*Results out of a Station research:*

The screenshot displays the Cisco search interface. At the top, a search bar contains the text "station" and a blue "Search" button. Below the search bar, a notification indicates "20 results found for 'station'". A button labeled "Save this search as a Preset" is circled with a "1". The results are listed under "Components (20)". The first two results are "STATION" components, each with IP, MAC, and properties. A "technical sheet" icon is circled with a "2" and an arrow pointing to it. The third result is "LD810EP" with IP, MAC, and properties. The fourth result is "Pump PLC".

In the example above, 20 components have been found with the mention "station" in their name, property values and tags.

It is possible to create a preset out of your research results (1). Presets created out of results will automatically update as new data are detected on the network.

If you mouse over a component, the button that gives access to its [technical sheet](#) (2) appears. This view will give you access to advanced data about the component.
