

# Advanced Network Configuration

---

This chapter contains the following sections:

- [Media Settings on Ethernet Interfaces, on page 1](#)
- [Network Interface Card Pairing/Teaming, on page 2](#)
- [Virtual Local Area Networks \(VLANs\), on page 5](#)
- [Direct Server Return, on page 9](#)
- [Ethernet Interface's Maximum Transmission Unit, on page 13](#)
- [Accept or Reject ARP Replies with a Multicast Address, on page 14](#)

## Media Settings on Ethernet Interfaces

Media settings for the ethernet interfaces can be accessed via the use of the etherconfig command. Each ethernet interface is listed with its current setting. By selecting the interface, the possible media settings are displayed. See [Example of Editing Media Settings, on page 1](#) for an example.

## Using etherconfig to Edit Media Settings on Ethernet Interfaces

The etherconfig command can be used to set the duplex settings (full/half) as well as the speed (10/100/1000 Mbps) of ethernet interfaces. By default, interfaces automatically select the media settings; however, in some cases you may wish to override this setting.

---

**Note** If you have completed the GUI's System Setup Wizard (or the Command Line Interface systemsetup command) as described in the "Setup and Installation" chapter and committed the changes, the default ethernet interface settings should already be configured on your appliance .

---

Some appliances contain a fiber optic network interface option. If available, you will see two additional ethernet interfaces (Data 3 and Data 4) in the list of available interfaces on these appliances . These gigabit fiber optic interfaces can be paired with the copper (Data 1, Data 2, and Management) interfaces in a heterogeneous configuration. See [Network Interface Card Pairing/Teaming, on page 2](#).

## Example of Editing Media Settings

```
mail3.example.com> etherconfig
```

```

Choose the operation you want to perform:
- MEDIA - View and edit ethernet media settings.
- PAIRING - View and configure NIC Pairing.
- VLAN - View and configure VLANs.
- LOOPBACK - View and configure Loopback.
- MTU - View and configure MTU.
- MULTICAST - Accept or reject ARP replies with a multicast address.

[ ]> media

- LOOPBACK - View and configure Loopback.
- MTU - View and configure MTU.
- MULTICAST - Accept or reject ARP replies with a multicast address.
[ ]>

```

## Network Interface Card Pairing/Teaming

NIC pairing allows you to combine any two physical data ports in order to provide a backup Ethernet interface if the data path from the NIC to the upstream Ethernet port should fail. Basically, pairing configures the Ethernet interfaces so that there is a primary interface and a backup interface. If the primary interface fails (i.e. if the carrier between the NIC and the upstream node is disrupted), the backup interface becomes active and an alert is sent. When the primary interface is up again, this interface will become active automatically. Within the documentation for this product, NIC pairing is synonymous with NIC teaming.

---

**Note** NIC pairing is not available on C170, C190 and C195 appliances .

---

You can create more than one NIC pair, providing you have enough data ports. When creating pairs, you can combine any two data ports. For example:

Data 1 and Data 2

Data 3 and Data 4

Data 2 and Data 3

etc.

Some appliances contain a fiber optic network interface option. If available, you will see two additional ethernet interfaces (Data 3 and Data 4) in the list of available interfaces on these appliances . These gigabit fiber optic interfaces can be paired with the copper (Data 1, Data 2, and Management) interfaces in a heterogeneous configuration.

## NIC Pairing and VLANs

VLANs (see [Virtual Local Area Networks \(VLANs\), on page 5](#)) are only allowed on the primary interface.

## NIC Pair Naming

When creating NIC pairs, you must specify a name to use to refer to the pair. NIC pairs created in versions of AsyncOS prior to version 4.5 will automatically receive the default name of 'Pair 1' following an upgrade.

Any alerts generated regarding NIC pairing will reference the specific NIC pair by name.

## NIC Pairing and Existing Listeners

If you enable NIC pairing on an interface that has listeners assigned to it, you are prompted to either delete, reassign, or disable all listeners assigned to the backup interface.

## Enabling NIC Pairing via the etherconfig Command

---

**Note** NIC pairing is not available on C170, C190 and C195 appliances .

---

```
mail3.example.com> etherconfig
```

Choose the operation you want to perform:

- MEDIA - View and edit ethernet media settings.
- PAIRING - View and configure NIC Pairing.
- VLAN - View and configure VLANs.
- LOOPBACK - View and configure Loopback.

```
- MTU - View and configure MTU.
- MULTICAST - Accept or reject ARP replies with a multicast address.

[]> pairing

Paired interfaces:

Choose the operation you want to perform:

- NEW - Create a new pairing.

[]> new

Please enter a name for this pair (Ex: "Pair 1"):

[]> Pair 1

Warning: The backup (Data 2) for the NIC Pair is currently configured with one or more
IP addresses. If you continue, the Data 2 interface will be deleted.

Do you want to continue? [N]> y

The interface you are deleting is currently used by listener "OutgoingMail".

What would you like to do?

1. Delete: Remove the listener and all its settings.
2. Change: Choose a new interface.
3. Ignore: Leave the listener configured for interface "Data 2" (the listener will be
disabled until you add a new interface named "Data 2" or edit the listener's settings).

[1]>

Listener OutgoingMail deleted for mail3.example.com.

Interface Data 2 deleted.

Paired interfaces:

1. Pair 1:

Primary (Data 1) Active, Link is up
Backup (Data 2) Standby, Link is up

Choose the operation you want to perform:

- DELETE - Delete a pairing.
- STATUS - Refresh status.

[]>
```

## Virtual Local Area Networks (VLANs)

You can configure multiple virtual local area networks (VLANs) on any physical network port on the appliance .

You can use VLANs to:

- Increase the number of networks the appliance can connect to beyond the number of physical interfaces on the appliance .
- Allow more networks to be defined on separate “ports” on existing listeners.
- Segment networks for security purposes, to ease administration, or increase bandwidth.

Example use case:

Two mail servers that are unable to communicate directly due to VLAN limitations can send mail through the appliance . The Data 2 interface on the appliance is configured with VLAN1 and VLAN2. The blue line shows mail coming from the sales network (VLAN1) to the appliance. The appliance processes the mail as normal and then, upon delivery, tags the packets with the destination VLAN2 information (red line).

Using VLANs to Facilitate Communication Between Appliances

**Figure 1: Using VLANs to Facilitate Communication Between Appliances**

## About Configuring VLANs

You can configure multiple VLANs on any physical network port on the appliance , including “Data” and “Management” ports and the fiber optic data ports available on some appliance models. AsyncOS supports up to 30 VLANs.

A physical port does not need an IP address configured in order to be in a VLAN. The physical port on which a VLAN is created can have an IP that will receive non-VLAN traffic, so you can have both VLAN and non-VLAN traffic on the same interface.

VLANs can be used with NIC pairing (available on paired NICs) and with Direct Server Return (DSR).

VLANs appear as dynamic “Data Ports” labeled in the format of: “VLAN DDDD” where the “DDDD” is the ID and is an integer up to 4 digits long (VLAN 2, or VLAN 4094 for example). VLAN IDs must be unique on your appliance.

### Related Topics

[FTP, SSH, and SCP Access](#)

## Managing VLANs

You can create, edit and delete VLANs via the etherconfig command. Once created, a VLAN can be configured via the Network > Interfaces page or the interfaceconfig command in the CLI. Remember to commit all changes.

### Creating a New VLAN via the etherconfig Command

In this example, two VLANs are created (named VLAN 31 and VLAN 34) on the Data 1 port:

```
mail3.example.com> etherconfig
```

```
Choose the operation you want to perform:
```

- MEDIA - View and edit ethernet media settings.
- PAIRING - View and configure NIC Pairing.
- VLAN - View and configure VLANs.
- LOOPBACK - View and configure Loopback.
- MTU - View and configure MTU.
- MULTICAST - Accept or reject ARP replies with a multicast address.

```
[> vlan
```

```
VLAN interfaces:
```

```
Choose the operation you want to perform:
```

- NEW - Create a new VLAN.

```
[> new
```

```
VLAN ID for the interface (Ex: "34"):
```

```
[> 34
```

```
Enter the name or number of the ethernet interface you wish bind to:
```

1. Data 1
2. Data 2
3. Management

```
[1]> 1
```

```
VLAN interfaces:
```

1. Data 1
2. Data 2
3. Management

[1]> 1
VLAN interfaces:

1. VLAN 31 (Data 1)
2. VLAN 34 (Data 1)

Choose the operation you want to perform:

- NEW - Create a new VLAN.
- EDIT - Edit a VLAN.
- DELETE - Delete a VLAN.

[ ]>

Choose the operation you want to perform:

- MEDIA - View and edit ethernet media settings.
- PAIRING - View and configure NIC Pairing.
- VLAN - View and configure VLANs.
- LOOPBACK - View and configure Loopback.
- MTU - View and configure MTU.
- MULTICAST - Accept or reject ARP replies with a multicast address.

[ ]>
```

## Creating an IP Interface on a VLAN via the interfaceconfig Command

In this example, a new IP interface is created on the VLAN 31 ethernet interface. Making changes to an interface may close your connection to the appliance .

```
mail3.example.com> interfaceconfig

Currently configured interfaces:

1. Data 1 (10.10.1.10/24: example.com)
2. Management (10.10.0.10/24: example.com)

Choose the operation you want to perform:

- NEW - Create a new interface.
- EDIT - Modify an interface.
- GROUPS - Define interface groups.
- DELETE - Remove an interface.

[ ]> new

Please enter a name for this IP interface (Ex: "InternalNet"):

[ ]> InternalVLAN31

Would you like to configure an IPv4 address for this interface (y/n)? [Y]>

5. VLAN 34

[1]> 4

Hostname:

[ ]> mail31.example.com

Do you want to enable SSH on this interface? [N]>

Do you want to enable FTP on this interface? [N]>

Do you want to enable HTTP on this interface? [N]>

Do you want to enable HTTPS on this interface? [N]>
```

```
Currently configured interfaces:

1. Data 1 (10.10.1.10/24: example.com)

2. InternalVLAN31 (10.10.31.10/24: mail31.example.com)

3. Management (10.10.0.10/24: example.com)

Choose the operation you want to perform:

- NEW - Create a new interface.

- EDIT - Modify an interface.

- GROUPS - Define interface groups.

- DELETE - Remove an interface.

[ ]>
```

## Configuring VLANs Using the Web Interface

After a VLAN is created using the etherconfig command, you can configure it using the Network > Listeners page.

## Direct Server Return

Direct Server Return (DSR) is a way of providing support for a light-weight load balancing mechanism to load balance between multiple appliances sharing the same Virtual IP (VIP).

DSR is implemented via an IP interface created on the “loopback” ethernet interface on the appliance .

---

**Note** Configuring load balancing for appliances is beyond the scope of this document

---

## Enabling Direct Server Return

Enable DSR by enabling the “loopback” ethernet interface on each participating appliance . Next, create an IP interface on the loopback interface with a virtual IP (VIP) via the **interfaceconfig** command in the CLI or via the Network > Interfaces page in the GUI. Finally, create a listener on the new IP interface via the **listenerconfig** command in the CLI or via the Network > Listeners page in the GUI. Remember to commit all changes.

---

**Note** Using the loopback interface prevents the appliance from issuing ARP replies for that specific interface

---

When enabling DSR, the following rules apply:

All systems use the same Virtual IP (VIP) address

All systems must be on the same switch and subnet as the load balancer

**Figure 2: Using DSR to Load Balance Between Multiple Appliances on a Switch**

Using DSR to Load Balance Between Multiple Appliances on a Switch

## Enabling the Loopback Interface via the etherconfig Command

Once enabled, the loopback interface is treated like any other interface (e.g. Data 1):

```
mail3.example.com> etherconfig
```

Choose the operation you want to perform:

- MEDIA - View and edit ethernet media settings.
- PAIRING - View and configure NIC Pairing.
- VLAN - View and configure VLANs.
- LOOPBACK - View and configure Loopback.
- MTU - View and configure MTU.
- MULTICAST - Accept or reject ARP replies with a multicast address.

```
[> loopback
```

Currently configured loopback interface:

Choose the operation you want to perform:

- ENABLE - Enable Loopback Interface.

```
[> enable
```

Currently configured loopback interface:

```
1. Loopback
```

Choose the operation you want to perform:

- DISABLE - Disable Loopback Interface.

```
[>
```

Choose the operation you want to perform:

```
- MEDIA - View and edit ethernet media settings.
- PAIRING - View and configure NIC Pairing.
- VLAN - View and configure VLANs.
- LOOPBACK - View and configure Loopback.
- MTU - View and configure MTU.
- MULTICAST - Accept or reject ARP replies with a multicast address.

[]>
```

## Creating an IP Interface on Loopback via the interfaceconfig Command

Create an IP interface on the loopback interface:

```
mail3.example.com> interfaceconfig
Currently configured interfaces:
1. Data 1 (10.10.1.10/24: example.com)
2. InternalV1 (10.10.31.10/24: mail31.example.com)
3. Management (10.10.0.10/24: example.com)
Choose the operation you want to perform:
- NEW - Create a new interface.
- EDIT - Modify an interface.
- GROUPS - Define interface groups.
- DELETE - Remove an interface.

[]> new
Please enter a name for this IP interface (Ex: "InternalNet"):

[]> LoopVIP
Would you like to configure an IPv4 address for this interface (y/n)? [Y]>
IPv4 Address (Ex: 10.10.10.10):

[]> 10.10.1.11
Netmask (Ex: "255.255.255.0" or "0xffffffff"):

[255.255.255.0]> 255.255.255.255
Would you like to configure an IPv6 address for this interface (y/n)? [N]>
Ethernet interface:
1. Data 1
2. Data 2
```

```
3. Loopback
4. Management
5. VLAN 31
6. VLAN 34
[1]> 3
Hostname:
[]> example.com
Do you want to enable SSH on this interface? [N]>
Do you want to enable FTP on this interface? [N]>
Do you want to enable HTTP on this interface? [N]>
Do you want to enable HTTPS on this interface? [N]>
Currently configured interfaces:
1. Data 1 (10.10.1.10/24: example.com)
2. InternalV1 (10.10.31.10/24: mail31.example.com)
3. LoopVIP (10.10.1.11/24: example.com)
4. Management (10.10.0.10/24: example.com)
Choose the operation you want to perform:
- NEW - Create a new interface.
- EDIT - Modify an interface.
- GROUPS - Define interface groups.
- DELETE - Remove an interface.
[]>
```

## Creating a Listener on the New IP Interface

Create a listener on the new IP interface via the GUI or the CLI. For example, the following figure shows the newly created IP interface available in the Add Listener page in the GUI.

Figure 3: Creating a Listener on the New Loopback IP Interface

**Add Listener**

Listener Settings	
Name:	<input type="text"/>
Type of Listener:	<input checked="" type="radio"/> Public <input type="radio"/> Private
Interface:	<input type="text" value="Data 1 (10.10.1.10/24: example.com)"/> TCP Port: <input type="text" value="25"/>
Bounce Profile:	<input type="text" value="Data 1 (10.10.1.10/24: example.com)"/>
Disclaimer Above:	<input type="text" value="LoopVIP (10.10.11.10/24: mail11.example.com)"/> <small>Disclaimer text will be applied above the message body.</small>
Disclaimer Below:	<input type="text" value="None"/> <small>Disclaimer text will be applied below the message body.</small>
SMTP Authentication Profile:	<input type="text" value="None"/>
Certificate:	<input type="text" value="System Default"/>
▶ SMTP Address Parsing Options:	Optional settings for controlling parsing in SMTP "MAIL FROM" and "RCPT TO"
▶ Advanced:	Optional settings for customizing the behavior of the Listener
▶ LDAP Queries:	No LDAP Server Profiles have been created. Profiles can be defined at System Administration > LDAP
SMTP Call-Ahead Profile:	<input type="text" value="None"/>

## Ethernet Interface's Maximum Transmission Unit

The maximum transmission unit (MTU) is the largest unit of data that an ethernet interface will accept. You can decrease the MTU for an ethernet interface using the etherconfig command. The default MTU size is 1500 bytes, which is the largest MTU that the ethernet interface can accept.

To edit an interface's MTU:

```
mail3.example.com> etherconfig
```

Choose the operation you want to perform:

- MEDIA - View and edit ethernet media settings.
- PAIRING - View and configure NIC Pairing.
- VLAN - View and configure VLANs.
- LOOPBACK - View and configure Loopback.
- MTU - View and configure MTU.
- MULTICAST - Accept or reject ARP replies with a multicast address.

```
[ ]> mtu
```

Ethernet interfaces:

1. Data 1 mtu 1400
2. Data 2 default mtu 1500
3. Management default mtu 1500

Choose the operation you want to perform:

```
- EDIT - Edit an ethernet interface.

[]> edit

Enter the name or number of the ethernet interface you wish to edit.

[]> 2

Please enter a non-default (1500) MTU value for the Data 2 interface.

[]> 1200

Ethernet interfaces:

1. Data 1 mtu 1400
2. Data 2 mtu 1200
3. Management default mtu 1500

Choose the operation you want to perform:

- EDIT - Edit an ethernet interface.

[]>
```

## Accept or Reject ARP Replies with a Multicast Address

You can now specify whether to accept or reject ARP replies with a multicast address. Use the MULTICAST subcommand to configure this functionality.

The following example shows how to configure your appliance to accept ARP replies with a multicast address:

```
mail.example.com> etherconfig
Choose the operation you want to perform:
- MEDIA - View and edit ethernet media settings.
- VLAN - View and configure VLANs.
- LOOPBACK - View and configure Loopback.
- MTU - View and configure MTU.
- MULTICAST - Accept or reject ARP replies with a multicast address.
[]> multicast
ARP replies with a multicast address will be rejected.
Choose the operation you want to perform:
- ACCEPT - Accept ARP replies with a multicast address.
[]> accept
ARP replies with a multicast address will be accepted.
```
