show certificate root-ca-cert

Syntax Description

None

Command History

Release	Modification
14.2.	Command introduced.

Examples

Show certificate root-ca-cert

```
vSmart# show certificate root-ca-cert

show certificate root-ca-crl

To display the decoded CRL of the installed root certificate authority, use the **show certificate root-ca-crl** command in privileged EXEC mode.

show certificate root-ca-crl

Command Modes

Privileged EXEC

Command History

Release	Modification
Cisco SD-WAN Release 20.7.1	This command was introduced.

Examples

The following is sample output from the **show certificate root-ca-crl** command showing the decoded CRL of the installed root certificate authority

```
vEdge # show certificate root-ca-crl
Certificate Revocation List (CRL):

show certificate serial

show certificate serial—Display the serial number for a vBond orchestrator or a vSmart controller. Display the serial number and chassis number for a vEdge router.

Command Syntax

show certificate serial

Syntax Description

None

Command History

Release	Modification
14.1.	Command introduced.

Examples

Show certificate serial

```
vEdge# show certificate serial
Chassis num = 1102136130018 Board id serial num : 10000161
```

Related Topics

request vsmart-upload serial-file, on page 156

show certificate installed, on page 208 show certificate root-ca-cert, on page 212 show certificate signing-request, on page 215 show certificate validity, on page 217

show certificate signing-request

show certificate signing-request—Display the certificate signing requests installed on a vBond orchestrator, vManage NMS, or vSmart controller. This CSR is the one that has been signed by the device's private key.

Command Syntax

show certificate signing-request [decoded]

Syntax Description

None	Display the certificate signing request hash.
decoded	Decoded Certificate Signing Request
	Display the decrypted hashed certificate signing request.

Command History

Release	Modification
14.2.	Command introduced.

Examples

vSmart# show certificate signing-request

show certificate validity

show certificate validity—Display how long a certificate is valid for (on vSmart controllers and vBond orchestrators only).

Command Syntax

show certificate validity

Syntax Description

None

Command History

Release	Modification
14.1.	Command introduced.

Examples

Show certificate validity

```
vSmart# show certificate validity
The certificate is valid from Apr 20 21:03:38 2015 GMT (Current date is Mon Apr 20 23:00:19 GMT 2015 )
& valid until Apr 19 21:03:38 2016 GMT
```

Related Topics

show clock

show clock—Display the system time.

Command Syntax

show clock

None	Display time in the local timezone.
------	-------------------------------------

universal
Display time in UTC.

Release	Modification
14.1.	Command introduced.
14.2.	Introduced universal option.

Examples

Show clock

vEdge# show clock
Mon Jul 7 13:36:00 PDT 2014
vEdge# show clock universal
Mon Jul 7 20:36:05 UTC 2014

Related Topics

show uptime, on page 472 timestamp, on page 485

show cloudexpress applications

show cloudexpress applications—Display the best path for applications configured with Cloud OnRamp for SaaS (formerly called CloudExpress service) (on vEdge routers only). The best path could be a local interface with Direct Internet Access (DIA), or the path to a remote gateway.

Command Syntax

show cloudexpress applications vpn-id

Syntax Description

None	Display the best interface for all applications in all VPNs configured with Cloud OnRamp for SaaS.
vpn-id	Specific VPN
	Display the best interface for all applications in VPN x configured with Cloud OnRamp for SaaS.

Release	Modification
16.3.	Command introduced.

Examples

Show cloudexpress applications

vEdge# show cloudexpress applications

		EXIT	GATEWAY			
LOCA VPN COLO	APPLICATION	TYPE	SYSTEM IP	INTERFACE	LATENCY	LOSS
1 lt.e	salesforce	gateway	172.16.255.14	_	103	1

# show control affinity config

**show control affinity config**—Display configuration information about the control connections between the vEdge router and one or more vSmart controllers (on vEdge routers only).

### **Command Syntax**

**show control affinity config** [index [parameter]]

### **Syntax Description**

None	Display information about all control connections between the vEdge router and vSmart controllers
index[parameter]	Information about a Specific Parameter
	Display configuration information about a specific parameter, starting with the index number of the control connection. <i>parameter</i> can be one of the following: <b>affc-ccl</b> (current controller group ID list), <b>affc-ecl</b> (effective controller group ID list), <b>affc-equil</b> (equilibrium status), <b>affc-ervc</b> (count of effective required vSmart controllers), and <b>affc-interface</b> (interface name).

Release	Modification
16.1.	Command introduced.
16.2.	Display last-resort interface information.

### **Examples**

### Show control affinity config

```
vEdge# show control affinity config
```

```
EFFECTIVE CONTROLLER LIST FORMAT - G(C),... - Where G is the Controller Group ID C is the Required vSmart Count

CURRENT CONTROLLER LIST FORMAT - G(C)s,... - Where G is the Controller Group ID c is the current vSmart count s Status Y when matches, N when does not match

EFFECTIVE REQUIRED

LAST-RESORT

INDEX INTERFACE VS COUNT EFFECTIVE CONTROLLER LIST CURRENT CONTROLLER LIST EQUILIBRIUM INTERFACE
```

0	ge0/2	2	1(1),	2(1)	1(1)Y,	2(1)Y	Yes

show control affinity config, on page 225 show control connections, on page 227 show control local-properties, on page 233

# show control connection-info

**show control connection-info**—Display information about the control plane connections on the Cisco vEdge device.

### **Command Syntax**

show control connection-info

## **Syntax Description**

None

### **Command History**

Release	Modification
14.3.	Command introduced.

### **Examples**

#### Show control connection-info

```
vEdge# show control connection-info control connection-info "Per-Control Connection Rate: 300 pps"
```

#### **Related Topics**

control-session-pps

# show control connections

**show control connections**—Display information about active control plane connections (on vSmart controllers and vEdge routers only).

# **Command Syntax**

show control connections [controller-group-id number] [detail]
show control connections instance-id [vbond | vedge | vsmart] [parameters] [detail]

# **Syntax Description**

None	Display information about the active control plane connections to all Cisco vEdge devices in the local domain. Each connection exists on a DTLS connection between the local device and a remote device in the Cisco SD-WAN overlay network.			
vbond[parameters]	Connections to vBond Orchestrators  (On vSmart controllers only.) Display information about the active control plane connections between a vSmart controller and vBond systems in the domain. <i>parameters</i> is one or more of the column headers in the <b>show control connections</b> command output.			
vedge[parameters]	Connections to vEdge Routers  (On vSmart controllers only.) Display information about the active control plane connections between a vSmart controller and vEdge routers in the domain. <i>parameters</i> is one or more of the column headers in the <b>show control connections</b> command output.			
	Note The interface marked as "last-resort" or admin down is skipped when calculating the number of control connections and partial status is determined based on the other tlocs which are UP. Since the last resort is expected to be down, it is skipped while calculating the partial connection status. Same is the case with admin down interfaces when a particular interface is configured as shutdown.			
	For example, when LTE transport is configured as a last resort circuit, and if the Edge device has 3 tlocs in total including the one with LTE interface, then the device reports partial on 2(4) control connection status.			
vsmart[parameters]	Connections to vSmart Controllers			
	(On vEdge routers only). Display information about the active control plane connections between a vEdge router and vSmart controllers in the domain. <i>parameters</i> is one or more of the column headers in the <b>show control connections</b> command output.			
controller-group-id	Controller Group			
number	(On vEdge routers only). Display information about a specific controller group. <i>number</i> can be a value from 0 through 100.			
detail	Detailed Information			
	Display detailed information.			

Release	Modification
14.1.	Command introduced.
16.2.	Controller group ID added to vEdge router output.
16.3.	Added IPv6 addresses and ports to output.

Release	Modification
18.2.	Added Proxy column to vEdge router output.

Note

The commands **show control connections** and **show control valid-vedges** are supported on vEdge platforms only and do not support on devices with ACT2/TAM modules.

Note

The control connections with Cisco vManange goes down for subnet IP 172.17.0.0/16 range on transport interfaces. The IP 172.17.0.0/16 is a reserved range and cannot be used on transport interfaces.

### **Examples**

### **Show control connections**

# show control connections-history

**show control connections-history**—Display information about control plane connection attempts initiated by the local device.

### **Command Syntax**

show control connections-history [index] [detail]

show control connections-history connection-parameter [detail]

None	List the history of connections and connection attempts by this Cisco vEdge device.
detail	Detailed Output
	List detailed connection history information, which includes transmit and receive statistics.

connection-parameter	Specific Connection Parameter			
	List the connection history only for those items match the connection parameter. <i>connection-parameter</i> can be one of the following: <b>domain-id,peer-type, private-ip, private-port, public-ip, public-port, site-id,</b> and <b>system-ip</b> . These values corresponds to the column headers in the output of the show control connections-history command.			
index	Specific History Item  List the connection history only for the specific item in the history list.			

Release	Modification
14.1.	Command introduced.

### **Examples**

### **Show control connections-history**

#### vSmart# show control connections-history

```
Legend for Errors
ACSRREJ
         - Challenge rejected by peer.
                                                      NOVMCFG
                                                                 - No cfg in vmanage for
device.
BDSGVERFL - Board ID Signature Verify Failure.
                                                       NOZTPEN
                                                                 - No/Bad chassis-number
entry in ZTP.
BIDNTPR
        - Board ID not Initialized.
                                                      ORPTMO
                                                                - Server's peer timed out.
BIDNTVRFD - Peer Board ID Cert not verified.

# show control local-properties

**show control local-properties**—Display the basic configuration parameters and local properties related to the control plane (on vEdge routers, vManage NMSs, and vSmart controllers only).

### **Command Syntax**

**show control local-properties** [parameter]

None	Display the basic configuration parameters and local properties related to the control plane.
------	-----------------------------------------------------------------------------------------------

param	eter Information about a Specific Parameter
	Display configuration information about a specific parameter. <i>parameter</i> can be one of the following: board-serial, certificate-not-valid-after, certificate-not-valid-before, certificate-status, certificate-validity, device-type, dns-cache-flush-interval, dns-name, domain-id, ip-address-list, keygen-interval, max-controllers, no-activity, number-active-wan-interfaces, number-vbond-peers, organization-name, port-hopped, protocol, register-interval, retry-interval, root-ca-chain-status, root-ca-crl-status site-id, system-ip, time-since-port-hop, tls-port, uuid, vbond-address-list, vedge-list-version, vsmart-list-version, and wan-interface-list.

Release	Modification
14.1.	Command introduced.
16.1.	Added instance field to output for vSmart controllers and vManage NMSs.
16.2.	Added SPI Time Remaining and Last-Resort Interface fields to output for vEdge routers.
16.3.	Added display information about IPv6 WAN interfaces, NAT type, low-bandwidth interface, and vManage connection preference.
17.7	Added root-ca-crl-status parameter.
Cisco SD-WAN Release 20.7.1	Added the Hierarchical SD-WAN region assignment to the <b>REGION IDs</b> column.
Cisco SD-WAN Release 20.8.1	For Hierarchical SD-WAN architectures, the <b>REGION IDs</b> column shows the secondary region also.

# show control statistics

**show control statistics**—Display statistics about the packets that a vEdge router or vSmart controller has transmitted and received in the process of establishing and maintaining secure DTLS connections to Cisco vEdge devices in the overlay network (on vEdge routers and vSmart controllers only).

#### **Command Syntax**

**show control statistics** [counter-name]

# **Syntax Description**

None	Display statistics about all packets sent and received by the vEdge router or vSmart controller as it establishes and maintains DTLS tunnel connections to the Cisco vEdge devices in the overlay network.	
counter-name	Statistics about a Specific Counter	ĺ
	Display the statistics for the specific counter. For a list of counters, see the Example Output below.	

# **Command History**

Release	Modification
14.1.	Command introduced.

# **Examples**

## **Show control statistic**

# show control summary

**show control summary**—List a count of Cisco vEdge devices that the local device is aware of. For devices running on virtual machines (VMs) that have more than one core, this command shows the number of devices that each vdaemon process instance is handling.

### **Command Syntax**

**show control summary** [instance]

### **Syntax Description**

None	Display a count of all the vBond orchestrators, vEdge routers, vManage NMSs, and vSmart controllers in the overlay network.
instance	Devices for a Specific vdaemon Process  Display a count of devices for a specific instance of a vdaemon process. Cisco vEdge devices that run on VMs that have more than one core automatically spawn one vdaemon process for each core, to load-balance the Cisco SD-WAN software functions across all the CPUs in the VM server.

Release	Modification
14.1.	Command introduced.
15.3.3.	Added support for multiple vdaemon processes (for vManage NMS only).
15.4.	Added support for multiple vdaemon processes for all devices running as VMs.
16.3.	Added display of IPv6 addresses and ports.

### **Examples**

### **Show control summary**

vEdge# show control summary

INSTANCE		VMANAGE COUNTS			PROTOCOL	LISTENING IP	LISTENING IPV6	LISTENING PORT
0	1 1	0	2	3 2	dtls dtls	10.0.12.22 10.0.12.22		12346 12446

### **Related Topics**

show control connections, on page 227 show orchestrator summary, on page 377

# show control valid-vedges

**show control valid-vedges**—List the chassis numbers of the valid vEdge routers in the overlay network (on vSmart controllers only).

### **Command Syntax**

show control valid-vedges

## **Syntax Description**

None

# **Command History**

Release	Modification
14.1.	Command introduced.
14.2	Command renamed from show control valid-devices

### **Examples**

### Show control valid-vedges

vSmart# show control valid-vedges

	SERIAL	
CHASSIS NUMBER	NUMBER	VALIDITY
110D113140004	10000266	valid
110D145130082	10000142	staging
110D252130046	100001FF	valid
110D252130049	1000020B	valid
110D252130057	1000020C	staging
R260C126140004	10000369	valid

show control connections, on page 227 show control valid-vsmarts, on page 241 show orchestrator valid-vedges, on page 378

# show control valid-vsmarts

List the serial numbers of the valid vSmart controllers in the overlay network (on vEdge routers and vSmart controllers only).

**show control valid-vsmarts** [serial-number]

### **Syntax Description**

None	Display the serial numbers of all valid vSmart controllers in the overlay network.
Serial Number	serial-number List whether a specific vSmart serial number is valid.

### **Command History**

Release	Modification
14.1.	Command introduced.

### **Examples**

#### **Show control valid-vsmarts**

### **Related Topics**

show control connections, on page 227 show control valid-vedges, on page 240 show orchestrator valid-vsmarts, on page 379

# show crash

Display a list of the core files on the local device. Core files are saved in the /var/crash directory on the local device. They are readable by the "admin" user.

**show crash** [index-number] [**core-filename** filename]

### **Syntax Description**

None	List all core files on the local device.
Core Filename	<b>core-filename</b> List a specific core filename.
File Index Number	index-number List a specific file by file index number.

### **Command History**

Release	Modification
14.1.	Command introduced.

### **Examples**

### **Show crash**

```
vSmart# show crash

INDEX CORE TIME CORE FILENAME

Tue Sep 2 17:13:43 2014 core.ompd.866.vsmart.1409703222
```

### **Related Topics**

clear crash, on page 30 file list, on page 79 file show, on page 80 logging disk show logging, on page 329

# show crypto pki trustpoints status

To display the trustpoint information, use the **show crypto pki trustpoints status** command.

show crypto pki trustpoints label status

### **Syntax Description**

label	A user-specified label that is referenced within the <b>crypto pki</b>
	trustpoint command.

**Command Default** 

None

**Command Modes** 

Privileged EXEC (#)

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.2.1r	This command was introduced.
Cisco SD-WAN Release 20.1.1	This command was introduced.

### Example

This example shows how to display the trustpoint information:

# show devices

Display information about the Cisco vEdge devices that a vManage NMS is managing (on vManage NMSs only).

show devices [device device-name] [commit-queue] [state state]

None	List information about all devices that the vManage NMS is managing.
Queue Length	<b>commit-queue</b> List information about the queue length.
Specific Device	<b>device</b> device-name List information about a specific device that the vManage NMS is managing.
Specific State	state state List information about a specific state. state can be admin-state, last-transaction-id, oper-state, and oper-state-error-tag. These states correspond to the column headings in the output of the show devices command.

Release	Modification
14.2.	Command introduced.

### **Examples**

Display information about all the Cisco vEdge devices that a vManage NMS is managing:

## **Show devices**

vManage# show devices

					OPER	
					STATE	LAST
	QUEUE	WA	ITING	OPER	ERROR	TRANSACTION
NAME	LENGTH	FO	R	STATE	TAG	ID

vsmart-172.16.255.20	0	[	]	enabled	-	_

# show dhcp interface

Display information about interfaces that are DHCPv4 clients (on vEdge routers and vSmart controllers only). **show dhcp interface [vpn** *vpn-id*] [*interface-name*]**show dhcp interface [dns-list**] [**state**]

None	Display information about all interfaces that are DHCPv4 clients.
DNS Servers	dns-list Display the DHCPv4 client DNS information.
Lease State	<b>state</b> Display the DHCPv4 client interface state information.
VPN	<b>vpn</b> <i>vpn-id</i> Display DHCPv4 client interface information for a specific VPN.

Release	Modification
14.3.	Command introduced.

### **Examples**

### Show dhcp interface

0 ge0/4 bound 192.168.178.131/24 192.168.178.1 13:00:00:00 11:15:32:11 192.168.178.1 0 192.168.178.1

# **Related Topics**

clear dhcp server-bindings, on page 30 dhcp-helper dhcp-server show dhcp server, on page 245 show ipv6 dhcp interface, on page 315

# show dhcp server

Display information about the DHCP server functionality that is enabled on the router (on vEdge routers only). **show dhcp server** [**bindings** *mac-address*] [*dhcp-property*]**show dhcp server** [**vpn** *vpn-id*] [**bindings** *mac-address*] [*dhcp-property*]

None	Display information about all DHCP server functionality enabled on the router.
Client Binding	<b>bindings</b> <i>mac-address</i> Display the DHCP binding information for the client with the specified MAC address.
DHCP Property	<i>dhcp-property</i> Display information about a specific DHCP property. <i>dhcp-property</i> can be one of <b>client-ip</b> <i>ip-address</i> , <b>host-name</b> <i>hostname</i> , <b>lease-time</b> , <b>least-time-remaining</b> , and <b>static-binding</b> ( <b>false</b>   <b>true</b> ).
VPN	<b>vpn</b> <i>vpn-id</i> Display DHCP server information for a specific VPN.

### **Examples**

Release	Modification
14.3.	Command introduced.

### Show dhcp server

# show hardware alarms

Display information about currently active hardware alarms (on vEdge routers only). **show hardware alarms** [alarm-number]

### **Syntax Description**

None	Display all currently active hardware alarms.
Specific Alarm	alarm-number Display information about a specific hardware alarm.

Release	Modification
14.1.	Command introduced.

### **Examples**

#### Show hardware alarms

vEdge: ALARM	# show hard ALARM	ware alarms	ALARM		
ID	INSTANCE	ALARM NAME	ALARM TIME	CATEGORY	ALARM DESCRIPTION
5	0		Thu Nov 07 14:19:21 PST 2	Minor	Power supply '0'
5	or not pres 1 or not pres	Power Supply Down	Thu Nov 07 14:19:21 PST 2	Minor	Power supply '1'

### **Related Topics**

```
show hardware environment, on page 251 show hardware inventory, on page 254 show hardware real time information, on page 257 show hardware temperature-thresholds, on page 258 show interface sfp detail, on page 283 show interface sfp diagnostic, on page 287
```

# show hardware environment

Display status information about the router components, including component temperature (on vEdge routers only).

show hardware environment [Fans [fan-name]] [PEM [pem-name]] [PIM [pim-name] [Temperature [component-name]] [USB]show hardware environment (measurement | status)

None	None:	
	Display status information about all router components.	
measurement	Component Measurement:	
	List the components and the information in the Measurement column, such as a component's temperature.	
status	Component Status:	
	List the components and the information in the Status column.	
Temperature [	Component Temperature:	
component-name]	Display the temperature of all router components or of a specific component.	

Fans [fan-name]	Fan Information:
	Display information about all the fans or about a specific fan. Note that the Cisco SD-WAN software maintains the fans at an optimal fan speed, raising the speed as the ambient temperature increases and decreasing the speed as the temperature decreases, to keep the vEdge router operating at the lowest possible temperature in the green temperature threshold.
PEM [ pem-name]	PEM Information:
	Display information about all the power supply modules or about a specific power supply.
PIM [ pim-name]	PIM Information:
	Display information about all the Pluggable Interface Modules (PIMs) or about a specific PIM.
USB	USB Information:
	USB Display information about USB controllers.

Release	Modification	
14.1	Command introduced.	
17.1	Display status of router LEDs in the command output.	

## **Output Fields**

# **LEDs**

In Releases 17.1 and later, the command output shows the status of the hardware router LEDs, as follows:

- vEdge 100b—System LED
- vEdge 100m—System and WWAN LEDs
- vEdge 100wm—System, WLAN, and WWAN LEDs
- vEdge 1000—Status and System LEDs
- vEdge 2000—PIM Status, Status, and System LEDs

show hardware temperature-thresholds

## **Related Topics**

show hardware alarms, on page 250

show hardware inventory, on page 254

show hardware real time information, on page 257

show hardware temperature-thresholds, on page 258

## show hardware inventory

Display an inventory of the hardware components in the router, including serial numbers (on vEdge routers only).

**show hardware inventory** [component-name]

### **Syntax Description**

	None:
	Display the inventory of all router components.
component-name	Specific Component:
	Display inventory information about a specific component. <i>component-name</i> can be one of <b>cpu</b> , <b>chassis</b> , <b>dram</b> , <b>eemc</b> , <b>fan-tray</b> , <b>flash</b> , <b>pim</b> , and <b>transceiver</b> .

### **Command History**

Release	Modification
14.1	Command introduced.

# No entries found.

#### **Output Fields**

For vEdge routers that support WLAN interfaces, the Description column for the Chassis includes the country code (shows as CC:).

## show hardware poe

**show hardware poe**—Display the status of PoE interfaces (on vEdge 100 series routers only). **show hardware poe** 

## **Syntax Description**

None

None	Display status information about all router components.
Component Measurement	<b>measurement</b> List the components and the information in the Measurement column, such as a component's temperature.
Component Status	status List the components and the information in the Status column.

Component	<b>Temperature</b> [component-name] Display the temperature of all router components
Temperature	or of a specific component.

Fan
Information

**Fans** [fan-name] Display information about all the fans or about a specific fan. Note that the Cisco SD-WAN software maintains the fans at an optimal fan speed, raising the speed as the ambient temperature increases and decreasing the speed as the temperature decreases, to keep the vEdge router operating at the lowest possible temperature in the green temperature threshold.

#### **Examples**

vEdge# <b>sh</b>	ow hardw	are poe		POE	MAXIMUM	USED	DEVICE	INTERFACE
ADMIN	STATUS		POWER					
Enabled					ge0,	/0	Up	

#### **Command History**

Command introduced in Cisco SD-WAN Software Release 18.2.

## show hardware real time information

**show hardware real-time-information**—Display real-time information about hardware vEdge routers, including board details, hardware components, bootloader version, and temperature threshold history (on vEdge routers only).

show hardware real-time-information

#### **Command History**

Release	Modification
17.2	Command introduced.

#### **Output Fields**

The output fields are self-explanatory.

#### Example

```
vEdge# show hardware real-time-information
Hardware Information
Baseboard Details:
board type:board_type: 20003
board serial number: board serial number: 110G119160463
TPM Details:
Chip name: R5H30211
Firmware name: Board ID 2.0
Firmware version: 0x20A13811
Pheripheral Connected:
HW TYPE INDEX VERSION PART NUMBER SERIAL NUMBER HW DESCRIPTION
Chassis 0 7.0 vEdge-1000 110G119160463 vEdge-1000. CPLD rev: 0xB, PCB rev: G.
CPU 0 None None Quad-Core Octeon-II
DRAM 0 None None None 4096 MB DDR3
Flash 0 None None None Flash: Type - nor, Size - 16.00 MB
eMMC 0 None None eMMC: Size - 7.31 GB
PIM 0 None ge-fixed-8 None 8x 1GE Fixed Module
Transceiver 1 A FCLF8521P2BTL PVM16HM Port 0/1, Type 0x08 (1G Copper), Date: 2016/5/22, Vendor: FINISAR CORP. , Support: Yes
FanTray 0 None None Fixed Fan Tray - 2 Fans

U-Boot 2013.07-g1874683 (Build time: Mar 22 2017 - 12:57:51)
U-Boot 2013.07-g1874683 (Build time: Mar 22 2017 - 12:57:51)
```

## **Operational Commands**

show hardware alarms

show hardware environment

show hardware temperature-thresholds

show interface sfp detail

show interface sfp diagnostic

#### **Related Topics**

```
show hardware alarms, on page 250 show hardware environment, on page 251 show hardware temperature-thresholds, on page 258 show interface sfp detail, on page 283 show interface sfp diagnostic, on page 287
```

## show hardware temperature-thresholds

**show hardware temperature-thresholds**—Display temperature thresholds at which green, yellow, and red alarms are generated (on vEdge routers only).

show hardware temperature-thresholds [board [board-number]] [cpu] [dram]

#### **Syntax Description**

None	None:				
	Display status information about all router components.				
board	Board Temperature Threshold:				
[board-number]	Display the alarm threshold temperature for all boards in the router or for a specific board.				
cpu	CPU Temperature Threshold:				
	Display the alarm threshold temperature for the router's CPU.				
dram	DRAM Temperature:				
	Display the alarm threshold temperature for the router's DRAM.				

#### **Command History**

Release	Modification
14.1	Command introduced.

#### **Output Fields**

The output fields are self-explanatory.

#### **Example**

v Edge # show hardware temperature-thresholds

HW SENSOR TYPE	HW DEV INDEX	FAN SPEED NORMAL	FAN SPEED HIGH	YELLOW ALARM NORMAL	YELLOW ALARM BAD FAN	RED ALARM NORMAL	RED ALARM BAD FAN
Board	0	64	64	65	60	80	75
Board	1	64	64	65	60	80	75
Board	2	64	64	65	60	80	75
Board	3	64	64	65	60	80	75
CPU Junction	0	79	79	80	75	95	90
DRAM	0	64	64	65	60	80	75

vEdge-Cloud# show hardware inventory

	HW DEV			SERIAL	
HW TYPE	INDEX	VERSION	PART NUMBER	NUMBER	HW DESCRIPTION
Chassis PIM	0	1.0 None	vEdge-Cloud ge-8	sim None	vEdge-Cloud Max 8 x 1GE VM ports

vEdge-Cloud# show hardware alarms

# No entries found.

 $\verb|vEdge-Cloud| # show hardware temperature-thresholds|$ 

% No entries found.

#### **Operational Commands**

## show history

**show history**—Display the history of the commands issued in operational mode. **show history** [*number*]

### **Syntax Description**

None	None:
	List all operational commands that have been issued during the current login session.
number	Specific Number of Commands:
	Display the specified number of most recent commands that have been issued in operational mode.

### **Command History**

Release	Modification
14.1	Command introduced.

## **Output Fields**

The output fields are self-explanatory.

#### **Example**

```
vm4(config) # show history 12

02:07:53 -- show configuration merge banner

02:09:45 -- show configuration rollback changes 14

02:10:11 -- show full-configuration

02:14:20 -- show full-configuration banner

02:15:52 -- show configuration running

02:18:18 -- show configuration running banner

02:22:06 -- show configuration rollback changes 1

02:22:13 -- show configuration rollback changes 2

02:22:16 -- show configuration rollback changes 3

02:34:36 -- show configuration this omp

02:35:32 -- show history 12

vm4(config) #
```

#### **Operational Commands**

## show igmp groups

**show igmp groups**—Display information about multicast groups (on vEdge routers only). **show igmp groups** [vpn vpn-id]show igmp groups vpn vpn-id group-property

## **Syntax Description**

None	None:
	Display information about all multicast groups.
group-property	Group Properties:
	group-property Display group information for a specific IGMP multicast group. group-property can be one of the following: event, expires, state, up-time, v1-expires, and v1-members-present. Note that these options correspond to the column heads in the output of the plain show igmp groups command.
vpn [vpn-id]	VPN:
	Display multicast group information for interfaces in a specific VPN.

## **Command History**

Release	Modification
14.3	Command introduced.

## **Output Fields**

The output fields are self-explanatory.

## **Example**

#### vEdge# show igmp groups

1	ge0/5	229.229.229.229	false	members-present	0:01:33:52			init-event
VPN	NAME	NAME GROUP		STATE	UPTIME EXPIRES		EXPIRES	EVENT
	IF		MEMBERS				V1	
			V1					

## **Operational Commands**

clear igmp interface

igmp

show igmp groups

show igmp statistics

how igmp summary

## **Related Topics**

igmp

show igmp interface, on page 262

show igmp statistics, on page 263 show igmp summary, on page 264

## show igmp interface

**show igmp interface**—Display information about the interfaces on which IGMP is enabled on the router (on vEdge routers only).

show igmp interface [vpn vpn-id]show igmp interface vpn vpn-id igmp-property

#### **Syntax Description**

None	None:
	Display information about all interfaces on which IGMP is enabled.
igmp-property	IGMP Options:
	Display interface information for a specific IGMP property. <i>igmp-property</i> can be one of the following: <b>event</b> , <b>group-count</b> , <b>if-addr</b> , <b>querier</b> , <b>querier-ip</b> , and <b>state</b> . Note that these options correspond to the column heads in the output of the plain <b>show igmp interface</b> command.
vpnvpn-id	VPN
	<b>vpn</b> <i>vpn-id</i> Display IGMP information for interfaces in a specific VPN.

## **Command History**

Release	Modification
14.3	Command introduced.

OTHER

## **Output Fields**

The output fields are self-explanatory.

### **Example**

#### vEdge# show igmp interface

VPN	IF NAME IF ADDR		GROUP COUNT QUERIER QUERIER IF			QUERY INTERVAL	STATE	QUERIER EXPIRY	EVENT
	_	10.20.24.15/24 56.0.1.15/24	0 1	true true	10.20.24.15 56.0.1.15		*		init-event init-event

## **Operational Commands**

clear igmp interface

igmp

show igmp groups

show igmp statistics

how igmp summary

## **Related Topics**

clear igmp interface, on page 34 igmp show igmp groups, on page 261 show igmp statistics, on page 263 show igmp summary, on page 264

# show igmp statistics

**show igmp statistics**—Display IGMP statistics (on vEdge routers only). **show igmp statistics [vpn** *vpn-id*]**show igmp statistics vpn** *vpn-id* statistic

## **Syntax Description**

None	None:
	Display information about all interfaces on which IGMP is enabled.
group-property	Specific Statistic:
	group-property Display interface information for a specific IGMP statistic. statistic can be one of the following: rx_error, rx_general_query, rx_group_query, rx_leave, rx_unknown, rx_v1_report, rx_v2_reporttx_error, tx_general_query, and tx_group_query. Note that these options correspond to the column heads in the output of the plain show igmp statistics command.
VPN	VPN:
	<b>vpn</b> <i>vpn-id</i> Display IGMP group information for interfaces in a specific VPN.

## **Command History**

Release	Modification
14.3	Command introduced.

### **Output Fields**

The output fields are self-explanatory.

## Example

vEdge# show igmp statistics

VPN	RX GENERAL QUERY						RX ERROR	TX GENERAL QUERY		
1	0	0	0	0	0	0	0	238	0	0

## **Operational Commands**

igmp

show igmp groups

show igmp interface

how igmp summary

## **Related Topics**

igmp

show igmp groups, on page 261

show igmp interface, on page 262

show igmp summary, on page 264

## show igmp summary

**show igmp summary**—Display information about the IGMP version and IGMP timers (on vEdge routers only).

**show igmp summary** [*igmp-property*]

### **Syntax Description**

None	None:
	Display all IGMP version and timer information.
igmp-property	IGMP Properties:
	igmp-property Display information for a specific IGMP property. group-property can be one of the following: last-member-query-count, last-member-query-response-time, querier-timeout, query-interval, query-response-time, and version. Note that these options correspond to the column heads in the output of the plain show igmp summary command.

## **Command History**

Release	Modification
14.3	Command introduced.

## **Output Fields**

Output Field	Description
Last Member Query Count	How many group-specific query messages the router sends when it has receives a Leave Group message for a group before assuming that no members of the group remain on the interface. When no members appear to be present, the vEdge router removes the IGMP state for the group.
Last Member Query Response	How long the router waits, in seconds, to receive a response a group-specific query message. The default value is 1 second (1000 milliseconds). You cannot modify this value.

Output Field	Description
Other Querier Timeout	How long to wait for another IGMP querier to time out before assuming the role of querier. If IGMP on an interface or circuit detects another querier that has a lower IP than its own, it must become a non-querier on that network, and it starts watching for query messages from the querier. If the vEdge router has not received a query message from the querier in the Other Querier Timeout interval, it resumes the role of querier. The default other querier timeout value is 125 seconds. You cannot modify this value.
Query Interval	How often the router sends IGMP general query messages to solicit membership information. The default is 125 seconds. You cannot modify this value.
Query Response Interval	Maximum amount of time, in seconds, that the router waits to receive a response to a general query message. The default is 10 seconds. You cannot modify this value.
Version	IGMP version. Currently, vEdge routers run only IGMPv2.

## **Example**

```
vEdge# show igmp summary
Version 2
Query Interval 125 seconds
Query Response Interval 10 seconds
Last Member Query Response 1 seconds
Last Member Query Count 2
```

## **Operational Commands**

Other Querier Timeout

igmp show igmp groups show igmp interface how igmp statistics

## **Related Topics**

igmp show igmp groups, on page 261 show igmp interface, on page 262 show igmp statistics, on page 263

## show interface

**show interface**—Display information about IPv4 interfaces on a Cisco vEdge device. **show interface [detail]** [*interface-name*] [**vpn** *vpn-id*]

255 seconds

## **Syntax Description**

None	None:	
	Display standard information about the interfaces on the Cisco vEdge device.	

detail	Detailed Interface Information:  Display detailed information about the interfaces (available only on vEdge routers).
interface-name	Specific Interface:  Display information about a specific interface. On vEdge routers, <i>interface-name</i> can be a physical interface ( <b>ge</b> <i>slot/port</i> ), a subinterface or VLAN ( <b>ge</b> <i>slot/port.vlan-number</i> ), the interface corresponding to the system IP address ( <b>system</b> ), the management interface (typically, <b>eth0</b> ), or a GRE tunnel ( <b>gre</b> <i>number</i> ). On vSmart controllers, <i>interface-name</i> can be an interface ( <b>eth</b> <i>number</i> ) or the interface corresponding to the system IP address ( <b>system</b> ).
vpn vpn-id	Specific VPN: Display information about interfaces in a specific VPN.

## **Command History**

Release	Modification
14.1	Command introduced.

## **Output Fields**

The following are the fields in the show interface command output:

Output Fields	Description
1Duplex	Whether the interface is operating in duplex or simplex mode. This field does not apply to virtual interfaces, such as GRE, IRB, loopback, and system interfaces
Encapsulation Type	Encapsulation configured on the interface with the encapsulation command.
Hardware Address	MAC address of the interface.
If Admin Status	Administrative status of the interface; that is, its status as a result of the interface's configuration. The status can be either Up or Down. By default, interfaces are administratively down, and you must include the no shutdown command in the interface's configuration to bring the interface up. An interface that is both administratively and operationally up is able to transmit and receive traffic. To bring down an interface administratively, include the shutdown command in the interface's configuration.
If Oper Status	Operational status of the interface; that is, its status as a result of operational factors. The status can be either Up or Down. An interface can be operationally up if it is Interface is administratively up, the interface link layer state is up, and the interface initialization has completed. An interface that is both administratively and operationally up is able to transmit and receive traffic. If the operational status is down, the interface is functionally down and is not able to transmit or receive any traffic.
MTU	MTU size for packets being send over the interface.

Output Fields	Description
Port Type	Describes the port's function from the point of view of the overlay network. It can be one of the following:
	<b>loopback</b> —Loopback interface. The device's system IP address is listed as a loopback interface.
	service—Interface for data traffic.
	<b>transport</b> —Interface running a DTLS control session.
RX Packets and TX Packets	For GRE interfaces, these fields show counts of the data traffic received and transmitted on GRE tunnels. To display GRE keepalive traffic counts, use the show tunnel gre-keepalives command. To display all GRE tunnel statistics, use the show tunnel statistics gre command.
Speed	Speed of the interface, in megabits per second (Mbps). This field does not apply to virtual interfaces, such as GRE, IRB, loopback, and system interfaces.
TCP MSS Adjust	Maximum segment size (MSS) of TCP SYN packets on the interface. For more information see tcp-mss-adjust.
Uptime	How long the interface has been up, in days, hours, minutes, and seconds.

The following are the additional fields included in the show interface detail command output:

- addr-type—Type of address configured on the interface, either IPv4 or IPv6, and how the address is configured, either dynamic or static.
- allow-service—Services allowed on the interface. For more information, see allow-service.
- arp-add-fails—Packets for which an ARP entry in the forwarding plane could not be created.
- bad-label—Packets dropped because of an invalid next-hop label record for a destination.
- cpu-policer-drops—Packets destined to the control plane dropped because they exceeded the CPU policer limit.
- dot1x-rx-pkts—802.1X packets received on the interface.
- dot1x-tx-pkts—802.1X packets transmitted on the interface.
- filter-drops—Packets dropped because of an implicit or explicit localized data policy (ACL) filter configuration.
- icmp-redirect-rx-drops-
- icmp-redirect-tx-drops—ICMP redirect packets dropped by the interface.
- if-addr, ip-address/broadcast-addr/secondary—Interface's primary unicast and broadcast addresses, and interface's secondary address, if one is configured.
- ifindex—Interface's SNMP index number.
- if-tracker-status—Whether interface tracking is enabled. For more information, see tracker.
- interface-disabled—Incoming packets dropped because the interface port is not enabled.

- mirror-drops—Fragmented packets that are being mirrored to a destination.
- route-lookup-fail—Packets that could not be forwarded because no route is present in the forwarding table (FIB).
- rx-arp-non-local-drops—Received ARP packets that do not match the destination IP address of any local IP address.
- rx-arp-replies—Received ARP replies
- rx-arp-rate-limit-drops—Currently, the software does not increment this counter.
- rx-arp-reply-drops—Currently, the software does not increment this counter.
- rx-arp-request-fail—Packets that could not be received because there is not corresponding MAC address.
- rx-arp-requests—Received ARP requests.
- rx-broadcast-pkts—Received broadcast packets.
- rx-drops—Received packets that were dropped.
- rx-errors—Received packets that were errored.
- rx-ip-ttl-expired—Received IP packets whose time-to-live value expired.
- rx-multicast-pkts—Received multicast packets.
- rx-non-ip-drops—Received packets other than IP or ARP packets that the interface dropped.
- rx-oversize-errors—Currently, the software does not increment this counter.
- rx-octets—Number of octets in received packets.
- rx-packets—Received packets.
- rx-policer-drops—Incoming packets dropped because of the rate exceeded the configured ingress policer rate.
- rx-policer-remark—Received packets remarked as the result of a policer.
- rx-pps—Receipt rate of packets, in packets per second.
- rx-replay-integrity-drops—Received packets dropped because the IPsec packet arrive outside of the anti-replay window or because the integrity check performed by ESP or AH failed. To view the configured anti-replay window, use the show security-info command. To modify the anti-replay window size, use the security ipsec replay-window configuration command.
- rx-undersize-errors—Currently, the software does not increment this counter.
- rx-wred-drops—Incoming packets dropped because of a RED drop profile associated with an interface queue. To configure a RED drop profile, use the drops option when configuring a QoS scheduler.
- shaping-rate—Traffic rate on the interface if rate is configured with the shaping-rate command to be less than the maximum rate.
- split-horizon-drops—BGP packets dropped as a result of split-horizon determination that the router was advertising a route back on the same interface from which it was learned.

- tx-arp-rate-limit-drops—Number of ARP packets generated by the forwarding plane that exceed the CPU rate limit, which is 16 ARP packets sent towards the CPU and 128 ARP packets send towards physical ports.
- tx-broadcast-pkts—Transmission rate of broadcast packets, in packets per second.
- tx-drops—Transmitted packets that were dropped.
- tx-errors—Transmitted packets that were errored.
- tx-icmp-mirrored-drops—ICMP redirect packets dropped by the system.
- tx-icmp-policer-drops—ICMP packets generated by the system that were dropped because of ICMP policer limits.
- tx-multicast-pkts—Transmitted multicast packets.
- tx-no-arp-drops—Packets dropped in the forwarding plane because of a missing ARP entry for a destination IP address.
- tx-octets—Number of octets in transmitted packets.

## show interface arp-stats

**show interface arp-stats**—Display the ARP statistics for each interface (on vEdge routers only). **show interface arp-stats [vpn** *vpn-id*] [*interface-name*]

#### **Syntax Description**

None	None:						
	Display standard information about ARP statistics for each interface.						
interface-name	Specific Interface:						
	Display ARP statistics for a specific interface.						
vpnvpn-id	VPN:						
	Display ARP statistics for interfaces in a specific VPN.						

## **Command History**

Release	Modification
14.1	Command introduced.

#### **Output Fields**

The following are the fields included in the show interface arp-stats command output:

- rx-arp-requests/tx-arp-replies, RX Requests/Tx Replies—Number of ARP requests received on the interface, and number of replies sent to these ARP requests.
- tx-arp-requests/rx-arp-replies, TX Requests/Rx Replies—Number of ARP requests sent on the interface, and number of replies received to these ARP requests.
- arp-add-fails, Add Fails—Packets for which an ARP entry in the forwarding plane could not be created.

- rx-arp-reply-drops, RX Reply Drops—Currently, the software does not increment this counter.
- rx-arp-rate-limit-drops, RX Rate Limit Drops—Currently, the software does not increment this counter.
- tx-arp-rate-limit-drops, TX Rate Limit Drops—Number of ARP packets generated by the forwarding plane that exceed the CPU rate limit, which is 16 ARP packets sent towards the CPU and 128 ARP packets send towards physical ports.
- rx-arp-non-local-drops, RX Non-Local Drops—Received ARP packets that do not match the destination IP address of any local IP address.
- tx-arp-request-fail—Packets that could not be transmitted because an ARP request for the MAC address corresponding to the destination IP address was unable to retrieve a MAC address.
- tx-no-arp-drops, TX No ARP Drops—Packets dropped in the forwarding plane because of a missing ARP entry for a destination IP address.

## show interface errors

**show interface errors**—Display error statistics for interfaces (on vEdge routers only). **show interface errors [vpn** *vpn-id*] [*interface-name*]

#### **Syntax Description**

None	None:
	Display standard information about errors for each interface.
interface-name	Specific Interface:
	Display error information for a specific interface.
vpnvpn-id	VPN:
	Display error information for interfaces in a specific VPN.

#### **Command History**

Release	Modification
14.1	Command introduced.

#### **Output Fields**

Following are explanations of the output fields:

- arp-add-fails—Packets for which an ARP entry in the forwarding plane could not be created.
- bad-label—Packets dropped because of an invalid next-hop label record for a destination.
- cpu-policer-drops—Packets destined to the control plane dropped because they exceeded the CPU policer limit.
- filter-drops—Packets dropped because of an implicit or explicit localized data policy (ACL) filter configuration.
- fragment-df-drops—Packets dropped because their size is larger than the configure MTU, if the Don't Fragment bit is set.
- interface-disabled—Incoming packets dropped because the interface port is not enabled.
- ip-fwd-null-hop—Packets that could not be forwarded because the next-hop address was invalid or the next hop was unavailable.
- ip-fwd-unknown-nh-type—Packets dropped because the next-hop type was unknown.
- mirror-drops—Fragmented packets that are being mirrored to a destination.
- port-disabled-rx—Incoming packets dropped because the interface port is not enabled.
- port-disabled-tx—Outgoing packets dropped because the interface port is not enabled.
- route-lookup-fail—Packets that could not be forwarded because no route is present in the forwarding table (FIB).

- rx-arp-cpu-rate-limit-drops—ARP reply packets dropped because the number of packets exceeded the CPU rate limit.
- rx-arp-non-local-drops—Received ARP packets that do not match the destination IP address of any local IP address.
- rx-arp-rate-limit-drops—Currently, the software does not increment this counter.
- rx-arp-reply-drops—Currently, the software does not increment this counter.
- rx-dmac-filter-drops—Received packets that do not match the destination MAC address corresponding to the Layer 3 interface.
- rx-fcs-align-errors— In MIPS-based Cisco vEdge devices, like Cisco vEdge 1000 or Cisco vEdge 2000, this counter is the sum of all dropped error packets. The errors may be caused due to:
  - FCS (frame check sequence) errors
  - alignment errors

These errors are detected at the hardware layer but are not related to DMAC (Destination MAC) filter drop or lack of room in the receiver FIFO.

- rx-implicit-acl-drops—Received packets dropped because of an implicit route policy (access list). Router tunnel interfaces also have implicit ACLs, which are also referred to as services. Some of these are present by default on the tunnel interface, and they are in effect unless you disable them. Through configuration, you can also enable other implicit ACLs. On vEdge routers, the following services are enabled by default: DHCP (for DHCPv4 and DHCPv6), DNS, and ICMP. You can also enable services for BGP, Netconf, NTP, OSPF, SSHD, and STUN. To enable the logging of the headers of packets dropped because they do not match a service configure with an allow-service command, configure policy implicit-acl-logging (on vEdge routers only).
- rx-inb-errors—Currently, the software does not increment this counter.
- rx-interface-not-found—Packets dropped because of an invalid VLAN tag.
- rx-ip-errors—Received packets whose IP or Thernet header could not be parsed.
- rx-ip-ttl-expired—Received IP packets whose time-to-live value expired.
- rx-non-ip-drops—Received packets other than IP or ARP packets that the interface dropped.
- rx-oversize-errors—Currently, the software does not increment this counter.
- rx-policer-drops—Incoming packets dropped because of the rate exceeded the configured ingress policer rate.
- rx-replay-integrity-drops—Received packets dropped because the IPsec packet arrive outside of the anti-replay window or because the integrity check performed by ESP or AH failed. To view the configured anti-replay window, use the show security-info command. To modify the anti-replay window size, use the security ipsec replay-window configuration command.
- rx-undersize-errors—Currently, the software does not increment this counter.
- rx-wred-drops—Incoming packets dropped because of a RED drop profile associated with an interface queue. To configure a RED drop profile, use the drops option when configuring a QoS scheduler.
- split-horizon-drops—BGP packets dropped as a result of split-horizon determination that the router was advertising a route back on the same interface from which it was learned.

- tx-arp-rate-limit-drops—Number of ARP packets generated by the forwarding plane that exceed the CPU rate limit, which is 16 ARP packets sent towards the CPU and 128 ARP packets send towards physical ports.
- tx-arp-request-fail—Packets that could not be transmitted because an ARP request for the MAC address corresponding to the destination IP address was unable to retrieve a MAC address.
- tx-collision-drops—Packets dropped because the interface attempted to send packets at the same time.
- tx-fragment-drops—Packets dropped because of issues related to fragmentation, such as when a fragment exceeds the MTU size when the DF bit is set and when issues occur in reassembling packets after fragmentation.
- tx-fragment-needed—Packets requiring fragmentation because they are larger than the interface's MTU.
- tx-icmp-mirrored-drops—ICMP redirect packets dropped by the system.
- tx-icmp-policer-drops—ICMP packets generated by the system that were dropped because of ICMP policer limits.
- tx-interface-disabled—Currently, the software does not increment this counter.
- tx-no-arp-drops—Packets dropped in the forwarding plane because of a missing ARP entry for a destination IP address.
- tx-underflow-pkts—Packets dropped during transmission because packet data was not made available to the TX FIFO in time. This situation can result in FCS errors on the receiving side.

### **Example**

#### vEdge# show interface errors interface vpn 0 interface ge0/0 arp-add-fails rx-arp-reply-drops rx-arp-rate-limit-drops 2 tx-arp-rate-limit-drops 0 rx-arp-non-local-drops 183 tx-arp-request-fail tx-no-arp-drops rx-ip-ttl-expired rx-ip-errors interface-disabled Ω rx-policer-drops rx-non-ip-drops 144 filter-drops 0 mirror-drops cpu-policer-drops 0 split-horizon-drops Ο route-lookup-fail bad-label 0 rx-dmac-filter-drops rx-drop-pkts Ω rx-drop-octets rx-wred-drops rx-interface-not-found 0 rx-inh-errors rx-oversize-errors rx-fcs-align-errors 0 rx-undersize-errors 0 tx-underflow-pkts

tx-collision-drops 0

## **Operational Commands**

# show interface queue

**show interface queue**—Display interface queue statistics (on vEdge routers only). **show interface queue [vpn** *vpn-id*] [*interface-name*]

#### **Syntax Description**

None	None:						
	Display standard interface queue statistics.						
interface-name	Specific Interface:						
	Display interface queue statistics for a specific interface.						
vpnvpn-id	VPN:						
	Display interface queue statistics for interfaces in a specific VPN.						

Note

The queue drop details are dispalyed when you pass commands, **show interface statistics** and **show interface port-stats**.

### **Command History**

Release	Modification
14.1	Command introduced.
19.1	Added attributes to the command output: queue-depth, max-depth, avg-queue, queue-pps, queue-drop-pps

#### **Output Fields**

#### **QNUM**

Queue number. Hardware vEdge routers have 8 queues, numbered 0 through 7. From 17.2.7 Release onwards, vEdge Cloud software router have 8 queues, numbered 0 through 7.

The remaining output fields are self-explanatory.

### Example

#### vedge# show interface queue ge0/0

VPN	INTERFACE	AF TYPE	QNUM	QUEUED PACKETS	TAIL DROP PACKETS	TAIL DROP BYTES	RED DROP PACKETS	RED DROP BYTES	TX PACKETS	TX BYTES	QUEUE DEPTH	MAX DEPTH	AVG QUEUE	QUEUE PPS	QUEUE DROP PPS

# show interface sfp detail

show interface sfp detail—Display detailed SFP status and digital diagnostic information for bytes 0 through 95 of an SPF A0 section, as described in SFF-8472 (on vEdge routers only). This command also provides information about the types of fiber supported, the distance the SFP can drive, and the wavelength used by the SFP. The output of this command is useful for diagnosing issues with a troublesome SFP link.

**show interface sfp detail** [interface-name]

## **Syntax Description**

None	None:					
	Display detailed information for all interfaces in the router.					
interface-name	Interface Name:					
	interface-name Display detailed information for the specific interface.					

#### **Command History**

Release	Modification
16.1	Command introduced.

### **Output Fields**

The output fields are drawn from the SFP addresses listed below. Not all fields are valid or make sense for all SFP types.

#### Table 3: SFP Types

Field Name	Value	SFP Address	
Physical identifier	Physical device identifier	A0.0-1	
Connector type	Values such as LC, SC, and RJ45	A0.2	
Transceiver compliance (compatibility)	List of compliance values	A0.3 to A0.10, A0.36	
Encoding	Values such as 8b10b and 64b66b	A0.11	
Nominal speed	Speed, in bps	A0.12, A0.66 to A0.67	
Rate select options	Rate identifiers	A0.13

## show interface sfp diagnostic

**show interface sfp diagnostic**—Display SFP diagnostic information for fiber-based SFPs only (on vEdge routers only). This data is taken from bytes in the SFP A2 page, as described in SFF-8472. This section is not available for copper RJ45 SFPs.

The data for this output is stored in the A2 page of the SFP, and it contains minimum/maximum threshold parameters for laser transmitters and receivers, as well as dynamic run-time data values. This data page also might contain calibration data if the devices were externally calibrated. In this show command, the calibration data is used, if populated; however, it is not specifically be displayed.

## **show interface sfp diagnostic** [interface-name]

### **Syntax Description**

None	None:				
	Display SFP diagnostic information for all interfaces in the router.				
interface-name	Interface Name:				
	Display SFP diagnostic information for the specific interface.				

### **Command History**

Release	Modification
16.1	Command introduced.

#### **Output Fields**

The output fields are drawn from the SFP addresses listed below. Not all fields are valid or make sense for all SFP types.

The following information is displayed for SFP diagnostics. Measurement information is presented as floating-point data.

Threshold and measurement data are all floating point data and are specified for accuracy relative to the source data. Measurement units are included in the value label.

In addition to allowing current measurements to be display, each of the following measurements has associated flag status indicating whether the measurement is in or out of alarm or warning state. This data is sourced from A2.112-117 SFP data.

Based on options declared to be supported by the SFP, several bit-based statuses are included in the display output. These include items such as select, transmit disable state, and receive loss-of-signal state, and are from A2.110.

Measurement	High Warning	High Alarm	Low Warning	Low Alarm	Current
Optical laser temperature	A2.44 to A2.45	A2.40 to A2.41	A2.46 to A2.47	A2.42 to A2.43	A2.106 to A2.107
Optical TEC current	A2.52 to A2.53	A2.48 to A2.49	A2.54 to A2.55	A2.50 to A2.51	A2.108 to A2.109
Receive power	A2.36 to A2.37	A2.32 to A2.33	A2.38 to A2.39	A2.34 to A2.35	A2.104 to A2.105
SFP temperature	A2.4 to A2.5	A2.0 to A2.1	A2.6 to A2.7	A2.2 to A2.3	A2.96 to A2.97
Supply voltage	A2.12 to A2.13	A2.8 to A2.9	A2.14 to A2.15	A2.10 to A2.11	A2.98 to A2.99
Transmit bias current	A2.20 to A2.21	A2.16 to A2.17	A2.22 to A2.23	A2.18 to A2.19	A2.100 to A2.101

# show ip dns-snoop

Display details of a fully qualified domain name (FQDN) and its corresponding IP address mapping information.

The DNS snooping agent (DSA) maintains an "IP cache" table of fully qualified domain names (FQDN) and their corresponding IP addresses. The command displays the complete information in this table (all option), or details for specific FQDN's (pattern option) or IP addresses (address option).

(for Cisco IOS XE SD-WAN devices)

# **Command Syntax**

**show ip dns-snoop** {address ip-address | all pattern pattern}

#### **Syntax Description**

address ip-address	Display details for a specific IP address in the DSA IP cache table.
all	Display details for all IP addresses in the DSA IP cache table.
pattern pattern	Display details for a specific FQDN in the DSA IP cache table, matching a text pattern.

#### **Command Mode**

Privileged EXEC mode

#### **Command History**

Release	Modification
Cisco IOS XE Amsterdam 17.2	Command introduced.

## **Examples**

## Example

Device# show ip dns	s-snoop all			
IP Address	Client(s)	Expire	RegexId	Dirty Match
192.168.0.1	0x1 992	0xef270000	0x00	cisco\.com

# show ip fib

To display the IPv4 entries in the local forwarding table (on Cisco vEdge routers only), use the **show ip fib** command in privileged EXEC mode.

**show ip fib** [ **vpn** *vpn-id* ] [ *ipv4-prefix/length* ] [ **tloc** { **color** *color* | **tloc-ip** *ip-address* } ]

# **Syntax Description**

	None:	
	List standard information about the IPv4 entries in the forwarding table.	

ipv4-prefix/length	Specific Prefix: List the forwarding table entry for the specified IPv4 prefix.
tloc [color color   tloc-ip ip-address]	TLOC-Specific Entries: Display forwarding table IPv4 entries for specific TLOCs.
vpn vpn-id	VPN-Specific Routes: List only the forwarding table IPv4 entries for the specified VPN.

Release	Modification
14.1	Command introduced.
Cisco SD-WAN Release 20.9.1	This command was modified. Support was added to display interservice replicated route VPN.

# **Examples**

The following is a sample output from the **show ip fib vpn** command that shows the replicated route VPNs:

vEdge# show ip fib vpn 102

VPN COLO	PREFIX DR	NEXTHOP IF NAME	NEXTHOP ADDR	NEXTHOP LABEL	NEXTHOP VPN	SA INDEX	TLOC IP
102	10.0.100.0/24	ge0/4.105	-	-	-	-	_
102	10.51.51.16/32	ge0/4.105	-	-	-	-	-
102	10.61.61.0/24	-	-	-	6	-	-

#### **Examples**

The following is a sample output from the **show ip fib** command:

# show ip mfib oil

**show ip mfib oil**—Display the list of outgoing interfaces from the Multicast Forwarding Information Base (MFIB) (on vEdge routers only).

**show ip mfib oil show ip mfib oil** [group-number] [group-address] [source-address] [**mcast-oil-list** number]

# **Syntax Description**

None	None:
	List standard information about outgoing interfaces from the MFIB.
group-number group-address	Specific Information:
source-address mcast-oil-list	List more specific information from the MFIB.

# **Command History**

Release	Modification
14.2	Command introduced.

# **Output Fields**

The output fields are self-explanatory.

#### **Example**

vEdge# show ip mfib oil

VPN ID	GROUP	SOURCE	INDEX	OIL INTERFACE	OIL REMOTE SYSTEM
1	224.0.1.39	0.0.0.0			
1	224.0.1.40	0.0.0.0			
1	225.0.0.1	0.0.0.0	0	-	172.16.255.14

#### **Operational Commands**

show ip mfib summary

show ip mfib stats

#### **Related Topics**

show ip mfib summary, on page 299 show ip mfib stats, on page 298

# show ip mfib stats

**show ip mfib stats**—Display packet transmission and receipt statistics for active entries in the Multicast Forwarding Information Base (MFIB) (on vEdge routers only). Packet rates are computed every 10 seconds.

#### **Command Syntax**

show ip mfib stats

#### **Syntax Description**

None

#### **Output Fields**

#### Rx Policy Drop, Tx Policy Drop

The number of inbound or outbound packets dropped as the result of applying a policy. The remaining output fields are self-explanatory.

# **Command History**

Release	Modification
14.2	Command introduced.
16.3	Added Rx Policy Drop and Tx Policy Drop fields to command output.

#### **Examples**

vEdge# show ip mfib stats

									RX	RX	TX	TX			RX	TX	INVALI	D
				RX	RX	TX	TX	CTRL	PACKETS	OCTETS	PACKETS	OCTETS	AVG	RPF	POLICY	POLICY	OIL	TX
7	VPN	GROUP	SOURCE	PKTS	OCTETS	PKTS	OCTETS	PKTS	(PPS)	(KBPS)	(PPS)	(KBPS)	REPLICATION	FAILURE	DROP	DROP	FAILURE	FAILURE

# **Operational Commands**

show ip nat interface

show ip nat interface-statistics

# **Related Topics**

nat

show ip nat interface, on page 301

show ip nat interface-statistics, on page 302

# show ip nat interface

**show ip nat interface**—List the interfaces on which NAT is enabled and the NAT translational filters on those interfaces (on vEdge routers only).

# **Command Syntax**

**show ip nat interface** [nat-vpn vpn-id] [nat-parameter]

## **Syntax Description**

Nme	List information about all NAT interfaces in all VPNs.
-----	--------------------------------------------------------

### Table 4: Syntax Description

nat-parameter	Specific NAT Interface Parameter:
	List specific NAT interface information. <i>nat-parameter</i> can be one of the following, which correspond to the column heads in the command output: <b>fib-filter-count</b> , <b>filter-type</b> , <b>ip</b> , <b>mapping-type</b> , and <b>number-ip-pools</b> .
nat-vpn vpn-id	Specific VPN: List information for NAT interface only for the specified VPN.

# **Command History**

Release	Modification
14.2.	Command introduced.

#### **Output Fields**

In the Map Type field, all SD-WAN NAT types are endpoint-independent.

The other output fields are self-explanatory.

#### Output

vEdge# show ip nat interface

					FIB		NUMBER

# show ip nat interface-statistics

show ip nat interface-statistics—List packet, NAT, and ICMP statistics for the interfaces on which NAT is enabled (on vEdge routers only).

#### **Command Syntax**

show ip nat filter interface-statistics [nat-vpn vpn-id]

# **Syntax Description**

#### Table 5: Syntax Description

None	Display statistics for all interfaces in all VPNs.
nat-vpn	VPN:
vpn-id	Display statistics for the interfaces in the specified VPN.

Release	Modification
14.2.	Command introduced.

# show ip routes

To display the IPv4 entries in the local route table, use the **show ip routes** command in privileged EXEC mode. On Cisco vSmart controllers, the route table incorporates forwarding information.

show ip routes [vpn vpn-id] [ipv4-address] [ipv4prefix/length] [bgp] [connected] [gre] [nat] [natpool-inside] [natpool-outside] [omp] [ospf] [static] [summary [protocol protocol]] [detail]

# **Syntax Description**

	None: List standard information about the entries in the local IPv4 route table.
detail	Detailed Information: List detailed information about the entries in the local IPv4 route table.
ipv4-address ipv4prefix /length  vpn vpn-id	IP Address or Route Prefix: List route information for the specified route prefix. If you omit the prefix length, you must specify a VPN identifier so that the Cisco SD-WAN software can find the route that best matches the prefix.
nat	NAT Routes: List routes learned from static routes that are advertised to a different VPN (configured using the <b>ip route vpn</b> command).
natpool-inside natpool-outside	NAT Pool Routes: List routes learned from NAT pools that are advertised by OMP ( <i>natpool-inside</i> ) and routes learned from the service side ( <i>natpool-outside</i> ) for Cisco vEdge devices acting as NATs.
protocol	Routes Learned from a Protocol or Connected Networks: List routes learned from one or more specific protocols—bgp, connected, gre, omp, ospf, and static. The protocol static includes both routes that are statically configured on the local device as well as routes learned from a DHCP server if one or more interfaces in VPN 0 are configured to learn their IP addresses via DHCP.
summary [summary protocol]	Summary of Routes: List summary information about the IP routes in the route table or about routes learned from the specified protocol. Protocol can be bgp, connected, omp, ospf, or static.
vpn vpn-id	VPN-Specific Routes: List only the route table entries for the specified VPN.

Note

Any BFD event (up/down) for a vEdge peer will result in withdrawal and re-installation of all OMP routes learnt from the remote vEdge, consequently, re-setting the uptime as well.

# **Command History**

Release	Modification
14.1	Command introduced.
16.3	Added support for displaying NAT-related routes.
17.1	Display omp-tag and ospf-tag fields in detailed output.
17.2	Renamed natpool-omp and natpool-service options to natpool-inside and natpool-outside.
Cisco SD-WAN Release 20.9.1	This command was modified. Support was added to display interservice VPN route replication in detailed output.

# show ipsec ike inbound-connections

**show ipsec ike inbound-connections**—Display information about the IKE sessions that remote IKE peers have established to the local router (on vEdge routers only).

#### **Command Syntax**

show ipsec ike inbound-connections

show ipsec ike inbound-connections source-ip-address [source-port [destination-ip-address [destination-port ]]] [ (ciphersuite suite | new-key-hash hash | new-spi spi | old-key-hash hash | old-spi spi ]]]]

#### **Syntax Description**

	None:
	Display information for all the IKE sessions that have been established to the local router.
source-ip-address	Specific IKE-Enabled IPsec Tunnel Connection:
[source-port[destination-ip-address[destination-port]]][(ciphersuite suite   new-key-hash hash  new-spi spi  old-key-hash hash   old-spi spi)]]]]	

#### **Command History**

Release	Modification
17.2	Command introduced.

#### Example

For the following example, the output of the **show ipsec ike inbound-connections** command on the vEdge1 router shows the IKE-enabled IPsec tunnel connection that originates on the vEdge2 router, whose tunnel source IP address is 10.1.16.16. The command output on the vEdge2 router shows the connection from vEdge1, whose tunnel source IP address is 10.1.15.15.

# show ipsec ike outbound-connections

**show ipsec ike outbound-connections**—Display information about the IKE sessions that the local router has established to remote IKE peers (on vEdge routers only).

#### **Command Syntax**

show ipsec ike outbound-connections

**show ipsec ike outbound-connections** *source-ip-address* [*source-port* [*destination-ip-address* [*destination-port*] [*spi*]]][ (**ciphersuite** *suite* | **key-hash** *hash* | **tunnel-mtu** *mtu* )]]]]

#### **Syntax Description**

	None:
	Display information for all the IKE sessions that have been established to remote IKE peers.
source-ip-address [source-port	Specific IKE-Enabled IPsec Tunnel Connection:
[destination-ip-address] [destination-port] [spi] ] ] [ (ciphersuite suite  tunnel-mtu mtu) ] ] ]	Display information for a specific IKE-enabled IPsec tunnel.
]	

#### **Command History**

Release	Modification
17.2	Command introduced.

#### **Examples**

On the vEdge1 router, the output of the **show ipsec ike outbound-connections** command shows the IKE-enabled IPsec tunnel connection that originates from the local router, whose tunnel source IP address is 10.1.15.15. The command output on the vEdge2 router shows the connection originating from that router, 10.1.15.15.

# show ipsec inbound-connections

**show ipsec inbound-connections**—Display information about IPsec tunnels that originate on remote routers (on vEdge routers only).

#### **Command Syntax**

show ipsec inbound-connections

**show ipsec inbound-connections** *local-tloc-address* [*local-color* [*remote-tloc-address* [*remote-color* [ (**dest-ip** | **dest-port** | **source-ip** | **source-port**) ] ] ] ]

#### Syntax Description

None:
Display information for all the IPsec connections that originate
on the vEdge router. The tunnel connections are listed in order
according to the local TLOC address.

local-tloc-address [local-color	Specific Tunnel Connection:	
[remote-tloc-address[ remote-color [ (dest-ip  dest-port  source-ip  source-port)	Display information for a specific IPsec connection.	
]]]]		

Release	Modification
14.1	Command introduced.
15.2	Command renamed from <b>show tunnel inbound-connections</b> .
16.2	Display negotiated encryption algorithm in command output.

Examples	vEdge#	show ip	sec inbound-connections					
SOURCE NEGOTIATED		SOURCE	DEST	DEST	REMOTE	REMOTE	LOCAL	LOCAL
IP ENCRYPTION ALGORITHM	TC SPIs	PORT	IP	PORT	TLOC ADDRESS	TLOC COLOR	TLOC ADDRESS	TLOC COLOR

request security ipsec-rekey, on page 141 show ipsec inbound-connections, on page 311 show ipsec outbound-connections, on page 313

# show ipsec outbound-connections

**show ipsec outbound-connections**—Display information about the IPsec connections to remote routers (on Cisco vEdge devices only).

# **Command Syntax**

**show ipsec outbound-connections** [source-ip-address]

 $\textbf{show ipsec outbound-connections} \ [\textbf{authentication-used} \ \textit{string} \ | \textbf{tunnel-mtu} \ \textit{number}]$ 

show ipsec outbound-connections (remote-tloc-address ip-address | remote-tloc-color color)

	ription

	None:
	Display information for all the IPsec connections that originate on the local Cisco vEdge device.
authentication-used string	Authentication Type:
	Display information for the IPsec connections that use the specified authentication.

remote-tloc-address ip-address	TLOC Address:	
	Display the IPsec connection information for a specific TLOC address.	
remote-tloc-color color	TLOC Color:	
	Display the IPsec connection information for a specific TLOC color.	
tunnel-mtu number	Tunnel MTU Size:	
	Display information for the IPsec connections with the specified MTU size.	

Release	Modification
14.1	Command introduced.
15.2	Command renamed from <b>show tunnel outbound-connections</b> .
16.2	Display negotiated encryption algorithm in command output.
Cisco SD-WAN Release 20.6.1	The output of this command was modified. Starting from Cisco SD-WAN Release 20.6.1, the command output replaces the Authentication Used column with the Integrity Used column.  The values null, ah-shal-hmac, ah-no-id, and shal-hmac are replaced with none, ip-udp-esp, ip-udp-esp-no-id, and esp respectively.

# **Examples**

The following is a sample output of the  ${f show}$  ipsec outbound-connections for Cisco SD-WAN Release 20.6.1 and later.

Device# show sdwan ip	sec outbound-con	nections

# show ipv6 dhcp interface

**show ipv6 dhcp interface**—Display information about interfaces that are DHCPv6 clients (on Cisco vEdge devices and Cisco Catalyst SD-WAN Controllersonly).

#### **Command Syntax**

show ipv6 dhcp interface [vpn vpn-id] [interface-name]
show ipv dhcp interface [dns-list] [state]

#### **Syntax Description**

	None:
	Display information about all interfaces that are DHCPv6 clients.
dns-list	DNS Servers:
	Display the DHCPv6 client DNS information.
state	Lease State:
	Display the DHCPv6 client interface state information.
vpn	VPN:
vpn-id	Display DHCPv6 client interface information for a specific VPN.

#### **Output Fields**

The state can be one of bound, init, rebind, release, renew, and request.

The DNS column lists the IPv6 addresses of the DNS servers returned by DHCPv6.

The remaining output fields are self-explanatory.

Release	Modification
16.3	Command introduced.

# **Examples**

vEdge# show ipv6 dhcp interface

VPN GAT	I INTERFACI EWAY INDE		ACQUIRED IP	SERVER	LEASE TIME	REMAINING

show ipv6 neighbor, on page 320
show ipv6 routes, on page 323
```

# show ipv6 neighbor

**show ipv6 neighbor**—Display the entries in the Address Resolution Protocol (ARP) table for IPv6 neighbors, which lists the mapping of IPv6 addresses to device MAC addresses (on Cisco vEdge devices and Cisco Catalyst SD-WAN Controllers only).

#### **Command Syntax**

show ipv6 neighbor [vpn vpn-id]

# **Syntax Description**

	None:
	List all the IPv6 entries in the ARP table.
vpn	Specific VPN:
vpn-id	List the IPv6 ARP table entries for the specified VPN.

# **Output Fields**

The output fields are self-explanatory.

#### **Command History**

Release	Modification
16.3	Command introduced.

#### **Examples**

#### vEdge# show ipv6 neighbor

VPN	NAME	IP	MAC	STATE	IDLE TIMER	UPTIME
0	_	2001::2 fe80::20c:bdff:fe06:4757	00:0c:bd:06:47:57			0:00:00:37
0	5	fe80::250:b6ff:fe0f:1c84				

#### **Related Topics**

```
clear arp, on page 20
show arp, on page 185
show ipv6 interface, on page 317
show ipv6 routes, on page 323
```

# show ipv6 policy access-list-associations

**show ipv6 policy access-list-associations**—Display the IPv6 access lists that are operating on each interface (on Cisco vEdge devices only).

#### **Command Syntax**

show ipv6 policy access-list-associations

#### **Syntax Description**

None

#### **Output Fields**

The output fields are self-explanatory.

# **Command History**

Release	Modification
16.3	Command introduced.

#### **Example**

vEdge# show ipv6 policy access-list-associations

	INTERFACE	INTERFACE
NAME	NAME	DIRECTION
ipv6-policy	ge0/2	out

#### **Related Topics**

access-list

show policy access-list-associations, on page 402

# show ipv6 policy access-list-counters

**show ipv6 policy access-list-counters**—Display the number of packets counted by IPv6 access lists configured on the Cisco vEdge device (on Cisco vEdge devices only).

#### **Command Syntax**

show ipv6 policy access-list-counters

# **Syntax Description**

None

#### **Output Fields**

The output fields are self-explanatory.

Release	Modification
16.3	Command introduced.

### **Example**

vEdge# show ipv6 policy access-list-counters

NAME	COUNTER NAME	PACKETS	BYTES
ipv6-policy	ipv6-counter	1634	135940

# **Related Topics**

access-list

show policy access-list-counters, on page 403

# show ipv6 policy access-list-names

**show ipv6 policy access-list-names**—Display the names of the IPv6 access lists configured on the Cisco vEdge device (on Cisco vEdge devices only).

#### **Command Syntax**

show policy access-list-names

#### **Syntax Description**

None

#### **Output Fields**

The output fields are self-explanatory.

#### **Command History**

Release	Modification
16.3	Command introduced.

# **Examples**

vEdge# show ipv6 policy access-list-names

NAME -----ipv6-policy

# **Related Topics**

access-list

show policy access-list-names, on page 404

# show ipv6 policy access-list-policers

**show ipv6 policy access-list-policers**—Display information about the policers configured in IPv6 access lists (on Cisco vEdge devices only).

#### **Command Syntax**

show ipv6 policy access-list-policers

#### **Syntax Description**

None

#### **Output Fields**

The output fields are self-explanatory.

#### **Command History**

Release	Modification
16.3	Command introduced.

# **Examples**

Display a list of policers configured in access lists. This output shows that the policer named "p1_police" was applied in sequence 10 in the access list "ipv6_p1" in sequences 10, 20, and 30 in the "ipv6_plp" access list.

#### vEdge# show policy access-list-policers

NAME	POLICER NAME	PACKETS
ipv6_p1 ipv6_plp	10.p1_police 10.p1_police 20.p1_police 30.p2_police	0

#### **Related Topics**

clear policer statistics, on page 55 show policer, on page 401 show policy access-list-policers, on page 405

# show ipv6 routes

**show ipv6 routes**—Display the IPv6 entries in the local route table. On Cisco Catalyst SD-WAN Controllers, the route table incorporates forwarding information.

#### **Command Syntax**

show ipv6 routes [detail] [ipv6-address] [ipv6-prefix/length] [bgp] [connected] [omp] [ospf] [static] [summary protocol protocol] [vpn vpn-id]

show ipv6 routes vpn vpn-id [detail] [ipv6-address] [ipv6-prefix/length] [bgp] [connected] [omp] [ospf] [static]

#### **Syntax Description**

	None:
	List standard information about the entries in the local IPv6 route table.
detail	Detailed Information:
	List detailed information about the entries in the local IPv6 route table.
ipv6-address	IP Address or Route Prefix:
ipv6-prefix/length	List route information for the specified IPv6 route prefix. If you omit the prefix
prefix <b>vpn</b> vpn-id	length, you must specify a VPN identifier so that the Cisco SD-WAN software can find the route that best matches the prefix.
	Routes Learned from a Protocol:
	List routes learned from one or more specific protocols—bgp, connected, omp, ospf, and static. The protocol static includes both routes that are statically configured on the local device as well as routes learned from a DHCP server if one or more interfaces in VPN 0 are configured to learn their IP addresses via DHCP.
summary protocol protocol	Summary of Routes Learned from a Protocol:
	List summary information about the IP routes in the route table or about routes learned from the specified protocol. <i>protocol</i> can be <b>bgp</b> , <b>connected</b> , <b>omp</b> , <b>ospf</b> , or <b>static</b> .
vpn vpn-id	VPN-Specific Routes:
	List only the route table entries for the specified VPN.

# **Output Fields**

The output fields are self-explanatory.

#### **Command History**

Release	Modification
16.3	Command introduced.

#### **Examples**

```
vEdge# show ipv6 routes
Codes Proto-sub-type:
  IA -> ospf-inter-area,

                                   PROTOCOL
                                                         SUB TYPE IF NAME
                                                                                                               VPN
                                                                                                                        TLOC IP
                                                                                                                                                  COLOR
                                                                                        ADDR
```

#### **Related Topics**

```
show ip routes, on page 303
show ipv6 interface, on page 317
show ipv6 neighbor, on page 320
```

### show jobs

**show jobs**—View a list of the files that are currently being monitored on the local device. This command is the same as the UNIX jobs command.

#### **Command Syntax**

show jobs

#### **Syntax Description**

None

#### **Output Fields**

The output fields are self-explanatory.

#### **Command History**

Release	Modification
15.4	Command introduced.

#### **Examples**

Start and stop monitoring a file, and view the files that are being monitored:

```
vEdge# monitor start /var/log/vsyslog
vEdge# show jobs
JOB COMMAND
1 monitor start /var/log/vsyslog
vEdge# log:local7.notice: Dec 16 14:55:26 vsmart SYSMGR[219]:
%Viptela-vsmart-SYSMGR-5-NTCE-200025: System clock set to Wed Dec 16 14:55:26 2015 (timezone 'America/Los_Angeles')
log:local7.notice: Dec 16 14:55:27 vsmart SYSMGR[219]: %Viptela-vsmart-SYSMGR-5-NTCE-200025:
System clock set to Wed Dec 16 14:55:27 2015 (timezone 'America/Los_Angeles')
vEdge# monitor stop /var/log/vsyslog
vEdge#
```

#### **Related Topics**

```
job stop, on page 83
monitor start, on page 85
monitor stop, on page 86
```

### show licenses

show licenses—Display the licenses for the software packages used by the Cisco SD-WAN software.

#### **Command Syntax**

show licenses [list | package package-name]

#### **Syntax Description**

	None:	
	Display the licenses for all the software packages used by the Cisco SD-WAN software.	
package	Display the License for an Individual Package:	
package-name	Display the license for a specific software package.	
list	List the Software Package Licenses:	
	List the software packages used by the Cisco SD-WAN software.	

#### **Output Fields**

The output of the **show licenses** command is quite extensive. To read all the licenses, it is recommended that you save the command output to a file:

vEdge# **show licenses** | **save** *filename* 

#### **Command History**

Release	Modification
14.1	Command introduced.

#### **Examples**

vEdge# **show licenses list** 

LIST OF PACKAGES licenses acl apmd attr base-files base-passwd bash beecrypt bison busybox bzip2 coreutils cracklib e2fsprogs elfutils ethtool

#### **Related Topics**

show version, on page 473

### show log

**show log**—Display the contents of system log (syslog) files.

#### **Command Syntax**

**show log** *filename* [**tail** *number*]

#### **Syntax Description**

Filename	Filename: Name of the syslog file.
tail number	Last Lines in the File: Display the last lines in the file. In <i>number</i> , specify the number of lines to display.

#### **Output Fields**

The output fields are self-explanatory.

#### **Command History**

Release	Modification
17.1	Command introduced.

#### **Example**

```
vEdge# show log messages tail 10
local7.info: Jan 25 13:46:42 vedge DHCP_CLIENT[651]: %Viptela-vedge-DHCP_CLIENT-6-INFO-1300004: Requesting renew [50%] for interface eth0 address 10.0.1.33/24

# show logging

**show logging**—Display the settings for logging syslog messages.

#### **Command Syntax**

**show logging** [logging-parameter]

#### **Syntax Description**

	None:
	Display all logging information.
logging-parameter	Specific Logging Parameter:
	Display information for a specific logging parameter. <i>logging-parameter</i> can be disk_filename, disk_filerotate, disk_filesize, disk_priority, disk_status, host_name, host_priority, host_status, and host_vpn_id.

#### **Output Fields**

The output fields are self-explanatory.

#### **Command History**

Release	Modification
14.1	Command introduced.

#### **Example**

#### Edge# show logging

```
System logging to in vpn 0 is disabled
Priority for host logging is set to: info

System logging to disk is enabled
Priority for disk logging is set to: info
File name for disk logging is set to: /var/log/vsyslog
File size for disk logging is set to: 10 MB
File recycle count for disk logging is set to: 10

Syslog facility is set to: local7
```

#### **Related Topics**

```
file list, on page 79

show crash, on page 241
```

show log, on page 328

# show logging process

To view messages logged by binary trace for a process or processes, use the **show logging process** command in the privileged EXEC mode.

**show logging process** process-name [{ extract-pcap to-file path | [ end timestamp ts ] [ module name ] [ internal ] [ start { last { n { days | hours | minutes | seconds | clear boot | | timestamp ts | [ end { last { n { days | hours | minutes | seconds | clear boot | | timestamp ts | ] ] [ level | level ] [ fru | slot ] [ { reverse | [ { trace-on-failure | metadata }] [ to-file | path ] }] **Syntax Description** Shows logs for one or more Cisco SD-WAN processes. You can process-name specify a comma-separated list of processes, for example, fpmd, For the list of Cisco SD-WAN processes for which binary trace is supported see the table 'Supported Cisco SD-WAN Daemons' under 'Usage Guidelines'. extract-pcap to-file path Extracts peap data to a file. end timestamp ts Shows logs up to the specified timestamp. module name Selects logs for specific modules. internal Selects all logs. start{ last { n {days | hours | minutes | Shows logs collected between the specified start and end times. seconds} | clear | boot} | timestamp ts [end { last { n {days | hours | minutes} | seconds} | clear | boot} | timestamp tslevel level Shows logs for the specified and higher levels. fru slot Shows logs from a specific FRU. reverse Shows logs in reverse chronological order. to-file path Decodes files stored in disk and writes output to file. trace-on-failure Shows the trace on failure summary. metadata Shows metadata for every log message.

**Command Default** 

None

**Command Modes** 

Privileged EXEC

#### **Command History**

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	Command support introduced for select Cisco SD-WAN processes. See the table 'Supported Cisco SD-WAN Daemons' under 'Usage Guidelines'.

#### **Usage Guidelines**

#### Table 6: Supported Cisco SD-WAN Daemons

Supported from Release
Cisco IOS XE Catalyst SD-WAN Release 17.4.1a

#### **Example**

```

### show logging profile sdwan

To view messages logged by binary trace for Cisco-SD-WAN-specific processes and process modules, use the **show logging profile sdwan** command in the privileged EXEC mode. The messages are displayed in chronological order.

show logging profile sdwan

[{ extract-pcap to-file path | [ end timestamp ts ] [ module name ] [ internal ] [ start { last { n { days | hours | minutes | seconds } clear boot } | timestamp ts } [ end { last { n { days | hours | minutes | seconds } clear boot } | timestamp ts } ] [ level | level ] [ fru | slot ] [ { reverse | [ { trace-on-failure | metadata } ] [ to-file | path ] } ] }

#### **Syntax Description**

extract-pcap to-file path	Extracts pcap data to a file.
end timestamp ts	Shows logs up to the specified timestamp.
module name	Selects logs for specific modules.
internal	Selects all logs.
start{ last { n {days   hours   minutes   seconds}   clear   boot}   timestamp ts}[end{ last { n {days   hours   minutes   seconds}   clear   boot}   timestamp ts}]	Shows logs collected between the specified start and end times.
level level	Shows logs for the specified and higher levels.
fru slot	Shows logs from a specific FRU.
reverse	Shows logs in reverse chronological order.
to-file path	Decodes files stored in disk and writes output to file.
trace-on-failure	Shows the trace on failure summary.
metadata	Shows metadata for every log message.

#### **Command Default**

#### **Command Modes**

Privileged EXEC

#### **Command History**

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	Command support introduced for select Cisco SD-WAN processes. See the table 'Supported Cisco SD-WAN Daemons' under 'Usage Guidelines'.

#### **Usage Guidelines**

#### Table 7: Supported Cisco SD-WAN Daemons

Cisco SD-WAN Daemons	Supported from Release
• fpmd	Cisco IOS XE Catalyst SD-WAN Release 17.4.1a
• ftm	
• ompd	
• vdaemon	
• cfgmgr	

The following example shows a truncated output of the **show logging profile sdwan start last boot internal** command. From the timestamps, we can see that the messages are shown in a chronological order.

```
Device# show logging profile sdwan start last boot internal
Logging display requested on 2020/11/18 18:59:16 (UTC) for Hostname: [Device], Model:
[ISR4451-X/K9], Version: [17.04.01], SN: [FOC23125GHG], MD SN: [FGL231432EQ]

### show monitor event-trace sdwan

To display event trace messages for Cisco SD-WAN subsystem components, use the **show monitor event-trace** command in the privileged EXEC mode.

**show monitor event-trace sdwan** [all] *component* { all | back *hour:minute* | clock *hour:minute* | from-boot *seconds* | latest | parameters }

#### **Syntax Description**

all-traces	(Optional) Displays all event trace messages in memory to the console.
all	Displays all event trace messages currently in memory.
back mmm   hhh:mm }	Specifies how far back from the current time you want to view messages. For example, you can gather messages from the last 30 minutes. The time argument is specified either in minutes or in hours and minutes format (mmm or hh:mm).
clock hh:mm	Displays event trace messages starting from a specific clock time in hours and minutes format (hh:mm).
date	(Optional) Day of the month.
month	(Optional) Displays the month of the year.
from-boot seconds	Displays event trace messages starting from a specified number of seconds after booting (uptime).
latest	Displays only the event trace messages since the last command was entered.

1-	Displays the trace parameters. The only parameter displayed is the size (number of trace messages) of the trace file.
detail	(Optional) Displays detailed trace information.

#### **Command Modes**

Privileged EXEC

#### **Command History**

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.2.1r	This command was introduced.

#### **Usage Guidelines**

The trace function is not locked while information is being displayed to the console, which means that new trace messages can accumulate in memory. If entries accumulate faster than they can be displayed, some messages can be lost. If this happens, the **show monitor event-trace** command will generate a message indicating that some messages might be lost; however, messages will continue to display on the console. If the number of lost messages is excessive, the **show monitor event-trace** command will stop displaying messages.

#### Example

The following is sample output from the **show monitor event-trace** command for the SD-WAN device. Notice that each trace message is numbered and is followed by a time stamp (derived from the device uptime). Following the time stamp is the component-specific message data.

```
Device# show monitor event-trace sdwan all
*Nov 6 23:30:51.393: <-cfg[2] A: vrf activate IPv4 table 0x3
*Nov 6 23:30:51.754: <-fib[2] A: vrf_activate IPv4 table 0x3

### show multicast replicator

show multicast replicator—List information about multicast replicators (on Cisco vEdge devices only).

#### **Command Syntax**

show multicast replicator [vpn vpn-id]

#### **Syntax Description**

	None:
	List standard information about multicast replicators.
vpn vpn-id	VPN-Specific Replicators:
vpn-id	List only the multicast replicators in the specified VPN.

#### **Output Fields**

The output fields are self-explanatory.

#### **Command History**

Release	Modification
14.2	Command introduced.

#### **Example**

vEdge# show multicast replicator

	REPLICATOR	REPLICATOR	LOAD		
VPN	ADDRESS	STATUS	PERCENT		
1	170 16 055 14	TID	_		

#### **Related Topics**

```

```

# show multicast rpf

show multicast rpf—List multicast reverse-path forwarding information (on Cisco vEdge devices only).

#### **Command Syntax**

show multicast rpf [vpn vpn-id]

#### **Syntax Description**

	None:
	List standard RPF information.
vpn vpn-id	VPN-Specific RPF Information:
	List the RPF information only for the specified VPN.

#### **Output Fields**

The output fields are self-explanatory.

#### **Command History**

Release	Modification
14.2	Command introduced.

#### **Example**

vEdge# show multicast rpf

```
| RPF | RPF
```

#### **Related Topics**

```

show pim interface, on page 394
show pim neighbor, on page 395
```

show pim rp-mapping, on page 396 show pim statistics, on page 397

# show multicast topology

**show multicast topology**—List information related to the topology of the multicast domain (on Cisco vEdge devices only).

#### **Command Syntax**

**show multicast topology** [**vpn** *vpn-id*]

#### **Syntax Description**

	None:
	List standard information related to the topology of the multicast domain.
vpn vpn-id	VPN-Specific Topology Information:
	List multicast topology information only for the specified VPN.

#### **Output Fields**

The output fields are self-explanatory.

#### **Command History**

Release	Modification
14.2	Command introduced.

#### **Example**

vEdge show multicast topology

### show multicast tunnel

**show multicast tunnel**—List information about the IPsec tunnels between multicast peers (on Cisco vEdge devices only).

#### **Command Syntax**

**show multicast tunnel** [vpn vpn-id]

#### **Syntax Description**

	None:
	List standard information about the multicast IPsec tunnels.
vpn vpn-id	VPN-Specific Tunnels:
vpn-id	List IPsec tunnel information only for the specified VPN.

#### **Output Fields**

The output fields are self-explanatory.

Release	Modification
14.2	Command introduced.

vEdge# show multicast tunnel

TUNNEL	TUNNEL	
ADDRESS	STATUS	REPLICATOR
172.16.255.11	UP	no
172.16.255.14	UP	yes

### show nms-server running

**show nms-server running**—Display whether a vManage NMS server is operational (on vManage NMSs only).

#### **Command Syntax**

show nms-server running

#### **Syntax Description**

None

#### **Output Fields**

The output fields are self-explanatory.

Release	Modification
16.2	Command introduced.

Display the operational status of a vManage server.

```
vManage# show nms-server running nms-server running true
```

#### **Related Topics**

request nms-server, on page 130

### show notification stream

**show notification stream**—Display notifications about events that have occurred on the Cisco SD-WAN device.

#### **Command Syntax**

show notification stream viptela [from date-time] [last number] [to date-time]

#### **Syntax Description**

	None: Display notifications about all events.
to (ccyy-mm-dd   hh:mm:ss   ccyy-mmThh:mm:ss)	Event End Time: Display notifications of events that have occurred up until the specified date and time.
to (ccyy-mm-dd   hh:mm:ss   ccyy-mmThh:mm:ss)	Event Start Time:  Display notifications of events that have occurred up until the specified date and time.
to number	Most Recent Events:  Display the most recent event notifications up to the specified number of events.

#### **Output Fields**

The output fields are self-explanatory.

Release	Modification
14.1	Command introduced.

```
vEdge# show notification stream viptela

### show ntp associations

**show ntp associations**—Display information about the status connections to peers.

#### **Command Syntax**

show ntp associations

#### **Syntax Description**

None

#### **Output Fields**

The output fields are self-explanatory.

#### **Command History**

Release	Modification
14.1	Command introduced.

#### **Example**

vEdge# show ntp associations

IDX	ASSOCID	STATUS	CONF	REACHABILITY	AUTH	CONDITION	LAST EVENT	COUNT
1	18402	80a3	yes	no	none	reject	unreachable	10
2	18403	967a	yes	yes	none	sys.peer	sys peer	7

#### **Related Topics**

ntp

show ntp peer, on page 343

# show ntp peer

**show ntp peer**—Display information about the NTP peers with which the Cisco SD-WAN software is synchronizing its clocks.

#### **Command Syntax**

show ntp peer [index] [parameter]

#### **Syntax Description**

	None:							
	Display standard information about the interfaces on the Cisco SD-WAN device.							
parameter	Specific Parameter:							
	Display information about a specific NTP parameter. <i>parameter</i> can be one of the following: <b>delay</b> , <b>jitter</b> , <b>offset</b> , <b>poll</b> , <b>reach</b> , <b>refif</b> , <b>remote</b> , <b>st</b> , <b>type</b> , and <b>when</b> .							
index	Specific Peer:							
	Display information about a specific peer, identified by its index number in the <b>show ntp peer</b> command output.							

#### **Output Fields**

The output fields are self-explanatory.

#### **Command History**

Release	Modification
14.1	Command introduced.

#### **Example**

vEdge#	show	ntp	peer	
--------	------	-----	------	--

INDEX	REMOTE	REFID	ST	TYPE	WHEN	POLL	REACH	DELAY	OFFSET	JITTER	
1	107 107 1 0

#### **Related Topics**

ntp

show ntp associations, on page 342

# show omp cloudexpress

**show omp cloudexpress**—Display OMP routes for applications configured with Cloud OnRamp for SaaS (formerly called CloudExpress service) (on Cisco vEdge devices only).

#### **Command Syntax**

show omp cloudexpress [detail]

#### **Syntax Description**

	None:	]
	Display OMP routes for all applications in all VPNs configured with Cloud OnRamp for SaaS.	
detail	Detailed Information:	
	List detailed information.	

#### **Output Fields**

The output fields are self-explanatory.

Release	Modification
16.3	Command introduced.
Cisco SD-WAN Release 20.7.1	Added APP TYPE and SUBAPP ID columns to the command output.

The following example shows the command output as it appears beginning with Cisco SD-WAN Release 20.7.1.

```
vEdge#show omp cloudexpress
Code:
C -> chosen
I -> installed
Red -> redistributed
Rej -> rejected
L -> looped
R -> resolved
S -> stale

### show omp multicast-auto-discover

**show omp multicast-auto-discover**—List the peers that support multicast (on Cisco vEdge devices and vSmart controllers only).

#### **Command Syntax**

show omp multicast-auto-discover [detail]

 $show\ omp\ multicast-auto-discover\ [detail]\ [family\ ipv4]\ [entries\ advertised\ {\it destination-peer-address}]$ 

 $show\ omp\ multicast-auto-discover\ [detail]\ [family\ ipv4]\ [entries\ received\ source-peer-address]\ [loss-reason\ reason\ |\ status\ status\ ]$ 

#### **Syntax Description**

family ipv4 entries advertised [destination-peer-address]	None: List standard information about the PIM IPsec tunnels.  Advertised Multicast Sources: List the multicast sources advertised.
detail	Detailed Information: List detailed information.
family ipv4 entries received source-peer-address [loss-reason reason   status status]	Received Multicast Sources List the multicast sources received. Include the loss-reason option to list specific reasons for losses of multicast sources. reason can be distance, invalid, none, omp-version, origin-metric, origin-protocol, origin-protocol-subtype, peer-id, personality, preference, site-id, stale-entry, tloc-id, and tloc-preference.
	Include the <b>status</b> option to list specific route-table status. <i>status</i> can be <b>C</b> (for chosen), <b>Ext</b> (for extranet), <b>I</b> (for installed), <b>Inv</b> (for invalid), <b>L</b> (for looped), <b>R</b> (for resolved), <b>Red</b> (for redistributed), <b>Rej</b> (for rejected), <b>S</b> (for stale), and <b>U</b> (for unknown).

#### **Output Fields**

The output fields are self-explanatory.

#### **Command History**

Release	Modification
14.2	Command introduced.

#### **Example**

```
vEdge# show omp multicast-auto-discover
Code:
C   -> chosen
I   -> installed
Red   -> redistributed
Rej   -> rejected
L   -> looped
R   -> resolved
```

```
S -> stale
Ext -> extranet
Inv -> invalid
```

### show omp peers

**show omp peers**—Display information about the OMP peering sessions that are active on the local vSmart controller or Cisco vEdge device.

#### **Command Syntax**

show omp peers [detail]

show omp peers ip-address [detail]

#### **Syntax Description**

	None:
	List information about all OMP peering sessions on the local device.
detail	Detailed information:
	Display detailed information.
ip-address	Specific OMP Peer:
	Display configuration OMP peering session information about a specific peer.

#### **Output Fields**

Field	Explanation
Domain ID	Identifier of the domain that the device is a member of.
downcount	Number of times an OMP peering session has gone down.
last-downtime	The last time that an OMP peering session went down.
last-uptime	The last time that an OMP peering session came up.
Peer or peer	IP address of the connected Cisco SD-WAN device.
Region ID	Region assigned for Hierarchical SD-WAN.
	When you use the command on a device, this is the region to which the device is assigned.
	When you use the command on a Cisco SD-WAN Controller, this shows the region(s) that the Cisco SD-WAN Controller is managing.
	For information, see Hierarchical SD-WAN.
R/I/S	Number of routes received, installed, and sent over the OMP session.
routes-installed	Number of routes installed over the OMP session.
routes-received	Number of routes received over the OMP session.
routes-sent	Number of routes sent over the OMP session.
services-installed	Number of services installed that were learned over OMP sessions.
services-received	Number of services received over OMP sessions.
services-sent	Number of services advertised over OMP sessions.
Site ID	Identifier of the Cisco SD-WAN administrative site where the connected Cisco SD-WAN device is located.
state	Operational state of the connection to the Cisco SD-WAN device:
	• down—The connection is not functioning.
	down-in-gr—A connection on which OMP grace restart is enabled is down.
	init—The connection is initializing.
	up—The connection is operating.

Field	Explanation
tlocs-installed	Number of TLOCs installed that were learned over OMP sessions.
tlocs-received	Number of TLOCs received over OMP sessions.
tlocs-sent	Number of TLOCs advertised over OMP sessions.
Type or type	Type of Cisco SD-WAN device:
	• vEdge - Cisco vEdge device
	vsmart - vSmart controller
upcount	Number of times an OMP peering session has come up.
Uptime	How long the OMP session between the Cisco SD-WAN devices has been up and operational.

#### **Command History**

Release	Modification
14.1	Command introduced.
14.3	Down-in-gr stated added.
Cisco SD-WAN Release 20.6.1	Added Region ID to output.

#### **Examples**

#### **Example 1**

### show omp routes

To display information about OMP routes on Cisco Catalyst SD-WAN Controllers and Cisco vEdge devices only, use the **show omp routes** command. OMP routes carry information that the learns from the routing protocols running on its local network including routes learned from BGP and OSPF as well direct, connected, and static routes.

#### **Command Syntax**

show omp routes [ ipv4 prefix IP / length ] [ family family-address ] [ vpn vpn-id ] [ advertised ] [ received ] [ detail ]

#### **Syntax Description**

	None:	
	Lists routing information about all OMP peering sessions on the local device.	
<i>ipv4 prefix</i> Displays the route prefix.		
	Lists OMP route information for the specified route prefix.	
<i>IP</i>	Displays IP address of the specific route.	
	Lists OMP IP address for the specific route.	
length	Displays the route length.	
detail	Detailed information:	
	Lists detailed route information about OMP peering sessions on the local device.	
family family:		
address	Lists OMP route information for the specified IP family. <i>family address</i> can be <i>ipv4</i> or <i>ipv6</i> .	
vpn vpn-id	VPN-Specific Routes:	
	Lists the OMP routes for the specified VPN.	
received	Received Servers:	
	Displays the services received by OMP peering sessions.	
advertised	Advertised Servers:	
	Displays the services advertised by OMP peering sessions.	

Release	Modification
14.1	Command introduced.
Cisco SD-WAN Release 20.7.1	advertised and received are added in this release.
Cisco SD-WAN Release 20.7.1	Added <b>REGION ID</b> to the output to show the Hierarchical SD-WAN region ID.
Cisco SD-WAN Release 20.8.1	Added <b>PREFERENCE</b> and <b>AFFINITY GROUP NUMBER</b> to the output to indicate the affinity group preference order and the affinity ID.

The following is a sample output from the **show omp routes** command:

```
vEdge# show omp routes

### show omp services

**show omp services**—Display the services learned from OMP peering sessions (on vSmart controllers and Cisco vEdge devices only).

#### **Command Syntax**

show omp services [vpn vpn-id] [detail]

show omp services [advertised | received] [vpn vpn-id] [detail] show omp services [vpn vpn-id] originator ip-address [advertised | received] [detail] show omp services [vpn vpn-id] service service-name [advertised | received] [detail]

#### **Syntax Description**

	None:
	List information about the services learned from OMP peering sessions.
advertised	Advertised Services:
	List information about the services advertised by OMP peering sessions.
detail	Detailed Information:
	Display detailed information.
received	Received Services:
	List information about the services received by OMP peering sessions.
originator	Service Originator:
ip-address	List the services learned from a specific OMP peer.
service service-name	Specific Service:
	List information about the specific service.
vpn vpn-id	VPN:
	List OMP service information learned from a specific VPN.

#### **Output Fields**

The output fields are self-explanatory.

#### **Command History**

Release	Modification
14.1	Command introduced.

#### **Example**

```
vSmart# show omp services (command issued from a vSmart controller)
C -> chosen
I -> installed
Red -> redistributed
Rej -> rejected
L -> looped
R -> resolved
S -> stale
Ext -> extranet
Inv -> invalid

# show omp summary

**show omp summary**—Display information about the OMP sessions running between vSmart controllers and Cisco vEdge devices (on vSmart controllers and Cisco vEdge devices only).

#### **Command Syntax**

**show omp summary** [parameter-name]

#### **Syntax Description**

	None:
	List information about the OMP peering sessions running on the local device
parameter-name	Information about a Specific Parameter:
	Display configuration information about a specific OMP peering session parameter. parameter-name can be one of the following: adminstate, devicetype, ompdowntime, ompuptime, operstate, peers, routes-installed, routes-received, routes-sent, services-installed, services-sent, tlocs-installed, tlocs-received, tlocs-sent, and vsmart-peers. For an explanation of these parameters, see the Output Fields below.

#### **Output Fields**

Field	Explanation
admin-state	Administrative state of the OMP session. It can be UP or DOWN.
omp-uptime	How long the OMP session has been up and operational.
oper-state	Operational status of the OMP session. It can be UP or DOWN.

Field	Explanation
personality	Cisco vEdge device personality.
routes-installed	Number of routes installed over the OMP session.
routes-received	Number of routes received over the OMP session.
routes-sent	Number of routes sent over the OMP session.
services-installed	Number of services installed that were learned over OMP sessions.
services-received	Number of services received over OMP sessions.
services-sent	Number of services advertised over OMP sessions.
tlocs-installed	Number of TLOCs installed that were learned over OMP sessions.
tlocs-received	Number of TLOCs received over OMP sessions.
tlocs-sent	Number of TLOCs advertised over OMP sessions.
vsmart-peers	Number of vSmart peers that are up.

#### **Command History**

Release	Modification
14.1	Command introduced.
Cisco SD-WAN Release 20.6.1	Added device-role and region-id fields.

# show omp tlocs

To display information learned from the TLOC routes advertised over the OMP sessions running between and Cisco Catalyst SD-WAN Controllers and Cisco vEdge devices only, use the **show omp tlocs** command in privileged EXEC mode.

## **Command Syntax**

show omp tlocs [detail] [color lte] [encap ipsec] [ip ip-address] [advertised] [received]

## **Syntax Description**

	None:
	Lists information about all TLOCs that the local device has learned about.
detail	Detailed information:
	Displays the detailed information.
color lte	Color Information:
	Displays the TLOC color information.
encap ipsec	TLOC Encapsulation:
	Displays the TLOC encapsulation information.
ip	TLOC IP Address:
ip-address	Displays the TLOC IP address.
received	Received Servers:
	Displays the services received by OMP peering sessions.
advertised	Advertised Servers:
	Displays the services advertised by OMP peering sessions.

## **Command History**

Release	Modification
14.1	Command introduced.
16.3	Add display of IPv6 information.
Cisco SD-WAN Release 20.7.1	advertised and received are added in this release.

## **Examples**

The following is a sample output from the **show omp tlocs** command:

```
vEdge# show omp tlocs

# show omp verify-routes

To verify if a route prefix is available, use the **show omp verify-routes** command in privileged EXEC mode.

show omp verify-routes vpn vpn-id prefix/length

## **Syntax Description**

vpn	Lists the Overlay Management Protocol (OMP) routes for the specified VPN.
vpn-id	Specifies the VPN ID to be verified.
prefix/length	Specifies route prefix and length.
	Lists OMP route information for the specified route prefix.

#### **Command Default**

This command has no default behavior.

## **Command Modes**

Privileged EXEC (#)

## **Command History**

Release	Modification
Cisco SD-WAN Release 20.8.1	This command was introduced.

## **Usage Guidelines**

This command helps to reduce the number of steps needed for troubleshooting an OMP prefix by verifying the received and installed RIB and FIB entries, corresponding TLOCs, and BFD sessions.

#### **Examples**

The following is a sample output from the **show omp verify-routes** command displaying a prefix table with the prefix's verification details:

```
Device# show omp verify-routes vpn 1 10.2.2.0/24

#### Table 8: show omp verify-routes Field Descriptions

Field	Description
FROM PEER	Displays the IP address of the peer from which the route is received.
PATH ID	Displays the ID of the OMP path.
LABEL	Displays the service label.
STATUS	Displays the status information codes of routes.
ATTRIBUTE TYPE	Displays the attribute type information regarding the route installation in RIB.
TLOC IP	Displays the TLOC IP address.
TLOC COLOR	Displays the TLOC color information.
TLOC ENCAP	Displays the TLOC encapsulation information.
TLOC STATUS	Displays the status information codes of TLOC.
PREFERENCE	Displays the preference information of TLOC.
BFD STATUS	Displays the connectivity status of a BFD session of a route.
RIB STATUS	Displays the code information of routes installed in RIB.

## show orchestrator connections

**show orchestrator connections**—List the Cisco SD-WAN devices that have active DTLS connections to the vBond orchestrator (on vBond orchestrators only).

## **Command Syntax**

**show orchestrator connections** [vsmart [site-id]] [detail]

## **Syntax Description**

	None: List information about all the Cisco SD-WAN devices that have active DTLS connections to the vBond orchestrator.
vsmart [site-id]	Connections to vSmart Controllers:  List information about the vSmart controllers that have active DTLS connections to the vBond orchestrator or about a vSmart controller at a specific site in the Cisco SD-WAN network.
detail	Detailed Information:  Display information about the vBond connections and about the handshaking packets that are exchanged when a connection is being established, maintained, and torn down.

## **Output Fields**

For the State columen, the operational state can be one of the following: challenge_ack, challenge_resp, connect, down, handshake, tear_down, trying, and up.

The remaining output fields are self-explanatory.

## **Command History**

Release	Modification
14.1	Command introduced.

## **Examples**

# show orchestrator connections-history

**show orchestrator connections-history**—List the history of connections and connection attempts made by the vBond orchestrator (on vBond orchestrators only).

## **Command Syntax**

show orchestrator connections-history [index] [detail]

show orchestrator connections-history connection-parameter [detail]

## **Syntax Description**

	None: List the history of connections and connection attempts between Cisco vEdge devices and the vBond orchestrator.
detail	Detailed Output:  List detailed connection history information and information about the handshaking packets that are exchanged when a connection is being established, maintained, and torn down.
connection-parameter	Specific Connection Parameter:  List the connection history only for those items match the connection parameter.  connection-parameter can be one of the following: domain-id, peer-type, private-ip, private-port, public-ip, public-port, site-id, and system-ip. These values corresponds to the column headers in the output of the show orchestrator connections-history command.
index	Specific History Item: List the connection history only for the specific item in the history list.

## **Output Fields**

Field	Explanation
Domain ID	Administrative state of the interface:
	state-down—The interface has not been configured.
	state-up—The interface has been configured.
Index	Index counter of the connection operation. The initial operation has an index of 0. The newest operation is listed first.

Field	Explanation
Peer Type	Type of Cisco SD-WAN device:
	vmanage—vManage management configuration system.
	vsmart—vSmart controller.
Private IP	Private IP address of the connected Cisco SD-WAN device. If the Cisco SD-WAN device is behind a NAT device, the private and public IP addresses are different.
Private Port	Private UDP port number used to connect to the vBond orchestrator. If the Cisco SD-WAN device is behind a NAT device, the private and public UDP port numbers are likely different.
Public IP	Public IP address of the connected Cisco SD-WAN device.
Public Port	Public UDP port number used to connect to the vBond orchestrator.
Site ID	Identifier of the Cisco SD-WAN administrative site where the connected Cisco SD-WAN device is located.
State	Operational state of the connection to the Cisco SD-WAN device. It can be one of the following: challenge, challenge_ack, challenge_resp, connect, down, handshake, tear_down, trying, and up.
System IP	System IP address of the Cisco SD-WAN device.
Uptime	How long the connection between the Cisco SD-WAN device and the vBond orchestrator has been up and operational.

## **Command History**

## show orchestrator statistics

**show orchestrator statistics**—Display statistics about the packets that a vBond orchestrator has transmitted and received in the process of establishing and maintaining secure DTLS connections to Cisco SD-WAN devices in the overlay network (on vBond orchestrators only).

## **Command Syntax**

**show orchestrator statistics** [counter-name]

#### **Syntax Description**

	None:
	Display statistics about handshaking packets sent and received by the vBond orchestrator as it establishes, maintains, and tears down DTLS connections to the Cisco SD-WAN devices in the overlay network.
counter-name	Statistics about a Specific Counter:
	Display the statistics for the specific counter.

## **Output Fields**

**Rx Statistics:** Statistics about received handshaking packets.

**Tx Statistics:** Statistics about transmitted handshaking packets.

## **Command History**

Release	Modification
14.1	Command introduced.

## **Example**

vBond# show orchestrator statistics

Tx Statistics:	
Packets Octets Error Blocked Connects Registers Register Replies	3180 357705 0 0 1599 0 1581
DTLS Handshake DTLS Handshake Failures DTLS Handshake Done	0 0 0

Challenge Challenge Response Challenge Ack Challenge Failures	0 25 0

## **Related Topics**

show orchestrator connections, on page 368 show orchestrator local-properties, on page 373

## show orchestrator summary

**show orchestrator summary**—Display a count of the Cisco vEdge devices, vManage Network Management Systems (NMSs), and vSmart controllers in the overlay network (on vBond orchestrators only). For vBond orchestrators running on virtual machines (VMs) that have more than one core, this command shows the number of devices that each vdaemon process is handling.

## **Command Syntax**

**show orchestrator summary** [instance]

## **Syntax Description**

	None:
	Display a count of all the Cisco vEdge devices, vManage NMSs, and vSmart controllers in the overlay network.
instance	Devices for a Specific vdaemon Process:
	Display a count of devices for a specific instance of a vdaemon process. Cisco SD-WAN devices that run on VMs that have more than one core automatically spawn one vdaemon process for each core, to load-balance the Cisco SD-WAN software functions across all the CPUs in the VM server.

## **Output Fields**

The output fields are self-explanatory.

#### **Command History**

Release	Modification
14.1	Command introduced.
15.4	Add support for multiple vdaemon processes.
16.3	Add support for IPv6.

## Example

vBond# show orchestrator summary

INSTANCE	VMANAGE COUNTS			PROTOCOL	LISTENING IP	LISTENING IPV6	LISTENING PORT
0	2	4	0	dtls	10.1.14.14	::	12346

## **Related Topics**

show control summary, on page 239 show orchestrator connections, on page 368

## show orchestrator valid-vedges

**show orchestrator valid-vedges**—List the chassis numbers of the valid Cisco vEdge devices in the overlay network (on vBond orchestrators only).

#### **Command Syntax**

show orchestrator valid-vedges

#### **Syntax Description**

None

## **Output Fields**

The output fields are self-explanatory.

#### **Command History**

Release	Modification
14.1	Command introduced.
14.2	Command renamed from <b>show orchestrator valid-devices</b> .

#### **Example**

vBond# show orchestrator valid-vedges

CHASSIS NUMBER	SERIAL NUMBER	VALIDITY
110D113140004	10000266	valid
110D115140004 110D145130082	10000200	staging
110D252130046	100001FF	valid
110D252130049	1000020B	valid
110D252130057	1000020C	staging
R260C126140004	10000369	valid

#### **Related Topics**

```
show control valid-vedges, on page 240 show control valid-vsmarts, on page 241 show orchestrator connections, on page 368 show orchestrator valid-vmanage-id, on page 378 show orchestrator valid-vsmarts, on page 379
```

# show orchestrator valid-vmanage-id

**show orchestrator valid-vmanage-id**—List the chassis numbers of the valid vManage NMSs in the overlay network (on vBond orchestrators only).

## **Command Syntax**

**show orchestrator valid-vmanage-id** [serial-number]

## **Syntax Description**

	None:
	Display the chassis numbers of all valid vManage NMSs in the overlay network.
serial-number	Serial Number:
	List whether a specific vManage chassis number is valid.

## **Output Fields**

The output fields are self-explanatory.

## **Command History**

Release	Modification
16.3.1	Command introduced.

## **Example**

vBond# show orchestrator valid-vmanage-id

## **Related Topics**

show control valid-vedges, on page 240 show control valid-vsmarts, on page 241 show orchestrator connections, on page 368 show orchestrator valid-vedges, on page 378 show orchestrator valid-vsmarts, on page 379

## show orchestrator valid-vsmarts

**show orchestrator valid-vsmarts**—List the serial numbers of the valid vSmart controllers in the overlay network (on vBond orchestrators only).

## **Command Syntax**

 $\textbf{show or chestrator valid-vsmarts} \ [\textit{serial-number}]$ 

## **Syntax Description**

	None:
	Display the serial numbers of all valid vSmart controllers in the overlay network.
serial-number	Serial Number:
	List whether a specific vSmart serial number is valid.

#### **Output Fields**

The output fields are self-explanatory.

## **Command History**

Release	Modification
14.1	Command introduced.

## **Example**

vBond# show orchestrator valid-vsmarts

## **Related Topics**

show control valid-vedges, on page 240 show control valid-vsmarts, on page 241 show orchestrator connections, on page 368 show orchestrator valid-vedges, on page 378 show orchestrator valid-vmanage-id, on page 378 show orchestrator valid-vsmarts, on page 379

# show ospf database

**show ospf database**—List the entries in the OSPF Link-State Advertisement (LSA) database (on Cisco vEdge devices only).

## **Command Syntax**

**show ospf database** [**vpn** *vpn-id*] [*ospf-parameter*] [**detail**]

## **Syntax Description**

	None:
	List all the entries in the OSPF LSA database.
detail	Detailed Information:
	List detailed information about the entries in the OSPF LSA database.
ospf-parameter	Specific OSPF Property:
	List information about a specific OSPF property. <i>ospf-property</i> can be one of the following: <b>adv-route</b> , <b>area</b> , <b>area-local-opaque</b> , <b>as-external-opaque</b> , <b>asbr-summary</b> , <b>external</b> , <b>group-member</b> , <b>link-id</b> , <b>link-local-opaque</b> , <b>network</b> , <b>nssa-external</b> , <b>router</b> , <b>summary</b> , and <b>type-ext-attributes</b> .
vpn vpn-id	VPN-Specific Routes
	List the OSPF routing process information for the specified VPN.

## **Output Fields**

The output fields are self-explanatory.

## **Command History**

Release	Modification
14.1	Command introduced.

## Example

## Example 1

vEdge# show ospf database							
		LSA	LINK	ADVERTISING

```

## show ospf database-summary

**show ospf database-summary**—List how many of each type of LSA is present in the OSPF database, along with the total number of LSAs in the database (on Cisco vEdge devices only).

## **Command Syntax**

show ospf database-summary [vpn vpn-id] [ospf-lsa]

#### **Syntax Description**

	None:
	List a summary of all the LSAs in the OSPF LSA database.
ospf-lsa	Specific OSPF LSA Type:
	List information about a specific OSPF LSA. <i>ospf-lsa</i> can be one of the following: <b>as-external-lsa</b> , <b>network-lsa</b> , <b>nssa-lsa</b> , <b>router-lsa</b> , <b>summary-lsa</b> , and <b>total-lsa</b> .

vpn	VPN-Specific Routes
vpn-id	List the OSPF routing process information for the specified VPN.

## **Output Fields**

The output fields are self-explanatory.

## **Command History**

Release	Modification
14.1	Command introduced.

#### **Example**

vEdge# show ospf database-summary

			AS					
		ROUTER	NETWORK	SUMMARY	EXTERNAL	NSSA	TOTAL	
VPN	AREA	LSA	LSA	LSA	LSA	LSA	LSA	
0	51	6	4	0	0	0	10	

## **Related Topics**

show ospf database, on page 380 show ospf interface, on page 383 show ospf neighbor, on page 385 show ospf process, on page 386 show ospf routes, on page 388

# show ospf interface

**show ospf interface**—Display information about interfaces that are running OSPF (onCisco vEdge devices only).

## **Command Syntax**

show ospf interface [vpn vpn-id]
show ospf route vpn vpn-id[ip-address [interface-index [ospf-property]]]

## **Syntax Description**

	None: List standard information about all interfaces that are running OSPF.
if-name interface-name	OSPF Interface:
	Display interface-specific OSPF information.

Specific OSPF Interface Information:  Display information about the OSPF interface in the specified VPN and with the specified IP address, and optionally for a specific interface index and a specific OSPF property on that interface. <i>ospf-property</i> can be one of the fields in the <b>show ospf interface</b> command output.
VPN-Specific Interfaces:  Display information about the OSPF interfaces in the specified VPN.

## **Output Fields**

The output fields are self-explanatory.

#### **Command History**

Release	Modification
14.1	Command introduced.

## **Example**

```

# show ospf neighbor

show ospf neighbor—List information about OSPF neighbors (on vEdge routers only).

## **Command Syntax**

```
show ospf neighbor [detail] [vpn vpn-id ]
show ospf route vpn vpn-id [ip-address[ospf-property] ]
```

## **Syntax Description**

	None:
	List standard information about OSPF neighbors.
detail	Detailed Information:
	List detailed information about OSPF neighbors.
vpn vpn-id ip-address [ospf-property]	Specific OSPF Route Information:  List the information about entries for specific OSPF route and, optionally, for a specific interface index and a specific OSPF property on that interface. For a list of OSPF properties, see the fields in the <b>show ospf neighbor detail</b> command output, shown below.
vpn vpn-id	VPN-Specific Routes: List only the OSPF neighbors in the specified VPN.

## **Command History**

Release	Modification
14.1	Command introduced.

## **Examples**

## Example 1

vEdge# show ospf neighbor  DBsmL -> Database Summary List  RqstL -> Link State Request List  RXmtl -> Link State Retransmission List										
	INTERFACE IF			DEAD

# show ospf routes

Display the entries that the route table has learned from OSPF (on vEdge routers only).

**show ospf routes** [detail] [prefix/length] [vpn vpn-id]show ospf routes vpn vpn-id [route-type [prefix/length]]

## **Syntax Description**

None	List standard information about the entries the route table has learned from OSPF.
Detailed Information	<b>detail</b> List detailed information about the entries the route table has learned from OSPF.
Route Prefix	prefix/length prefix vpn vpn-id List route information for the specified route prefix learned from OSPF. If you omit the prefix length, you must specify a VPN identifier so that the Cisco SD-WAN software can find the route that best matches the prefix.

Specific OSPF Route Type	route-type [prefix/length] List the information about entries for specific OSPF route types and optionally learned from the specified IP prefix. For a list of route types, see the Output Fields table below.
VPN-Specific Routes	<b>vpn</b> <i>vpn- id</i> List only the route table entries for the specified VPN.

## **Command History**

Release	Modification
14.1.	Command introduced.

## **Examples**

## Show ospf routes

# show packet-capture

To view details of the packets captured, use the **show packet-capture** command in privileged EXEC mode.

**show packet-capture** [ **details** [{ **interface** interface-name | **packets-captured** packets | **session-id** session-id | **vpn** vpn-id }]]

#### **Syntax Description**

interface interface-name	(Optional) Name of the interface.
packets-captured packets	(Optional) Number of packets.
session-id session-id	(Optional) Session ID.
vpn vpn-id	(Optional) VPN ID.

## **Command Default**

This command has no default behavior.

## **Command Modes**

Privileged EXEC (#)

## **Command History**

Release	Modification
Cisco SD-WAN Release 20.6.1	This command was introduced.

## **Example**

Following is a sample output from the **show packet-capture** command using the keyword **details**.

```
Device# show packet-capture details
SESSION PACKETS
VPN INTERFACE ID CAPTURED STATE
1 ipsec1 s123 59 Running
```

# show packet-trace

To view detailed packet tracer statistics for the specified trace ID or summary statistics for all the filtered packets, up to 1024 records, use the **show packet-trace** command in privileged EXEC mode.

show packet-trace [details trace-id] [statistics [{ trace-id | decision string | destination-ip ip-address | destination-interface interface | destination-port port | duration seconds | source-interface interface | source-ip ip-address | source-port port }]]

## **Syntax Description**

details trace-id	(Optional) Displays packet trace details for the specified trace ID.
statistics	(Optional) Displays packet trace statistics for the parameter specified.
trace-id	(Optional) Displays packet statistics for the specified trace-id. Range: 0 to 1023.
decision string	(Optional) Displays packet drop/forward information.
destination-ip ip-address	(Optional) Displays packet trace statistics for the specified destination IPv4 address.
destination-interface interface	(Optional) Displays statistics for the specified destination-interface.
destination-port port	(Optional) Displays packet trace statistics for the specified destination port. Range: 0 to 65535.
duration seconds	(Optional) Displays packet trace statistics for the specified duration in μsecs.
source-interface interface	(Optional) Displays packet trace statistics for the specified source interface.
source-ip ip-address	(Optional) Displays packet trace statistics for the specified source IPv4 address.
source-port port	(Optional) Displays packet trace statistics for the specified source port. Range: 0 to 65535.

#### **Command Default**

None

## **Command Modes**

Privileged EXEC (#)

## **Command History**

Release	Modification
Cisco SD-WAN Release 20.5.1	This command was introduced.

## **Example**

This is the sample output for the show packet-trace details command, which is displayed for the specified trace ID 10.

Device# show packet-trace details 10

Pkt-id	src_	_ip	(in	gre	ss_	if)		de	est_	_ip	(egi	ress	s_i:	E)		Dui	rati	ion		De	ecis	sion	า

## show platform resources

#### **Table 9: Feature History**

Feature Name	Release Information	Description
Crypto Utilization in Show Platform Resources Command	Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	This feature adds information about crypto utilization to the <b>show platform resources</b> command on the supported routers.

To monitor system resources, including crypto utilization, use the **show platform resources** command in privileged EXEC mode.

#### show platform resources

## **Syntax Description**

This command has no arguments or keywords.

#### **Command Default**

No default behavior or values.

#### **Command Modes**

Privileged EXEC

#### **Command History**

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	The command is modified. The command output is enhanced to include crypto-utilization information on the supported routers.

## **Usage Guidelines**

Crypto utilization is displayed only for the following supported routers:

- Cisco ASR 1000-ESP100 CN6870 (15-13063-01)
- Cisco ASR 1000-ESP200 2x CN6880 (15-13062-01)
- Cisco ASR 1001-X CN6645 (15-14203-01)
- Cisco ASR 1002-X CN6335 (15-13267-01)
- Cisco ASR 1001-HX CN6870-800 (15-13063-01)
- Cisco ASR 1002-HX CN6880-1200 (15-13062-01)
- Cisco ASR1000-ESP100-X
- · Cisco ASR 1000-ESP200-X
- Cisco Catalyst 8500-12X
- Cisco Catalyst 8500-12X4QC

Note

Some of the supported routers above have a "- CN6XXX" designation trailing the Cisco product name, indicating the part number of the particular Cavium/Marvell network processor used.

The following is a sample output from the **show platform resources** command that is run on a Cisco ASR 1000 Series router:

#### # show platform resources

**State Acronym: H - He Resource	ealthy, W - Warning, Usage		Warning	Critical	State

# show platform software trace level

To view the binary trace levels for the modules of a Cisco SD-WAN process executing on a specific hardware slot, issue the command **show platform software trace level** in the Privileged EXEC mode.

show platform software trace level process slot

Syntax Description	process	Specify a Cisco SD-WAN process.
		For the list of Cisco SD-WAN processes for which binary trace is supported see the table 'Supported Cisco SD-WAN Daemons' under 'Usage Guidelines'.
	slot	Hardware slot from which process messages must be logged.
Command Default	None	
Command Modes	- Privilege	d EXEC

## **Command History**

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	Support introduced for select Cisco SD-WAN processes. See the table 'Supported Cisco SD-WAN Daemons' under 'Usage Guidelines'.

## **Usage Guidelines**

# show policer

Display information about the policers that are in effect (on vEdge routers only).

**show policer** [burst bytes] [oos-action action] [oos-pkts number] [rate bps]

## **Syntax Description**

None	Display information about all policers.
Specific Burst Size	<b>burst</b> <i>bytes</i> Display information about policers that match the specified burst size. <i>Range</i> : 0 through $2^{64} - 1$ bytes
Specific Out-of-Specification Action	oos-action action Display information about policers that match the specified OOS action. A policed packet is out of specification when the policer does not allow it to pass. Depending on the policer configuration, these packets are either dropped or they are remarked, which sets the packet loss priority (PLP) value on the egress interface to high. Action: drop, remark
Specific Out-of-Specification Packet Count	oos-pkts <i>number</i> Display information about policers that match the specified OOS packet count. <i>Range</i> : 0 through $2^{64} - 1$
Specific Bandwidth	<b>rate</b> bps Display information about policers that match the specified bandwidth. Range: 0 through $2^{64} - 1$ bps

## **Command History**

Release	Modification
14.1.	Command introduced.
16.3	Added burst, oos-action, oos-pkts, and rate options.

## **Examples**

Display the policers that are in effect on the router:

#### Show policer

```
        vEdge# show policer

        NAME
        INDEX
        DIRECTION
        RATE
        BURST
        ACTION
        PKTS

        ge0_0_llq
        10
        out
        20000000000
        15000
        drop
        0

        ge0_3_llq
        11
        out
        20000000000
        15000
        drop
        0
```

## **Related Topics**

```
clear policer statistics, on page 55

show policy from-vsmart, on page 409
```

# show policy access-list-associations

Display the IPv4 access lists that are operating on each interface (on vEdge routers only).

**show policy access-list-associations** [access-list-name]

#### **Syntax Description**

None	Display all access lists operating on the vEdge router's interfaces.
Specific Access List	access-list-name Display the interfaces on which the specific access list is operating.

### **Command History**

Release	Modification
14.1.	Command introduced.

#### **Examples**

#### Show policy access-list-associations

```
vEdge# show running-config policy
policy
access-list ALLOW_OSPF_PACKETS
  sequence 65535
  match
    protocol 89
  !
  action accept
    count count_OSPF_PACKETS
  !
  !
  edefault-action accept
  !
}
```

```
access-list
show ipv6 policy access-list-associations, on page 320
show policy access-list-counters, on page 403
show policy access-list-names, on page 404
show policy access-list-policers, on page 405
show policy data-policy-filter, on page 406
```

## show policy access-list-counters

Display the number of packets counted by IPv4 access lists configured on the vEdge router (on vEdge routers only).

**show policy access-list-counters** [access-list-name]

### **Syntax Description**

None	Display the count of packets that have been collected by all data policies on the local vEdge router.		
Specific Access List	access-list-name Display the count of packets that have been collected by the specified data policy on the local vEdge router.		

#### **Command History**

Release	Modification
14.1.	Command introduced.

#### **Examples**

#### Show policy access-list-counters

```
vEdge# show running-config policy
policy
access-list ALLOW_OSPF_PACKETS
  sequence 65535
  match
    protocol 89
!
  action accept
    count count_OSPF_PACKETS
!
  default-action accept
```

```
access-list
show ipv6 policy access-list-counters, on page 321
show policy access-list-associations, on page 402
show policy access-list-names, on page 404
show policy access-list-policers, on page 405
show policy data-policy-filter, on page 406
```

## show policy access-list-names

Display the names of the IPv4 access lists configured on the vEdge router (on vEdge routers only).

show policy access-list-names

## **Syntax Description**

#### **Syntax Description**

None

### **Command History**

Release	Modification
14.1.	Command introduced.

#### **Examples**

#### Show policy access-list-names

```
vEdge# show running-config policy
policy
access-list ALLOW_OSPF_PACKETS
  sequence 65535
  match
    protocol 89
  !
  action accept
    count count_OSPF_PACKETS
  !
  !
  default-action accept
  !
  vEdge# show policy access-list-names
```

```
ALLOW_OSPF_PACKETS
```

access-list show ipv6 policy access-list-names, on page 322 show policy access-list-associations, on page 402 show policy access-list-counters, on page 403 show policy access-list-policers, on page 405 show policy data-policy-filter, on page 406

# show policy access-list-policers

Display information about the policers configured in IPv4 access lists (on vEdge routers only). show policy access-list-policers

#### **Syntax Description**

None

## **Command History**

Release Modification			
14.1	Command introduced.		
16.2.5	Add the policy sequence number to the policer name.		

#### **Example**

Display a list of policers configured in access lists. This output shows that the policer named "p1_police" was applied in sequence 10 in the access list "acl_p1" in sequences 10, 20, and 30 in the "acl_plp" access list.

#### vEdge# show policy access-list-policers

NAME	POLICER NAME	OOS PACKETS
acl_p1 acl_plp	10.p1_police 10.p1_police 20.p1_police 30.p2_police	0

#### **Related Topics**

```
clear policer statistics, on page 55
show ipv6 policy access-list-policers, on page 323
show policer, on page 401
```

# show policy data-policy-filter

Display information about data policy filters for configured counters and policers, and for out-of-sequence packets (on vEdge routers only).

show policy data-policy-filter

#### **Syntax Description**

None

## **Command History**

Release	Modification
14.1	Command introduced.
16.2.5	Add the policy sequence number to the policer name
17.1	Add out-of-specification bytes (OOS Btytes) column to command output.

#### **Examples**

#### Example 1

Display the number of packets and bytes for four configured data policy counters:

```
vSmart# show running-config policy data-policy
```

```
policy
 data-policy Local-City-Branch
   vpn-list-Guest-VPN
    sequence 10
      action accetp
       count Guest-Wifi-Traffic
       cflod
    default-action accept
  vpn-list Service-VPN
   sequence 10
     match
       destination-data-prefix-list Business-Prefixes
       destination-port 80
     action accept
       count Business-Traffic
        cflowd
    sequence 20
     match
       destination-port 10090
       protocol 6
     action accept
       count Other-Branch-Traffic
        cflowd
```

```
sequence 30
action accept
count Misc-Traffic
oflowd
!
! default-action accept
!
```

#### vEdge# show policy data-policy-filter

NAME	NAME	COUNTER NAME	PACKETS	BYTES	NAME	PACKETS	BYTES
Local-City-Branch		Business-Traffic Other-Branch-Traffic	92436 1663339139	12422330320 7082643 163093277861 5118593007			

## Example 2

Display packet information for policers. This output shows that the policer named "police" was applied in sequences 10, 20, and 30 in the data policy "dp1" and in sequence 10 in the "dp2" data policy.

#### vEdge# show policy data-policy-filter

NAME	NAME	COUNTER NAME	PACKETS	BYTES	POLICER NAME	OOS PACKETS	OOS BYTES
dp1	vpn_1_list	police_count police_count20	0	0	10.police 20.police 30.police	0 0	
dp2	vpn_1_list				10.police	0	

## Example 3

For a data policy that includes a policer, display the policers:

#### vEdge# show policy from-vsmart

```
from-vsmart data-policy dp1
direction from-service
vpn-list vpn 1 list
 sequence 10
  match
   protocol 1
  action accept
   count police count
   set
    policer police
  sequence 20
  action accept
   count police_count20
    policer police
  sequence 30
  action accept
   set
    policer police
  default-action accept
from-vsmart policer police
 rate 10000000
burst 1000000
```

```
exceed remark
from-vsmart lists vpn-list vpn_1_list
    vpn 1
```

vEdge# show policy data-policy-filter

NAME	NAME	COUNTER NAME	PACKETS	BYTES	POLICER NAME	OOS PACKETS	OOS BYTES
dp1	vpn_1_list	police_count police_count20	0	0	10.police 20.police 30.police	0

Table 11: show policy ef-stats Field Descriptions

Field	Description
CORE NUM	Core Number
EF NUM	Number of elephant flows identified at present.
CUSTOM MATCH	Number of elephant flows identified at present because of a matched sequence.
CUR CPU USAGE	Current CPU usage.

# show policy from-vsmart

Display a centralized data policy, an application-aware policy, or a cflowd policy that a vSmart controller has pushed to the vEdge router (on vEdge routers only). The vSmart controller pushes the policy via OMP after it has been configured and activated on the controller.

#### show policy from-vsmart

show policy from-vsmart [app-route-policy] [cflowd-template [template-option]] [data-policy] [lists (data-prefix-list | vpn-list)] [policer] [sla-class]

### **Syntax Description**

None	None: Display all the data policies that the vSmart controller has pushed to the vEdge router.
app-route-policy	Application Route Policies: Display only the application-aware routing policies that the vSmart controller has pushed to the vEdge router.
cflowd-template [template-option]	cflowd Templates: Display only the cflowd template information that that vSmart controller has pushed to the vEdge router.
	template-option can be one of collector, flow-active-timeout, flow-inactive-timeout, and template-refresh.
data-policy	Data Policies: Display only the data policies that the vSmart controller has pushed to the vEdge router.

lists (data-prefix-list   vpn-list)	Lists: Display only the policy-related lists that the vSmart controller has pushed to the vEdge router.
policer	Policers: Display only the policers that the vSmart controller has pushed to the vEdge router.
sla-class	SLA Classes: Display only the SLA classes for application-aware routing that the vSmart controller has pushed to the vEdge router.

#### **Command History**

Release	Modification
14.1	Command introduced.
14.2	Command renamed from show omp data-policy to show policy from-vsmart.
14.3	cflowd-template option added.

#### **Examples**

### **Example 1**

```
vEdge# show policy from-vsmart
from-vsmart sla-class test_sla_class
latency 50
from-vsmart app-route-policy test_app_route_policy

```

## show policy qos-map-info

Display information about the QoS maps are applied to each interface (on vEdge routers only). **show policy qos-map-info** [map-name]

#### **Syntax Description**

None	Display information for all QoS maps.
[map-name]	Specific Map: Display information for a specific QoS map.

#### **Command History**

Release	Modification
14.1	Command introduced.

#### **Example**

#### 

### **Related Topics**

show policy qos-scheduler-info, on page 412

# show policy qos-scheduler-info

Display information about the configured QoS schedulers and the associated QoS map (on vEdge routers only).

**show policy qos-scheduler-info** [scheduler-name]

#### **Syntax Description**

None	Display information for all configured QoS schedulers.
scheduler-name	Specific Scheduler: Display information for a specific QoS scheduler.

#### **Command History**

Release	Modification
14.1	Command introduced.

#### **Example**

vEdge# show policy QOS SCHEDULER NAME	qos-schedul BANDWIDTH PERCENT	er-info BUFFER PERCENT	QUEUE	QOS MAP NAME
VOICE DEFAULT BULK-DATA NETWORK-CONTROL STREAMING-VIDEO VOICE-SIGNALLING BUSINESS-CRITICAL	50 12 5 3 3 3	50 12 5 3 3 3	0 7 6 3 2 3 4	my_qos_map my_qos_map my_qos_map my_qos_map my_qos_map my_qos_map my_qos_map

show policy qos-map-info, on page 411

## show policy service-path

Determine the next-hop information for an IP packet that a vEdge router sends out a service-side interface (on vEdge routers only). You identify the IP packet by specifying fields in the IP header. You can use this command when using application-aware routing, to determine that path taken by the packets associated with a DPI application.

show policy service-path vpn-id vpn-id interface interface-name source-ip ip-address dest-ip ip-address protocol number source-port port-number dest-port port-number [all | app application-name | dscp value]

#### **Syntax Description**

all	All Possible Paths: Display all possible paths for a packet.
dest-ip ip-address dest-port port-number	Destination IP Address and Port Number: IP address and port number of the remote end of the IPsec tunnel.
app application-name	DPI Application: Display the packets associated with the specified DPI application.
dscp value	DSCP Value: DSCP value being used on the IPsec tunnel. Range: 0 through 63
interface interface-name	Interface: Name of the local interface being used for the IPsec tunnel.
protocol number	Protocol: Number of the protocol being used on the IPsec tunnel.
source-ip ip-address source-port port-number	Source IP Address and Port Number: IP address and port number of the local end of the IPsec tunnel.
vpn-id vpn-id	VPN: Identifier of the service VPN.

#### **Command History**

Release	Modification
15.1	Command introduced.
15.3	all and app options added.

#### **Example**

```
vEdge# show policy service-path vpn 0 interface ge0/0 source-ip 172.0.101.15 dest-ip 172.0.101.16 protocol 1 source-port 1 dest-port 1 all Number of possible next hops: 1
```

```
Next Hop: Svc_GRE
Source: 10.1.15.15 Destination: 10.1.16.16
```

```
show app-route sla-class, on page 182
show app-route stats, on page 183
show ip fib, on page 292
show ip routes, on page 303
show policy tunnel-path, on page 414
```

# show policy tunnel-path

Determine the next-hop information for an IP packet that a vEdge router sends out a WAN transport tunnel interface (on vEdge routers only). You identify the IP packet by specifying fields in the IP header. You can use this command when using application-aware routing, to determine that path taken by the packets associated with a DPI application.

show policy service-path vpn-id vpn-id interface interface-name source-ip ip-address dest-ip ip-address protocol number source-port port-number dest-port port-number [all | app application-name | dscp value]

#### **Syntax Description**

all	All Possible Paths: Display all possible paths for a packet.
dest-ip ip-address dest-port port-number	Destination IP Address and Port Number: IP address and port number of the remote end of the IPsec tunnel.
app application-name	DPI Application: Display the packets associated with the specified DPI application.
dscp value	DSCP Value: DSCP value being used on the IPsec tunnel.
interface interface-name	Interface: Name of the local interface being used for the IPsec tunnel.
protocol number	Protocol: Number of the protocol being used on the IPsec tunnel.
source-ip ip-address source-port port-number	Source IP Address and Port Number: IP address and port number of the local end of the IPsec tunnel.
vpn-id vpn-id	VPN: Identifier of the transport VPN.

### **Command History**

Release	Modification
15.2	Command renamed from <b>show app-route path</b> and introduced.
15.3	all and app options added.

### **Example**

```
vEdge# show policy tunnel-path vpn 0 interface ge0/2 source-ip 10.0.5.11 dest-ip 10.0.5.21
protocol 6
source-port 12346 dest-port 12346
Nexthop: Direct
Interface ge0/2 index: 3
```

#### **Related Topics**

```
show app-route stats, on page 183
show app-route sla-class, on page 182
show policy service-path, on page 413
```

## show policy zbfw filter-statistics

Display a count of the packets that match a zone-based firewall's match criteria and the number of bytes that match the criteria (on vEdge routers only).

show policy zbfw filter-statistics

#### **Syntax Description**

None

#### **Command History**

Release	Modification
18.2	Command introduced.

#### **Example**

For the configured zone-based firewalls, display the number of packets and the number of bytes that match the match criteria in the firewalls:

```
vEdge# show policy zbfw filter-statistics
```

NAME	COUNTER	NAME	PACKETS	BYTES
ZONE-POLICY-1	counter	seq_1	2	196

#### **Related Topics**

```
clear policy zbfw filter-statistics, on page 56 clear policy zbfw global-statistics, on page 57
```

# show policy zbfw global-statistics

Display statistics about the packets processed by zone-based firewalls (on vEdge routers only).

#### show policy zbfw global-statistics

#### **Syntax Description**

None

#### **Command History**

Release	Modification
18.2	Command introduced.

#### **Example**

Display statistics about packets that the router has processed with zone-based firewalls:

```
vEdge# show policy zbfw global-statistics
        Total zone-based firewall packets
       Fragments
       Fragment failures
                                         : 0
       State check failures
                                        : 0
                                        : 0
       Flow addition failures
       Unsupported protocol
                                         : 0
       Number of flow entries
       Exceeded maximum TCP half-open : 0
       Mailbox message full
                                         : 0
       Packets Implicitly Allowed
         No pair in same zone
                                         : 0
                                         : 0
         No-zone-to-no-zone packets
                                        : 0
         Zone-to-no-zone internet
         TCP Stats
           TCP retransmitted segments : 0

           Invalid sequence number : 0

Invalid seq synroyd state : 0
           Invalid seg synrcvd state
           Syn in window
           Unexpected TCP payload
           Invalid seg pkt too old
                                        : 0
           Invalid seg pkt win overflow : 0
           Invalid seg pyld after fin send : 0
```

No syn in listen state : 0 Internal TCP invalid direction : 0

## **Table 12: Statistics Information**

Statistics	Description
Total zone-based firewall packets	The total number of packets passing through firewall.
Self zone packets	Packets that are directed to/going out from the router (not pass through traffic).
Fragments	Packet Fragments counter.
Fragment failures	Failure to reassemble fragments.
State check failures	Any TCP state check failures found during flow add or flow inspect process, will be counted towards this counter.
Fragment state check failures	For fragmented packets, if the first packet has failed state check and dropped, drop other fragments and increment the counter.
Flow addition failures	Failed to add a flow record for a given traffic flow.
Unsupported protocol	Packets where the protocol number not supported by firewall.
Number of flow entries	Points to the number of sessions created.
Exceeded maximum TCP half-open	After the max half open TCP connections have reached (which is set by tcp-syn-flood-limit), this counter gets incremented.
Mailbox message full	SMTP 554, mailbox full.
No pair in same zone	Packets belonging to same zones and no zone pair. Basically packets across interfaces belonging to same zone.
No-zone-to-no-zone packets	None of the VPN's (source/destination) are part of any zones, then allow the packets to go through.
Zone-to-no-zone internet	When one VPN is part of a zone, and other VPN is a Internet VPN0 AND its not part of the zone, then if "zone-to-nozone-internet" is <b>allow</b> , this counter will be incremented.
Umbrella registration packets	Initial Umbrella registration packets.
No pair Self zone packets	If no zone pair found and if its a self-zone packet allow the packet.
TCP retransmitted segments	TCP retransmitted segments.
TCP out-of-order segments	Out of order segments that arrive during ESTAB, CLOSEWAIT OR LASTACK, are allowed implicitly.
During policy change	Packets dropped during policy change due to reconfig.
Invalid filter	No longer a valid policy filter, then increment this counter.

Statistics	Description
No pair for different zone	No zone pair between different zones, then drop the packet and increment the counter.
Zone-to-no-zone packets	All traffic from Zone to a No-Zone will be dropped.
Zone-to-no-zone internet	When one VPN is part of a zone, and other VPN is a Internet VPN0 AND its not part of the zone, then if "zone-to-nozone-internet" is <b>deny</b> , this counter will be incremented.
Internal invalid tcp state	If the TCP state check for the flow, does not match any of the valid states such as LISTEN, SYNSENT, SYNRCVD, ESTABLISHED, CLOSEWAIT, LASTACK OR TIMEWAIT.
Stray seg	A TCP segment is received that should not have been received through the TCP state machine such as a TCP SYN packet being received in the listen state from the responder.
Invalid flags	This can be caused by:
	1. During LISTEN state, a TCP peer receives a RST or an ACK
	2. Expected SYN/ACK is not received from the responder.
	3. TCP initial SYN packet has flags other than SYN.
Syn with data	If the SYN packet contains payload for some reason, then drop the packet.
Invalid win scale option	Caused by incorrect window scale option byte length.
Invalid seg synsent state	An invalid TCP segment in SYNSENT state is caused by:
	1. SYN/ACK has payload.
	2. SYN/ACK has other flags (PSH, URG, FIN) set.
	<b>3.</b> Receive a non-SYN packet from initiator.
Invalid ack numif	This drop could be caused by one of these reasons:
	1. ACK not equals to the next_seq# of the TCP peer.
	2. ACK is greater than the most recent SEQ# sent by the TCP peer.
Invalid ack flag	Drop the packet if
	1. Expecting ACK flag, but not set during different TCP states.
	2. ACK flag is set and other flags (such as RST) is set.
Reset to Responder	Send RST to responder in SYNSENT state when ACK# is not equal to ISN+1.
Retrans invalid flags	If this is retransmitted packet and already ACKed drop the packet.

Statistics	Description
Reset in window	A RST packet is observed within the window of an already established TCP connection.
Invalid sequence number	In SYNRCVD state, drop the packet if,
	If Seq number is less than ISN
	If receiver window is zero, then drop any segment with Data and drop any out-of-order segments.
	If receiver window is non-zero, then drop any segment whose SEQ falls beyond the window.
Invalid seg synrcvd state	In SYNRCVD state, drop the packet if, receive a retransit SYN with payload from initiator.
Syn in window	If a SYN is received in an already established connection, then drop the packet.
Unexpected TCP payload	In SYNRCVD state, if a packet with payload from responder to initiator direction is received, drop the packet.
Invalid seg pkt too old	Packet is too old - one window behind the other side's ACK. This could happen in ESTABLISHED, CLOSEWAIT and LASTACK state.
Invalid seg pkt win overflow	This occurs when incoming segment size overflows receiver's window. This check is done during TCP ESTAB, CLOSEWAIT and LASTACK state processing.
Invalid seg pyld after fin send	Payload received after FIN sent. This could happen in CLOSEWAIT state.
No syn in listen state	During TCP LISTEN state processing, if the packet received is not SYN packet, then drop the packet.
Internal TCP invalid direction	Packet direction undefined.

clear policy zbfw global-statistics, on page 57

# show policy zbfw sessions

Display the session flow information for all zone pairs configured with a zone-based firewall policy (on vEdge routers only).

show policy zbfw sessions

## **Syntax Description**

None

#### **Command History**

Release	Modification
18.2	Command introduced.

#### **Example**

For the configured zone-based firewalls, display the number of packets and the number of bytes that match the match criteria in the firewalls:

vEdge# show policy zbfw sessions

ZONE P	AIR VPN	SOURCE IP ADDRESS	DESTINATION IP ADDRESS	SOURCE PORT	DESTINATION PORT	PROTOCOL	SOURCE VPN	DESTINATION VPN	IDLE TIMEOUT	OUTBOUND PACKETS	OUTBOUND OCTETS	INBOUND PACKETS	INBOUND OCTETS	FILTER STATE

# show ppp interface

Display PPP interface information (on vEdge routers only).

show ppp interface

## **Syntax Description**

None

#### **Command History**

Release	Modification
15.3.3	Command introduced.
17.1	Add Auth Type field to command output.

#### **Example**

vEdge# show ppp interface

		PPPOE	INTERFACE		PRIMARY	SECONDARY		AUTH
VPN	IFNAME	INTERFACE	IP	GATEWAY IP	DNS	DNS	MTU	TYPE
0	ppp10	ge0/1	11.1.1.1	115.0.1.100	8.8.8.8	8.8.4.4	1150	pap

## **Related Topics**

clear pppoe statistics, on page 58

show pppoe session, on page 421 show pppoe statistics, on page 421

# show pppoe session

Display PPPoE session information (on vEdge routers only).

show pppoe session

## **Syntax Description**

None

## **Command History**

Release	Modification
15.3.3	Command introduced.

#### **Example**

#### vEdge# show pppoe session

		SESSION			PPP		SERVICE
VPN	IFNAME	ID	SERVER MAC	LOCAL MAC	INTERFACE	AC NAME	NAME
0	ge0/1	1	00:0c:29:2e:20:1a	00:0c:29:be:27:f5	ppp1	branch100	-

## show reboot history

To display the history of when the Cisco vManage device is rebooted, use the **show reboot history** command in privileged EXEC mode. The command displays only the latest 20 reboots.

#### show reboot history

#### **Syntax Description**

None

#### **Command History**

Release	Modification
14.1	Command introduced.

#### Example

```
      vEdge# show reboot history
      REBOOT DATE TIME
      REBOOT REASON

      2016-03-14T23:24:43+00:00
      Initiated by user - patch

      2016-03-14T23:36:20+00:00
      Initiated by user
```

```

reboot, on page 94 show system status, on page 456

## show running-config

Display the active configuration that is running on the Cisco vEdge device. Use the **details** filter with this command to display the default values for configured components.

**show running-config** [configuration-hierarchy]

**show running-config** [configuration-hierarchy] | **details** 

#### **Syntax Description**

None	Display the full active configuration.
details	Default Values in Running Configuration: Display the default values for the components configured in the running configuration.
configuration-hierarchy	Specific Configuration Hierarchy: Display the active configuration for a specific hierarchy in the configuration.

## **Command History**

Release	Modification
14.1	Command introduced.
Cisco SD-WAN Release 20.8.1	Added <b>secondary-region</b> to the output to show the Hierarchical SD-WAN region ID, and <b>region</b> to show the secondary region mode. Added <b>transport-gateway</b> to the output to indicate the enabled/disabled status. Added <b>affinity-group</b> and <b>affinity-group preference</b> to the output to indicate the affinity group ID assigned to the device and the preference order.

### **Examples**

#### **Example 1**

```
vEdge# show running-config system

## show sdwan appqoe

To view infrastructure statistics, NAT statistics, resource manager resources and statistics, TCP optimization status, and service chain status, use the **show sdwan appqoe** command in privileged EXEC mode.

show sdwan appqoe { infra-statistics | nat-statistics | rm-statistics | ad-statistics | aoim-statistics | rm-resources | tcpopt status | service-chain status | libuinet-statistics [{ sppi | verbose }] }

#### **Syntax Description**

infra-statistics	Displays infra statistics
nat-statistics	Displays NAT statistics
rm-statistics	Displays resource manager status
ad-statistics	Displays the status for auto discovery of peer devices
aoim-statistics	Displays the statistics for one time exchange of information between peer devices
rm-resources	Displays resource manager resources
tcpopt status	Displays information about TCP optimization
service-chain status	Displays service chain status
libuinet-statistics sppi verbose	Displays libuinet statistics

#### **Command History**

# show sdwan appqoe flow closed

To view the closed appqoe flows, use the **show sdwan appqoe flow closed** command in privileged EXEC mode.

show sdwan appqoe flow closed { all | detail | flow-id | server-port | port-number | server-ip | server-port | port-number | client-ip | client-ip | server-port | port-number | server-port | server-port | port-number | server-port | server

#### **Syntax Description**

all	Displays all flows
detail	Displays flow details for all flows
flow-id flow-id	Filters flows by flow-id
server-ip server-ip	Filters flows by the server IP address
client-ip client-ip	Filters flows by the client IP address
server-port port-number	Filters flows by server port number. Range: 1 to 65535
error	Displays the latest flows with errors.

#### **Command Modes**

Privileged EXEC (#)

#### **Command History**

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.2.1r	This command was introduced.
Cisco IOS XE Catalyst SD-WAN Release 17.6.1a	A new keyword <b>error</b> was introduced.

#### The following is a sample out from the **show sdwan appqoe flow closed all** command:

```
Device# show sdwan appqoe flow closed all
Current Historical Optimized Flows: 6
Optimized Flows
T:TCP, S:SSL, U:UTD

```

# show sdwan appqoe flow flow-id

To view the closed appqoe flows, use the **show sdwan appqoe flow flow-id** command in privileged EXEC mode.

show sdwan appqoe flow flow-id [ debug { all | SSL | TCP | UTD } ]

#### **Syntax Description**

all	Displays all debug statistics
SSL	Displays debug statistics for SSL
TCP	Displays debug statistics for TCP
UTD	Displays debug statistics for UTD
DRE	Displays debug statistics for DRE

#### Release Modification

Cisco IOS XE Catalyst SD-WAN Release 17.2.1r Command introduced.

## **Usage Guidelines**

Run this command in privileged EXEC mode.

```
Device# show sdwan appqoe flow flow-id 52590946740086387
Flow ID: 52590946740086387

# show sdwan appqoe flow vpn-id

To view the appqoe flows using vpn ids, use the **show sdwan appqoe flow vpn-id** command in privileged EXEC mode.

**show sdwan appqoe flow vpn-id** { **client-ip** [ **server-ip** [ **server-ip** [ **server-ip** ] | **server-ip** | **server-ip** | **server-port** | **serve** 

#### **Syntax Description**

vpn-id	VPN/VRF ID. Range: 1 to 64
client-ip client-ip	Filters flows by the client IP address
server-ip server-ip	Filters flows by the server IP address
server-port port-number	Filters flows by server port number. Range: 1 to 65535

## **Command History**

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.2.1r	Command introduced.

Device# show sdwan appqoe flow vpn-id 101 server-port 443 T:TCP, S:SSL, U:UTD

# show sdwan cloudexpress applications

To display the best path that Cloud onRamp for SaaS has selected for each configured SaaS application, on Cisco IOS XE Catalyst SD-WAN devices, use the **show sdwan cloudexpress applications** command in privileged EXEC mode.

show sdwan cloudexpress applications

## **Syntax Description**

None.

#### **Command Mode**

Privileged EXEC mode

## **Command History**

Release	Modification
Cisco IOS XE Release 17.2	This command was introduced.

#### **Examples**

#### **Example**

```
Device# show sdwan cloudexpress applications
cloudexpress applications vpn 1 office365
exit-type local
interface GigabitEthernet1
latency 1 loss 40
cloudexpress applications vpn 1 amazon aws
exit-type gateway
gateway-system-ip 10.0.0.1
latency
loss
local-color lte remote-color lte
cloudexpress applications vpn 1 dropbox
exit-type gateway
gateway-system-ip 10.0.0.1
latency 19
loss
local-color
                lte
remote-color
                 lte
```

# show sdwan cloudexpress gateway-exits

To display the Quality of Experience (QoS) measurements received from gateway sites, for Cloud onRamp for SaaS, on Cisco IOS XE Catalyst SD-WAN devices, use the **show sdwan cloudexpress gateway-exits** command in privileged EXEC mode. The output may include entries for branch sites, and for branch sites with direct internet access (DIA).

show sdwan cloudexpress gateway-exits

## **Syntax Description**

This command has no arguments or keywords.

#### **Command Mode**

Privileged EXEC mode

## **Command History**

Release	Modification
Cisco IOS XE Release 17.2	This command was introduced.

#### **Examples**

#### **Example**

```
Device# show sdwan cloudexpress gateway-exits
cloudexpress gateway-exits vpn 1 office365 10.0.0.1
latency 2
loss 50
local-color lte
remote-color lte
cloudexpress gateway-exits vpn 1 amazon_aws 10.0.0.2
latency 1
loss 0
local-color lte
remote-color lte
cloudexpress gateway-exits vpn 1 dropbox 10.0.0.2
latency 1
loss 0
local-color lte
cloudexpress gateway-exits vpn 1 dropbox 10.0.0.2
latency 19
loss 0
local-color lte
remote-color lte
```

# show sdwan cloudexpress local-exits

To display the list of applications enabled for Cloud onRamp for SaaS probing, on Cisco IOS XE Catalyst SD-WAN devices, and the interfaces on which the probing occurs, use the **show sdwan cloudexpress local-exits** command in privileged EXEC mode. Each line of the output applies to a specific application and interface, and includes the average latency and loss for each application and interface. The interfaces may include branch site direct internet access (DIA) interfaces, and gateway site interfaces.

### show sdwan cloudexpress local-exits

#### **Syntax Description**

This command has no arguments or keywords.

#### **Command Mode**

Privileged EXEC mode

#### **Command History**

Release	Modification
Cisco IOS XE Release 17.2	This command was introduced.

## **Examples**

#### **Example**

Device#	show	sdwan	${\tt cloudexpress}$	local-exits
---------	------	-------	----------------------	-------------

VPN	APPLICATION	INTERFACE	LATENCY	LOSS
1	office365	GigabitEthernet1	1	43
1	office365	GigabitEthernet5	1	42

# show sdwan cloudexpress service-area-applications

To display the applications enabled for Cloud onRamp for SaaS and the best path that has been selected for each, use the **show sdwan cloudexpress service-area-applications** command in Privileged EXEC mode.

#### show sdwan cloudexpress service-area-applications

Command Default	Not applicable.

Privileged EXEC

## **Command History**

**Command Modes** 

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.4.1a	This command is introduced.

#### **Usage Guidelines**

The output includes separate sections with the details for each unique combination of:

- Service area (Microsoft Exchange traffic is currently the only possible value)
- VPN
- Application

For each combination, the output includes:

- exit-type:
  - Local: The application traffic uses the local interface for example a Direct Internet Access (DIA) interface at a branch site.
  - Gateway: The application traffic uses a remote gateway.
  - None: Cloud on Ramp for SaaS has not determined a best path for the application traffic.
- interface: Interface for current best path.
- latency: Last measured latency.
- loss: Last measured packet loss.
- override-status: Score for the path:
  - **OK**: Acceptable for application traffic.

• NOT-OK: Not acceptable for application traffic.

• INIT: Insufficient data.

## **Example**

In the following example, the output snippet shows the best-path information for the office 365 application, for VPN 1 only. In the example, Office 365 traffic on VPN 1 is using a local interface (GigabitEthernet0/0/2).

Device#show sdwan cloudexpress service-area-applications cloudexpress service-area-applications Exchange vpn 1 office365 exit-type local interface GigabitEthernet0/0/2 latency 3 loss 0 override-status OK

# show sdwan policy

Display information about policy configuration on the IOS XE router.

show sdwan policy app-route-policy filter show sdwan policy access-list-associations show sdwan policy access-list-counters show sdwan policy access-list-names show sdwan policy data policy filter show sdwan policy from-vsmart show sdwan policy from-vsmart lists

#### **Syntax Description**

The options for the **show sdwan policy** commands are the same as for the equivalent vEdge router commands.

#### **Command History**

Release	Modification
16.9.1	Command introduced.

Note

The **show sdwan policy data-policy-filter** commands display in different formats depending on if the counter has a value or not. If the counter has a value, the output for the show sdwan policy data-policy-filter displays in a linear format. If the counter does not have a value, the output displays in a tabular format.

#### **Example**

The example output for the **show sdwan policy** commands is the same as for the equivalent vEdge router commands. Below is an example output for the **show sdwan policy app-route-policy-filter** command.

```
ISR4K# show sdwan policy app-route-policy-filter
app-route-policy-filter app_route_policy_pm9008
app-route-policy-vpnlist all_vpns
app-route-policy-counter count_appr_pm9008_1001
packets 15126027
bytes 15305251759
app-route-policy-counter count_appr_pm9008_1002
packets 10364400
bytes 11151607158
app-route-policy-counter count_appr_pm9008_1003
packets 0
bytes 0
app-route-policy-counter count_appr_pm9008_1004
packets 265882
bytes 34997066
```

#### CSR# show sdwan policy data-policy-filter

NAME	NAME	COUNTER NAME	PACKETS	BYTES	POLICER NAME	OOS PACKETS	OOS BYTES
TCP_Proxy	1	TCP1 TCP2 default_action_count	0 0 0	0 0 0			

When counter has some value it has below output pattern.

```
CSR# show sdwan policy data-policy-filter
data-policy-filter TCP_Proxy
data-policy-vpnlist 1
   data-policy-counter TCP1
   packets 764954
   bytes 1009386894
   data-policy-counter TCP2
   packets 163154
   bytes 14693558
   data-policy-counter default_action_count
   packets 22
   bytes 7524
```

### **Related Topics**

show sdwan, on page 426

# show sdwan policy service-path

To display the next-hop information for an IP packet that a Cisco IOS XE router received from a service-side interface, use the **show sdwan policy service-path** command in the privileged EXEC mode.

show sdwan policy service-path vpn-id vpn-id interface interface-name source-ip ip-address dest-ip ip-address protocol number source-port port-number dest-port port-number [all | app application-name | dscp value]

## **Syntax Description**

vpn-id vpn-id	Identifies the service VPN.		
interface interface-name	Specifies the name of the local interface being used for the IPsec tunnel.		
source-ip ip-address	Specifies the source IP address number of the local end of the IPsec tunnel.		
dest-ip ip-address	Specifies the destination IP address of the remote end of the IPsec tunnel.		
protocol number	Specifies the number of the protocol being used on the IPsec tunnel.		
source-port port-number	Specifies the port number of the local end of the IPsec tunnel.		
dest-port port-number	Specifies the port number of the remote end of the IPsec tunnel.		
all	Displays all possible paths for a packet.		
app application-name	Displays the packets associated with the specified DPI application.		
dscp value	Specifies the DSCP value being used on the IPsec tunnel. <i>Range:</i> 0 through 63		

#### **Command Default**

NA

#### **Command Modes**

Privileged EXEC

## **Command History**

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.2.1r	This command was introduced.

## **Usage Guidelines**

You identify the IP packet by specifying fields in the IP header. You can use this command when using application-aware routing, to determine that path taken by the packets associated with a DPI application.

### **Example**

#### Device#show sdwan policy service-path

```
vpn 1 interface GigabitEthernet 5 source-ip 10.20.24.17 dest-ip 10.20.25.18
protocol 1 Next Hop: IPsec
Source: 10.1.15.15 12346 Destination: 10.1.16.16 12366
Local Color: lte Remote Color: lte Remote System IP: 172.16.255.16
```

# show sdwan policy tunnel-path

To display the next-hop information for an IP packet that a Cisco IOS XE router received from a WAN transport tunnel interface, use the **show sdwan policy tunnel-path** command in the privileged EXEC mode.

show sdwan policy tunnel-path vpn-id vpn-id interface interface-name source-ip ip-address dest-ip ip-address protocol number source-port port-number dest-port port-number [all | app application-name | dscp value]

#### **Syntax Description**

vpn-id vpn-id	Identifies the service VPN.			
interface interface-name	Specifies the name of the local interface being used for the IPsec tunnel.			
source-ip ip-address	Specifies the source IP address number of the local end of the IPsec tunnel.			
dest-ip ip-address	Specifies the destination IP address of the remote end of the IPsec tunnel.			
protocol number	Specifies the number of the protocol being used on the IPsec tunnel.			
source-port port-number	Specifies the port number of the local end of the IPsec tunnel.			
dest-port port-number	Specifies the port number of the remote end of the IPsec tunnel.			
all	Displays all possible paths for a packet.			
app application-name	Displays the packets associated with the specified DPI application.			
dscp value	Specifies the DSCP value being used on the IPsec tunnel. <i>Range:</i> 0 through 63			

## **Command Default**

NA

## **Command Modes**

Privileged EXEC

#### **Command History**

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.2.1r	This command was introduced.

## **Usage Guidelines**

You identify the IP packet by specifying fields in the IP header. You can use this command when using application-aware routing, to determine that path taken by the packets associated with a DPI application.

### **Example**

Device#show sdwan policy tunnel-path vpn 0 interface ge0/2 source-ip 10.0.5.11 dest-ip 10.0.5.21 protocol 6 source-port 12346 dest-port 12346

```
Nexthop: Direct Interface ge0/2 index: 3
```

# show security-info

List the configured security information for IPsec tunnel connections (on vEdge routers only).

show security-info [{ authentication-type | encryption-supported | fips-mode | pairwise-keying | rekey | replay-window }]

## **Syntax Description**

None	Lists information about all configured IPsec tunnel security parameters.		
authentication-type	Lists the configured authentication type for IPsec tunnels.		
encryption-supported	Lists the supported encryption type.		
fips-mode	Displays whether fips mode is enabled or disabled.		
pairwise-keying	Displays whether pairwise-keying is enabled or disabled.		
rekey	Lists the configured rekeying time for IPsec tunnels, in seconds.		
replay-window	Lists the configured replay window size for IPsec tunnels.		

#### **Command History**

Release	Modification
14.2	Command introduced.
16.2	Added support for displaying authentication negotiation.
17.2	Added FIPS status
Cisco SD-WAN Release 20.6.1	The output of this command was modified to included an additional field, security-info integrity-type.

The following is a sample output from the **show security-info** command applicable to Cisco SD-WAN Release 20.6.1 and later.

```
vm4# show security-info
security-info authentication-type deprecated
security-info rekey 86400
security-info replay-window 512
security-info encryption-supported "AES_GCM_256 (for unicast & multicast)"
security-info fips-mode Enabled
security-info pairwise-keying Disabled
security-info integrity-type "ip-udp-esp esp"
```

The following is a sample output from the **show security-info** command applicable to releases before Cisco SD-WAN Release 20.6.1.

```
vEdge# show security-info
security-info authentication-type "SHA1_HMAC / NULL"
security-info rekey 3600000
security-info replay-window 512
security-info encryption-supported "AES_GCM_256 and, for multicast, AES_256_CBC"
security-info fips-mode Enabled
```

#### **Related Topics**

# show nms server-proxy ratelimit

To view rate limits for bulk and non-bulk APIs, use the **show nms server-proxy ratelimit** command in the operational mode.

#### show nms server-proxy ratelimit

#### **Syntax Description**

This command has no arguments or keywords.

#### **Command Modes**

Operational mode (#)

#### **Command History**

Release	Modification		
Cisco vManage Release 20.10.1	This command is introduced.		

#### **Examples**

The following is a sample output of the **show nms server-proxy ratelimit** command on a single Cisco vManage node:

```
vManage# show nms server-proxy ratelimit
```

```
Non Bulk API: 100/second (per node)
Bulk API: 48/minute (per node)
```

The following is a sample output of the **show nms server-proxy ratelimit** command on a Cisco vManage node belonging to a three-node cluster:

```
vManage# show nms server-proxy ratelimit Non Bulk API: 100/second (per node)
```

Bulk API: 150/minute (across cluster)

## **Related Commands**

Command	Description		
request nms server-proxy set ratelimit	Configures rate limits for bulk and non-bulk APIs on the Cisco vManage server-proxy.		

# show software

List the software images that are installed on the local device (on vEdge routers and vSmart controllers).

show software image-name [active | confirmed | default | previous | timestamp]

#### show software

## **Syntax Description**

None	List information about all software images installed on the local device.
[active   confirmed   default   previous   timestamp]	Software Image Status: List whether the image is the actively running image, the default image, or the previously running image, when the image was installed, and who confirmed the software installation.
image-name	Specific Software Image: List information about a specific software image.

## **Command History**

Release	Modification	
15.3.3	Command introduced for vEdge 100 routers only.	
15.4	Command available on all Cisco SD-WAN devices.	

## **Example**

#### vEdge# show software

VERSION	ACTIVE	DEFAULT	PREVIOUS	CONFIRMED	TIMESTAMP
15.3.3	true	true	false	_	2015-10-08T12:54:50-00:00

# show support omp peer

To display information about the active OMP peer sessions on the local Cisco SD-WAN Controller or Cisco vEdge device, use the **show support omp peer** command in privilege EXEC mode.

show support omp peer peer-ip ip-address

## **Syntax Description**

peer-ip	System-IP address of the connected Cisco Catalyst SD-WAN device.
ip-address	Display configuration OMP peer session information about a specific peer.

### **Command Modes**

Privileged EXEC (#)

#### **Command History**

Release	Modifications
Cisco SD-WAN Release 20.8.1	This command was introduced.
Cisco Catalyst SD-WAN Control Components Release 20.11.1	Added the <b>TLOC color supported list</b> field in the output.

### **Usage Guidelines**

Detailed information about OMP peer is displayed along with all timers and assigned policies in XML format.

The following is a sample output from the **show support omp peer** command:

```
Device# show support omp peer peer-ip 172.16.255.41
```

```

The following example, executed on a Cisco SD-WAN Controller, shows the TLOC colors that the peer device 10.0.0.15 is advertising—in this case, Ite and 3g.

```
vsmart# show support omp peer peer-ip 10.0.0.15 | inc color ed bitmap: 0xc0, TLOC color supported list: lte 3g
```

# show system buffer-pool-status

Display statistics about internal data packet buffers, which are used in the forwarding path.

show system buffer-pool-status

## **Syntax Description**

None

## **Command History**

Release	Modification
17.2	Command introduced.

## **Example**

vEdge#	show system	buffer-pool-	-status
Pool	Block-Size	Max-Blocks	Avail-Blocks
0	0	655209	
1	0	677233	
2	0	3920	
3	0	10201	
4	0	7982	
5	0	8180	
6	0	6140	
7	0	0

## **Related Topics**

iptables-enable

# show system on-demand

To display the status of on-demand tunnels, use the **show system on-demand** command in privileged EXEC mode.

	show [sdwan]	system on-demand [remote-system] [system-ip ip-address]				
	snow [suwan]	system on-demand [remote-system] [system-ip tp-adaress]				
Syntax Description	sdwan	Include <b>sdwan</b> only when using the command on a Cisco IOS XE Catalyst SD-WAN device, not on a Cisco vEdge device.				
	remote-system	Use <b>remote-system</b> to include on-demand tunnel information about all connected devices				
		For example, if device A has numerous on-demand tunnels configured to other devices, and you use (for a Cisco IOS XE Catalyst SD-WAN device) <b>show sdwan system on-demand remote-system</b> on device A, the output includes information for each site that device A is connected to. The information for each site includes whether the site has on-demand tunnels enabled, whether the tunnel to the site is active, inactive, or not in on-demand tunnel mode, and so on.				
		Without this keyword, the command provides only the local status of the device on which the command is executed. For example, if you execute this command on device A, without <b>remote-system</b> , the output shows only the local on-demand tunnel status of device A.				
	system-ip ip-address	Displays the output only for the specified device.				
Command Default	Not applicable.					
Command Modes	Privileged EXEC					
Command History	Release	Modification				
	Cisco IOS XE Cat	alyst SD-WAN Release 17.3.1a This command was				
	Cisco vManage R	elease 20.3.1 introduced.				

Use this command on a hub or spoke device. The output shows the following:

**Usage Guidelines** 

- SITE-ID: Site ID.
- SYSTEM-IP: IP address of the device.
- ON-DEMAND:
  - yes: On-demand tunnels are enabled on the device.
  - no: On-demand tunnels are not enabled on the device.
- STATUS:
  - active: The on-demand tunnel to this device is active.
  - **inactive**: The on-demand tunnel to this device is inactive.
  - **not-on-demand**: On-demand tunnels are enabled on the device, but this tunnel is not in on-demand mode because another device at the same multi-home site does not have on-demand tunnels enabled.
- IDLE-TIMEOUT-CFG(min): Configured on-demand tunnel timeout (minutes) for this device.
- IDLE-TIMEOUT-EXPIRY(sec): Seconds before timeout for this on-demand tunnel.

## **Example**

In the following example, **show sdwan system on-demand** is executed on a Cisco IOS XE Catalyst SD-WAN device, so it includes the **sdwan** keyword.

The output shows the on-demand tunnel configuration of the device on which the command was executed, which is at site 800 in the example. On-demand tunnels are enabled.

Device# <b>shov</b>	w sdwan syste	m on-demand		
SITE-ID	SYSTEM-IP	ON-DEMAND	STATUS	IDLE-TIMEOUT-CFG(min)
800	10.0.0.18	yes	active	10

#### **Example**

In the following example **show sdwan system on-demand remote-system** is executed on a Cisco IOS XE Catalyst SD-WAN device, so it includes the **sdwan** keyword.

The output shows the status of 5 devices at a total of 4 sites. Site 500 is a multi-home site, with 2 devices. Because one of the devices at site 500 (10.0.0.15) does not have on-demand tunnels enabled, the other device at the site (10.0.016) has a status of not-on-demand even though that device has on-demand tunnels enabled.

Device# <b>show</b> SITE-ID	w sdwan system SYSTEM-IP	on-demand ON-DEMAND	remote-system STATUS	IDLE-TIMEOUT-EXPIRY(sec)
300	10.0.0.11	yes	inactive	-
200	10.0.0.12	no	_	-
400	10.0.0.14	yes	active	48
500	10.0.0.15	no	-	-
500	10.0.0.16	yes	not-on-dema	and -

In the following example, **system-ip** is used to display the status of a single device.

Device#show	v sdwan syste	m on-demand	remote-system	system-ip 10.0.0.10
SITE-ID	SYSTEM-IP	ON-DEMAND	STATUS	IDLE-TIMEOUT-EXPIRY(sec)
400	10.0.0.10	ves	active	33

# show system statistics

Display system-wide forwarding statistics (on vEdge routers only).

show system statistics [diff]

## **Syntax Description**

None	Display all system statistics.	]
diff	Statistics Changes: Display the changes in statistics since you last issued the <b>show system statistics</b> command.	

#### **Command History**

Release	Modification
14.1	Command introduced.
16.3.2	Add display BFD PMTU statistics.

## **Example**

vEdge# show system statistics

# show system status

Display time and process information for the device, as well as CPU, memory, and disk usage data.

show system status

### **Syntax Description**

None

#### **Command History**

Release	Modification
14.1	Command introduced.
15.3	Changed format of command output for vEdge 100 routers.
15.4	Changed format of command output changed for all devices.
16.3.2	Added system state field to output on vEdge routers.

Release	Modification
17.1	Added CPU-reported reboot field to output on hardware vEdge routers.
17.2	Added CPU allocation field to output on hardware vEdge routers; added FIPS state.

## **Examples**

#### Example 1

In Releases 17.1 and later:

```
vEdge# show system status
```

Cisco SD-WAN (tm) vedge Operating System Software Copyright (c) 2013-2018 by Cisco, Inc. Version: 17.1.0

System logging to host is disabled System logging to disk is enabled

System state: GREEN. All daemons up

System FIPS state: Enabled

Last reboot: Initiated by user - activate 17.1.0.

CPU-reported reboot: Warm

Boot loader version: U-Boot 2013.07-ga9b015 (Build time: May 12 2016 - 13:58:12)

System uptime: 0 days 03 hrs 27 min 26 sec Current time: Tue Mar 28 12:59:02 PDT 2017

Load average: 1 minute: 0.11, 5 minutes: 29, 15 minutes: 38

Processes: 241 total

CPU allocation: 32 total, 3 control, 29 data, 1 tcpd
CPU states: 11.00% user, 10.10% system, 78.90% idle
Memory usage: 2973024K total, 752796K used, 1865932K free

# show tech-support

To display general information about the Cisco SD-WAN devices, use the **show tech-support** command in the privileged EXEC mode.

#### show tech-support

#### **Syntax Description**

This command has no arguments or keywords.

**Command Default** 

NA

**Command Modes** 

Privileged EXEC

#### **Command History**

Release	Modification

Cisco IOS XE Catalyst SD-WAN Release 17.2.1r Command introduced to display the admin-tech and memory details.

## **Usage Guidelines**

When a Cisco device reboots, it collects system status information in a compressed tar file to aid in troubleshooting and diagnostics. The tar file is saved in your system's home directory and contains the following information:

- · output of commands
- content of files on the local device
- core files
- syslog files for each process
- configuration rollback files

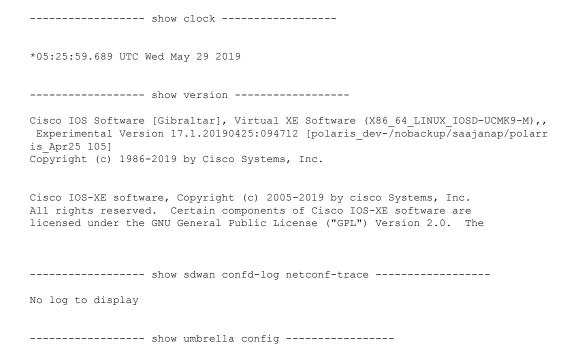

This command is useful for collecting a large amount of information about devices for troubleshooting. The output of this command can be provided to technical support representatives when reporting a problem. The command output displays the output of a number of show commands at once. The output from this command varies depending on your platform and configuration. Where as, the command **request admin-tech** collects all system status information, including core files, log files, and the process (daemon) and operational-related files that are stored in the /var/tech directory on the local device. For more information on **admin-tech** command, see request admin-tech. The **show tech-support** command displays the output from the following **show** commands, as listed in the order below:

- · show platform
- show platform software status control-processor brief
- show platform resources
- · show memory statistics history
- show memory allocating-process total
- · show process memory sorted
- show process memory platform sorted
- show memory lite-chunks totals
- · show buffer
- · show buffer usage
- show region
- show memory dead totals
- · show chunk brief

#### **Example**

The following is sample output from the **show tech-support** command. Following are the excerpts from /var/tech/ios file extracted from the admin-tech tar file which shows that the corresponding command output is captured in admin-tech.

```
Device# show tech-support memory ------ show tech-support memory -----
```

# show tenant-mapping

On a Cisco vBond Orchestrator, to view the mapping of tenants to multitenant Cisco vSmart Controllers, use the **show tenant-mapping** command.

**show tenant-mapping** [vSmart-serial-number]

#### **Syntax Description**

[vSmart-serial-number]

(Optional) Specify the serial number of a specific Cisco vSmart Controller to view the tenants assigned to it.

#### **Command Default**

None

#### **Command Modes**

#

#### **Command History**

Release	Modification
Cisco SD-WAN Release 20.4.1	Command introduced.

#### **Example**

vBond# **show tenant-mapping** VSMART SERIAL

# show tenant omp peers

To view information about the OMP peering sessions that are active on the multitenant Cisco vSmart Controller for a particular tenant, use the **show tenant** *tenant-name* **omp peers** command.

show tenant tenant-name omp peers [peer-ip-address] [detail]

•	_	_	-	
V-1	ntav	Desc	rii	ntınn
•	IIIUA	DUSU		puon

tenant-name	Specify the name of a tenant assigned to the multitenant Cisco vSmart Controller.
peer-ip-address	(Optional) View OMP peering session information for a specific peer.
detail	(Optional) View detailed information.

#### **Command Default**

None

## **Command Modes**

#

## **Command History**

Release	Modification
Cisco SD-WAN Release 20.4.1	Command introduced.

### **Example**

```
vSmart# show tenant multitenancy-Customer1 omp peers
R -> routes received

I -> routes installed
S -> routes sent

DOMAIN OVERLAY SITE

PEER TYPE ID ID ID STATE UPTIME R/I/S
```

172.16.255.14	vedge	1	1	400	up	23:09:40:04	4/0/0
172.16.255.15	vedge	1	1	500	up	0:14:33:55	0/0/0
172.16.255.24	vsmart	1	1	103	up	44:06:36:31	4/0/4

# show tenant omp routes

To view information about information about OMP routes for a tenant on a multitenant Cisco vSmart Controller, use the **show tenant** *tenant-name* **omp routes** command.

**show tenant** tenant-name **omp routes** [ **family** family-address ] [ **vpn** vpn-id ] [{ prefix | ip-address }] [{ advertised | received }] [**detail**]

## **Syntax Description**

tenant-name	Specify the name of a tenant assigned to the multitenant Cisco vSmart Controller.
prefix	(Optional) Lists OMP route information for the specified route prefix.
ip-address	(Optional) Displays IP address of specific route.
familyfamily-address	Lists OMP route information for the specified IP family. <i>family-address</i> can be <b>ipv4</b> or <b>ipv6</b> .
vpnvpn-id	Lists the OMP routes for the specified VPN.
detail	Lists detailed route information about OMP peering sessions.

## **Command Default**

None

## **Command Modes**

#

## **Command History**

Release	Modification
Cisco SD-WAN Release 20.4.1	Command introduced.

## **Example**

vSmart# show tenant multitenancy-Customer1 omp routes

# show tenant-summary

To view information about the tenants assigned to a multitenant Cisco vSmart Controller, use the **show tenant-summary** command.

show tenant-summary [{ max-tenants | num-active-tenants | tenant-org-names [tenant-name] [detail] | detail }]

Syntax Description		Y' 1
Syntax Description	max-tenants	View the maximum number of tenants that can be assigned to the
		Cisco vSmart Controller.

num-active-tenants	View the number of tenants assigned to the Cisco vSmart Controller.
tenant-org-names[tenant-name][detail]	Enter only the <b>tenant-org-names</b> argument to view information on the tenants assigned to the Cisco vSmart Controller, and the tenant and VPN IDs for each tenant.
	(Optional) Enter a tenant name along with <b>tenant-org-names</b> to view information about a specific tenant.
	(Optional) Enter the <b>detail</b> keyword for more detailed information for all or one of the tenants assigned to the Cisco vSmart Controller.
detail	Enter the <b>detail</b> keyword for detailed information for all the tenants assigned to the Cisco vSmart Controller.

## **Command Default**

None

## **Command Modes**

## **Command History**

Release	Modification
Cisco SD-WAN Release 20.4.1	Command introduced.

## **Example**

#### vSmart# show tenant-summary

tenant-summary max-tenants 24

tenant-summary num-active-tenants 4

	TENANT	TENANT
TENANT ORG NAME	ID	VPN ID
multitenancy-Customer1	1	1003
multitenancy-Customer2	2	1004
multitenancy-Customer3	3	1005
multitenancy-Customer4	4	1006

# show transport connection

Display the status of the DTLS connection to a vBond orchestrator (on vEdge routers and vSmart controllers only).

## show transport connection

**show transport connection** [ip-address] [history [index [state state]]]

## **Syntax Description**

history	Connection History and Index: Display the complete connection history or the connection
[index]	history of a specific indexed item.

state state	Connection State: Display connections with the specified state.			
	state can be <b>up</b> or <b>down</b> .			
ip-address	vBond Address: IP address of the vBond orchestrator or the DNS name that points to the vBond orchestrator.			

## **Command History**

Release	Modification				
14.1	Command introduced.				

## **Example**

#### vEdge# show transport connection

ADDRESS	HOST	INDEX	TIME	STATE
10.11.12.123	vbond.viptela.com	100 99 98 97 96 95 94 93	Thu Mar 27 17:35:15 2014 Thu Mar 27 17:35:13 2014 Wed Mar 26 11:20:58 2014 Wed Mar 26 11:16:46 2014 Wed Mar 26 08:05:24 2014 Wed Mar 26 08:05:23 2014 Sun Mar 23 20:20:24 2014 Fri Mar 21 16:50:24 2014	down up down up down up down up down up up up

track-transport

# show tunnel gre-keepalives

Display information about the keepalive packets transmitted and received on GRE tunnels that originate on the local router (on vEdge routers only).

 $\textbf{show tunnel gre-keepalives} \ [\textit{vpn-id}]$ 

## **Syntax Description**

None Display keepalive information for all GRE tunnels.
---------------------------------------------------------

*vpn-id* Specific VPN: Display keepalive information for GRE tunnels in a specific VPN.

## **Command History**

Release	Modification				
15.4.1	Command introduced.				

#### **Example**

vEdge# show tunnel gre-keepalives

							REMOTE	REMOTE					
	IF			ADMIN	OPER	KA	TX	RX	TX	RX	TX	RX	
VPN	NAME	SOURCE IP	DEST IP	STATE	STATE	ENABLED	PACKETS	PACKETS	PACKETS	PACKETS	ERRORS	ERRORS	TRANSITIONS
0	gre1	10.0.5.11	172.168.1.1	up	down	true	0	0	370	0	0	0	0
0	are2	10.0.5.11	172.168.122.11	up	down	true	0	0	644	0	0	0	0

## **Related Topics**

keepalive show interface, on page 265 show tunnel statistics, on page 470 tunnel-destination tunnel-source

# show tunnel inbound-connections

Display information about the IPsec tunnel connections that originate on the local router, showing the TLOC addresses for both ends of the tunnel (on vEdge routers only).

In Releases 15.2 and later, this command has been renamed to **show ipsec outbound-connections**.

## show tunnel inbound-connections

 $\begin{tabular}{ll} \textbf{show tunnel inbound-connections} & local-tloc-address & [local-color & [remote-tloc-address & [remote-color & [(\textbf{dest-ip} \mid \textbf{dest-port} \mid \textbf{source-ip} \mid \textbf{source-port})]]]] \end{tabular}$ 

## **Syntax Description**

	Display information for all the IPsec connections that originate on the vEdge router. The tunnel connections are listed in order according to the local TLOC address.
local-tloc-address [local-color	Specific Tunnel Connection: Display information for a specific
[remote-tloc-address [remote-color [(dest-ip	IPsec connection.
$\big      \mathbf{dest\text{-}port}     \mathbf{source\text{-}ip}     \mathbf{source\text{-}port})  ]  \big]  \big]  \big]$	

Release	Modification
14.1	Command introduced.
15.2	Command renamed to show ipsec outbound-connections

## **Example**

vEage# show tunr	nel imbou	ind-connections					
SOURCE	SOURCE	DEST	DEST	REMOTE	REMOTE	LOCAL	LOCAL
IP	PORT	IP	PORT	TLOC ADDRESS	TLOC COLOR	TLOC ADDRESS	TLOC COLOR

## **Related Topics**

show tunnel local-sa, on page 469 show ipsec outbound-connections, on page 313

## show tunnel local-sa

Display the IPsec tunnel security associations for the local TLOCs (on vEdge routers only).

In Releases 15.2 and later, this command has been renamed to **show ipsec local-sa**.

#### show tunnel local-sa

show tunnel local-sa tloc-address [color [spi [(auth-key-hash | encrypt-key-hash | ip | port)]]]]

## **Syntax Description**

None	Display information for all the IPsec tunnels that originate on the router. The tunnel connections are listed in order according to the local TLOC address.
tloc-address [color [spi [(auth-key-hash   encrypt-key-hash   ip   port) ] ] ] ]	Specific SA: Display information for a specific security association.

## **Command History**

Release	Modification
14.1	Command introduced.
15.2	Command renamed to show ipsec local-sa.

### **Example**

vEdge# show tunnel local-sa

			SOURCE	SOURCE	
TLOC ADDRESS	TLOC COLOR	SPI	IP	PORT	KEY HASH
172.16.255.15	lte	260	10.1.15.15	12346	*****0979

COLLDON

### **Related Topics**

rekey

request security ipsec-rekey, on page 141

show tunnel inbound-connections, on page 468

show ipsec outbound-connections, on page 313

## show tunnel statistics

Display information about the packets transmitted and received on the data plane tunnels that originate on the local router (on vEdge routers only).

show tunnel statistics

show tunnel statistics bfd

show tunnel statistics dest-ip ip-address

show tunnel statistics dest-port port-number

show tunnel statistics ipsec

show tunnel statistics source-ip ip-address

 ${\bf show\ tunnel\ statistics\ source-port\ } port\text{-}number$ 

show tunnel statistics tunnel-protocol (gre | ipsec)

None	Display statistics for all data plane tunnels, for both IPsec and GRE tunnels. Note that the output fields are specific for IPsec, so for GRE tunnels, the values for all fields are zero or empty.
bfd	BFD Tunnels: Display statistics for all BFD tunnels.
dest-ip ip-addressdest-port port-number	Destination IP Address or Port: Display statistics for the specified destination address or destination port number.
ipsec	IPsec Tunnels: Display statistics for IPsec tunnels.
source-ip ip-addresssource-port port-number	Source IP Address or Port: Display statistics for the specified source address or source port number.

tunnel-protocol (gre   ipsec)	Tunnel Protocol: Display tunnel statistics for either GRE or IPsec tunnels.
	To display the count of data packets, use the <b>show interface</b> command. To
	display the count of only GRE keepalive packets, use the <b>show tunnel</b>
	gre-keepalives command.

Release	Modification
14.1	Command introduced.
15.4.1	Added support for GRE tunnels.
16.3.2	Added <b>bfd</b> option and display BFD hello and PMTU packet statistics.

## **Example**

## Example 1

dae#	show	tunnel	statistics

# show umbrella deviceid

To display the Umbrella registration status, for Cisco IOS XE Catalyst SD-WAN devices, use the **show umbrella deviceid** command.

show umbrella deviceid

## **Syntax Description**

This command has no arguments or keywords.

## **Command History**

Release	Modification
Cisco IOS XE Catalyst SD-WAN Release 17.2.1r	This command was introduced.

#### **Examples**

The command displays a table with the registration details:

Column	Description
VRF	Virtual routing forwarding (VRF) instance.
Tag	VPN number from which registration is successful.
Status	Created or Unsuccessful.
Device-id	Unique number associated with the registration.

Device# show umbrella deviceid Device registration details VRF vpn1

Status Device-id
201 CREATED ab00f5cee26f962e

# show uptime

Show how long the system has been running. This command is the same as the UNIX **uptime** command.

### show uptime

## **Syntax Description**

None

## **Command History**

Release	Modification			
14.1	Command introduced.			

```
vEdge# show uptime
16:34:32 up 6:29, 1 user, load average: 0.04, 0.05, 0.05
```

## **Related Topics**

show system status, on page 456

## show users

Display the users currently logged in to the device.

show users

## vManage Equivalent

For all Cisco vEdge devices:

Monitor > Network > Real Time > Users

## **Syntax Description**

None

## **Command History**

Release	Modification				
14.1	Command introduced.				

## **Example**

### **Example**

vEdge# show users

					AUTH	
SESSION	USER	CONTEXT	FROM	PROTO	GROUP	LOGIN TIME
96	admin	cli	10.0.1.1	ssh	netadmin	2014-07-24T14:57:43+00:00

## **Related Topics**

aaa

request aaa unlock-user, on page 96

## show version

Display the active version of the Cisco SD-WAN software running on the device.

show version

## **Syntax Description**

None

Release	Modification				
14.1	Command introduced.				

#### **Example**

#### **Example**

vEdge# show version 15.3.3

## **Related Topics**

request software install, on page 143

# show vrrp

Display information about the configured VRRP interfaces and groups (on vEdge routers only). show vrrp [interfaces interface-name] [groups group-number [vrrp-parameter]] show vrrp vpn vpn-id [interfaces interface-name] [groups group-number [vrrp-parameter]]

	None: Display information about all VRRP interfaces and groups configured on the local vEdge router, for all VPNs.
interfaces interface-name	Interface: Display VRRP information for a specific interface.
vpn vpn-id	VPN: Refresh the dynamic ARP cache entries for the specific VPN.
groups group-number	VRRP Group: Display information for a specific VRRP group.

groups group-number vrrp-parameter	VRRP Parameter: Display information about a specific VRRP parameter in a VRRP group. <i>vrrp-parameter</i> can be one of the following, which correspond to the header fields in the <b>show vrrp</b> output:
	• advertisement-timer [number]
	• last-state-change-time [ccyy-mm-ddthh:mm:ss]
	• master-down-timer [number]
	• omp-state [down   up]
	• prefix-list-state [resolved   unresolved]
	• priority [number]
	• track-prefix-list [prefix-list-name]
	• virtual-ip [ip-address]
	• virtual-mac [mac-address]
	• vrrp-state [backup   init   master]

Release	Modification				
14.1	Command introduced.				

## **Related Topics**

show interface, on page 265 vrrp

## show wlan clients

Display information about the clients on the wireless WAN (on vEdge routers only).

**show wlan clients** [vap-number]

## **Syntax Description**

play information about the clients connected to a specific virtual access point.	vap-number
----------------------------------------------------------------------------------	------------

## **Command History**

Release	Modification				
16.3	Command introduced.				

### **Example**

### **Example**

Display information about all clients connected to all VAPs on the WLAN:

#### vEdge# show wlan clients

VAP	CLIENT ID	MAC	MODE	BAND	CHANNEL	CHANNEL BANDWIDTH	DATA SECURITY	RX RATE	RSSI	ASSOC TIME
vap0	0	50:50:50:50:50:50	802.11ac	5 GHz	36	80	none	175	11	00:11:43
vap0	1	50:50:50:50:50:53	802.11ac	5 GHz	36	80	none	175	11	00:11:43

vap0	9	50:50:50:50:50:58	802.11ac	5 GHz	36	80	none	58	11	00:11:43

## **Related Topics**

show interface, on page 265 show wlan interfaces, on page 476 show wlan radios, on page 477

## show wlan interfaces

Display information about the virtual access point (VAP) interfaces (on vEdge routers only).

Note

The **show interface** command displays no information about VAP interfaces.

## show wlan interfaces [detail] [vap-id]

detail	Detailed VAP Interface Information: Display detailed information about the VAP interfaces.
vap-id	Specific VAP: Display information about a specific virtual access point.

## **Command History**

Release	Modification
16.3	Command introduced.

#### **Examples**

#### **Example 1**

Display regular and detailed information about all the VAP interfaces on the WLAN:

vEdge# show wlan interfaces

VAP	SSID	BSSID	DATA SECURITY	MGMT SECURITY	BAND	MODE	ADMIN STATUS	OPER STATUS	NUM CLIENTS
vap1 vap2	tb31_pm6_5ghz_vap0 tb31_pm6_5ghz_vap1 tb31_pm6_5ghz_vap2 tb31_pm6_5ghz_vap3	80:b7:09:08:b7:6b 80:b7:09:08:b7:6c	wpa/wpa2-enterprise wpa/wpa2-personal	none none optional optional	5 GHz 5 GHz	802.11ac 802.11ac 802.11ac	Up Up	Up Up Up Up	0 0 8

#### vEdge# show wlan interfaces detail

#### Example 2

Display information about a specific VAP:

#### vEdge# show wlan interfaces

VAP	SSID	BSSID	DATA SECURITY	MGMT SECURITY	BAND	MODE		OPER STATUS	NUM CLIENTS
-		80:b7:09:01:39:0a 80:b7:09:01:39:0b				802.11ac 802.11ac	-	Up Up	0

#### vEdge# show wlan interfaces vap1

#### vap1 :

IEEE 802.11ac 5 GHz SSID: test2
Admin status: Up, Oper status: Up
BSSID: 80:b7:09:01:39:0b
Data security: wpa2-personal
Management security: none
Description:
Bit rate: 1300 Mbps
Transmit power: 25 dBm
Active clients: 1, Max clients: 25

### **Related Topics**

show interface, on page 265 show wlan clients, on page 475 show wlan radios, on page 477

## show wlan radios

Display information about the WLAN radios (on vEdge routers only).

**show wlan radios** [radio-name [parameter]]

	None: Display information about all WLAN radios.
radio-name [parameter]	Specific Radio: Display information about a specific radio and about a specific radio parameter. <i>parameter</i> can be one of the column heads in the output of the regular <b>show wlan radios</b> command.

Release	Modification					
16.3	Command introduced.					

#### **Examples**

#### **Example 1**

Display information about all WLAN radios:

#### vEdge# show wlan radios

RADIO						CHANNEL		GUARD	
NAME	MODE	BAND	MAC	COUNTRY	CHANNEL	BANDWIDTH	FREQUENCY	INTERVAL	VAPS
wifi0	802.11ac	5 GHz	80:b7:09:08:b7:6a	United States	36	80	5180	400	4

#### Example 2

Display information about a specific radio:

```
vEdge# show wlan radios wifi0
wifi0 :
     IEEE 802.11ac 5 GHz 80 MHz
     MAC address: 80:b7:09:08:b7:6a
     Channel: 36 Frequency: 5180 MHz
     Regulatory country: United States
     Guard interval: 400 ns
     Number of VAPs: 4
vEdge# show wlan radios wifi0 ?
Description: Display WLAN radio information
Possible completions:
 band
                     Radio band
  channel
                    Radio channel
 channel-bandwidth Channel bandwidth, in MHz

                     Number of virtual access point interfaces
                     Output modifiers
vEdge# show wlan radios wifi0 country
country "United States"
```

#### **Related Topics**

```
show interface, on page 265
show wlan clients, on page 475
show wlan interfaces, on page 476
```

## show wlan radius

Display information about the sessions with RADIUS servers being used for WLAN authentication (on vEdge routers only).

show wlan radius [vap number] [tag]

#### **Syntax Description**

tag	Tag Associated with a RADIUS Server: The tag can be from 4 through 16 characters long. You configure it with the <b>wlan interface vap</b> <i>number</i> <b>radius-servers</b> <i>tag</i> command.
vap	VAP Interface Virtual access point instance.
number	Range: 0 through 3

#### **Command History**

Release	Modification
17.1	Command introduced.

### **Example**

#### Example 1

Display information about the RADIUS servers that are being used for WLAN authentication:

```
vEdge# show wlan radius
vap1:
    Primary Server, Tag: tag dummy1, IP: 10.20.24.15, VPN: 1
    Priority: 0, Source interface:
    Authentication information

# show ztp entries

Display a list of the vEdge router chassis numbers that are present in the ZTP table on the vBond orchestrator that is acting as a ZTP server.

## show ztp entries

show ztp entries [row-index] (chassis-number number | organization-name name | root-cert-path path | validity (valid | invalid) | vbond-ip ip-address | vbond-port number)

#### **Syntax Description**

	None: List all entries in the ZTP table.
chassis-number number   organization-name name   root-cert-path path   validity (valid   invalid)   vbond-ip ip-address   vbond-port number	Chassis Information: List the entries corresponding to the specific chassis-related information.
row-index	Table Row: List the ZTP entry corresponding to the specified row number in the ZTP table.

#### **Command History**

Release	Modification
15.3	Command introduced.

#### **Example**

```
vBond# request device add chassis-number 12345 serial-number 6789 validity valid vbond 10.1.14.1 org-name viptela
Adding Chassis number 12345 to the database
Successfully added the chassis-number

Creating Serial file ..
Uploading serial numbers via VPN 0
Copying ... /home/admin/vedge_serial_entries via VPN 0
Successfully loaded the vEdge serial numbers
```

#### vBond# show ztp entries

INDEX	CHASSIS NUMBER		VALIDITY	VBOND IP		ORGANIZATION NAME	CERT PATH
1	12345	6789	valid	10.1.14.1	12345	viptela

# tcpdump

Print a description of the contents of control plane packets on a network interface that match a boolean expression. This command is the same as the UNIX **tcpdump** command.

tcpdump [help] [interface interface-name] [options "unix-options"] [vpn vpn-id]

### **Syntax Description**

interface interface-name	Interface to Watch: Name of the interface on which to perform a TCP dump.
options " unix-options "	Options: One or more of the UNIX <b>tcpdump</b> command options, from among the following: [-AbdDefhHIJKILnNOpqStuUv] [-B size] [-c count] [-E algorithm:secret] [-j timestamp-type] [-M secret] [-T type] [-y data-link-type] [expression]  You must enclose unix-options in quotation marks.  For an explanation of the options, see http://www.tcpdump.org/tcpdump_man.html.
vpn vpn-id	VPN to Watch: VPN identifier in which the interface is located.

For an explanation of the remaining standard UNIX options, see http://www.tcpdump.org/tcpdump_man.html.

## **Command History**

Release	Modification
14.1	Command introduced.
16.3	Updated the command options.

## Example

```
vEdge# tcpdump vpn 1
tcpdump in vpn 1
tcpdump: verbose output suppressed, use -v or -vv for full protocol decode
listening on ge0_0, link-type EN10MB (Ethernet), capture size 65535 bytes
19:29:49.765224 TP 10.2.2.11 > 224.0.0.5: OSPFv2, Hello, length 48
19:29:49.768263 TP 10.2.2.12 > 224.0.0.5: OSPFv2, Hello, length 48
```

```
^C
2 packets captured
2 packets received by filter
0 packets dropped by kernel

vEdge# tcpdump vpn 512 interface eth0 options "-v -n tcp port 22"

tcpdump -i eth0 -s 128 -v -n tcp port 22 in VPN 512

tcpdump: listening on eth0, link-type ENIOMB (Ethernet), capture size 128 bytes
14:42:45.077442 IP (tos 0x10, ttl 64, id 50767, offset 0, flags [DF], proto TCP (6), length 184)

14:42:45.121925 IP (tos 0x10, ttl 64, id 50768, offset 0, flags [DF], proto TCP (6), length 632)
```

## test policy match control-policy

To determine the sequence number that matches a particular input variable and a policy name, use the **test policy match control-policy** command in privileged EXEC mode.

test policy match control-policy policy name input variable

#### **Syntax Description**

policy Name of a policy.

input variable The following are the input variables used to search for policies:

- carrier: Identifier of the carrier type. It primarily indicates whether the transport is public or private.
- color: Identifier of the Transport Locator (TLOC) type.
- color-list: Name of the list of colors defined in policy lists.
- community-list: Name of the BGP community list defined in policy lists.
- domain-id: Domain identifier, or ID related to group of devices in the same domain and associated with a TLOC.
- **expanded-community-list**: Name of community list of Regex BGP community strings defined in policy lists.
- group-id: Specific group id of devices.
- ipv4-prefix: An IPv4 prefix.
- ipv4-prefix-list: Name of the list of IPv4 prefixes defined in policy lists.
- ipv6-prefix: An IPv6 prefix.
- ipv6-prefix-list: Name of the list of IPv6 prefixes defined in policy lists.
- omp-tag: OMP tag value associated with the TLOC route in the route table on the device.
- origin: Source of the route, either BGP, OSPF, connected, static.
- **originator**: System-ip address of the originating node.
- **preference**: OMP path-selection preference. A higher value is a more preferred path. Preference value for a route or prefix in the local site.
- region: Region ID defined in hierarchical SDWAN.
- region-list: Name of the region list ids defined in policy lists.
- role: Search by one of the hierarchical SDWAN roles.
- **site-id**: Individual site contributor or more overlay network site identifiers. A site can have multiple nodes or TLOCs.
- site-list: Name of the site list. Search by the name of list of site ids defined in policy lists.
- tloc: TLOC used as next hop for the vRoute. Search by individual TLOC address.
- tloc-list: Name of the list of tlocs defined in policy lists.
- vpn: VPN to which the vRoute belongs. Search by individual VPN ID.
- vpn-list: Name of the list of VPN IDs defined in policy lists.

**Command Default** 

None

**Command Modes** 

Privileged EXEC (#)

Release	Modification

Cisco IOS XE Catalyst SD-WAN Release 17.8.1a This command was introduced.

### **Usage Guidelines**

For the following, use the **test policy match control-policy** command:

- When there are one or more control policies that are configured on a Cisco SD-WAN Controller.
- When a policy is configured, to check if an entity is assigned correctly under a policy's sequence.
- To troubleshoot large policies with multiple sequence numbers. This command returns the sequence number of the policy that matches input.

### **Examples**

The following sample output shows the sequence in control policy1 for vpn 2:

```
Device# test policy match control-policy control_policy1 vpn 2
Found: vpn 2 matches policy control_policy1 sequence 111
    sequence: 111
    match route [VPN-ID (0x100)]
        vpn-id: 2
    action: reject
    set: [ (0x0) ]
```

The following sample output shows the sequence of the cp1 policy for prefix 10.1.1.1/32:

The following sample output shows the sequence of the cp1 policy for ipv6-prefix a:a:a:a:a:a:a:a:a:a:a/128:

```
Device# test policy match control-policy cp1 ipv6-prefix a:a:a:a:a:a:a:a:a/128

Found: ipv6-prefix a:a:a:a:a:a:a:a/28 matches policy cp1 sequence 600

sequence: 600

match route [PFX-LIST (0x10)]

IPv6 prefix-list: pfv61 (0x7ff7be6cb080)

action: reject
set: [ (0x0) ]
```

#### Table 13: test policy match control-policy Field Descriptions

Field	Description
FOUND	Displays a statement informing about the policy's sequence with the search entity.
SEQUENCE	Displays the policy sequence added to the policy name.
VPN-ID	Displays the VPN ID of the policy match that is found.
ACTION	Displays the configured action for the given sequence in a policy.

Field	Description
SET	Displays the configured set actions when a route or a TLOC is accepted.

# timestamp

Control the inclusion of timestamp information in command output and logging files.

timestamp (disable | enable)

## **Syntax Description**

disable	Disable Timestamp Information: Disable the inclusion of timestamp information. This is the default.
enable	Enable Timestamp Information: Enable the inclusion of timestamp information.

## **Command History**

Release	Modification
14.1	Command introduced.

## **Example**

#### **Example 1**

```
vEdge# timestamp enable
vEdge# timestamp disable
Tue Feb 18 19:09:37.112 UTC
vEdge# timestamp enable
vEdge#
```

#### **Related Topics**

show clock, on page 218

# tools ip-route

Display IP routes and the routing cache. This command is effectively the standard Linux **ip-route** command. **tools ip-route** 

## **Syntax Description**

None

Release	Modification
16.1	Command introduced.

#### **Example**

#### **Example 1**

```
vEdge# tools ip-route
default via 10.0.5.13 dev eth1 proto zebra

```

#### **Related Topics**

show ip routes, on page 303

# tools iperf

Run tests to display various parameters related to timing, buffers, and the TCP and UDP protocols for IPv4 and IPv6 (on vEdge routers only). This command is similar to the standard **iperf** command.

tools iperf [options options] [vpn vpn-id]

tools iperf help

#### **Syntax Description**

help	Command Help: Display all the command options.
options options	Command Options: See the Example Output below for a list of all the <b>tools iperf</b> command options.
vpn vpn-id	Specific VPN: Run the command in a specific VPN.  Default: VPN 0

#### **Command History**

Release	Modification
17.1	Command introduced.

#### **Example**

```
vEdge# tools iperf helpUSAGE:
 Options:
  help
                           Show usage
   vpn
                           VPN or namespace
   options
                           iperf options
iperf --help in VPN 0
Usage: iperf [-s|-c host] [options]
       iperf [-h|--help] [-v|--version]
Client/Server:
  -f, --format
                 [kmKM] format to report: Kbits, Mbits, KBytes, MBytes
  -i, --interval #
                         seconds between periodic bandwidth reports
                       length of buffer to read or write (default 8 KB)
 -1, --len
                 #[KM]
  -m, --print mss
                         print TCP maximum segment size (MTU - TCP/IP header)
                 <filename> output the report or error message to this specified file
  -o, --output
  -p, --port
                        server port to listen on/connect to
  -u, --udp
                          use UDP rather than TCP
  -w, --window
                 #[KM]
                         TCP window size (socket buffer size)
  -B, --bind
                 <host> bind to <host>, an interface or multicast address
                        for use with older versions does not sent extra msgs
  -C, --compatibility
  -M, --mss
                          set TCP maximum segment size (MTU - 40 bytes)
  -N, --nodelay
                         set TCP no delay, disabling Nagle's Algorithm
  -V, --IPv6Version
                         Set the domain to IPv6
Server specific:
  -s, --server
                          run in server mode
  -U, --single_udp
                          run in single threaded UDP mode
  -D, --daemon
                         run the server as a daemon
Client specific:
  -b, --bandwidth #[KM]
                         for UDP, bandwidth to send at in bits/sec
                          (default 1 Mbit/sec, implies -u)
                 <host> run in client mode, connecting to <host>
  -c, --client
  -d, --dualtest
                         Do a bidirectional test simultaneously
  -n, --num
                 #[KM] number of bytes to transmit (instead of -t)
  -r, --tradeoff
                          Do a bidirectional test individually
  -t, --time
                          time in seconds to transmit for (default 10 secs)
  -F, --fileinput <name>
                          input the data to be transmitted from a file
  -I, --stdin
                          input the data to be transmitted from stdin
                         port to receive bidirectional tests back on
  -L, --listenport #
  -P, --parallel #
                         number of parallel client threads to run
  -T, --ttl
               #
                          time-to-live, for multicast (default 1)
  -Z, --linux-congestion <algo> set TCP congestion control algorithm (Linux only)
Miscellaneous:
  -x, --reportexclude [CDMSV] exclude C(connection) D(data) M(multicast) S(settings)
V(server) reports
  -y, --reportstyle C
                          report as a Comma-Separated Values
  -h, --help
                          print this message and quit
  -v, --version
                          print version information and quit
[KM] Indicates options that support a K or M suffix for kilo- or mega-
The TCP window size option can be set by the environment variable
TCP WINDOW SIZE. Most other options can be set by an environment variable
IPERF <long option name>, such as IPERF BANDWIDTH.
Report bugs to <iperf-users@lists.sourceforge.net>
```

Determine the data transfer rate and bandwidth available between two vEdge routers. Set up the client side:

#### Start the test on the server side:

```
Server-vEdge# tools iperf vpn 0 options "-c 172.16.255.13" option_list, -c 172.16.255.13 arg list, -c 172.16.255.13 iperf -c 172.16.255.13 in VPN 0

Client connecting to 172.16.255.13, TCP port 5001

TCP window size: 22.1 KByte (default)
```

#### View the output on the server vEdge router:

#### View the output and terminate the test on the client vEdge router:

## tools minicom

Connect to the serial console through USB ports (on vEdge 1000, vEdge 2000, and vEdge 5000 routers only). This command is effectively the standard Linux **minicom** command.

#### tools minicom options options

#### tools minicom help

help	Command Help: Display all the command options.
options options	Command Options: See the Linux <b>minicom</b> man page for a list of all the <b>tools minicom</b> command options.

Release	Modification
17.1	Command introduced.

## **Example**

#### Example 1

Access the serial console of a remote device through the USB port on a vEdge 1000 router:

- Connect the USB port of a vEdge 1000 or vEdge 200 router to a console port, either on the router
  or another device.
- **2.** Exit from the CLI to the router's shell:

```
vEdge1000# vshell
```

**3.** Determine which USB port is connected:

```
# ls -lrt /dev/tty*
```

**4.** Return to the CLI:

# exit

**5.** Set the baud rate on the port:

```
vEdge-1000# tools minicom "-b 115200 /dev/ttyUSB-port
```

**6.** Press Ctrl-a and z, set up the port with the minicom tool, and save the configuration.

#### **Related Topics**

console-baud-rate

## tools netstat

Display information about network connections, routing tables, interface statistics, masquerading connections, and multicast memberships. This command is effectively the standard Linux **netstat** command.

tools netstat [options options] [vpn vpn-id]

tools netstat help

help	Command Help: Display all the command options.		
options options	Command Options: See the Example Output below for a list of all the <b>tools netstat</b> command options.		
<b>vpn</b> vpn-id	Specific VPN: Run the command in a specific VPN.		
	Default: VPN 0		

Release	Modification
15.4.5	Command introduced.

#### **Examples**

#### **Example 1**

```
vEdge# tools netstat help
USAGE:
Options:

## tools nping

Generate network packets, analyze responses, and measure response times. This command is effectively the standard Linux **nping** command.

nping generates network packets of different protocols. You can use the command as a simple ping utility to detect active hosts, and you can use it to generate raw packets to perform network stack stress tests, ARP poisoning, denial-of-service attacks, route tracing, among other things.

nping echo mode displays how generated probes change in transit so that you can track differences between transmitted and received packets.

Note

The nping command expects the echo response packet to be received on the same interface as the echo request transmit interface. If it is not the same, nping treats it as a failure.

**tools nping** (hostname | ip-address) [**options** options] [**vpn** vpn-id] **tools nping help** 

help	Command Help: Display all the command options.
------	------------------------------------------------

options options	Command Options: See the Example Output below for a list of all the <b>tools nping</b> command options.
hostname   ip-address	Host To Check Connectivity To: Name or IP address of host to check connectivity to.
vpn vpn-id	Specific VPN: Run the command in a specific VPN.  Default: VPN 0

Release	Modification
16.1	Command introduced.

#### Example

```
vEdge# tools nping help
USAGE:
Options:
  help
                           Show usage
                           VPN or namspace
  vpn
  options
                           Nping options
Nping in VPN 0
Nping 0.6.47 ( http://nmap.org/nping )
Usage: nping [Probe mode] [Options] {target specification}
TARGET SPECIFICATION:
 Targets may be specified as hostnames, IP addresses, networks, etc.
 Ex: scanme.nmap.org, microsoft.com/24, 192.168.0.1; 10.0.*.1-24
PROBE MODES:
                                  : Unprivileged TCP connect probe mode.
 --tcp-connect
  --tcp
                                   : TCP probe mode.
 --udp
                                   : UDP probe mode.
 --icmp
                                  : ICMP probe mode.
                                  : ARP/RARP probe mode.
 --arp
 --tr, --traceroute
                                 : Traceroute mode (can only be used with
                                    TCP/UDP/ICMP modes).
TCP CONNECT MODE:
   -p, --dest-port <port spec> : Set destination port(s).
   -g, --source-port <portnumber> : Try to use a custom source port.
TCP PROBE MODE:
  -g, --source-port <portnumber> : Set source port.
  -p, --dest-port <port spec> : Set destination port(s).
   --seq <seqnumber>
                                  : Set sequence number.
  --flags <flag list>
                                 : Set TCP flags (ACK, PSH, RST, SYN, FIN...)
  --ack <acknumber>
                                 : Set ACK number.
  --win <size>
                                  : Set window size.
   --badsum
                                  : Use a random invalid checksum.
UDP PROBE MODE:
  -g, --source-port <portnumber> : Set source port.
   -p, --dest-port <port spec> : Set destination port(s).
   --badsum
                                  : Use a random invalid checksum.
ICMP PROBE MODE:
```

```
: ICMP type.
  --icmp-type <type>
  --icmp-code <code>
                                  : ICMP code.
  --icmp-id <id>
                                  : Set identifier.
  --icmp-seq <n>
                                 : Set sequence number.
  --icmp-redirect-addr <addr> : Set redirect address.
--icmp-param-pointer <pnt> : Set parameter problem
  --icmp-advert-ort : Set router advert : Set router advert : Set router advert :
                                  : Set router advertisement lifetime.
  --icmp-advert-entry <IP,pref> : Add router advertisement entry.
  --icmp-orig-time <timestamp> : Set originate timestamp.
  --icmp-recv-time <timestamp> : Set receive timestamp.
  --icmp-trans-time <timestamp> : Set transmit timestamp.
ARP/RARP PROBE MODE:
  --arp-type <type>
                                  : Type: ARP, ARP-reply, RARP, RARP-reply.
  --arp-sender-mac <mac>
                                 : Set sender MAC address.
  --arp-sender-ip <addr>
                                 : Set sender IP address.
  --arp-target-mac <mac>
                                 : Set target MAC address.
  --arp-target-ip <addr>
                                  : Set target IP address.
IPv4 OPTIONS:
 -S, --source-ip
                                  : Set source IP address.
  --dest-ip <addr>
                                  : Set destination IP address (used as an
                                    alternative to {target specification} ).
  --tos <tos>
                                  : Set type of service field (8bits).
  --id <id>
                                  : Set identification field (16 bits).
  --df
                                  : Set Don't Fragment flag.
  --mf
                                  : Set More Fragments flag.
  --ttl <hops>
                                  : Set time to live [0-255].
  --badsum-ip
                                  : Use a random invalid checksum.
  --ip-options \langle S|R \text{ [route]}|L \text{ [route]}|T|U \ldots \rangle : Set IP options
  --ip-options <hex string>
                                               : Set IP options
  --mtu <size>
                                   : Set MTU. Packets get fragmented if MTU is
                                    small enough.
IPv6 OPTIONS:
  -6. -- TPv6
                                  : Use IP version 6.
  --dest-ip
                                   : Set destination IP address (used as an
                                    alternative to {target specification}).
                                  : Set hop limit (same as IPv4 TTL).
  --hop-limit
  --traffic-class <class> : : Set traffic class.
  --flow <label>
                                  : Set flow label.
ETHERNET OPTIONS:
  --dest-mac <mac>
                                  : Set destination mac address. (Disables
                                    ARP resolution)
  --source-mac <mac>
                                 : Set source MAC address.
  --ether-type <type>
                                 : Set EtherType value.
PAYLOAD OPTIONS:
                             : Include a custom ASCII text.
  --data <hex string>
  --data-string <text>
  --data-length <len>
                                  : Include len random bytes as payload.
ECHO CLIENT/SERVER:
                               : Run Nping in client mode.
  --echo-client <passphrase>
  --echo-server <passphrase>
                                  : Run Nping in server mode.
  --echo-port <port>
                                   : Use custom <port> to listen or connect.
  --no-crypto
                                  : Disable encryption and authentication.
  --once
                                  : Stop the server after one connection.
  --safe-payloads
                                  : Erase application data in echoed packets.
TIMING AND PERFORMANCE:
  Options which take <time> are in seconds, or append 'ms' (milliseconds),
  's' (seconds), 'm' (minutes), or 'h' (hours) to the value (e.g. 30m, 0.25h).
  --delay <time>
                                  : Adjust delay between probes.
  --rate <rate>
                                  : Send num packets per second.
MISC:
  -h, --help
                                  : Display help information.
  -V, --version
                                   : Display current version number.
  -c, --count <n>
                                  : Stop after <n> rounds.
  -e, --interface <name>
                                 : Use supplied network interface.
```

```
-H, --hide-sent
                                   : Do not display sent packets.
  -N, --no-capture
                                   : Do not try to capture replies.
  --privileged
                                  : Assume user is fully privileged.
  --unprivileged
                                  : Assume user lacks raw socket privileges.
  --send-eth
                                  : Send packets at the raw Ethernet layer.
  --send-ip
                                   : Send packets using raw IP sockets.
  --bpf-filter <filter spec>
                                   : Specify custom BPF filter.
OUTPUT:
                                   : Increment verbosity level by one.
  -v[level]
                                  : Set verbosity level. E.g: -v4
  -d
                                  : Increment debugging level by one.
  -d[level]
                                   : Set debugging level. E.g: -d3
                                   : Decrease verbosity level by one.
  -q
  -q[N]
                                  : Decrease verbosity level N times
  --quiet
                                  : Set verbosity and debug level to minimum.
  --debug
                                   : Set verbosity and debug to the max level.
EXAMPLES:
  nping scanme.nmap.org
  nping --tcp -p 80 --flags rst --ttl 2 192.168.1.1
 nping --icmp --icmp-type time --delay 500ms 192.168.254.254
 nping --echo-server "public" -e wlan0 -vvv
 nping --echo-client "public" echo.nmap.org --tcp -p1-1024 --flags ack

                                                                              don't truncate IP addresses
                   -n, --numeric
                                                                            don't resolve names
                   --numeric-hosts
                                                                           don't resolve host names
                   --numeric-ports
                                                                           don't resolve port names
                                                                            don't resolve user names
                   --numeric-users
                   -N, --symbolic
                                                                              resolve hardware names
                   -e, --extend
                                                                              display other/more information
                    -p, --programs
                                                                            display PID/Program name for sockets
                   -c, --continuous
                                                                            continuous listing
                    -1, --listening
                                                                              display listening server sockets
                    -a, --all, --listening display all sockets (default: connected)
                    -o, --timers
                                                                              display timers
                   -F, --fib
                                                                               display Forwarding Information Base (default)
                   -C, --cache
                                                                               display routing cache instead of FIB
     \ensuremath{\mbox{\sc Kocket}} = \{-t|--tcp\} \ \{-u|--udp\} \ \{-w|--raw\} \ \{-x|--unix\} \ --ax25 \ --ipx \ --netrom \ --netrom \ --ax25 \ --ipx \ --netrom \
     <af>=Use '-6|-4' or '-A <af>' or '--<af>'; default: inet</a>
     List of possible address families (which support routing):
         inet (DARPA Internet) inet6 (IPv6) netrom (AMPR NET/ROM)
```

tools netstat, on page 489

## tools stun-client

Discover the local device's external IP address when that device is located behind a NAT device. This command obtains a port mapping for the device and optionally discovers properties about the Network Address Translator (NAT) between the local device and a server. This command is similar to a standard Linux **stun**, **stunc**, and **stun-client** commands.

Device discovery is done using the Session Traversal Utilities for NAT (STUN) protocol, which is defined in RFC 5389 .

 $\textbf{tools stun-client [options } options] \textbf{ server } (domain-name \mid ip\text{-}address) \textbf{ [port } port\text{-}number] \textbf{ [vpn } vpn\text{-}id] \\ \textbf{tools } \textbf{stun-client } \textbf{help}$ 

#### **Syntax Description**

help	Command Help: Display all the command options.
options options	Command Options: See the Example Output below for a list of all the <b>tools stun-client</b> command options.
server (domain-name   ip-address)   [port port-number]	Remote STUN Server: Remote server to attach to, and port to use to reach the server. The default port number for UDP and TCP is 3478.
vpn vpn-id	Specific VPN: Run the command in a specific VPN.
	Default: VPN 0

### **Command History**

Release	Modification
16.2	Command introduced.

#### **Examples**

#### Example 1

Perform a generic basic binding STUN test against Googles STUN server:

```
vEdge# tools stun-client vpn 0 options "--mode basic stun.1.google.com 19302" stunclient --mode basic stun.1.google.com 19302 in VPN 0 Binding test: success Local address: 50.247.64.109:56485 Mapped address: 50.247.64.109:56485
```

#### Example 2

Perform a full test to detect NAT type against Google's STUN server:

```
vEdge# tools stun-client vpn 0 options "--mode full stun.1.google.com 19302"
stunclient --mode full stun.1.google.com 19302 in VPN 0
Binding test: success
Local address: 50.247.64.109:33760
Mapped address: 50.247.64.109:33760
Behavior test: success
Nat behavior: Direct Mapping
Filtering test: success
Nat filtering: Endpoint Independent Filtering
```

#### Example 3

Perform a full NAT detection test using UDP source port 12346 (the default DTLS/IPsec port) against Google's STUN server:

```
vEdge# tools stun-client vpn 0 options "--mode full --localport 12346 stun.l.google.com
19302"
stunclient --mode full --localport 12346 stun.l.google.com 19302 in VPN 0
Binding test: success
```

```
Local address: 50.247.64.109:12346
Mapped address: 50.247.64.109:12346
Behavior test: success
Nat behavior: Direct Mapping
Filtering test: success
Nat filtering: Endpoint Independent Filtering
```

#### Example 4

Display help for the **tools stun-client** command:

```
vEdge# tools stun-client help
The following options are supported:
    --mode MODE
   --localaddr INTERFACE
    --localport PORTNUMBER
    --family IPVERSION
   --protocol PROTO
    --verbosity LOGLEVEL
   --help
--mode (basic | full)
"basic" mode is the default and indicates that the client should perform a STUN binding
only. "full" mode indicates that the client should attempt to diagnose NAT behavior and
filtering methodologies if the server supports this mode. The NAT filtering test is supported
only for UDP.
--localaddr INTERFACE or IPADDRESS
Name of an interface (such as "eth0") or one of the available IP addresses assigned to a
network interface present on the host. The interface chosen is the preferred address for
sending and receiving responses with the remote server. The default is to let the system
decide
which address to send on and to listen for responses on all addresses (INADDR ANY).
--localport PORTNUM
PORTNUM is a value between 1 to 65535. It is the UDP or TCP port that the primary and
alternate interfaces listen on as the primary port for binding requests. If not specified,
system randomly chooses an available port.
--family IPVERSION
IPVERSION is either "4" or "6" to specify the usage of IPv4 or IPv6. The default value is
"4".
--protocol (udp | tcp)
"udp" is the default.
--verbosity LOGLEVEL
Set the logging verbosity level. 0 is the default, for minimal output and logging). 1 shows
slightly more, and 2 and higher show even more.
EXAMPLES
stunclient stunserver.org 3478
   Perform a simple binding test request with the server, listening at "stunserver.org".
stunclient --mode full --localport 9999 12.34.56.78
   Perform a full set of UDP NAT behavior tests from local port 9999 to the server, listening
    at IP address 12.34.56.78 (port 3478).
```

```
stunclient --protocol tcp stun.selbie.com
   Performs a simple binding test using TCP to server, listening on the default port of
3478
   at stun.selbie.com.
```

## traceroute

Display the path that packets take to reach a host or IP address on the network.

**traceroute interface** interface-name [size bytes] [options options] (hostname | ip-address)

traceroute vpn vpn-id [interface interface-name] [size bytes] [options " options "] (hostname | ip-address)

interface interface-name	Interface: Interface through which traceroute probe should send packets.
(hostname   ip-address)	Network Host: Hostname or IPv4 or IPv6 address of a system on the network.
options " options	Options: One or more options for the traceroute probe. <i>option</i> can be one or more of the following. Enclose the options in quotation marks (" ").
	• -d: Set the SO_DEBUG options to socket.
	• - <b>f</b> <i>first-ttl</i> : Report the traceroute probe results starting with the specified hop in the path.
	• -g gateway: Add an IP source route gateway to the outgoing packet.
	• -I (capital letter "i"): Use ICMP echo packets instead of UDP datagrams.
	• -i (lowercase letter "i") <i>interface-name</i> : Network interface from which to obtain the source IP address for outgoing traceroute probe packets.
	• - <b>m</b> <i>maximum-ttl</i> : Set the maximum time-to-live value, which is the maximum number of hops.
	• – <b>n</b> : Print numeric IP addresses.
	• <b>-p</b> <i>port</i> : Base UDP port number to use in traceroute probes. The default port is 33434.
	• -q <i>probes</i> : Number of probes to send per TTL. The default is 3.
	• -r: Bypass the normal route tables, and send the traceroute probe directly to a host.
	• -s source-ip-address: Source IP address to use in the probe packets.
	• -t tos: Type-of-service value to use in the probe packets. The default is 0.
	• –v: Display output in verbose mode.
	• -w wait-time: Time, in seconds, to wait for a response. The default is 3 seconds.
	• - <b>z</b> pause-time: Time, in milliseconds, to pause between probes. The default is 0 milliseconds.

1 *	Probe Packet Size: Size of the traceroute probe packets, in bytes. The maximum packet size is 32,768 bytes.
vpn vpn-id	VPN: VPN in which the network host is located.

Release	Modification
14.1	Command introduced.
14.2	Added interface, options, size, and vpn options.
16.3	Added support for IPv6 host addresses.

## **Usage Guidelines**

When a traceroute packet inside a service VPN arrives on the WAN interface:

• The Cisco vEdge device responds with a source IP of one of the interfaces in the service VPN.

Note

For Cisco vEdge devices, the **traceroute** command does not support UDP.

• The Cisco IOS XE Catalyst SD-WAN device responds with a source IP of the WAN interface where the packet is received.

In both cases, the packets are always encapsulated in IPSec.

#### **Examples**

#### Example 1

```
vEdge-112# traceroute vpn 1 192.168.111.30
Traceroute in vpn 1
traceroute to 192.168.111.30 (192.168.111.30), 30 hops max, 46 byte packets
1 172.23.2.2 (172.23.2.2) 0.171 ms 0.196 ms 0.126 ms
2 100.100.100.11 (100.100.100.11) 0.128 ms 0.197 ms 0.127 ms
3 100.100.100.12 (100.100.100.12) 0.165 ms 0.194 ms 0.146 ms
4 172.23.111.2 (172.23.111.2) 0.218 ms 0.227 ms 0.214 ms
5 192.168.111.30 (192.168.111.30) 1.173 ms 0.824 ms 1.239 ms
```

### Example 2

```
vEdge# traceroute host 10.2.3.12 size 1000 vpn 1 options "-q1 -w1 -m5" Traceroute -q1 -w1 -m5 10.2.3.12 in VPN 1 traceroute to 10.2.3.12 (10.2.3.12), 5 hops max, 1000 byte packets 1 10.20.24.15 (10.20.24.15) 0.254 ms 2 10.0.5.21 (10.0.5.21) 1.318 ms 3 10.2.3.12 (10.2.3.12) 1.310 ms
```

## vshell

Exit from the Cisco SD-WAN CLI to the Linux shell running on the device. In the shell, the default terminal is xterm.

Use the UNIX **exit** command to return to the CLI. If the shell session is inactive, it times out after 15 minutes, and the device returns to the Cisco SD-WAN CLI.

Once you are in the shell, you can use standard Linux commands to perform standard operations, such as listing files, changing directories, and copying files off the device. To edit a file, use the **vi** editor.

#### vshell

#### **Syntax Description**

None

#### **Command History**

Release	Modification
14.1	Command introduced.
15.4	Idle session timeout added.
15.4.3	Having xterm be default terminal added

#### **Example**

#### Example 1

```
vEdge# show version
15.4.3
vEdge# vshell
vEdge$ echo $TERM
xterm
vEdge:~$ exit
exit
vEdge#
```

To open an SSH connection from a vManage NMS to an IOS XE router, you must specify the port number, which is 830:

```
vManage# vshell
vManage:~$ ssh 172.16.255.15 -p 830
admin@172.16.255.15's password:
```
