

CHAPTER 1

Configuring NetFlow Secure Event Logging (NSEL)

This chapter describes how to configure NSEL, a security logging mechanism that is built on NetFlow Version 9 technology, and how to handle events and syslog messages through NSEL.

This chapter includes the following sections:

- [Information About NSEL, page 1-1](#)
- [Licensing Requirements for NSEL, page 1-4](#)
- [Prerequisites for NSEL, page 1-4](#)
- [Guidelines and Limitations, page 1-4](#)
- [Configuring NSEL, page 1-5](#)
- [Monitoring NSEL, page 1-9](#)
- [Configuration Examples for NSEL, page 1-10](#)
- [Where to Go Next, page 1-11](#)
- [Additional References, page 1-11](#)
- [Feature History for NSEL, page 1-12](#)

Information About NSEL

This section includes the following topics:

- [Using NSEL and Syslog Messages, page 1-2](#)
- [Using NSEL in Clustering, page 1-3](#)

The ASA and ASASM support NetFlow Version 9 services. For more information about NetFlow services, see the “[RFCs](#)” section on [page 1-12](#).

The ASA and ASASM implementations of NSEL provide a stateful, IP flow tracking method that exports only those records that indicate significant events in a flow. In stateful flow tracking, tracked flows go through a series of state changes. NSEL events are used to export data about flow status and are triggered by the event that caused the state change.

The significant events that are tracked include flow-create, flow-teardown, flow-denied (excluding those flows that are denied by EtherType ACLs), and flow-update. In addition, the ASA and ASASM implementation of NSEL generates periodic NSEL events and flow-update events to provide periodic

byte counters over the duration of the flow. These events are usually time-driven, which makes them more in line with traditional Netflow; however, these events may also be triggered by state changes in the flow.

**Note**

The flow-update event feature is available only in Version 8.4(5). It is not available in Version 9.0(1) or later.

Each NSEL record has an event ID and an extended event ID field, which describes the flow event.

The ASA and ASASM implementations of NSEL provide the following major functions:

- Tracks flow-create, flow-teardown, and flow-denied events, and generates appropriate NSEL data records.
- Defines and exports templates that describe the progression of a flow. Templates describe the format of the data records that are exported through NetFlow. Each event has several record formats or templates associated with it.
- Tracks configured NSEL collectors and delivers templates and data records to these configured NSEL collectors through NetFlow over UDP only.
- Sends template information periodically to NSEL collectors. Collectors receive template definitions, normally before receiving flow records.
- Filters NSEL events based on the traffic and event type through Modular Policy Framework, then sends records to different collectors. Traffic is matched based on the order in which classes are configured. After a match is found, no other classes are checked. The supported event types are flow-create, flow-denied, flow-teardown, and all. Records can be sent to different collectors. For example, with two collectors, you can do the following:
 - Log all flow-denied events that match access list 1 to collector 1.
 - Log all flow-create events to collector 1.
 - Log all flow-teardown events to collector 2.
- Delays the export of flow-create events.

Using NSEL and Syslog Messages

[Table 1-1](#) lists the syslog messages that have an equivalent NSEL event, event ID, and extended event ID. The extended event ID provides more detail about the event (for example, which ACL—ingress or egress—has denied a flow).

**Note**

Enabling NetFlow to export flow information makes the syslog messages that are listed in [Table 1-1](#) redundant. In the interest of performance, we recommend that you disable redundant syslog messages, because the same information is exported through NetFlow. You can enable or disable individual syslog messages by following the procedure in the [“Disabling and Reenabling NetFlow-related Syslog Messages”](#) section on page 1-8.

Table 1-1 Syslog Messages and Equivalent NSEL Events

Syslog Message	Description	NSEL Event ID	NSEL Extended Event ID
106100	Generated whenever an ACL is encountered.	1—Flow was created (if the ACL allowed the flow). 3—Flow was denied (if the ACL denied the flow).	0—If the ACL allowed the flow. 1001—Flow was denied by the ingress ACL. 1002—Flow was denied by the egress ACL.
106015	A TCP flow was denied because the first packet was not a SYN packet.	3—Flow was denied.	1004—Flow was denied because the first packet was not a TCP SYN packet.
106023	When a flow was denied by an ACL attached to an interface through the access-group command.	3—Flow was denied.	1001—Flow was denied by the ingress ACL. 1002—Flow was denied by the egress ACL.
302013, 302015, 302017, 302020	TCP, UDP, GRE, and ICMP connection creation.	1—Flow was created.	0—Ignore.
302014, 302016, 302018, 302021	TCP, UDP, GRE, and ICMP connection teardown.	2—Flow was deleted.	0—Ignore. > 2000—Flow was torn down.
313001	An ICMP packet to the device was denied.	3—Flow was denied.	1003—To-the-box flow was denied because of configuration.
313008	An ICMP v6 packet to the device was denied.	3—Flow was denied.	1003—To-the-box flow was denied because of configuration.
710003	An attempt to connect to the device interface was denied.	3—Flow was denied.	1003—To-the-box flow was denied because of configuration.

**Note**

When NSEL and syslog messages are both enabled, there is no guarantee of chronological ordering between the two logging types.

Using NSEL in Clustering

Each ASA establishes its own connection to the collector(s) using its unit local IP address. The fields in the header of the export packet include the system up time, UNIX time (synchronized across the cluster), and sequence number. These fields are all local to an individual ASA. The NSEL collector uses the combination of the source port of the packet to separate different exporters.

Each ASA manages and advertises its template independently. Because the ASA supports in-cluster upgrades, different units may run different image versions at a certain point in time. As a result, the template that each ASA supports may be different.

**Note**

Clustering is available on the ASA 5580 and 5585-X only. For more information about clustering, see [Chapter 1, “Configuring a Cluster of ASAs.”](#)

Licensing Requirements for NSEL

Model	License Requirement
All models	Base License.

Prerequisites for NSEL

NSEL has the following prerequisites:

- IP address and hostname assignments must be unique throughout the NetFlow configuration.
- You must have at least one configured collector before you can use NSEL.
- You must configure NSEL collectors before you can configure filters via Modular Policy Framework.

Guidelines and Limitations

This section includes the guidelines and limitations for this feature.

Context Mode Guidelines

Supported in single and multiple context mode.

Firewall Mode Guidelines

Supported in routed and transparent firewall mode.

IPv6 Guidelines

Supports IPv6 for the **class-map**, **match access-list**, and **match any** commands.

Additional Guidelines and Limitations

- If you have previously configured flow-export actions using the **flow-export enable** command, and you upgrade to a later version, then your configuration is automatically converted to the new Modular Policy Framework **flow-export event-type** command, which is described under the **policy-map** command.
- Flow-export actions are not supported in interface-based policies. You can configure flow-export actions in a class-map only with the **match access-list**, **match any**, or **class-default** commands. You can only apply flow-export actions in a global service policy.
- To view bandwidth usage for NetFlow records (not available in real-time), you must use the threat detection feature.
- Only the ASA 5580 and 5585-X support clustering.
- NetFlow records are sent only for connections whose source and destination addresses are both IPv4 or both IPv6. NetFlow records are not sent for connections with mixed traffic, such as NAT64 or NAT46.

Configuring NSEL

This section describes how to configure NSEL and includes the following topics:

- [Configuring NSEL Collectors, page 1-5](#)
- [Configuring Flow-Export Actions Through Modular Policy Framework, page 1-5](#)
- [Configuring Template Timeout Intervals, page 1-7](#)
- [Disabling and Reenabling NetFlow-related Syslog Messages, page 1-8](#)
- [Clearing Runtime Counters, page 1-8](#)

Configuring NSEL Collectors

To configure NSEL collectors, enter the following command:

Command	Purpose
<pre>flow-export destination interface-name ipv4-address hostname udp-port</pre> <p>Example:</p> <pre>hostname (config)# flow-export destination inside 209.165.200.225 2002</pre>	<p>Adds, edits, or deletes an NSEL collector to which NetFlow packets are sent. The destination keyword indicates that a NSEL collector is being configured. The <i>interface-name</i> argument is the name of the ASA and ASA Services Module interface through which the collector is reached. The <i>ipv4-address</i> argument is the IP address of the machine running the collector application. The <i>hostname</i> argument is the destination IP address or name of the collector. The <i>udp-port</i> argument is the UDP port number to which NetFlow packets are sent. You can configure a maximum of five collectors. After a collector is configured, template records are automatically sent to all configured NSEL collectors.</p> <p>Note Make sure that collector applications use the Event Time field to correlate events.</p>

What to Do Next

See the “[Configuring Flow-Export Actions Through Modular Policy Framework](#)” section on page 1-5.

Configuring Flow-Export Actions Through Modular Policy Framework

To export NSEL events by defining all classes with flow-export actions, perform the following steps:

	Command	Purpose
Step 1	<pre>class-map flow_export_class</pre> <p>Example:</p> <pre>hostname (config-pmap)# class-map flow_export_class</pre>	<p>Defines the class map that identifies traffic for which NSEL events need to be exported. The <i>flow_export_class</i> argument is the name of the class map.</p>
Step 2	Choose one of the following options:	

	Command	Purpose
	<pre>match access-list flow_export_acl</pre> <p>Example: hostname (config-cmap)# match access-list flow_export_acl</p>	Configures the access list to match specific traffic. The <i>flow_export_acl</i> argument is the name of the access list.
	<pre>match any</pre> <p>Example: hostname (config-cmap)# match any</p>	Matches any traffic.
Step 3	<pre>policy-map flow_export_policy</pre> <p>Example: hostname(config)# policy-map flow_export_policy</p>	<p>Defines the policy map to apply flow-export actions to the defined classes. The <i>flow_export_policy</i> argument is the name of the policy map.</p> <p>If you create a new policy map and apply it globally according to Step 6, the remaining inspection policies are deactivated.</p> <p>Alternatively, to insert a NetFlow class in the existing policy, enter the class flow_export_class command after the policy-map global_policy command.</p> <p>For more information about creating or modifying the Modular Policy Framework, see Chapter 1, “Configuring a Service Policy Using the Modular Policy Framework.”</p>
Step 4	<pre>class flow_export_class</pre> <p>Example: hostname (config-pmap)# class flow_export_class</p>	Defines the class to apply flow-export actions. The <i>flow_export_class</i> argument is the name of the class.
Step 5	<pre>flow-export event-type event-type destination flow_export_host1 [flow_export_host2]</pre> <p>Example: hostname (config-pmap-c)# flow-export event-type all destination 209.165.200.230</p>	Configures a flow-export action. The event_type keyword is the name of the supported event being filtered. The <i>flow_export_host</i> argument is the IP address of a host. The destination keyword is the IP address of the configured collector.
Step 6	<pre>service-policy flow_export_policy global</pre> <p>Example: hostname (config)# service-policy flow_export_policy global</p>	Adds or edits the service policy globally. The <i>flow_export_policy</i> argument is the name of the policy map.

What to Do Next

See the [“Configuring Template Timeout Intervals”](#) section on page 1-7.

Configuring Template Timeout Intervals

To configure template timeout intervals, enter the following command:

Command	Purpose
<pre>flow-export template timeout-rate <i>minutes</i></pre> <p>Example: hostname (config)# flow-export template timeout-rate 15</p>	<p>Specifies the interval at which template records are sent to all configured output destinations. The template keyword indicates the template-specific configurations. The timeout-rate keyword specifies the time before templates are resent. The <i>minutes</i> argument specifies the time interval in minutes at which the templates are resent. The default value is 30 minutes.</p>

What to Do Next

See the [“Delaying Flow-Crete Events”](#) section on page 1-7.

Delaying Flow-Crete Events

To delay the sending of flow-create events, enter the following command:

Command	Purpose
<pre>flow-export delay flow-create <i>seconds</i></pre> <p>Example: hostname (config)# flow-export delay flow-create 10</p>	<p>Delays the sending of a flow-create event by the specified number of seconds. The <i>seconds</i> argument indicates the amount of time allowed for the delay in seconds. If this command is not configured, there is no delay, and the flow-create event is exported as soon as the flow is created. If the flow is torn down before the configured delay, the flow-create event is not sent; an extended flow teardown event is sent instead.</p>

What to Do Next

See the [“Disabling and Reenabling NetFlow-related Syslog Messages”](#) section on page 1-8.

Disabling and Reenabling NetFlow-related Syslog Messages

To disable and reenabable NetFlow-related syslog messages, perform the following steps:

	Command	Purpose
Step 1	<pre>logging flow-export-syslogs disable</pre> <p>Example: hostname(config)# logging flow-export-syslogs disable</p>	<p>Disables syslog messages that have become redundant because of NSEL.</p> <p>Note Although you execute this command in global configuration mode, it is not stored in the configuration. Only the no logging message xxxxxx commands are stored in the configuration.</p>
Step 2	<pre>logging message xxxxxx</pre> <p>Example: hostname(config)# logging message 302013</p>	<p>Reenables syslog messages individually, where xxxxxx is the specified syslog message that you want to reenabable.</p>
Step 3	<pre>logging flow-export-syslogs enable</pre> <p>Example: hostname(config)# logging flow-export-syslogs enable</p>	<p>Reenables all NSEL events at the same time.</p>

What to Do Next

See the [“Clearing Runtime Counters”](#) section on page 1-8.

Clearing Runtime Counters

To reset runtime counters, enter the following command:

Command	Purpose
<pre>clear flow-export counters</pre> <p>Example: hostname# clear flow-export counters</p>	<p>Resets all runtime counters for NSEL to zero.</p>

What to Do Next

See the [“Monitoring NSEL” section on page 1-9](#).

Monitoring NSEL

You can use syslog messages to help troubleshoot errors or monitor system usage and performance. You can view real-time syslog messages that have been saved in the log buffer in a separate window, which include an explanation of the message, details about the message, and recommended actions to take, if necessary, to resolve an error. For more information, see the [“Using NSEL and Syslog Messages” section on page 1-2](#).

NSEL Monitoring Commands

To monitor NSEL, enter one of the following commands:

Command	Purpose
<code>show flow-export counters</code>	Shows runtime counters, including statistical data and error data, for NSEL.
<code>show running-config flow-export</code>	Shows the currently configured NetFlow commands.
<code>show logging flow-export-syslogs</code>	Lists all syslog messages that are captured by NSEL events.
<code>show running-config logging</code>	Shows disabled syslog messages, which are redundant syslog messages, because they export the same information through NetFlow.

Examples

The following example shows how to display flow-export counters:

```
hostname (config)# show flow-export counters

destination: inside 209.165.200.225 2055

Statistics:
  packets sent                250
Errors:
  block allocation errors     0
  invalid interface           0
  template send failure       0
  no route to collector       0
  source port allocation      0
```

The following example shows how to display the flow-export delay configuration:

```
hostname (config)# show running-config flow-export delay
flow-export delay flow-create 30
```

The following example shows how to display the flow-export destination configurations:

```
hostname (config)# show running-config flow-export destination
flow-export destination inside 192.68.10.70 9996
```

The following example shows how to display the flow-export template configuration:

```
hostname (config)# show running-config flow-export template
flow-export template timeout-rate 1
```

The following example shows how to display flow-export syslog messages:

```
hostname# show logging flow-export-syslogs

Syslog ID      Type                               Status
302013         Flow Created                       Enabled
302015         Flow Created                       Enabled
302017         Flow Created                       Enabled
302020         Flow Created                       Enabled
302014         Flow Deleted                       Enabled
302016         Flow Deleted                       Enabled
302018         Flow Deleted                       Enabled
302021         Flow Deleted                       Enabled
106015         Flow Denied                       Enabled
106023         Flow Denied                       Enabled
313001         Flow Denied                       Enabled
313008         Flow Denied                       Enabled
710003         Flow Denied                       Enabled
106100         Flow Created/Denied               Enabled
```

The following example shows how to display current syslog message settings:

```
hostname (config)# show running-config logging

no logging message 313008
no logging message 313001
```

Configuration Examples for NSEL

The following examples show how to filter NSEL events, with the specified collectors already configured:

- **flow-export destination inside 209.165.200.2055**
- **flow-export destination outside 209.165.201.29 2055**
- **flow-export destination outside 209.165.201.27 2055**

Log all events between hosts 209.165.200.224 and hosts 209.165.201.224 to 209.165.200.230, and log all other events to 209.165.201.29:

```
hostname (config)# access-list flow_export_acl permit ip host 209.165.200.224 host
209.165.201.224
hostname (config)# class-map flow_export_class
hostname (config-cmap)# match access-list flow_export_acl
hostname (config)# policy-map flow_export_policy
hostname (config-pmap)# class flow_export_class
hostname (config-pmap-c)# flow-export event-type all destination 209.165.200.230
hostname (config-pmap-c)# class class-default
hostname (config-pmap-c)# flow-export event-type all destination 209.165.201.29
hostname (config)# service-policy flow_export_policy global
```

Log flow-create events to 209.165.200.230, flow-teardown events to 209.165.201.29, and flow-denied events to 209.165.201.27:

```
hostname (config)# policy-map flow_export_policy
```

```
hostname (config-pmap)# class class-default
hostname (config-pmap-c)# flow-export event-type flow-creation destination 209.165.200.230
hostname (config-pmap-c)# flow-export event-type flow-teardown destination 209.165.201.29
hostname (config-pmap-c)# flow-export event-type flow-denied destination 209.165.201.27
hostname (config)# service-policy flow_export_policy global
```

Log flow-create events between hosts 209.165.200.224 and 209.165.200.230 to 209.165.201.29, and log all flow-denied events to 209.165.201.27:

```
hostname (config)# access-list flow_export_acl permit ip host 209.165.200.224 host
209.165.200.230
hostname (config)# class-map flow_export_class
hostname (config)# match access-list flow_export_acl
hostname (config)# policy-map flow_export_policy
hostname (config-pmap)# class flow_export_class
hostname (config-pmap-c)# flow-export event-type flow-creation destination 209.165.200.29
hostname (config-pmap-c)# flow-export event-type flow-denied destination 209.165.201.27
hostname (config-pmap)# class class-default
hostname (config-pmap-c)# flow-export event-type flow-denied destination 209.165.201.27
hostname (config)# service-policy flow_export_policy global
```

**Note**

You must enter the following command:

```
hostname (config-pmap-c)# flow-export event-type flow-denied destination 209.165.201.27
```

for *flow_export_acl*, because traffic is not checked after the first match, and you must explicitly define the action to log flow-denied events that match *flow_export_acl*.

Log all traffic except traffic between hosts 209.165.201.27 and 209.165.201.50 to 209.165.201.27:

```
hostname (config)# access-list flow_export_acl deny ip host 209.165.201.30 host
209.165.201.50
hostname (config)# access-list flow_export_acl permit ip any any
hostname (config)# class-map flow_export_class
hostname (config-cmap)# match access-list flow_export_acl
hostname (config)# policy-map flow_export_policy
hostname (config-pmap)# class flow_export_class
hostname (config-pmap-c)# flow-export event-type all destination 209.165.201.27
hostname (config)# service-policy flow_export_policy global
```

Where to Go Next

To configure the syslog server, see [Chapter 1, “Configuring Logging.”](#)

RFCs

RFC	Title
3954	Cisco Systems NetFlow Services Export Version 9

Feature History for NSEL

[Table 1-2](#) lists each feature change and the platform release in which it was implemented..

Table 1-2 Feature History for NSEL

Feature Name	Platform Releases	Feature Information
NetFlow	8.1(1)	<p>The NetFlow feature enhances the ASA logging capabilities by logging flow-based events through the NetFlow protocol. NetFlow Version 9 services are used to export information about the progression of a flow from start to finish. The NetFlow implementation exports records that indicate significant events in the life of a flow. This implementation is different from traditional NetFlow, which exports data about flows at regular intervals. The NetFlow module also exports records about flows that are denied by access lists. You can configure an ASA 5580 to send the following events using NetFlow: flow create, flow teardown, and flow denied (only flows denied by ACLs are reported).</p> <p>We introduced the following commands: clear flow-export counters, flow-export enable, flow-export destination, flow-export template timeout-rate, logging flow-export syslogs enable, logging flow-export syslogs disable, show flow-export counters, show logging flow-export-syslogs.</p>
NetFlow Filtering	8.1(2)	<p>You can filter NetFlow events based on traffic and event type, then send records to different collectors. For example, you can log all flow-create events to one collector, and log flow-denied events to a different collector.</p> <p>We modified the following commands: class, class-map, flow-export event-type destination, match access-list, policy-map, service-policy.</p> <p>For short-lived flows, NetFlow collectors benefit from processing a single event instead of two events: flow create and flow teardown. You can configure a delay before sending the flow-create event. If the flow is torn down before the timer expires, only the flow teardown event is sent. The teardown event includes all information regarding the flow; no loss of information occurs.</p> <p>We introduced the following command: flow-export delay flow-create.</p>
NSEL	8.2(1)	The NetFlow feature has been ported to all available models of ASAs.
Clustering	9.0(1)	The NetFlow feature supports clustering.
NSEL		<p>A new NetFlow error counter, source port allocation failure, has been added.</p> <p>We modified the following command: show flow-export counters.</p> <p>Flow-update events have been introduced to provide periodic byte counters for flow traffic. You can change the time interval at which flow-update events are sent to the NetFlow collector. You can filter to which collectors flow-update records will be sent.</p> <p>Note The flow-update event feature is available in Version 8.4(5) only; it is not available in Version 9.0(1) or later.</p>
