

Managing Software and Configurations

This chapter describes how to manage the ASA software and configurations and includes the following sections:

- [Introduction](#), page 1-1
- [Managing Files](#), page 1-9
- [Configuring the Images and Startup Configuration to Use](#), page 1-13
- [Using the ROM Monitor to Load an Image](#), page 1-14
- [Backing Up Configurations or Other Files](#), page 1-16
- [Downgrading Your Software](#), page 1-25
- [Configuring Auto Update](#), page 1-26

Table 1-1 Zero-Downtime Upgrade Support

Type of Upgrade	Support
Maintenance Release	You can upgrade from any maintenance release to any other maintenance release within a minor release. For example, you can upgrade from 8.4(1) to 8.4(6) without first installing the maintenance releases in between.

Table 1-1 Zero-Downtime Upgrade Support (continued)

Type of Upgrade	Support
Minor Release	<p>You can upgrade from a minor release to the next minor release. You cannot skip a minor release.</p> <p>For example, you can upgrade from 8.2 to 8.3. Upgrading from 8.2 directly to 8.4 is not supported for zero-downtime upgrades; you must first upgrade to 8.3. For models that are not supported on a minor release, you can skip the minor release; for example, for the ASA 5585-X, you can upgrade from 8.2 to 8.4 (the model is not supported on 8.3).</p> <p> Note Zero-downtime upgrades are possible, even when feature configuration is migrated, for example, from 8.2 to 8.3.</p>
Major Release	<p>You can upgrade from the last minor release of the previous version to the next major release.</p> <p>For example, you can upgrade from 8.6 to 9.0, assuming that 8.6 is the last minor version in the 8.x release series for your model. Upgrading from 8.6 directly to 9.1 is not supported for zero-downtime upgrades; you must first upgrade to 9.0. For models that are not supported on a minor release, you can skip the minor release; for example, for the ASA 5585-X, you can upgrade from 8.4 to 9.0 (the model is not supported on 8.5 or 8.6).</p> <p> Note Zero-downtime upgrades are possible, even when feature configuration is migrated, for example, from 8.4 to 9.0.</p>

	Command	Purpose
Step 1	<pre>more system:running-config</pre> <p>Example: hostname# more system:running-config</p>	<p>(If there is a configuration migration) The output shows the configuration on the terminal so that you can back up your configuration. Copy the output from this command, then paste the configuration in to a text file.</p> <p>Note If you are upgrading from a pre-8.3 version, then the running configuration is backed up automatically.</p> <p>For other methods of backing up, see the configuration guide.</p>
Step 2	<pre>copy tftp://server[/path]/asa_image_name {disk0:/ disk1:/}[/path/]asa_image_name</pre> <p>Example: hostname# copy tftp://10.1.1.1/asa901-smp-k9.bin disk0:/asa901-smp-k9.bin</p>	<p>Copies the ASA software to the active unit flash memory. For other methods than TFTP, see the copy command.</p>

	Command	Purpose
Step 3	<pre>copy tftp://server[/path]/asdm_image_name {disk0:/ disk1:/}[/path]/asdm_image_name</pre> <p>Example: <pre>hostname# copy tftp://10.1.1.1/asdm-701.bin disk0:/asdm-701.bin</pre></p>	Copies the ASDM image to the active unit flash memory.
Step 4	<pre>configure terminal</pre> <p>Example: <pre>hostname(config)# configure terminal</pre></p>	If you are not already in global configuration mode, accesses global configuration mode.
Step 5	<pre>show running-config boot system</pre> <p>Example: <pre>hostname(config)# show running-config boot system boot system disk0:/cdisk.bin boot system disk0:/asa841-smp-k9.bin</pre></p>	Shows the current boot images configured (up to 4). The ASA uses the images in the order listed; if the first image is unavailable, the next image is used, and so on. You cannot insert a new image URL at the top of the list; to specify the new image to be first, you must remove any existing entries, and enter the image URLs in the order desired, according to the following steps.
Step 6	<pre>no boot system {disk0:/ disk1:/}[/path]/asa_image_name</pre> <p>Example: <pre>hostname(config)# no boot system disk0:/cdisk.bin hostname(config)# no boot system disk0:/asa841-smp-k9.bin</pre></p>	Removes any existing boot image configurations so you can enter the new boot image as your first choice.
Step 7	<pre>boot system {disk0:/ disk1:/}[/path]/asa_image_name</pre> <p>Example: <pre>hostname(config)# boot system disk0://asa901-smp-k9.bin</pre></p>	Sets the ASA image to boot that you just uploaded. Repeat this command for any backup images you want to use in case this image is unavailable. For example, you can re-enter the images you previously removed in Step 6 .
Step 8	<pre>asdm image {disk0:/ disk1:/}[/path]/asdm_image_name</pre> <p>Example: <pre>hostname(config)# asdm image disk0:/asdm-701.bin</pre></p>	Sets the ASDM image to use that you just uploaded. You can only configure one ASDM image to use, so you do not need to first remove the existing configuration.
Step 9	<pre>write memory</pre> <p>Example: <pre>hostname(config)# write memory</pre></p>	Saves the new settings to the startup configuration.
Step 10	<pre>reload</pre> <p>Example: <pre>hostname# reload</pre></p>	Reloads the ASA.

	Command	Purpose
Step 1	<pre>more system:running-config</pre> <p>Example: active# more system:running-config</p>	<p>(If there is a configuration migration) The output shows the configuration on the terminal so that you can back up your configuration. Copy the output from this command, then paste the configuration in to a text file.</p> <p>Note If you are upgrading from a pre-8.3 version, then the running configuration is backed up automatically.</p> <p>For other methods of backing up, see the configuration guide.</p>
Step 2	<pre>copy tftp://server[/path]/asa_image_name {disk0:/ disk1:/}[path/]asa_image_name</pre> <p>Example: active# copy tftp://10.1.1.1/asa901-smp-k9.bin disk0:/asa901-smp-k9.bin</p>	<p>Copies the ASA software to the active unit flash memory. For other methods than TFTP, see the copy command.</p>
Step 3	<pre>failover exec mate copy /noconfirm tftp://server[/path]/filename {disk0:/ disk1:/}[path/]filename</pre> <p>Example: active# failover exec mate copy /noconfirm tftp://10.1.1.1/asa901-smp-k9.bin disk0:/asa901-smp-k9.bin</p>	<p>Copies the software to the standby unit; be sure to specify the same path as for the active unit.</p>
Step 4	<pre>copy tftp://server[/path]/asdm_image_name {disk0:/ disk1:/}[path/]asdm_image_name</pre> <p>Example: active# copy tftp://10.1.1.1/asdm-701.bin disk0:/asdm-701.bin</p>	<p>Copies the ASDM image to the active unit flash memory.</p>
Step 5	<pre>failover exec mate copy /noconfirm tftp://server[/path]/asdm_image_name {disk0:/ disk1:/}[path/]asdm_image_name</pre> <p>Example: active# failover exec mate copy /noconfirm tftp://10.1.1.1/asdm-701.bin disk0:/asdm-701.bin</p>	<p>Copies the ASDM image to the standby unit; be sure to specify the same path as for the active unit.</p>
Step 6	<pre>configure terminal</pre> <p>Example: active(config)# configure terminal</p>	<p>If you are not already in global configuration mode, accesses global configuration mode.</p>
Step 7	<pre>show running-config boot system</pre> <p>Example: hostname(config)# show running-config boot system boot system disk0:/cdisk.bin boot system disk0:/asa841-smp-k9.bin</p>	<p>Shows the current boot images configured (up to 4). The ASA uses the images in the order listed; if the first image is unavailable, the next image is used, and so on. You cannot insert a new image URL at the top of the list; to specify the new image to be first, you must remove any existing entries, and enter the image URLs in the order desired, according to the following steps.</p>

	Command	Purpose
Step 8	<pre>no boot system {disk0:/ disk1:/} [path/] asa_image_name</pre> <p>Example:</p> <pre>hostname(config)# no boot system disk0:/cdisk.bin hostname(config)# no boot system disk0:/asa841-smp-k9.bin</pre>	Removes any existing boot image configurations so you can enter the new boot image as your first choice.
Step 9	<pre>boot system {disk0:/ disk1:/} [path/] asa_image_name</pre> <p>Example:</p> <pre>hostname(config)# boot system disk0://asa901-smp-k9.bin</pre>	<p>Sets the ASA image to boot that you just uploaded.</p> <p>Repeat this command for any backup images you want to use in case this image is unavailable. For example, you can re-enter the images you previously removed in Step 8.</p>
Step 10	<pre>asdm image {disk0:/ disk1:/} [path/] asdm_image_name</pre> <p>Example:</p> <pre>hostname(config)# asdm image disk0:/asdm-701.bin</pre>	Sets the ASDM image to use that you just uploaded. You can only configure one ASDM image to use, so you do not need to first remove the existing configuration.
Step 11	<pre>write memory</pre> <p>Example:</p> <pre>active(config)# write memory</pre>	Saves the new settings to the startup configuration.
Step 12	<pre>failover reload-standby</pre> <p>Example:</p> <pre>active# failover reload-standby</pre>	<p>Reloads the standby unit to boot the new image.</p> <p>Wait for the standby unit to finish loading. Use the show failover command to verify that the standby unit is in the Standby Ready state.</p>
Step 13	<pre>no failover active</pre> <p>Example:</p> <pre>active# no failover active</pre>	Forces the active unit to fail over to the standby unit.
Step 14	<pre>reload</pre> <p>Example:</p> <pre>active# reload</pre>	Reloads the former active unit (now the new standby unit). If you want to restore this unit to be active after it reloads, enter the failover active command.

	Command	Purpose
Step 1	<pre>more system:running-config</pre> <p>Example: primary# more system:running-config </p>	<p>(If there is a configuration migration) The output shows the configuration on the terminal so that you can back up your configuration. Copy the output from this command, then paste the configuration in to a text file.</p> <p>Note If you are upgrading from a pre-8.3 version, then the running configuration is backed up automatically.</p> <p>For other methods of backing up, see the configuration guide.</p>
Step 2	<pre>copy tftp://server[/path]/asa_image_name {disk0:/ disk1:/}[path/]asa_image_name</pre> <p>Example: primary# copy tftp://10.1.1.1/asa901-smp-k9.bin disk0:/asa901-smp-k9.bin </p>	<p>Copies the ASA software to the primary unit flash memory. For other methods than TFTP, see the copy command.</p>
Step 3	<pre>failover exec mate copy /noconfirm tftp://server[/path]/filename {disk0:/ disk1:/}[path/]filename</pre> <p>Example: primary# failover exec mate copy /noconfirm tftp://10.1.1.1/asa901-smp-k9.bin disk0:/asa901-smp-k9.bin </p>	<p>Copies the software to the secondary unit; be sure to specify the same path as for the primary unit.</p>
Step 4	<pre>copy tftp://server[/path]/asdm_image_name {disk0:/ disk1:/}[path/]asdm_image_name</pre> <p>Example: primary# copy tftp://10.1.1.1/asdm-701.bin disk0:/asdm-701.bin </p>	<p>Copies the ASDM image to the primary unit flash memory.</p>
Step 5	<pre>failover exec mate copy /noconfirm tftp://server[/path]/asdm_image_name {disk0:/ disk1:/}[path/]asdm_image_name</pre> <p>Example: primary# failover exec mate copy /noconfirm tftp://10.1.1.1/asdm-701.bin disk0:/asdm-701.bin </p>	<p>Copies the ASDM image to the secondary unit; be sure to specify the same path as for the active unit.</p>
Step 6	<pre>failover active group 1 failover active group 2</pre> <p>Example: primary# failover active group 1 primary# failover active group 2 </p>	<p>Makes both failover groups active on the primary unit.</p>
Step 7	<pre>configure terminal</pre> <p>Example: primary(config)# configure terminal </p>	<p>If you are not already in global configuration mode, accesses global configuration mode.</p>

	Command	Purpose
Step 8	<pre>show running-config boot system</pre> <p>Example:</p> <pre>hostname(config)# show running-config boot system boot system disk0:/cdisk.bin boot system disk0:/asa841-smp-k9.bin</pre>	Shows the current boot images configured (up to 4). The ASA uses the images in the order listed; if the first image is unavailable, the next image is used, and so on. You cannot insert a new image URL at the top of the list; to specify the new image to be first, you must remove any existing entries, and enter the image URLs in the order desired, according to the following steps.
Step 9	<pre>no boot system {disk0:/ disk1:/} [path/]asa_image_name</pre> <p>Example:</p> <pre>hostname(config)# no boot system disk0:/cdisk.bin hostname(config)# no boot system disk0:/asa841-smp-k9.bin</pre>	Removes any existing boot image configurations so you can enter the new boot image as your first choice.
Step 10	<pre>boot system {disk0:/ disk1:/} [path/]asa_image_name</pre> <p>Example:</p> <pre>hostname(config)# boot system disk0://asa901-smp-k9.bin</pre>	Sets the ASA image to boot that you just uploaded. Repeat this command for any backup images you want to use in case this image is unavailable. For example, you can re-enter the images you previously removed in Step 9 .
Step 11	<pre>asdm image {disk0:/ disk1:/} [path/]asdm_image_name</pre> <p>Example:</p> <pre>hostname(config)# asdm image disk0:/asdm-701.bin</pre>	Sets the ASDM image to use that you just uploaded. You can only configure one ASDM image to use, so you do not need to first remove the existing configuration.
Step 12	<pre>write memory</pre> <p>Example:</p> <pre>primary(config)# write memory</pre>	Saves the new settings to the startup configuration.
Step 13	<pre>failover reload-standby</pre> <p>Example:</p> <pre>primary# failover reload-standby</pre>	Reloads the secondary unit to boot the new image. Wait for the secondary unit to finish loading. Use the show failover command to verify that both failover groups are in the Standby Ready state.
Step 14	<pre>no failover active group 1 no failover active group 2</pre> <p>Example:</p> <pre>primary# no failover active group 1 primary# no failover active group 2</pre>	Forces both failover groups to become active on the secondary unit.
Step 15	<pre>reload</pre> <p>Example:</p> <pre>primary# reload</pre>	Reloads the primary unit. If the failover groups are configured with the preempt command, they automatically become active on their designated unit after the preempt delay has passed. If the failover groups are not configured with the preempt command, you can return them to active status on their designated units using the failover active group command.

	Command	Purpose
Step 1	<pre>more system:running-config</pre> <p>Example: <pre>master# more system:running-config</pre></p>	<p>(If there is a configuration migration) Back up your configuration file. Copy the output from this command, then paste the configuration in to a text file.</p> <p>For other methods of backing up, see the configuration guide.</p>
Step 2	<pre>cluster exec copy /noconfirm tftp://server[/path]/asa_image_name {disk0:/ disk1:/}[/path/]asa_image_name</pre> <p>Example: <pre>master# cluster exec copy /noconfirm tftp://10.1.1.1/asa901-smp-k9.bin disk0:/asa901-smp-k9.bin</pre></p>	<p>Copies the ASA software to all units in the cluster. For other methods than TFTP, see the copy command.</p>
Step 3	<pre>cluster exec copy /noconfirm tftp://server[/path]/asdm_image_name {disk0:/ disk1:/}[/path/]asdm_image_name</pre> <p>Example: <pre>master# cluster exec copy /noconfirm tftp://10.1.1.1/asdm-701.bin disk0:/asdm-701.bin</pre></p>	<p>Copies the ASDM image to all units in the cluster.</p>
Step 4	<pre>configure terminal</pre> <p>Example: <pre>master(config)# configure terminal</pre></p>	<p>If you are not already in global configuration mode, accesses global configuration mode.</p>
Step 5	<pre>show running-config boot system</pre> <p>Example: <pre>hostname(config)# show running-config boot system boot system disk0:/cdisk.bin boot system disk0:/asa841-smp-k9.bin</pre></p>	<p>Shows the current boot images configured (up to 4). The ASA uses the images in the order listed; if the first image is unavailable, the next image is used, and so on. You cannot insert a new image URL at the top of the list; to specify the new image to be first, you must remove any existing entries, and enter the image URLs in the order desired, according to the following steps.</p>
Step 6	<pre>no boot system {disk0:/ disk1:/}[/path/]asa_image_name</pre> <p>Example: <pre>hostname(config)# no boot system disk0:/cdisk.bin hostname(config)# no boot system disk0:/asa841-smp-k9.bin</pre></p>	<p>Removes any existing boot image configurations so you can enter the new boot image as your first choice.</p>
Step 7	<pre>boot system {disk0:/ disk1:/}[/path/]asa_image_name</pre> <p>Example: <pre>hostname(config)# boot system disk0://asa901-smp-k9.bin</pre></p>	<p>Sets the ASA image to boot that you just uploaded.</p> <p>Repeat this command for any backup images you want to use in case this image is unavailable. For example, you can re-enter the images you previously removed in Step 6.</p>

	Command	Purpose
Step 8	<pre>asdm image {disk0:/ disk1:/} [path/] asdm_image_name</pre> <p>Example: hostname(config)# asdm image disk0:/asdm-701.bin</p>	Sets the ASDM image to use that you just uploaded. You can only configure one ASDM image to use, so you do not need to first remove the existing configuration.
Step 9	<pre>write memory</pre> <p>Example: master(config)# write memory</p>	Saves the new settings to the startup configuration.
Step 10	<pre>cluster exec unit slave-unit reload noconfirm</pre> <p>Example: master# cluster exec unit unit2 reload noconfirm</p>	<p>Reload each slave unit by repeating this command for each unit name. To avoid connection loss and allow traffic to stabilize, wait for each unit to come back up (approximately 5 minutes) before reloading the next unit.</p> <p>To view member names, enter cluster exec unit ?, or enter the show cluster info command.</p>
Step 11	<pre>no enable</pre> <p>Example: master(config)# no enable</p>	<p>Disables clustering on the master unit. Wait for 5 minutes for a new master to be selected and traffic to stabilize.</p> <p>Do not enter write memory; when the master unit reloads, you want clustering to be enabled on it.</p>
Step 12	<pre>reload noconfirm</pre> <p>Example: master# reload noconfirm</p>	Reloads the master unit. A new election takes place for a new master unit. When the former master unit rejoins the cluster, it will be a slave.

Managing Files

- [Viewing Files in Flash Memory, page 1-9](#)
- [Deleting Files from Flash Memory, page 1-10](#)
- [Erasing the Flash File System, page 1-10](#)
- [Downloading a File, page 1-11](#)
- [Downloading a File to the Startup or Running Configuration, page 1-12](#)

Viewing Files in Flash Memory

You can view files in flash memory and see information about files as follows:

- To view files in flash memory, enter the following command:

```
hostname# dir [disk0: | disk1:]
```

Enter **disk0:** for the internal flash memory. The **disk1:** keyword represents the external flash memory. The internal flash memory is the default.

For example:

```
hostname# dir
```

```
Directory of disk0:/
500   -rw-  4958208    22:56:20 Nov 29 2004  cdisk.bin
2513  -rw-   4634      19:32:48 Sep 17 2004  first-backup
2788  -rw-   21601    20:51:46 Nov 23 2004  backup.cfg
2927  -rw-  8670632    20:42:48 Dec 08 2004  asdmfile.bin
```

- To view extended information about a specific file, enter the following command:

```
hostname# show file information [path:/] filename
```

The default path is the root directory of the internal flash memory (disk0:/).

For example:

```
hostname# show file information cdisk.bin

disk0:/cdisk.bin:
  type is image (XXX) []
  file size is 4976640 bytes version 7.0(1)
```

The file size listed is for example only.

Deleting Files from Flash Memory

You can remove files from flash memory that you no longer need. To delete a file from flash memory, enter the following command:

```
hostname# delete disk0: filename
```

By default, the file is deleted from the current working directory if you do not specify a path. You may use wildcards when deleting files. You are prompted with the filename to delete, and then you must confirm the deletion.

Erasing the Flash File System

To erase the flash file system, perform the following steps:

-
- Step 1** Connect to the ASA console port according to the instructions in the [“Accessing the ASA Services Module Command-Line Interface”](#) section on page 1-2 or the [“Accessing the Appliance Command-Line Interface”](#) section on page 1-1.
 - Step 2** Power off the ASA, then power it on.
 - Step 3** During startup, press the **Escape** key when you are prompted to enter ROMMON mode.
 - Step 4** Enter the **erase** command, which overwrites all files and erases the file system, including hidden system files.

```
rommon #1> erase [disk0: | disk1: | flash:]
```

Downloading a File

This section describes how to download the application image, ASDM software, a configuration file, or any other file that needs to be downloaded to flash memory.

You can download application images, ASDM images, configuration files, and other files to the internal flash memory or, for the ASA, to the external flash memory from a TFTP, FTP, SMB, HTTP, or HTTPS server.

Guidelines

- For the IPS SSP software module, before you download the IPS software to disk0, make sure at least 50% of the flash memory is free. When you install IPS, IPS reserves 50% of the internal flash memory for its file system.
- You cannot have two files with the same name but with different letter case in the same directory in flash memory. For example, if you attempt to download the file, Config.cfg, to a location that contains the file, config.cfg, you receive the following error message:

```
%Error opening disk0:/Config.cfg (File exists).
```

- For information about installing the Cisco SSL VPN client, see the *Cisco AnyConnect VPN Client Administrator Guide*. For information about installing Cisco Secure Desktop on the ASA, see the *Cisco Secure Desktop Configuration Guide for Cisco ASA 5500 Series Administrators*.
- To configure the ASA to use a specific application image or ASDM image if you have more than one installed, or have installed them in external flash memory, see the [“Configuring the Images and Startup Configuration to Use” section on page 1-13](#).
- For multiple context mode, you must be in the system execution space.

Detailed Steps

To download a file to flash memory, see the following commands for each download server type:

- To copy from a TFTP server, enter the following command:

```
hostname# copy tftp://server[/path]/filename {disk0:/ | disk1:/} [path/] filename
```

- To copy from an FTP server, enter the following command:

```
hostname# copy ftp://[user[:password]@]server[/path]/filename {disk0:/ | disk1:/} [path/] filename
```

- To copy from an HTTP or HTTPS server, enter the following command:

```
hostname# copy http[s]://[user[:password]@]server[:port] [/path]/filename {disk0:/ | disk1:/} [path/] filename
```

- To copy from an SMB server, enter the following command:

```
hostname# copy smb://[user[:password]@]server[/path]/filename {disk0:/ | disk1:/} [path/] filename
```

- To use secure copy, first enable secure shell (SSH), and then enter the following command:

```
hostname# ssh scopy enable
```

From a Linux client, enter the following command:

```
scp -v -pw password filename username@asa_address
```

The **-v** is for verbose, and if **-pw** is not specified, you will be prompted for a password.

Downloading a File to the Startup or Running Configuration

You can download a text file to the running or startup configuration from a TFTP, FTP, SMB, or HTTP(S) server, or from the flash memory.

To configure the ASA to use a specific configuration as the startup configuration, see the [“Configuring the File to Boot as the Startup Configuration”](#) section on page 1-13.

Guidelines

When you copy a configuration to the running configuration, you merge the two configurations. A merge adds any new commands from the new configuration to the running configuration. If the configurations are the same, no changes occur. If commands conflict or if commands affect the running of the context, then the effect of the merge depends on the command. You might get errors, or you might have unexpected results.

Detailed Steps

To copy a file to the startup configuration or running configuration, enter one of the following commands for the appropriate download server:

- To copy from a TFTP server, enter the following command:

```
hostname# copy tftp://server[/path]/filename {startup-config | running-config}
```

- To copy from an FTP server, enter the following command:

```
hostname# copy ftp://[user[:password]@]server[/path]/filename {startup-config | running-config}
```

- To copy from an HTTP or HTTPS server, enter the following command:

```
hostname# copy http[s]://[user[:password]@]server[:port] [/path]/filename {startup-config | running-config}
```

- To copy from an SMB server, enter the following command:

```
hostname# copy smb://[user[:password]@]server[/path]/filename {startup-config | running-config}
```

- To copy from flash memory, enter the following command:

```
hostname# copy {disk0:/ | disk1:/}[path/]filename {startup-config | running-config}
```

For example, to copy the configuration from a TFTP server, enter the following command:

```
hostname# copy tftp://209.165.200.226/configs/startup.cfg startup-config
```

To copy the configuration from an FTP server, enter the following command:

```
hostname# copy ftp://admin:letmein@209.165.200.227/configs/startup.cfg startup-config
```

To copy the configuration from an HTTP server, enter the following command:

```
hostname# copy http://209.165.200.228/configs/startup.cfg startup-config
```

Configuring the Images and Startup Configuration to Use

By default, the ASA boots the first application image that it finds in internal flash memory. It also boots the first ASDM image it finds in internal flash memory, or if one does not exist in this location, then in external flash memory. If you have more than one image, you should specify the image that you want to boot. For the ASDM image, if you do not specify the image to boot, even if you have only one image installed, then the ASA inserts the **asdm image** command into the running configuration. To avoid problems with Auto Update (if configured), and to avoid the image search at each startup, you should specify the ASDM image that you want to boot in the startup configuration.

- [Configuring the ASA and ASDM Images to Use, page 1-13](#)
- [Configuring the File to Boot as the Startup Configuration, page 1-13](#)

Configuring the ASA and ASDM Images to Use

To configure the application image to boot, enter the following command:

```
hostname(config)# boot system url
```

where *url* can be one of the following:

- `{disk0:/ | disk1:/}[path/]filename`
- `tftp://[user[:password]@]server[:port]/[path/]filename`

Note The TFTP option is not supported on all models.

You can enter up to four **boot system** command entries to specify different images to boot from in order; the ASA boots the first image it finds successfully. When you enter the **boot system** command, it adds an entry at the bottom of the list. To reorder the boot entries, you must remove all entries using the **clear configure boot system** command, and re-enter them in the order you desire. Only one **boot system tftp** command can be configured, and it must be the first one configured.

Note If the ASA is stuck in a cycle of constant booting, you can reboot the ASA into ROMMON mode. For more information about the ROMMON mode, see the [“Viewing Debugging Messages” section on page 1-1](#).

To configure the ASDM image to boot, enter the following command:

```
hostname(config)# asdm image {disk0:/ | disk1:/}[path/]filename
```

Configuring the File to Boot as the Startup Configuration

By default, the ASA boots from a startup configuration that is a hidden file. You can alternatively set any configuration to be the startup configuration by entering the following command:

```
hostname(config)# boot config {disk0:/ | disk1:/}[path/]filename
```

Using the ROM Monitor to Load an Image

- [Using ROM Monitor for the ASA 5500 Series, page 1-14](#)
- [Using the ROM Monitor for the ASASM, page 1-15](#)

Using ROM Monitor for the ASA 5500 Series

To load a software image to an ASA from the ROM monitor mode using TFTP, perform the following steps:

-
- Step 1** Connect to the ASA console port according to the instructions in the [“Accessing the Appliance Command-Line Interface”](#) section on page 1-1.
- Step 2** Power off the ASA, then power it on.
- Step 3** During startup, press the **Escape** key when you are prompted to enter ROMMON mode.
- Step 4** In ROMMON mode, define the interface settings to the ASA, including the IP address, TFTP server address, gateway address, software image file, and port, as follows:

```
rommon #1> ADDRESS=10.132.44.177
rommon #2> SERVER=10.129.0.30
rommon #3> GATEWAY=10.132.44.1
rommon #4> IMAGE=f1/asa800-232-k8.bin
rommon #5> PORT=Ethernet0/0
Ethernet0/0
Link is UP
MAC Address: 0012.d949.15b8
```

Note Be sure that the connection to the network already exists.

- Step 5** To validate your settings, enter the **set** command.

```
rommon #6> set
ROMMON Variable Settings:
  ADDRESS=10.132.44.177
  SERVER=10.129.0.30
  GATEWAY=10.132.44.1
  PORT=Ethernet0/0
  VLAN=untagged
  IMAGE=f1/asa840-232-k8.bin
  CONFIG=
  LINKTIMEOUT=20
  PKTTIMEOUT=4
  RETRY=20
```

- Step 6** Ping the TFTP server by entering the **ping server** command.

```
rommon #7> ping server
Sending 20, 100-byte ICMP Echoes to server 10.129.0.30, timeout is 4 seconds:

Success rate is 100 percent (20/20)
```

- Step 7** Load the software image by entering the **tftp** command.

```
rommon #8> tftp
ROMMON Variable Settings:
  ADDRESS=10.132.44.177
  SERVER=10.129.0.30
```

```
GATEWAY=10.132.44.1
PORT=Ethernet0/0
VLAN=untagged
IMAGE=f1/asa840-232-k8.bin
CONFIG=
LINKTIMEOUT=20
PKTTIMEOUT=4
RETRY=20

tftp f1/asa840-232-k8.bin@10.129.0.30 via 10.132.44.1

Received 14450688 bytes

Launching TFTP Image...
Cisco ASA Security Appliance admin loader (3.0) #0: Mon Mar 5 16:00:07 MST 2011

Loading...N
After the software image is successfully loaded, the ASA automatically exits ROMMON mode.
```

Step 8 To verify that the correct software image has been loaded into the ASA, check the version in the ASA by entering the following command:

```
hostname# show version
```

Using the ROM Monitor for the ASASM

To load a software image to an ASASM from the ROM monitor mode using TFTP, perform the following steps:

- Step 1** Connect to the ASA console port according to the instructions in the [“Accessing the ASA Services Module Command-Line Interface”](#) section on page 1-2.
- Step 2** Make sure that you reload the ASASM image.
- Step 3** During startup, press the **Escape** key when you are prompted to enter ROMMON mode.
- Step 4** In ROMMOM mode, define the interface settings to the ASASM, including the IP address, TFTP server address, gateway address, software image file, port, and VLAN, as follows:

```
rommon #1> ADDRESS=172.16.145.149
rommon #2> SERVER=172.16.171.125
rommon #3> GATEWAY=172.16.145.129
rommon #4> IMAGE=f1/asa851-smp-k8.bin
rommon #5> PORT=Data0
rommon #6> VLAN=1
Data0
Link is UP
MAC Address: 0012.d949.15b8
```

Note Be sure that the connection to the network already exists.

- Step 5** To validate your settings, enter the **set** command.

```
rommon #7> set
ROMMON Variable Settings:
ADDRESS=172.16.145.149
SERVER=172.16.171.125
GATEWAY=172.16.145.129
```

```

PORT=Data0
VLAN=1
IMAGE=f1/asa851-smp-k8.bin
CONFIG=
LINKTIMEOUT=20
PKTTIMEOUT=2
RETRY=20

```

Step 6 Ping the TFTP server by entering the **ping server** command.

```

rommon #8> ping server
Sending 20, 100-byte ICMP Echoes to server 172.16.171.125, timeout is 2 seconds:

Success rate is 100 percent (20/20)

```

Step 7 Load the software image by entering the **tftp** command.

```

rommon #9> tftp
Clearing EOBC receive queue ...
cmostime_set = 1
ROMMON Variable Settings:
  ADDRESS=172.16.145.149
  SERVER=172.16.171.125
  GATEWAY=172.16.145.129
  PORT=Data0
  VLAN=1
  IMAGE=f1/asa851-smp-k8.bin
  CONFIG=
  LINKTIMEOUT=20
  PKTTIMEOUT=2
  RETRY=20

tftp f1/asa851-smp-k8.bin@172.16.171.125 via 172.16.145.129
Starting download. Press ESC to abort.

```

After the software image is successfully loaded, the ASASM automatically exits ROMMON mode.

Note You must download the image to the system flash separately after ROMMON boot is complete; booting the module into ROMMON mode does not preserve the system image across reloads.

Step 8 To verify that the correct software image has been loaded into the ASASM, check the version by entering the following command:

```

hostname# show version

```

Backing Up Configurations or Other Files

- [Backing up the Single Mode Configuration or Multiple Mode System Configuration, page 1-17](#)
- [Backing Up a Context Configuration or Other File in Flash Memory, page 1-17](#)
- [Backing Up a Context Configuration within a Context, page 1-18](#)
- [Copying the Configuration from the Terminal Display, page 1-18](#)
- [Backing Up Additional Files Using the Export and Import Commands, page 1-18](#)
- [Using a Script to Back Up and Restore Files, page 1-19](#)

Backing up the Single Mode Configuration or Multiple Mode System Configuration

In single context mode or from the system configuration in multiple mode, you can copy the startup configuration or running configuration to an external server or to the local flash memory as follows:

- To copy to a TFTP server, enter the following command:

```
hostname# copy {startup-config | running-config} tftp://server[/path]/filename
```

- To copy to a FTP server, enter the following command:

```
hostname# copy {startup-config | running-config}
ftp://[user[:password]@] server[/path]/filename
```

- To copy to local flash memory, enter the following command:

```
hostname# copy {startup-config | running-config} {flash:/ | disk0:/ |
disk1:/} [path/] filename
```

Note Be sure that the destination directory exists. If it does not exist, first create the directory using the **mkdir** command.

Backing Up a Context Configuration or Other File in Flash Memory

Copy context configurations or other files that are on the local flash memory by entering one of the following commands in the system execution space:

- To copy to a TFTP server, enter the following command:

```
hostname# copy disk{0 | 1}:[path/]filename tftp://server[/path]/filename
```

- To copy to a FTP server, enter the following command:

```
hostname# copy disk{0 | 1}:[path/]filename
ftp://[user[:password]@] server[/path]/filename
```

- To copy to an SMB file-system, enter the following command:

```
hostname# copy disk{0 | 1}:[path/]filename
smb://[user[:password]@] server[/path]/filename
```

- To copy from the ASA using HTTPS, enter the following URL in your browser:

```
https://ASA_IP/disk{0 | 1}/filename
```

- To copy to local flash memory, enter the following command:

```
hostname# copy disk{0 | 1}:[path/]filename disk{0 | 1}:[path/]newfilename
```

Note Be sure that the destination directory exists. If it does not exist, first create the directory using the **mkdir** command.

Backing Up a Context Configuration within a Context

In multiple context mode, from within a context, you can perform the following backups:

- To copy the running configuration to the startup configuration server (connected to the admin context), enter the following command:

```
hostname/contexta# copy running-config startup-config
```

- To copy the running configuration to a TFTP server connected to the context network, enter the following command:

```
hostname/contexta# copy running-config tftp:/server[/path]/filename
```

Copying the Configuration from the Terminal Display

To print the configuration to the terminal, enter the following command:

```
hostname# show running-config
```

Copy the output from this command, and then paste the configuration into a text file.

Backing Up Additional Files Using the Export and Import Commands

Additional files essential to your configuration might include the following:

- Files that you import using the **import webvpn** command. Currently, these files include customizations, URL lists, web content, plug-ins, and language translations.
- DAP policies (dap.xml).
- CSD configurations (data.xml).
- Digital keys and certificates.
- Local CA user database and certificate status files.

The CLI lets you back up and restore individual elements of your configuration using the **export** and **import** commands.

To back up these files, for example, those files that you imported with the **import webvpn** command or certificates, perform the following steps:

Step 1 Run the applicable **show** command(s) as follows:

```
hostname # show import webvpn plug-in
ica
rdp
ssh, telnet
vnc
```

Step 2 Run the **export** command for the file that you want to back up (in this example, the rdp file):

```
hostname # export webvpn plug-in protocol rdp tftp://tftpserver/backupfilename
```

Using a Script to Back Up and Restore Files

You can use a script to back up and restore the configuration files on your ASA, including all extensions that you import via the **import webvpn** CLI, the CSD configuration XML files, and the DAP configuration XML file. For security reasons, we do not recommend that you perform automated backups of digital keys and certificates or the local CA key.

This section provides instructions for doing so and includes a sample script that you can use as is or modify as your environment requires. The sample script is specific to a Linux system. To use it for a Microsoft Windows system, you need to modify it using the logic of the sample.

Note

The existing CLI lets you back up and restore individual files using the **copy**, **export**, and **import** commands. It does not, however, have a facility that lets you back up all ASA configuration files in one operation. Running the script facilitates the use of multiple CLIs.

This section includes the following topics:

- [Prerequisites, page 1-19](#)
- [Running the Script, page 1-19](#)
- [Sample Script, page 1-20](#)

Prerequisites

To use a script to back up and restore an ASA configuration, first perform the following tasks:

- Install Perl with an Expect module.
- Install an SSH client that can reach the ASA.
- Install a TFTP server to send files from the ASA to the backup site.

Another option is to use a commercially available tool. You can put the logic of this script into such a tool.

Running the Script

To run a backup-and-restore script, perform the following steps:

- Step 1** Download or cut-and-paste the script file to any location on your system.
- Step 2** At the command line, enter **Perl** *scriptname*, where *scriptname* is the name of the script file.
- Step 3** Press **Enter**.
- Step 4** The system prompts you for values for each option. Alternatively, you can enter values for the options when you enter the **Perl** *scriptname* command before you press **Enter**. Either way, the script requires that you enter a value for each option.
- Step 5** The script starts running, printing out the commands that it issues, which provides you with a record of the CLIs. You can use these CLIs for a later restore, which is particularly useful if you want to restore only one or two files.

Sample Script

```
#!/usr/bin/perl
#Function: Backup/restore configuration/extensions to/from a TFTP server.
#Description: The objective of this script is to show how to back up
configurations/extensions before the backup/restore command is developed.
# It currently backs up the running configuration, all extensions imported via "import
webvpn" command, the CSD configuration XML file, and the DAP configuration XML file.
#Requirements: Perl with Expect, SSH to the ASA, and a TFTP server.
#Usage: backupasa -option option_value
#       -h: ASA hostname or IP address
#       -u: User name to log in via SSH
#       -w: Password to log in via SSH
#       -e: The Enable password on the security appliance
#       -p: Global configuration mode prompt
#       -s: Host name or IP address of the TFTP server to store the configurations
#       -r: Restore with an argument that specifies the file name. This file is produced
during backup.
#If you don't enter an option, the script will prompt for it prior to backup.
#
#Make sure that you can SSH to the ASA.

    $restore = 1;  
    $restore_file = $options{r};  
  }  
}
```

Downgrading Your Software

When you upgrade to Version 8.3, your configuration is migrated. The old configuration is automatically stored in flash memory. For example, when you upgrade from Version 8.2(1) to 8.3(1), the old 8.2(1) configuration is stored in flash memory in a file called 8_2_1_0_startup_cfg.sav.

Note

You must manually restore the old configuration before downgrading.

This section describes how to downgrade and includes the following topics:

- [Information About Activation Key Compatibility, page 1-25](#)
- [Performing the Downgrade, page 1-25](#)

Information About Activation Key Compatibility

Your activation key remains compatible if you upgrade to the latest version from any previous version. However, you might have issues if you want to maintain downgrade capability:

- Downgrading to Version 8.1 or earlier versions—After you upgrade, if you activate additional feature licenses that were introduced *before* 8.2, the activation key continues to be compatible with earlier versions if you downgrade. However if you activate feature licenses that were introduced in Version 8.2 or later versions, the activation key is not backwards compatible. If you have an incompatible license key, see the following guidelines:
 - If you previously entered an activation key in an earlier version, the ASA uses that key (without any of the new licenses you activated in Version 8.2 or later versions).
 - If you have a new system and do not have an earlier activation key, you need to request a new activation key compatible with the earlier version.
- Downgrading to Version 8.2 or earlier versions—Version 8.3 introduced more robust time-based key usage as well as failover license changes:
 - If you have more than one time-based activation key active, when you downgrade, only the most recently activated time-based key can be active. Any other keys are made inactive.
 - If you have mismatched licenses on a failover pair, downgrading will disable failover. Even if the keys are matching, the license used will no longer be a combined license.

Performing the Downgrade

To downgrade from Version 8.3, perform the following steps:

Detailed Steps

Step 1 Enter the following command:

```
hostname(config)# downgrade [/noconfirm] old_image_url old_config_url [activation-key
old_key]
```

Where the **/noconfirm** option downgrades without prompting. The *image_url* is the path to the old image on disk0, disk1, tftp, ftp, or smb. The *old_config_url* is the path to the saved, premigration configuration (by default, this configuration was saved on disk0). If you need to revert to a pre-8.3 activation key, you can enter the old activation key.

This command is a shortcut for completing the following functions:

1. Clearing the boot image configuration (**clear configure boot**).
2. Setting the boot image to be the old image (**boot system**).
3. (Optional) Entering a new activation key (**activation-key**).
4. Saving the running configuration to startup (**write memory**). This action sets the BOOT environment variable to the old image, so when you reload, the old image is loaded.
5. Copying the old configuration to the startup configuration (**copy old_config_url startup-config**).
6. Reloading (**reload**).

For example:

```
hostname(config)# downgrade /noconfirm disk0:/asa821-k8.bin disk0:/8_2_1_0_startup_cfg.sav
```

Configuring Auto Update

This section includes the following topics:

- [Information About Auto Update, page 1-26](#)
- [Configuring Communication with an Auto Update Server, page 1-27](#)
- [Configuring Client Updates as an Auto Update Server, page 1-29](#)
- [Viewing Auto Update Status, page 1-30](#)

Information About Auto Update

Auto Update is a protocol specification that allows an Auto Update Server to download configurations and software images to many ASAs and can provide basic monitoring of the ASAs from a central location.

The ASA can be configured as either a client or a server. As an Auto Update client, it periodically polls the Auto Update Server for updates to software images and configuration files. As an Auto Update Server, it issues updates for ASAs configured as Auto Update clients.

Auto Update is useful in solving many issues facing administrators for ASA management, such as:

- Overcoming dynamic addressing and NAT challenges.
- Committing configuration changes in one action.
- Providing a reliable method for updating software.
- Leveraging well-understood methods for high availability (failover).
- Providing flexibility with an open interface.

- Simplifying security solutions for Service Provider environments.

The Auto Update specification provides the infrastructure necessary for remote management applications to download ASA configurations, software images, and to perform basic monitoring from a centralized location or multiple locations.

The Auto Update specification allows the Auto Update server to either push configuration information and send requests for information to the ASA, or to pull configuration information by having the ASA periodically poll the Auto Update server. The Auto Update server can also send a command to the ASA to send an immediate polling request at any time. Communication between the Auto Update server and the ASA requires a communications path and local CLI configuration on each ASA.

Guidelines and Limitations

- If HTTPS is chosen as the protocol to communicate with the Auto Update server, the ASA uses SSL, which requires the ASA to have a DES or 3DES license.
- Auto Update is supported in single context mode only.

Configuring Communication with an Auto Update Server

Detailed Steps

—
To configure the ASA as an Auto Update client, perform the following steps:

- Step 1** To specify the URL of the Auto Update Server, enter the following command:

```
hostname(config)# auto-update server url [source interface] [verify-certificate]
```

where *url* has the following syntax:

```
http[s]://[user:password@]server_ip[:port]/pathname
```

SSL is used when **https** is specified. The *user* and *password* arguments of the URL are used for basic authentication when logging in to the server. If you use the **write terminal**, **show configuration** or **show tech-support** commands to view the configuration, the user and password are replaced with ‘*****’.

The default port is 80 for HTTP and 443 for HTTPS.

The **source interface** keyword and argument specify which interface to use when sending requests to the Auto Update Server. If you specify the same interface specified by the **management-access** command, the Auto Update requests travel over the same IPsec VPN tunnel used for management access.

The **verify-certificate** keyword verifies the certificate returned by the Auto Update Server.

- Step 2** (Optional) To identify the device ID to send when communicating with the Auto Update Server, enter the following command:

```
hostname(config)# auto-update device-id {hardware-serial | hostname | ipaddress [if-name] | mac-address [if-name] | string text}
```

The identifier used is determined by specifying one of the following parameters:

- The *hardware-serial* argument specifies the ASA serial number.
- The *hostname* argument specifies the ASA hostname.

- The **ipaddress** keyword specifies the IP address of the specified interface. If the interface name is not specified, it uses the IP address of the interface used to communicate with the Auto Update Server.
- The **mac-address** keyword specifies the MAC address of the specified interface. If the interface name is not specified, it uses the MAC address of the interface used to communicate with the Auto Update Server.
- The **string** keyword specifies the specified text identifier, which cannot include white space or the characters ‘, “, , >, & and ?.

Step 3 (Optional) To specify how often to poll the Auto Update Server for configuration or image updates, enter the following command:

```
hostname(config)# auto-update poll-period poll-period [retry-count [retry-period]]
```

The *poll-period* argument specifies how often (in minutes) to check for an update. The default is 720 minutes (12 hours).

The *retry-count* argument specifies how many times to try reconnecting to the server if the first attempt fails. The default is zero.

The *retry-period* argument specifies how long to wait (in minutes) between retries. The default is five minutes.

Step 4 (Optional) To schedule a specific time for the ASA to poll the Auto Update Server, enter the following command:

```
hostname(config)# auto-update poll-at days-of-the-week time [randomize minutes]
[retry_count [retry_period]]
```

The *days-of-the-week* argument is any single day or combination of days: Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, and Sunday. Other possible values are daily (Monday through Sunday), weekdays (Monday through Friday), and weekends (Saturday and Sunday).

The *time* argument specifies the time in the format HH:MM at which to start the poll. For example, 8:00 is 8:00 a.m. and 20:00 is 8:00 p.m.

The **randomize minutes** keyword and argument specify the period to randomize the poll time following the specified start time. The range is from 1 to 1439 minutes.

The *retry_count* argument specifies how many times to try reconnecting to the Auto Update Server if the first attempt fails. The default is zero.

The *retry_period* argument specifies how long to wait between connection attempts. The default is five minutes. The range is from 1 to 35791 minutes.

Step 5 (Optional) If the Auto Update Server has not been contacted for a certain period of time, entering the following command causes it to stop passing traffic:

```
hostname(config)# auto-update timeout period
```

The *period* argument specifies the timeout period in minutes between 1 and 35791. The default is to never time out (zero minutes). To restore the default, enter the **no** form of this command.

Use the **auto-update timeout** command to be sure that the ASA has the most recent image and configuration. This condition is reported with system log message 201008.

In the following example, an ASA is configured to poll an Auto Update Server with the IP address 209.165.200.224, at port number 1742, from the outside interface, with certificate verification.

The ASA is also configured to use the hostname as the device ID and to poll an Auto Update Server every Friday and Saturday night at a random time between 10:00 p.m. and 11:00 p.m. On a failed polling attempt, the ASA will try to reconnect to the Auto Update Server ten times, and will wait three minutes between attempts at reconnecting, as shown in the following example:

```
hostname (config)# auto-update server
https://jcrichton:farscape@209.165.200.224:1742/management source outside
verify-certificate
hostname (config)# auto-update device-id hostname
hostname (config)# auto-update poll-at Friday Saturday 22:00 randomize 60 2 10
```

Configuring Client Updates as an Auto Update Server

Entering the **client-update** command enables updates for ASAs configured as Auto Update clients and lets you specify the type of software component (ASDM or boot image), the type or family of ASA, revision numbers to which the update applies, and a URL or IP address from which to obtain the update.

To configure the ASA as an Auto Update Server, perform the following steps:

Step 1 To enable client update, enter the following command:

```
hostname (config)# client-update enable
```

Step 2 Configure the following parameters for the **client-update** command that you want to apply to the ASAs:

```
client-update {component {asdm | image} | device-id dev_string |
family family_name | type type} url url-string rev-nums rev-nums}
```

The **component** {**asdm** | **image**} parameter specifies the software component, either ASDM or the boot image of the ASA.

The **device-id** *dev_string* parameter specifies a unique string that the Auto Update client uses to identify itself. The maximum length is 63 characters.

The **family** *family_name* parameter specifies the family name that the Auto Update client uses to identify itself. It can be asa, pix, or a text string with a maximum length of seven characters.

The **rev-nums** *rev-nums* parameter specifies the software or firmware images for this client. Enter up to four, in any order, separated by commas.

The **type** *type* parameter specifies the type of clients to notify of a client update. Because this command is also used to update Windows clients, the list of clients includes several Windows operating systems. The ASAs in the list may include the following:

- asa5505: Cisco 5505 ASA
- asa5510: Cisco 5510 ASA
- asa5520: Cisco 5520 ASA
- asa5540: Cisco 5540 ASA

The **url** *url-string* parameter specifies the URL for the software/firmware image. This URL must point to a file appropriate for this client. For all Auto Update clients, you must use the protocol “http://” or “https://” as the prefix for the URL.

Configure the parameters for the client update that you want to apply to all ASAs of a particular type. That is, specify the type of ASA and the URL or IP address from which to get the updated image. In addition, you must specify a revision number. If the revision number of the remote ASA matches one of the specified revision numbers, there is no need to update the client, and the update is ignored.

To configure a client update for Cisco 5520 ASAs, enter the following command:

```
hostname(config)# client-update type asa5520 component asdm url  
http://192.168.1.114/aus/asdm601.bin rev-nums 8.0(1)
```

Viewing Auto Update Status

To view the Auto Update status, enter the following command:

```
hostname(config)# show auto-update
```

The following is sample output from the **show auto-update** command:

```
hostname(config)# show auto-update  
  
Server: https://*****@209.165.200.224:1742/management.cgi?1276  
Certificate will be verified  
Poll period: 720 minutes, retry count: 2, retry period: 5 minutes  
Timeout: none  
Device ID: host name [corporate]  
Next poll in 4.93 minutes  
Last poll: 11:36:46 PST Tue Nov 13 2004  
Last PDM update: 23:36:46 PST Tue Nov 12 2004
```
