Configuring Link Bundling on Cisco IOS XR Software

This module describes the configuration of link bundle interfaces on the Cisco XR 12000 Series Router. A link bundle is a group of one or more ports that are aggregated together and treated as a single link. Each bundle has a single MAC, a single IP address, and a single configuration set, such as Quality of Service (QoS).

---

**Note**

Link bundles do not have a one-to-one modular services card association. Member links can terminate on different cards.
Feature History for Configuring Link Bundling

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 3.6.0</td>
<td>This feature was first supported on the Cisco XR 12000 Series Router.</td>
</tr>
</tbody>
</table>
| Release 3.8.0 | This feature was updated as follows:  
  - The **reasons** keyword was removed from the `show bundle bundle-Ether` command and the `show bundle bundle-POS` command. Now, if a port is in a state other than the distributing state, the output of both commands displays the reason.  
  - The **hot-standby** keyword was added to the `bundle maximum-active links` command.  
  - The **lacp fast-switchover** command was added. |
| Release 3.8.4 | Bundle member links are put into new err-disable link interface status and admin-down protocol state when a bundle interface is shut down. |
| Release 3.9.0 | Support for short LACP was added.  
  Support for load balancing was added.  
  Support for POS link bundles, QoS on link bundles, and MPLS TE with FRR on link bundles was added. |
| Release 4.1.0 | Support for the following link bundling features was added:  
  - ACLs  
  - BFD on bundle members (Ethernet and POS SPAs only as supported by the Cisco XR 12000 SIP-600, SIP-401, SIP-501 and SIP-601) For more information about BFD support, see the “Configuring Bidirectional Forwarding Detection on Cisco IOS XR Software” module.  
  - IPv6  
  - L2TPv3 with core-facing link bundles  
  - MAC accounting  
  - mVPNv4 with edge-facing link bundles  
  - 6PE with link bundles on the edge (with MPLS core)  
  - PIM IPv6  
  - Unequal bandwidth  
  - uRPF  
  - VPLS with core-facing link bundles (Ethernet and POS SPAs only as supported by the Cisco XR 12000 SIP-600, SIP-401, SIP-501 and SIP-601)  
  - VPLS with link bundles as core (Ethernet and POS SPAs only as supported by the Cisco XR 12000 SIP-600, SIP-401, SIP-501 and SIP-601) |
Prerequisites for Configuring Link Bundling

You must be in a user group associated with a task group that includes the proper task IDs. The command reference guides include the task IDs required for each command. If you suspect user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The prerequisites for link bundling depend on the platform on which you are configuring this feature. This section includes the following information:

- Prerequisites for Configuring Link Bundling on a Cisco XR 12000 Series Router, page 205

Prerequisites for Configuring Link Bundling on a Cisco XR 12000 Series Router

Before configuring link bundling on a Cisco XR 12000 Series Router, be sure that the following tasks and conditions are met:

- You know the interface IP address.
- You know which links should be included in the bundle you are configuring.
- You have at least one of the following SIPs installed in the router:
  - Cisco XR 12000 SIP-401
  - Cisco XR 12000 SIP-501
  - Cisco XR 12000 SIP-601
- You have at least one of the following Ethernet cards installed in the router:
  - 1-port 10-Gigabit Ethernet SPA
  - 10-port Gigabit Ethernet SPA
  - 8-port Gigabit Ethernet SPA
  - 5-port Gigabit Ethernet SPA
  - 4-port ISE Gigabit Ethernet Line Card
  - 4-port OC-3 POS/SDH SPA
  - 8-port OC-3 POS/SDH SPA
  - 2-port OC-12 POS/SDH SPA
  - 4-port OC-12 POS/SDH SPA
  - 8-port OC-12 POS/SDH SPA
  - 4-port OC-3 POS ISE Line Card
  - 8-port OC-3 POS ISE Line Card
Prerequisites for Configuring Link Bundling

- 12-port OC-3 POS ISE Line Card
- 16-port OC-3 POS ISE Line Card
- 1-port OC-48 POS ISE Line Card
- 4 port OC-12 POS ISE Line Card

Restrictions

After a system upgrade or reload, current link bundling design prevents a bundled interface from remaining in the up state if there are errors encountered on features, such as QOS, configured under it. This behavior applies to bundled interfaces only. Physical interfaces are not effected.

Media Access Control (MAC) Accounting is not supported on Ethernet link bundles.

Features Supported

On the Cisco XR 12000 Series Router, link bundling supports the following features:

- 802.3ad LACP support
- Access Control Lists (ACLs)
- IPv4 unicast and multicast forwarding
- IPv6 unicast and multicast forwarding
- SNF, Routing protocols support over LB interface
- L2TPv3 with core-facing link bundles
- MPLS
- MPLS forwarding
- MPLS traffic engineering (TE)
- MPLS TE for Fast Re-route (FRR)
- mMVPN4 for both core- and edge-facing bundles
- PIM IPv6
- QoS on Link Bundles
- 6PE with link bundles on the edge (with MPLS core)
- Unequal bandwidth
- uRPF
- VPLS with core-facing link bundles (Ethernet and POS SPAs only as supported by the Cisco XR 12000 SIP-600, SIP-401, SIP-501 and SIP-601)
- VPLS with link bundles as core (Ethernet and POS SPAs only as supported by the Cisco XR 12000 SIP-600, SIP-401, SIP-501 and SIP-601)

Features Not Supported

On the Cisco XR 12000 Series Router, link bundling does not support the following features:

- QinQ encapsulation
- Multicast VPNs
Information About Configuring Link Bundling

To configure link bundling, you must understand the following concepts:

- Link Bundling Overview, page 208
- Features and Compatible Characteristics of Link Bundles, page 209
- Link Aggregation Through LACP, page 210
- LACP Short Period Time Intervals, page 211
- Load Balancing, page 212
- Unequal Bandwidth on Link Bundles, page 213
- QoS and Link Bundling, page 213
- MPLS-TE and FRR over Link Bundles, page 213
- Link Bundle Configuration Overview, page 215
- Nonstop Forwarding During RP Switchover, page 215
- Link Switchover, page 216
Link Bundling Overview

The Link Bundling feature allows you to group multiple point-to-point links together into one logical link and provide higher bidirectional bandwidth, redundancy, and load balancing between two routers. A virtual interface is assigned to the bundled link. The component links can be dynamically added and deleted from the virtual interface.

The virtual interface is treated as a single interface on which one can configure an IP address and other software features used by the link bundle. Packets sent to the link bundle are forwarded to one of the links in the bundle.

The advantages of link bundles are as follows:

- Multiple links can span several line cards and SPAs to form a single interface. Thus, the failure of a single link does not cause a loss of connectivity.
- Bundled interfaces increase bandwidth availability, because traffic is forwarded over all available members of the bundle. Therefore, traffic can move onto another link if one of the links within a bundle fails. You can add or remove bandwidth without interrupting packet flow. For example, you can upgrade from an OC-48c PLIM modular services card to an OC-192 PLIM modular services card without interrupting traffic.

All links within a bundle must be of the same type. For example, a bundle can contain all Ethernet interfaces, or it can contain all POS interfaces, but it cannot contain Ethernet and POS interfaces at the same time.

Cisco IOS XR software supports the following methods of forming bundles of Ethernet and POS interfaces:

- IEEE 802.3ad—Standard technology that employs a Link Aggregation Control Protocol (LACP) to ensure that all the member links in a bundle are compatible. Links that are incompatible or have failed are automatically removed from a bundle.
- EtherChannel or POS Channel—Cisco proprietary technology that allows the user to configure links to join a bundle, but has no mechanisms to check whether the links in a bundle are compatible. (EtherChannel applies to Ethernet interfaces, and POS Channel applies to POS interfaces.)

The following types of link bundling are supported on Cisco XR 12000 Series Routers:

- EtherChannel is used bundle multiple Gigabit Ethernet (GE) interfaces.
- Gigabit EtherChannel link bundles are at Layer 2 and use one MAC address and one IP address for all Gigabit Ethernet interfaces in the bundle.
- POS Channel is used to bundle multiple Packet-over-SONET (POS) interfaces.

On Cisco XR 12000 Series Routers, Gigabit EtherChannel and POS Channel link bundling provide the following benefits:

- Flexible, incremental bandwidth
- Transparency to network applications
- Support for IP unicast and MPLS traffic
- Load balancing (equal cost) across all active links on the bundle
- Redundancy: if there is a failure of an individual GE or POS link, the traffic flow through the channel is evenly distributed across the available links.
- Interoperability with link bundling implementations in other Cisco and OEM routers and switches.
- Out-of-service support: a Gigabit EtherChannel or POS Channel is brought down if the minimum number of Gigabit Ethernet or POS links are not up.
- Bandwidth propagation support: bandwidth changes in a Gigabit EtherChannel or POS Channel can be (optionally) propagated to the upper-layer protocols until the amount of bandwidth required in the link bundle exceeds a specified threshold.

**Features and Compatible Characteristics of Link Bundles**

Link bundles support the following features:

- ACL
- Basic IP
- Basic MPLS
- MPLS VPN
- Sampled Netflow
- BGP Policy Accounting
- HSRP/VRRP
- VLAN Bundling (Ethernet only)
- Basic IP
- Basic MPLS
- MPLS VPN
- Inter-AS
- WRED/MDRR per member interface.

The following list describes the properties and limitations of link bundles:

- A bundle contains links, each of which has LACP enabled or disabled. If a bundle contains links, some that have LACP enabled and some that have LACP disabled, the links with LACP disabled are not aggregated in the bundle.
- Bundle membership can span across several modular services cards that are installed in a single router and across SPAS in the same service card.
- The Cisco XR 12000 Series Router supports a maximum of 16 bundles: 16 Etherbundles or 16 POS bundles.
- Physical layer and link layer configuration are performed on individual member links of a bundle.
- Configuration of network layer protocols and higher layer applications is performed on the bundle itself.
- IPv4 and IPv6 addressing is supported on link bundles.
- A bundle can be administratively enabled or disabled. Beginning in Cisco IOS XR Release 3.8.4, when you shut down a bundle interface, the member links are put into err-disable link interface status and admin-down line protocol state. You can show the status of a bundle interface and its members using the `show interfaces` command.
- Each individual link within a bundle can be administratively enabled or disabled.
- Each individual member link within a bundle has unique MAC address.
- If a MAC address is not set on the bundle, the bundle and bundle members inherit the address of the first member.
Each link within a bundle can be configured to allow different keepalive periods on different members.

Load balancing (the distribution of data between member links) is done by flow instead of by packet.

Upper layer protocols, such as routing updates and hellos, are sent over any member link of an interface bundle.

All links within a single bundle must terminate on the same two systems. Both systems must be directly connected.

Bundled interfaces are point-to-point.

A bundle can contain physical links only. Tunnels and VLAN subinterfaces cannot be bundle members. However, you can create VLANs as subinterfaces of bundles.

An IPv4 address configuration on link bundles is identical to an IPv4 address configuration on regular interfaces.

Multicast traffic is load balanced over the members of a bundle. For a given flow, internal processes select the member link, and all traffic for that flow is sent over that member.

**Characteristics of Cisco XR 12000 Series Router Link Bundles**

The following list describes additional properties and limitations of link bundles that are specific to Cisco XR 12000 Series Routers:

- A single bundle supports a maximum of 8 physical links. If you add more than 8 links to a bundle, only 8 of the links function, and the remaining links are automatically disabled.
- A Cisco XR 12000 Series Router supports a maximum of 16 bundles.
- Ethernet link bundles are created in the same way as Ethernet channels, where the user enters the same configuration on both end systems.

**Link Aggregation Through LACP**

Aggregating interfaces on different modular services cards and on SPAs within the same services cards provides redundancy, allowing traffic to be quickly redirected to other member links when an interface or modular services card failure occurs.

The optional Link Aggregation Control Protocol (LACP) is defined in the IEEE 802 standard. LACP communicates between two directly connected systems (or peers) to verify the compatibility of bundle members. The peer can be either another router or a switch. LACP monitors the operational state of link bundles to ensure the following:

- All links terminate on the same two systems.
- Both systems consider the links to be part of the same bundle.
- All links have the appropriate settings on the peer.

LACP transmits frames containing the local port state and the local view of the partner system’s state. These frames are analyzed to ensure both systems are in agreement.

**IEEE 802.3ad Standard**

The IEEE 802.3ad standard typically defines a method of forming Ethernet link bundles. In Cisco IOS XR software, the IEEE 802.3ad standard is used on both Ethernet and POS link bundles.
For each link configured as bundle member, the following information is exchanged between the systems that host each end of the link bundle:

- A globally unique local system identifier
- An identifier (operational key) for the bundle of which the link is a member
- An identifier (port ID) for the link
- The current aggregation status of the link

This information is used to form the link aggregation group identifier (LAG ID). Links that share a common LAG ID can be aggregated. Individual links have unique LAG IDs.

The system identifier distinguishes one router from another, and its uniqueness is guaranteed through the use of a MAC address from the system. The bundle and link identifiers have significance only to the router assigning them, which must guarantee that no two links have the same identifier, and that no two bundles have the same identifier.

The information from the peer system is combined with the information from the local system to determine the compatibility of the links configured to be members of a bundle.

The MAC address of the first link attached to a bundle becomes the MAC address of the bundle itself. The bundle uses this MAC address until that link (the first link attached to the bundle) is detached from the bundle, or until the user configures a different MAC address. The bundle MAC address is used by all member links when passing bundle traffic. Any unicast or multicast addresses set on the bundle are also set on all the member links.

**Note**

We recommend that you avoid modifying the MAC address, because changes in the MAC address can affect packet forwarding.

**LACP Short Period Time Intervals**

As packets are exchanged across member links of a bundled interface, some member links may slow down or time-out and fail. LACP packets are exchanged periodically across these links to verify the stability and reliability of the links over which they pass. The configuration of short period time intervals, in which LACP packets are sent, enables faster detection and recovery from link failures.

**Note**

On the Cisco XR 12000 Series Router, only the default short period (1000 milliseconds) is supported.

Short period time intervals are configured as follows:

- In milliseconds
- In increments of 100 milliseconds
- In the range 100 to 1000 milliseconds
- The default is 1000 milliseconds (1 second)
- Up to 64 member links
- Up to 1280 packets per second (pps)

After 6 missed packets, the link is detached from the bundle.

When the short period time interval is not configured, LACP packets are transmitted over a member link every 30 seconds by default.
When the short period time interval is configured, LACP packets are transmitted over a member link once every 1000 milliseconds (1 second) by default. Optionally, both the transmit and receive intervals can be configured to less than 1000 milliseconds, independently or together, in increments of 100 milliseconds (100, 200, 300, and so on).

When you configure a custom LACP short period transmit interval at one end of a link, you must configure the same time period for the receive interval at the other end of the link.

**Note**
You must always configure the transmit interval at both ends of the connection before you configure the receive interval at either end of the connection. Failure to configure the transmit interval at both ends first results in route flapping (a route going up and down continuously). When you remove a custom LACP short period, you must do it in reverse order. You must remove the receive intervals first and then the transmit intervals.

## Load Balancing

Load balancing is a forwarding mechanism which distributes traffic over multiple links, based on Layer 3 routing information in the router. Per-flow load balancing is supported on all links in the bundle. This scheme achieves load sharing by allowing the router to distribute packets over one of the links in the bundle, that is determined through a hash calculation. The hash calculation is an algorithm for link selection based on certain parameters.

The standard hash calculation is a 3-tuple hashing, using the following parameters:

- IP source address
- IP destination address
- Router ID

7-tuple hashing can also be configured, based on Layer 3 and Layer 4 parameters:

- IP source address
- IP destination address
- Router ID
- Input interface
- IP protocol
- Layer 4 source port
- Layer 4 destination port

When per-flow load balancing and 3-tuple hashing is enabled, all packets for a certain source-destination pair will go through the same link, though there are multiple links available. Per-flow load balancing ensures that packets for a certain source-destination pair arrive in order.

**Note**
For multicast traffic, ingress forwarding is based on the Fabric Multicast Group Identifier (FGID). Egress forwarding over the bundle is based on the bundle load balancing.
Unequal Bandwidth on Link Bundles

In Cisco IOS XR Releases prior to 4.1, all of the interfaces in a link bundle are required to have the same bandwidth characteristic. For example, an OC-3 POS link could be part of a bundle which has other OC-3 links, but it could not be part of a bundle with either OC-12 or OC-48 links.

Unequal bandwidth on link bundles allows links with different bandwidth characteristics to be part of the same bundle. This feature allows a 4:1 ratio in bandwidth characteristic of participating links in the same bundle, which means the following combination of links are supported:

- Bundles with OC-3 and OC-12 links
- Bundles with OC-12 and OC-48 links

The following combination of links are unsupported:

- Bundles with OC-3 and OC-48 links
- Bundles with Gigabit links and 10 Gigabit links
- Bundle with Gigabit and POS links

QoS and Link Bundling

On the Cisco XR 12000 Series Router, QoS features currently supported on Ethernet and Packet-over-SONET (POS) interfaces are also supported on link bundle interfaces.

For complete information on configuring QoS and important restrictions for link bundles, refer to the Cisco XR 12000 Series Router Modular Quality of Service Configuration Guide and the Cisco XR 12000 Series Router Modular Quality of Service Command Reference.

MPLS-TE and FRR over Link Bundles

Beginning with Cisco IOS XR Release 3.9.0, MPLS Traffic Engineering (TE) tunnels and Fast Re-Route (FRR) are supported on Link Bundle interfaces.

MPLS-TE and FRR are supported on the following types of Link Bundle interfaces:

- Packet-over-SONET (POS)
- Ethernet

MPLS-TE is supported, but FRR is not supported on the following types of Link Bundle interfaces:

- VLANs

The following example shows the configuration for FRR:

```plaintext
config
  mpls traffic-eng
        interface Bundle-Ether1
              backup-path tunnel-te 2
```

For complete information on MPLS-TE and FRR, refer to the Cisco XR 12000 Series Router MPLS Configuration Guide and the Cisco XR 12000 Series Router MPLS Command Reference.
Restrictions

The following restrictions apply to MPLS-TE and FRR over Link Bundles in Cisco IOS XR Release 3.9.0:

- The maximum number of links for MPLS-TE and FRR is 100.
- Backup assignments are void if both the primary assignment and the backup assignment are over the same physical Link Bundle interface.
- Packet loss greater than 50ms can happen if a single member link goes down, but the number of currently active members is still above the configured threshold.
- BFD is not supported on bundle interfaces.

MPLS-TE

MPLS-TE software enables an MPLS backbone to replicate and expand the traffic engineering capabilities of Layer 2 ATM and Frame Relay networks. MPLS is an integration of Layer 2 and Layer 3 technologies. By making traditional Layer 2 features available to Layer 3, MPLS enables traffic engineering (TE). With MPLS, TE capabilities are integrated into Layer 3, which optimizes the routing of IP traffic, given the constraints imposed by backbone capacity and topology.

FRR

Fast ReRoute (FRR) is used by MPLS-TE. FRR guarantees that if a TE tunnel fails, traffic is switched to a backup tunnel. FRR provides link protection to LSPs by rerouting traffic carried by LSPs to other links. The ability to configure FRR on a per-LSP basis makes it possible to provide different levels of FRR to tunnels with different bandwidths.

FRR is triggered on Link Bundles in the following ways:

- When the minimum links threshold is reached, FRR is triggered over a Link Bundle interface.
- When the minimum available bandwidth threshold is reached, FRR is triggered over a Link Bundle interface.

CLI

No new CLI commands are introduced in Cisco IOS XR Release 3.9.0.

See Example: Configuring MPLS-TE and FRR over Link Bundles, page 244 for examples of how to configure MPLS-TE and FRR on Link Bundles.

To verify MPLS-TE and FRR over Link Bundles, use any of the following MPLS commands that are documented in the Cisco XR 12000 Series Router MPLS Command Reference:

- show [l cef [ipv4 | mpls] adjacency tunnel-te hardware [ingress | egress] location
- show int tunnel-te * accounting
- sshow mpls traffic-eng fast-reroute database
- show mpls traffic-eng tunnels 1
- show mpls forwarding
- show cef ipv4 adjacency hardware egress location
- show cef ipv4 adjacency bundle-ether 22 hardware egress location
VLANs on an Ethernet Link Bundle

802.1Q VLAN subinterfaces can be configured on 802.3ad Ethernet link bundles. Keep the following information in mind when adding VLANs on an Ethernet link bundle:
- The maximum number of VLANs allowed per bundle is 100.
- The maximum number of bundled VLANs allowed per router is 1600.

Note
The memory requirement for bundle VLANs is slightly higher than standard physical interfaces.

To create a VLAN subinterface on a bundle, include the VLAN subinterface instance with the `interface Bundle-Ether` command, as follows:
```
interface Bundle-Ether interface-bundle-id.subinterface
```

After you create a VLAN on an Ethernet link bundle, all VLAN subinterface configuration is supported on that link bundle.

VLAN subinterfaces can support multiple Layer 2 frame types and services, such as Ethernet Flow Points - EFPs) and Layer 3 services.

Link Bundle Configuration Overview

The following steps provide a general overview of the link bundle configuration. Keep in mind that a link must be cleared of all previous network layer configuration before it can be added to a bundle:

1. In global configuration mode, create a link bundle. To create an Ethernet link bundle, enter the `interface Bundle-Ether` command. To create a POS link bundle, enter the `interface Bundle-POS` command.
2. Assign an IP address and subnet mask to the virtual interface using the `ipv4 address` command.
3. Add interfaces to the bundle you created in Step 1 with the `bundle id` command in the interface configuration submode. You can add up to 32 links to a single bundle.

Note
A link is configured as a member of a bundle from the interface configuration submode for that link.

Nonstop Forwarding During RP Switchover

Cisco IOS XR software supports nonstop forwarding during switchover between active and standby paired RP cards. Nonstop forwarding ensures that there is no change in the state of the link bundles when a switchover occurs.

For example, if an active RP fails, the standby RP becomes operational. The configuration, node state, and checkpoint data of the failed RP are replicated to the standby RP. The bundled interfaces will all be present when the standby RP becomes the active RP.
Note: You do not need to configure anything to guarantee that the standby interface configurations are maintained.

**Link Switchover**

By default, a maximum of 8 links can actively carry traffic on a Cisco XR 12000 Series Router. If one member link in a bundle fails, traffic is redirected to the remaining operational member links. If the active and standby links are running LACP, you can choose between an IEEE standard-based switchover (the default) or a faster proprietary optimized switchover. If the active and standby links are not running LACP, the proprietary optimized switchover option is used. Regardless of the type of switchover you are using, you can disable the wait-while timer, which expedites the state negotiations of the standby link and causes a faster switchover from a failed active link to the standby link.

### How to Configure Link Bundling

This section contains the following procedures:

- Configuring Ethernet Link Bundles, page 216
- Configuring EFP Load Balancing on an Ethernet Link Bundle, page 221
- Configuring VLAN Bundles, page 223
- Configuring POS Link Bundles, page 229
- Configuring the Default LACP Short Period Time Interval, page 234
- Configuring Custom LACP Short Period Time Intervals, page 236

#### Configuring Ethernet Link Bundles

This section describes how to configure an Ethernet link bundle.

**Note:** MAC accounting is not supported on Ethernet link bundles.

**Note:** In order for an Ethernet bundle to be active, you must perform the same configuration on both connection endpoints of the bundle.

**SUMMARY STEPS**

The creation of an Ethernet link bundle involves creating a bundle and adding member interfaces to that bundle, as shown in the steps that follow.

1. `configure`
2. `interface Bundle-Ether bundle-id`
3. `ipv4 address ipv4-address mask`
4. `bundle minimum-active bandwidth kbps`
5. **bundle minimum-active links** *links*
6. **bundle maximum-active links** *links* [hot-standby]
7. **lacp fast-switchover**
8. **exit**
9. **interface** \{GigabitEthernet \| TenGigE\} *interface-path-id*
10. **bundle id** *bundle-id* \{mode \{active \| on \| passive\}\}
11. **bundle port-priority** *priority*
12. **no shutdown**
13. **exit**
14. Repeat Step 8 through Step 11 to add more links to the bundle you created in Step 2.
15. **end**
16. **exit**
17. **exit**
18. Perform Step 1 through Step 15 on the remote end of the connection.
19. **show bundle** Bundle-Ether *bundle-id*
20. **show lacp** Bundle-Ether *bundle-id*

## Detailed Steps

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> RP/0/0/CPU0:router# configure</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> interface Bundle-Ether <em>bundle-id</em></td>
<td>Creates a new Ethernet link bundle with the specified bundle-id. The range is 1 to 65535. This <strong>interface Bundle-Ether</strong> command enters you into the interface configuration submode, where you can enter interface specific configuration commands are entered. Use the <strong>exit</strong> command to exit from the interface configuration submode back to the normal global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> RP/0/0/CPU0:router(config)# interface Bundle-Ether 3</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> ipv4 address <em>ipv4-address</em> <em>mask</em></td>
<td>Assigns an IP address and subnet mask to the virtual interface using the <strong>ipv4 address</strong> configuration subcommand.</td>
</tr>
<tr>
<td><strong>Example:</strong> RP/0/0/CPU0:router(config-if)# ipv4 address 10.1.2.3 255.0.0.0</td>
<td><strong>Note</strong></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
</tbody>
</table>
| **Step 4**  
bundle minimum-active bandwidth *kbps* | (Optional) Sets the minimum amount of bandwidth required before a user can bring up a bundle.  
Example:  
RP/0/0/CPU0:router(config-if)# bundle minimum-active bandwidth 580000 |
| **Step 5**  
bundle minimum-active links *links* | (Optional) Sets the number of active links required before you can bring up a specific bundle.  
Example:  
RP/0/R0/CPU0:router(config-if)# bundle minimum-active links 2 |
| **Step 6**  
bundle maximum-active links *links* [hot-standby] | (Optional) Implements 1:1 link protection for the bundle, which causes the highest-priority link in the bundle to become active and the second-highest-priority link to become the standby. Also, specifies that a switchover between active and standby LACP-enabled links is implemented per a proprietary optimization.  
Note  
The Cisco XR 12000 Series Router does not currently support 1:1 link protection. Therefore, the **bundle maximum-active links** command is not supported on the Cisco XR 12000 Series Router.  
Note  
The priority of the active and standby links is based on the value of the **bundle port-priority** command.  
Example:  
RP/0/0/CPU0:router(config-if)# bundle maximum-active links 1 hot-standby |
| **Step 7**  
lacp fast-switchover | (Optional) If you enabled 1:1 link protection (you set the value of the **bundle maximum-active links** command to 1) on a bundle with member links running LACP, you can optionally disable the wait-while timer in the LACP state machine. Disabling this timer causes a bundle member link in standby mode to expedite its normal state negotiations, thereby enabling a faster switchover from a failed active link to the standby link.  
Note  
The Cisco XR 12000 Series Router does not currently support 1:1 link protection. Therefore, the **lacp fast-switchover** command is not supported on the Cisco XR 12000 Series Router.  
Example:  
RP/0/0/CPU0:router(config-if)# lacp fast-switchover |
| **Step 8**  
exit | Exits interface configuration submode for the Ethernet link bundle.  
Example:  
RP/0/0/CPU0:router(config-if)# exit |
### Command or Action

**Step 9**

```
interface (GigabitEthernet | TenGigE)
interface-path-id
```

**Example:**

```
RP/0/0/CPU0:router(config)# interface GigabitEthernet 1/0/0/0
```

- **Purpose:** Enters interface configuration mode for the specified interface.
- **Action:** Enter the `GigabitEthernet` or `TenGigE` keyword to specify the interface type. Replace the `interface-path-id` argument with the node-id in the rack/slot/module format.

**Step 10**

```
bundle id bundle-id [mode {active | on | passive}]
```

**Example:**

```
RP/0/0/CPU0:router(config-if)# bundle-id 3
```

- **Purpose:** Adds the link to the specified bundle.
- **Action:** To enable active or passive LACP on the bundle, include the optional `mode active` or `mode passive` keywords in the command string.
- **Action:** To add the link to the bundle without LACP support, include the optional `mode on` keywords with the command string.
- **Note:** If you do not specify the `mode` keyword, the default mode is on (LACP is not run over the port).

**Step 11**

```
bundle port-priority priority
```

**Example:**

```
RP/0/0/CPU0:router(config-if)# bundle port-priority 1
```

- **Purpose:** (Optional) If you set the `bundle maximum-active links` command to 1, you must also set the priority of the active link to the highest priority (lowest value) and the standby link to the second-highest priority (next lowest value). For example, you can set the priority of the active link to 1 and the standby link to 2.

**Step 12**

```
no shutdown
```

**Example:**

```
RP/0/0/CPU0:router(config-if)# no shutdown
```

- **Purpose:** (Optional) If a link is in the down state, bring it up. The `no shutdown` command returns the link to an up or down state depending on the configuration and state of the link.

**Step 13**

```
exit
```

**Example:**

```
RP/0/0/CPU0:router(config-if)# exit
```

- **Purpose:** Exits interface configuration submode for the Ethernet interface.
### Command or Action

**Step 14**

```
interface {GigabitEthernet | TenGigE} number
bundle id bundle-id [mode {active | passive | on}]
no shutdown
exit
```

**Example:**

```
RP/0/0/CPU0:router(config)# interface GigabitEthernet 1/0/2/1
RP/0/0/CPU0:router(config-if)# bundle id 3
RP/0/0/CPU0:router(config-if)# bundle port-priority 2
RP/0/0/CPU0:router(config-if)# no shutdown
RP/0/0/CPU0:router(config-if)# exit
```

(Optional) Repeat Step 8 through Step 11 to add more links to the bundle.

### Purpose

**Step 15**

```
end
or
commit
```

**Example:**

```
RP/0/0/CPU0:router(config-if)# end
```

Saves configuration changes.

- When you issue the `end` command, the system prompts you to commit changes:

  Uncommitted changes found, commit them before exiting(yes/no/cancel)?
  [cancel]:

  - Entering `yes` saves configuration changes to the running configuration file, exits the configuration session, and returns the router to EXEC mode.
  - Entering `no` exits the configuration session and returns the router to EXEC mode without committing the configuration changes.
  - Entering `cancel` leaves the router in the current configuration session without exiting or committing the configuration changes.

- Use the `commit` command to save the configuration changes to the running configuration file and remain within the configuration session.

**Step 16**

```
exit
```

**Example:**

```
RP/0/0/CPU0:router(config-if)# exit
```

Exits interface configuration mode.
Configuring EFP Load Balancing on an Ethernet Link Bundle

This section describes how to configure Ethernet flow point (EFP) Load Balancing on an Ethernet link bundle.

By default, Ethernet flow point (EFP) load balancing is enabled. However, the user can choose to configure all egressing traffic on the fixed members of a bundle to flow through the same physical member link. This configuration is available only on an Ethernet Bundle subinterface with Layer 2 transport (l2transport) enabled.

**Note**
If the active members of the bundle change, the traffic for the bundle may get mapped to a different physical link that has a hash value that matches the configured value.

### SUMMARY STEPS

Perform the following steps to configure EFP Load Balancing on an Ethernet link bundle:

1. `configure`
2. `interface Bundle-Ether bundle-id l2transport`
3. `bundle load-balance hash hash-value [auto]`
4. `end`
   or
   `commit`

Configuring VLAN Bundles

This section describes how to configure a VLAN bundle. The creation of a VLAN bundle involves three main tasks:

1. Create an Ethernet bundle
2. Create VLAN subinterfaces and assign them to the Ethernet bundle.
3. Assign Ethernet links to the Ethernet bundle.

These tasks are described in detail in the procedure that follows.

**Note**

In order for a VLAN bundle to be active, you must perform the same configuration on both ends of the bundle connection.

Restrictions

The Cisco XR 12000 Series Router does not currently support 1:1 link protection. Therefore, the `bundle maximum-active links` and `lacp fast-switchover` commands are not supported on the Cisco XR 12000 Series Router.

SUMMARY STEPS

The creation of a VLAN link bundle is described in the steps that follow.

1. `configure`
2. `interface Bundle-Ether bundle-id`
3. `ipv4 address ipv4-address mask`
4. `bundle minimum-active bandwidth kbps`
5. `bundle minimum-active links links`
6. `bundle maximum-active links links [hot-standby]`
7. `lacp fast-switchover`
8. `exit`
9. `interface Bundle-Ether bundle-id.vlan-id`
10. `dot1q vlan vlan-id`
11. `ipv4 address ipv4-address mask`
12. `no shutdown`
13. `exit`
14. Repeat Step 9 through Step 12 to add more VLANS to the bundle you created in Step 2.
15. `end`
16. `exit`
17. `exit`
18. `configure`
19. `interface {GigabitEthernet | TenGigE} interface-path-id`
20. `bundle id bundle-id [mode {active | on | passive}]`
21. `bundle port-priority priority`
22. `no shutdown`
23. Repeat Step 19 through Step 21 to add more Ethernet Interfaces to the bundle you created in Step 2.
24. `end`
   or
   `commit`
25. Perform Step 1 through Step 23 on the remote end of the connection.
26. `show bundle Bundle-Ether bundle-id`
27. `show vlan interface`
28. `show vlan trunks [{GigabitEthernet | TenGigE | Bundle-Ether} interface-path-id] [brief | summary] [location node-id]`

### Detailed Steps

### Configuring Link Bundling on Cisco IOS XR Software

#### How to Configure Link Bundling

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 6    | `bundle maximum-active links links [hot-standby]` | (Optional) Implements 1:1 link protection for the bundle, which causes the highest-priority link in the bundle to become active and the second-highest-priority link to become the standby. Also, specifies that a switchover between active and standby LACP-enabled links is implemented per a proprietary optimization.  

**Example:**  
RP/0/0/CPU0:router(config-if)# bundle maximum-active links 1 hot-standby  

**Note** The Cisco XR 12000 Series Router does not currently support 1:1 link protection. Therefore, the `bundle maximum-active links` command is not supported on the Cisco XR 12000 Series Router.  

**Note** The priority of the active and standby links is based on the value of the `bundle port-priority` command. |
| 7    | `lacp fast-switchover` | (Optional) If you enabled 1:1 link protection (you set the value of the `bundle maximum-active links` command to 1) on a bundle with member links running LACP, you can optionally disable the wait-while timer in the LACP state machine. Disabling this timer causes a bundle member link in standby mode to expedite its normal state negotiations, thereby enabling a faster switchover from a failed active link to the standby link.  

**Example:**  
RP/0/0/CPU0:router(config-if)# lacp fast-switchover  

**Note** The Cisco XR 12000 Series Router does not currently support 1:1 link protection. Therefore, the `lacp fast-switchover` command is not supported on the Cisco XR 12000 Series Router. |
| 8    | `exit` | Exits the interface configuration submode.  

**Example:**  
RP/0/0/CPU0:router(config-if)# exit |
### Command or Action

<table>
<thead>
<tr>
<th>Step 9</th>
<th>interface Bundle-Ether bundle-id.vlan-id</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>RP/0/0/CPU0:router#(config)# interface Bundle-Ether 3.1</td>
</tr>
</tbody>
</table>

- **Purpose**: Creates a new VLAN, and assigns the VLAN to the Ethernet bundle you created in Step 2. Replace the *bundle-id* argument with the *bundle-id* you created in Step 2. Replace the *vlan-id* with a subinterface identifier. Range is from 1 to 4094 inclusive (0 and 4095 are reserved).

- **Note**: When you include the *vlan-id* argument with the `interface Bundle-Ether bundle-id` command, you enter subinterface configuration mode.

<table>
<thead>
<tr>
<th>Step 10</th>
<th>dot1q vlan vlan-id</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>RP/0/0/CPU0:router#(config-subif)# dot1q vlan 10</td>
</tr>
</tbody>
</table>

- **Purpose**: Assigns a VLAN to the subinterface. Replace the *vlan-id* argument with a subinterface identifier. Range is from 1 to 4094 inclusive (0 and 4095 are reserved).

<table>
<thead>
<tr>
<th>Step 11</th>
<th>ipv4 address ipv4-address mask</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>RP/0/0/CPU0:router#(config-subif)# ipv4 address 10.1.2.3/24</td>
</tr>
</tbody>
</table>

- **Purpose**: Assigns an IP address and subnet mask to the subinterface.

<table>
<thead>
<tr>
<th>Step 12</th>
<th>no shutdown</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>RP/0/0/CPU0:router#(config-subif)# no shutdown</td>
</tr>
</tbody>
</table>

- **Purpose**: (Optional) If a link is in the down state, bring it up. The `no shutdown` command returns the link to an up or down state depending on the configuration and state of the link.

<table>
<thead>
<tr>
<th>Step 13</th>
<th>exit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>RP/0/0/CPU0:router#(config-subif)# exit</td>
</tr>
</tbody>
</table>

- **Purpose**: Exits subinterface configuration mode for the VLAN subinterface.

<table>
<thead>
<tr>
<th>Step 14</th>
<th>Repeat Step 9 through Step 12 to add more VLANS to the bundle you created in Step 2.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>interface Bundle-Ether bundle-id.vlan-id</td>
</tr>
<tr>
<td></td>
<td>dot1q vlan vlan-id</td>
</tr>
<tr>
<td></td>
<td>ipv4 address ipv4-address mask</td>
</tr>
<tr>
<td></td>
<td>no shutdown</td>
</tr>
<tr>
<td></td>
<td>exit</td>
</tr>
</tbody>
</table>

- **Example**: RP/0/0/CPU0:router#(config-subif)# interface Bundle-Ether 3.1 RP/0/0/CPU0:router#(config-subif)# dot1q vlan 20 RP/0/0/CPU0:router#(config-subif)# ipv4 address 20.2.3.4/24 RP/0/0/CPU0:router#(config-subif)# no shutdown exit

- **Purpose**: (Optional) Adds more subinterfaces to the bundle.
Configuring Link Bundling on Cisco IOS XR Software

How to Configure Link Bundling

HC-227
Cisco IOS XR Interface and Hardware Component Configuration Guide for the Cisco XR 12000 Series Router
OL-24667-01

Step 15

**Command or Action**

- `end`
- `commit`

**Example:**

RP/0/0/CPU0:router(config-subif)# end

or

RP/0/0/CPU0:router(config-subif)# commit

**Purpose**

Saves configuration changes.

- When you issue the `end` command, the system prompts you to commit changes:

Uncommitted changes found, commit them before exiting(yes/no/cancel)? [cancel]:

  - Entering **yes** saves configuration changes to the running configuration file, exits the configuration session, and returns the router to EXEC mode.
  - Entering **no** exits the configuration session and returns the router to EXEC mode without committing the configuration changes.
  - Entering **cancel** leaves the router in the current configuration session without exiting or committing the configuration changes.

- Use the `commit` command to save the configuration changes to the running configuration file and remain within the configuration session.

Step 16

**Command or Action**

- `exit`

**Example:**

RP/0/0/CPU0:router(config-subif)# end

**Purpose**

Exits interface configuration mode.

Step 17

**Command or Action**

- `exit`

**Example:**

RP/0/0/CPU0:router(config)# exit

**Purpose**

Exits global configuration mode.

Step 18

**Command or Action**

- `configure`

**Example:**

RP/0/RP0/CPU0:router # configure

**Purpose**

Enters global configuration mode.

Step 19

**Command or Action**

- `interface {GigabitEthernet | TenGigE} interface-path-id`

**Example:**

RP/0/0/CPU0:router(config)# interface GigabitEthernet 1/0/0/0

**Purpose**

Enters interface configuration mode for the Ethernet interface you want to add to the Bundle.

Enter the **GigabitEthernet** or **TenGigE** keyword to specify the interface type. Replace the **interface-path-id** argument with the node-id in the rack/slot/module format.

**Note**

A VLAN bundle is not active until you add an Ethernet interface on both ends of the link bundle.
### Command or Action

| Step 20 | Bundle id bundle-id [mode {active | on | passive}] | Purpose |
|---------|---------------------------------------------------|---------|
| Example: | RP/0/0/CPU0:router(config-if)# bundle-id 3 | Adds an Ethernet interface to the bundle you configured in Step 2 through Step 13. |
|         |                                                   | To enable active or passive LACP on the bundle, include the optional **mode active** or **mode passive** keywords in the command string. |
|         |                                                   | To add the interface to the bundle without LACP support, include the optional **mode on** keywords with the command string. |
| Note    | If you do not specify the **mode** keyword, the default mode is **on** (LACP is not run over the port). |

| Step 21 | Bundle port-priority priority | (Optional) If you set the **bundle maximum-active links** command to 1, you must also set the priority of the active link to the highest priority (lowest value) and the standby link to the second-highest priority (next lowest value). For example, you can set the priority of the active link to 1 and the standby link to 2. |
| Example: | RP/0/0/CPU0:router(config-if)# bundle port-priority 1 | |

| Step 22 | No shutdown | (Optional) If a link is in the down state, bring it up. The **no shutdown** command returns the link to an up or down state depending on the configuration and state of the link. |
| Example: | RP/0/0/CPU0:router(config-if)# no shutdown | |

| Step 23 | Repeat Step 19 through Step 21 to add more Ethernet interfaces to the VLAN bundle. |

| Step 24 | End or commit | Saves configuration changes. |
| Example: | RP/0/0/CPU0:router(config-subif)# end or commit | |

- **End** command: Exits the configuration session and returns the router to EXEC mode.
- **Commit** command: Saves the configuration changes to the running configuration file and remains in the configuration session.
- **No** command: Exits the configuration session without committing the configuration changes.
- **Yes** command: Saves the configuration changes to the running configuration file, exits the configuration session, and returns the router to EXEC mode.
- **Cancel** command: Leaves the router in the current configuration session without exiting or committing the configuration changes.

- When you issue the **end** command, the system prompts you to commit changes:
  ```
  Uncommitted changes found, commit them before exiting(yes/no/cancel)? [cancel]:
  ```

- Entering **yes** saves configuration changes to the running configuration file, exits the configuration session, and returns the router to EXEC mode.
- Entering **no** exits the configuration session and returns the router to EXEC mode without committing the configuration changes.
- Entering **cancel** leaves the router in the current configuration session without exiting or committing the configuration changes.
- Use the **commit** command to save the configuration changes to the running configuration file and remain within the configuration session.
Configuring Link Bundling on Cisco IOS XR Software

How to Configure Link Bundling

This section describes how to configure a POS link bundle.

Note

In order for a POS bundle to be active, you must perform the same configuration on both connection endpoints of the POS bundle.
SUMMARY STEPS

The creation of a bundled POS interface involves configuring both the bundle and the member interfaces, as shown in the following steps.

1. configure
2. interface Bundle-POS bundle-id
3. ipv4 address ipv4-address mask
4. bundle minimum-active bandwidth kbps
5. bundle minimum-active links links
6. bundle maximum-active links links [hot-standby]
7. lacp fast-switchover
8. exit
9. interface POS number
10. bundle id bundle-id [mode {active | on | passive}]
11. bundle port-priority priority
12. no shutdown
13. exit
14. Repeat Step 8 through Step 11 to add more links to the bundle you created in Step 2.
15. end
   or
   commit
16. exit
17. exit
18. Perform Step 1 through Step 15 on the remote end of the connection.
19. show bundle Bundle-POS bundle-id
20. show lacp bundle Bundle-POS bundle-id

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>

<td>RP/0/0/CPU0:router(config)# interface POS 0/1/0/0</td>
</tr>
</tbody>
</table>
### Command or Action

**Step 10** `bundle id bundle-id [mode {active | passive | on}]`

**Example:**
```
RP/0/0/CPU0:router(config-if)# bundle-id 3
```

**Purpose**
- Adds the link to the specified bundle.
- To enable active or passive LACP on the bundle, include the optional `mode active` or `mode passive` keywords in the command string.
- To add the link to the bundle without LACP support, include the optional `mode on` keywords with the command string.

**Note** If you do not specify the `mode` keyword, the default mode is `on` (LACP is not run over the port).

**Step 11** `bundle port-priority priority`

**Example:**
```
RP/0/0/CPU0:router(config-if)# bundle port-priority 1
```

**Purpose**
(Optional) If you set the `bundle maximum-active links` command to 1, you must also set the priority of the active link to the highest priority (lowest value) and the standby link to the second-highest priority (next lowest value). For example, you can set the priority of the active link to 1 and the standby link to 2.

**Step 12** `no shutdown`

**Example:**
```
RP/0/0/CPU0:router(config-if)# no shutdown
```

**Purpose**
Removes the shutdown configuration which forces the interface administratively down. The `no shutdown` command then returns the link to an up or down state, depending on the configuration and state of the link.

**Step 13** `exit`

**Example:**
```
RP/0/0/CPU0:router# exit
```

**Purpose**
Exits the interface configuration submode for the POS interface.

**Step 14** Repeat Step 8 through Step 11 to add more links to a bundle

**Purpose**
(Optional) Adds more links to the bundle you created in Step 2.
<table>
<thead>
<tr>
<th>Step 15</th>
<th>end or commit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>RP/0/0/CPU0:router(config-if)# end or RP/0/0/CPU0:router(config-if)# commit</td>
</tr>
</tbody>
</table>
| Purpose: | Saves configuration changes.  
  - When you issue the `end` command, the system prompts you to commit changes:  
    Uncommitted changes found, commit them before exiting(yes/no/cancel)?  
    [cancel]:  
    - Entering `yes` saves configuration changes to the running configuration file, exits the configuration session, and returns the router to EXEC mode.  
    - Entering `no` exits the configuration session and returns the router to EXEC mode without committing the configuration changes.  
    - Entering `cancel` leaves the router in the current configuration session without exiting or committing the configuration changes.  
  - Use the commit command to save the configuration changes to the running configuration file and remain within the configuration session. |

Configuring the Default LACP Short Period Time Interval

This section describes how to configure the default short period time interval for sending and receiving LACP packets on a Gigabit Ethernet interface. This procedure also enables the LACP short period.

**SUMMARY STEPS**

To enable an LACP short period time interval, using the default time of 1 second, perform the following steps.

1. `configure`
2. `interface GigabitEthernet interface-path`
3. `bundle id number mode active`
4. `lacp period short`
5. `commit`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> RP/0/0/CPU0:router# configure</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> interface GigabitEthernet interface-path</td>
<td>Creates a Gigabit Ethernet interface and enters interface configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> RP/0/0/CPU0:router(config)# interface GigabitEthernet 0/0/0/1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> bundle id number mode active</td>
<td>Specifies the bundle interface and puts the member interface in active mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> RP/0/0/CPU0:router(config-if)# bundle id 1 mode active</td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

#### Step 4
```
lacp period short
```

**Example:**
```
RP/0/0/CPU0:router(config-if)# lacp period short
```

**Purpose:**
Configures a short period time interval for the sending and receiving of LACP packets, using the default time period of 1000 milliseconds or 1 second.

#### Step 5
```
end
```

**or**
```
commit
```

**Example:**
```
RP/0/0/CPU0:router(config-if)# end
```

**or**
```
RP/0/0/CPU0:router(config-if)# commit
```

**Purpose:**
Saves configuration changes.

- When you issue the **end** command, the system prompts you to commit changes:
  
  Uncommitted changes found, commit them before exiting (yes/no/cancel)? [cancel]:
  
  - Entering **yes** saves configuration changes to the running configuration file, exits the configuration session, and returns the router to EXEC mode.
  
  - Entering **no** exits the configuration session and returns the router to EXEC mode without committing the configuration changes.
  
  - Entering **cancel** leaves the router in the current configuration session without exiting or committing the configuration changes.

- Use the **commit** command to save the configuration changes to the running configuration file and remain within the configuration session.
Configuring Custom LACP Short Period Time Intervals

This section describes how to configure custom short period time intervals (less than 1000 milliseconds) for sending and receiving LACP packets on a Gigabit Ethernet interface.

**Note**

You must always configure the *transmit* interval at both ends of the connection before you configure the *receive* interval at either end of the connection. Failure to configure the *transmit* interval at both ends first results in route flapping (a route going up and down continuously). When you remove a custom LACP short period, you must do it in reverse order. You must remove the *receive* intervals first and then the *transmit* intervals.

**SUMMARY STEPS**

To configure custom receive and transmit intervals for LACP packets, perform the following steps.

**Router A**

1. configure
2. interface GigabitEthernet interface-path
3. bundle id *number* mode active
4. lacp period short
5. commit

**Router B**

6. configure
7. interface GigabitEthernet interface-path
8. bundle id *number* mode active
9. lacp period short
10. commit

**Router A**

11. configure
12. interface GigabitEthernet interface-path
13. lacp period short transmit *interval*
14. commit

**Router B**

15. configure
16. interface GigabitEthernet interface-path
17. lacp period short transmit *interval*
18. commit

**Router A**

19. configure
20. interface GigabitEthernet interface-path
21. lACP period short receive interval
22. commit

Router B
23. configure
24. interface GigabitEthernet interface-path
25. lACP period short receive interval
26. commit or end

</tbody>
</table>
| **Step 7** | interface GigabitEthernet interface-path
**Example:**
RP/0/0/CPU0:router(config)# interface GigabitEthernet 0/0/0/1 |
| Creates a Gigabit Ethernet interface and enters interface configuration mode. |
| **Step 8** | bundle id number mode active
**Example:**
RP/0/0/CPU0:router(config-if)# bundle id 1 mode active |
| Specifies the bundle interface and puts the member interface in active mode. |
| **Step 9** | lacp period short
**Example:**
RP/0/0/CPU0:router(config-if)# lacp period short |
| Enables the short period time interval. |
| **Step 10** | commit
**Example:**
RP/0/0/CPU0:router(config-if)# commit |
| Saves configuration changes and exits to EXEC mode. |
| **Router A** | configure
**Example:**
RP/0/0/CPU0:router# configure |
| Enters global configuration mode. |
| **Step 12** | interface GigabitEthernet interface-path
**Example:**
RP/0/0/CPU0:router(config)# interface GigabitEthernet 0/0/0/1 |
| Creates a Gigabit Ethernet interface and enters interface configuration mode at one end of the connection. |
| **Step 13** | lacp period short transmit interval
**Example:**
RP/0/0/CPU0:router(config-if)# lacp period short transmit 500 |
| Configures the short period transmit time interval for LACP packets at one end of the connection. Valid values are 100 to 1000 milliseconds in multiples of 100, such as 100, 200, 300, and so on. |
| **Step 14** | commit
**Example:**
RP/0/0/CPU0:router(config-if)# commit |
| Saves configuration changes and exits to EXEC mode. |
| **Router B** | configure
**Example:**
RP/0/0/CPU0:router# configure |
| Enters global configuration mode. |
### Command or Action | Purpose
--- | ---
**Step 16** | `interface GigabitEthernet interface-path`<br>Example:<br>RP/0/0/CPU0:router(config)# interface GigabitEthernet 0/0/0/1 | Creates a Gigabit Ethernet interface and enters interface configuration mode at one end of the connection.  

**Step 17** | `lacp period short transmit interval`<br>Example:<br>RP/0/0/CPU0:router(config-if)# lacp period short transmit 500 | Configures the short period transmit time interval for LACP packets at one end of the connection. Valid values are 100 to 1000 milliseconds in multiples of 100, such as 100, 200, 300, and so on.  

**Step 18** | `commit`<br>Example:<br>RP/0/0/CPU0:router(config-if)# commit | Saves configuration changes and exits to EXEC mode.  

**Router A**<br>**Step 19** | `configure`<br>Example:<br>RP/0/0/CPU0:router# configure | Enters global configuration mode.  

**Step 20** | `interface GigabitEthernet interface-path`<br>Example:<br>RP/0/0/CPU0:router(config)# interface GigabitEthernet 0/0/0/1 | Creates a Gigabit Ethernet interface and enters interface configuration mode at one end of the connection.  

**Step 21** | `lacp period short receive interval`<br>Example:<br>RP/0/0/CPU0:router(config-if)# lacp period short receive 500 | Configures the short period receive time interval for LACP packets at one end of the connection. Valid values are 100 to 1000 milliseconds in multiples of 100, such as 100, 200, 300, and so on.  

**Step 22** | `commit`<br>Example:<br>RP/0/0/CPU0:router(config-if)# commit | Saves configuration changes and exits to EXEC mode.  

**Router B**<br>**Step 23** | `configure`<br>Example:<br>RP/0/0/CPU0:router# configure | Enters global configuration mode.
### Configuration Examples for Link Bundling

This section contains the following examples:

- Example: Configuring an Ethernet Link Bundle, page 241
- Example: Configuring a VLAN Link Bundle, page 241
- Example: Configuring a POS Link Bundle, page 242
- Example: Configuring EFP Load Balancing on an Ethernet Link Bundle, page 242
- Examples: Configuring LACP Short Periods, page 243
- Example: Configuring MPLS-TE and FRR over Link Bundles, page 244

#### Command or Action

<table>
<thead>
<tr>
<th>Step 24</th>
<th>interface GigabitEthernet interface-path</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>RP/0/0/CPU0:router(config)# interface GigabitEthernet 0/0/0/1</td>
</tr>
</tbody>
</table>

**Purpose:** Creates a Gigabit Ethernet interface and enters interface configuration mode at one end of the connection.

<table>
<thead>
<tr>
<th>Step 25</th>
<th>lacp period short receive interval</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>RP/0/0/CPU0:router(config-if)# lacp period short receive 500</td>
</tr>
</tbody>
</table>

**Purpose:** Configures the short period receive time interval for LACP packets at one end of the connection.

Valid values are 100 to 1000 milliseconds in multiples of 100, such as 100, 200, 300, and so on.

<table>
<thead>
<tr>
<th>Step 26</th>
<th>end or commit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>RP/0/0/CPU0:router(config-if)# end or RP/0/0/CPU0:router(config-if)# commit</td>
</tr>
</tbody>
</table>

**Purpose:** Saves configuration changes.

- When you issue the `end` command, the system prompts you to commit changes:
  
  Uncommitted changes found, commit them before exiting (yes/no/cancel)? [cancel]:
  
  - Entering `yes` saves configuration changes to the running configuration file, exits the configuration session, and returns the router to EXEC mode.
  - Entering `no` exits the configuration session and returns the router to EXEC mode without committing the configuration changes.
  - Entering `cancel` leaves the router in the current configuration session without exiting or committing the configuration changes.

- Use the `commit` command to save the configuration changes to the running configuration file and remain within the configuration session.
Example: Configuring an Ethernet Link Bundle

The following example shows how to join two ports to form an EtherChannel bundle running LACP:

```bash
RP/0/RP0/CPU0:Router# config
RP/0/RP0/CPU0:Router(config)# interface Bundle-Ether 3
RP/0/RP0/CPU0:Router(config-if)# ipv4 address 1.2.3.4/24
RP/0/RP0/CPU0:Router(config-if)# bundle minimum-active bandwidth 620000
RP/0/RP0/CPU0:Router(config-if)# bundle minimum-active links 1
RP/0/RP0/CPU0:Router(config-if)# bundle maximum-active links 1 hot-standby
RP/0/RP0/CPU0:Router(config-if)# lacp fast-switchover
RP/0/RP0/CPU0:Router(config-if)# exit
RP/0/RP0/CPU0:Router(config)# interface TenGigE 0/3/0/0
RP/0/RP0/CPU0:Router(config-if)# bundle id 3 mode active
RP/0/RP0/CPU0:Router(config-if)# bundle port-priority 1
RP/0/RP0/CPU0:Router(config-if)# no shutdown
RP/0/RP0/CPU0:Router(config)# interface TenGigE 0/3/0/1
RP/0/RP0/CPU0:Router(config-if)# bundle id 3 mode active
RP/0/RP0/CPU0:Router(config-if)# bundle port-priority 2
RP/0/RP0/CPU0:Router(config-if)# no shutdown
RP/0/RP0/CPU0:Router(config)# exit
```

Example: Configuring a VLAN Link Bundle

The following example shows how to create and bring up two VLANS on an Ethernet bundle:

```bash
RP/0/RP0/CPU0:Router# config
RP/0/RP0/CPU0:Router(config)# interface Bundle-Ether 1
RP/0/RP0/CPU0:Router(config)# ipv4 address 1.2.3.4/24
RP/0/RP0/CPU0:Router(config)# bundle minimum-active bandwidth 620000
RP/0/RP0/CPU0:Router(config)# bundle minimum-active links 1
RP/0/RP0/CPU0:Router(config)# interface Bundle-Ether 1.1
RP/0/RP0/CPU0:Router(config-subif)# dot1q vlan 10
RP/0/RP0/CPU0:Router(config-subif)# ip addr 10.2.3.4/24
RP/0/RP0/CPU0:Router(config-subif)# no shutdown
RP/0/RP0/CPU0:Router(config-subif)# exit
RP/0/RP0/CPU0:Router(config)# interface Bundle-Ether 1.2
RP/0/RP0/CPU0:Router(config-subif)# dot1q vlan 20
RP/0/RP0/CPU0:Router(config-subif)# ip addr 20.2.3.4/24
RP/0/RP0/CPU0:Router(config-subif)# no shutdown
RP/0/RP0/CPU0:Router(config-subif)# exit
RP/0/RP0/CPU0:Router(config)# interface gig 0/1/5/7
RP/0/RP0/CPU0:Router(config-if)# bundle-id 1 mode act
RP/0/RP0/CPU0:Router(config-if)# commit
RP/0/RP0/CPU0:Router(config-if)# exit
RP/0/RP0/CPU0:Router(config)# exit
RP/0/RP0/CPU0:Router # show vlan trunks
```
Example: Configuring a POS Link Bundle

The following example shows how to join two ports to form a Packet-over-SONET (POS) link bundle:

```
RP/0/0/CPU0:Router# config
RP/0/0/CPU0:Router(config)# interface Bundle-POS 5
RP/0/0/CPU0:Router(config-if)# ipv4 address 1.2.3.4/24
RP/0/0/CPU0:Router(config-if)# bundle minimum-active bandwidth 620000
RP/0/0/CPU0:Router(config-if)# exit
RP/0/0/CPU0:Router(config)# interface POS 0/0/1/0
RP/0/0/CPU0:Router(config-if)# bundle id 5
RP/0/0/CPU0:Router(config-if)# no shutdown
RP/0/0/CPU0:Router(config-if)# exit
RP/0/0/CPU0:Router(config)# interface POS 0/0/1/1
RP/0/0/CPU0:Router(config-if)# bundle id 5
RP/0/0/CPU0:Router(config-if)# no shutdown
RP/0/0/CPU0:Router(config-if)# exit
```

Example: Configuring EFP Load Balancing on an Ethernet Link Bundle

The following example shows how to configure all egressing traffic on the fixed members of a bundle to flow through the same physical member link automatically.

```
RP/0/RP0/CPU0:router# configuration terminal
RP/0/RP0/CPU0:router(config)# interface bundle-ether 1.1 l2transport
RP/0/RP0/CPU0:router(config-subif)# bundle load-balancing hash auto
```

The following example shows how to configure all egressing traffic on the fixed members of a bundle to flow through a specified physical member link.

```
RP/0/RP0/CPU0:router# configuration terminal
RP/0/RP0/CPU0:router(config)# interface bundle-ether 1.1 l2transport
RP/0/RP0/CPU0:router(config-subif)# bundle load-balancing hash 1
```
Examples: Configuring LACP Short Periods

The following example shows how to configure the LACP short period time interval to the default time of 1000 milliseconds (1 second):

```plaintext
config
interface gigabitethernet 0/0/0/1
  bundle id 1 mode active
  lacp period short
commit
```

The following example shows how to configure custom LACP short period transmit and receive intervals to less than the default of 1000 milliseconds (1 second):

**Router A**
```
config
interface gigabitethernet 0/0/0/1
  bundle id 1 mode active
  lacp period short
commit
```

**Router B**
```
config
interface gigabitethernet 0/0/0/1
  bundle id 1 mode active
  lacp period short
commit
```

**Router A**
```
config
interface gigabitethernet 0/0/0/1
  lacp period short transmit 100
commit
```

**Router B**
```
config
interface gigabitethernet 0/0/0/1
  lacp period short transmit 100
commit
```

**Router A**
```
config
interface gigabitethernet 0/0/0/1
  lacp period short receive 100
commit
```

**Router B**
```
config
interface gigabitethernet 0/0/0/1
  lacp period short receive 100
commit
```
Example: Configuring MPLS-TE and FRR over Link Bundles

The following example shows how to configure MPLS-TE and FRR on a TE1 tunnel:

```config
config
    interface tunnel-te1
        ipv4 unnumbered Loopback0
        autoroute announce
        destination 10.10.10.10
        ! For PBTS: All traffic which has exp set to 2, will take this tunnel.
        policy-class 2
        ! For FRR
        fast-reroute
        record-route
        path-option 1 explicit name PRIMARY

The following example shows how to configure MPLS-TE and FRR on an Ether bundle:

```config
config
    interface Bundle-Ether2
        mtu 1500
        ipv4 address 11.1.1.1 255.255.255.0
        bundle minimum-active links 2
        bundle minimum-active bandwidth 2000000

    interface GigabitEthernet0/3/0/2
        bundle id 2 mode active

    interface GigabitEthernet0/3/0/3
        bundle id 2 mode active
```

**Note**

To trigger FRR using the minimum link threshold, use the `bundle minimum-active links` command and the `bundle minimum-active bandwidth` command in interface submode.

The following example shows how to configure a backup tunnel configuration on PLR:

```config
config
    interface tunnel-te2
    ! backup tunnel configuration on PLR
        ipv4 unnumbered Loopback0
        autoroute announce
        destination 31.0.0.1

    ! mpls traffic-eng
        interface Bundle-Ether1  <=Protected interface.
            ! backup-path tunnel-te 2  <= Backup tunnel
```
